The BNF is available online through bnf.org and MedicinesComplete, and as mobile apps; a PDA version is also available. In addition, BNF content can be integrated into a local formulary by using BNF on FormularyComplete; see bnf.org for details.

The BNF is also available on www.evidence.nhs.uk and the NICE BNF smartphone app can be downloaded with a NHS Athens password in England, Scotland, and Wales; for technical support, email: contactus@evidence.nhs.uk.
Preface

The BNF is a joint publication of the British Medical Association and the Royal Pharmaceutical Society. It is published under the authority of a Joint Formulary Committee which comprises representatives of the two professional bodies, the UK Health Departments, the Medicines and Healthcare products Regulatory Agency, and a national guideline producer. The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the Group includes representatives of the British Dental Association and a representative from the UK Health Departments. The Nurse Prescribers’ Advisory Group advises on the content relevant to nurses and includes representatives from different parts of the nursing community and from the UK Health Departments.

The BNF aims to provide prescribers, pharmacists, and other healthcare professionals with sound up-to-date information about the use of medicines.

The BNF includes key information on the selection, prescribing, dispensing and administration of medicines. Medicines generally prescribed in the UK are covered and those considered less suitable for prescribing are clearly identified. Little or no information is included on medicines promoted for purchase by the public.

Information on drugs is drawn from the manufacturers’ product literature, medical and pharmaceutical literature, UK health departments, regulatory authorities, and professional bodies. Advice is constructed from clinical literature and reflects, as far as possible, an evaluation of the evidence from diverse sources. The BNF also takes account of authoritative national guidelines and emerging safety concerns. In addition, the editorial team receives advice on all therapeutic areas from expert clinicians; this ensures that the BNF’s recommendations are relevant to practice.

The BNF is designed as a digest for rapid reference and it may not always include all the information necessary for prescribing and dispensing. Also, less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. BNF for Children should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services (see inside front cover).

It is important to use the most recent BNF information for making clinical decisions. The print edition of the BNF is updated in March and September each year. Monthly updates are provided online via the BNF Publications website bnf.org, MedicinesComplete, and the NHS Evidence portal. The more important changes for this edition are listed on p. xvii; changes listed online are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies.

The website (bnf.org) includes additional information of relevance to healthcare professionals. Other digital formats of the BNF—including versions for mobile devices and integration into local formularies—are also available.

The BNF welcomes comments from healthcare professionals. Comments and constructive criticism should be sent to: British National Formulary, Royal Pharmaceutical Society, 1 Lambeth High Street, London SE1 7JN. editor@bnf.org

The contact email for manufacturers or pharmaceutical companies wishing to contact BNF Publications is manufacturerinfo@bnf.org

Acknowledgements

The Joint Formulary Committee is grateful to individuals and organisations that have provided advice and information to the BNF.

The principal contributors for this edition were:

Expert advice on the management of oral and dental conditions was kindly provided by M. Addy, P. Coulthard, A. Crighton, M.A.O. Lewis, J.G. Meechan, N.D. Robb, C. Scully, R.A. Seymour, R. Welbury, and J.M. Zakrzewska. S. Kaur provided valuable advice on dental prescribing policy.

Members of the British Association of Dermatologists’ Therapy & Guidelines Subcommittee, D.A. Buckley, E. Duarte Williamson, M. Griffiths, J. Hughes, T. Leslie, N.J. Levell, E. Mallon, A.J. McDonagh, P. McHenry, I. Nasr, C. Saunders, V. Swale, A. Brain (Secretariat), and M.F. Mohd Mustapa (Secretariat) have provided valuable advice.

Members of the Advisory Committee on Malaria Prevention, R.H. Behrens, D. Bell, P.L. Chiodini, V. Field, F. Genasi, L. Goodyer, A. Green, J. Jones, G. Kassianos, D.G. Laloo, D. Patel, H. Patel, M. Powell, D.V. Shingadia, N.O. Subair, C.J.M. Whitty, M. Blaze (Secretariat), and V. Smith (Secretariat) have provided valuable advice.

The UK Ophthalmic Pharmacy Group have also provided valuable advice.

The Joint British Societies’ Coronary Risk Prediction Charts have been reproduced with the kind permission of P.N. Durrington.

R. Suvarna and colleagues at the MHRA have provided valuable assistance.

Correspondents in the pharmaceutical industry have provided information on new products and commented on products in the BNF.

Numerous doctors, pharmacists, nurses, and others have sent comments and suggestions.

The BNF has valuable access to the *Martindale* data banks by courtesy of A. Brayfield and staff. F. Gibson and staff provided valuable technical assistance.

A. Holmes, E. Laughton, and P.D. Lee provided considerable assistance during the production of this edition of the BNF.

How the BNF is constructed

The BNF is unique in bringing together authoritative, independent guidance on best practice with clinically validated drug information, enabling healthcare professionals to select safe and effective medicines for individual patients.

Information in the BNF has been validated against emerging evidence, best-practice guidelines, and advice from a network of clinical experts. Hundreds of changes are made between print editions, and are published monthly online. The most clinically significant changes are listed at the front of each edition (p. xvii).

Joint Formulary Committee

The Joint Formulary Committee (JFC) is responsible for the content of the BNF. The JFC includes doctors appointed by the BMJ Group, pharmacists appointed by the Royal Pharmaceutical Society, and representatives from the Medicines and Healthcare products Regulatory Agency (MHRA), the UK Health Departments, and a national guideline producer. The JFC decides on matters of policy and reviews amendments to the BNF in the light of new evidence and expert advice.

Dental Advisory Group

The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the group includes representatives from the British Dental Association and a representative from the UK Health Departments.

Editorial team

BNF clinical writers have all worked as pharmacists and have a sound understanding of how drugs are used in clinical practice. Each clinical writer is responsible for editing, maintaining, and updating specific chapters of the BNF. During the publication cycle the clinical writers review information in the BNF against a variety of sources (see below).

Amendments to the text are drafted when the clinical writers are satisfied that any new information is reliable and relevant. The draft amendments are passed to expert advisers for comment and then presented to the Joint Formulary Committee for consideration. Additionally, sections are regularly chosen from every chapter for thorough review. These planned reviews aim to verify all the information in the selected sections and to draft any amendments to reflect the current best practice.

Clinical writers prepare the text for publication and undertake a number of checks on the knowledge at various stages of the production.

Expert advisers

The BNF uses about 60 expert clinical advisers (including doctors, pharmacists, nurses, and dentists) throughout the UK to help with the clinical content. The role of these expert advisers is to review existing text and to comment on amendments drafted by the clinical writers. These clinical experts help to ensure that the BNF remains reliable by:

- commenting on the relevance of the text in the context of best clinical practice in the UK;
- checking draft amendments for appropriate interpretation of any new evidence;
- providing expert opinion in areas of controversy or when reliable evidence is lacking;
- advising on areas where the BNF diverges from summaries of product characteristics;
- providing independent advice on drug interactions, prescribing in hepatic impairment, renal impairment, pregnancy, breast-feeding, children, the elderly, palliative care, and the emergency treatment of poisoning.

In addition to consulting with regular advisers, the BNF calls on other clinical specialists for specific developments when particular expertise is required.

The BNF also works closely with a number of expert bodies that produce clinical guidelines. Drafts or pre-publication copies of guidelines are routinely received for comment and for assimilation into the BNF.

Sources of BNF information

The BNF uses a variety of sources for its information; the main ones are shown below.

Summaries of product characteristics

The BNF receives summaries of product characteristics (SPCs) of all new products as well as revised SPCs for existing products. The SPCs are the principal source of product information and are carefully processed, despite the ever-increasing volume of information being issued by the pharmaceutical industry. Such processing involves:

- verifying the approved names of all relevant ingredients including ‘non-active’ ingredients (the BNF is committed to using approved names and descriptions as laid down by the Human Medicines Regulations 2012);
- comparing the indications, cautions, contra-indications, and side-effects with similar existing drugs. Where these are different from the expected pattern, justification is sought for their inclusion or exclusion;
- seeking independent data on the use of drugs in pregnancy and breast-feeding;
- incorporating the information into the BNF using established criteria for the presentation and inclusion of the data;
- checking interpretation of the information by a second clinical writer before submitting to a lead editor; changes relating to doses receive an extra check;
- identifying potential clinical problems or omissions and seeking further information from manufacturers or from expert advisers;
- careful validation of any areas of divergence of the BNF from the SPC before discussion by the Committee (in the light of supporting evidence);
constructing, with the help of expert advisers, a comment on the role of the drug in the context of similar drugs.

Much of this processing is applicable to the following sources as well.

**Expert advisers** The role of expert clinical advisers in providing the appropriate clinical context for all BNF information is discussed above.

**Literature** Clinical writers monitor core medical and pharmaceutical journals. Research papers and reviews relating to drug therapy are carefully processed. When a difference between the advice in the BNF and the paper is noted, the new information is assessed for reliability and relevance to UK clinical practice. If necessary, new text is drafted and discussed with expert advisers and the Joint Formulary Committee. The BNF enjoys a close working relationship with a number of national information providers.

**Systematic reviews** The BNF has access to various databases of systematic reviews (including the Cochrane Library and various web-based resources). These are used for answering specific queries, for reviewing existing text, and for constructing new text. Clinical writers receive training in critical appraisal, literature evaluation, and search strategies. Reviews published in Clinical Evidence are used to validate BNF advice.

**Consensus guidelines** The advice in the BNF is checked against consensus guidelines produced by expert bodies. A number of bodies make drafts or pre-publication copies of the guidelines available to the BNF; it is therefore possible to ensure that a consistent message is disseminated. The BNF routinely processes guidelines from the National Institute for Health and Care Excellence (NICE), the Scottish Medicines Consortium (SMC), and the Scottish Intercollegiate Guidelines Network (SIGN).

**Reference sources** Textbooks and reference sources are used to provide background information for the review of existing text or for the construction of new text. The BNF team works closely with the editorial team that produces *Martindale: The Complete Drug Reference*. The BNF has access to *Martindale* information resources and each team keeps the other informed of significant developments and shifts in the trends of drug usage.

**Statutory information** The BNF routinely processes relevant information from various Government bodies including Statutory Instruments and regulations affecting the Prescription only Medicines Order. Official compendia such as the British Pharmacopoeia and its addenda are processed routinely to ensure that the BNF complies with the relevant sections of the Human Medicines Regulations 2012. The BNF maintains close links with the Home Office (in relation to controlled drug regulations) and the Medicines and Healthcare products Regulatory Agency (including the British Pharmacopoeia Commission). Safety warnings issued by the Commission on Human Medicines (CHM) and guidelines on drug use issued by the UK health departments are processed as a matter of routine.

Relevant professional statements issued by the Royal Pharmaceutical Society are included in the BNF as are guidelines from bodies such as the Royal College of General Practitioners.

The BNF reflects information from the Drug Tariff, the Scottish Drug Tariff, and the Northern Ireland Drug Tariff.

**Pricing information** NHS Prescription Services (from the NHS Business Services Authority) provides information on prices of medicinal products and appliances in the BNF.

**Comments from readers** Readers of the BNF are invited to send in comments. Numerous letters and emails are received by the BNF team. Such feedback helps to ensure that the BNF provides practical and clinically relevant information. Many changes in the presentation and scope of the BNF have resulted from comments sent in by users.

**Comments from industry** Close scrutiny of the BNF by the manufacturers provides an additional check and allows them an opportunity to raise issues about the BNF’s presentation of the role of various drugs; this is yet another check on the balance of the BNF’s advice. All comments are looked at with care and, where necessary, additional information and expert advice are sought.

**Virtual user groups** The BNF has set up virtual user groups across various healthcare professions (e.g. doctors, pharmacists, nurses, dentists). The aim of these groups will be to provide feedback to the editors and publishers to ensure that BNF publications continue to serve the needs of its users.

**Market research** Market research is conducted at regular intervals to gather feedback on specific areas of development, such as drug interactions or changes to the way information is presented in digital formats.

The BNF is an independent professional publication that is kept up-to-date and addresses the day-to-day prescribing information needs of healthcare professionals. Use of this resource throughout the health service helps to ensure that medicines are used safely, effectively, and appropriately.
How to use the BNF

In order to achieve the safe, effective, and appropriate use of medicines, healthcare professionals must be able to use the BNF effectively, and keep up to date with significant changes in the BNF that are relevant to their clinical practice. How to Use the BNF is aimed as a quick refresher for all healthcare professionals involved with prescribing, monitoring, supplying, and administering medicines, and as a learning aid for students training to join these professions. While How to Use the BNF is linked to the main elements of rational prescribing, the generic structure of this section means that it can be adapted for teaching and learning in different clinical settings.

Structure of the BNF

The Contents list (on p. iv) shows that information in the BNF is divided into:
- How the BNF is Constructed (p. ix);
- Changes (p. xviii);
- Guidance on Prescribing (p. 1), which provides practical information on many aspects of prescribing from writing a prescription to prescribing in palliative care;
- Emergency Treatment of Poisoning (p. 33), which provides an overview on the management of acute poisoning;
- Classified notes on clinical conditions, drugs, and preparations, these notes are divided into 15 chapters, each of which is related to a particular system of the body (e.g. chapter 2, Cardiovascular System) or to an aspect of medical care (e.g. chapter 5, Infections). Each chapter is further divided into classified sections. Each section usually begins with prescribing notes followed by relevant drug monographs and preparations (see fig. 1). Drugs are classified in a section according to their pharmacology and therapeutic use;
- Appendices and Indices, includes 5 Appendices (providing information on drug interactions, Borderline substances, cautionary and advisory labels for dispensed medicines, intravenous additives, and wound management), the Dental Practitioners' Formulary, the Nurse Prescribers' Formulary, Non-medical Prescribing, Index of Manufacturers, and the main Index. The information in the Appendices should be used in conjunction with relevant information in the chapters.

Finding information in the BNF

The BNF includes a number of aids to help access relevant information:
- Index, where entries are included in alphabetical order of non-proprietary drug names, proprietary drug names, clinical conditions, and prescribing topics. A specific entry for ‘Dental Prescribing’ brings together topics of relevance to dentists. The page reference to the drug monograph is shown in bold type. References to drugs in Appendices 1 and 3 are not included in the main Index;
- Contents (p. iv), provides a hierarchy of how information in the BNF is organised;
- The beginning of each chapter includes a classified hierarchy of how information is organised in that chapter;
- Running heads, located next to the page number on the top of each page, show the section of the BNF that is being used;
- Thumbnails, on the outer edge of each page, show the chapter of the BNF that is being used;
- Cross-references, lead to additional relevant information in other parts of the BNF.

Finding dental information in the BNF

Extra signposts have been added to help access dental information in the BNF:
- Prescribing in Dental Practice (p. 27), includes a contents list dedicated to drugs and topics of relevance to dentists, together with cross-references to the prescribing notes in the appropriate sections of the BNF. For example, a review of this list shows that information on the local treatment of oral infections is located in chapter 12 (Ear, Nose, and Oropharynx) while information on the systemic treatment of these infections is found in chapter 5 (Infections). This section also includes advice on Medical Emergencies in Dental Practice (p. 27) and Medical Problems in Dental Practice (p. 29). Guidance on the prevention of endocarditis and advice on the management of anticoagulated patients undergoing dental surgery can also be found here;
- Side-headings, in the prescribing notes, side-headings facilitate the identification of advice on oral conditions (e.g. Dental and Orofacial Pain, p. 274);
- Dental prescribing on NHS, in the body of the BNF, preparations that can be prescribed using NHS form FP10D (GP14 in Scotland, WP10D in Wales) can be identified by means of a note headed ‘Dental prescribing on NHS’ (e.g. Aciclovir Tablets, p. 424).

Identifying effective drug treatments

The prescribing notes in the BNF provide an overview of the drug management of common conditions and facilitate rapid appraisal of treatment options (e.g. hypertension, p. 108). For ease of use, information on the management of certain conditions has been tabulated (e.g. acute asthma, p. 183). Information is also provided on the prevention of disease (e.g. malaria prophylaxis for travellers, p. 437). Cardiovascular risk prediction charts for the primary prevention of cardiovascular disease can be found in the glossy pages at the back of the BNF.

Advice issued by the National Institute for Health and Clinical Excellence (NICE) is integrated within the BNF prescribing notes if appropriate. Summaries of NICE technology appraisals, and relevant short guidelines, are included in blue panels. The BNF also includes advice issued by the Scottish Medicines Consortium (SMC) when a medicine is restricted or not recommended for use within NHS Scotland.

In order to select safe and effective medicines for individual patients, information in the prescribing notes must be used in conjunction with other prescribing details about the drugs and knowledge of the patient’s medical and drug history.
A brief description of the clinical uses of a drug can usually be found in the Indications section of its monograph (e.g. bendroflumethiazide, p. 87); a cross-reference is provided to any indications for that drug that are covered in other sections of the BNF.

The symbol \[\text{\textbullet}\] is used to denote preparations that are considered by the Joint Formulary Committee to be less suitable for prescribing. Although such preparations may not be considered as drugs of first choice, their use may be justifiable in certain circumstances.

**Drug management of medical emergencies**

Guidance on the drug management of medical emergencies can be found in the relevant BNF chapters (e.g. treatment of anaphylaxis is included in section 3.4.3); advice on the management of medical emergencies in dental practice can be found in Prescribing in Dental Practice, p. 27. A summary of drug doses used for Medical Emergencies in the Community can be found in the glossy pages at the back of the BNF. An algorithm for Adult Advanced Life Support can also be found within these pages.

**Figure 1** Illustrates the typical layout of a drug monograph and preparation records in the BNF

**Drugs**

Drugs appear under pharmacopoeial or other non-proprietary titles. When there is an appropriate current monograph (Human Medicines Regulations 2012) preference is given to a name at the head of that monograph; otherwise a British Approved Name (BAN), if available, is used.

The symbol \[\text{\textbullet}\] is used to denote those preparations that are considered by the Joint Formulary Committee to be less suitable for prescribing. Although such preparations may not be considered as drugs of first choice, their use may be justifiable in certain circumstances.

**Prescription-only medicines**

This symbol has been placed against those preparations that are available only on a prescription issued by an appropriate practitioner. For more detailed information see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).

The symbols (\[\text{\textbullet}\]) indicate that the preparations are subject to the prescription requirements of the Misuse of Drugs Act. For regulations governing prescriptions for such preparations see Controlled Drugs and Drug Dependence.

**Preparations not available for NHS prescription**

This symbol has been placed against those preparations included in the BNF that are not prescribable under the NHS. Those prescribable only for specific disorders have a footnote specifying the condition(s) for which the preparation remains available. Some preparations which are not prescribable by brand name under the NHS may nevertheless be dispensed using the brand name providing that the prescription shows an appropriate non-proprietary name.

**Prices**

Prices have been calculated from the basic cost used in pricing NHS prescriptions, see also Prices in the BNF for details.
Minimising harm in patients with co-morbidities

The drug chosen to treat a particular condition should have minimal detrimental effects on the patient’s other diseases and minimise the patient’s susceptibility to adverse effects. To achieve this, the Cautions, Contra-indications, and Side-effects of the relevant drug should be reviewed, and can usually be found in the drug monograph. However, if a class of drugs (e.g. tetracyclines, p. 374) share the same cautions, contra-indications, and side-effects, these are amalgamated in the prescribing notes while those unique to a particular drug in that class are included in its individual drug monograph. Occasionally, the cautions, contra-indications, and side-effects may be included within a preparation record if they are specific to that preparation or if the preparation is not accompanied by a monograph.

The information under Cautions can be used to assess the risks of using a drug in a patient who has co-morbidities that are also included in the Cautions for that drug—if a safer alternative cannot be found, the drug may be prescribed while monitoring the patient for adverse-effects or deterioration in the co-morbidity. Contra-indications are far more restrictive than Cautions and mean that the drug should be avoided in a patient with a condition that is contra-indicated.

The impact that potential side-effects may have on a patient’s quality of life should also be assessed. For instance, in a patient who has difficulty sleeping, it may be preferable to avoid a drug that frequently causes insomnia. The prescribing notes in the BNF may highlight important safety concerns and differences between drugs in their ability to cause certain side-effects.

Prescribing for patients with hepatic or renal impairment

Drug selection should aim to minimise the potential for drug accumulation, adverse drug reactions, and exacerbation of pre-existing hepatic or renal disease. If it is necessary to prescribe drugs whose effect is altered by hepatic or renal disease, appropriate drug dose adjustments should be made, and patients should be monitored adequately. The general principles for prescribing are outlined under Prescribing in Hepatic Impairment (p. 17) and Prescribing in Renal Impairment (p. 17). Information about drugs that should be avoided or used with caution in hepatic disease or renal impairment can be found in drug monographs under Hepatic Impairment and Renal Impairment (e.g. fluconazole, p. 404). However, if a class of drugs (e.g. tetracyclines, p. 374) share the same recommendations for use in hepatic disease or renal impairment, this advice is presented in the prescribing notes under Hepatic Impairment and Renal Impairment and any advice that is unique to a particular drug in that class is included in its individual drug monograph.

Prescribing for patients who are pregnant or breast-feeding

Drug selection should aim to minimise harm to the fetus, nursing infant, and mother. The infant should be monitored for potential side-effects of drugs used by the mother during pregnancy or breast-feeding. The general principles for prescribing are outlined under Prescribing in Pregnancy (p. 19) and Prescribing in Breast-feeding (p. 19). The prescribing notes in the BNF chapters provide guidance on the drug treatment of common conditions that can occur during pregnancy and breast-feeding (e.g. asthma, p. 181). Information about the use of specific drugs during pregnancy and breast-feeding can be found in their drug monographs under Pregnancy and Breast-feeding (e.g. fluconazole, p. 404). However, if a class of drugs (e.g. tetracyclines, p. 374) share the same recommendations for use during pregnancy or breast-feeding, this advice is amalgamated in the prescribing notes under Pregnancy and Breast-feeding while any advice that is unique to a particular drug in that class is included in its individual drug monograph.

Minimising drug interactions

Drug selection should aim to minimise drug interactions. If it is necessary to prescribe a potentially serious combination of drugs, patients should be monitored appropriately. The mechanisms underlying drug interactions are explained in Appendix 1 (p. 884).

Details of drug interactions can be found in Appendix 1 of the BNF (p. 885). Drugs and their interactions are listed in alphabetical order of the non-proprietary drug name, and cross-references to drug classes are provided where appropriate. Each drug or drug class is listed twice: in the alphabetical list and also against the drug or class with which it interacts. The symbol ⚠ is placed against interactions that are potentially serious and where combined administration of drugs should be avoided (or only undertaken with caution and appropriate monitoring). Interactions that have no symbol do not usually have serious consequences.

If a drug or drug class has interactions, a cross reference to where these can be found in Appendix 1 is provided under the Cautions of the drug monograph or prescribing notes.

Prescribing for the elderly

General guidance on prescribing for the elderly can be found on p. 25.

Prescribing for children

General guidance on prescribing for children can be found on p. 15. For detailed advice on medicines used in children, consult BNF for Children.

Selecting the dose

The drug dose is usually located in the Dose section of the drug monograph or preparation record. The dose of a drug may vary according to different indications and routes of administration. If no indication is given by the dose, then that dose can be used for the conditions specified in the Indications section of that drug monograph, but not for the conditions cross-referring to other sections of the BNF. The dose is located within the preparation record when the dose varies according to different formulations of that drug (e.g. amphotericin, p. 407) or when a preparation has a dose different to that in its monograph (e.g. Sporanox® liquid, p. 405). Occasionally, drug doses may be included in the prescribing notes for practical reasons (e.g. doses of drugs in Helicobacter pylori eradication regimens, p. 51). The right dose should be selected for the right indication, route of administration, and preparation.
Selecting a suitable preparation

Patients should be prescribed a preparation that complements their daily routine, and that provides the right dose of drug for the right indication and route of administration.

In the BNF, preparations usually follow immediately after the monograph for the drug which is their main ingredient. The preparation record (see fig. 1) provides information on the type of formulation (e.g. tablet), the amount of active drug in a solid dosage form, and the concentration of active drug in a liquid dosage form. The legal status is shown for prescription only medicines and controlled drugs; any exception to the legal status is shown by a Note immediately after the preparation record or a footnote. If a proprietary preparation has a distinct colour, coating, scoring, or flavour, this is shown in the preparation record. If a proprietary preparation includes excipients usually specified in the BNF (see p. 2), these are shown in the Exipients statement, and if it contains clinically significant quantities of electrolytes, these are usually shown in the Electrolytes statement.

Branded oral liquid preparations that do not contain fructose, glucose, or sucrose are described as ‘sugar-free’ in the BNF. Preparations containing hydrogenated glucose syrup, mannitol, maltitol, sorbitol, or xylitol are also marked ‘sugar-free’ since there is evidence that they do not cause dental caries. Patients receiving medicines containing saccharin and their labels is included in alphabetical order of the non-proprietary and proprietary drug names.

Advising patients

The prescriber and the patient should agree on the health outcomes that the patient desires and on the strategy for achieving them (see Taking Medicines to Best Effect, p. 1). Taking the time to explain to the patient (and carers) the rationale and the potential adverse effects of treatment may improve adherence. For some medicines there is a special need for counselling (e.g. appropriate posture during administration of doxycycline); this is shown in Counselling statements, usually in the Cautions or Dose section of a monograph, or within a preparation record if it is specific to that preparation.

Patients should be advised if treatment is likely to affect their ability to drive or operate machinery. Cautionary and advisory labels that pharmacists are recommended to add when dispensing are included in the preparation record (see fig. 1). Details of these labels can be found in Appendix 3 (p. 1034); a list of products and their labels is included in alphabetical order of the non-proprietary and proprietary drug names.

Monitoring drug treatment

Patients should be monitored to ensure they are achieving the expected benefits from drug treatment without any unwanted side-effects. The prescribing notes or the monitoring requirements. Further information on monitoring the plasma concentration of drugs with a narrow therapeutic index can be found as a Note under the Dose section of the drug monograph.

Identifying and reporting adverse drug reactions

Clinically relevant Side-effects for most drugs are included in the monographs. However, if a class of drugs (e.g. tetracyclines, p. 374) share the same side-effects, these are presented in the prescribing notes while those unique to a particular drug in that class are included in its individual drug monograph. Occasionally, side-effects may be included within a prepara-
An e-learning programme developed in collaboration with the Centre for Pharmacy Postgraduate Education (CPPE), enables pharmacists to identify and assess how significant changes in the BNF affect their clinical practice. The module can be found at www.cppe.ac.uk.

So many changes are made for each update of the BNF, that not all of them can be accommodated in the Changes section. We encourage healthcare professionals to review regularly the prescribing information on drugs that they encounter frequently.

Nutrition
Appendix 2 (p. 997) includes tables of ACBS-approved enteral feeds and nutritional supplements based on their energy and protein content. There are separate tables for specialised formulae for specific clinical conditions. Classified sections on foods for special diets and nutritional supplements for metabolic diseases are also included.

Wound dressings
A table on wound dressings in Appendix 5 (p. 1061) allows an appropriate dressing to be selected based on the appearance and condition of the wound. Further information about the dressing can be found by following the cross-reference to the relevant classified section in the Appendix. In section (A5.2) advanced wound contact dressings have been classified in order of increasing absorbency.

Unlicensed medicines
The BNF includes unlicensed use of medicines when the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience. When the BNF recommends an unlicensed medicine or the ‘off-label’ use of a licensed medicine, this is shown in the appropriate place by ‘[unlicensed]’.

Prices in the BNF
Basic NHS net prices are given in the BNF to provide an indication of relative cost. Where there is a choice of suitable preparations for a particular disease or condition the relative cost may be used in making a selection. Cost-effective prescribing must, however, take into account other factors (such as dose frequency and duration of treatment) that affect the total cost. The use of more expensive drugs is justified if it will result in better treatment of the patient, or a reduction of the length of an illness, or the time spent in hospital. We regularly update prices using the Drug Tariff and proprietary price information published by the NHS dictionary of medicines and devices (dm+d, www.dmd.nhs.uk). The weekly updated dm+d data (including prices) can be accessed using the dm+d browser of the NHS Business Services Authority (www.ppa.org.uk/systems/pcddbrowserv2_3new/browser.jsp).

Prices have generally been calculated from the net cost used in pricing NHS prescriptions in June 2014 (for non-proprietary and proprietary preparations). Prices generally reflect whole dispensing packs; prices for injections are stated per ampoule, vial, or syringe. Prices for extemporaneously prepared preparations are not provided in the BNF as prices vary between different manufacturers. In Appendix 5 prices stated are per dressing or bandage.

BNF prices are not suitable for quoting to patients seeking private prescriptions or contemplating over-the-counter purchases because they do not take into account VAT, professional fees, and other overheads.
A fuller explanation of costs to the NHS may be obtained from the Drug Tariff. Separate drug tariffs are applicable to England and Wales (www.ppa.org.uk/ppa/edt_intro.htm), Scotland (www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/), and Northern Ireland (www.dhsspsni.gov.uk/pas-tariff); prices in the different tariffs may vary.

**Extra resources on the BNF website**

While the BNF website (bnf.org) provides online access to BNF content, it also provides additional resources such as an archive of the e-newsletter and policies.

**Using other sources for medicines information**

The BNF is designed as a digest for rapid reference. Less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. *BNF for Children* should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services (see inside front cover).
Changes

Monthly updates are provided online via bnf.org, MedicinesComplete, and the NHS Evidence portal. The changes listed below are cumulative (from one print edition to the next).

Significant changes

Significant changes have been made in the following sections for BNF 68:

1. Interchangeability of oral mesalazine preparations, section 1.5.1
2. Zaleplon: change to legal classification, see Sonata® and Controlled Drugs and Drug Dependence
3. Zopiclone: change to legal classification, see individual zopiclone preparations and Controlled Drugs and Drug Dependence
4. Haloperidol [significant changes to indications and doses], section 4.2.1
5. Domperidone: risk of cardiac side-effects—restricted indication, new contra-indications, reduced dose and duration of use [MHRA advice], section 4.6
6. Tramadol: change to legal classification, see individual tramadol preparations and Controlled Drugs and Drug Dependence
7. Treatment of epilepsy [updated guidance], section 4.8.1
8. Voriconazole [risk of hepatotoxicity and phototoxicity], section 5.2.1
9. Levothyroxine sodium and liothyronine sodium use in pregnancy, section 6.2.1
10. Strontium ranelate [restrictions on use], section 6.6.2
11. Risk of venous thromboembolism with combined hormonal contraceptives, section 7.3.1
12. Fixatorone monotherapy for treating multiply relapsed or refractory aggressive non-Hodgkin’s B-cell lymphoma [NICE guidance], section 8.1.2
13. Pemetrexed maintenance treatment following induction therapy with pemetrexed and cisplatin for non-squamous non-small-cell lung cancer [NICE guidance], section 8.1.3
14. Vinflunine for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract [NICE guidance], section 8.1.4
15. Afiblercept in combination with irinotecan and fluorouracil-based therapy for treating metastatic colorectal cancer that has progressed following prior oxaliplatin-based chemotherapy [NICE guidance], section 8.1.5
16. Bortezomib for induction therapy in multiple myeloma before high-dose chemotherapy and autologous stem cell transplantation [NICE guidance], section 8.1.5
17. Afatinib for treating epidermal growth factor receptor mutation-positive locally advanced or metastatic non-small-cell lung cancer [NICE guidance], section 8.1.5
18. Bosutinib for previously treated chronic myeloid leukaemia [NICE guidance], section 8.1.5
19. Rituximab in combination with glucocorticoids for treating anti-neutrophil cytoplasmic antibody-associated vasculitis [NICE guidance], section 8.2.3

Dose changes

Changes in dose statements introduced into BNF 68:

1. Acenocoumarol, p. 153
2. Actikerall®, p. 813
3. Amoxicillin [paediatric oral dose], p. 363
4. Ampicillin [paediatric oral dose], p. 364
5. Cilostazol, p. 140
6. Dobutamine, p. 141
7. Domperidone, p. 269
8. Glucagon [intravenous route deleted], p. 476
9. Granisetron, p. 270
10. Haloperidol, p. 234
11. Human papillomavirus vaccine [schedule updated], p. 830
12. Levothyroxine sodium, p. 480
13. Migraleve® [licensed age], p. 278
14. MigraMax® [licensed age], p. 276
15. Naloxone [overdosage with opioids], p. 38
16. Pentasa® granules [dose for acute attack], p. 64
17. Prasugrel, p. 161
18. Rosuvastatin, p. 173
19. Simvastatin [dose with concomitant lomitapide], p. 173
20. Teicoplanin, p. 385
21. Tenofovir disoproxil [dose in renal impairment], p. 415
22. Terbutaline [uncomplicated premature labour], p. 531
23. Tirofibian, p. 162
24. Ulipristal acetate [pre-operative treatment of symptoms of uterine fibroids], p. 498

Classification changes

Classification changes have been made in the following sections for BNF 68:

Section 13.6.3 Topical preparations for rosacea [new sub-section]

New names

Name changes introduced into BNF 68:

1. Levocarnitine [formerly carnitine], p. 695

Deleted preparations

Preparations discontinued during the compilation of BNF 68:

1. Anafranil® capsules
Betin® [generic now available]
Calcicard CR®
Doribax®
Doripenem
Dulcolax® Pico Perles
Edrophonium
Emcor®
Epanutin® capsules [generic now available]
Ethanolamine olate
Fibro-Vein®
Fluenz®
Flunisolide
Forceval Junior® capsules
Glytrin Spray®
Gopto®
Holdor® injection [generic still available]
Holdor® tablets [generic still available]
Half-Inderal LA®
Hydromol® HC Intensive
Inderal-LA®
Isradipine
Macrodantin®
Minims® Proxymetacaine and Fluorescein
Mysoline® [generic now available]
Otosporin®
Prescal®
Sanomigran® elixir
Serevent diskhaler®
Syntaris®
Tarka®
Tevagrestim®
Topal®
Utinor®

Kadcyla® [trastuzumab emtansine], p. 614
Lemtrada® [alemtuzumab], p. 624
Lidocaine with prilocaine cream [new generic], p. 881
Lojista® [lomitapide], p. 177
Lubion® [progesterone], p. 498
Minims® Povidone Iodine [povidone iodine eye drops], p. 760
Mirvaso® [brimonidine], p. 810
Niasil® e/c tablets, p. 406
Noyada® [captopril], p. 121
Opaunit® [macitentan], p. 112
Palexia® oral solution [tapentadol], p. 290
Phenytoin capsules [new generic], p. 309
Primidone [new generic], p. 309
Recriv® [fentanyl sublingual tablets], p. 284
Relvar Ellipta® [fluticasone furoate with vilanterol], p. 200
Sovaldi® [sofosbuvir], p. 431
Spectra® [avanafil], p. 559
Tofinlar® [dabrafenib], p. 602
Tecfidera® [dimethyl fumarate], p. 629
Timolol [new generic], p. 107
Tivicay® [dolutegravir], p. 422
Tranexamic acid injection, p. 168
Vaqto® Adult [hepatitis A vaccine], p. 837
Vesomni® [tamsulosin with solifenacin], p. 550
Vipdomet® [alogliptin with metformin], p. 470
Vipidia® [alogliptin], p. 470
Xigduo® [dapagliflozin with metformin], p. 471
Zeroderm®, p. 783

New preparations included in the relevant sections of BNF 68:
Abilify Maintena® [aripiprazole depot injection], p. 243
Adempas® [riociguat], p. 113
Aubagio® [teriflunomide], p. 635
BindRen® [colestilan], p. 685
Breakyl® [fentanyl buccal film], p. 284
Dexafree® eye drops [dexamethasone phosphate], p. 745
Ditropan® elixir [oxybutynin hydrochloride], p. 553
Emerade® [adrenaline], p. 211
Fibrovein® [sodium tetradeyl sulfate], p. 179
Fluzn Tetra® [seasonal influenza vaccine], p. 842
Giotrif® [afatinib], p. 600
Hapoptic® [buproporphine transdermal patch], p. 281
Invokana® [canagliflozin], p. 471
General guidance

Medicines should be prescribed only when they are necessary, and in all cases the benefit of administering the medicine should be considered in relation to the risk involved. This is particularly important during pregnancy, when the risk to both mother and fetus must be considered (for further details see Prescribing in Pregnancy, p. 19).

It is important to discuss treatment options carefully with the patient to ensure that the patient is content to take the medicine as prescribed (see also Taking Medicines to Best Effect, below). In particular, the patient should be helped to distinguish the adverse effects of prescribed drugs from the effects of the medical disorder. When the beneficial effects of the medicine are likely to be delayed, the patient should be advised of this.

Taking medicines to best effect  Difficulties in adherence to drug treatment occur regardless of age. Factors contributing to poor compliance with prescribed medicines include:

- prescription not collected or not dispensed;
- purpose of medicine not clear;
- perceived lack of efficacy;
- real or perceived adverse effects;
- patients’ perception of the risk and severity of side-effects may differ from that of the prescriber;
- instructions for administration not clear;
- physical difficulty in taking medicines (e.g. swallowing the medicine, handling small tablets, or opening medicine containers);
- unattractive formulation (e.g. unpleasant taste);
- complicated regimen.

The prescriber and the patient should agree on the health outcomes that the patient desires and on the strategy for achieving them (‘concordance’). The prescriber should be sensitive to religious, cultural, and personal beliefs that can affect a patient’s acceptance of medicines.

Taking the time to explain to the patient (and relatives) the rationale and the potential adverse effects of treatment may improve adherence. Reinforcement and elaboration of the physician’s instructions by the pharmacist and other members of the healthcare team also helps. Advising the patient of the possibility of alternative treatments may encourage the patient to seek advice rather than merely abandon unacceptable treatment.

Simplifying the drug regimen may help; the need for frequent administration may reduce adherence, although there appears to be little difference in adherence between once-daily and twice-daily administration. Combination products reduce the number of drugs taken but at the expense of the ability to titrate individual doses.

Biosimilar medicines  A biosimilar medicine is a new biological product that is similar to a medicine that has already been authorised to be marketed (the biological reference medicine) in the European Union. The active substance of a biosimilar medicine is similar, but not identical, to the biological reference medicine. Biological products are different from standard chemical products in terms of their complexity and although theoretically there should be no important differences between the biosimilar and the biological reference medicine in terms of safety or efficacy, when prescribing biological products, it is good practice to use the brand name. This will ensure that substitution of a biosimilar medicine does not occur when the medicine is dispensed.

Biosimilar medicines have black triangle status (▼, see p. 12) at the time of initial marketing. It is important to report suspected adverse reactions to biosimilar medicines using the Yellow Card Scheme (p. 12). For biosimilar medicines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine.

Complementary and alternative medicine  An increasing amount of information on complementary and alternative medicine is becoming available. The scope of the BNF is restricted to the discussion of conventional medicines but reference is made to complementary treatments if they affect conventional therapy (e.g. interactions with St John’s wort—see Appendix 1). Further information on herbal medicines is available at www.mhra.gov.uk.

Abbreviation of titles  In general, titles of drugs and preparations should be written in full. Unofficial abbreviations should not be used as they may be misinterpreted.

Non-proprietary titles  Where non-proprietary (‘generic’) titles are given, they should be used in prescribing. This will enable any suitable product to be dispensed, thereby saving delay to the patient and sometimes expense to the health service. The only exception is where there is a demonstrable difference in clinical effect between each manufacturer’s version of the formulation, making it important that the patient should always receive the same brand; in such cases, the brand name or the manufacturer should be stated. Non-proprietary titles should not be invented for the purposes of prescribing generically since this can lead to confusion, particularly in the case of compound and modified-release preparations.

Titles used as headings for monographs may be used freely in the United Kingdom but in other countries may be subject to restriction. Many of the non-proprietary titles used in this book are titles of monographs in the European Pharmacopoeia, British Pharmacopoeia, or British Pharmaceutical Codex 1973. In such cases the preparations must comply with the standard (if any) in the appropriate publication, as required by the Human Medicines Regulations 2012.
Proprietary titles Names followed by the symbol® are or have been used as proprietary names in the United Kingdom. These names may in general be applied only to products supplied by the owners of the trade marks.

Marketing authorisation and BNF advice In general the doses, indications, cautions, contra-indications, and side-effects in the BNF reflect those in the manufacturers’ data sheets or Summaries of Product Characteristics (SPCs) which, in turn, reflect those in the corresponding marketing authorisations (formerly known as Product Licences). The BNF does not generally include proprietary medicines that are not supported by a valid Summary of Product Characteristics or when the marketing authorisation holder has not been able to supply essential information. When a preparation is available from more than one manufacturer, the BNF reflects advice that is the most clinically relevant regardless of any variation in the marketing authorisations. Unlicensed products can be obtained from ‘special-order’ manufacturers or specialist importing companies, see p. 1104.

Where an unlicensed drug is included in the BNF, this is indicated in square brackets after the entry. When the BNF suggests a use (or route) that is outside the licensed indication of a product (‘off-label’ use), this too is indicated. Unlicensed use of medicines becomes necessary if the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience. The doses stated in the BNF are intended for general guidance and represent, unless otherwise stated, the usual range of doses that are generally regarded as being suitable for adults.

Prescribing unlicensed medicines Prescribing medicines outside the recommendations of their marketing authorisation alters (and probably increases) the prescriber’s professional responsibility and potential liability. The prescriber should be able to justify and feel competent in using such medicines, and also inform the patient or the patient’s carer that the prescribed medicine is unlicensed.

Oral syringes An oral syringe is supplied when oral liquid medicines are prescribed in doses other than multiples of 5 mL. The oral syringe is marked in 0.5-mL divisions from 1 to 5 mL to measure doses of less than 5 mL (other sizes of oral syringe may also be available). It is provided with an adaptor and an instruction leaflet. The 5-mL spoon is used for doses of 5 mL (or multiples thereof).

Important To avoid inadvertent intravenous administration of oral liquid medicines, only an appropriate oral or enteral syringe should be used to measure an oral liquid medicine (if a medicine spoon or graduated measure cannot be used), these syringes should not be compatible with intravenous or other parenteral devices. Oral or enteral syringes should be clearly labelled ‘Oral’ or ‘Enteral’ in a large font size; it is the healthcare practitioner’s responsibility to label the syringe with this information if the manufacturer has not done so.

Excipients Branded oral liquid preparations that do not contain fructose, glucose, or sucrose are described as ‘sugar-free’ in the BNF. Preparations containing hydrogenated glucose syrup, mannitol, maltitol, sorbitol, or xylitol are also marked ‘sugar-free’ since there is evidence that they do not cause dental caries. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries. Sugar-free preparations should be used whenever possible.

Where information on the presence of aspartame, gluten, saffltes, tartrazine, arachis (peanut) oil or sesame oil is available, this is indicated in the BNF against the relevant preparation.

Information is provided on selected excipients in skin preparations (section 13.1.3), in vaccines (section 14.1), and on selected preservatives and excipients in eye drops and injections.

The presence of benzyl alcohol and polyoxyl castor oil (polyethoxylated castor oil) in injections is indicated in the BNF. Benzyl alcohol has been associated with a fatal toxic syndrome in preterm neonates, and therefore, parenteral preparations containing the preservative should not be used in neonates. Polyoxyl castor oils, used as vehicles in intravenous injections, have been associated with severe anaphylactoid reactions.

The presence of propylene glycol in oral or parenteral medicines is indicated in the BNF; it can cause adverse effects if its elimination is impaired, e.g. in renal failure, in neonates and young children, and in slow metabolisers of the substance. It may interact with disulfiram and metronidazole.

The lactose content in most medicines is too small to cause problems in most lactose-intolerant patients. However in severe lactose intolerance, the lactose content should be determined before prescribing. The amount of lactose varies according to manufacturer, product, formulation, and strength.

Important In the absence of information on excipients in the BNF and in the product literature (available at www.medicines.org.uk/emc), contact the manufacturer (see Index of Manufacturers) if it is essential to check details.

Extemporaneous preparation A product should be dispensed extemporaneously only when no product with a marketing authorisation is available.

The BP direction that a preparation must be freshly prepared indicates that it must be made not more than 24 hours before it is issued for use. The direction that a preparation should be recently prepared indicates that deterioration is likely if the preparation is stored for longer than about 4 weeks at 15–25˚C.

The term water used without qualification means either potable water freshly drawn direct from the public supply and suitable for drinking or freshly boiled and cooled purified water. The latter should be used if the public supply is from a local storage tank or if the potable water is unsuitable for a particular preparation (Water for injections, section 9.2.2).
Drugs and driving  Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

Patents  In the BNF, certain drugs have been included notwithstanding the existence of actual or potential patent rights. In so far as such substances are protected by Letters Patent, their inclusion in this Formulary neither conveys, nor implies, licence to manufacture.

Health and safety  When handling chemical or biological materials particular attention should be given to the possibility of allergy, fire, explosion, radiation, or poisoning. Substances such as corticosteroids, some antimicrobials, phenothiazines, and many cytotoxics, are irritant or very potent and should be handled with caution. Contact with the skin and inhalation of dust should be avoided.

Safety in the home  Patients must be warned to keep all medicines out of the reach of children. All solid dose and all oral and external liquid preparations must be dispensed in a reclosable child-resistant container unless:

- the medicine is in an original pack or patient pack such as to make this inadvisable;
- the patient will have difficulty in opening a child-resistant container;
- a specific request is made that the product shall not be dispensed in a child-resistant container;
- no suitable child-resistant container exists for a particular liquid preparation.

All patients should be advised to dispose of unwanted medicines by returning them to a supplier for destruction.

Labelling of prescribed medicines  There is a legal requirement for the following to appear on the label of any prescribed medicine:

- name of the patient;
- name and address of the person dispensing the medicine;
- date of dispensing;
- name of the medicine;
- directions for use of the medicine;
- precautions relating to the use of the medicine.

The Royal Pharmaceutical Society recommends that the following also appears on the label:

- the words ‘Keep out of the sight and reach of children’;
- where applicable, the words ‘Use this medicine only on your skin’.

A pharmacist can exercise professional skill and judgement to amend or include more appropriate wording for the name of the medicine, the directions for use, or the precautions relating to the use of the medicine.

Non-proprietary names of compound preparations  Non-proprietary names of compound preparations which appear in the BNF are those that have been compiled by the British Pharmacopoeia Commission or another recognised body; whenever possible they reflect the names of the active ingredients.

Prescribers should avoid creating their own compound names for the purposes of generic prescribing; such names do not have an approved definition and can be misinterpreted.

Special care should be taken to avoid errors when prescribing compound preparations; in particular the hyphen in the prefix ‘co-’ should be retained.

Special care should also be taken to avoid creating generic names for modified-release preparations where the use of these names could lead to confusion between formulations with different lengths of action.

EEA and Swiss prescriptions  Pharmacists can dispense prescriptions issued by doctors and dentists from the European Economic Area (EEA) or Switzerland (except prescriptions for controlled drugs in Schedules 1, 2, or 3, or for drugs without a UK marketing authorisation). Prescriptions should be written in ink or otherwise so as to be indelible, should be dated, should state the name of the patient, should state the address of the prescriber, should contain particulars indicating whether the prescriber is a doctor or dentist, and should be signed by the prescriber.

Security and validity of prescriptions  The Councils of the British Medical Association and the Royal Pharmaceutical Society have issued a joint statement on the security and validity of prescriptions. In particular, prescription forms should:

- not be left unattended at reception desks;
- not be left in a car where they may be visible; and
- when not in use, be kept in a locked drawer within the surgery and at home.

Where there is any doubt about the authenticity of a prescription, the pharmacist should contact the prescriber. If this is done by telephone, the number should be obtained from the directory rather than relying on the information on the prescription form, which may be false.

Patient group direction (PGD)  In most cases, the most appropriate clinical care will be provided on an individual basis by a prescriber to a specific individual patient. However, a Patient Group Direction for supply and administration of medicines by other healthcare professionals can be used where it would benefit patient care without compromising safety.

A Patient Group Direction is a written direction relating to the supply and administration (or administration only) of a licensed prescription-only medicine (including some Controlled Drugs in specific circumstances) by certain classes of healthcare professionals; the Direction is signed by a doctor (or dentist) and by a pharmacist. Further information on Patient Group Directions is available in Health Service Circular HSC 2000/026 (England), HDL (2001) 7 (Scotland), and WHC (2000) 116 (Wales); see also the Human Medicines Regulations 2012.
NICE and Scottish Medicines Consortium  Advice issued by the National Institute for Health and Care Excellence (NICE) is included in the BNF when relevant. The BNF also includes advice issued by the Scottish Medicines Consortium (SMC) when a medicine is restricted or not recommended for use within NHS Scotland. If advice within a NICE Single Technology Appraisal differs from SMC advice, the Scottish Executive expects NHS Boards within NHS Scotland to comply with the SMC advice. Details of the advice together with updates can be obtained from www.nice.org.uk and from www.scottishmedicines.org.uk.
Prescription writing

Shared care

In its guidelines on responsibility for prescribing (circular EL (91) 127) between hospitals and general practitioners, the Department of Health has advised that legal responsibility for prescribing lies with the doctor who signs the prescription.

Prescriptions should be written legibly in ink or otherwise so as to be indelible, should be dated, should state the name and address of the patient, the address of the prescriber, an indication of the type of prescriber, and should be signed in ink by the prescriber. The age and the date of birth of the patient should preferably be stated, and it is a legal requirement in the case of prescription-only medicines to state the age for children under 12 years.

The following should be noted:

(a) The strength or quantity to be contained in capsules, lozenges, tablets etc. should be stated by the prescriber. In particular, strength of liquid preparations should be clearly stated (e.g. 125 mg/5 mL).

(b) The unnecessary use of decimal points should be avoided, e.g. 3 mg, not 3.0 mg.

Quantities of 1 gram or more should be written as 1 g etc.

Quantities less than 1 gram should be written in milligrams, e.g. 500 mg, not 0.5 g.

Quantities less than 1 mg should be written in micrograms, e.g. 100 micrograms, not 0.1 mg.

When decimals are unavoidable a zero should be written in front of the decimal point where there is no other figure, e.g. 0.5 mL, not .5 mL.

Use of the decimal point is acceptable to express a range, e.g. 0.5 to 1 g.

(c) ‘Micrograms’ and ‘nanograms’ should not be abbreviated. Similarly ‘units’ should not be abbreviated.

(d) The term ‘millilitre’ (ml or mL) is used in medicine and pharmacy, and cubic centimetre, c.c., or cm³ should not be used.

(e) Dose and dose frequency should be stated; in the case of preparations to be taken ‘as required’ a minimum dose interval should be specified.

When doses other than multiples of 5 mL are prescribed for oral liquid preparations the dose-volume will be provided by means of an oral syringe, see p. 2 (except for preparations intended to be measured with a pipette).

Suitable quantities:

Elixirs, Linctuses, and Paediatric Mixtures (5-mL dose), 50, 100, or 150 mL.

Adult Mixtures (10-mL dose), 200 or 300 mL.

Ear Drops, Eye drops, and Nasal Drops, 10 mL (or the manufacturer’s pack).

Eye Lotions, Gargles, and Mouthwashes, 200 mL.

(f) For suitable quantities of dermatological preparations, see section 13.1.2.

(g) The names of drugs and preparations should be written clearly and not abbreviated, using approved titles only (see also advice in box on p. 3 to avoid creating generic titles for modified-release preparations).

(h) The quantity to be supplied may be stated by indicating the number of days of treatment required in the box provided on NHS forms. In most cases the exact amount will be supplied. This does not apply to items directed to be used as required—if the dose and frequency are not given then the quantity to be supplied needs to be stated.

When several items are ordered on one form the box can be marked with the number of days of treatment provided the quantity is added for any item for which the amount cannot be calculated.

(i) Although directions should preferably be in English without abbreviation, it is recognised that some Latin abbreviations are used (for details see Inside Back Cover).

For a sample prescription, see below.

1. These recommendations are acceptable for prescription-only medicines (POM). For items marked (E), (ED), (EDR), (B), and (NH) see also Controlled Drugs and Drug Dependence, p. 8.

2. It is permissible to issue carbon copies of NHS prescriptions as long as they are signed in ink.

3. Computer-generated facsimile signatures do not meet the legal requirement.

4. The use of capital ‘L’ in mL is a printing convention throughout the BNF, both ‘mL’ and ‘ml’ are recognised SI abbreviations.
Prescribing by dentists

Until new prescribing arrangements are in place for NHS prescriptions, dentists should use form FP10D (GP14 in Scotland, WP10D in Wales) to prescribe only those items listed in the Dental Practitioners’ Formulary. The Human Medicines Regulations 2012 does not set any limitations upon the number and variety of substances which the dentist may administer to patients in the surgery or may order by private prescription—provided the relevant legal requirements are observed the dentist may use or order whatever is required for the clinical situation. There is no statutory requirement for the dentist to communicate with a patient’s medical practitioner when prescribing for dental use. There are, however, occasions when this would be in the patient’s interest and such communication is to be encouraged. For legal requirements relating to prescriptions for Controlled Drugs, see p. 8.

Computer-issued prescriptions

For computer-issued prescriptions the following advice, based on the recommendations of the Joint GP Information Technology Committee, should also be noted:

1. The computer must print out the date, the patient’s reference number, and Primary Care Trust (PCT)1 normally sign it). The doctor’s surgery address, phone number should be printed.

2. The doctor’s name must be printed at the bottom of the prescription form; this will be the name of the doctor responsible for the prescription (who will normally sign it). The doctor’s surgery address, reference number, and Primary Care Trust (PCT)2 are also necessary. In addition, the surgery telephone number must be printed.

3. When prescriptions are to be signed by general practitioner registrars, assistants, locums, or deputising doctors, the name of the doctor printed at the bottom of the form must still be that of the responsible principal.

4. Names of medicines must come from a dictionary held in the computer memory, to provide a check on the spelling and to ensure that the name is written in full. The computer can be programmed to recognise both the non-proprietary and the proprietary name of a particular drug and to print out the preferred choice, but must not print out both names. For medicines not in the dictionary, separate checks are required—the user must be warned that no check was possible and the entire prescription must be entered in the lexicon.

5. The dictionary may contain information on the usual doses, formulations, and pack sizes to produce standard predetermined prescriptions for common preparations, and to provide a check on the validity of an individual prescription on entry.

6. The prescription must be printed in English without abbreviation; information may be entered or stored in abbreviated form. The dose must be in numbers, the frequency in words, and the quantity in numbers in brackets, thus: 40 mg four times daily (112). It must also be possible to prescribe by indicating the length of treatment required, see (h) above.

7. The BNF recommendations should be followed as in (a), (b), (c), (d), and (e) above.

8. Checks may be incorporated to ensure that all the information required for dispensing a particular drug has been filled in. For instructions such as ‘as directed’ and ‘when required’, the maximum daily dose should normally be specified.

9. Numbers and codes used in the system for organising and retrieving data must never appear on the form.

10. Supplementary warnings or advice should be written in full, should not interfere with the clarity of the prescription itself, and should be in line with any warnings or advice in the BNF; numerical codes should not be used.

11. A mechanism (such as printing a series of non-specific characters) should be incorporated to cancel out unused space, or wording such as ‘no more items on this prescription’ may be added after the last item. Otherwise the doctor should delete the space manually.

12. To avoid forgery the computer may print on the form the number of items to be dispensed (somewhere separate from the box for the pharmacist). The number of items per form need be limited only by the ability of the printer to produce clear and well-demarcated instructions with sufficient space for each item and a spacer line before each fresh item.

13. Handwritten alterations should only be made in exceptional circumstances—it is preferable to print out a new prescription. Any alterations must be made in the doctor’s own handwriting and countersigned; computer records should be updated to fully reflect any alteration. Prescriptions for drugs used for contraceptive purposes (but which are not promoted as contraceptives) may need to be marked in handwriting with the symbol ᵃ (or endorsed in another way to indicate that the item is prescribed for contraceptive purposes).

14. Prescriptions for controlled drugs can be printed from the computer, but the prescriber’s signature must be handwritten2.

15. The strip of paper on the side of the FP10SS3 may be used for various purposes but care should be taken to avoid including confidential information. It may be advisable for the patient’s name to appear at the top, but this should be preceded by ‘confidential’.

16. In rural dispensing practices prescription requests (or details of medicines dispensed) will normally be entered in one surgery. The prescriptions (or dispensed medicines) may then need to be delivered to another surgery or location; if possible the computer should hold up to 10 alternatives.

17. Prescription forms that are reprinted or issued as a duplicate should be labelled clearly as such.

---

1. Health Board in Scotland, Local Health Board in Wales.

2. See Controlled Drugs and Drug Dependence p. 8, the prescriber may use a date stamp.

3. GP10SS in Scotland, WP10SS in Wales.
Emergency supply of medicines

Emergency supply requested by member of the public

Pharmacists are sometimes called upon by members of the public to make an emergency supply of medicines. The Human Medicines Regulations 2012 allows exemptions from the Prescription Only requirements for emergency supply to be made by a person lawfully conducting a retail pharmacy business provided:

(a) that the pharmacist has interviewed the person requesting the prescription-only medicine and is satisfied:
   (i) that there is immediate need for the prescription-only medicine and that it is impracticable in the circumstances to obtain a prescription without undue delay;
   (ii) that treatment with the prescription-only medicine has on a previous occasion been prescribed for the person requesting it;
   (iii) as to the dose that it would be appropriate for the person to take;
(b) that no greater quantity shall be supplied than will provide 5 days' treatment of phenobarbital, phenobarbital sodium, or Controlled Drugs in Schedules 4 or 5, or 30 days' treatment for other prescription-only medicines, except when the prescription-only medicine is:
   (i) insulin, an ointment or cream, or a preparation for the relief of asthma in an aerosol dispenser when the smallest pack can be supplied;
   (ii) an oral contraceptive when a full cycle may be supplied;
   (iii) an antibiotic in liquid form for oral administration when the smallest quantity that will provide a full course of treatment can be supplied;
(c) that an entry shall be made in the prescription book stating:
   (i) the date of supply;
   (ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   (iii) the name and address of the patient;
   (iv) the nature of the emergency;
(d) that the container or package must be labelled to show:
   (i) the date of supply;
   (ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   (iii) the name of the patient;
   (iv) the name and address of the pharmacy;
   (v) the words 'Emergency supply';
   (vi) the words 'Keep out of the reach of children' (or similar warning);
(e) that the prescription-only medicine is not a substance specifically excluded from the emergency supply provision, and does not contain a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital or phenobarbital sodium for the treatment of epilepsy; for details see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).

Emergency supply requested by prescriber

Emergency supply of a prescription-only medicine may also be made at the request of a doctor, a dentist, a supplementary prescriber, a community practitioner nurse prescriber, a nurse, pharmacist, or optometrist independent prescriber, or a doctor or dentist from the European Economic Area or Switzerland, provided:

(a) that the pharmacist is satisfied that the prescriber by reason of some emergency is unable to furnish a prescription immediately;
(b) that the prescriber has undertaken to furnish a prescription within 72 hours;
(c) that the medicine is supplied in accordance with the directions of the prescriber requesting it;
(d) that the medicine is not a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital or phenobarbital sodium for the treatment of epilepsy: for details see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition);
(e) that an entry shall be made in the prescription book stating:
   (i) the date of supply;
   (ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   (iii) the name and address of the practitioner requesting the emergency supply;
   (iv) the name and address of the patient;
   (v) the date on the prescription;
   (vi) when the prescription is received the entry should be amended to include the date on which it is received.

Royal Pharmaceutical Society’s guidelines

1. The pharmacist should consider the medical consequences of not supplying a medicine in an emergency.
2. If the pharmacist is unable to make an emergency supply of a medicine the pharmacist should advise the patient how to obtain essential medical care.

For conditions that apply to supplies made at the request of a patient see Medicines, Ethics and Practice, London Pharmaceutical Press, (always consult latest edition).

1. Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation.
The Misuse of Drugs Act, 1971 prohibits certain activities in relation to ‘Controlled Drugs’, in particular their manufacture, supply, and possession. The penalties applicable to offences involving the different drugs are graded broadly according to the harmfulness attributable to a drug when it is misused and for this purpose the drugs are defined in the following three classes:

**Class A** includes: afentanil, cocaine, diamorphine (heroin), dipipanone, lysergide (LSD), methadone, methylenedioxyamphetamine (MDMA, ‘ecstasy’), morphone, opium, pethidine, phencyclidine, remifentanil, and class B substances when prepared for injection.

**Class B** includes: oral amfetamines, barbiturates, cannabis, cannabis resin, codeine, ethylmorphine, glutethimide, ketamine, nabilone, pentazocine, phentermine, and pholcodine.

**Class C** includes: certain drugs related to the amfetamines such as benzafetamine and chlorpentermine, buprenorphine, diethylpropion, mazindol, meprobamate, penoline, pipradrol, most benzoazepines, tramadol, zaleplon, zolpidem, zopiclone, androgeneric and anabolic steroids, denbuterol, chioronic gonadotrophin (HCG), non-human chioronic gonadotrophin, somatotropin, somatrem, and somatropin.

The Misuse of Drugs Regulations 2001 (and subsequent amendments) define the classes of person who are authorised to supply and possess controlled drugs while acting in their professional capacities and lay down the conditions under which these activities may be carried out. In the regulations drugs are divided into five schedules each specifying the requirements governing such activities as import, export, production, supply, possession, prescribing, and record keeping which apply to them.

**Schedule 1** includes drugs such as lysergide which is not used medicinally. Possession and supply are prohibited except in accordance with Home Office authority.

**Schedule 2** includes drugs such as diamorphine (heroin), morphine, nabilone, remifentanil, pethidine, secobarbital, glutethimide, the amfetamines, and cocaine and are subject to the full controlled drug requirements relating to prescriptions, safe custody (except for secobarbital), the need to keep registers, etc. (unless exempted in Schedule 5).

**Schedule 3** includes the barbiturates (except secobarbital, now Schedule 2), buprenorphine, diethylpropion, mazindol, meprobamate, midazolam, pentazocine, phentermine, temazepam, and tramadol. They are subject to the special prescription requirements (except for temazepam) and to the safe custody requirements (except for any 5,5 disubstituted barbituric acid (e.g. phenobarbital), mazindol, meprobamate, midazolam, pentazocine, phentermine, tramadol, or any stereoisomeric form or salts of the above). Records in registers do not need to be kept (although there are requirements for the retention of invoices for 2 years).

**Schedule 4** includes in Part I benzodiazepines (except temazepam and midazolam, which are in Schedule 3), zaleplon, zolpidem, and zopiclone which are subject to minimal control. Part II includes androgenic and anabolic steroids, clenbuterol, chioronic gonadotrophin (HCG), non-human chioronic gonadotrophin, somatotropin, somatrem, and somatropin. Controlled drug prescription requirements do not apply and Schedule 4 Controlled Drugs are not subject to safe custody requirements.

**Schedule 5** includes those preparations which, because of their strength, are exempt from virtually all Controlled Drug requirements other than retention of invoices for two years.

**Prescriptions** Preparations in Schedules 1, 2, 3, and 4 of the Misuse of Drugs Regulations 2001 (and subsequent amendments) are identified throughout the BNF using the following symbols:

- **B1** for preparations in Schedule 1;
- **B2** for preparations in Schedule 2;
- **B3** for preparations in Schedule 3;
- **B4** for preparations in Schedule 4 (Part I);
- **B5** for preparations in Schedule 4 (Part II).

The principal legal requirements relating to medical prescriptions are listed below (see also Department of Health Guidance, p. 9).

**Prescription requirements** Prescriptions for Controlled Drugs that are subject to prescription requirements must be indelible, and must be signed by the prescriber, be dated, and specify the prescriber’s address. The prescription must always state:

- the name and address of the patient;
- in the case of a preparation, the form and where appropriate the strength of the preparation;
- for liquids, the total volume in millilitres (in both words and figures) of the preparation to be supplied;
- for dosage units, the number (in both words and figures) of dosage units to be supplied; in any other case, the total quantity (in both words and figures) of the Controlled Drug to be supplied;
- the dose;
- the words ‘for dental treatment only’ if issued by a dentist.

A pharmacist is not allowed to dispense a Controlled Drug unless all the information required by law is given on the prescription. In the case of a prescription for a Controlled Drug in Schedule 2 or 3, a pharmacist can amend the prescription if it specifies the total quantity.

1. All preparations in Schedules 2 and 3, except temazepam.
2. A machine-written prescription is acceptable. The prescriber's signature must be handwritten.
3. The dosage form (e.g. tablets) must be included on a Controlled Drugs prescription irrespective of whether it is implicit in the proprietary name (e.g. MST Continus) or whether only one form is available.
4. When more than one strength of a preparation exists the strength required must be specified.
5. The instruction 'one as directed' constitutes a dose but 'as directed' does not.
Instalments and 'repeats' A prescription may order a Controlled Drug to be dispensed by instalments; the amount of instalments and the intervals to be observed must be specified.\(^2\)

Instalment prescriptions must be dispensed in accordance with the directions in the prescription. However, the Home Office has approved specific wording which may be included in an instalment prescription to cover certain situations; for example, if a pharmacy is closed on the day when an instalment is due. For details, see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition) or see Drug Misuse and Dependence: UK Guidelines on Clinical Management (2007), available at www.nta.nhs.uk/uploads/clinical_guidelines_2007.pdf.

Prescriptions ordering 'repeats' on the same form are not permitted for Controlled Drugs in Schedules 2 or 3.

Private prescriptions Private prescriptions for Controlled Drugs in Schedules 2 and 3 must be written on specially designated forms provided by Primary Care Trusts in England, Health Boards in Scotland, Local Health Boards in Wales, or the Northern Ireland Central Services Agency; in addition, prescriptions must specify the prescriber's identification number. Prescriptions to be supplied by a pharmacist in hospital are exempt from the requirements for private prescriptions.

Department of Health guidance Guidance (June 2006) issued by the Department of Health in England on prescribing and dispensing of Controlled Drugs requires:

- in general, prescriptions for Controlled Drugs in Schedules 2, 3, and 4 to be limited to a supply of up to 30 days' treatment; exceptionally, to cover a justifiable clinical need and after consideration of any risk, a prescription can be issued for a longer period, but the reasons for the decision should be recorded on the patient’s notes;
- the patient’s identifier to be shown on NHS and private prescriptions for Controlled Drugs in Schedules 2 and 3.

Further information is available at www.gov.uk/dh.

1. The prescriber may forward-date the prescription; the start date may also be specified in the body of the prescription.
2. A total of 14 days’ treatment by instalment of any drug listed in Schedule 2 of the Misuse of Drugs Regulations, buprenorphine, and diazepam may be prescribed in England. In England, forms FP10(MDA) (blue) and FP10H (MDA) (blue) should be used. In Scotland, forms CP10 (peach), HBP (blue), or HBPA (pink) should be used. In Wales a total of 14 days' treatment by instalment of any drug listed in Schedules 2–5 of the Misuse of Drugs Regulations may be prescribed. In Wales, forms WP10(MDA) or form WP10HP(AD) should be used.

For a sample prescription, see below.

**Dependence and misuse** The most serious drugs of addiction are cocaine, diamorphine (heroin), morphine, and the synthetic opioids. For arrangements for prescribing of diamorphine, dipipanone, or cocaine for addicts, see p. 11.

Despite marked reduction in the prescribing of amphetamines, there is concern that abuse of illicit amphetamine and related compounds is widespread.

**Benzodiazepines** are commonly misused. However, the misuse of barbiturates is now uncommon, in line with declining medicinal use and consequent availability.

**Cannabis** (Indian hemp) has no approved medicinal use and cannot be prescribed by doctors. Its use is illegal but widespread. Cannabis is a mild hallucinogen seldom accompanied by a desire to increase the dose; withdrawal symptoms are unusual. However, cannabis extract is licensed as a medicinal product, see p. 734.

**Lsergide** (lysergic acid diethylamide, LSD) is a much more potent hallucinogen; its use can lead to severe psychotic states which can be life-threatening.

There are concerns over increases in the availability and misuse of other drugs with variously combined hallucinogenic, anaesthetic, or sedative properties. These include ketamine and gamma-hydroxybutyrate (sodium oxybate, GHB).

**Supervised consumption** Individuals prescribed opioid substitution therapy (section 4.10.3) can take their daily dose under the supervision of a doctor, nurse, or pharmacist during the dose stabilisation phase (usually the first 3 months of treatment), after a relapse or period of instability, or if there is a significant increase in the dose of methadone. Supervised consumption should continue (in accordance with local protocols) until the prescriber is confident that the patient is compliant with their treatment.
Prescribing drugs likely to cause dependence or misuse  The prescriber has three main responsibilities:

- To avoid creating dependence by introducing drugs to patients without sufficient reason. In this context, the proper use of the morphine-like drugs is well understood. The dangers of other Controlled Drugs are less clear because recognition of dependence is not easy and its effects, and those of withdrawal, are less obvious.
- To see that the patient does not gradually increase the dose of a drug, given for good medical reasons, to the point where dependence becomes more likely. This tendency is seen especially with hypnotics and anxiolytics (for CSM advice see section 4.1). The prescriber should keep a close eye on the amount prescribed to prevent patients from accumulating stocks. A minimal amount should be prescribed in the first instance, or when seeing a new patient for the first time.
- To avoid being used as an unwitting source of supply for addicts. Methods include visiting more than one doctor, fabricating stories, and forging prescriptions.

Patients under temporary care should be given only small supplies of drugs unless they present an unequivocal letter from their own doctor. Doctors should also remember that their own patients may be attempting to collect prescriptions from other prescribers, especially in hospitals. It is sensible to reduce dosages steadily or to issue weekly or even daily prescriptions for small amounts if it is apparent that dependence is occurring. The stealing and misuse of prescription forms could be minimised by the following precautions:

- do not leave unattended if called away from the consulting room or at reception desks; do not leave in a car where they may be visible; when not in use, keep in a locked drawer within the surgery and at home;
- draw a diagonal line across the blank part of the form under the prescription;
- write the quantity in words and figures when prescribing drugs prone to abuse; this is obligatory for controlled drugs (see Prescriptions, above);
- alterations are best avoided but if any are made they should be clear and unambiguous; add initials against altered items;
- if prescriptions are left for collection they should be left in a safe place in a sealed envelope.

Travelling abroad  Prescribed drugs listed in Schedule 4 Part II (CD Anab) and Schedule 5 of the Misuse of Drugs Regulations 2001 are not subject to export or import licensing. However, patients intending to travel abroad for more than 3 months carrying any amount of drugs listed in Schedules 2, 3, or 4 Part I (CD Benz) will require a personal export/import licence. Further details can be obtained at www.gov.uk/controlled-drugs-licences-fees-and-returns, or from the Home Office by contacting licensing_enquiry.aadu@homeoffice.gsi.gov.uk (in cases of emergency, telephone (020) 7035 6330).

Applications must be supported by a covering letter from the prescriber and should give details of:

- the patient’s name and address;
- the quantities of drugs to be carried;
- the country or countries of destination;
- the dates of travel to and from the United Kingdom.

Applications for licences should be sent to the Home Office, Drugs Licensing & Compliance Unit, Fry Building, 2 Marsham Street, London, SW1P 4DF. Alternatively, completed application forms can be emailed to dlccommsofficer@homeoffice.gsi.gov.uk with a copy of the covering letter from the prescriber as a pdf. A minimum of two weeks should be allowed for processing the application.

Patients travelling for less than 3 months do not require a personal export/import licence for carrying Controlled Drugs, but are advised to carry a letter from the prescribing doctor. Those travelling for more than 3 months are advised to make arrangements to have their medication prescribed by a practitioner in the country they are visiting.

Doctors who want to take Controlled Drugs abroad while accompanying patients may similarly be issued with licences. Licences are not normally issued to doctors who want to take Controlled Drugs abroad solely in case a family emergency should arise.

Personal export/import licences do not have any legal status outside the UK and are issued only to comply with the Misuse of Drugs Act and to facilitate passage through UK Customs and Excise control. For clearance in the country to be visited it is necessary to approach that country’s consulate in the UK.

Notification of patients receiving structured drug treatment for substance dependence

In England, doctors should report cases where they are providing structured drug treatment for substance dependence to their local National Drug Treatment Monitoring System (NDTMS) Team. General information about NDTMS can be found at www.nta.nhs.uk/ndtms.aspx.

In Scotland, doctors should report cases to the Substance Misuse Programme (SMP).

In Northern Ireland, the Misuse of Drugs (Notification of and Supply to Addicts) (Northern Ireland) Regulations 1973 require doctors to send particulars of persons whom they consider to be addicted to certain controlled drugs to the Chief Medical Officer of the Department of Health and Social Services. The Northern Ireland contacts are:

Medical contact:
Dr Ian McMaster
C3 Castle Buildings
Belfast BT4 3FQ
Tel: (028) 9052 2421
Fax: (028) 9052 0718
ian.mcmaster@dhsspsni.gov.uk
Prescribing of diamorphine (heroin), dipipanone, and cocaine for addicts

The Misuse of Drugs (Supply to Addicts) Regulations 1997 require that only medical practitioners who hold a special licence issued by the Home Secretary may prescribe, administer, or supply diamorphine, dipipanone (Diconal®), or cocaine in the treatment of drug addiction; other practitioners must refer any addict who requires these drugs to a treatment centre. Whenever possible the addict will be introduced by a member of staff from the treatment centre to a pharmacist whose agreement has been obtained and whose pharmacy is conveniently sited for the patient. Prescriptions for weekly supplies will be sent to the pharmacy by post and will be dispensed on a daily basis as indicated by the doctor. If any alterations of the arrangements are requested by the addict, the portion of the prescription affected must be represcribed and not merely altered.

General practitioners and other doctors do not require a special licence for prescribing diamorphine, dipipanone, and cocaine for patients (including addicts) for relieving pain from organic disease or injury.

For guidance on prescription writing, see p. 8.
Adverse reactions to drugs

Any drug may produce unwanted or unexpected adverse reactions. Rapid detection and recording of adverse drug reactions is of vital importance so that unrecognised hazards are identified promptly and appropriate regulatory action is taken to ensure that medicines are used safely. Healthcare professionals and coroners (see also Self-reporting below) are urged to report suspected adverse drug reactions directly to the Medicines and Healthcare products Regulatory Agency (MHRA) through the Yellow Card Scheme using the electronic form at yellowcard.mhra.gov.uk. Alternatively, prepaid Yellow Cards for reporting are available from the address below and are also bound in this book (inside back cover). Send Yellow Cards to: FREEPOST YELLOW CARD (No other address details required) Tel: 0800 731 6789

Suspected adverse drug reactions to *any* therapeutic agent should be reported, including drugs (self-medication as well as those prescribed), blood products, vaccines, radiographic contrast media, complementary and herbal products. For biosimilar medicines and vaccines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine or vaccine.

Adverse drug reactions where harm occurs as a result of a medication error are reportable as a Yellow Card or through local risk management systems into the National Reporting and Learning System (NRLS). If reported to the NRLS, these will be shared with the MHRA. If the NRLS is not available and harm occurs, report using a Yellow Card.

A 24-hour Freephone service is available to all parts of the UK for advice and information on suspected adverse drug reactions; contact the National Yellow Card Information Service at the MHRA on 0800 731 6789. Outside office hours a telephone-answering machine will take messages.

The following Yellow Card Centres can be contacted for further information:

- **Yellow Card Centre Northwest**
  - 70 Pembroke Place
  - Liverpool L69 3GF
  - Tel: (0151) 794 8122

- **Yellow Card Centre Scotland**
  - CARDS, Royal Infirmary of Edinburgh
  - 51 Little France Crescent
  - Old Dalkeith Road
  - Edinburgh EH16 4SA
  - Tel: (0131) 242 2919
  - YCCScotland@liht.scot.nhs.uk

- **Yellow Card Centre Wales**
  - Cardiff University
  - Department of Pharmacology, Therapeutics and Toxicology
  - Heath Park
  - Cardiff CF14 4XN
  - Tel: (029) 2074 4181

- **Yellow Card Centre Northern & Yorkshire**
  - Wolfson Unit
  - Claremont Place
  - Newcastle upon Tyne NE2 4HH
  - Tel: (0191) 260 6182

  - City Hospital
  - Dudley Road
  - Birmingham B18 7QH
  - Tel: (0121) 507 5672

The MHRA’s database facilitates the monitoring of adverse drug reactions. More detailed information on reporting and a list of products currently under additional monitoring can be found on the MHRA website: www.mhra.gov.uk.

**Self-reporting** Patients and their carers can also report suspected adverse drug reactions to the MHRA. Reports can be submitted directly to the MHRA through the Yellow Card Scheme using the electronic form at yellowcard.mhra.gov.uk, by telephone on 0808 100 3352, or by downloading the Yellow Card form from www.mhra.gov.uk. Alternatively, patient Yellow Cards are available from pharmacies and GP surgeries. Information for patients about the Yellow Card Scheme is available in other languages at yellowcard.mhra.gov.uk.

**Prescription-event monitoring** In addition to the MHRA’s Yellow Card Scheme, an independent scheme monitors the safety of new medicines using a different approach. The Drug Safety Research Unit identifies patients who have been prescribed selected new medicines and collects data on clinical events in these patients. The data are submitted on a voluntary basis by general practitioners on green forms. More information about the scheme and the Unit’s educational material is available from www.dsru.org.

**Newer drugs and vaccines** Only limited information is available from clinical trials on the safety of new medicines. Further understanding about the safety of medicines depends on the availability of information from routine clinical practice.

The black triangle symbol ( ▼) identifies newly licensed medicines that require additional monitoring by the European Medicines Agency. Such medicines include new active substances, biosimilar medicines, and medicines that the European Medicines Agency consider require additional monitoring. The black triangle symbol also appears in the Patient Information Leaflets for relevant medicines, with a brief explanation of what it means. Products usually retain a black triangle for 5 years, but this can be extended if required.

Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. For medicines showing the black triangle symbol, the MHRA asks that all suspected reactions (including those considered not to be serious) are reported through the Yellow Card Scheme. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well recognised, or if other drugs have been given at the same time.

**Established drugs and vaccines** Healthcare professionals and coroners are asked to report all serious suspected reactions to established drugs (including over-the-counter, herbal, and unlicensed medicines and medicines used off-label) and vaccines. Serious reactions include those that are fatal, life-threatening, disabling, incapacitating, or which result in or prolong...
When an infant is born, congenital abnormalities are of particular importance. Special problems affecting children and the elderly include:

- **Children**: Particular vigilance is required to identify and report adverse reactions in children, including those resulting from the unlicensed use of medicines; all suspected reactions should be reported directly to the MHRA through the Yellow Card Scheme (see also Adverse Drug Reactions in Children, p. 15).

- **Prevention of adverse reactions**: Adverse reactions may be prevented as follows:
  - never use any drug unless there is a good indication. If the patient is pregnant do not use a drug unless the need for it is imperative;
  - allergy and idiosyncrasy are important causes of adverse drug reactions. Ask if the patient had previous reactions;
  - ask if the patient is already taking other drugs including self-medication drugs, health supplements, complementary and alternative therapies; interactions may occur;
  - age and hepatic or renal disease may alter the metabolism or excretion of drugs, so that much smaller doses may be needed. Genetic factors may also be responsible for variations in metabolism, notably of isoniazid and the tricyclic antidepressants;
  - prescribe as few drugs as possible and give very clear instructions to the elderly or any patient likely to misunderstand complicated instructions;
  - whenever possible use a familiar drug; with a new drug, be particularly alert for adverse reactions or unexpected events;
  - warn the patient if serious adverse reactions are liable to occur.

**Oral side-effects of drugs**

Drug-induced disorders of the mouth may be due to a local action on the mouth or to a systemic effect manifested by oral changes. In the latter case urgent referral to the patient’s medical practitioner may be necessary.

**Oral mucosa**

Medicaments left in contact with or applied directly to the oral mucosa can lead to inflammation or ulceration; the possibility of allergy should also be borne in mind.

**Aspirin** tablets allowed to dissolve in the sulcus for the treatment of toothache can lead to a white patch followed by ulceration. Flavouring agents, particularly *essential oils*, may sensitise the skin, but mucosal swelling is not usually prominent.

The oral mucosa is particularly vulnerable to ulceration in patients treated with cytotoxic drugs, e.g. methotrexate. Other drugs capable of causing oral ulceration include ACE inhibitors, gold, nicorandil, NSAIDs, pancreatin, penicillamine, progabide, and protease inhibitors.

**Erythema multiforme or Stevens-Johnson syndrome** may follow the use of a wide range of drugs including antibacterials, antiretrovirals, sulfonamide derivatives, and anticonvulsants; the oral mucosa may be extensively ulcerated, with characteristic target lesions.

**Special problems**

**Delayed drug effects** Some reactions (e.g. cancers, chloroquine retinopathy, and retroperitoneal fibrosis) may become manifest months or years after exposure. Any suspicion of such an association should be reported directly to the MHRA through the Yellow Card Scheme.

**The elderly** Particular vigilance is required to identify adverse reactions in the elderly.

**Congenital abnormalities** When an infant is born with a congenital abnormality or there is a malformed aborted fetus doctors are asked to consider whether this might be an adverse reaction to a drug and to report all drugs (including self-medication) taken during pregnancy.
on the skin. Oral lesions of toxic epidermal necrolysis have been reported with a similar range of drugs. Lichenoid eruptions are associated with ACE inhibitors, NSAIDs, methylxypor, chloroquine, oral antidiabetics, thiazide diuretics, and gold. Candidiasis can complicate treatment with antibacterials and immunosuppressants and is an occasional side-effect of corticosteroid inhalers, see also p. 196.

Teeth and Jaw
Brown staining of the teeth frequently follows the use of chlorhexidine mouthwash, spray or gel, but can readily be removed by polishing. Iron salts in liquid form can stain the enamel black. Superficial staining has been reported rarely with co-amoxiclav suspension. Intrinsic staining of the teeth is most commonly caused by tetracyclines. They will affect the teeth if given at any time from about the fourth month in utero until the age of twelve years; they are contra-indicated during pregnancy, in breast-feeding women, and in children under 12 years. All tetracyclines can cause permanent, unsightly staining in children, the colour varying from yellow to grey. Excessive ingestion of fluoride leads to dental fluorosis with mottling of the enamel and areas of hypoplasia or pitting: fluoride supplements occasionally cause mild mottling (white patches) if the dose is too large for the child’s age (taking into account the fluoride content of the local drinking water and of toothpaste).

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget’s disease. All patients receiving bisphosphonates should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment, see also Bisphosphonates: Osteonecrosis of the Jaw, p. 513. For cancer patients taking bevacizumab or sunitinib, see also MHRA/CHM advice (Bevacizumab and sunitinib: cancer patients taking bevacizumab or sunitinib, see soon as possible after starting treatment, see also Bisphosphonates for osteoporosis or Paget’s disease. All treatment of cancer than for patients receiving oral bisphosphonates in osteonecrosis of the jaw

Some drugs (e.g. clozapine, neostigmine) can increase saliva production but this is rarely a problem unless the patient has associated difficulty in swallowing. Pain in the salivary glands has been reported with some antihypertensives (e.g. clonidine, methylxypor) and with vinca alkaloids. Swelling of the salivary glands can occur with iodides, antithyroid drugs, phenothiazines, and sulfonamides.

Taste

There can be decreased taste acuity or alteration in taste sensation. Many drugs are implicated, including amiodarone, calcitriol, ACE inhibitors, carbinazole, clarithromycin, gold, griseofulvin, lithium salts, metform, metronidazole, penicillamine, phenindione, propafenone, protease inhibitors, terbinafine, and zopiclone.

Defective medicines

During the manufacture or distribution of a medicine an error or accident may occur whereby the finished product does not conform to its specification. While such a defect may impair the therapeutic effect of the product and could adversely affect the health of a patient, it should not be confused with an Adverse Drug Reaction where the product conforms to its specification. The Defective Medicines Report Centre assists with the investigation of problems arising from licensed medicinal products thought to be defective and co-ordinates any necessary protective action. Reports on suspect defective medicinal products should include the brand or the non-proprietary name, the name of the manufacturer or supplier, the strength and dosage form of the product, the product licence number, the batch number or numbers of the product, the nature of the defect, and an account of any action already taken in consequence. The Centre can be contacted at:

The Defective Medicines Report Centre

Prescribing for children

For detailed advice on medicines used for children, consult BNF for Children

Children, and particularly neonates, differ from adults in their response to drugs. Special care is needed in the neonatal period (first 28 days of life) and doses should always be calculated with care. At this age, the risk of toxicity is increased by reduced drug clearance and differing target organ sensitivity.

Whenever possible, intramuscular injections should be avoided in children because they are painful. Where possible, medicines for children should be prescribed within the terms of the marketing authorisation (product licence). However, many children may require medicines not specifically licensed for paediatric use.

Although medicines cannot be promoted outside the limits of the licence, the Human Medicines Regulations 2012 does not prohibit the use of unlicensed medicines. It is recognised that the informed use of unlicensed medicines or of licensed medicines for unlicensed applications (‘off-label’ use) is often necessary in paediatric practice.

Adverse drug reactions in children The reporting of all suspected adverse drug reactions, no matter how minor, in children under 18 years is strongly encouraged through the Yellow Card Scheme (see p. 12) even if the additional monitoring symbol (▼) has been removed. This is because experience in children may still be limited.

The identification and reporting of adverse reactions to drugs in children and neonates is particularly important because:

- the action of the drug and its pharmacokinetics in children (especially in the very young) may be different from that in adults;
- drugs are not extensively tested in children;
- many drugs are not specifically licensed for use in children and are used ‘off-label’ or as unlicensed products;
- drugs may affect the way a child grows and develops or may cause delayed adverse reactions which do not occur in adults;
- suitable formulations may not be available to allow precise dosing in children or they may contain excipients that should be used with caution in children;
- the nature and course of illnesses and adverse drug reactions may differ between adults and children.

Even if reported through the British Paediatric Surveillance Unit’s Orange Card Scheme, any identified suspected adverse drug reactions should also be submitted to the Yellow Card Scheme.

Prescription writing Prescriptions should be written according to the guidelines in Prescription Writing (p. 5) Inclusion of age is a legal requirement in the case of prescription-only medicines for children under 12 years of age, but it is preferable to state the age for all prescriptions for children.

It is particularly important to state the strengths of capsules or tablets. Although liquid preparations are particularly suitable for children, they may contain sugar which encourages dental decay. Sugar-free medicines are preferred for long-term treatment.

Many children are able to swallow tablets or capsules and may prefer a solid dose form; involving the child and parents in choosing the formulation is helpful.

When a prescription for a liquid oral preparation is written and the dose ordered is smaller than 5 mL an oral syringe will be supplied (for details, see p. 2). Parents should be advised not to add any medicines to the infant’s feed, since the drug may interact with the milk or other liquid in it; moreover the ingested dosage may be reduced if the child does not drink all the contents.

Parents must be warned to keep all medicines out of reach of children, see Safety in the Home, p. 3.

Rare paediatric conditions

Information on substances such as biotin and sodium benzoate used in rare metabolic conditions is included in BNF for Children; further information can be obtained from:

- Alder Hey Children’s Hospital
  Drug Information Centre
  Liverpool L12 2AP
  Tel: (0151) 252 5381
- Great Ormond Street Hospital for Children
  Pharmacy
  Great Ormond St
  London WC1N 3JH
  Tel: (020) 7405 9200

Dosage in children

Children’s doses in the BNF are stated in the individual drug entries or a cross-reference is provided to BNF for Children.

Doses are generally based on body-weight (in kilograms) or the following age ranges:

- first month (neonate)
- up to 1 year (infant)
- 1–6 years
- 6–12 years

Dose calculation Many children’s doses are standardised by weight (and therefore require multiplying by the body-weight in kilograms to determine the child’s dose); occasionally, the doses have been standardised by body surface area (in m²). These methods should be used rather than attempting to calculate a child’s dose on the basis of doses used in adults.

For most drugs the adult maximum dose should not be exceeded. For example if the dose is stated as 8 mg/kg (max. 300 mg), a child weighing 10 kg should receive 80 mg but a child weighing 40 kg should receive 300 mg (rather than 320 mg).

Young children may require a higher dose per kilogram than adults because of their higher metabolic rates. Other problems need to be considered. For example,
calculation by body-weight in the overweight child may result in much higher doses being administered than necessary; in such cases, dose should be calculated from an ideal weight, related to height and age (see inside back cover).

**Body surface area (BSA) estimates** are sometimes preferable to body-weight for calculation of paediatric doses since many physiological phenomena correlate better with body surface area. Body surface area can be estimated from weight. For more information, refer to *BNF for Children*.

Where the dose for children is not stated, prescribers should consult *BNF for Children* or seek advice from a medicines information centre.

**Dose frequency**  Antibacterials are generally given at regular intervals throughout the day. Some flexibility should be allowed in children to avoid waking them during the night. For example, the night-time dose may be given at the child’s bedtime.

Where new or potentially toxic drugs are used, the manufacturers’ recommended doses should be carefully followed.
Prescribing in hepatic impairment

Liver disease may alter the response to drugs in several ways as indicated below, and drug prescribing should be kept to a minimum in all patients with severe liver disease. The main problems occur in patients with jaundice, ascites, or evidence of encephalopathy.

**Impaired drug metabolism** Metabolism by the liver is the main route of elimination for many drugs, but hepatic reserve is large and liver disease has to be severe before important changes in drug metabolism occur. Routine liver-function tests are a poor guide to the capacity of the liver to metabolise drugs, and in the individual patient it is not possible to predict the extent to which the metabolism of a particular drug may be impaired.

A few drugs, e.g. rifampicin and fusidic acid, are excreted in the bile unchanged and can accumulate in patients with intrahepatic or extrahepatic obstructive jaundice.

**Hypoproteinaemia** The hypoalbuminaemia in severe liver disease is associated with reduced protein binding and increased toxicity of some highly protein-bound drugs such as phenytoin and prednisolone.

**Reduced clotting** Reduced hepatic synthesis of blood-clotting factors, indicated by a prolonged prothrombin time, increases the sensitivity to oral anticoagulants such as warfarin and phenindione.

**Hepatic encephalopathy** In severe liver disease many drugs can further impair cerebral function and may precipitate hepatic encephalopathy. These include all sedative drugs, opioid analgesics, those diuretics that produce hypokalaemia, and drugs that cause constipation.

**Fluid overload** Oedema and ascites in chronic liver disease can be exacerbated by drugs that give rise to fluid retention, e.g. NSAIDs and corticosteroids.

**Hepatotoxic drugs** Hepatotoxicity is either dose-related or unpredictable (idosyncratic). Drugs that cause dose-related toxicity may do so at lower doses in the presence of hepatic impairment than in individuals with normal liver function, and some drugs that produce reactions of the idiosyncratic kind do so more frequently in patients with liver disease. These drugs should be avoided or used very carefully in patients with liver disease.

Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in the BNF.

Prescribing in renal impairment

The use of drugs in patients with reduced renal function can give rise to problems for several reasons:

- reduced renal excretion of a drug or its metabolites may cause toxicity;
- sensitivity to some drugs is increased even if elimination is unimpaired;
- many side-effects are tolerated poorly by patients with renal impairment;
- some drugs are not effective when renal function is reduced.

Many of these problems can be avoided by reducing the dose or by using alternative drugs.

**Principles of dose adjustment in renal impairment**

The level of renal function below which the dose of a drug must be reduced depends on the proportion of the drug eliminated by renal excretion and its toxicity.

For many drugs with only minor or no dose-related side-effects very precise modification of the dose regimen is unnecessary and a simple scheme for dose reduction is sufficient.

For more toxic drugs with a small safety margin or patients at extremes of weight, dose regimens based on creatinine clearance (see below for details) should be used. When both efficacy and toxicity are closely related to plasma-drug concentration, recommended regimens should be regarded only as a guide to initial treatment; subsequent doses must be adjusted according to clinical response and plasma-drug concentration.

Renal function declines with age; many elderly patients have renal impairment but, because of reduced muscle mass, this may not be indicated by a raised serum creatinine. It is wise to assume at least mild impairment of renal function when prescribing for the elderly.

The total daily maintenance dose of a drug can be reduced either by reducing the size of the individual doses or by increasing the interval between doses. For some drugs, although the size of the maintenance dose is reduced it is important to give a loading dose if an immediate effect is required. This is because it takes about five times the half-life of the drug to achieve steady-state plasma concentrations. Because the plasma half-life of drugs excreted by the kidney is prolonged in renal impairment it can take many doses for the reduced dosage to achieve a therapeutic plasma concentration. The loading dose should usually be the same size as the initial dose for a patient with normal renal function.

**Nephrototoxic drugs** should, if possible, be avoided in patients with renal disease because the consequences of nephrotoxicity are likely to be more serious when renal reserve is already reduced.

Dose recommendations are based on the severity of renal impairment.

Renal function is measured either in terms of estimated glomerular filtration rate (eGFR) calculated from a formula derived from the Modification of Diet in Renal
Disease study (‘MDRD formula’ that uses serum creatinine, age, sex, and race (for Afro-Caribbean patients)) or it can be expressed as **creatinine clearance** (best derived from a 24-hour urine collection but often calculated from the Cockcroft and Gault formula (CG)).

### Cockcroft and Gault formula

Estimated Creatinine Clearance in mL/minute  
\[
\text{ Estimated Creatinine Clearance } = \frac{(140 - \text{Age}) \times \text{Weight} \times \text{Constant}}{\text{Serum creatinine}}
\]

- Age in years
- Weight in kilograms; use ideal body-weight
- Serum creatinine in micromol/litre
- Constant = 1.23 for men; 1.04 for women

The serum-creatinine concentration is sometimes used instead as a measure of renal function but it is only a rough guide to drug dosing.

### Important

Renal function in adults is increasingly being reported on the basis of estimated glomerular filtration rate (eGFR) normalised to a body surface area of 1.73 m² and derived from the Modification of Diet in Renal Disease (MDRD) formula. However, published information on the effects of renal impairment on drug elimination is usually stated in terms of creatinine clearance as a surrogate for glomerular filtration rate (GFR).

The information on dosage adjustment in the BNF is expressed in terms of eGFR, rather than creatinine clearance, for most drugs (see exceptions below: Toxic Drugs and Patients at Extremes of Weight). Although the two measures of renal function are not interchangeable, in practice, for most drugs and for most patients (over 18 years) of average build and height, eGFR (MDRD ‘formula’) can be used to determine dosage adjustments in place of creatinine clearance. An individual’s absolute glomerular filtration rate can be calculated from the eGFR as follows:  

\[
\text{GFR Absolute} = \text{eGFR} \times \left(\frac{\text{individual’s body surface area}}{1.73}\right)
\]

### Toxic drugs

For potentially toxic drugs with a small safety margin, creatinine clearance (calculated from the Cockcroft and Gault formula) should be used to adjust drug dosages in addition to plasma-drug concentration and clinical response.

### Patients at extremes of weight

In patients at both extremes of weight (BMI of less than 18.5 kg/m² or greater than 30 kg/m²) the absolute glomerular filtration rate or creatinine clearance (calculated from the Cockcroft and Gault formula) should be used to adjust drug dosages.

In the BNF, values for eGFR, creatinine clearance (for toxic drugs), or another measure of renal function are included where possible. However, where such values are not available, the BNF reflects the terms used in the published information.

### Chronic kidney disease in adults: UK guidelines for identification, management and referral (March 2006) define renal function as follows:

<table>
<thead>
<tr>
<th>Degree of impairment</th>
<th>eGFR mL/minute/1.73 m²</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal - Stage 1</td>
<td>More than 90 (with other evidence of kidney damage)</td>
</tr>
<tr>
<td>Mild - Stage 2</td>
<td>60–89 (with other evidence of kidney damage)</td>
</tr>
<tr>
<td>Moderate¹ - Stage 3</td>
<td>30–59</td>
</tr>
<tr>
<td>Severe - Stage 4</td>
<td>15–29</td>
</tr>
<tr>
<td>Established renal failure - Stage 5</td>
<td>Less than 15</td>
</tr>
</tbody>
</table>

¹. NICE clinical guideline 73 (September 2008)—Chronic kidney disease: Stage 3A eGFR 45–59, Stage 3B eGFR 30–44

### Dialysis

For prescribing in patients on continuous ambulatory peritoneal dialysis (CAPD) or haemodialysis, consult specialist literature.

Drug prescribing should be kept to the minimum in all patients with severe renal disease.

If even mild renal impairment is considered likely on clinical grounds, renal function should be checked before prescribing any drug which requires dose modification.

Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug in the BNF.
Prescribing in pregnancy

Drugs can have harmful effects on the embryo or fetus at any time during pregnancy. It is important to bear this in mind when prescribing for a woman of childbearing age or for men trying to father a child.

During the first trimester drugs can produce congenital malformations (teratogenesis), and the period of greatest risk is from the third to the eleventh week of pregnancy.

During the second and third trimesters drugs can affect the growth or functional development of the fetus, or they can have toxic effects on fetal tissues.

Drugs given shortly before term or during labour can have adverse effects on labour or on the neonate after delivery.

Not all the damaging effects of intrauterine exposure to drugs are obvious at birth, some may only manifest later in life. Such late-onset effects include malignancy, e.g. adenocarcinoma of the vagina after puberty in females exposed to diethylstilbestrol in the womb, and adverse effects on intellectual, social, and functional development.

The BNF identifies drugs which:

- may have harmful effects in pregnancy and indicates the trimester of risk
- are not known to be harmful in pregnancy

The information is based on human data, but information from animal studies has been included for some drugs when its omission might be misleading.

Where care is needed when prescribing in pregnancy, this is indicated under the relevant drug in the BNF.

Important

Drugs should be prescribed in pregnancy only if the expected benefit to the mother is thought to be greater than the risk to the fetus, and all drugs should be avoided if possible during the first trimester. Drugs which have been extensively used in pregnancy and appear to be usually safe should be prescribed in preference to new or untried drugs; and the smallest effective dose should be used.

Few drugs have been shown conclusively to be teratogenic in humans, but no drug is safe beyond all doubt in early pregnancy. Screening procedures are available when there is a known risk of certain defects.

Absence of information does not imply safety. It should be noted that the BNF provides independent advice and may not always agree with the product literature.

Information on drugs and pregnancy is also available from the UK Teratology Information Service. www.uktis.org

Tel: 0844 892 0909 (09.00–17:00 Monday to Friday; urgent enquiries only outside these hours).

Prescribing in breast-feeding

Breast-feeding is beneficial; the immunological and nutritional value of breast milk to the infant is greater than that of formula feeds.

Although there is concern that drugs taken by the mother might affect the infant, there is very little information on this. In the absence of evidence of an effect, the potential for harm to the infant can be inferred from:

- the amount of drug or active metabolite of the drug delivered to the infant (dependent on the pharmacokinetic characteristics of the drug in the mother);
- the efficiency of absorption, distribution, and elimination of the drug by the infant (infant pharmacokinetics);
- the nature of the effect of the drug on the infant (pharmacodynamic properties of the drug in the infant).

The amount of drug transferred in breast milk is rarely sufficient to produce a discernible effect on the infant. This applies particularly to drugs that are poorly absorbed and need to be given parenterally. However, there is a theoretical possibility that a small amount of drug present in breast milk can induce a hypersensitivity reaction.

A clinical effect can occur in the infant if a pharmacologically significant quantity of the drug is present in milk. For some drugs (e.g. fluvastatin), the ratio between the concentration in milk and that in maternal plasma may be high enough to expose the infant to adverse effects. Some infants, such as those born prematurely or who have jaundice, are at a slightly higher risk of toxicity.

Some drugs inhibit the infant’s sucking reflex (e.g. phenobarbital) while others can affect lactation (e.g. bromocriptine).

The BNF identifies drugs:

- that should be used with caution or are contraindicated in breast-feeding;
- that can be given to the mother during breast-feeding because they are present in milk in amounts which are too small to be harmful to the infant;
- that might be present in milk in significant amount but are not known to be harmful.

Where care is needed when prescribing in breast-feeding, this is indicated under the relevant drug in the BNF.

Important

For many drugs insufficient evidence is available to provide guidance and it is advisable to administer only essential drugs to a mother during breast-feeding. Because of the inadequacy of information on drugs in breast-feeding, absence of information does not imply safety.
Prescribing in palliative care

Palliative care is the active total care of patients whose disease is not responsive to curative treatment. Control of pain, of other symptoms, and of psychological, social and spiritual problems, is paramount to provide the best quality of life for patients and their families. Careful assessment of symptoms and needs of the patient should be undertaken by a multidisciplinary team. Specialist palliative care is available in most areas as day hospice care, home-care teams (often known as Macmillan teams), in-patient hospice care, and hospital teams. Many acute hospitals and teaching centres now have consultative, hospital-based teams.

Prescribing in palliative care

Pain

Pain management in palliative care is focused on achieving control of pain by administering the right drug in the right dose at the right time. Analgesics can be divided into three broad classes: non-opioid (paracetamol, NSAID), opioid (e.g. codeine ‘weak’, morphine ‘strong’) and adjuvant (e.g. antidepressants, antiepileptics). Drugs from the different classes are used alone or in combination according to the type of pain and response to treatment. Analgesics are more effective in preventing pain than in the relief of established pain; it is important that they are given regularly.

Paracetamol (p. 276) or a NSAID (p. 702) given regularly will often be sufficient to manage mild pain. If non-opioid analgesics alone are not sufficient, then an opioid analgesic alone or in combination with a non-opioid analgesic at an adequate dosage, may be helpful in the control of moderate pain. Codeine (p. 281) or tramadol (p. 290) can be considered for moderate pain. If these preparations do not control the pain then morphine (p. 286) is the most useful opioid analgesic. Alternatives to morphine, including transdermal buprenorphine (p. 280), transdermal fentanyl (p. 283), hydromorphone (p. 285), methadone (p. 285), or oxycodone (p. 287), should be initiated by those with experience in palliative care. Initiation of an opioid analgesic should not be delayed by concern over a theoretical likelihood of psychological dependence (addiction).

Bone metastases

In addition to the above approach, radiotherapy, bisphosphonates (p. 512), and radioactive isotopes of strontium® (Metas- tron® available from GE Healthcare) may be useful for pain due to bone metastases.

Neuropathic pain

Patients with neuropathic pain (p. 291) may benefit from a trial of a tricyclic antidepressant. An antiepileptic may be added or substituted if pain persists; gabapentin and pregabalin (p. 303) are licensed for neuropathic pain. Ketamine is sometimes used under specialist supervision for neuropathic pain that responds poorly to opioid analgesics. Pain due to nerve compression may be reduced by a corticosteroid such as dexamethasone 8mg daily, which reduces oedema around the tumour, thus reducing compression. Nerve blocks or regional anaesthesia techniques (including the use of epidural and intrathecal catheters) can be considered when pain is localised to a specific area.

Pain management with opioids

Oral route Treatment with morphine is given by mouth as immediate-release or modified-release preparations. During the titration phase the initial dose is based on the previous medication used, the severity of the pain, and other factors such as presence of renal impairment, increasing age, or frailty. Recommended starting doses vary but, generally, a starting dose between 20–30 mg daily is safe for opioid-naïve patients and 40–60 mg daily for patients being switched from a regular weak opioid. The dose is given either as an immediate-release preparation 4-hourly or as a modified-release preparation 12-hourly, in addition to rescue doses.

If pain occurs between regular doses of morphine (‘breakthrough pain’), an additional dose (‘rescue dose’) of immediate-release morphine should be given. An additional dose should also be given 30 minutes before an activity that causes pain, such as wound dressing. The standard dose of a strong opioid for breakthrough pain is usually one-tenth to one-sixth of the regular 24-hour dose, repeated every 2–4 hours as required (up to hourly may be needed if pain is severe or in the last days of life). Review pain management if rescue analgesic is required frequently (twice daily or more). Each patient should be assessed on an individual basis. Formulations of fentanyl that are administered nasally, buccally or sublingually are also licensed for breakthrough pain.

When adjusting the dose of morphine, the number of rescue doses required and the response to them should be taken into account; increments of morphine should not exceed one-third to one-half of the total daily dose every 24 hours. Thereafter, the dose should be adjusted with careful assessment of the pain, and the use of adjuvant analgesics should also be considered. Upward titration of the dose of morphine stops when either the pain is relieved or unacceptable adverse effects occur, after which it is necessary to consider alternative measures.

Morphine immediate-release 30 mg 4-hourly (or modified-release 100 mg 12-hourly) is usually adequate for most patients; some patients require morphine immediate-release up to 200 mg 4-hourly (or modified-release 600 mg 12-hourly), occasionally more is needed.
Once their pain is controlled, patients started on 4-hourly immediate-release morphine can be transferred to the same total 24-hour dose of morphine given as the modified-release preparation for 12-hourly or 24-hourly administration. The first dose of the modified-release preparation is given with, or within 4 hours of, the last dose of the immediate-release preparation. For preparations suitable for 12-hourly or 24-hourly administration see modified-release preparations under Morphine, p. 286. Increments should be made to the dose, not to the frequency of administration. The patient must be monitored closely for efficacy and side-effects, particularly constipation, and nausea and vomiting. A suitable laxative (p. 68) should be prescribed routinely.

Oxycodone, (p. 287) can be used in patients who require an opioid but cannot tolerate morphine. If the patient is already receiving an opioid, oxycodone should be started at a dose equivalent to the current analgesic (see below). Oxycodone immediate-release preparations can be given for breakthrough pain.

### Equivalent doses of opioid analgesics

This is only an approximate guide (doses may not correspond with those given in clinical practice); patients should be carefully monitored after any change in medication and dose titration may be required.

</tbody>
</table>

PO = by mouth; IM = intramuscular, IV = intravenous, SC = subcutaneous.

### Parenteral route

The equivalent parenteral dose of morphine (subcutaneous, intramuscular, or intravenous) is about half of the oral dose. If the patient becomes unable to swallow, generally morphine is administered as a continuous subcutaneous infusion (for details, see Continuous Subcutaneous Infusions below). Diamorphine is sometimes preferred, because being more soluble, it can be given in a smaller volume. The equivalent subcutaneous dose of diamorphine is about one-third of the oral dose of morphine.

If the patient can resume taking medicines by mouth, then oral morphine may be substituted for subcutaneous infusion of morphine or diamorphine, see table above of approximate equivalent doses of morphine and diamorphine. The infusion is discontinued when the first oral dose of morphine is given.

### Rectal route

Morphine is also available for rectal administration as suppositories; alternatively oxycodone suppositories can be obtained on special order.

### Transdermal route

Transdermal preparations of fentanyl and buprenorphine are available (section 4.7.2.): they are not suitable for acute pain or in patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Prescribers should ensure that they are familiar with the correct use of transdermal preparations, see under buprenorphine (p. 280) and fentanyl (p. 283) (inappropriate use has caused fatalities). Immediate-release morphine can be given for breakthrough pain.

The following 24-hour oral doses of morphine are considered to be approximately equivalent to the buprenorphine and fentanyl patches shown, however when switching due to possible opioid-induced hyperalgesia, reduce the calculated equivalent dose of the new opioid by one-quarter to one-half.

### Buprenorphine patches are approximately equivalent to the following 24-hour doses of oral morphine

</tbody>
</table>

Note: Fentanyl equivalences in this table are for patients on well-tolerated opioid therapy for long periods; for patients who are opioid naive or who have been stable on oral morphine or other immediate release opioid for only several weeks, see Transdermal Route above, and section 4.7.2. Conversion ratios vary and these figures are a guide only. Morphine equivalences for transdermal opioid preparations have been approximated to allow comparison with available preparations of oral morphine.

### Symptom control

#### Unlicensed indications or routes

Several recommendations in this section involve unlicensed indications or routes.

**Anorexia** Anorexia may be helped by prednisolone 15–30 mg daily or dexamethasone 2–4 mg daily.

**Bowel colic and excessive respiratory secretions** Bowel colic and excessive respiratory secre-
Prescribing in palliative care

Fungating tumours can be treated by regular dressing and antibacterial drugs; systemic treatment with metronidazole (section 5.1.11) is often required to reduce malodour but topical metronidazole (section 13.10.1.2) is also used.

Gastro-intestinal pain The pain of bowel colic may be reduced by loperamide 2–4 mg 4 times daily. Hyoscine butylbromide (section 4.6) may also be helpful, given sublingually at a dose of 300 micrograms 3 times daily as Kwells® tablets. Subcutaneous injections of hyoscine butylbromide, hyoscine hydrobromide, and glycopyrronium can also be used to treat bowel colic (see above). For doses by continuous subcutaneous infusion, see p. 23.

Distension pain due to pressure on the stomach may be helped by a preparation incorporating an antacid with an antiflatulent (section 1.1.1) and a prokinetic such as domperidone 10 mg 3 times daily before meals.

Hiccups Hiccups due to gastric distension may be helped by a preparation incorporating an antacid with an antiflatulent (section 1.1.1). If this fails, metoclopramide 10 mg every 6 to 8 hours by mouth or by subcutaneous or intramuscular injection can be added; if this also fails, baclofen 5 mg twice daily, or nifedipine 10 mg three times daily, or chlordiazepoxide (section 4.2.1) can be tried.

Hypercalcaemia see section 9.5.1.2

Insomnia Patients with advanced cancer may not sleep because of discomfort, cramps, night sweats, joint stiffness, or fear. There should be appropriate treatment of these problems before hypnotics are used. Benzodiazepines, such as temazepam (section 4.1.1), may be useful.

Intractable cough Intractable cough may be relieved by moist inhalations or by regular administration of oral morphine in an initial dose of 5 mg every 4 hours. Methadone linctus should be avoided because it has a long duration of action and tends to accumulate.

Muscle spasm The pain of muscle spasm can be helped by a muscle relaxant such as diazepam 5–10 mg daily or baclofen 5–10 mg 3 times daily.

Nausea and vomiting Nausea and vomiting are common in patients with advanced cancer. Ideally, the cause should be determined before treatment with an antiemetic (section 4.6) is started. A prokinetic antiemetic may be a preferred choice for first-line therapy.

Nausea and vomiting may occur with opioid therapy particularly in the initial stages but can be prevented by giving an antiemetic such as haloperidol or metoclopramide. An antiemetic is usually necessary only for the first 4 or 5 days and therefore combined preparations containing an opioid with an antiemetic are not recommended because they lead to unnecessary antiemetic therapy (and associated side-effects when used long-term).

Metoclopramide has a prokinetic action and is used in a dose of 10 mg 3 times daily by mouth for nausea and vomiting associated with gastritis, gastric stasis, and functional bowel obstruction. Drugs with antimuscarinic effects antagonise prokinetic drugs and, if possible, should not be used concurrently.

Haloperidol is used by mouth in an initial dose of 1.5 mg once or twice daily (can be increased if necessary to 5–10 mg daily in divided doses) for most metabolic causes of vomiting (e.g. hypercalcaemia, renal failure). Cyclizine is given in a dose of 50 mg up to 3 times daily by mouth. It is used for nausea and vomiting due to...
mechanical bowel obstruction, raised intracranial pressure, and motion sickness.

Levomepromazine is used as an antiemetic: it is given by mouth or by subcutaneous injection in an initial dose of 6 mg or 6.25 mg at bedtime, titrated if necessary to 12.5–25 mg twice daily (6-mg tablets available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104). For the dose by subcutaneous infusion, see below. Dexamethasone 8–16 mg daily by mouth can be used as an adjunct.

Antiemetic therapy should be reviewed every 24 hours; it may be necessary to substitute the antiemetic or to add another one. For the administration of antiemetics by subcutaneous infusion using a continuous infusion device, see below.

For the treatment of nausea and vomiting associated with cancer chemotherapy, see section 8.1.

Pruritus Pruritus, even when associated with obstructive jaundice, often responds to simple measures such as application of emollients (section 13.2.1). In the case of obstructive jaundice, further measures include administration of colestyramine (section 1.9.2).

Raised intracranial pressure Headache due to raised intracranial pressure often responds to a high dose of a corticosteroid, such as dexamethasone 16 mg daily for 4 to 5 days, subsequently reduced to 4–6 mg daily if possible; dexamethasone should be given before 6 p.m. to reduce the risk of insomnia.

Restlessness and confusion Restlessness and confusion may require treatment with an antipsychotic, e.g. haloperidol 2 mg by mouth or 2.5 mg by subcutaneous injection, or levomepromazine 6 mg by mouth or 6.25 mg by subcutaneous injection, both repeated every 2 hours if required. The dose and frequency is adjusted according to the level of patient distress and the response. A regular maintenance dose should also be considered, given twice daily either by mouth or by subcutaneous injection; alternatively use a continuous infusion device, see below.

Levomepromazine is licensed to treat pain in palliative care—this use is reserved for distressed patients with severe pain unresponsive to other measures (seek specialist advice).

Continuous subcutaneous infusions

Although drugs can usually be administered by mouth to control the symptoms of advanced cancer, the parenteral route may sometimes be necessary. Repeated administration of intramuscular injections can be difficult in a cachectic patient. This has led to the use of portable continuous infusion devices, such as syringe drivers, to give a continuous subcutaneous infusion, which can provide good control of symptoms with little discomfort or inconvenience to the patient.

Syringe driver rate settings

Staff using syringe drivers should be adequately trained and different rate settings should be clearly identified and differentiated; incorrect use of syringe drivers is a common cause of medication errors.

Preparation of continuous subcutaneous infusions

Continuous subcutaneous infusions should be prepared in the pharmacy and issued in a minimum of 100 mL ampoules (25 mg/mL) (5 mg/mL in 5 mL ampoules should be considered in palliative care and other situations where a higher strength may be more appropriate to administer the prescribed dose, and where the risk of overdosage has been assessed. It is advised that flumazenil (section 15.1.7) is available when midazolam is used, to reverse the effects if necessary.

Nausea and vomiting Haloperidol is given in a subcutaneous infusion dose of 2.5–10 mg/24 hours.
Prescribing in palliative care

Levomepromazine is given in a subcutaneous infusion dose of 5–25 mg/24 hours but sedation can limit the dose.

Cyclizine is particularly likely to precipitate if mixed with diamorphine or other drugs (see under Mixing and Compatibility, below); it is given in a subcutaneous infusion dose of 150 mg/24 hours.

Metoclopramide can cause skin reactions; it is given in a subcutaneous infusion dose of 250–500 micrograms/24 hours to reduce intestinal secretions and to reduce vomiting due to bowel obstruction. Doses of 750 micrograms/24 hours, and occasionally higher, are sometimes required.

1. Cyclizine may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9% or as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.
2. Special care is needed to avoid precipitation of dexamethasone when preparing it.
3. Mixtures of haloperidol and diamorphine are likely to precipitate after 24 hours if haloperidol concentration is above 2 mg/mL.
4. Under some conditions infusions containing metoclopramide become discoloured; such solutions should be discarded.

Pain control  Diamorphine is the preferred opioid since its high solubility permits a large dose to be given in a small volume (see under Mixing and Compatibility, below). The table below shows approximate equivalent doses of morphine and diamorphine.

The following can be mixed with diamorphine:

- Hyoscine butylbromide
- Octreotide (section 8.3.4.3), which stimulates water and electrolyte absorption and inhibits water secretion in the small bowel, can be used by subcutaneous infusion in a dose of 250–500 micrograms/24 hours to reduce intestinal secretions and to reduce vomiting due to bowel obstruction. Doses of 750 micrograms/24 hours, and occasionally higher, are sometimes required.

Problems encountered with syringe drivers

The following are problems that may be encountered with syringe drivers and the action that should be taken:

- If the subcutaneous infusion runs too quickly check the rate setting and the calculation;
- If the subcutaneous infusion runs too slowly check the start button, the battery, the syringe driver, the cannula, and make sure that the injection site is not inflamed;
- If there is an injection site reaction make sure that the site does not need to be changed—firmness or swelling at the site of injection is not in itself an indication for change, but pain or obvious inflammation is.

Subcutaneous infusion solution should be monitored regularly both to check for precipitation (and discoloration) and to ensure that the infusion is running at the correct rate.

If breakthrough pain occurs give a subcutaneous (preferable) or intramuscular injection equivalent to one-tenth to one-sixth of the total 24-hour subcutaneous infusion dose. It is kinder to give an intermittent bolus injection subcutaneously—absorption is smoother so that the risk of adverse effects at peak absorption is avoided (an even better method is to use a subcutaneous butterfly needle).

To minimise the risk of infection no individual subcutaneous infusion solution should be used for longer than 24 hours.
Prescribing for the elderly

Old people, especially the very old, require special care and consideration from prescribers. *Medicines for Older People*, a component document of the National Service Framework for Older People, describes how to maximise the benefits of medicines and how to avoid excessive, inappropriate, or inadequate consumption of medicines by older people.

**Appropriate prescribing** Elderly patients often receive multiple drugs for their multiple diseases. This greatly increases the risk of drug interactions as well as adverse reactions, and may affect compliance (see Taking medicines to best effect under General guidance). The balance of benefit and harm of some medicines may be altered in the elderly. Therefore, elderly patients’ medicines should be reviewed regularly and medicines which are not of benefit should be stopped.

Non-pharmacological measures may be more appropriate for symptoms such as headache, sleeplessness, and lightheadedness when associated with social stress as in widowhood, loneliness, and family dispersal. In some cases prophylactic drugs are inappropriate if they are likely to complicate existing treatment or introduce unnecessary side-effects, especially in elderly patients with poor prognosis or with poor overall health. However, elderly patients should not be denied medicines which may help them, such as anticoagulants or antiplatelet drugs for atrial fibrillation, anti-hypertensives, statins, and drugs for osteoporosis.

**Form of medicine** Frail elderly patients may have difficulty swallowing tablets; if left in the mouth, ulceration may develop. They should always be encouraged to take their tablets or capsules with enough fluid, and whilst in an upright position to avoid the possibility of oesophageal ulceration. It can be helpful to discuss with the patient the possibility of taking the drug as a liquid if available.

**Manifestations of ageing** In the very old, manifestations of normal ageing may be mistaken for inappropriate prescribing. In addition, age-related muscle weakness and difficulty in maintaining balance should not be confused with neurological disease. Disorders such as lightheadedness not associated with postural or postprandial hypotension are unlikely to be helped by drugs.

**Sensitivity** The nervous system of elderly patients is more sensitive to many commonly used drugs, such as opioid analgesics, benzodiazepines, antipsychotics, and antiParkinsonian drugs, all of which must be used with caution. Similarly, other organs may also be more susceptible to the effects of drugs such as anti-hypertensives and NSAIDs.

**Pharmacokinetics** Pharmacokinetic changes can markedly increase the tissue concentration of a drug in the elderly, especially in debilitated patients.

The most important effect of age is reduced renal clearance. Many aged patients thus excrete drugs slowly, and are highly susceptible to nephrotoxic drugs. Acute illness can lead to rapid reduction in renal clearance, especially if accompanied by dehydration. Hence, a patient stabilised on a drug with a narrow margin between the therapeutic and the toxic dose (e.g. digoxin) can rapidly develop adverse effects in the aftermath of a myocardial infarction or a respiratory tract infection. The hepatic metabolism of lipid soluble drugs is reduced in elderly patients because there is a reduction in liver volume. This is important for drugs with a narrow therapeutic window.

**Adverse reactions** Adverse reactions often present in the elderly in a vague and non-specific fashion. Confusion is often the presenting symptom (caused by almost any of the commonly used drugs). Other common manifestations are constipation (with antimuscarinics and many tranquillisers) and postural hypotension and falls (with diuretics and many psychotropics).

**Hypnotics** Many hypnotics with long half-lives have serious hangover effects, including drowsiness, unsteadiness, and slurred speech, and confusion. Hypnotics with short half-lives should be used but they too can present problems (section 4.1.1). Short courses of hypnotics are occasionally useful for helping a patient through an acute illness or some other crisis but every effort must be made to avoid dependence. Benzodiazepines impair balance, which can result in falls.

**Diuretics** Diuretics are overprescribed in old age and should not be used on a long-term basis to treat simple gravitational oedema which will usually respond to increased movement, raising the legs, and support stockings. A few days of diuretic treatment may speed the clearing of the oedema but it should rarely need continued drug therapy.

**NSAIDs** Bleeding associated with aspirin and other NSAIDs is more common in the elderly who are more likely to have a fatal or serious outcome. NSAIDs are also a special hazard in patients with cardiac disease or renal impairment which may again place older patients at particular risk. Owing to the increased susceptibility of the elderly to the side-effects of NSAIDs the following recommendations are made:

- for osteoarthritis, soft-tissue lesions, and back pain, first try measures such as weight reduction (if obese), warmth, exercise, and use of a walking stick;
- for osteoarthritis, soft-tissue lesions, back pain, and pain in rheumatoid arthritis, paracetamol should be used first and can often provide adequate pain relief;
- alternatively, a low-dose NSAID (e.g. ibuprofen up to 1.2 g daily) may be given;
- for pain relief when either drug is inadequate, paracetamol in a full dose plus a low-dose NSAID may be given;
- if necessary, the NSAID dose can be increased or an opioid analgesic given with paracetamol;
- do not give two NSAIDs at the same time.

---

For advice on prophylaxis of NSAID-induced peptic ulcers if continued NSAID treatment is necessary, see section 1.3.

Other drugs Other drugs which commonly cause adverse reactions are antiparkinsonian drugs, antihypertensives, psychotropics, and digoxin. The usual maintenance dose of digoxin in very old patients is 125 micrograms daily (62.5 micrograms in those with renal disease); lower doses are often inadequate but toxicity is common in those given 250 micrograms daily.

Drug-induced blood disorders are much more common in the elderly. Therefore drugs with a tendency to cause bone marrow depression (e.g. co-trimoxazole, mianserin) should be avoided unless there is no acceptable alternative.

The elderly generally require a lower maintenance dose of warfarin than younger adults; once again, the outcome of bleeding tends to be more serious.

Guidelines

Always consider whether a drug is indicated at all.

Limit range It is a sensible policy to prescribe from a limited range of drugs and to be thoroughly familiar with their effects in the elderly.

Reduce dose Dosage should generally be substantially lower than for younger patients and it is common to start with about 50% of the adult dose. Some drugs (e.g. long-acting antidiabetic drugs such as glibenclamide) should be avoided altogether.

Review regularly Review repeat prescriptions regularly. In many patients it may be possible to stop some drugs, provided that clinical progress is monitored. It may be necessary to reduce the dose of some drugs as renal function declines.

Simplify regimens Elderly patients benefit from simple treatment regimens. Only drugs with a clear indication should be prescribed and whenever possible given once or twice daily. In particular, regimens which call for a confusing array of dosage intervals should be avoided.

Explain clearly Write full instructions on every prescription (including repeat prescriptions) so that containers can be properly labelled with full directions. Avoid imprecisions like ‘as directed’. Child-resistant containers may be unsuitable.

Repeats and disposal Instruct patients what to do when drugs run out, and also how to dispose of any that are no longer necessary. Try to prescribe matching quantities.

If these guidelines are followed most elderly people will cope adequately with their own medicines. If not then it is essential to enrol the help of a third party, usually a relative or a friend.
Prescribing in dental practice

The following is a list of topics of particular relevance to dentists.

Medical emergencies in dental practice
This section provides guidelines on the management of
the more common medical emergencies which may
arise in dental practice. Dentists and their staff should
be familiar with standard resuscitation procedures, but
in all circumstances it is advisable to summon medical
assistance as soon as possible. For an algorithm of the
procedure for cardiopulmonary resuscitation, see
inside back cover.

The drugs referred to in this section include:
Adrenaline Injection (Epinephrine Injection), adren-
aline 1 in 1000, (adrenaline 1 mg/mL as acid
tartrate), 1-mL amps
Aspirin Dispersible Tablets 300 mg
Glucagon Injection, glucagon (as hydrochloride), 1-
unit vial (with solvent)
Glucose (for administration by mouth)
Glyceryl Trinitrate Spray
Midazolam Buccal Liquid, midazolam 10 mg/mL or
Midazolam Injection (for buccal administration),
midazolam (as hydrochloride) 5 mg/mL, 2-mL amps
Oxygen
Salbutamol Aerosol Inhalation, salbutamol 100 micro-
grams/metered inhalation

Adrenal insufficiency
Adrenal insufficiency may follow prolonged therapy
with corticosteroids and can persist for years after
stopping. A patient with adrenal insufficiency may
become hypotensive under the stress of a dental visit
(important: see also p. 484 for details of corticosteroid
cover before dental surgical procedures under general
anaesthesia).

Management
• Lay the patient flat
• Give oxygen (see section 3.6)
• Transfer patient urgently to hospital

Anaphylaxis
A severe allergic reaction may follow oral or parenteral
administration of a drug. Anaphylactic reactions in
dentistry may follow the administration of a drug or
contact with substances such as latex in surgical gloves.
In general, the more rapid the onset of the reaction the
more profound it tends to be. Symptoms may develop
within minutes and rapid treatment is essential.
Anaphylactic reactions may also be associated with
additives and excipients in foods and medicines (see
Excipients, p. 2). Refined arachis (peanut) oil, which
may be present in some medicinal products, is unlikely
to cause an allergic reaction—nevertheless it is wise to
test the full formula of preparations which may con-
tain allergens (including those for topical application,
particularly if they are intended for use in the mouth or
for application to the nasal mucosa).

Symptoms and signs
• Paraesthesia, flushing, and swelling of face
• Generalised itching, especially of hands and feet
Prescribing in dental practice

- Bronchospasm and laryngospasm (with wheezing and difficulty in breathing)
- Rapid weak pulse together with fall in blood pressure and pallor; finally cardiac arrest

Management

First-line treatment includes securing the airway, restoration of blood pressure (laying the patient flat and raising the feet, or in the recovery position if unconscious or nauseous and at risk of vomiting), and administration of adrenaline (epinephrine) injection (section 3.4.3). This is given intramuscularly in a dose of 500 micrograms (0.5 mL adrenaline injection 1 in 1000); a dose of 300 micrograms (0.3 mL adrenaline injection 1 in 1000) may be appropriate for immediate self-administration. The dose is repeated if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function. Oxygen administration is also of primary importance (see section 3.6). Arrangements should be made to transfer the patient to hospital urgently.

For further details on the management of anaphylaxis including details of paediatric doses of adrenaline, see p. 209

Asthma

Patients with asthma may have an attack while at the dental surgery. Most attacks will respond to 2 puffs of the patient’s short-acting beta_2_ agonist inhaler such as salbutamol 100 micrograms/puff; further puffs are required if the patient does not respond rapidly. If the patient is unable to use the inhaler effectively, further puffs should be given through a large-volume spacer device (or, if not available, through a plastic or paper cup with a hole in the bottom for the inhaler mouthpiece). If the response remains unsatisfactory, or if further deterioration occurs, then the patient should be transferred urgently to hospital. Whilst awaiting transfer, oxygen (section 3.6) should be given with salbutamol 5 mg or terbutaline 10 mg by nebuliser; if a nebuliser is unavailable, then 2–10 puffs of salbutamol 100 micrograms/metered inhalation should be given (preferably by a large-volume spacer), and repeated every 10–20 minutes if necessary. If asthma is part of a more generalised anaphylactic reaction, an intramuscular injection of adrenaline (as detailed under Anaphylaxis above) should be given.

For a table describing the management of acute asthma, see p. 183

Patients with severe chronic asthma or whose asthma has deteriorated previously during a dental procedure may require an increase in their prophylactic medication before a dental procedure. This should be discussed with the patient’s medical practitioner and may include increasing the dose of inhaled or oral corticosteroid.

Cardiac emergencies

If there is a history of angina the patient will probably carry glyceryl trinitrate spray or tablets (or isosorbide dinitrate tablets) and should be allowed to use them. Hospital admission is not necessary if symptoms are mild and resolve rapidly with the patient’s own medication. See also Coronary Artery Disease on p. 30.

Arrhythmias may lead to a sudden reduction in cardiac output with loss of consciousness. Medical assistance should be summoned. For advice on pacemaker interference, see also Pacemakers, p. 30.

The pain of myocardial infarction is similar to that of angina but generally more severe and more prolonged. For general advice see also Coronary Artery Disease on p. 30

Symptoms and signs of myocardial infarction

- Progressive onset of severe, crushing pain across front of chest; pain may radiate towards the shoulder and down arm, or into neck and jaw
- Skin becomes pale and clammy
- Nausea and vomiting are common
- Pulse may be weak and blood pressure may fall
- Breathlessness

Initial management of myocardial infarction

Call immediately for medical assistance and an ambulance, as appropriate.

Allow the patient to rest in the position that feels most comfortable; in the presence of breathlessness this is likely to be sitting position, whereas the syncopal patient should be laid flat; often an intermediate position (dictated by the patient) will be most appropriate. Oxygen may be administered (see section 3.6).

Sublingual glyceryl trinitrate may relieve pain. Intramuscular injection of drugs should be avoided because absorption may be too slow (particularly when cardiac output is reduced) and pain relief is inadequate. Intramuscular injection also increases the risk of local bleeding into the muscle if the patient is given a thrombolytic drug.

Reassure the patient as much as possible to relieve further anxiety. If available, aspirin in a single dose of 300 mg should be given. A note (to say that aspirin has been given) should be sent with the patient to the hospital. For further details on the initial management of myocardial infarction, see p. 164.

If the patient collapses and loses consciousness attempt standard resuscitation measures. For an algorithm of the procedure for cardiopulmonary resuscitation, see inside back cover.

Epileptic seizures

Patients with epilepsy must continue with their normal dosage of anticonvulsant drugs when attending for dental treatment. It is not uncommon for epileptic patients not to volunteer the information that they are epileptic but there should be little difficulty in recognising a tonic-clonic (grand mal) seizure.

Symptoms and signs

- There may be a brief warning (but variable)
- Sudden loss of consciousness, the patient becomes rigid, falls, may give a cry, and becomes cyanotic (tonic phase)
- After 30 seconds, there are jerking movements of the limbs; the tongue may be bitten (clonic phase)
- There may be frothing from mouth and urinary incontinence
- The seizure typically lasts a few minutes; the patient may then become flaccid but remain unconscious. After a variable time the patient regains consciousness but may remain confused for a while
Management

During a convulsion try to ensure that the patient is not at risk from injury but make no attempt to put anything in the mouth or between the teeth (in mistaken belief that this will protect the tongue). Give oxygen (section 3.6) to support respiration if necessary. Do not attempt to restrain convulsive movements.

After convulsive movements have subsided place the patient in the coma (recovery) position and check the airway.

After the convulsion the patient may be confused (‘post-ictal confusion’) and may need reassurance and sympathy. The patient should not be sent home until fully recovered. Seek medical attention or transfer the patient to hospital if it was the first episode of epilepsy, or if the convulsion was atypical, prolonged (or repeated), or if injury occurred.

Medication should only be given if convulsive seizures are prolonged (convulsive movements lasting 5 minutes or longer) or repeated rapidly.

Either midazolam buccal liquid or midazolam injection solution can be given by the buccal route [unlicensed use] in a single dose of 10 mg. For further details on the management of status epilepticus, including details of paediatric doses of midazolam, see p. 317.

Focal seizures similarly need very little active management (in an automatism only a minimum amount of restraint should be applied to prevent injury). Again, the patient should be observed until post-ictal confusion has completely resolved.

Hypoglycaemia

Insulin-treated diabetic patients attending for dental treatment under local anaesthesia should inject insulin and eat meals as normal. If food is omitted the blood glucose will fall to an abnormally low level (hypoglycaemia). Patients can often recognise the symptoms themselves and this state responds to sugar in water or a few lumps of sugar. Children may not have such prominent changes but may appear unduly lethargic.

Symptoms and signs

- Shaking and trembling
- Sweating
- ‘Pins and needles’ in lips and tongue
- Hunger
- Palpitation
- Headache (occasionally)
- Double vision
- Difficulty in concentration
- Shuffling of speech
- Confusion
- Change of behaviour; truculence
- Convulsions
- Unconsciousness

Management

Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. Approximately 10 g of glucose is available from non-diet versions of Lucozade®, Energy Original 55 mL, Coca-Cola® 100 mL, Ribena® Blackcurrant 19 mL (to be diluted), 2 teaspoons sugar, and also from 3 sugar lumps1. If necessary this may be repeated in 10–15 minutes.

If glucose cannot be given by mouth, if it is ineffective, or if the hypoglycaemia causes unconsciousness, glucagon 1 mg (1 unit) should be given by intramuscular (or subcutaneous) injection; a child under 8 years or of body-weight under 25 kg should be given 500 micrograms. Once the patient regains consciousness oral glucose should be administered as above. If glucagon is ineffective or contra-indicated, the patient should be transferred urgently to hospital. The patient must also be admitted to hospital if hypoglycaemia is caused by an oral antidiabetic drug.

Syncope

Insufficient blood supply to the brain results in loss of consciousness. The commonest cause is a vasovagal attack or simple faint (syncope) due to emotional stress.

Symptoms and signs

- Patient feels faint
- Low blood pressure
- Pallor and sweating
- Yawning and slow pulse
- Nausea and vomiting
- Dilated pupils
- Muscular twitching

Management

- Lay the patient as flat as is reasonably comfortable and, in the absence of associated breathlessness, raise the legs to improve cerebral circulation
- Loosen any tight clothing around the neck
- Once consciousness is regained, give sugar in water or a cup of sweet tea

Other possible causes

Postural hypotension can be a consequence of rising abruptly or of standing upright for too long; antihypertensive drugs predispose to this. When rising, susceptible patients should take their time. Management is as for a vasovagal attack.

Under stressful circumstances, some patients hyperventilate. This gives rise to feelings of faintness but does not usually result in syncope. In most cases reassurance is all that is necessary; rebreathing from cupped hands or a bag may be helpful but calls for careful supervision.

Adrenal insufficiency or arrhythmias are other possible causes of syncope, see p. 27 and p. 30.

Medical problems in dental practice

Individuals presenting at the dental surgery may also suffer from an unrelated medical condition; this may require modification to the management of their dental condition. If the patient has systemic disease or is taking other medication, the matter may need to be discussed with the patient’s general practitioner or hospital consultant.

1. Proprietary products of quick-acting carbohydrate (e.g. GlucoGel®, Dextrogel®, GSF-Syrup®, Rapilose® gel) are available on prescription for the patient to keep to hand in case of hypoglycaemia.
Prescribing in dental practice

For advice on adrenal insufficiency, anaphylaxis, asthma, cardiac emergencies, epileptic seizures, hypoglycaemia and syncope see under Medical Emergencies in Dental Practice.

Allergy
Patients should be asked about any history of allergy; those with a history of atopic allergy (asthma, eczema, hay fever, etc.) are at special risk. Those with a history of a severe allergy or of anaphylactic reactions are at high risk—it is essential to confirm that they are not allergic to any medication, or to any dental materials or equipment (including latex gloves). See also Anaphylaxis on p. 27.

Arrhythmias
Patients, especially those who suffer from heart failure or who have sustained a myocardial infarction, may have irregular cardiac rhythm. Atrial fibrillation is a common arrhythmia even in patients with normal hearts and is of little concern except that dentists should be aware that such patients may be receiving anticoagulant therapy. The patient’s medical practitioner should be asked whether any special precautions are necessary. Premedication (e.g. with temazepam) may be useful in some instances for very anxious patients. See also Cardiac emergencies, p. 28 and Dental Anaesthesia, p. 877.

Cardiac prostheses
For an account of the risk of infective endocarditis in patients with prosthetic heart valves, see Infective Endocarditis, below. For advice on patients receiving anticoagulants, see Thromboembolic Disease, below.

Coronary artery disease
Patients are vulnerable for at least 4 weeks following a myocardial infarction or following any sudden increase in the symptoms of angina. It would be advisable to check with the patient’s medical practitioner before commencing treatment. See also Cardiac Emergencies on p. 28.

Treatment with low-dose aspirin (75 mg daily), clopidogrel, or dipyridamole should not be stopped routinely nor should the dose be altered before dental procedures.

A Working Party of the British Society for Antimicrobial Chemotherapy has not recommended antibiotic prophylaxis for patients following coronary artery bypass surgery.

Cyanotic heart disease
Patients with cyanotic heart disease are at risk in the dental chair, particularly if they have pulmonary hypertension. In such patients a syncopal reaction increases the shunt away from the lungs, causing more hypoxia which worsens the syncopal reaction—a vicious circle that may prove fatal. The advice of the cardiologist should be sought on any patient with congenital cyanotic heart disease. Treatment in hospital is more appropriate for some patients with this condition.

Hypertension
Patients with hypertension are likely to be receiving antihypertensive drugs such as those described in section 2.5. Their blood pressure may fall dangerously low under general anaesthesia, see also under Dental Anaesthesia on p. 877.

Immunosuppression and indwelling intraperitoneal catheters
See Table 2, section 5.1

Infective endocarditis
While almost any dental procedure can cause bacteremia, there is no clear association with the development of infective endocarditis. Routine daily activities such as tooth brushing also produce a bacteremia and may present a greater risk of infective endocarditis than a single dental procedure.

Antibacterial prophylaxis and chlorhexidine mouthwash are not recommended for the prevention of endocarditis in patients undergoing dental procedures. Such prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Reduction of oral bacteremia Patients at risk of endocarditis should be advised to maintain the highest possible standards of oral hygiene in order to reduce the:

- need for dental extractions or other surgery;
- chances of severe bacteremia if dental surgery is needed;
- possibility of ‘spontaneous’ bacteremia.

Postoperative care Patients at risk of endocarditis should be warned to report to the doctor or dentist any unexplained illness that develops after dental treatment. Any infection in patients at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

Patients on anticoagulant therapy For general advice on dental surgery in patients receiving oral anticoagulant therapy see Thromboembolic Disease, below.

Joint prostheses
See Table 2, section 5.1

Pacemakers
Pacemakers prevent asystole or severe bradycardia. Some ultrasonic scalers, electronic apex locators, electro-analgesic devices, and electrocautery devices interfere with the normal function of pacemakers (including shielded pacemakers) and should not be used. The manufacturer’s literature should be consulted whenever possible. If severe bradycardia occurs in a patient fitted with a pacemaker, electrical equipment should be switched off and the patient placed supine with the legs elevated. If the patient loses consciousness and the pulse remains slow or is absent, cardiopulmonary resuscitation (see inside back cover) may be needed. Call immediately for medical assistance and an ambulance, as appropriate.

1. Patients at risk of endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis.

**Thromboembolic disease**

Patients receiving a heparin or an oral anticoagulant such as warfarin,acenocoumarol (nicoumalone),phenindione,apixaban, dabigatran etexilate, or rivaroxaban may be liable to excessive bleeding after extraction of teeth or other dental surgery. Often dental surgery can be delayed until the anticoagulant therapy has been completed.

For a patient requiring long-term therapy with warfarin, the patient’s medical practitioner should be consulted and the International Normalised Ratio (INR) should be assessed 72 hours before the dental procedure. This allows sufficient time for dose modification if necessary. In those with an unstable INR (including those who require weekly monitoring of their INR, or those who have had some INR measurements greater than 4.0 in the last 2 months), the INR should be assessed within 24 hours of the dental procedure. Patients requiring minor dental procedures (including extractions) who have an INR below 4.0 may continue warfarin without dose adjustment. There is no need to check the INR for a patient requiring a non-invasive dental procedure.

If it is necessary to remove several teeth, a single extraction should be done first; if this goes well further teeth may be extracted at subsequent visits (two or three at a time). Measures should be taken to minimise bleeding during and after the procedure. This includes the use of sutures and a haemostatic such as oxidised cellulose, collagen sponge or resorbable gelatin sponge. Scaling and root planing should initially be restricted to a limited area to assess the potential for bleeding.

For a patient on long-term warfarin, the advice of the clinician responsible for the patient’s anticoagulation should be sought if:

- the INR is unstable, or if the INR is greater than 4.0;
- the patient has thrombocytopenia, haemophilia, or other disorders of haemostasis, or suffers from liver impairment, alcoholism, or renal failure;
- the patient is receiving antiplatelet drugs, cytotoxic drugs or radiotherapy.

Intramuscular injections are contra-indicated in patients taking anticoagulants with an INR above the therapeutic range, and in those with any disorder of haemostasis. In patients taking anticoagulants who have a stable INR within the therapeutic range, intramuscular injections should be avoided if possible; if an intramuscular injection is necessary, the patient should be informed of the increased risk of localised bleeding and monitored carefully.

A local anaesthetic containing a vasoconstrictor should be given by infiltration, or by intraligamentary or mental nerve injection if possible. If regional nerve blocks cannot be avoided the local anaesthetic should be given cautiously using an aspirating syringe.

Drugs which have potentially serious interactions with anticoagulants include aspirin and other NSAIDs, carbamazepine, imidazole and triazole antifungals (including miconazole), erythromycin, clarithromycin, and metronidazole; for details of these and other interactions with anticoagulants, see Appendix 1 (dabigatran etexilate, heparins, phenindione, rivaroxaban, and coumarins).

Although studies have failed to demonstrate an interaction, common experience in anticoagulant clinics is that the INR can be altered following a course of an oral broad-spectrum antibiotic, such as ampicillin or amoxicillin.

**Liver disease**

Liver disease may alter the response to drugs and drug prescribing should be kept to a minimum in patients with severe liver disease. Problems are likely mainly in patients with jaundice, ascites, or evidence of encephalopathy.

For guidance on prescribing for patients with hepatic impairment, see p. 17. Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in the BNF.

**Renal impairment**

The use of drugs in patients with reduced renal function can give rise to many problems. Many of these problems can be avoided by reducing the dose or by using alternative drugs.

Special care is required in renal transplantation and immunosuppressed patients; if necessary such patients should be referred to specialists.

For guidance on prescribing in patients with renal impairment, see p. 17. Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug in the BNF.

**Pregnancy**

Drugs taken during pregnancy can be harmful to the fetus and should be prescribed only if the expected benefit to the mother is thought to be greater than the risk to the fetus; all drugs should be avoided if possible during the first trimester.

For guidance on prescribing in pregnancy, see p. 19. Where care is needed when prescribing in pregnancy, this is indicated under the relevant drug in the BNF.

**Breast-feeding**

Some drugs taken by the mother whilst breast-feeding can be transferred to the breast milk, and may affect the infant.

For guidance on prescribing in breast-feeding, see p. 19. Where care is needed when prescribing in breast-feeding, this is indicated under the relevant drug in the BNF.
Drugs and sport

UK Anti-Doping, the national body responsible for the UK’s anti-doping policy, advises that athletes are personally responsible should a prohibited substance be detected in their body. An advice card listing examples of permitted and prohibited substances is available from:

UK Anti-Doping
Oceanic House
1a Cockspur Street
London SW1Y 5BG
Tel: (020) 7766 7350
information@ukad.org.uk
www.ukad.org.uk

General Medical Council’s advice

Doctors who prescribe or collude in the provision of drugs or treatment with the intention of improperly enhancing an individual’s performance in sport contravene the GMC’s guidance, and such actions would usually raise a question of a doctor’s continued registration. This does not preclude the provision of any care or treatment where the doctor’s intention is to protect or improve the patient’s health.
Emergency treatment of poisoning

These notes provide only an overview of the treatment of poisoning, and it is strongly recommended that either TOXBASE or the UK National Poisons Information Service (see below) be consulted when there is doubt about the degree of risk or about management.

Hospital admission Patients who have features of poisoning should generally be admitted to hospital. Patients who have taken poisons with delayed action should also be admitted, even if they appear well. Delayed-action poisons include aspirin, iron, paracetamol, tricyclic antidepressants, and co-phenotrope (diphenoxylate with atropine, Lomotil®); the effects of modified-release preparations are also delayed. A note of all relevant information, including what treatment has been given, should accompany the patient to hospital.

Further information and advice
TOXBASE, the primary clinical toxicology database of the National Poisons Information Service, is available on the internet to registered users at www.toxbase.org (a backup site is available at www.toxbasebackup.org if the main site cannot be accessed). It provides information about routine diagnosis, treatment, and management of patients exposed to drugs, household products, and industrial and agricultural chemicals.

Specialist information and advice on the treatment of poisoning is available day and night from the UK National Poisons Information Service on the following number:
Tel: 0844 892 0111

Advice on laboratory analytical services can be obtained from TOXBASE or from the National Poisons Information Service.

Help with identifying capsules or tablets may be available from a regional medicines information centre (see inside front cover) or (out of hours) from the National Poisons Information Service.

General care
It is often impossible to establish with certainty the identity of the poison and the size of the dose. This is not usually important because only a few poisons (such as opioids, paracetamol, and iron) have specific antidotes; few patients require active removal of the poison.

In most patients, treatment is directed at managing symptoms as they arise. Nevertheless, knowledge of the type and timing of poisoning can help in anticipating the course of events. All relevant information should be sought from the poisoned individual and from carers or parents. However, such information should be interpreted with care because it may not be complete or entirely reliable. Sometimes symptoms arise from other illnesses and patients should be assessed carefully.

Accidents may involve domestic and industrial products (the contents of which are not generally known). The National Poisons Information Service should be consulted when there is doubt about any aspect of suspected poisoning.

Respiration
Respiration is often impaired in unconscious patients. An obstructed airway requires immediate attention. In the absence of trauma, the airway should be opened with simple measures such as chin lift or jaw thrust. An oropharyngeal or nasopharyngeal airway may be useful in patients with reduced consciousness to prevent obstruction, provided ventilation is adequate. Intubation and ventilation should be considered in patients whose airway cannot be protected or who have respiratory acidosis because of inadequate ventilation; such patients should be monitored in a critical care area.

Most poisons that impair consciousness also depress respiration. Assisted ventilation (either mouth-to-mouth or using a bag-valve-mask device) may be needed. Oxygen is not a substitute for adequate ventilation, although it should be given in the highest concentration possible in poisoning with carbon monoxide and irritant gases.

Blood pressure
Hypotension is common in severe poisoning with central nervous system depressants. A systolic blood pressure of less than 70 mmHg may lead to irreversible brain damage or renal tubular necrosis. Hypotension should be corrected initially by raising the foot of the bed and administration of an infusion of either sodium chloride or a colloid. Vasodilator sympathomimetics (section 2.7.2) are rarely required and their use may be discussed with the National Poisons Information Service.

Fluid depletion without hypotension is common after prolonged coma and after aspirin poisoning due to vomiting, sweating, and hyperpnoea.

Hypertension, often transient, occurs less frequently than hypotension in poisoning; it may be associated with sympathomimetic drugs such as amphetamines, phencyclidine, and cocaine.

Heart
Cardiac conduction defects and arrhythmias can occur in acute poisoning, notably with tricyclic antidepressants, some antipsychotics, and some antihistamines. Arrhythmias often respond to correction of underlying hypoxia, acidosis, or other biochemical abnormalities, but ventricular arrhythmias that cause serious hypertension require treatment (section 2.3.1). If the QT interval is prolonged, specialist advice should be sought because the use of some anti-arrhythmic drugs may be inappropriate. Supraventricular arrhythmias are seldom life-threatening and drug treatment is best withheld until the patient reaches hospital.

Body temperature
Hypothermia may develop in patients of any age who have been deeply unconscious for some hours, particularly following overdose with barbiturates or phenothiazines. It may be missed unless core temperature is measured using a low-reading rectal thermometer or by
some other means. Hyperthermia should be managed by prevention of further heat loss and appropriate re-warming as clinically indicated. Hyperthermia can develop in patients taking CNS stimulants; children and the elderly are also at risk when taking therapeutic doses of drugs with anti-muscarinic properties. Hyperthermia is initially managed by removing all unnecessary clothing and using a fan. Sponging with tepid water will promote evaporation. Advice should be sought from the National Poisons Information Service on the management of severe hyperthermia resulting from conditions such as the serotonin syndrome.

Both hypothermia and hyperthermia require urgent hospitalisation for assessment and supportive treatment.

**Convulsions**
Single short-lived convulsions (lasting less than 5 minutes) do not require treatment. If convulsions are protracted or recur frequently, lorazepam 4 mg or diazepam (preferably as emulsion) 10 mg should be given by slow intravenous injection into a large vein (section 4.8.2). Benzodiazepines should not be given by the intramuscular route for convulsions. If the intravenous route is not readily available, midazolam [unlicensed use] can be given by the buccal route or diazepam can be administered as a rectal solution (section 4.8.2).

**Methaemoglobinaemia**
Drug- or chemical-induced methaemoglobinaemia should be treated with methylthioninium chloride if the methaemoglobin concentration is 30% or higher, or if symptoms of tissue hypoxia are present despite oxygen therapy. Methylthioninium chloride reduces the ferric iron of methaemoglobin back to the ferrous iron by reaction with sodium dithionite. Methylthioninium chloride reduces the ferric iron of methaemoglobin back to the ferrous iron of haemoglobin; in high doses, methylthioninium can itself cause methaemoglobinaemia.

**METHYLTHIONINIUM CHLORIDE**
(Methylene blue)

**Indications** drug- or chemical-induced methaemoglobinaemia

**Cautions** children under 3 months more susceptible to methaemoglobinaemia from high doses of methylthioninium; G6PD deficiency (seek advice from National Poisons Information Service); chlorate poisoning (reduces efficacy of methylthioninium); methaemoglobinaemia due to treatment of cyanide poisoning with sodium nitrite (seek advice from National Poisons Information Service); pulse oximetry may give false estimation of oxygen saturation; interactions: Appendix 1 (methylthioninium)

**Renal impairment** use with caution in severe impairment (dose reduction may be required)

**Pregnancy** no information available, but risk to fetus of untreated methaemoglobinaemia likely to be significantly higher than risk of treatment

**Breast-feeding** manufacturer advises avoid breast-feeding for up to 6 days after administration—no information available

**Side-effects** nausea, vomiting, abdominal pain, hyperbilirubinaemia (in infants), chest pain, arrhythmia, hypertension, hypotension, dyspnoea, tachypnoea, headache, dizziness, tremor, confusion, anxiety, agitation, fever, haemolytic anaemia, methaemoglobinaemia, blue-green discoloration of urine, faeces, and skin, mydriasis, sweating

**Dose**
- **By slow intravenous injection** over 5 minutes, ADULT and CHILD over 3 months, 1–2 mg/kg, repeated after 30–60 minutes if necessary, seek advice from National Poisons Information Service if further repeat doses required (max. cumulative dose per course 7 mg/kg, or if aniline- or dapsone-induced methaemoglobinaemia, 4 mg/kg); CHILD under 3 months, seek advice from National Poisons Information Service

**Proveblue®** (Martindale) [POI] Injection, methylthioninium chloride 5 mg/mL, net price 10-mL amp = £39.38

**Removal and elimination**

**Prevention of absorption**
Given by mouth, activated charcoal can bind many poisons in the gastro-intestinal system, thereby reducing their absorption. The sooner it is given the more effective it is, but it may still be effective up to 1 hour after ingestion of the poison—longer in the case of modified-release preparations or of drugs with anti-muscarinic (anticholinergic) properties. It is particularly useful for the prevention of absorption of poisons that are toxic in small amounts, such as antidepressants.

For the use of charcoal in active elimination techniques, see below.

**Active elimination techniques**
Repeated doses of activated charcoal by mouth enhance the elimination of some drugs after they have been absorbed; repeated doses are given after overdosage with:
- Carbamazepine
- Dapsone
- Phenobarbital
- Quinine
- Theophylline

The usual dose of activated charcoal in adults and children over 12 years of age is 50 g initially then 50 g every 4 hours. Vomiting should be treated (e.g. with an antiemetic drug) since it may reduce the efficacy of charcoal treatment. In cases of intolerance, the dose may be reduced and the frequency increased (e.g. 25 g every 2 hours or 12.5 g every hour) but this may compromise efficacy.

In children under 12 years of age, activated charcoal is given in a dose of 1 g/kg (max. 50 g) every 4 hours; the dose may be reduced and the frequency increased if not tolerated.

Other techniques intended to enhance the elimination of poisons after absorption are only practicable in hospital and are only suitable for a small number of severely poisoned patients. Moreover, they only apply to a limited number of poisons. Examples include:
- haemodialysis for ethylene glycol, lithium, methanol, phenobarbital, salicylates, and sodium valproate;
- alkalisation of the urine for salicylates.
Removal from the gastro-intestinal tract

Gastric lavage is rarely required; for substances that cannot be removed effectively by other means (e.g. iron), it should be considered only if a life-threatening amount has been ingested within the previous hour. It should be carried out only if the airway can be protected adequately. Gastric lavage is contra-indicated if a corrosive substance or a petroleum distillate has been ingested, but it may occasionally be considered in patients who have ingested drugs that are not adsorbed by charcoal, such as iron or lithium. Induction of emesis (e.g. with ipecacuanha) is not recommended because there is no evidence that it affects absorption and it may increase the risk of aspiration.

Whole bowel irrigation (by means of a bowel cleansing preparation) has been used in poisoning with certain modified-release or enteric-coated formulations, in severe poisoning with iron and lithium salts, and if illicit drugs are carried in the gastro-intestinal tract ('body-packing'). However, it is not clear that the procedure improves outcome and advice should be sought from the National Poisons Information Service.

CHARCOAL, ACTIVATED

Indications reduction of absorption of poisons in the gastro-intestinal system; see also active elimination techniques, above.

Cautions drowsy or comatose patient (risk of aspiration—ensure airway protected); reduced gastro-intestinal motility (risk of obstruction); not for poisoning with petroleum distillates, corrosive substances, alcohols, malathion, cyanides, and metal salts including iron and lithium salts.

Side-effects black stools

Dose
- Reduction of absorption, ADULT and CHILD over 12 years, 50 g; CHILD under 12 years, 1 g/kg (max. 50 g)
- Active elimination, see notes above.

Note Activated charcoal doses in BNF may differ from those in product literature. Suspension or reconstituted powder may be mixed with soft drinks (e.g. caffeine-free diet cola) or fruit juices to mask the taste.

Actidose-Aqua® Advance (Alliance)
Oral suspension, activated charcoal 1.04 g/5 mL, net price 50-g pack (240 mL) = £12.89

Carbonix® (Beacon)
Granules, activated charcoal, net price 50-g pack = £11.90

Charcordote® (TEVA UK)
Oral suspension, activated charcoal 1 g/5 mL, net price 50-g pack = £11.88

Specific drugs

Alcohol

Acute intoxication with alcohol (ethanol) is common in adults but also occurs in children. The features include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis. Aspiration of vomit is a special hazard and hypoglycaemia may occur in children and some adults. Patients are managed supportively, with particular attention to maintaining a clear airway and measures to reduce the risk of aspiration of gastric contents. The blood glucose is measured and glucose given if indicated.

Analgesics (non-opioid)

Aspirin The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning. The associated acid-base disturbances are complex.

Treatment must be in hospital, where plasma salicylate, pH, and electrolytes can be measured; absorption of aspirin may be slow and the plasma-salicylate concentration may continue to rise for several hours, requiring repeated measurement. Plasma-salicylate concentration may not correlate with clinical severity in the young and the elderly, and clinical and biochemical assessment is necessary. Generally, the clinical severity of poisoning is less below a plasma-salicylate concentration of 500 mg/litre (3.6 mmol/litre), unless there is evidence of metabolic acidosis. Activated charcoal can be given within 1 hour of ingesting more than 125 mg/kg of aspirin. Fluid losses should be replaced and intravenous sodium bicarbonate may be given (ensuring plasma-potassium concentration is within the reference range) to enhance urinary salicylate excretion (optimum urinary pH 7.5–8.5).

Plasma-potassium concentration should be corrected before giving sodium bicarbonate as hypokalaemia may complicate alkalinaisation of the urine. Haemodialysis is the treatment of choice for severe salicylate poisoning and should be considered when the plasma-salicylate concentration exceeds 700 mg/litre (5.1 mmol/litre) or in the presence of severe metabolic acidosis.

NSAIDs Mefenamic acid has important consequences in overdosage because it can cause convulsions, which if prolonged or recurrent require treatment, see p. 34.

Overdosage with ibuprofen may cause nausea, vomiting, epigastric pain, and tinnitus, but more serious toxicity is very uncommon. Activated charcoal followed by symptomatic measures are indicated if more than 100 mg/kg has been ingested within the preceding hour.

Paracetamol

In cases of intravenous paracetamol poisoning contact the National Poisons Information Service for advice on risk assessment and management.

Toxic doses of paracetamol may cause severe hepato-cellular necrosis and, much less frequently, renal tubular necrosis. Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis. Liver damage is maximal 3–4 days after paracetamol overdose and may lead to encephalopathy, haemorrhage, hypoglycaemia, cerebral oedema, and death. Therefore, despite a lack of significant early symptoms, patients who have taken an
overdose of paracetamol should be transferred to hospital urgently.

To avoid underestimating the potentially toxic paracetamol dose ingested by obese patients who weigh more than 110 kg, use a body-weight of 110 kg (rather than their actual body-weight) when calculating the total dose of paracetamol ingested (in mg/kg).

**Acetylcysteine** protects the liver if infused up to, and possibly beyond, 24 hours of ingesting paracetamol. It is most effective if given within 8 hours of ingestion, after which effectiveness declines. Very rarely, giving acetylcysteine by mouth [unlicensed route] is an alternative if intravenous access is not possible—contact the National Poisons Information Service for advice.

Neonates less than 45 weeks corrected gestational age may be more susceptible to paracetamol-induced liver toxicity, therefore, treatment with acetylcysteine should be considered in all paracetamol overdoses, and advice should be sought from the National Poisons Information Service.

**Acute overdose** Hepatotoxicity may occur after a single ingestion of more than 150 mg/kg paracetamol taken in less than 1 hour. Rarely, hepatotoxicity may develop with single ingestions as low as 75 mg/kg of paracetamol taken in less than 1 hour. Patients who have ingested 75 mg/kg or more of paracetamol in less than 1 hour should be referred to hospital. Administration of activated charcoal should be considered if paracetamol in excess of 150 mg/kg is thought to have been ingested within the previous hour.

Patients at risk of liver damage and, therefore, requiring acetylcysteine, can be identified from a single measurement of the plasma-paracetamol concentration, related to the time from ingestion, provided this time interval is not less than 4 hours; earlier samples may be misleading. The concentration is plotted on a paracetamol treatment graph, with a reference line (‘treatment line’) joining plots of 100 mg/litre (0.66 mmol/litre) at 4 hours and 3.13 mg/litre (0.02 mmol/litre) at 24 hours (see p. 36). Acetylcysteine treatment should commence immediately in patients:

- whose plasma-paracetamol concentration falls on or above the *treatment line* on the paracetamol treatment graph (see p. 36);
- who present 8–24 hours after taking an acute overdose of more than 150 mg/kg of paracetamol, even if the plasma-paracetamol concentration is not yet available; acetylcysteine can be discontinued if the plasma-paracetamol concentration is later reported to be below the *treatment line* on the paracetamol treatment graph (see p. 36), provided that the patient is asymptomatic and liver function tests, serum creatinine and INR are normal.

---

![Graph](image-url)

*Graph reproduced courtesy of Medicines and Healthcare products Regulatory Agency.*
The prognostic accuracy of a plasma-paracetamol concentration taken after 15 hours is uncertain, but a concentration on or above the treatment line on the paracetamol treatment graph (see p. 36) should be regarded as carrying a serious risk of liver damage. If more than 15 hours have elapsed since ingestion, or there is doubt about appropriate management, advice should be sought from the National Poisons Information Service.

‘Staggered’ overdose, uncertain time of overdose, or therapeutic excess A ‘staggered’ overdose involves ingestion of a potentially toxic dose of paracetamol over more than one hour, with the possible intention of causing self-harm. Therapeutic excess is the inadvertent ingestion of a potentially toxic dose of paracetamol during its clinical use. The paracetamol treatment graph is unreliable if a ‘staggered’ overdose is taken, if there is uncertainty about the time of the overdose, or if there is therapeutic excess. In these cases, patients who have taken more than 150 mg/kg of paracetamol in any 24-hour period are at risk of toxicity and should be commenced on acetylcysteine immediately, unless it is more than 24 hours since the last ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal.

Rarely, toxicity can occur with paracetamol doses between 75–150 mg/kg in any 24-hour period; clinical judgement of the individual case is necessary to determine whether to treat those who have ingested this amount of paracetamol. For small adults, this may be within the licensed dose, but ingestion of a licensed dose of paracetamol is not considered an overdose.

Although there is some evidence suggesting that factors such as the use of liver enzyme-inducing drugs (e.g. carbamazepine, efavirenz, nevirapine, phenobarbital, phenytoin, primidone, rifabutin, rifampicin, St John’s wort), chronic alcoholism, and starvation may increase the risk of hepatotoxicity, the CHM has advised that these should no longer be used in the assessment of paracetamol toxicity.

Significant toxicity is unlikely if, 24 hours or longer after the last paracetamol ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal. Patients with clinical features of hepatic injury such as jaundice or hepatic tenderness should be treated urgently with acetylcysteine. If there is uncertainty about a patient’s risk of toxicity after paracetamol overdose, treatment with acetylcysteine should be commenced. Advice should be sought from the National Poisons Information Service whenever necessary.

**Acetylcysteine dose and administration** For paracetamol overdose, acetylcysteine is given in a total dose that is divided into 3 consecutive intravenous infusions over a total of 21 hours. The tables below include the dose of acetylcysteine, for adults and children of body-weight 40 kg and over, in terms of the volume of Acetylcysteine Concentrate for Intravenous Infusion required for each of the 3 infusions. The requisite dose of acetylcysteine is added to Glucose Intravenous Infusion 5%.

**First infusion** (based on an acetylcysteine dose of approx. 150 mg/kg)—add requisite volume of Acetylcysteine Concentrate for Intravenous Infusion to 200 mL Glucose Intravenous Infusion 5%; infuse over 1 hour.

<table>

**Note** Glucose Intravenous Infusion 5% is the preferred fluid; Sodium Chloride Intravenous Infusion 0.9% is an alternative if Glucose Intravenous Infusion 5% is unsuitable.
Emergency treatment of poisoning

**ACETYL CUSTINE**

**Indications** paracetamol overdosage, see notes above

**Cautions** atopy; asthma (see Side-effects below but do not delay acetylcysteine treatment); acetylcysteine may slightly increase INR and prothrombin time

**Side-effects** hypersensitivity-like reactions managed by reducing infusion rate or suspending until reaction settled (rash also managed by giving antihistamine; acute asthma managed by giving nebulised short-acting beta2 agonist)—contact the National Poisons Information Service if reaction severe; slight increase in INR and prothrombin time

**Dose**
- **By intravenous infusion**, ADULT and **CHILD** body-weight over 40 kg, see Acetylcysteine Dose and Administration in notes above; **CHILD** body-weight under 20 kg, initially 150 mg/kg in 3 mL/kg glucose 5% and given over 1 hour, followed by 50 mg/kg in 7 mL/kg glucose 5% and given over 4 hours, then 100 mg/kg in 14 mL/kg glucose 5% and given over 16 hours; **CHILD** body-weight 20–40 kg, initially 150 mg/kg in 100 mL glucose 5% and given over 1 hour, followed by 50 mg/kg in 250 mL glucose 5% and given over 4 hours, then 100 mg/kg in 500 mL glucose 5% and given over 16 hours

  **Note** Glucose 5% is preferred infusion fluid; sodium chloride 0.9% is an alternative if glucose 5% unsuitable

**Acetylcysteine** (Non-proprietary) (PhA)

Concentrate for intravenous infusion, acetylcysteine 200 mg/mL, net price 10-mL amp = £1.96

**Parvolex** (UCB Pharma) (PhA)

Concentrate for intravenous infusion, acetylcysteine 200 mg/mL, net price 10-mL amp = £2.25

**Electrolytes**

**Analgesics (opioid)**

Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. The specific antidote naloxone is indicated if there is coma or bradypnoea. Since naloxone has a shorter duration of action than many opioids, close monitoring and repeated injections are necessary according to the respiratory rate and depth of coma. When repeated administration of naloxone is required, it can be given by continuous intravenous infusion instead and the rate of infusion adjusted according to vital signs. The effects of some opioids, such as buprenorphine, are only partially reversed by naloxone. Dextropropoxyphene and methadone have such as buprenorphine, are only partially reversed by naloxone. Dextropropoxyphene and methadone have according to vital signs. The effects of some opioids, such as buprenorphine, are only partially reversed by naloxone. Dextropropoxyphene and methadone have

**NALOXONE HYDROCHLORIDE**

**Indications** overdosage with opioids; reversal of postoperative respiratory depression and reversal of neonatal respiratory and CNS depression resulting from opioid administration to mother during labour (section 15.1.7)

**Cautions** physical dependence on opioids; cardiac irritability; naloxone is short-acting, see notes above

**Pregnancy** section 15.1.7

**Breast-feeding** section 15.1.7

**Side-effects** section 15.1.7

**Dose**
- **By intravenous injection**, 400 micrograms; if no response after 1 minute, give 800 micrograms, and if still no response after another 1 minute, repeat dose of 800 micrograms; if still no response, give 2 mg (4 mg may be required in a seriously poisoned patient), then review diagnosis; further doses may be required if respiratory function deteriorates; **CHILD** under 12 years 100 micrograms/kg (max 2 mg); if no response, repeat at intervals of 1 minute to a total max. 2 mg, then review diagnosis; further doses may be required if respiratory function deteriorates
- **By subcutaneous or intramuscular injection**, ADULT and **CHILD** dose as for intravenous injection but use only if intravenous route not feasible (onset of action slower); for **intramuscular injection** in a non-medical setting, see under preparations
- **By continuous intravenous infusion** using an infusion pump, ADULT and **CHILD**, rate adjusted according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per minute)

  **Note** The initial resuscitative intravenous injection dose is that which maintained satisfactory ventilation for at least 15 minutes

**Important** Doses used in acute opioid overdosage may not be appropriate for the management of opioid-induced respiratory depression and sedation in those receiving palliative care and in chronic opioid use; see also section 15.1.7 for management of postoperative respiratory depression

1. **Naloxone** (Non-proprietary) (PhA)

**Injection**, naloxone hydrochloride 20 micrograms/mL, net price 2-mL amp = £5.50; 400 micrograms/mL, 1-mL amp = £4.10; 1 mg/mL, 2-mL prefilled syringe = £18.00

**Minijet** **Naloxone** (UCB Pharma) (PhA)

**Injection**, naloxone hydrochloride 400 micrograms/mL, net price 1-mL disposable syringe = £20.40, 2-mL disposable syringe = £12.96, 5-mL disposable syringe = £20.40

1. **Prenaxod** (Martindale) (PhA)

**Injection**, naloxone hydrochloride 1 mg/mL, net price 2-mL prefilled syringe = £18.00

**Electrolytes** Na+ < 0.5 mmol/L/syringe

**Dose by intramuscular injection** (into deltoid region or anterolateral thigh) in a non-medical setting, ADULT 400 micrograms repeated at intervals of 2–3 minutes (in subsequent resuscitation cycles if patient not breathing normally) until consciousness regained, breathing normally, medical assistance available, or contents of syringe used up

**Antidepressants**

**Tricyclic and related antidepressants** Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. Metabolic acidosis may complicate severe poisoning; delirium with confusion, agitation, and visual and auditory hallucinations are common during recovery.

1. **PhA** restriction does not apply where administration is for saving life in emergency
Assessment in hospital is strongly advised in case of poisoning by *tricyclic and related antidepressants* but symptomatic treatment can be given before transfer. Supportive measures to ensure a clear airway and adequate ventilation during transfer are mandatory. Intravenous lorazepam or intravenous diazepam (preferably in emulsion form) may be required to treat convulsions. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Although arrhythmias are worrying, some will respond to correction of hypoxia and acidosis. The use of anti-arrhythmic drugs is best avoided, but intravenous infusion of sodium bicarbonate can arrest arrhythmias or prevent them in those with an extended QRS duration. Diazepam given by mouth is usually adequate to sedate delirious patients but large doses may be required.

**Selective serotonin re-uptake inhibitors (SSRIs)** Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

Management of SSRI poisoning is supportive. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Convulsions can be treated with lorazepam, diazepam, or buccal midazolam [unlicensed use] (see p. 34). Contact the National Poisons Information Service for the management of hyperthermia or the serotonin syndrome.

**Antimalarials**

Overdosage with quinine, chloroquine, or hydroxychloroquine is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

**Beta-blockers**

Therapeutic overdosages with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerated. These complications are most likely in patients with conduction system disorders or impaired myocardial function. Bradycardia is the most common arrhythmia caused by beta-blockers, but sotalol may induce ventricular tachyarrhythmias (sometimes of the torsade de pointes type). The effects of massive overdose can vary from one beta-blocker to another; propranolol overdose in particular may cause coma and convulsions.

**Acute massive overdose** must be managed in hospital and expert advice should be obtained. Maintenance of a clear airway and adequate ventilation is mandatory. An intravenous injection of atropine is required to treat bradycardia (3 mg for an adult, 40 micrograms/kg [max. 3 mg]) for a child). Cardiogenic shock unresponsive to atropine is probably best treated with an intravenous injection of glucagon 2–10 mg (child 50–150 micrograms/kg, max. 10 mg) [unlicensed indication and dose] in glucose 5% (with precautions to protect the airway in case of vomiting) followed by an intravenous infusion of 50 micrograms/kg/hour. If glucagon is not available, intravenous isoprenaline (available from ‘special-order’ manufacturers or specialty importing companies, see p. 1104) is an alternative. A cardiac pace-maker can be used to increase the heart rate.

**Calcium-channel blockers**

Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. Verapamil and diltiazem have a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole. The dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

Activated charcoal should be considered if the patient presents within 1 hour of overdose with a calcium-channel blocker; repeated doses of activated charcoal are considered if a modified-release preparation is involved. In patients with significant features of poisoning, calcium chloride or calcium gluconate (section 9.5.1.1) is given by injection; atropine is given to correct symptomatic bradycardia. In severe cases, an insulin and glucose infusion may be required in the management of hypotension and myocardial failure. For the management of hypotension, the choice of inotropic support depends on whether hypotension is secondary to vasodilatation or to myocardial depression—advice should be sought from the National Poisons Information Service (p. 33).

**Hypnotics and anxiolytics**

**Benzodiazepines** Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. Activated charcoal can be given within 1 hour of ingesting a significant quantity of benzodiazepine, provided the patient is awake and the airway is protected. Benzodiazepines potentiate the effects of other central nervous system depressants taken concomitantly. Use of the benzodiazepine antagonist flumazenil [unlicensed indication] can be hazardous, particularly in mixed overdoses involving tricyclic antidepressants or in benzodiazepine-dependent patients. Flumazenil may prevent the need for ventilation, particularly in patients with severe respiratory disorders; it should be used on expert advice only and not as a diagnostic test in patients with a reduced level of consciousness.

**Iron salts**

Iron poisoning in childhood is usually accidental. The symptoms are nausea, vomiting, abdominal pain, diarrhoea, haematomesis, and rectal bleeding. Hypotension and hepatocellular necrosis can occur later. Coma, shock, and metabolic acidosis indicate severe poisoning.

Advice should be sought from the National Poisons Information Service if a significant quantity of iron has been ingested within the previous hour. Mortality is reduced by intensive and specific therapy with *desferrioxamine*, which chelates iron. The serum-
iron concentration is measured as an emergency and intravenous desferrioxamine given to chelate absorbed iron in excess of the expected iron binding capacity. In **severe toxicity** intravenous desferrioxamine should be given immediately without waiting for the result of the serum-iron measurement.

**DESFERRIOXAMINE MESILATE**

(Desferrioxamine Mesilate)

**Indications** iron poisoning; chronic iron overload (section 9.1.3)

**Cautions** section 9.1.3

**Renal impairment** section 9.1.3

**Pregnancy** section 9.1.3

**Breast-feeding** section 9.1.3

**Side-effects** section 9.1.3

**Dose**

- By continuous intravenous infusion, **ADULT** and **CHILD** up to 15 mg/kg/hour, reduced after 4–6 hours; max. 80 mg/kg in 24 hours (in severe cases, higher doses on advice from the National Poisons Information Service)

**Preparations** Section 9.1.3

### Lithium

Most cases of lithium intoxication occur as a complication of long-term therapy and are caused by reduced excretion of the drug because of a variety of factors including dehydration, deterioration of renal function, infections, and co-administration of diuretics or NSAIDs (or other drugs that interact). Acute deliberate overdoses may also occur with delayed onset of symptoms (12 hours or more) owing to slow entry of lithium into the tissues and continuing absorption from modified-release formulations.

The early clinical features are non-specific and may include apathy and restlessness which could be confused with mental changes arising from the patient’s depressive illness. Vomiting, diarrhoea, ataxia, weakness, dysarthria, muscle twitching, and tremor may follow. Severe poisoning is associated with convulsions, coma, renal failure, electrolyte imbalance, dehydration, and hypotension.

Therapeutic serum-lithium concentrations are within the range of 0.4–1 mmol/litre; concentrations in excess of 2 mmol/litre are usually associated with serious toxicity and such cases may need treatment with haemodialysis if neurological symptoms or renal failure are present. In acute overdosage much higher serum-lithium concentrations may be present without features of toxicity and all that is usually necessary is to take measures to increase urine output (e.g. by increasing fluid intake but avoiding diuretics). Otherwise, treatment is supportive with special regard to electrolyte balance, renal function, and control of convulsions. Gastric lavage may be considered if it can be performed within 1 hour of ingesting significant quantities of lithium. Whole-bowel irrigation should be considered for significant ingestion, but advice should be sought from the National Poisons Information Service, p. 33.

### Phenothiazines and related drugs

Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. Dystonic reactions can occur with therapeutic doses (particularly with prochlorperazine and trifluoperazine), and convulsions may occur in severe cases. Arrhythmias may respond to correction of hypoxia, acidosis, and other biochemical abnormalities, but specialist advice should be sought if arrhythmias result from a prolonged QT interval; the use of some anti-arrhythmic drugs can worsen such arrhythmias. Dystonic reactions are rapidly abolished by injection of drugs such as procyclidine (section 4.9.2) or diazepam (section 4.8.2, emulsion preferred).

### Second-generation antipsychotic drugs

Features of poisoning by second-generation antipsychotic drugs (section 4.2.1) include drowsiness, convulsions, extrapyramidal symptoms, hypotension, and ECG abnormalities (including prolongation of the QT interval). Management is supportive. Activated charcoal can be given within 1 hour of ingesting a significant quantity of a second-generation antipsychotic drug.

### Stimulants

**Amphetamines** Amphetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. The early stages can be controlled by diazepam or lorazepam; advice should be sought from the National Poisons Information Service (p. 33) on the management of hypertension. Later, rapid spiking, anticonvulsants, and artificial respiration may be needed.

**Cocaine** Cocaine stimulates the central nervous system, causing agitation, dilated pupils, tachycardia, hypertension, hallucinations, hyperthermia, hypertonia, and hyperreflexia; cardiac effects include chest pain, myocardial infarction, and arrhythmias.

Initial treatment of cocaine poisoning involves intravenous administration of diazepam to control agitation and cooling measures for hyperthermia (see Body temperature, p. 33); hypertension and cardiac effects require specific treatment and expert advice should be sought.

**Ecstasy** Ecstasy (methyleneoxymethamphetamine, MDMA) may cause severe reactions, even at doses that were previously tolerated. The most serious effects are delirium, coma, convulsions, ventricular arrhythmias, hyperthermia, rhabdomyolysis, acute renal failure, acute hepatitis, disseminated intravascular coagulation, adult respiratory distress syndrome, hyperreflexia, hypotension and intracerebral haemorrhage; hyponatraemia has also been associated with ecstasy use.

Treatment of methyleneoxymethamphetamine poisoning is supportive, with diazepam to control severe agitation or persistent convulsions and close monitoring including ECG. Self-induced water intoxication should be considered in patients with ecstasy poisoning.

‘Liquid ecstasy’ is a term used for sodium oxybate (gamma-hydroxybutyrate, GHB), which is a sedative.

### Theophylline

Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore
be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

Repeated doses of activated charcoal can be used to eliminate theophylline even if more than 1 hour has elapsed after ingestion and especially if a modified-release preparation has been taken (see also under Active Elimination Techniques, p. 34). Ondansetron (section 4.6) may be effective for severe vomiting that is resistant to other antiemetics [unlicensed indication]. Hypokalaemia is corrected by intravenous infusion of potassium chloride (section 9.2.1) and may be so severe as to require 60 mmol/hour (high doses require ECG monitoring). Convulsions should be controlled by intravenous administration of lorazepam or diazepam (see Convulsions, p. 34). Sedation with diazepam may be necessary in agitated patients.

Provided the patient does not suffer from asthma, a short-acting beta-blocker (section 2.4) can be administered intravenously to reverse severe tachycardia, hypokalaemia, and hyperglycaemia.

**Other poisons**

Consult either the National Poisons Information Service day and night or TOXBASE, see p. 33.

**Cyanides**

Oxygen should be administered to patients with cyanide poisoning. The choice of antidote depends on the severity of poisoning, certainty of diagnosis, and the cause. Dicobalt edetate is the antidote of choice when there is a strong clinical suspicion of severe cyanide poisoning. Dicobalt edetate itself is toxic, associated with anaphylactoid reactions, and is potentially fatal if administered in the absence of cyanide poisoning. A regimen of sodium nitrite followed by sodium thiosulfate is an alternative if dicobalt edetate is not available.

Hydroxocobalamin (Cyanokit®—no other preparation of hydroxocobalamin is suitable) can be considered for use in victims of smoke inhalation who show signs of significant cyanide poisoning.

**DICOBALT EDETATE**

**Indications** severe poisoning with cyanides

**Cautions** owing to toxicity to be used only for definite cyanide poisoning when patient tending to lose, or has lost, consciousness; not to be used as a precautionary measure

**Side-effects** hypotension, tachycardia, and vomiting; anaphylactoid reactions including facial and laryngeal oedema and cardiac abnormalities

**Dose**

- By intravenous injection, ADULT 300 mg over 1 minute (5 minutes if condition less serious) followed immediately by 50 mL of glucose intravenous infusion 50%; if response inadequate a second dose of both may be given, but risk of cobalt toxicity; CHILD consult the National Poisons Information Service

**HYDROXOCOBALAMIN**

**Indications** poisoning with cyanides (see notes above)

**Side-effects** gastro-intestinal disturbances, transient hypertension, peripheral oedema, dyspnœa, throat disorders, hot flush, dizziness, headache, restlessness, memory impairment, red coloration of urine, lymphocytopenia, eye disorders, pustular rashes, pruritus, reversible red coloration of skin and mucous membranes

**Dose**

- By intravenous infusion, ADULT 5 g over 15 minutes; a second dose of 5 g can be given over 15 minutes–2 hours depending on severity of poisoning and patient stability; CHILD under 18 years with body-weight 5 kg and over, 70 mg/kg (max. 5 g) over 15 minutes; a second dose of 70 mg/kg (max. 5 g) can be given over 15 minutes–2 hours depending on severity of poisoning and patient stability

Cyanokit® (Swedish Orphan) Intravenous infusion, powder for reconstitution, hydroxocobalamin, net price 5-g vial = £772.00

Note Deep red colour of hydroxocobalamin may interfere with laboratory tests (see Side-effects, above) and haemodialysis

**SODIUM NITRITE**

**Indications** poisoning with cyanides (used in conjunction with sodium thiosulfate)

**Side-effects** flushing and headache due to vasodilatation

**Dose**

- By intravenous injection over 5–20 minutes (as sodium nitrite injection 30 mg/mL), 300 mg; CHILD 4–10 mg/kg (max. 300 mg)

**SODIUM THIOSULFATE**

**Indications** in conjunction with sodium nitrite for cyanide poisoning

**Dose**

- By intravenous injection, ADULT 300 mg over 1 minute (5 minutes if condition less serious) followed immediately by 50 mL of glucose intravenous infusion 50%; if response inadequate a second dose of both may be given, but risk of cobalt toxicity; CHILD consult the National Poisons Information Service

1. *10 mg/kg (max. 300 mg) restriction does not apply where administration is for saving life in emergency*
Emergency treatment of poisoning

Ethylene glycol and methanol

Fomepizole (available from 'special-order' manufacturers or specialist importing companies, see p. 1104) is the treatment of choice for ethylene glycol and methanol (methyl alcohol) poisoning. If necessary, ethanol (by mouth or by intravenous infusion) can be used, but with caution. Advice on the treatment of ethylene glycol and methanol poisoning should be obtained from the National Poisons Information Service. It is important to start antidote treatment promptly in cases of suspected poisoning with these agents.

Heavy metals

Heavy metal antidotes include succimer (DMSA) [unlicensed], unithiol (DMPS) [unlicensed], sodium calcium edetate [unlicensed], and dimercaprol. Dimercaprol in the management of heavy metal poisoning has been superseded by other chelating agents. In all cases of heavy metal poisoning, the advice of the National Poisons Information Service should be sought.

Noxious gases

Carbon monoxide Carbon monoxide poisoning is usually due to inhalation of smoke, car exhaust, or fumes caused by blocked flues or incomplete combustion of fuel gases in confined spaces.

Immediate treatment of carbon monoxide poisoning is essential. The person should be moved to fresh air, the airway cleared, and high-flow oxygen given. Oxygen should be supplied through a tight-fitting mask with an inflated face seal. Artificial respiration should be given as necessary and continued until adequate spontaneous breathing starts, or stopped only after persistent and efficient treatment of cardiac arrest has failed. The patient should be admitted to hospital because complications may arise after a delay of hours or days. Cerebral oedema may occur in severe poisoning and is treated with an intravenous infusion of mannitol (section 2.2.5). Referral for hyperbaric oxygen treatment should be discussed with the National Poisons Information Service if the patient is pregnant or in cases of severe poisoning, such as if the patient is or has been unconscious, or has psychiatric or neurological features other than a headache, or has myocardial ischaemia or an arrhythmia, or has a blood carboxyhaemoglobin concentration of more than 20%.

Sulfur dioxide, chlorine, phosgene, ammonia

All of these gases can cause upper respiratory tract and conjunctival irritation. Pulmonary oedema, with severe breathlessness and cyanosis may develop suddenly up to 36 hours after exposure. Death may occur. Patients are kept under observation and those who develop pulmonary oedema are given oxygen. Assisted ventilation may be necessary in the most serious cases.

CS Spray

CS spray, which is used for riot control, irritates the eyes (hence 'tear gas') and the respiratory tract; symptoms normally settle spontaneously within 15 minutes. If symptoms persist, the patient should be removed to a well-ventilated area, and the exposed skin washed with soap and water after removal of contaminated clothing. Contact lenses should be removed and rigid ones washed (soft ones should be discarded). Eye symptoms should be treated by irrigating the eyes with physiological saline (or water if saline is not available) and advice sought from an ophthalmologist. Patients with features of severe poisoning, particularly respiratory complications, should be admitted to hospital for symptomatic treatment.

Nerve agents

Treatment of nerve agent poisoning is similar to organophosphorus insecticide poisoning (see below), but advice must be sought from the National Poisons Information Service. The risk of cross-contamination is significant; adequate decontamination and protective clothing for healthcare personnel are essential. In emergencies involving the release of nerve agents, kits (‘NAAS pods’) containing pralidoxime can be obtained through the Ambulance Service from the National Blood Service (or the Welsh Blood Service in South Wales or designated hospital pharmacies in Northern Ireland and Scotland—see TOXBASE for list of designated centres).

The National Poisons Information Service (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night.

Pesticides

Organophosphorus insecticides

Organophosphorus insecticides are usually supplied as powders or dissolved in organic solvents. All are absorbed through the skin and intact skin as well as through the gut and inhibit cholinesterase activity, thereby prolonging and intensifying the effects of acetylcholine. Toxicity between different compounds varies considerably, and onset may be delayed after skin exposure.

Acetylcholinesterase inhibitors

Acetylcholinesterase inhibitors are used in organophosphorus poisoning. They are not antagonists and do not reverse the effects of the cholinesterase inhibitor. They are supplied as pralidoxime chloride for injection and as atropine sulfate for injection. Atropine is a muscarinic antagonist that reverses the effects of muscarinic stimulation. It is therefore used in organophosphorus poisoning to control the salivary, lacrimal, and bronchial secretions.

Pralidoxime chloride, a cholinesterase reactivator, is used as an adjunct to atropine in moderate or severe poisoning. It improves muscle tone within 30 minutes of administration. Pralidoxime chloride is continued until the patient has not required atropine for 12 hours. Pralidoxime chloride can be obtained from designated centres, the names of which are held by the National Poisons Information Service (see p. 33).

Pralidoxime chloride can be obtained from designated centres, the names of which are held by the National Poisons Information Service (see p. 33).
Pralidoxime chloride

**Indications**
adjunct to atropine in the treatment of poisoning by organophosphorus insecticide or nerve agent.

**Cautions**
myasthenia gravis

**Contra-indications**
poisoning with carbamates or with organophosphorus compounds without anti-cholinesterase activity.

**Renal impairment**
use with caution.

**Side-effects**
drowsiness, dizziness, disturbances of vision, nausea, tachycardia, headache, hyperventilation, and muscular weakness.

**Dose**
- By intravenous infusion, **Adult** and **Child** initially 30 mg/kg over 20 minutes, followed by 8 mg/kg/hour; usual max. 12 g in 24 hours.

Note: The loading dose may be administered by *intravenous injection* (diluted to a concentration of 50 mg/mL with water for injections) over at least 5 minutes if pulmonary oedema is present or if it is not practical to administer an intravenous infusion; pralidoxime chloride doses in BNF may differ from those in product literature.

1Pralidoxime chloride (PRALIDOXYME CHLORIDE)

**Injection**, powder for reconstitution, pralidoxime chloride 1 g/vial.
Available as Protopam® (from designated centres for organophosphorus insecticide poisoning or from the National Blood Service (or Welsh Ambulance Services for Mid West and South East Wales)—see TOXBASE for list of designated centres).

Snake bites and animal stings

**Snake bites**
Envenoming from snake bite is uncommon in the UK. Many exotic snakes are kept, some illegally, but the only indigenous venomous snake is the adder (*Viper aterus*). The bite may cause local and systemic effects. Local effects include pain, swelling, bruising, and tender enlargement of regional lymph nodes. Systemic effects include early anaphylactic symptoms (transient hypotension with syncope, angio-oedema, urticaria, abdominal colic, diarrhoea, and vomiting), with later persistent or recurrent hypotension, ECG abnormalities, spontaneous systemic bleeding, coagulopathy, adult respiratory distress syndrome, and acute renal failure. Fatal envenoming is rare but the potential for severe envenoming must not be underestimated.

Early anaphylactic symptoms should be treated with **adrenaline (epinephrine)** (section 3.4.3). Indications for antivenom treatment include *systemic envenoming*, especially hypotension (see above), ECG abnormalities, vomiting, haemostatic abnormalities, and marked local envenoming such that after bites on the hand or foot, swelling extends beyond the wrist or ankle within 4 hours of the bite. For both *adults* and *children*, the contents of one vial (10 mL) of *European viper venom antiserum* (to order, email immform@dh.gsi.gov.uk) is given by *intravenous injection over 10–15 minutes* or by *intravenous infusion over 30 minutes* after diluting in sodium chloride 0.9% (use 5 mL diluent/kg body-weight). The dose can be repeated after 1–2 hours if symptoms of *systemic envenoming* persist. However, for those patients who present with clinical features of *severe envenoming* (e.g. shock, ECG abnormalities, or local swelling that has advanced from the foot to above the knee or from the hand to above the elbow within 2 hours of the bite), an initial dose of 2 vials (20 mL) of the antiserum is recommended; if symptoms of *systemic envenoming* persist contact the National Poisons Information Service. Adrenaline (epinephrine) injection must be immediately to hand for treatment of anaphylactic reactions to the antivenom (for the management of anaphylaxis, see section 3.4.3).

Antivenom is available for bites by certain foreign snakes, spiders, stings by scorpions and fish. For information on identification, management, and for supply in an emergency, telephone the National Poisons Information Service. Whenever possible the TOXBASE entry should be read, and relevant information collected, before telephoning the National Poisons Information Service (see p. 33).

**Insect stings**
Stings from ants, wasps, hornets, and bees cause local pain and swelling but seldom cause severe direct toxicity unless many stings are inflicted at the same time. If the sting is in the mouth or on the tongue local swelling may threaten the upper airway. The stings from these insects are usually treated by cleaning the area with a topical antiseptic. Bee stings should be removed as quickly as possible. Anaphylactic reactions require immediate treatment with intramuscular **adrenaline (epinephrine)**; self-administered intramuscular adrenaline (e.g. EpiPen®) is the best first-aid treatment for patients with severe hypersensitivity. An inhaled bronchodilator should be used for asthmatic reactions. For the management of anaphylaxis, see section 3.4.3. A short course of an oral *antihistamine* or a topical *corticosteroid* may help to reduce inflammation and relieve itching. A vaccine containing extracts of bee and wasp venom can be used to reduce the risk of anaphylaxis and systemic reactions in patients with systemic hypersensitivity to bee or wasp stings (section 3.4.2).

**Marine stings**
The severe pain of weeverfish (*Trachinias vipera*) and Portuguese man-o’-war can be relieved by immersing the stung area immediately in uncomfortably hot, but not scalding, water (not more than 45°C). People stung by jellyfish and Portuguese man-o’-war around the UK coast should be removed from the sea as soon as possible. Adherent tentacles should be lifted off carefully (wearing gloves or using tweezers) or washed off with seawater. Alcoholic solutions, including suntan lotions, should not be applied because they can cause further discharge of stinging hairs. Ice packs can be used to reduce pain.

**Note**.
1. BNF restriction does not apply where administration is for saving life in emergency.
1 Gastro-intestinal system

1.1 Dyspepsia and gastro-oesophageal reflux disease
  1.1.1 Antacids and simeticone
  1.1.2 Compound alginates and proprietary indigestion preparations

1.2 Antispasmodics and other drugs altering gut motility

1.3 Antisecretory drugs and mucosal protectants
  1.3.1 H2-receptor antagonists
  1.3.2 Selective antimuscarinics

  1.9.3 Aprotinin
  1.9.4 Pancreatin

1.10 This chapter also includes advice on the drug management of the following:
  Clostridium difficile infection, p. 62
  constipation, p. 68
  Crohn’s disease, p. 60
  diverticular disease, p. 62
  food allergy, p. 68
  Helicobacter pylori infection, p. 50
  irritable bowel syndrome, p. 62
  NSAID-associated ulcers, p. 51
  ulcerative colitis, p. 60

Dyspepsia
Dyspepsia covers upper abdominal pain, fullness, early satiety, bloating, and nausea. It can occur with gastric and duodenal ulceration (section 1.3) and gastric cancer but most commonly it is of uncertain origin.

Urgent endoscopic investigation is required if dyspepsia is accompanied by ‘alarm features’ (e.g. bleeding, dysphagia, recurrent vomiting, or weight loss). Urgent investigation should also be considered for patients over 55 years with unexplained, recent-onset dyspepsia that has not responded to treatment.

Patients with dyspepsia should be advised about lifestyle changes (see Gastro-oesophageal reflux disease, below). Some medications may cause dyspepsia—these should be stopped, if possible. Antacids may provide some symptomatic relief.

If symptoms persist in uninvestigated dyspepsia, treatment involves a proton pump inhibitor (section 1.3.5) for up to 4 weeks. A proton pump inhibitor can be used intermittently to control symptoms long term. Patients with uninvestigated dyspepsia, who do not respond to an initial trial with a proton pump inhibitor, should be tested for Helicobacter pylori and given eradication therapy (section 1.3) if H. pylori is present. Alternatively, particularly in populations where H. pylori infection is more likely, the ‘test and treat’ strategy for H. pylori can be used before a trial with a proton pump inhibitor.
If *H. pylori* is present in patients with functional (investigated, non-ulcer) dyspepsia, eradication therapy should be provided. If symptoms persist, treatment with either a proton pump inhibitor (section 1.3.5) or a histamine H₂-receptor antagonist (section 1.3.1) can be given for 4 weeks. These antisecretory drugs can be used intermittently to control symptoms long term. However, most patients with functional dyspepsia do not benefit symptomatically from *H. pylori* eradication therapy or antisecretory drugs.

**Gastro-oesophageal reflux disease**

Gastro-oesophageal reflux disease (including non-erosive gastro-oesophageal reflux and erosive oesophagitis) is associated with heartburn, acid regurgitation, and sometimes, difficulty in swallowing (dysphagia); oesophageal inflammation (oesophagitis), ulceration, and stricture formation may occur and there is an association with asthma.

The management of gastro-oesophageal reflux disease includes drug treatment, lifestyle changes and, in some cases, surgery. Initial treatment is guided by the severity of symptoms and treatment is then adjusted according to response. The extent of healing depends on the severity of the disease, the treatment chosen, and the duration of therapy.

Patients with gastro-oesophageal reflux disease should be advised about lifestyle changes (avertance of excess alcohol and of aggravating foods such as fats); other measures include weight reduction, smoking cessation, and raising the head of the bed.

For mild symptoms of gastro-oesophageal reflux disease, initial management may include the use of antacids and alginates. Alginate-containing antacids can form a ‘raft’ that floats on the surface of the stomach contents to reduce reflux and protect the oesophageal mucosa. Histamine H₂-receptor antagonists (section 1.3.1) may relieve symptoms and permit reduction in antacid consumption. However, proton pump inhibitors (section 1.3.5) provide more effective relief of symptoms than H₂-receptor antagonists. When symptoms abate, treatment is titrated down to a level which maintains remission (e.g. by giving treatment intermittently).

For severe symptoms of gastro-oesophageal reflux disease or for patients with a proven or severe pathology (e.g. oesophagitis, oesophageal ulceration, oesophagopharyngeal reflux, Barrett’s oesophagus), initial management involves the use of a proton pump inhibitor (section 1.3.5); patients need to be reassessed if symptoms persist despite treatment for 4–6 weeks with a proton pump inhibitor. When symptoms abate, treatment is titrated down to a level which maintains remission (e.g. by reducing the dose of the proton pump inhibitor or by giving it intermittently, or by substituting treatment with a histamine H₂-receptor antagonist). However, for endoscopically confirmed erosive, ulcerative, or strictureting disease, or Barrett’s oesophagus, treatment with a proton pump inhibitor usually needs to be maintained at the minimum effective dose.

**Pregnancy**

If dietary and lifestyle changes (see notes above) fail to control gastro-oesophageal reflux disease in pregnancy, an antacid (section 1.1.2) or an alginate (section 1.1.2) can be used. If this is ineffective, ranitidine (section 1.3.1) can be tried. Omeprazole (section 1.3.5) is reserved for women with severe or complicated reflux disease.

**Children**

Gastro-oesophageal reflux disease is common in infancy but most symptoms resolve without treatment between 12 and 18 months of age. In infants, mild or moderate reflux without complications can be managed initially by changing the frequency and volume of feed; a feed thickener or thickened formula feed can be used (with advice of a dietitian—see Appendix 2 for suitable products). If necessary, a suitable alginate-containing preparation can be used instead of thickened feeds. For older children, lifestyle changes similar to those for adults (see above) may be helpful followed if necessary by treatment with an alginate-containing preparation.

Children who do not respond to these measures or who have problems such as respiratory disorders or suspected oesophagitis need to be referred to hospital, an H₂-receptor antagonist (section 1.3.1) may be needed to reduce acid secretion. If the oesophagitis is resistant to H₂-receptor blockade, the proton pump inhibitor omeprazole (section 1.3.5) can be tried.
doses also cause hypercalcaemia and alkalosis, and can precipitate the milk-alkali syndrome.

Simeticone (activated dimeticone) is added to an antacid as an antifoaming agent to relieve flatulence. These preparations may be useful for the relief of hiccup in palliative care. Alginites, added as protectants, may be useful in gastro-oesophageal reflux disease (section 1.1 and section 1.1.2). The amount of additional ingredient or antacid in individual preparations varies widely, as does their sodium content, so that preparations may not be freely interchangeable.

See also section 1.3 for drugs used in the treatment of peptic ulceration.

Hepatic impairment In patients with fluid retention, avoid antacids containing large amounts of sodium. Avoid antacids that cause constipation because this can precipitate coma. Avoid antacids containing magnesium salts in hepatic coma if there is a risk of renal failure.

Renal impairment In patients with fluid retention, avoid antacids containing large amounts of sodium. There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics). Antacids containing magnesium salts should be avoided or used at a reduced dose because there is an increased risk of toxicity.

Interactions Antacids should preferably not be taken at the same time as other drugs since they may impair absorption. Antacids may also damage enteric coatings designed to prevent dissolution in the stomach. See also Appendix 1 (antacids, calcium salts).

Low Na⁺
The words ‘low Na⁺’ added after some preparations indicate a sodium content of less than 1 mmol per tablet or 10-mL dose.

Aluminium- and magnesium-containing antacids

Aluminium Hydroxide

Indications
dyspepsia; hyperphosphataemia (section 9.5.2.2)

Cautions see notes above; interactions: Appendix 1 (antacids)

Contra-indications
hypophosphataemia

Hepatic impairment see notes above

Renal impairment see notes above

Side-effects
diarrhoea; belching due to liberated carbon dioxide

Mucogel

Aromatic Magnesium Carbonate Mixture, BP

Magnesium Carbonate

Indications
dyspepsia

Cautions see notes above; interactions: Appendix 1 (antacids)

Contra-indications
hypophosphataemia

Hepatic impairment see notes above

Renal impairment see notes above; magnesium carbonate mixture has a high sodium content

Side-effects
diarrhoea; belching due to liberated carbon dioxide

Aromatic Magnesium Carbonate Mixture, BP

Magnesium Trisilicate

Indications
dyspepsia

Cautions see notes above; interactions: Appendix 1 (antacids)

Contra-indications
hypophosphataemia

Hepatic impairment see notes above

Renal impairment see notes above; magnesium trisilicate mixture has a high sodium content

Side-effects
diarrhoea; belching due to liberated carbon dioxide; silica-based renal stones reported on long-term treatment

Mucogel

Magnesium Trisilicate Tablets, Compound, BP

Magnesium Trisilicate

Indications
dyspepsia

Cautions see notes above; interactions: Appendix 1 (antacids)

Contra-indications
hypophosphataemia

Hepatic impairment see notes above

Renal impairment see notes above

Side-effects
diarrhoea; belching due to liberated carbon dioxide; silica-based renal stones reported on long-term treatment

Mucogel

Magnesium Trisilicate Tablets, Compound, BP

Magnesium Trisilicate

Indications
dyspepsia

Cautions see notes above; interactions: Appendix 1 (antacids)

Contra-indications
hypophosphataemia

Hepatic impairment see notes above

Renal impairment see notes above

Side-effects
diarrhoea; belching due to liberated carbon dioxide; silica-based renal stones reported on long-term treatment

Mucogel

Magnesium Trisilicate Tablets, Compound, BP

Magnesium Trisilicate

Indications
dyspepsia

Cautions see notes above; interactions: Appendix 1 (antacids)

Contra-indications
hypophosphataemia

Hepatic impairment see notes above

Renal impairment see notes above

Side-effects
diarrhoea; belching due to liberated carbon dioxide; silica-based renal stones reported on long-term treatment

Mucogel

Magnesium Trisilicate Tablets, Compound, BP

Magnesium Trisilicate

Indications
dyspepsia

Cautions see notes above; interactions: Appendix 1 (antacids)

Contra-indications
hypophosphataemia

Hepatic impairment see notes above

Renal impairment see notes above

Side-effects
diarrhoea; belching due to liberated carbon dioxide; silica-based renal stones reported on long-term treatment

Mucogel

Magnesium Trisilicate Tablets, Compound, BP

Magnesium Trisilicate

Indications
dyspepsia

Cautions see notes above; interactions: Appendix 1 (antacids)

Contra-indications
hypophosphataemia

Hepatic impairment see notes above
**Aluminium-magnesium complexes**

**HYDROTALCITE**  
Aluminium magnesium carbonate hydroxide hydrate

**Indications**  
dyspepsia

**Cautions**  
see notes above; interactions: Appendix 1 (antacids)

**Hepatic impairment**  
see notes above

**Renal impairment**  
see notes above

**Side-effects**  
see notes above

**With simeticone**

**Altacite Plus®**  
see notes above

**Antacid preparations containing simeticone**

**Altacite Plus®**  
(Peckforton)  
**Suspension**, sugar-free, co-simalcite 125/500 (simeticone 125 mg, hydrocaltite 500 mg)/5 mL (low Na⁺). Net price 500 mL = £3.20  
**Dose**  
10 mL between meals and at bedtime when required; **CHILD** 8–12 years 5 mL between meals and at bedtime when required

**Maalox Plus®**  
(Sanofi-Aventis)  
**Suspension**, sugar-free, dried aluminium hydroxide 220 mg, simeticone 25 mg, magnesium hydroxide 195 mg/5 mL (low Na⁺). Net price 500 mL = £3.90  
**Dose**  
5–10 mL 4 times daily (after meals and at bedtime) or when required; **CHILD** under 12 years see **BNF for Children**

**Simeticone alone**

**Simeticone**  
(activated dimeticone) is an antifoaming agent. It is licensed for infantile colic but evidence of benefit is uncertain.

**Dentinox®**  
(DDD)  
**Colic drops** (= emulsion), simeticone 21 mg/2.5-mL dose. Net price 100 mL = £1.73  
**Dose**  
ocolic or wind pains, **NEODATE** and **INFANT** 2.5 mL with or after each feed (max. 6 doses in 24 hours); may be added to bottle feed  
**Note**  
The brand name Dentinox® is also used for other preparations including teething gel

**Infacol®**  
(Forest)  
**Liquid**, sugar-free, simeticone 40 mg/mL (low Na⁺). Net price 50 mL = £2.71. Counselling, use of dropper  
**Dose**  
ocolic or wind pains, **NEODATE** and **INFANT** 0.5–1 mL before feeds

**1.1.2 Compound alginates and proprietary indigestion preparations**

Alginates taken in combination with an antacid increases the viscosity of stomach contents and can protect the oesophageal mucosa from acid reflux. Some alginate-containing preparations form a viscous gel (‘raft’) that floats on the surface of the stomach contents, thereby reducing symptoms of reflux.

Antacids may damage enteric coatings designed to prevent dissolution in the stomach. For interactions, see Appendix 1 (antacids, calcium salts).

**Alginates raft-forming oral suspensions**

The following preparations contain sodium alginate, sodium bicarbonate, and calcium carbonate in a suitable flavoured vehicle, and conform to the specification for Alginate Raft-forming Oral Suspension, BP.

**Acidex®**  
(Pinewood)  
**Liquid**, sugar-free, sodium alginate 250 mg, sodium bicarbonate 133.5 mg, calcium carbonate 80 mg/5 mL. Contains about 3 mmol Na⁺/5 mL. Net price 500 mL (aniseed- or peppermint-flavour) = £2.50  
**Dose**  
10–20 mL after meals and at bedtime; **CHILD** 6–12 years 5–10 mL after meals and at bedtime

**Gaviscon®**  
(Reckitt Benckiser)  
**Suspension**, sugar-free, aniseed- or peppermint flavour, sodium alginate 250 mg, sodium bicarbonate 133.5 mg, calcium carbonate 80 mg/5 mL. Contains 3.1 mmol Na⁺/5 mL. Net price 300 mL = £4.20, 600 mL = £6.89  
**Dose**  
10–20 mL after meals and at bedtime; **CHILD** 6–12 years 5–10 mL after meals and at bedtime

**Peptac®**  
(TEVA UK)  
**Suspension**, sugar-free, sodium bicarbonate 133.5 mg, sodium alginate 250 mg, calcium carbonate 80 mg/5 mL. Contains 3.1 mmol Na⁺/5 mL. Net price 500 mL (aniseed- or peppermint-flavoured) = £1.95  
**Dose**  
10–20 mL after meals and at bedtime; **CHILD** 6–12 years 5–10 mL after meals and at bedtime

**Other compound alginate preparations**

**Gastrocote®**  
(Actavis)  
**Tablets**, alginic acid 200 mg, dried aluminium hydroxide 80 mg, magnesium trisilicate 40 mg, sodium bicarbonate 70 mg. Contains about 1 mmol Na⁺/tablet. Net price 100-tab pack = £3.51  
**Cautions**  
diabetes mellitus (high sugar content)

**Dose**  
**ADULT** and **CHILD** over 6 years, 1–2 tablets chewed 4 times daily (after meals and at bedtime)  
**Liquid**, sugar-free, peach-coloured, dried aluminium hydroxide 80 mg, magnesium trisilicate 40 mg, sodium alginate 220 mg, sodium bicarbonate 70 mg/5 mL. Contains 2.13 mmol Na⁺/5 mL. Net price 500 mL = £2.67  
**Dose**  
5–15 mL 4 times daily (after meals and at bedtime); **CHILD** 6–12 years, 5–10 mL 4 times daily (after meals and at bedtime)

**Gaviscon® Advance**  
(Reckitt Benckiser)  
**Chewable tablets**, sugar-free, sodium alginate 500 mg, potassium bicarbonate 100 mg. Contains 2.25 mmol Na⁺, 1 mmol K⁺/tablet. Net price 60-tab pack (peppermint-flavoured) = £3.07  
**Excipients**  
include aspartame (section 9.4.1)

**Dose**  
**ADULT** and **CHILD** over 12 years, 1–2 tablets to be chewed after meals and at bedtime; **CHILD** 6–12 years, 1 tablet to be chewed after meals and at bedtime (under medical advice only)

**Suspension**, sugar-free, aniseed- or peppermint flavour, sodium alginate 500 mg, potassium bicarbonate 100 mg/5 mL. Contains 2.3 mmol Na⁺, 1 mmol K⁺/5 mL, net price 250 mL = £2.61, 500 mL = £5.21  
**Dose**  
**ADULT** and **CHILD** over 12 years, 5–10 mL after meals and at bedtime; **CHILD** 2–12 years, 2.5–5 mL after meals and at bedtime (under medical advice only)
Gastro-intestinal system

Antimuscarinics

Antimuscarinics (formerly termed ‘anticholinergics’) reduce intestinal motility. They are used for the management of irritable bowel syndrome and diverticular disease. However, their value has not been established and response varies. Other indications for antimuscarinic drugs include arrhythmias (section 2.3.1), asthma and airways disease (section 3.1.2), motion sickness (section 4.6), parkinsonism (section 4.9.2), urinary incontinence (section 7.4.2), mydriasis and cycloplegia (section 11.5), and as an antidote to organophosphorus poisoning (p. 42).

Antimuscarinics that are used for gastro-intestinal smooth muscle spasm include the tertiary amines atropine sulfate and dicycloverine hydrochloride and the quaternary ammonium compounds propantheline bromide and hyoscine butylbromide. The quaternary ammonium compounds are less lipid soluble than atropine and are less likely to cross the blood–brain barrier; they are also less well absorbed from the gastro-intestinal tract.

Dicycloverine hydrochloride has a much less marked antimuscarinic action than atropine and may also have some direct action on smooth muscle. Hyoscine butylbromide is advocated as a gastro-intestinal antispasmodic, but it is poorly absorbed; the injection is useful in endoscopy and radiology. Atropine and the belladonna alkaloids are outmoded treatments, any clinical virtues being outweighed by atropinic side-effects.

Cautions

Antimuscarinics should be used with caution in Down’s syndrome, in children and in the elderly; they should also be used with caution in gastro-oesophageal reflux disease, diarrhoea, ulcerative colitis, autonomic neuropathy, acute myocardial infarction, hypertension, conditions characterised by tachycardia (including hyperthyroidism, cardiac insufficiency, cardiovascular disease, pyrexia, and in individuals susceptible to angle-closure glaucoma. Interactions: Appendix 1 (antimuscarinics).

Contra-indications

Antimuscarinics are contra-indicated in myasthenia gravis (but may be used to decrease muscarinic side-effects of anticholinesterases—section 10.2.1), paralytic ileus, pyloric stenosis, toxic megacolon, and prostatic enlargement.

Side-effects

Side-effects of antimuscarinics include constipation, transient bradycardia (followed by tachycardia, palpitation and arrhythmias), reduced bronchial secretions, urinary urgency and retention, dilatation of the pupils with loss of accommodation, photophobia, dry mouth, flushing and dryness of the skin. Side-effects that occur occasionally include confusion (particularly in the elderly), nausea, vomiting, and giddiness; very rarely, angle-closure glaucoma may occur.

ATROPINE SULFATE

Indications

Symptomatic relief of gastrointestinal disorders characterised by smooth muscle spasms; mydriasis and cycloplegia (section 11.5); premedication (section 15.1.3); see also notes above

Cautions

See notes above

Contra-indications

See notes above

Pregnancy

Manufacturer advises caution

Breast-feeding

Small amount present in milk—manufacturer advises caution; may suppress lactation

Side-effects

See notes above

Dose

0.6–1.2 mg at night

Atropine (Non-proprietary)

Tablets, atropine sulfate 600 micrograms. Net price 28-tab pack = £23.80

DICYCLOVERINE HYDROCHLORIDE

(Dicyclomine hydrochloride)

Indications

Symptomatic relief of gastrointestinal disorders characterised by smooth muscle spasm

Cautions

See notes above

Contra-indications

See notes above; also infants under 6 months

Pregnancy

Not known to be harmful; manufacturer advises use only if essential

Breast-feeding

Avoid—present in milk; apnoea reported in infant

Side-effects

See notes above

Dose

10–20 mg 3 times daily; INFANT 6–24 months 5–10 mg 3–4 times daily, 15 minutes before feeds; CHILD 2–12 years 10 mg 3 times daily

Dicycloverine (Non-proprietary)

Tablets, dicycloverine hydrochloride 10 mg, net price 100-tab pack = £53.75; 20 mg, 84-tab pack = £56.17

Syrup, dicycloverine hydrochloride 10 mg/5 mL, net price 120 mL = £49.74

Note

Dicycloverine hydrochloride can be sold to the public provided that max. single dose is 10 mg and max. daily dose is 60 mg.
**HYOSCINE BUTYLBROMIDE**

**Indications**
symptomatic relief of gastro-intestinal or genito-urinary disorders characterised by smooth muscle spasm; bowel colic and excessive respiratory secretions (see Prescribing in Palliative Care, p. 23)

**Cautions**
see notes above

**Contra-indications**
see notes above

**Pregnancy**
manufacturer advises avoid

**Breast-feeding**
amount too small to be harmful

**Side-effects**
see notes above

**Dose**
- **By mouth** (but poorly absorbed, see notes above), smooth muscle spasm, 20 mg 4 times daily; **CHILD** 6–12 years, 10 mg 3 times daily
- Irritable bowel syndrome, 10 mg 3 times daily, increased if required up to 20 mg 4 times daily
- **By intramuscular or slow intravenous injection**, acute spasm and spasm in diagnostic procedures, 20 mg repeated after 30 minutes if necessary (may be repeated more frequently in endoscopy), max. 100 mg daily; **CHILD** 2–18 years see BNF for Children

**Buscopan** (Boehringer Ingelheim)

- **Tablets**, coated, hyoscine butylbromide 10 mg, net price 56-tab pack = £3.00
- **Note** Hyoscine butylbromide tablets can be sold to the public for medically confirmed irritable bowel syndrome, provided single dose does not exceed 20 mg, daily dose does not exceed 80 mg, and pack does not contain a total of more than 240 mg

- **Injection**, hyoscine butylbromide 20 mg/mL, net price 1 mL amp = 29p

**ALVERINE CITRATE**

**Indications**
adjunct in gastro-intestinal disorders characterised by smooth muscle spasm; dysmenorrhea

**Contra-indications**
paralytic ileus

**Pregnancy**
use with caution

**Breast-feeding**
manufacturers advise avoid—no information available

**Side-effects**
nausea; dyspnoea; headache, dizziness; pruritus, rash; hepatitis also reported

**Dose**
- **ADULT** and **CHILD** over 12 years, 60–120 mg 1–3 times daily

**Spasmonal** (Meda)

- **Capsules**, alverine citrate 60 mg (blue/grey), net price 100-cap pack = £16.45; 120 mg (Spasmonal® Forte, blue/grey), 60-cap pack = £19.42

**MEBEVERINE HYDROCHLORIDE**

**Indications**
adjunct in gastro-intestinal disorders characterised by smooth muscle spasm

**Contra-indications**
paralytic ileus

**Pregnancy**
not known to be harmful—manufacturers advise avoid

**Breast-feeding**
manufacturers advise avoid—no information available

**Side-effects**
allergic reactions (including rash, urticaria, angioedema) reported

**Dose**
- **ADULT** and **CHILD** over 10 years 135–150 mg 3 times daily preferably 20 minutes before meals; **CHILD** under 10 years see BNF for Children

**1**Mebeverine Hydrochloride (Non-proprietary)

- **Tablets**, mebeverine hydrochloride 135 mg, net price 100-tab pack = £5.06. Counselling, administration

- **Oral suspension**, mebeverine hydrochloride (as mebeverine embonate) 50 mg/5 mL, net price 300 mL = £143.43. Counselling, administration

**Colofac** (Abbott Healthcare)

- **Tablets**, s/c, mebeverine hydrochloride 135 mg, net price 100-tab pack = £7.52. Counselling, administration

1. Mebeverine hydrochloride can be sold to the public for symptomatic relief of irritable bowel syndrome provided that max. single dose is 135 mg and max. daily dose is 405 mg; for uses other than symptomatic relief of irritable bowel syndrome provided that max. single dose is 100 mg and max. daily dose is 300 mg

**Other antispasmodics**

Alverine, mebeverine, and peppermint oil are believed to be direct relaxants of intestinal smooth muscle and may relieve pain in irritable bowel syndrome and diverticular disease. They have no serious adverse effects but, like all antispasmodics, should be avoided in paralytic ileus. Peppermint oil occasionally causes heartburn.
1 Antisecretory drugs and mucosal protectants

1.3 Antisecretory drugs and mucosal protectants

1.3.1 H₂-receptor antagonists

1.3.2 Selective antimuscarinics

1.3.3 Chelates and complexes

1.3.4 Prostaglandin analogues

1.3.5 Proton pump inhibitors

Peptic ulceration commonly involves the stomach, duodenum, and lower oesophagus; after gastric surgery it involves the gastro-enterostomy stoma. Healing can be promoted by general measures, stopping smoking and taking antacids and by antisecretory drug treatment, but relapse is common when treatment ceases. Nearly all duodenal ulcers and most gastric ulcers not associated with NSAIDs are caused by Helicobacter pylori.

The management of H. pylori infection and of NSAID-associated ulcers is discussed below.

Helicobacter pylori infection

Eradication of Helicobacter pylori reduces recurrence of gastric and duodenal ulcers and the risk of rebleeding. It also causes regression of most localised gastric mucosa-associated lymphoid-tissue (MALT) lymphomas. The presence of H. pylori should be confirmed before starting eradication treatment. Acid inhibition combined with antibacterial treatment is highly effective in the eradication of H. pylori; reinfection is rare. Antibiotic-associated colitis is an uncommon risk.

For initial treatment, a one-week triple-therapy regimen that comprises a proton pump inhibitor, clarithromycin, and either amoxicillin or metronidazole can be used. However, if a patient has been treated with metronidazole for other infections, a regimen containing a proton pump inhibitor, amoxicillin and clarithromycin is preferred for initial therapy. If a patient has been treated with a macrolide for other infections, a regimen containing a proton pump inhibitor, amoxicillin and metronidazole is preferred for initial therapy. These regimens eradicate H. pylori in about 85% of cases. There is usually no need to continue antisecretory treatment (with a proton pump inhibitor or H₂-receptor antagonist), however, if the ulcer is large, or complicated by haemorrhage or perforation, then antisecretory treatment is continued for a further 3 weeks. Treatment failure usually indicates antibacterial resistance or poor compliance. Resistance to amoxicillin is rare. However, resistance to clarithromycin and metronidazole is common and can develop during treatment. Two-week triple-therapy regimens offer the possibility of higher eradication rates compared to one-week regimens, but adverse effects are common and poor compliance is likely to offset any possible gain.

Two-week dual-therapy regimens using a proton pump inhibitor and a single antibacterial are licensed, but produce low rates of H. pylori eradication and are not recommended.

Tinidazole is also used occasionally for H. pylori eradication as an alternative to metronidazole; tinidazole should be combined with antisecretory drugs and other antibiotics. Routine retesting, to confirm eradication, is not necessary unless the patient has gastric MALT lymphoma or complicated H. pylori associated peptic ulcer.

A two-week regimen comprising a proton pump inhibitor (e.g. omeprazole 20 mg twice daily) plus tripotassium dicitratobismuthate 120 mg four times daily, plus tetracycline 500 mg four times daily, plus metronidazole 400–500 mg three times daily can be used for eradication failure. Alternatively, the patient can be referred for endoscopy and treatment based on the results of culture and sensitivity testing.

For the role of H. pylori eradication therapy in patients starting or taking a NSAID, see NSAID-associated Ulcers, p. 51. For H. pylori eradication in patients with dyspepsia, see also section 1.1.
65 years, those with a history of peptic ulcer disease or complications with a NSAID include those aged over 60 years. Patients at high risk of developing gastro-intestinal side-effects varies between individual NSAIDs (see NSAIDs and Gastro-intestinal Events, p. 703). Whenever possible, the NSAID should be withdrawn if an ulcer occurs.

At high risk of ulceration, a proton pump inhibitor usually produces the most rapid healing; alternatively, the ulcer can be treated with a H2-receptor antagonist or misoprostol. On healing, patients should be tested for H. pylori infection in children has not been established.

**Test for Helicobacter pylori**

13C-Urea breath test kits are available for the diagnosis of gastro-duodenal infection with Helicobacter pylori. The test involves collection of breath samples before and after ingestion of an oral solution of 13C-urea; the samples are sent for analysis by an appropriate laboratory. The test should not be performed within 4 weeks of treatment with an antibacterial or within 2 weeks of treatment with an antisecretory drug. A specific 13C-urea breath test kit for children is available (Helicobacter Test INFAI for children of the age 3–11). However, the appropriateness of testing for H. pylori infection in children has not been established.

### Test for *Helicobacter pylori*

13C-Urea breath test kits are available for the diagnosis of gastro-duodenal infection with *Helicobacter pylori*. The test involves collection of breath samples before and after ingestion of an oral solution of 13C-urea; the samples are sent for analysis by an appropriate laboratory. The test should not be performed within 4 weeks of treatment with an antibacterial or within 2 weeks of treatment with an antisecretory drug. A specific 13C-urea breath test kit for children is available (Helicobacter Test INFAI for children of the age 3–11). However, the appropriateness of testing for *H. pylori* infection in children has not been established.

**diabact UBT**

**Tablets,** 13C-urea 50 mg, net price 1 kit (including 1 tablet, 4 breath-sample containers, straws) = £21.25 (analysis included), 10-kit pack (hosp. only) = £74.50 (analysis not included)

**Helicobacter Test INFAI**

**Oral powder,** 13C-urea 75 mg, net price 1 kit (including 4 breath-sample containers, straws) = £19.75 (spectrometric analysis included), 1 kit (including 2 breath bags) = £19.20 (spectrometric analysis not included), 50-test set = £855.00 (spectrometric analysis included); 45 mg (Helicobacter Test INFAI for children of the age 3–11), 1 kit (including 4 breath-sample containers, straws) = £19.20 (spectrometric analysis included)

**Pylobactell**

**Soluble tablets,** 13C-Urea 100 mg, net price 1 kit (including 6 breath-sample containers, 30-mL mixing and administration vial, straws) = £20.75 (analysis included)

### NSAID-associated ulcers

Gastro-intestinal bleeding and ulceration can occur with NSAID use (section 10.1.1). The risk of serious upper gastro-intestinal side-effects varies between individual NSAIDs (see NSAIDs and Gastro-intestinal Events, p. 704). Whenever possible, the NSAID should be withdrawn if an ulcer occurs.

Patients at high risk of developing gastro-intestinal complications with a NSAID include those aged over 65 years, those with a history of peptic ulcer disease or serious gastro-intestinal complication, those taking other medicines that increase the risk of gastro-intestinal side-effects, or those with serious co-morbidity (e.g. cardiovascular disease, diabetes, renal or hepatic impairment). In those at risk of ulceration, a proton pump inhibitor can be considered for protection against gastric and duodenal ulcers associated with non-selective NSAIDs; a H2-receptor antagonist such as ranitidine given at twice the usual dose or misoprostol are alternatives. Colic and diarrhoea may limit the dose of misoprostol. A combination of a cyclo-oxygenase-2 selective inhibitor with a proton pump inhibitor may be more appropriate for those with a history of upper gastro-intestinal bleeding or 3 or more risk factors for gastro-intestinal ulceration, but see NSAIDs and Cardiovascular Events. p. 703.

NSAID use and *H. pylori* infection are independent risk factors for gastro-intestinal bleeding and ulceration. In patients already taking a NSAID, eradication of *H. pylori* is unlikely to reduce the risk of NSAID-induced bleeding or ulceration. However, in patients with dyspepsia or a history of gastric or duodenal ulcer, who are *H. pylori* positive, and who are about to start long-term treatment with a non-selective NSAID, eradication of *H. pylori* may reduce the overall risk of ulceration.

In a patient who has developed an ulcer, if the NSAID can be discontinued, a proton pump inhibitor usually produces the most rapid healing; alternatively, the ulcer can be treated with a H2-receptor antagonist or misoprostol. On healing, patients should be tested for *H. pylori* and given eradication therapy if *H. pylori* is present (see also Test for Helicobacter pylori, p. 51).

If treatment with a non-selective NSAID needs to continue, the following options are suitable:

- Treat ulcer with a proton pump inhibitor and on healing continue the proton pump inhibitor (dose not normally reduced because asymptomatic ulcer recurrence may occur);
- Treat ulcer with a proton pump inhibitor and on healing switch to misoprostol for maintenance therapy (colic and diarrhoea may limit the dose of misoprostol);
- Treat ulcer with a proton pump inhibitor and switch non-selective NSAID to a cyclo-oxygenase-2 selective inhibitor, but see NSAIDs and Cardiovascular
Events, p. 703; on healing, continuation of the proton pump inhibitor in patients with a history of upper gastro-intestinal bleeding may provide further protection against recurrence.

If treatment with a cyclo-oxygenase-2 selective inhibitor needs to continue, treat ulcer with a proton pump inhibitor; on healing continuation of the proton pump inhibitor in patients with a history of upper gastro-intestinal bleeding may provide further protection against recurrence.

### 1.3.1 H2-receptor antagonists

**Histamine H2-receptor antagonists** heal gastric and duodenal ulcers by reducing gastric acid output as a result of histamine H2-receptor blockade; they are also used to relieve symptoms of gastro-oesophageal reflux disease (section 1.1). H2-receptor antagonists should not normally be used for Zollinger-Ellison syndrome because proton pump inhibitors (section 1.3.5) are more effective.

Maintenance treatment with low doses for the prevention of peptic ulcer disease has largely been replaced in *Helicobacter pylori* positive patients by eradication regimens (section 1.3).

H2-receptor antagonists are used for the treatment of functional dyspepsia (section 1.1). H2-receptor antagonists may be used for the treatment of uninvestigated dyspepsia in patients without alarm features.

H2-receptor antagonist therapy can promote healing of NSAID-associated ulcers (particularly duodenal) (section 1.3).

Treatment with a H2-receptor antagonist has not been shown to be beneficial in haematemesis and melena, but prophylactic use reduces the frequency of bleeding from gastroduodenal erosions in hepatic coma, and possibly in other conditions requiring intensive care. H2-receptor antagonists also reduce the risk of acid aspiration in obstetric patients at delivery (Mendelson’s syndrome).

**Cautions** H2-receptor antagonists might mask symptoms of gastric cancer; particular care is required in patients presenting with ‘alarm features’ (see p. 44), in such cases gastric malignancy should be ruled out before treatment.

**Side-effects** Side-effects of the H2-receptor antagonists include diarrhoea, headache, and dizziness. Rash (including erythema multiforme and toxic epidermal necrolysis) occurs less frequently. Other side-effects reported rarely or very rarely include hepatitis, cholestatic jaundice, bradycardia, psychiatric reactions (including confusion, depression, and hallucinations) particularly in the elderly or the very ill, blood disorders (including leucopenia, thrombocytopenia, and pancytopenia), arthralgia, and myalgia. Gynaecomasia and impotence occur occasionally with cimetidine and there are isolated reports with the other H2-receptor antagonists.

**Interactions** Cimetidine retards oxidative hepatic drug metabolism by binding to microsomal cytochrome P450. It should be avoided in patients stabilised on warfarin, phenytoin, and theophylline (or aminophylline), but other interactions (see Appendix 1) may be of less clinical relevance. Famotidine, nizatidine, and ranitidine do not share the drug metabolism inhibitory properties of cimetidine.

### CIMETIDINE

**Indications** benign gastric and duodenal ulceration, stomal ulcer, reflux oesophagitis, other conditions where gastric acid reduction is beneficial (see notes above and section 1.9.4)

**Cautions** see notes above; **interactions:** Appendix 1 (histamine H2-antagonists) and notes above

**Hepatic impairment** increased risk of confusion; reduce dose

**Renal impairment** reduce dose; 200 mg 4 times daily if eGFR 30–50 mL/minute/1.73 m²; 200 mg 3 times daily if eGFR 15–30 mL/minute/1.73 m²; 200 mg twice daily if eGFR less than 15 mL/minute/1.73 m²; occasional risk of confusion

**Pregnancy** manufacturer advises avoid unless essential

**Breast-feeding** significant amount present in milk—not to be harmful but manufacturer advises avoid

**Side-effects** see notes above; also malaise; less commonly tachycardia; rarely interstitial nephritis; very rarely pancreatitis, galactorrhoea, vasculitis, alopecia

**Dose**
- 400 mg twice daily (with breakfast and at night) or 800 mg at night (benign gastric and duodenal ulceration) for at least 4 weeks (6 weeks in gastric ulceration, 8 weeks in NSAID-associated ulceration); when necessary the dose may be increased to 400 mg 4 times daily; **INFANT** under 1 year 20 mg/kg daily in divided doses has been used; **CHILD** 1–12 years, 25–30 mg/kg daily in divided doses; max. 400 mg 4 times daily

Maintenance. 400 mg at night or 400 mg morning and night
- Reflux oesophagitis, 400 mg 4 times daily for 4–8 weeks
- Prophylaxis of stress ulceration, 200–400 mg every 4–6 hours
- Gastric acid reduction (prophylaxis of acid aspiration; do not use syrup), obstetrics 400 mg at start of labour, then up to 400 mg every 4 hours if required (max. 2.4 g daily); surgical procedures 400 mg 90–120 minutes before induction of general anaesthesia
- Short-bowel syndrome, 400 mg twice daily (with breakfast and at bedtime) adjusted according to response
- To reduce degradation of pancreatic enzyme supplements, 0.8–1.6 g daily in 4 divided doses 1–1½ hours before meals

**Cimetidine (Non-proprietary)**

- Tablets, cimetidine 200 mg, net price 60-tab pack = £5.92; 400 mg, 60-tab pack = £1.78; 800 mg, 30-tab pack = £11.13
- Oral solution, cimetidine 200 mg/5 mL, net price 300 mL = £14.28

**Excipients** may include propylene glycol (see Excipients, p. 2)

1. Cimetidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks’ supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity (max. single dose 200 mg, max. daily dose 800 mg), and for the prophylactic management of nocturnal heartburn (single night-time dose 100 mg)
BNF 68

FAMOTIDINE

Indications see under Dose

Cautions see notes above; interactions: Appendix 1 (histamine H2-antagonists) and notes above

Renal impairment use normal dose every 36–48 hours or use half normal dose if eGFR less than 50 mL/minute/1.73 m2; seizures reported very rarely

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk

Breast-feeding present in milk—not known to be harmful but manufacturer advises avoid

Side-effects see notes above; also constipation; less commonly dry mouth, nausea, vomiting, flatulence, taste disorders, anorexia, fatigue; very rarely chest tightness, interstitial pneumonia, seizures, paraesthesia

Dose

Benign gastric and duodenal ulceration, treatment, 40 mg at night for 4–8 weeks; maintenance (duodenal ulceration), 20 mg at night

Reflux oesophagitis, 20–40 mg twice daily for 6–12 weeks; maintenance, 20 mg twice daily

CHILD not recommended

Famotidine (Non-proprietary) Form

Tablets, famotidine 20 mg, net price 28-tab pack = £20.98; 40 mg, 28-tab pack = £37.13

NIZATIDINE

Indications see under Dose

Cautions see notes above; also avoid rapid intravenous injection (risk of arrhythmias and postural hypotension); interactions: Appendix 1 (histamine H2-antagonists) and notes above

Hepatic impairment manufacturer advises caution

Renal impairment use half normal dose if eGFR 20–50 mL/minute/1.73 m2; use one-quarter normal dose if eGFR less than 20 mL/minute/1.73 m2

Pregnancy manufacturer advises avoid unless essential

Breast-feeding amount too small to be harmful

Side-effects see notes above; also sweating; rarely nausea, fever, vasculitis, hyperuricaemia

Dose

Benign gastric, duodenal or NSAID-associated ulceration, treatment, 300 mg in the evening or 150 mg twice daily for 4–8 weeks; maintenance, 150 mg at night

Gastro-oesophageal reflux disease, 150–300 mg twice daily for up to 12 weeks

CHILD not recommended

1. Famotidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks’ supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink including when they cause sleep disturbance (max. single dose 10 mg, max. daily dose 20 mg)

2. Nizatidine can be sold to the public for the prevention and treatment of symptoms of food-related heartburn and meal-induced indigestion in adults and children over 16 years, max. single dose 75 mg, max. daily dose 150 mg for max. 14 days
1.3.2 Selective antimuscarinics

Ranitidine (Non-proprietary) [FVR]

**Tablets**, ranitidine (as hydrochloride) 150 mg, net price 60-tab pack = £1.27; 300 mg, 30-tab pack = £2.09

**Brands** include: **Ranit®,**

Effervescent tablets, ranitidine (as hydrochloride) 150 mg, net price 60-tab pack = £25.47; 300 mg, 30-tab pack = £25.47. **Label:** 13

**Excipients** may include sodium (check with supplier)

**Oral solution**, ranitidine (as hydrochloride) 75 mg/5 mL, net price 100 mL = £2.75, 300 mL = £7.25

**Excipients** may include alcohol (check with supplier)

**Note**: Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription

**Note** Ranitidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks’ supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink (max. single dose 75 mg, max. daily dose 300 mg)

**Injection**, ranitidine (as hydrochloride) 25 mg/mL, net price 2-mL amp = 54p

Zantac® (GSK) [FVR]

**Tablets**, f/c, ranitidine (as hydrochloride) 150 mg, net price 60-tab pack = £1.30; 300 mg, 30-tab pack = £1.30

**Syrup**, sugar-free, ranitidine (as hydrochloride) 75 mg/5 mL, net price 300 mL = £20.76

**Excipients** include alcohol 8%

**Injection**, ranitidine (as hydrochloride) 25 mg/mL, net price 2-mL amp = 56p

### 1.3.3 Chelates and complexes

Tripotassium dicitratobismuthate is a bismuth chelate effective in healing gastric and duodenal ulcers. For the role of tripotassium dicitratobismuthate in a *Helicobacter pylori* eradication regimen for those who have not responded to first-line regimens, see section 1.3.

The bismuth content of tripotassium dicitratobismuthate is low but absorption has been reported; encephalopathy (described with older high-dose bismuth preparations) has not been reported.

Sucralfate may act by protecting the mucosa from acid-pepsin attack in gastric and duodenal ulcers. It is a complex of aluminium hydroxide and sulfated sucrose but has minimal antacid properties. It should be used with caution in patients under intensive care (important: reports of bezoar formation, see Bezoar Formation below)

**TRIPOTASSIUM DICITRATOBISMUTHATE**

**Indications** benign gastric and duodenal ulceration; see also *Helicobacter pylori* infection, section 1.3

**Cautions** see notes above; **interactions:** Appendix 1 (sucralfate)

**Renal impairment** avoid in severe impairment

**Pregnancy** manufacturer advises avoid on theoretical grounds

**Breast-feeding** no information available

**Side-effects** may darken tongue and blacken faeces; less commonly nausea, vomiting, diarrhoea, constipation, rash, and pruritus reported

De-Noltab® (Astellas) [FVR]

**Tablets**, f/c, tripotassium dicitratobismuthate 120 mg, net price 112-tab pack = £5.09. Counselling, see below

**Electrolytes** K+ 2 mmol/tablet

**Dose** 2 tablets twice daily or 1 tablet 4 times daily, taken for 28 days followed by further 28 days if necessary; maintenance not indicated but course may be repeated after interval of 1 month; **CHILD** not recommended

**Counselling** To be swallowed whole and not chewed or crushed. For adults and children over 16 years (provided packs do not contain more than 2 weeks’ supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink (max. single dose 75 mg, max. daily dose 300 mg)

**Side-effects** constipation; less frequently diarrhoea, nausea, indigestion, flatulence, gastric discomfort, back pain, dizziness, headache, drowsiness, bezoar formation (see above), dry mouth and rash

**Renal impairment** use with caution; aluminium is absorbed and may accumulate

**Pregnancy** no evidence of harm; absorption from gastro-intestinal tract negligible

**Breast-feeding** amount probably too small to be harmful

### 1.3.4 Prostaglandin analogues

Misoprostol, a synthetic prostaglandin analogue has antisecretory and protective properties, promoting healing of gastric and duodenal ulcers. It can prevent NSAID-associated ulcers, its use being most appropriate for the frail or very elderly from whom NSAIDs cannot be withdrawn.
MISOPROSTOL

Indications see notes above and under Dose

Cautions inflammatory bowel disease; conditions where hypotension might precipitate severe complications (e.g. cerebrovascular disease, cardiovascular disease)

Contra-indications planning pregnancy (important: see Women of Childbearing Age, and also Pregnancy, below)

Women of childbearing age Manufacturer advises that misoprostol should not be used in women of childbearing age unless pregnancy has been excluded. In such patients it is advised that misoprostol should only be used if the patient takes effective contraceptive measures and has been advised of the risks of taking misoprostol if pregnant.

Pregnancy avoid—potent uterine stimulant (has been used to induce abortion); teratogenic risk in first trimester; important: see also Women of Childbearing Age, above

Breast-feeding present in milk, but amount probably too small to be harmful

Side-effects diarrhoea (may occasionally be severe and require withdrawal, reduced by giving single doses not exceeding 200 micrograms and by avoiding magnesium-containing antacids); also reported: abdominal pain, dyspepsia, flatulence, nausea and vomiting, abnormal vaginal bleeding (including intermenstrual bleeding, menorrhagia, and postmenopausal bleeding), rashes, dizziness

Dose

- Benign gastric and duodenal ulceration and NSAID-associated ulceration, ADULT over 18 years, 800 micrograms daily (in 2–4 divided doses) with breakfast (or main meals) and at bedtime; treatment should be continued for at least 4 weeks and may be continued for up to 8 weeks if required.

- Prophylaxis of NSAID-induced gastric and duodenal ulcer, ADULT over 18 years, 200 micrograms 4 times daily (if not tolerated, reduced to 200 micrograms 2–3 times daily, but less effective)

Cytotec® (Pharmacia) Tablets, scored, misoprostol 200 micrograms, net price 60-tab pack = £10.03. Label: 21

With diclofenac or naproxen

Section 10.1.1

1.3.5 Proton pump inhibitors

Proton pump inhibitors inhibit gastric acid secretion by blocking the hydrogen-potassium adenosine triphosphatase enzyme system (the ‘proton pump’) of the gastric parietal cell. Proton pump inhibitors are effective short-term treatments for gastric and duodenal ulcers; they are also used in combination with antibacterials for the eradication of Helicobacter pylori (see p. 51 for specific regimens). Following endoscopic treatment of severe peptic ulcer bleeding, an intravenous, high-dose proton pump inhibitor reduces the risk of rebleeding and the need for surgery. Proton pump inhibitors can be used for the treatment of dyspepsia and gastro-oesophageal reflux disease (section 1.1).

Proton pump inhibitors are also used for the prevention and treatment of NSAID-associated ulcers (see p. 51). In patients who need to continue NSAID treatment after an ulcer has healed, the dose of proton pump inhibitor should normally not be reduced because asymptomatic ulcer deterioration may occur.

A proton pump inhibitor can be used to reduce the degradation of pancreatic enzyme supplements (section 1.9.4) in patients with cystic fibrosis. They can also be used to control excessive secretion of gastric acid in Zollinger–Ellison syndrome; high doses are often required.

Cautions Proton pump inhibitors may mask the symptoms of gastric cancer; particular care is required in those presenting with ‘alarm features’ (see p. 44), in such cases gastric malignancy should be ruled out before treatment. Patients at risk of osteoporosis should maintain an adequate intake of calcium and vitamin D, and, if necessary, receive other preventative therapy (see section 6.6). Measurement of serum-magnesium concentrations should be considered before and during prolonged treatment with a proton pump inhibitor, especially when used with other drugs that cause hypomagnesaemia or with digoxin. A proton pump inhibitor should be prescribed for appropriate indications at the lowest effective dose for the shortest period; the need for long-term treatment should be reviewed periodically.

Side-effects Side-effects of the proton pump inhibitors include gastro-intestinal disturbances (including nausea, vomiting, abdominal pain, flatulence, diarrhoea, constipation), and headache. Less frequent side-effects include dry mouth, peripheral oedema, dizziness, sleep disturbances, fatigue, paraesthesia, arthralgia, myalgia, rash, and pruritus. Other side-effects reported rarely or very rarely include taste disturbance, stomatitis, hepatitis, jaundice, hypersensitivity reactions (including anaphylaxis, bronchospasm), fever, depression, hallucinations, confusion, gynaecomastia, interstitial nephritis, hyponatraemia, hypomagnesaemia (usually after 1 year of treatment, but sometimes after 3 months of treatment), blood disorders (including leucopenia, leucytosis, pancytopenia, thrombocytopenia), visual disturbances, sweating, photosensitivity, alopecia, Stevens-Johnson syndrome, and toxic epidermal necrolysis. By decreasing gastric acidity, proton pump inhibitors may increase the risk of gastro-intestinal infections (including Clostridium difficile infection). Proton pump inhibitors can increase the risk of fractures, particularly when used at high doses for over a year in the elderly. Rebound acid hyperscretion and protracted dyspepsia may occur after stopping prolonged treatment with a proton pump inhibitor.

ESOMEPRAZOLE

Indications see under Dose

Cautions see notes above; interactions: Appendix 1 (proton pump inhibitors)

Hepatic impairment in severe hepatic impairment max. 20 mg daily (CHILD 1–12 years max. 10 mg daily); for severe peptic ulcer bleeding in severe hepatic impairment, initial intravenous infusion of 80 mg, then by continuous intravenous infusion, 4 mg/hour for 72 hours

Renal impairment manufacturer advises caution in severe renal insufficiency

Pregnancy manufacturer advises caution—no information available
Breast-feeding: Manufacturer advises avoid—no information available.

Side-effects: See notes above.

Dose: 
- By mouth: Duodenal ulcer associated with Helicobacter pylori, see eradication regimens on p. 51.
- NSAID-associated gastric ulcer, ADULT over 18 years, 20 mg once daily for 4–8 weeks; prophylaxis in patients with an increased risk of gastroduodenal complications who require continued NSAID treatment, 20 mg daily.
- Gastro-oesophageal reflux disease (in the presence of erosive reflux oesophagitis), ADULT and CHILD over 12 years, 20 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed or symptoms persist; maintenance 20 mg daily; CHILD 1–12 years, body-weight 10–20 kg, 10 mg once daily for 8 weeks; body-weight over 20 kg, 10–20 mg once daily for 8 weeks.
- Symptomatic treatment of gastro-oesophageal reflux disease (in the absence of oesophagitis), ADULT and CHILD over 12 years, 20 mg once daily for up to 4 weeks, then 20 mg daily when required; CHILD 1–12 years, body-weight over 10 kg, 10 mg once daily for up to 8 weeks.
- Zollinger–Ellison syndrome, ADULT over 18 years, initially 40 mg twice daily, adjusted according to response; usual range 80–160 mg daily (above 80 mg in 2 divided doses).
- By intravenous injection: over at least 3 minutes or by intravenous infusion, ADULT over 18 years, gastro-oesophageal reflux disease, 40 mg once daily; symptomatic reflux disease without oesophagitis, treatment of NSAID-associated gastric ulcer, prevention of NSAID-associated gastric or duodenal ulcer, 20 mg daily; continue until oral administration possible.
- Severe peptic ulcer bleeding (following endoscopic treatment), ADULT over 18 years, initial intravenous infusion of 80 mg over 30 minutes, then by continuous intravenous infusion 8 mg/hour for 72 hours, then by mouth 40 mg once daily for 4 weeks.

Esomeproazole (Non-proprietary)”

Capsules, enclosing e/c pellets, esomeprazole (as magnesium salt) 20 mg, net price 28-cap pack = £3.20; 40 mg, 28-cap pack = £4.57. Counselling, administration.

Brands include: Emozul®.

Counselling: Do not chew or crush capsules; swallow whole or mix capsule contents in water and drink within 30 minutes; for administration through a gastric tube, consult product literature.

Tablets, e/c, esomeprazole (as magnesium salt) 20 mg, net price 28-tab pack = £3.70; 40 mg, 28-tab pack = £4.58. Counselling, administration.

Counselling: Do not chew or crush tablets; swallow whole or disperse in water and drink within 30 minutes; for administration through a gastric tube, consult product literature.

Injection: Powder for reconstitution, esomeprazole (as sodium salt), net price 40-mg vial = £4.25.

With naproxen:

Section 10.1.1

LANSOPRAZOLE

Indications: See under Dose.

Cautions: See notes above; interactions: Appendix 1 (proton pump inhibitors).

Hepatic impairment: Use half normal dose in moderate to severe liver disease.

Pregnancy: Manufacturer advises avoid.

Breast-feeding: Avoid—present in milk in animal studies.

Side-effects: See notes above; also glossitis, pancreatitis, anorexia, restlessness, tremor, impotence, petechiae, and purpura; very rarely colitis, raised serum cholesterol or triglycerides.

Dose:
- Benign gastric ulcer, 30 mg daily in the morning for 8 weeks.
- Duodenal ulcer, 30 mg daily in the morning for 4 weeks; maintenance 15 mg daily.
- NSAID-associated duodenal or gastric ulcer, 30 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed; prophylaxis, 15–30 mg once daily.
- Eradication of Helicobacter pylori associated with duodenal ulcer or ulcer-like dyspepsia, see eradication regimens on p. 51.
- Zollinger–Ellison syndrome (and other hypersecretory conditions), initially 60 mg once daily adjusted according to response; daily doses of 120 mg or more given in two divided doses.
- Gastro-oesophageal reflux disease, 30 mg daily in the morning for 4 weeks, continued for further 4 weeks if not fully healed; prophylaxis, 15–30 mg daily.
- Acid-related dyspepsia, 15–30 mg daily in the morning for 2–4 weeks.

CHILD under 18 years see BNF for Children

Note: Lansoprazole doses in BNF may differ from those in product literature.

Lansoprazole (Non-proprietary)”

Capsules, enclosing e/c granules, lansoprazole 15 mg, net price 28-cap pack = £1.11; 30 mg, 28-cap pack = £1.47. Label: 5. 22, 25

Dental prescribing on NHS: Lansoprazole capsules may be prescribed.

Zoton® (Pfizer)”

FasTab® (= orodispersible tablet), lansoprazole 15 mg, net price 28-cap pack = £2.99; 30 mg, 28-cap pack = £5.50. Label: 5. 22, 25

Counselling: Tablets should be placed on the tongue, allowed to disperse and swallowed, or may be swallowed whole with a glass of water. Alternatively, tablets can be dispersed in a small amount of water and administered by an oral syringe or nasogastric tube.
**OMEPRAZOLE**

**Indications** see under Dose

**Cautions** see notes above; interactions: Appendix 1 (proton pump inhibitors)

**Hepatic impairment** not more than 20 mg daily should be needed

**Pregnancy** breastfeeding present in milk but not known to be harmful

**Side-effects** see notes above; also agitation and impotence

**Dose**

- By mouth, benign gastric and duodenal ulcers, 20 mg once daily for 4 weeks in duodenal ulceration or 8 weeks in gastric ulceration; in severe or recurrent cases increase to 40 mg daily; prevention of relapse in gastric ulcer, 20 mg once daily, increased to 40 mg once daily if necessary; prevention of relapse in duodenal ulcer, 20 mg once daily (range 10–40 mg daily)

- NSAID-associated duodenal or gastric ulcer and gastroduodenal erosions, 20 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed; prophylaxis in patients with a history of NSAID-associated duodenal or gastric ulcers, gastroduodenal lesions, or dyspeptic symptoms who require continued NSAID treatment, 20 mg once daily

- Duodenal or benign gastric ulcer associated with *Helicobacter pylori*, see eradication regimens on p. 51

- Zollinger–Ellison syndrome, initially 60 mg once daily; usual range 20–120 mg daily (above 80 mg in 2 divided doses)

- Gastro-oesophageal reflux disease, 20 mg once daily for 4 weeks, continued for further 4–8 weeks if not fully healed; 40 mg once daily has been given for 8 weeks in gastro-oesophageal reflux disease refractory to other treatment; maintenance 20 mg once daily

- Acid reflux disease (long-term management), 10 mg daily increasing to 20 mg once daily if symptoms return

- Acid-related dyspepsia, 10–20 mg once daily for 2–4 weeks according to response

- Severe ulcerating reflux oesophagitis, CHILD over 1 year, body-weight 10–20 kg, 10 mg once daily increased if necessary to 20 mg once daily for 4–12 weeks; body-weight over 20 kg, 20 mg once daily increased if necessary to 40 mg once daily for 4–12 weeks; to be initiated by hospital paediatrician

- By intravenous injection over 5 minutes or by intravenous infusion over 20–30 minutes, treatment and prevention of benign gastric ulcers, duodenal ulcers, or NSAID-associated ulcers, gastro-oesophageal reflux disease, 40 mg once daily until oral administration possible

- Zollinger-Ellison syndrome, initially 60 mg once daily, adjusted according to response; daily doses above 60 mg given in 2 divided doses

- Major peptic ulcer bleeding (following endoscopic treatment) [unlicensed indication], initial intravenous infusion of 80 mg over 40–60 minutes, then by continuous intravenous infusion, 8 mg/hour for 72 hours (then change to oral therapy)

- Counselling: Swallow whole, or disperse MUPS® tablets in water, or mix capsule contents or MUPS® tablets with fruit juice or yoghurt. Preparations consisting of an e/c tablet within a capsule should not be opened

**Omeprazole** (Non-proprietary) [PH]

Capsules, enclosing e/c granules, omeprazole 10 mg, net price 28-cap pack = £1.15; 20 mg, 28-cap pack = £1.15. 40 mg, 7-cap pack = £1.12, 28-cap pack = £4.98. Counselling, administration

**Dental prescribing on NHS** Gastro-resistant omeprazole capsules may be prescribed

Capsules, enclosing e/c tablet, omeprazole 10 mg, net price 28-cap pack = £1.04; 20 mg, 28-cap pack = £1.04. Counselling, administration

**Brands include** Mepradec®

**Intravenous infusion**, powder for reconstitution, omeprazole (as sodium salt), net price 40-mg vial = £4.16

**Losec®** (AstraZeneca) [PH]

MUPS® (multiple-unit pellet system = dispersible tablets), e/c, omeprazole 10 mg (light pink), net price 28-cap pack = £7.75; 20 mg (pink), 28-cap pack = £11.60; 40 mg (red-brown), 7-cap pack = £5.80. Counselling, administration

Capsules, enclosing e/c granules, omeprazole 10 mg (pink), net price 28-cap pack = £9.30; 20 mg (pink/brown), 28-cap pack = £13.92; 40 mg (brown), 7-cap pack = £6.96. Counselling, administration

**Intravenous infusion**, powder for reconstitution, omeprazole (as sodium salt), net price 40-mg vial = £6.50

**Injection**, powder for reconstitution, omeprazole (as sodium salt), net price 40-mg vial (with solvent) = £6.49

With ketoprofen Section 10.1.1

**PANTOPRAZOLE**

**Indications** see under Dose

**Cautions** see notes above; interactions: Appendix 1 (proton pump inhibitors)

**Hepatic impairment** max. 20 mg daily in severe impairment and cirrhosis—monitor liver function (discontinue if deterioration)

**Renal impairment** max. oral dose 40 mg daily

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—fetotoxic in animals

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk—small amount present in milk

**Side-effects** see notes above; also hyperlipidaemia, weight changes

**Dose**

- By mouth, benign gastric ulcer, ADULT over 18 years, 40 mg daily for 8 weeks; in severe cases increase up to 80 mg daily

- Duodenal ulcer, ADULT over 18 years, 40 mg daily for 4 weeks; in severe cases increase up to 80 mg daily

- Duodenal or benign gastric ulcer associated with

1. Omeprazole 10 mg tablets can be sold to the public for the short-term relief of reflux-like symptoms (e.g. heartburn) in adults over 18 years, max. daily dose 20 mg for max. 4 weeks, and a pack size of 28 tablets
**Helicobacter pylori**, see eradication regimens on p. 51

Prophylaxis of NSAID-associated gastric or duodenal ulcer in patients with an increased risk of gastrointestinal complications who require continued NSAID treatment, **ADULT** over 18 years, 20 mg daily

Gastro-oesophageal reflux disease, **ADULT** and **CHILD** over 12 years, 20–80 mg daily in the morning for 4 weeks, continued for further 4 weeks if not fully healed; maintenance 20 mg daily, increased to 40 mg daily if symptoms return

Zollinger–Ellison syndrome (and other hypersecretory conditions), **ADULT** over 18 years, initially 80 mg once daily adjusted according to response; **ELDERLY** max. 40 mg daily; daily doses above 80 mg given in 2 divided doses

- By intravenous injection over at least 2 minutes or by intravenous infusion, **ADULT** over 18 years, duodenal ulcer, gastric ulcer, and gastro-oesophageal reflux, 40 mg daily until oral administration can be resumed

Zollinger–Ellison syndrome (and other hypersecretory conditions), **ADULT** over 18 years, initially 80 mg (160 mg if rapid acid control required) then 80 mg once daily adjusted according to response; daily doses above 80 mg given in 2 divided doses

**Pantoprazole** (Non-proprietary) ⊙

**Tablets**, e/c, pantoprazole 20 mg, net price 28-tab pack = £1.08; 40 mg, 28-tab pack = £1.39. Label: 25

**Note** Pantoprazole 20 mg tablets can be sold to the public for the short-term treatment of reflux symptoms (e.g. heartburn) in adults over 18 years, max. daily dose 20 mg for max. 4 weeks

**Injection**, powder for reconstitution, pantoprazole (as sodium salt), net price 40-mg vial = £4.65

**Protium** (Takeda) ⊙

**Injection**, powder for reconstitution, pantoprazole (as sodium salt), net price 40-mg vial = £5.11

**RABEPRAZOLE SODIUM**

**Indications** see under Dose

**Cautions** see notes above; interactions: Appendix 1 (proton pump inhibitors)

**Hepatic impairment** manufacturer advises caution in severe hepatic dysfunction

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see notes above; also cough, influenza-like syndrome, and rhinitis; less commonly chest pain and nervousness; rarely anorexia and weight gain

**Dose**

- Benign gastric ulcer, 20 mg daily in the morning for 8 weeks

- Duodenal ulcer, 20 mg daily in the morning for 4 weeks

- Duodenal and benign gastric ulcer associated with **Helicobacter pylori**, see eradication regimens on p. 51

- Gastro-oesophageal reflux disease, 20 mg once daily for 4–8 weeks; maintenance 10–20 mg daily; symptomatic treatment in the absence of oesophagitis, 10 mg daily for up to 4 weeks, then 10 mg daily when required

- Zollinger–Ellison syndrome, initially 60 mg once daily adjusted according to response (max. 120 mg daily); doses above 100 mg daily given in 2 divided doses

- **CHILD** not recommended

**Rabeprazole** (Non-proprietary) ⊙

**Tablets**, e/c, rabeprazole sodium 10 mg, net price 28-tab pack = £1.95; 20 mg, 28-tab pack = £2.51. Label: 25

**Pariet** (Janssen, Eisai) ⊙

**Tablets**, e/c, rabeprazole sodium 10 mg (pink), net price 28-tab pack = £5.78; 20 mg (yellow), 28-tab pack = £11.34. Label: 25

---

### 1.4 Acute diarrhoea

**1.4.1 Adsorbents and bulk-forming drugs**

**1.4.2 Antimotility drugs**

**1.4.3 Enkephalinase inhibitors**

The priority in acute diarrhoea, as in gastro-enteritis, is the prevention or reversal of fluid and electrolyte depletion. This is particularly important in infants and in frail and elderly patients.

For details of oral rehydration preparations, see section 9.2.1.2. Severe depletion of fluid and electrolytes requires immediate admission to hospital and urgent replacement.

**Antimotility drugs** (section 1.4.2) relieve symptoms of acute diarrhoea. They are used in the management of uncomplicated acute diarrhoea in adults; fluid and electrolyte replacement may be necessary in case of dehydration. However, antimotility drugs are not recommended for acute diarrhoea in young children.

**Racecadotril** (section 1.4.3) is licensed, as an adjunct to rehydration, for the symptomatic treatment of uncomplicated acute diarrhoea.

Antispasmodics (section 1.2) are occasionally of value in treating abdominal cramp associated with diarrhoea but they should not be used for primary treatment. Antispasmodics and antiemetics should be avoided in young children with gastro-enteritis because they are rarely effective and have troublesome side-effects.

Antibacterial drugs are generally unnecessary in simple gastro-enteritis because the complaint usually resolves quickly without them, and infective diarrhoeas in the UK often have a viral cause. Systemic bacterial infection does, however, need appropriate systemic treatment; for drugs used in campylobacter enteritis, shigellosis, and salmonellosis, see Table 1, section 5.1. **Ciprofloxacin** is occasionally used for prophylaxis against travelers’ diarrhoea, but routine use is not recommended. Lactobacillus preparations have not been shown to be effective.

**Colestyramine** (section 1.9.2), binds unabsorbed bile salts and provides symptomatic relief of diarrhoea following ileal disease or resection.

**1.4.1 Adsorbents and bulk-forming drugs**

Adsorbents such as kaolin are not recommended for acute diarrhoea. Bulk-forming drugs, such as ispaghula, methylcellulose, and sterculia (section 1.6.1) are useful in controlling diarrhoea associated with diverticular disease.
1.4.2 Antimotility drugs

Antimotility drugs prolong the duration of intestinal transit by binding to opioid receptors in the gastrointestinal tract. Loperamide does not cross the blood-brain barrier readily. Antimotility drugs have a role in the management of uncomplicated acute diarrhoea in adults but not in young children; see also section 1.4. However, in severe cases, fluid and electrolyte replacement (section 9.2.1.2) are of primary importance. For comments on the role of antimotility drugs in chronic bowel disorders see section 1.5. For their role in stoma care see section 1.8.

Loperamide can be used for faecal incontinence [unlicensed indication] after the underlying cause of incontinence has been addressed.

**CO-PHENOTROPE**

A mixture of diphenoxylate hydrochloride and atropine sulfate in the mass proportions 100 parts to 1 part respectively

**Indications** adjunct to rehydration in acute diarrhoea (but see notes above); control of faecal consistency after colostomy or ileostomy (section 1.8)

**Cautions** section 4.7.2; also young children are particularly susceptible to overdosage and symptoms may be delayed and observation is needed for at least 48 hours after ingestion; presence of subclinical doses of atropine may give rise to atropine side-effects in susceptible individuals or in overdosage (section 1.2); interactions: Appendix 1 (antimuscarinics, opioid analgesics)

**Contra-indications** section 4.7.2; also avoid in jaundice

**Renal impairment** section 4.7.2

**Pregnancy** section 4.7.2 and also see under Antimuscarinics (section 1.2)

**Breast-feeding** may be present in milk

**Side-effects** section 4.7.2 and also see under Antimuscarinics (section 1.2); also abdominal pain, anorexia, and fever

**Dose**

- See preparations

- Co-phenotrope (Non-proprietary) (PHB)

  **Tablets**, co-phenotrope 2.5/0.025 (diphenoxylate hydrochloride 2.5 mg, atropine sulfate 25 micrograms), net price 100 = £10.74

  **Brands include** Lomotil®

  **Dose** initially 4 tablets, followed by 2 tablets every 6 hours until diarrhoea controlled; **CHILD** under 4 years see BNF for Children, 4–8 years 1 tablet 3 times daily, 9–12 years 1 tablet 4 times daily, 12–16 years 2 tablets 3 times daily, but see also notes above

  **Note** Co-phenotrope 2.5/0.025 can be sold to the public for adults and children over 16 years (provided packs do not contain more than 20 tablets) as an adjunct to rehydration in acute diarrhoea (max. daily dose 10 tablets)

**CODEINE PHOSPHATE**

**Indications** see notes above; cough suppression (section 3.9.1); pain (section 4.7.2)

**Cautions** section 4.7.2; tolerance and dependence may occur with prolonged use; interactions: Appendix 1 (opioid analgesics)

**Contra-indications** section 4.7.2; also conditions where inhibition of peristalsis should be avoided, where abdominal distension develops, or in acute diarrhoeal conditions such as acute ulcerative colitis or antibiotic-associated colitis

**Hepatic impairment** section 4.7.2

**Renal impairment** section 4.7.2

**Pregnancy** section 4.7.2

**Breast-feeding** section 4.7.2

**Side-effects** section 4.7.2

**Dose**

- Acute diarrhoea, **ADULT** and **CHILD** over 12 years, 30 mg 3–4 times daily (range 15–60 mg)

**Preparations**

Section 4.7.2

**LOPERAMIDE HYDROCHLORIDE**

**Indications** symptomatic treatment of acute diarrhoea; adjunct to rehydration in acute diarrhoea in adults and children over 4 years (but see notes above); chronic diarrhoea in adults only

**Cautions** see notes above; interactions: Appendix 1 (Loperamide)

**Contra-indications** conditions where inhibition of peristalsis should be avoided, where abdominal distension develops, or in conditions such as active ulcerative colitis or antibiotic-associated colitis

**Hepatic impairment** risk of accumulation—manufacturer advises caution

**Pregnancy** manufacturers advise avoid—no information available

**Breast-feeding** amount probably too small to be harmful

**Side-effects** nausea, flatulence, headache, dizziness; less commonly dyspepsia, vomiting, abdominal pain, dry mouth, drowsiness, rash (rarely Stevens-Johnson syndrome, toxic epidermal necrolysis); rarely paralytic ileus, fatigue, hypotonia, urinary retention

**Dose**

- Acute diarrhoea, 4 mg initially followed by 2 mg after each loose stool for up to 5 days; usual dose 6–8 mg daily; max. 16 mg daily; **CHILD** under 4 years not recommended; 4–8 years, 1 mg 3–4 times daily for up to 3 days only; 8–12 years, 2 mg 3–4 times daily for up to 5 days

- Chronic diarrhoea in adults, initially, 4–8 mg daily in divided doses, subsequently adjusted according to response and given in 2 divided doses for mainte-
Enkephalinase inhibitors

Racecadotril is a pro-drug of thiorphan. Thiophan is an enkephalinase inhibitor that inhibits the breakdown of endogenous opioids, thereby reducing intestinal secretions. Racecadotril is licensed, as an adjunct to rehydration, for the symptomatic treatment of uncomplicated acute diarrhoea; it should only be used in children over 12 years not recommended for use within NHS Scotland for the treatment of acute diarrhoea in children because there is insufficient evidence that it improves the recovery rate.

MORPHINE

Indications see notes above; cough in terminal disease (section 3.9.1); pain (section 4.7.2)
Cautions see notes above and under Morphine Salts (section 4.7.2)
Contra-indications see notes above and under Morphine Salts (section 4.7.2)
Hepatic impairment section 4.7.2
Renal impairment section 4.7.2
Pregnancy section 4.7.2
Breast-feeding see under Morphine Salts (section 4.7.2)
Side-effects see notes above and under Morphine Salts (section 4.7.2); sedation and the risk of dependence are greater
Dose
● See preparation

Kaolin and Morphine Mixture, BP (Kaolin and Morphine Oral Suspension)
Oral suspension, light kaolin or light kaolin (natural) 20%, sodium bicarbonate 5%, and chloroform and morphine tincture 4% in a suitable vehicle. Contains anhydrous morphine 550–800 micrograms/10 mL.
Dose ADULT and CHILD over 12 years, 10 mL every 6 hours in water

1.5 Chronic bowel disorders

1.5.1 Aminosalicylates
1.5.2 Corticosteroids
1.5.3 Drugs affecting the immune response
1.5.4 Food allergy

Once tumours are ruled out individual symptoms of chronic bowel disorders need specific treatment including dietary manipulation as well as drug treatment and the maintenance of a liberal fluid intake.

Inflammatory bowel disease
Chronic inflammatory bowel diseases include ulcerative colitis and Crohn’s disease. Effective management requires drug therapy, attention to nutrition, and in severe or chronic active disease, surgery.
Aminosalicylates (balsalazide, mesalazine, olsalazine, and sulfasalazine), corticosteroids (hydrocortisone, beclometasone, budesonide, and prednisolone), and drugs that affect the immune response are used in the treatment of inflammatory bowel disease.

Treatment of acute ulcerative colitis and Crohn’s disease  
Acute mild to moderate disease affecting the rectum (proctitis) or the recto-sigmoid is treated initially with local application of an aminosalicylate (section 1.5.1); alternatively, a local corticosteroid can be used but it is less effective. A combination of a local aminosalicylate and a local corticosteroid can be used for proctitis that does not respond to a local aminosalicylate alone. Foam preparations and suppositories are especially useful when patients have difficulty retaining liquid enemas.

Diffuse inflammatory bowel disease or disease that does not respond to local therapy requires oral treatment. Mild disease affecting the proximal colon can be treated with an oral aminosalicylate alone; a combination of a local and an oral aminosalicylate can be used in proctitis or distal colitis. Refractory or moderate inflammatory bowel disease usually requires adjunctive use of an oral corticosteroid such as prednisolone (section 1.5.2) for 4–8 weeks. Modified-release budesonide is licensed for Crohn’s disease affecting the ileum and the ascending colon; it causes fewer systemic side-effects than oral prednisolone but may be less effective. Beclometasone dipropionate by mouth is licensed as an adjunct to mesalazine for mild to moderate ulcerative colitis, but it is not known whether it is as effective as other corticosteroids.

Severe inflammatory bowel disease or disease that is not responding to an oral corticosteroid requires hospital admission and treatment with an intravenous corticosteroid (such as hydrocortisone or methylprednisolone, section 6.3.2); other therapy may include intravenous fluid and electrolyte replacement, and possibly parenteral nutrition. Specialist supervision is required for patients who fail to respond adequately to these measures. Patients with severe ulcerative colitis that has not responded to intravenous corticosteroids, may benefit from a short course of intravenous ciclosporin [unlicensed indication] (section 1.5.3). Patients with unresponsive or chronically active Crohn’s disease may benefit from azathioprine (section 1.5.3), mercaptopurine (section 1.5.3) [unlicensed indication], or once-weekly methotrexate (section 1.5.3) [unlicensed indication]; these drugs have a slower onset of action.

Infliximab (section 1.5.3) is licensed for the management of severe active Crohn’s disease and severe ulcerative colitis in patients whose condition has not responded adequately to treatment with a corticosteroid and a conventional drug that affects the immune response, or who are intolerant of them.

NICE guidance  
Infliximab and adalimumab for Crohn’s disease (May 2010)  
Infliximab or adalimumab is recommended for the treatment of severe active Crohn’s disease that has not responded to conventional therapy (including corticosteroids and other drugs affecting the immune response) or when conventional therapy cannot be used because of intolerance or contraindications; infliximab can also be used in a similar way in children over 6 years of age. In adults over 18 years of age, infliximab is recommended for the treatment of fistulating Crohn’s disease that has not responded to conventional therapy (including antibacterials, drainage, and other drugs affecting the immune response) or when conventional therapy cannot be used because of intolerance or contraindications.

Infliximab or adalimumab should be given as a planned course of treatment for 12 months or until treatment failure, whichever is shorter. Treatment should be continued beyond 12 months only if there is evidence of active disease—in these cases the need for treatment should be reviewed at least annually. If the disease relapses after stopping treatment, adalimumab or infliximab can be restarted [but see Hypersensitivity Reactions under Infliximab, p. 68].

www.nice.org.uk/TA187

NICE guidance  
Infliximab for subacute manifestations of ulcerative colitis (April 2008)  
Infliximab is not recommended for the treatment of subacute manifestations of moderate to severe active ulcerative colitis that would normally be managed in an outpatient setting.

www.nice.org.uk/TA140

NICE guidance  
Infliximab for acute exacerbations of ulcerative colitis (December 2008)  
Infliximab is recommended as an option for the treatment of acute exacerbations of severe ulcerative colitis when treatment with ciclosporin is contra-indicated or inappropriate.

www.nice.org.uk/TA163

Adalimumab (section 1.5.3) is licensed for the treatment of severe active Crohn’s disease and severe ulcerative colitis in patients whose condition has not responded adequately to treatment with a corticosteroid and a conventional drug that affects the immune response, or who are intolerant of them.

Golimumab (section 1.5.3) is licensed for the treatment of severe ulcerative colitis in patients whose condition has not responded adequately to conventional therapy, or who are intolerant of it.
**Maintenance of remission of acute ulcerative colitis and Crohn’s disease**

Smoking cessation (section 4.10.2) reduces the risk of relapse in Crohn’s disease and should be encouraged. Aminosalicylates are efficacious in the maintenance of remission of ulcerative colitis, but there is no evidence of efficacy in the maintenance of remission of Crohn’s disease. Corticosteroids are not suitable for maintenance treatment because of their side-effects. In resistant or frequently relapsing cases either azathioprine (section 1.5.3) or mercaptopurine (section 1.5.3) [unlicensed indication], given under close supervision may be helpful. Methotrexate (section 1.5.3) is tried in Crohn’s disease if azathioprine or mercaptopurine cannot be used [unlicensed indication]. Maintenance therapy with infliximab should be considered for patients with Crohn’s disease or ulcerative colitis who respond to the initial induction course of infliximab; fixed-interval dosing is superior to intermittent dosing. Adalimumab is licensed for maintenance therapy in Crohn’s disease and ulcerative colitis. Golimumab is licensed for maintenance therapy in ulcerative colitis.

**Fistulating Crohn’s disease**

Treatment may not be necessary for simple, asymptomatic perianal fistulas. Metronidazole (section 5.1.11) or ciprofloxacin (section 5.1.12) can improve symptoms of fistulating Crohn’s disease but complete healing occurs rarely [unlicensed indication]. Metronidazole by mouth is used at a dose of 10–20 mg/kg daily in divided doses (usual dose 400–500 mg 3 times daily); it is usually given for 1 month but no longer than 3 months because of concerns about peripheral neuropathy. Ciprofloxacin by mouth is given at a dose of 500 mg twice daily. Other antibacterials should be given if specifically indicated (e.g. sepsis associated with fistulas and perianal disease) and for managing bacterial overgrowth in the small bowel. Fistulas may also require surgical exploration and local drainage.

Either azathioprine or mercaptopurine is used as a second-line treatment for fistulating Crohn’s disease and continued for maintenance [unlicensed indication]. Infliximab is used for fistulating Crohn’s disease refractory to conventional treatments; fixed-interval dosing is superior to intermittent dosing. Maintenance therapy with infliximab should be considered for patients who respond to the initial induction course of infliximab. Adalimumab can be used if there is intolerance to infliximab [unlicensed indication].

**Adjunctive treatment of inflammatory bowel disease**

Due attention should be paid to diet; high-fibre or low-residue diets should be used as appropriate. Antimotility drugs such as codeine and loperamide, and antispasmodics may precipitate paralytic ileus and megacolon in active ulcerative colitis; treatment of the inflammation is more logical. An osmotic laxative, such as a macrogol, may be required in proctitis (section 1.6.4). Diarrhoea resulting from the loss of bile-salt absorption (e.g. in terminal ileal disease or bowel resection) may improve with colestyramine (section 1.9.2), which binds bile salts.

**Clostridium difficile infection**

Clostridium difficile infection is caused by colonisation of the colon with *Clostridium difficile* and production of toxin. It often follows antibiotic therapy and is usually of acute onset, but may become chronic. It is a particular hazard of ampicillin, amoxicillin, co-amoxiclav, second- and third-generation cephalosporins, clindamycin, and quinolones, but few antibiotics are free of this side-effect. Treatment options include metronidazole, vancomycin, and fidaxomycin (see table 1, section 5.1).

**Diverticular disease**

Diverticular disease is treated with a high-fibre diet, bran supplements, and bulk-forming drugs (section 1.6.1). Antispasmodics may provide symptomatic relief when colic is a problem (section 1.2). Antibacterials are used only when the diverticula in the intestinal wall become infected. Antimotility drugs which slow intestinal motility, e.g. codeine, diphenoxylate, and loperamide, could possibly exacerbate the symptoms of diverticular disease and are contra-indicated.

**Irritable bowel syndrome**

Irritable bowel syndrome can present with pain, constipation, or diarrhoea. In some patients there may be important psychological aggravating factors which respond to reassurance and possibly specific treatment e.g. with an antidepressant.

The fibre intake of patients with irritable bowel syndrome should be reviewed. If an increase in dietary fibre is required, soluble fibre (e.g. ispaghula husk, sterculia, or oats) is recommended; insoluble fibre (e.g. bran) may exacerbate symptoms and its use should be discouraged. A laxative (section 1.6) can be used to treat constipation. An osmotic laxative, such as a macrogol, is preferred; lactulose may cause bloating. Linacotide (section 1.6.7) is licensed for the treatment of moderate to severe irritable bowel syndrome associated with constipation. Stimulant laxatives should be avoided or used only occasionally. Loperamide (section 1.4.2) may relieve diarrhoea and antispasmodic drugs (section 1.2) may relieve pain. Opioids with a central action, such as codeine, are better avoided because of the risk of dependence. A tricyclic antidepressant (section 4.3.1) can be used for abdominal pain or discomfort [unlicensed indication] in patients who have not responded to laxatives, loperamide, or antispasmodics. Low doses of a tricyclic antidepressant are used (e.g. amitriptyline, initially 5–10 mg each night, increased if necessary in steps of 10 mg at intervals of at least 2 weeks to max. 30 mg each night). A selective serotonin reuptake inhibitor (section 4.3.3) may be considered in those who do not respond to a tricyclic antidepressant [unlicensed indication].

**Malabsorption syndromes**

Individual conditions need specific management and also general nutritional consideration. Coeliac disease (gluten enteropathy) usually needs a gluten-free diet and pancreatic insufficiency needs pancreatin supplements (section 1.9.4).

For further information on foods for special diets (ACBS), see Appendix 2.
### 1.5.1 Aminosalicylates

**Sulfasalazine** is a combination of 5-aminosalicylic acid (‘5-ASA’) and sulfapyridine; sulfapyridine acts only as a carrier to the colonic site of action but still causes side-effects. In the newer aminosalicylates, *mesalazine* (5-aminosalicylic acid), *balsalazide* (a produg of 5-aminosalicylic acid) and *olsalazine* (a dimer of 5-aminosalicylic acid which cleaves in the lower bowel), the sulfonamide-related side-effects of sulfasalazine are avoided, but 5-aminosalicylic acid alone can still cause side-effects including blood disorders (see recommendation below) and lupus-like syndrome also seen with sulfasalazine.

**Contra-indications** Aminosalicylates should be avoided in salicylate hypersensitivity.

**Side-effects** Side-effects of the aminosalicylates include diarrhoea, nausea, vomiting, abdominal pain, exacerbation of symptoms of colitis, headache, hypersensitivity reactions (including rash and urticaria); side-effects that occur rarely include acute pancreatitis, hepatitis, myocarditis, pericarditis, lung disorders (including eosinophilia and fibrosing alveolitis), peripheral neuropathy, blood disorders (including agranulocytosis, aplastic anaemia, leucopenia, methaemoglobinemia, neutropenia, and thrombocytopenia—see also recommendation above), renal dysfunction (interstitial nephritis, nephrotic syndrome), myalgia, arthralgia, skin reactions (including lupus erythematosus-like syndrome, Stevens-Johnson syndrome), alopecia.

**Blood disorders**

Patients receiving aminosalicylates should be advised to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise that occurs during treatment. A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.

**Dose**

- See under preparations, below

**Contra-indications** see notes above

**Hepatic impairment** avoid in severe impairment

**Renal impairment** use with caution; avoid if eGFR less than 20 mL/minute/1.73 m²

**Pregnancy**

negligible quantities cross placenta

**Breast-feeding**

diarrhoea reported but negligible amounts detected in breast milk; monitor infant for diarrhoea

**Side-effects** see notes above

**Blood disorders**

- Patients receiving aminosalicylates should be advised to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise that occurs during treatment. A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.

**Contra-indications**

- Aminosalicylates should be avoided in salicylate hypersensitivity.

**Side-effects**

- Side-effects of the aminosalicylates include diarrhoea, nausea, vomiting, abdominal pain, exacerbation of symptoms of colitis, headache, hypersensitivity reactions (including rash and urticaria); side-effects that occur rarely include acute pancreatitis, hepatitis, myocarditis, pericarditis, lung disorders (including eosinophilia and fibrosing alveolitis), peripheral neuropathy, blood disorders (including agranulocytosis, aplastic anaemia, leucopenia, methaemoglobinemia, neutropenia, and thrombocytopenia—see also recommendation above), renal dysfunction (interstitial nephritis, nephrotic syndrome), myalgia, arthralgia, skin reactions (including lupus erythematosus-like syndrome, Stevens-Johnson syndrome), alopecia.

**Dose**

- See under preparations, below

**Contra-indications** see notes above

**Hepatic impairment** avoid in severe impairment

**Renal impairment** use with caution; avoid if eGFR less than 20 mL/minute/1.73 m²

**Pregnancy**

negligible quantities cross placenta

**Breast-feeding**

diarrhoea reported but negligible amounts detected in breast milk; monitor infant for diarrhoea

**Side-effects** see notes above

### BALSALAZIDE SODIUM

**Indications**

- treatment of mild to moderate ulcerative colitis and maintenance of remission

**Cautions** see notes above; also history of asthma; interactions: Appendix 1 (aminosalicylates)

**Blood disorders**

- See recommendation above

**Contra-indications** see notes above

**Hepatic impairment**

avoid in severe impairment

**Renal impairment**

manufacturer advises avoid in moderate to severe impairment

**Pregnancy**

manufacturer advises avoid

**Breast-feeding**

monitor infant for diarrhoea

**Side-effects** see notes above; also cholelithiasis

**Dose**

- Acute attack, 2.25 g 3 times daily until remission occurs or for up to max. 12 weeks
- Maintenance, 1.5 g twice daily, adjusted according to response (max. 6 g daily)
- CHILD under 18 years see BNF for Children

**Colazide** (Almirall)®

**Capsules**, beige, balsalazide sodium 750 mg. Net price 130-cap pack = £30.42. Label: 21, 25, counselling, blood disorder symptoms (see recommendation above)

**MEASALAZINE**

**Indications**

- treatment of mild to moderate ulcerative colitis and maintenance of remission; see also under preparations

**Cautions** see notes above; elderly; interactions: Appendix 1 (aminosalicylates)

**Blood disorders**

- See recommendation above

**Contra-indications** see notes above

**Hepatic impairment**

avoid in severe impairment

**Renal impairment** use with caution; avoid if eGFR less than 20 mL/minute/1.73 m²

**Pregnancy**

negligible quantities cross placenta

**Breast-feeding**

diarrhoea reported but negligible amounts detected in breast milk; monitor infant for diarrhoea

**Side-effects** see notes above

**Dose**

- See under preparations, below

**Note**

There is no evidence to show that any one oral preparation of mesalazine is more effective than another; however, the delivery characteristics of oral mesalazine preparations may vary. If it is necessary to switch a patient to a different brand of mesalazine, the patient should be advised to report any changes in symptoms

**Asacol** (Warner Chilcott)®

**Foam enema**, mesalazine 1 g/metered application, net price 14-application canister with disposable applicators and plastic bags = £26.72. Counselling, blood disorder symptoms (see recommendation above)

**Excipients**

- include disodium edetate, hydroxybenzoates (parabens), polysorbate 20, sodium metabisulphite

**Dose**

- acute attack affecting the rectosigmoid region, 1 metered application (mesalazine 1 g) into the rectum daily for 4–6 weeks; acute attack affecting the descending colon, 2 metered applications (mesalazine 2 g) once daily for 4–6 weeks; CHILD 12–18 years, see BNF for Children

**Suppositories**, mesalazine 250 mg, net price 20-suppos pack = £4.82; 500 mg, 10-suppos pack = £4.82. Counselling, blood disorder symptoms (see recommendation above)

**Dose**

- acute attack or maintenance, by rectum 0.75–1.5 g daily in divided doses, with last dose at bedtime; CHILD 12–18 years, see BNF for Children

**Asacol MR** (Warner Chilcott)®

**Tablets**, red, e/c, mesalazine 400 mg, net price 90-tab pack = £29.41, 120-tab pack = £39.21. Label: 5, 25, counselling, blood disorder symptoms (see recommendation above)

**Dose**

- ulcerative colitis, acute attack, 2.4 g daily in divided doses; maintenance of remission of ulcerative colitis and Crohn’s ileo-colitis, 1.2–2.4 g daily in divided doses; CHILD 12–18 years, see BNF for Children

**Tablets**, red-brown, e/c, mesalazine 800 mg, net price 180-tab pack = £117.62. Label: 5, 25, counselling, blood disorder symptoms (see recommendation above)

**Dose**

- ADULT over 18 years, ulcerative colitis, acute attack, 2.4–4.8 g daily in divided doses; maintenance of remission of ulcerative colitis, up to 2.4 g once daily or in divided doses; maintenance of remission of Crohn’s ileo-colitis, up to 2.4 g daily in divided doses

**Note**

Preparations that lower stool pH (e.g. lactulose) may prevent release of mesalazine
### Gastro-intestinal system

#### 1.5.1 Aminosalicylates

**Ipofel**[^Ipofel] (Sandoz)  
Tablets, e/c, mesalazine 400 mg, net price 120-tab pack = £17.68. Label: 5, 25, counselling, blood disorder symptoms (see recommendation above)  
**Dose** acute attack, 2.4 g daily in divided doses; maintenance, 1.2–2.4 g daily in divided doses; **CHILD** 6–18 years, see **BNF for Children**  
**Note** Preparations that lower stool pH (e.g. lactulose) may prevent release of mesalazine

**Mezavant**[^Mezavant] XL (Shire)  
Tablets, m/r, red-brown, e/c, mesalazine 1.2 g, net price 60-tab pack = £62.44. Label: 21, 25, counselling, blood disorder symptoms (see recommendations above)  
**Dose** **ADULT** over 18 years, acute attack, 2.4 g once daily, increase if necessary to 4.8 g once daily (review at 8 weeks); maintenance, 2.4 g once daily

**Octasa**[^Octasa] (Tillotts)  
Tablets, m/r, red-brown, e/c, mesalazine 400 mg, net price 90-tab pack = £18.48. Label: 21, 25, counselling, blood disorder symptoms (see above)  
**Dose** acute attack, up to 4 g daily in 2–3 divided doses; maintenance, 2 g once daily; tablets may be dispersed in water, but should not be chewed; **CHILD** 5–18 years see **BNF for Children**

**Pentasa**[^Pentasa] (Ferring)  
Tablets, m/r, m/e, m/s, e/c, mesalazine 500 mg, net price 100-tab pack = £30.74; 1 g, 60-tab pack = £36.89. Counseling, administration, see dose, blood disorder symptoms (see recommendation above)  
**Dose** acute attack, up to 4 g once daily or in 2–4 divided doses; maintenance, 2 g once daily; granules should be placed on tongue and washed down with water or orange juice without chewing; **CHILD** over 12 years see **BNF for Children**

**Granules**, m/r, pale grey-brown, mesalazine 1 g/sachet, net price 50-sachet pack = £30.74; 2 g/sachet, 60-sachet pack = £73.78. Counseling, administration, see dose, blood disorder symptoms (see above)  
**Dose** acute attack, up to 4 g once daily or in 2–4 divided doses; maintenance, 2 g once daily; granules should be placed on tongue and washed down with water or orange juice without chewing; **CHILD** 5–18 years see **BNF for Children**

**Retention enema**, mesalazine 1 g in 100-mL pack. Net price 7 enemas = £17.73. Counseling, blood disorder symptoms (see recommendation above)  
**Dose** by rectum **ADULT** and **CHILD** over 12 years, 1 enema at bedtime

**Suppositories**, mesalazine 1 g. Net price 28-suppos pack = £40.01. Counseling, blood disorder symptoms (see recommendation above)  
**Dose** by rectum ulcerative proctitis, **ADULT** and **CHILD** over 15 years, acute attack, 1 g daily for 2–4 weeks; maintenance, 1 g daily; **CHILD** 12–15 years see **BNF for Children**

**Salofalk**[^Salofalk] (Dr Falk)  
Tablets, e/c, yellow, mesalazine 250 mg, net price 100-tab pack = £16.18; 500 mg, 100-tab pack = £32.38. Label: 5, 25, counselling, blood disorder symptoms (see above)  
**Dose** acute attack, 0.5–1 g 3 times daily; maintenance, 500 mg 3 times daily; **CHILD** 5–18 years see **BNF for Children**

**Granules**, m/r, grey, e/c, vanilla-flavoured, mesalazine 500 mg/sachet, net price 100-sachet pack = £28.74; 1 g/sachet, 50-sachet pack = £28.74; 1.5 g/sachet, 60-sachet pack = £48.85; 3 g/sachet, 60-sachet pack = £97.70. Label: 25, counselling, administration, see dose, blood disorder symptoms (see above)  
**Excipients** include aspartame (section 9.4.1)  
**Dose** acute attack, 1.5–3 g once daily (preferably in the morning) or 0.5–1 g 3 times daily; maintenance, 500 mg 3 times daily; **CHILD** 5–18 years see **BNF for Children**

**Counselling** granules should be placed on tongue and washed down with water without chewing  
**Note** Preparations that lower stool pH (e.g. lactulose) may prevent release of mesalazine

**Suppositories**, mesalazine 500 mg. Net price 30-suppos pack = £14.81. Counseling, blood disorder symptoms (see recommendation above)  
**Dose** **ADULT** and **CHILD** over 15 years, acute attack, by rectum, 0.5–1 g 2–3 times daily adjusted according to response; **CHILD** 12–15 years see **BNF for Children**

**Enema**, mesalazine 2 g in 59-mL pack. Net price 7 enemas = £29.92. Counseling, blood disorder symptoms (see recommendation above)  
**Dose** acute attack or maintenance, by rectum, 2 g daily at bedtime; **CHILD** 12–18 years see **BNF for Children**

**Rectal foam**, mesalazine 1 g/metered application, net price 14-application canister with disposable applicators and plastic bags = £30.17. Counseling, blood disorder symptoms (see recommendation above)  
**Excipients** include cetostearyl alcohol, dextran 60, propylene glycol, sodium metabisulphite

**Dose** mild ulcerative colitis affecting sigmoid colon and rectum, **ADULT** and **CHILD** over 12 years, 2 metered applications (mesalazine 2 g) into the rectum at bedtime or in 2 divided doses

### OLSALAZINE SODIUM

**Indications** treatment of mild ulcerative colitis and maintenance of remission  
**Cautions** see notes above; **interactions**: Appendix 1 (aminosalicylates)

**Blood disorders** See recommendation above  
**Contra-indications** see notes above  
**Renal impairment** use with caution; manufacturer advises avoid in significant impairment  
**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk  
**Breast-feeding** monitor infant for diarrhoea  
**Side-effects** see notes above; watery diarrhoea common; also reported, tachycardia, palpitation, pyrexia, blurred vision, and photosensitivity

**Dose**  
- **ADULT** and **CHILD** over 12 years, acute attack, 1 g daily in divided doses after meals increased if necessary over 1 week to max. 3 g daily (max. single dose 1 g); maintenance, 500 mg twice daily after meals  
- **CHILD** under 12 years see **BNF for Children**

**Dipentum**[^Dipentum] (UCB Pharma)  
**Capsules**, brown, olsalazine sodium 250 mg. Net price 112-cap pack = £19.77. Label: 21, counselling, blood disorder symptoms (see above)  
**Tablets**, yellow, scored, olsalazine sodium 500 mg. Net price 60-tab pack = £21.18. Label: 21, counselling, blood disorder symptoms (see recommendation above)

### SULFASALAZINE  
(Sulphasalazine)

**Indications** treatment of mild to moderate and severe ulcerative colitis and maintenance of remission; active Crohn’s disease; rheumatoid arthritis (section 10.1.3)
Cautions see notes above; also history of allergy or asthma; G6PD deficiency (section 9.1.5); slow acetylator status; risk of haematological and hepatic toxicity (differential white cell, red cell, and platelet counts initially and at monthly intervals for first 3 months; liver function tests at monthly intervals for first 3 months); maintain adequate fluid intake; upper gastro-intestinal side-effects common over 4 g daily; acute porphyria (section 9.8.2); interactions: Appendix 1 (aminosalicylates)

Blood disorders See recommendation above

Contra-indications see notes above; also sulfonamide hypersensitivity; child under 2 years of age

Hepatic impairment use with caution

Renal impairment risk of toxicity, including crystaluria, in moderate impairment—ensure high fluid intake; avoid in severe impairment

Pregnancy theoretical risk of neonatal haemolysis in third trimester; adequate folate supplements should be given to mother

Breast-feeding small amounts in milk (1 report of bloody diarrhoea); theoretical risk of neonatal haemolysis especially in G6PD-deficient infants

Side-effects see notes above; also cough, insomnia, dizziness, fever, blood disorders (including Heinz body anaemia, megaloblastic anaemia), proteinuria, tinnitus, stomatitis, taste disturbances, and pruritus; less commonly dyspnoea, depression, convulsions, vasculitis, and alopecia; also reported loss of appetite, hypersensitivity reactions (including exfoliative dermatitis, epidermal necrolysis, photosensitivity, anaphylaxis, serum sickness), ataxia, hallucinations, aseptic meningitis, oligospermia, crystalluria, disturbances of smell, and parotitis; yellow-orange discoloration of skin, urine, and other body fluids; some soft contact lenses may be stained

Dose
- By mouth, acute attack 1–2 g 4 times daily (but see cautions) until remission occurs (if necessary corticosteroids may also be given), reducing to a maintenance dose of 300 mg 4 times daily; CHILD 2–12 years see BNF for Children
- By rectum, in suppositories, alone or in conjunction with oral treatment 0.5–1 g morning and night after a bowel movement; CHILD 5–12 years see BNF for Children

Sulfasalazine (Non-proprietary) Tablets, sulfasalazine 500 mg, net price 112 = £5.58. Label: 14, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

Tablets, e/c, sulfasalazine 500 mg. Net price 112-tab pack = £7.67. Label: 5, 14, 25, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

Brands include Salazine EC®

Suspension, sulfasalazine 250 mg/5 mL, net price 500 mL = £39.75. Label: 14, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

Excipients may include alcohol

Note Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription

Salazopyrin® (Pharmacia) Tablets, yellow, scored, sulfasalazine 500 mg, net price 112-tab pack = £6.97. Label: 14, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

1.5.2 Corticosteroids

For the role of corticosteroids in acute ulcerative colitis and Crohn’s disease, see Inflammatory Bowel Disease, p. 60.

**BECLOMETASONE DIPROPIONATE**

**Indications** adjunct to aminosalicylates in acute mild to moderate ulcerative colitis; asthma (section 3.2); allergic and vasomotor rhinitis (section 12.2.1); oral ulceration [unlicensed indication] (section 12.3.1)

**Cautions** section 6.3.2; interactions: Appendix 1 (corticosteroids)

**Contra-indications** section 6.3.2

**Hepatic impairment** manufacturer advises avoid in severe impairment—no information available

**Pregnancy** section 6.3.2

**Breast-feeding** section 6.3.2

**Side-effects** section 6.3.2; also nausea, constipation, headache, and drowsiness

**Dose**
- 5 mg in the morning; max. duration of treatment 4 weeks; CHILD safety and efficacy not established

**Clipper®** (Chiesi) Tablets, m/c, ivory, beclometasone dipropionate 5 mg, net price 30-tab pack = £56.56. Label: 25

**BUDESONIDE**

**Indications** see preparations

**Cautions** section 6.3.2; for autoimmune hepatitis, monitor liver function tests every 2 weeks for 1 month, then at least every 3 months; interactions: Appendix 1 (corticosteroids)

**Contra-indications** section 6.3.2

**Hepatic impairment** section 6.3.2

**Pregnancy** section 6.3.2

**Breast-feeding** section 6.3.2

**Side-effects** section 6.3.2

**Dose**
- See preparations

**Budenofalk®** (Dr Falk) Capsules, pink, enclosing e/c granules, budesonide 3 mg, net price 100-cap pack = £75.05. Label: 5, 10, steroid card, 22, 25

**Dose** mild to moderate Crohn’s disease affecting ileum or ascending colon, chronic diarrhoea due to collagenous colitis, ADULT over 18 years, 3 mg 3 times daily for up to 8 weeks; reduce dose for the last 2 weeks of treatment (see also section 6.3.2); CHILD 12–18 years see BNF for Children Autoimmune hepatitis, ADULT over 18 years, induction of remission, 3 mg 3 times daily; maintenance, 3 mg twice daily
**1.5.3 Drugs affecting the immune response**

**Hydrocortisone**

**Indications** ulcerative colitis, proctitis, proctosigmoiditis

**Cautions** section 6.3.2; systemic absorption may occur; prolonged use should be avoided

**Contra-indications** intestinal obstruction, bowel perforation, recent intestinal anastomoses, extensive fistulas; untreated infection

**Side-effects** section 6.3.2; also local irritation

**Dose**
- by mouth, initially 20–40 mg daily (up to 60 mg daily in some cases), preferably taken in the morning after breakfast; continued until remission occurs, followed by reducing doses
- by rectum, see preparations

**Oral preparations**

**Section 6.3.2**

**Rectal preparations**

**Prednisolone** (Non-proprietary) (Pred)

Rectal foam in aerosol pack, prednisolone 20 mg (as metasulphobenzoate sodium)/metered application, net price 14-application canister with disposable applicators = £68.00

Dose proctitis and distal ulcerative colitis, 1 metered application (20 mg prednisolone) inserted into the rectum once or twice daily for 2 weeks, continued for further 2 weeks if good response; CHILD 12–18 years see BNF for Children

**Predsol®** (RPH) (Pred)

Retention enema, prednisolone 20 mg (as sodium phosphate) in 100-mL single-dose disposable packs fitted with a nozzle. Net price 7 = £7.50

Dose rectal and rectosigmoidal ulcerative colitis and Crohn’s disease, by rectum, initially 20 mg at bedtime for 2–4 weeks, continued if good response; CHILD not recommended

**Suppositories**, prednisolone 5 mg (as sodium phosphate). Net price 10 = £1.35

Dose ADULT and CHILD proctitis and rectal complications of Crohn’s disease, by rectum, 5 mg inserted night and morning after a bowel movement

---

**Prednisolone**

**Indications** ulcerative colitis, and Crohn’s disease; other indications, see section 6.3.2, see also preparations

**Cautions** section 6.3.2; systemic absorption may occur with rectal preparations; prolonged use should be avoided

**Contra-indications** section 6.3.2; intestinal obstruction, bowel perforation, recent intestinal anastomoses, extensive fistulas; untreated infection

**Hepatic impairment** section 6.3.2

**Renal impairment** section 6.3.2

**Pregnancy** section 6.3.2

**Breast-feeding** section 6.3.2

**Side-effects** section 6.3.2

**Dose**
- Severe acute Crohn’s disease, maintenance of remission of Crohn’s disease or ulcerative colitis, ADULT over 18 years, by mouth, 2–5 mg/kg daily; some patients may respond to lower doses

**Preparations**

Section 8.2.1

For the role of azathioprine, ciclosporin, mercaptopurine, and methotrexate in the treatment of inflammatory bowel disease, see p. 60.

Folic acid (section 9.1.2) should be given to reduce the possibility of methotrexate toxicity (unlicensed indication). Folic acid is usually given at a dose of 5 mg once weekly on a different day to the methotrexate, alternative regimens may be used in some settings.

**Azathioprine**

**Indications** see under Inflammatory Bowel Disease, p. 60; autoimmune conditions and prophylaxis of transplant rejection (section 8.2.1); rheumatoid arthritis (section 10.1.3); severe refractory eczema (section 13.5.3)

**Cautions** section 8.2.1

**Contra-indications** section 8.2.1

**Hepatic impairment** section 8.2.1

**Renal impairment** section 8.2.1

**Pregnancy** section 8.2.1

**Breast-feeding** section 8.2.1

**Side-effects** section 8.2.1

**Dose**
- Severe acute Crohn’s disease, maintenance of remission of Crohn’s disease or ulcerative colitis, ADULT over 18 years, by mouth, 2–5 mg/kg daily; some patients may respond to lower doses

**Preparations**

Section 8.2.1

For the role of azathioprine, ciclosporin, mercaptopurine, and methotrexate in the treatment of inflammatory bowel disease, see p. 60.
**CICLOSPORIN**  
(Cyclosporin)

**Indications**  severe acute ulcerative colitis refractory to corticosteroid treatment [unlicensed indication]; transplantation and graft-versus-host disease, nephrotic syndrome (section 8.2.2); rheumatoid arthritis (section 10.1.3); atopic dermatitis and psoriasis (section 13.5.3)

**Cautions** section 8.2.2  
**Hepatic impairment** section 8.2.2  
**Renal impairment** section 8.2.2  
**Pregnancy** see Immunosuppressant therapy, p. 615  
**Breast-feeding** section 8.2.2  
**Side-effects** section 8.2.2

**Dose**  
- **By continuous intravenous infusion**, ADULT over 18 years, 2 mg/kg daily over 24 hours; dose adjusted according to blood-cyclosporin concentration and response

**Preparations**  
Section 8.2.2

---

**MERCAPTOPURINE**  
(6-Mercaptopurine)

**Indications**  see under Inflammatory Bowel disease, p. 60; acute leukaemias and chronic myeloid leukaemia (section 8.1.3)

**Cautions** section 8.1.3  
**Hepatic impairment** section 8.1.3  
**Renal impairment** section 8.1.3  
**Pregnancy** section 8.1.3  
**Breast-feeding** section 8.1.3  
**Side-effects** section 8.1.3

**Dose**  
- Severe acute Crohn’s disease, maintenance of remission of Crohn’s disease or ulcerative colitis [unlicensed indications], ADULT over 18 years, **by mouth**, 1–1.5 mg/kg daily; some patients may respond to lower doses

**Preparations**  
Section 8.1.3

---

**METHOTREXATE**

**Indications**  see under Inflammatory Bowel Disease, p. 60; malignant disease (section 8.1.3); rheumatoid arthritis (section 10.1.3); psoriasis (section 13.5.3)

**Cautions** section 10.1.3  
**Contra-indications** section 10.1.3  
**Hepatic impairment** section 10.1.3  
**Renal impairment** section 10.1.3  
**Pregnancy** section 10.1.3  
**Breast-feeding** section 10.1.3  
**Side-effects** section 10.1.3

**Dose**  
- **By subcutaneous injection**, severe active Crohn’s disease, ADULT over 18 years, initially 80 mg, then 40 mg 2 weeks after initial dose or accelerated regimen, initially 160 mg (alternatively can be given as divided injections over 2 days), then 80 mg 2 weeks after initial dose; maintenance, 40 mg on alternate weeks, increased if necessary to 40 mg weekly; review treatment if no response within 12 weeks of initial dose; **CHILD** 6–18 years, see BNF for Children

**Preparations**  
Section 10.1.3

---

**Cytokine modulators**

**Infliximab, adalimumab, and golimumab** are monoclonal antibodies which inhibit the pro-inflammatory cytokine, tumour necrosis factor alpha. They should be used under specialist supervision. Adequate resuscitation facilities must be available when infliximab is used.

**ADALIMUMAB**

**Indications**  see under Inflammatory Bowel Disease, p. 61; ankylosing spondylitis, psoriatic arthritis, rheumatoid arthritis, juvenile idiopathic arthritis (section 10.1.3); psoriasis (section 13.5.3)

**Cautions** section 10.1.3, p. 723  
**Important** See section 10.1.3, p. 723 for information on tuberculosis and blood disorders

**Contra-indications** section 10.1.3, p. 723  
**Pregnancy** section 10.1.3, p. 723  
**Breast-feeding** section 10.1.3, p. 723  
**Side-effects** section 10.1.3, p. 723

**Dose**  
- **By subcutaneous injection**, severe active Crohn’s disease, ADULT over 18 years, initially 80 mg, then 40 mg 2 weeks after initial dose or accelerated regimen, initially 160 mg (alternatively can be given as divided injections over 2 days), then 80 mg 2 weeks after initial dose; maintenance, 40 mg on alternate weeks, increased if necessary to 40 mg weekly; review treatment if no response within 8 weeks of initial dose

**Preparations**  
Section 10.1.3

---

**Note**  
Max. 40 mg administered at a single site
1.5.4 Food allergy

**Food allergy**

Allergy with classical symptoms of vomiting, colic and diarrhoea caused by specific foods such as shellfish should be managed by strict avoidance. The condition should be distinguished from symptoms of occasional food intolerance in those with irritable bowel syndrome. **Sodium cromoglicate** may be helpful as an adjunct to dietary avoidance.

### Sodium Cromoglicate (Sodium cromoglycate)

**Indications**

Food allergy (in conjunction with dietary restriction); asthma (section 3.3.1); allergic conjunctivitis (section 11.4.2); allergic rhinitis (section 12.2.1)

**Pregnancy**

Not known to be harmful

**Breast-feeding**

Unlikely to be present in milk

**Side-effects**

Occasional nausea, rashes, and joint pain

**Dose**

- 200 mg 4 times daily before meals; may be increased if necessary after 2–3 weeks to a max. of 40 mg/kg daily and then reduced according to response.
- **CHILD** 2–14 years 100 mg 4 times daily before meals; may be increased if necessary after 2–3 weeks to a max. of 40 mg/kg daily and then reduced according to response

**Counselling**

Capsules may be swallowed whole or the contents dissolved in hot water and diluted with cold water before taking

**Nalcrom** (Sanofi-Aventis) (FPO)

Capsules, sodium cromoglicate 100 mg. Net price 100-cap pack = £41.14. Label: 22, counselling, see dose above
Thus, laxatives should generally be avoided except where straining will exacerbate a condition (such as angina) or increase the risk of rectal bleeding as in haemorrhoids. Laxatives are also of value in drug-induced constipation, for the expulsion of parasites after anthelmintic treatment, and to clear the alimentary tract before surgery and radiological procedures. Prolonged treatment of constipation is sometimes necessary.

For the role of laxatives in the treatment of irritable bowel syndrome, see p. 62. For the prevention of opioid-induced constipation in palliative care, see p. 22.

Children Laxatives should be prescribed by a healthcare professional experienced in the management of constipation in children. Delays of greater than 3 days between stools may increase the likelihood of pain on passing hard stools leading to anal fissure, anal spasm and eventually to a learned response to avoid defaecation.

In infants, increased intake of fluids, particularly fruit juice containing sorbitol (e.g. prune, pear, or apple), may be sufficient to soften the stool. In infants under 1 year of age with mild constipation, lactulose (section 1.6.4) can be used to soften the stool; either an oral preparation containing macrogols or, rarely, glycerol suppositories can be used to clear faecal impaction. The infant should be referred to a hospital paediatric specialist if these measures fail.

The diet of children over 1 year of age should be reviewed to ensure that it includes an adequate intake of fibre and fluid. An osmotic laxative containing macrogols (section 1.6.4) can also be used, particularly in children with chronic constipation; lactulose is an alternative in children who cannot tolerate a macrogol. If there is an inadequate response to the osmotic laxative, a stimulant laxative (section 1.6.2) can be added.

Treatment of faecal impaction may initially increase symptoms of soiling and abdominal pain. In children over 1 year of age with faecal impaction, an oral preparation containing macrogols (section 1.6.4) is used to clear faecal mass and to establish and maintain soft well-formed stools. If disimpaction does not occur after 2 weeks, a stimulant laxative (section 1.6.2) can be added. If the impacted mass is not expelled following treatment with macrogols and a stimulant laxative, a sodium citrate enema can be administered. Although rectal administration of laxatives may be effective, this route is frequently distressing for the child and may lead to persistence of withholding. A phosphate enema may be administered under specialist supervision if disimpaction does not occur after a sodium citrate enema; a bowel cleansing preparation (section 1.6.5) is an alternative. Manual evacuation under anaesthetic may be necessary if disimpaction does not occur after oral and rectal treatment, or if the child is afraid.

Long-term regular use of laxatives is essential to maintain well-formed stools and prevent recurrence of faecal impaction; intermittent use may provoke relapses. In children with chronic constipation, laxatives should be continued for several weeks after a regular pattern of bowel movements or toilet training is established. The dose of laxatives should then be tapered gradually, over a period of months, according to response. Some children may require laxative therapy for several years.

Pregnancy If dietary and lifestyle changes fail to control constipation in pregnancy, moderate doses of poorly absorbed laxatives may be used. A bulk-forming laxative should be tried first. An osmotic laxative, such as lactulose, can also be used. Bisacodyl or senna may be suitable, if a stimulant effect is necessary.

The laxatives that follow have been divided into 5 main groups (sections 1.6.1–1.6.5). This simple classification disguises the fact that some laxatives have a complex action.

1.6.1 Bulk-forming laxatives

Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis; patients should be advised that the full effect may take some days to develop.

Bulk-forming laxatives are of particular value in those with small hard stools, but should not be required unless fibre cannot be increased in the diet. A balanced diet, including adequate fluid intake and fibre is of value in preventing constipation.

Bulk-forming laxatives can be used in the management of patients with colostomy, ileostomy, haemorrhoids, anal fissure, chronic diarrhoea associated with diverticular disease, irritable bowel syndrome, and as adjuncts in ulcerative colitis (section 1.5). Adequate fluid intake must be maintained to avoid intestinal obstruction. Unprocessed wheat bran, taken with food or fruit juice, is a most effective bulk-forming preparation. Finely ground bran, though more palatable, has poorer water-retaining properties, but can be taken as bran bread or biscuits in appropriately increased quantities. Oat bran is also used.

Methylcellulose, ispaghula, and sterculia are useful in patients who cannot tolerate bran. Methylcellulose also acts as a faecal softener.

Ispaghula husk

Indications see notes above

Cautions adequate fluid intake should be maintained to avoid intestinal obstruction—it may be necessary to supervise elderly or debilitated patients or those with intestinal narrowing or decreased motility

Contra-indications difficulty in swallowing, intestinal obstruction, colonic atony, faecal impaction

Side-effects flatulence, abdominal distension, gastrointestinal obstruction or impaction; hypersensitivity reported

ISPAGHULA HUSK

BNF 68 1.6.1 Bulk-forming laxatives 69

For children with chronic constipation, it may be necessary to exceed the licensed doses of some laxatives. Parents and carers of children should be advised to adjust the dose of laxative in order to establish a regular pattern of bowel movements in which stools are soft, well-formed, and passed without discomfort.

Laxatives should be administered at a time that produces an effect that is likely to fit in with the child’s toilet routine.
1.6.2 Stimulant laxatives

Dose
- See preparations below

Counselling Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed

Fybogel® (Reckitt Benckiser)
Granules, buff, effervescent, sugar- and gluten-free, ispaghula husk 3.5 g/sachet (low Na+), net price 30 sachets (plain, lemon, or orange flavour) = £2.40. Label: 13, counselling, see above

Excipients include aspartame 16 mg/sachet (see section 8.4.1)

Dose 1 sachet or 2 level 5-mL spoonfuls in water twice daily preferably after meals. CHILD (but see section 1.6) 6–12 years ½–1 level 5-mL spoonful in water twice daily, preferably after meals

Isofel® (Potters)
Granules, brown, sugar- and gluten-free, ispaghula husk 90%. Net price 200 g = £3.24. Label: 13, counselling, see above

Dose constipation, 2 level 5-mL spoonfuls in water once or twice daily, preferably at mealtimes. CHILD (but see section 1.6) 6–12 years 1 level 5-mL spoonful in water once or twice daily, preferably at mealtimes

Diarrhoea (section 1.4.1), 1 level 5-mL spoonful 3 times daily

Note May be difficult to obtain

Ispagel Orange® (LPC)
Granules, beige, effervescent, sugar- and gluten-free, ispaghula husk 3.5 g/sachet, net price 30 sachets = £1.69. Label: 13, counselling, see above

Excipients include aspartame (section 8.4.1)

Dose 1 sachet in water 1–3 times daily preferably after meals; CHILD (but see section 1.6) 6–12 years see BNF for Children

Regular® (Procter & Gamble)
Powder, beige, sugar- and gluten-free, ispaghula husk 3.4 g/5.85-g sachet (orange or lemon/lime flavour). Net price 30 sachets = £1.24. Label: 13, counselling, see above

Excipients include aspartame (section 8.4.1)

Dose 1 sachet in 150 mL water 1–3 times daily, preferably after meals; CHILD (but see section 1.6) 6–12 years ½–1 level 5-mL spoonful in water 1–3 times daily, preferably after meals

METHYLCELLULOSE

Indications see notes above

Cautions see under Ispaghula Husk

Side-effects see under Ispaghula Husk

Dose
- See preparations below

Counselling Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed

Celevac® (AMCo)
Tablets, pink, scored, methylcellulose ‘450’ 500 mg, net price 112-tab pack = £3.22. Counselling, see above and dose

Dose constipation and diarrhoea, 3–6 tablets twice daily, in constipation the dose should be taken with at least 300 mL liquid; in diarrhoea, ileostomy, and colostomy control, avoid liquid intake for 30 minutes before and after dose; CHILD 7–12 years see BNF for Children

1.6.2 Stimulant laxatives

Sterculia

Indications see notes above

Cautions see under Ispaghula Husk

Contra-indications see under Ispaghula Husk

Pregnancy manufacturer of Normacol Plus® advises avoid

Breast-feeding manufacturer of Normacol Plus® advises avoid

Side-effects see under Ispaghula Husk

Dose
- See under preparations below

Counselling Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed

Normacol® (Norgine)
Granules, coated, gluten-free, sterculia 62%. Net price 500 g = £6.85; 60 x 7-g sachets = £5.77. Label: 25, 27, counselling, see above

Dose 1–2 heaped 5-mL spoonfuls, or the contents of 1–2 sachets, washed down without chewing with plenty of liquid once or twice daily after meals; CHILD (but see section 1.6) 6–12 years half adult dose

Normacol Plus® (Norgine)
Granules, brown, coated, gluten-free, sterculia 62%, frangula (standardised) 8%. Net price 500 g = £7.32; 60 x 7-g sachets = £6.16. Label: 25, 27, counselling, see above

Dose constipation and after haemorrhoidectomy, 1–2 heaped 5-mL spoonfuls or the contents of 1–2 sachets washed down without chewing with plenty of liquid once or twice daily after meals; CHILD 6–12 years see BNF for Children

Bisacodyl

Indications see under Dose

Cautions see notes above
**DANTRON**  
*Danthon*  

**Indications**  
- only for constipation in terminally ill patients of all ages  

**Cautions**  
- see notes above; *rodent* studies indicate potential carcinogenic risk; avoid prolonged contact with skin (as in incontinent patients or infants wearing nappies)—risk of irritation and excoriation  

**Contra-indications**  
- see notes above  

**Pregnancy**  
- manufacturers of co-danthramer and co-danthrusate advise avoid—no information available  

**Breast-feeding**  
- manufacturers of co-danthramer and co-danthrusate advise avoid—limited information available  

**Side-effects**  
- see notes above; urine may be coloured red  

**Dose**  
- see under preparations  

**With poloxamer ‘188’ (as co-danthramer)**  

**Note**  
- Co-danthramer suspension 5 mL = one co-danthramer capsule, but strong co-danthramer suspension 5 mL = two strong co-danthramer capsules  

**Co-danthramer (Non-proprietary)**  

**Capsules**, co-danthramer 25/200 (dantron 25 mg, poloxamer ‘188’ 200 mg), Net price 60-cap pack = £12.86. Label: 14, (urine red)  

**Dose**  
- 1–2 capsules at bedtime; CHILD 1 capsule at bedtime (restricted indications, see notes above)  

**Strong capsules**, co-danthramer 37.5/500 (dantron 37.5 mg, poloxamer ‘188’ 500 mg). Net price 60-cap pack = £15.55. Label: 14, (urine red)  

**Dose**  
- ADULT and CHILD over 12 years, 1–2 capsules at bedtime (restricted indications, see notes above)  

**Suspension**, co-danthramer 25/200 in 5 mL (dantron 25 mg, poloxamer ‘188’ 200 mg/5 mL). Net price 300 mL = £103.60. Label: 14, (urine red)  

**Note**  
- Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription  

**Brands include**  
- Dulcolax®  

**Dose**  
- 5–10 mL at night; CHILD 2.5–5 mL (restricted indications, see notes above)  

**Strong suspension**, co-danthramer 75/1000 in 5 mL (dantron 75 mg, poloxamer ‘188’ 1 g/5 mL). Net price 300 mL = £252.53. Label: 14, (urine red)  

**Note**  
- Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription  

**Dose**  
- ADULT and CHILD over 12 years, 5 mL at night (restricted indications, see notes above)  

**With docusate sodium (as co-danthrusate)**  

**Co-danthrusate (Non-proprietary)**  

**Capsules**, co-danthrusate 50/60 (dantron 50 mg, docusate sodium 60 mg). Net price 63-cap pack = £42.50. Label: 14, (urine red)  

**Brands include**  
- Normax®  

**Dose**  
- 1–3 capsules at night; CHILD 6–12 years 1 capsule at night (restricted indications, see notes above)  

**Suspension**, yellow, co-danthrusate 50/60 (dantron 50 mg, docusate sodium 60 mg/5 mL). Net price 200 mL = £89.92. Label: 14, (urine red)  

**Brands include**  
- Normax®  

**Dose**  
- 5–15 mL at night; CHILD 6–12 years 5 mL at night (restricted indications, see notes above)  

**DUCUSATE SODIUM**  
*Diocyl sodium sulphasuccinate*  

**Indications**  
- constipation, adjunct in abdominal radiological procedures  

**Cautions**  
- see notes above; do not give with liquid paraffin; rectal preparations not indicated if haemorrhoids or anal fissure  

**Contra-indications**  
- see notes above  

**Pregnancy**  
- not known to be harmful—manufacturer advises caution  

**Breast-feeding**  
- present in milk following oral administration—manufacturer advises caution; rectal administration not known to be harmful  

**Side-effects**  
- see notes above; also rash  

**Dose**  
- By mouth, chronic constipation, up to 500 mg daily in divided doses; CHILD (but see section 1.6) 6 months–2 years 12.5 mg 3 times daily, adjusted according to response (use paediatric solution); 2–12 years 12.5–25 mg 3 times daily, adjusted according to response (use paediatric oral solution)  

**Note**  
- Oral preparations act within 1–2 days  

**With barium meal, ADULT and CHILD over 12 years, 400 mg**  

**Dioctyl**  
*UCB Pharma*  

**Capsules**, yellow/white, docusate sodium 100 mg, net price 30-cap pack = £2.09, 100-cap pack = £6.98  

**Docusol®**  
*Typharm*  

**Adult oral solution**, sugar-free, docusate sodium 50 mg/5 mL, net price 300 mL = £5.49  

**Paediatric oral solution**, sugar-free, docusate sodium 12.5 mg/5 mL, net price 300 mL = £5.29
### 1.6.3 Faecal softeners

#### Rectal preparations

**Norgalax Micro-enema**® (Norgine)

- Enema, docusate sodium 120 mg in 10-g single-dose disposable packs. Net price 10-g unit = £6.67
- Dose
  - **ADULT** and **CHILD** (but see section 1.6) over 12 years, 10-g unit

**GLYCEROL**

(Glycerin)

- **Indications** constipation
- **Dose**
  - See below

**Glycerol Suppositories, BP** (Glycerin Suppositories)

- **Suppositories**, gelatin 140 mg, glycerol 700 mg, purified water to 1 g, net price 12 = 88p (1 g), 88p (2 g), £1.77 (4 g)
- **Dose** 1 suppository moistened with water before use, when required. The usual sizes are for **INFANT** under 1 year, small (1-g mould), **CHILD** 1–12 years medium (2-g mould), **ADULT** and **CHILD** over 12 years, large (4-g mould)

**SENNA**

(Non-proprietary)

- **Indications** constipation
- **Cautions** see notes above
- **Contra-indications** see notes above
- **Pregnancy** see Pregnancy, p. 69
- **Breast-feeding** not known to be harmful
- **Side-effects** see notes above; severe dehydration
- **Dose**
  - **ADULT** 2–6 years see BNF for Children
  - **CHILD** over 12 years, large (4-g mould)

**Sodium Picosulfate**

(Non-proprietary)

- **Indications** constipation; bowel evacuation before abdominal radiological and endoscopic procedures on the colon, and surgery (section 1.6.5); acts within 6–12 hours
- **Cautions** see notes above; active inflammatory bowel disease (avoid if fulminant)
- **Contra-indications** see notes above; severe dehydration
- **Pregnancy** see Pregnancy, p. 69
- **Breast-feeding** not known to be present in milk but manufacturer advises avoid unless potential benefit outweighs risk
- **Side-effects** see notes above; nausea and vomiting
- **Dose**
  - 5–10 mg at night: **CHILD** (but see section 1.6) 1 month–4 years 2.5–10 mg once daily, adjusted according to response; 4–18 years 2.5–20 mg once daily, adjusted according to response
  - **Note** Sodium picosulphate doses in BNF may differ from those in product literature

**Sodium Picosulfate (Non-proprietary)**

- **Elixir**, sodium picosulfate 5 mg/5 mL, net price 100 mL = £1.86
- **Note** The brand name Dulcolax® Pico Liquid (Boehringer Ingelheim) is used for sodium picosulfate elixir 5 mg/5 mL

#### Bowel cleansing preparations

**Section 1.6.5**

**Other stimulant laxatives**

Unstandardised preparations of cascara, frangula, rhubarb, and senna should be avoided as their laxative action is unpredictable. Aloes, colocynth, and jalap should be avoided as they have a drastic purgative action.

#### 1.6.3 Faecal softeners

**Sodium Picosulfate**

(Non-proprietary)

- **Indications** constipation; bowel evacuation before abdominal radiological and endoscopic procedures on the colon, and surgery (section 1.6.5); acts within 6–12 hours
- **Cautions** see notes above; active inflammatory bowel disease (avoid if fulminant)
- **Contra-indications** see notes above; severe dehydration
- **Pregnancy** see Pregnancy, p. 69
- **Breast-feeding** not known to be harmful
- **Side-effects** see notes above; severe dehydration
- **Dose**
  - 5–10 mg at night: **CHILD** (but see section 1.6) 1 month–4 years 2.5–10 mg once daily, adjusted according to response; 4–18 years 2.5–20 mg once daily, adjusted according to response
  - **Note** Sodium picosulphate doses in BNF may differ from those in product literature

**Sodium Picosulfate (Non-proprietary)**

- **Elixir**, sodium picosulfate 5 mg/5 mL, net price 100 mL = £1.86
- **Note** The brand name Dulcolax® Pico Liquid (Boehringer Ingelheim) is used for sodium picosulfate elixir 5 mg/5 mL

#### Bowel cleansing preparations

**Section 1.6.5**

**Other stimulant laxatives**

Unstandardised preparations of cascara, frangula, rhubarb, and senna should be avoided as their laxative action is unpredictable. Aloes, colocynth, and jalap should be avoided as they have a drastic purgative action.

#### Arachis Oil

**Arachis Oil (Non-proprietary)**

- **Enema**, arachis (peanut) oil in 130-mL single-dose disposable packs. Net price 130 mL = £7.98
- **Dose** to soften impacted faeces, 130 mL of the enema should be warmed before use; **CHILD** (but see section 1.6) under 3 years not recommended, over 3 years reduce adult dose in proportion to body-weight (medical supervision only), see **BNF for Children**
16.4 Osmotic laxatives

Osmotic laxatives increase the amount of water in the large bowel, either by drawing fluid from the body into the bowel or by retaining the fluid they were administered with.

Lactulose is a semi-synthetic disaccharide which is not absorbed from the gastro-intestinal tract. It produces an osmotic diarrhoea of low faecal pH, and discourages the proliferation of ammonia-producing organisms. It is therefore useful in the treatment of hepatic encephalopathy.

Macrogols are inert polymers of ethylene glycol which sequester fluid in the bowel; giving fluid with macrogols may reduce the dehydrating effect sometimes seen with osmotic laxatives.

Saline purgatives such as magnesium hydroxide are commonly abused but are satisfactory for occasional use; adequate fluid intake should be maintained. Magnesium salts are useful where rapid bowel evacuation is required. Sodium salts should be avoided as they may give rise to sodium and water retention in susceptible individuals. Phosphate enemas are useful in bowel clearance before radiology, endoscopy, and surgery.

LACTULOSE

Indications constipation (may take up to 48 hours to act), hepatic encephalopathy (portal systemic encephalopathy)

Cautions lactose intolerance; interactions: Appendix 1 (lactulose)

Contra-indications galactosaemia, intestinal obstruction

Pregnancy not known to be harmful; see also Pregnancy, p. 69

Side-effects nausea (can be reduced by administration with water, fruit juice or with meals), vomiting, flatulence, cramps, and abdominal discomfort

Dose See under preparations below

Lactulose (Non-proprietary)

Solution, lactulose 3.1–3.7 g/5 mL with other ketoses. Net price 300-mL = £1.69, 500-mL = £2.82, 10 × 15 mL sachet pack = £2.50

Brands include Diphalac®, Lactugal®, Laevolac®

Dose constipation, initially 15 mL twice daily, adjusted according to response; CHILD (but see section 1.6) under 1 year 2.5 mL twice daily, adjusted according to response; 1–5 years 2.5–10 mL twice daily, adjusted according to response; 5–18 years 5–20 mL twice daily, adjusted according to response

Hepatic encephalopathy, 30–50 mL 3 times daily, subsequently adjusted to produce 2–3 soft stools daily.

CHILD 12–18 years see BNF for Children

Note Lactulose doses in BNF may differ from those in product literature

MACROGOLS (Polyethylene glycols)

Indications see preparations below

Cautions discontinue if symptoms of fluid and electrolyte disturbance; see also preparations below; interactions: Appendix 1 (macrogols)

Contra-indications intestinal perforation or obstruction, paralytic ileus, severe inflammatory conditions of the intestinal tract (such as Crohn’s disease, ulcerative colitis, and toxic megacolon), see also preparations below

Pregnancy limited data, but manufacturer advises that it can be used

Breast-feeding manufacturer advises that it can be used

Side-effects abdominal distension and pain, nausea, flatulence

Dose See preparations below

Macrogol Oral Powder, Compound (Non-proprietary)

Oral powder, macrogol ‘3350’ (polyethylene glycol ‘3350’) 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet, net price 20-sachet pack = £4.45, 30-sachet pack = £6.68. Label: 13, counselling, administration

Brands include Lassido® Orange, Moxasole®

Cautions patients with cardiovascular impairment should not take more than 2 sachets in any 1 hour

Dose chronic constipation, ADULT and CHILD over 12 years, 1–3 sachets daily in divided doses usually for up to 2 weeks; maintenance, 1–2 sachets daily

Faecal impaction, ADULT and CHILD over 12 years, 4 sachets on first day, then increased in steps of 2 sachets daily to max. 8 sachets daily; total daily dose to be drunk within a 6 hour period. After disimpaction, switch to maintenance laxative therapy if required

Counselling Contents of each sachet to be dissolved in half a glass (approx. 125 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours
**Movicol® (Norgine)**

**Oral powder**, macrocol ‘3350’ (polyethylene glycol ‘3350’) 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet, net price 20-sachet pack (lime and lemon flavour) = £4.45, 30-sachet pack (lime- and lemon- or chocolate- or plain-flavoured) = £6.68, 50-sachet pack (lime- and lemon- or plain-flavoured) = £11.13. Label: 13, counselling, administration.

**Note** Amount of potassium chloride varies according to flavour of Movicol® as follows: half-flavour (sugar-free) = 9.0 mg/sachet, lime and lemon flavour = 46.6 mg/sachet; chocolate flavour = 31.7 mg/sachet. 1 sachet when reconstituted with 125 mL water provides K⁺ 5.4 mmol/litre.

**Caution** Patients with cardiovascular impairment should not take more than 2 sachets in any 1 hour.

**Dose**
- Chronic constipation, **Adult** and **Child** over 12 years, 1–3 sachets daily in divided doses usually for up to 3 weeks; maintenance, 1–2 sachets daily.
- Faecal impaction, **Adult** and **Child** over 12 years, 4 sachets on first day, then increased in steps of 2 sachets daily to max. 8 sachets daily; total daily dose to be drunk within a 6 hour period. After disimpaction, switch to maintenance laxative therapy if required.

**Counselling** Contents of each sachet to be dissolved in half a glass (approx. 125 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours.

**Oral concentrate**, macrocol ‘3350’ (polyethylene glycol ‘3350’) 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/25 mL, net price 500 mL (orange-flavoured) = £4.45. Label: 13, counselling, administration.

**Note** 25 mL of oral concentrate when diluted with 100 mL water provides K⁺ 5.4 mmol/litre.

**Dose** chronic constipation, **Adult** and **Child** over 12 years, 25 mL, 1–3 times daily usually for up to 2 weeks; maintenance, 25 mL, 1–2 times daily.

**Counselling** 25 mL of oral concentrate to be diluted with half a glass (approx. 100 mL of water). After dilution the solution should be discarded if unused after 24 hours.

**Movicol®-Half (Norgine)**

**Oral powder**, sugar-free, macrocol ‘3350’ (polyethylene glycol ‘3350’) 6.563 g, sodium bicarbonate 89.3 mg, sodium chloride 175.4 mg, potassium chloride 23.3 mg/sachet, net price 20-sachet pack (lime and lemon flavour) = £2.92, 30-sachet pack = £4.38. Label: 13, counselling, administration.

**Caution** Patients with cardiovascular impairment should not take more than 4 sachets in any 1 hour.

**Dose** chronic constipation, **Adult** and **Child** over 12 years, 2–6 sachets daily in divided doses usually for up to 2 weeks; maintenance, 2–4 sachets daily.

**Counselling** Contents of each sachet to be dissolved in quarter of a glass (approx. 60–65 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours.

**Movicol® Paediatric (Norgine)**

**Oral powder**, macrocol ‘3350’ (polyethylene glycol ‘3350’) 6.563 g, sodium bicarbonate 89.3 mg, sodium chloride 175.4 mg, potassium chloride 25.1 mg/sachet, net price 30-sachet pack (chocolate- or plain-flavoured) = £4.38. Label: 13, counselling, administration.

**Note** Amount of potassium chloride varies according to flavour of Movicol® Paediatric as follows: chocolate flavour = 15.9 mg/sachet; plain flavour (sugar-free) = 25.1 mg/sachet. 1 sachet when reconstituted with 62.5 mL water provides K⁺ 5.4 mmol/litre.

**Caution** With high doses, impaired gag reflexes, reflux oesophagitis, impaired consciousness.

**Contra-indications** cardiovascular impairment, renal impairment.

**Dose** chronic constipation and prevention of faecal impaction, **Child** under 2 years see BNF for Children; 2–6 years 1 sachet daily, adjusted according to response (max. 4 sachets daily); 6–12 years 2 sachets daily, adjusted according to response (max. 4 sachets daily).

**Faecal impaction, Child** under 5 years see BNF for Children: 5–12 years 4 sachets on first day then increased in steps of 2 sachets daily to 12 sachets daily (taken in divided doses over 12 hours each day until impaction resolves). After disimpaction, switch to maintenance laxative therapy.

**Counselling** Contents of each sachet to be dissolved in quarter of a glass (approx. 60–65 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 24 hours.

---

**Magnesium Hydroxide**

**Magnesium Hydroxide Mixture, BP**

Aqueous suspension containing about 8% hydrated magnesium oxide. Do not store in cold place.

**Dose** constipation, 30–45 mL with water at bedtime when required.

**Side-effects**
- Colic
- See preparations

**Magnesium hydroxide with liquid paraffin**

**Liquid Paraffin and Magnesium Hydroxide Oral Emulsion, BP**

Oral emulsion, 25% liquid paraffin in aqueous suspension containing 6% hydrated magnesium oxide.

**Dose** constipation, 5–20 mL when required.

**Note** Liquid paraffin and magnesium hydroxide preparations on sale to the public include: Milpar®, Milprofex.

**Magnesium sulfate**

**Magnesium Sulfate**

**Dose** rapid bowel evacuation (acts in 2–4 hours) 5–10 g in a glass of water preferably before breakfast.

**Note** Magnesium sulfate is on sale to the public as Epsom Salts.

**Bowel cleansing preparations**

Section 1.6.5

**Phosphates (Rectal)**

**Indications** rectal use in constipation; bowel evacuation before abdominal radiological procedures, endoscopy, and surgery.

**Caution** elderly and debilitated; see also notes above.

**Interactions**: Appendix 1 (antacids).

**Contra-indications** acute gastro-intestinal conditions.

**Hepatic impairment** avoid in hepatic coma if risk of renal failure.

**Renal impairment** avoid or reduce dose; increased risk of toxicity.

**Side-effects**
- Colic

---

**Phosphates (Rectal)**

**Indications**

- Rectal use in constipation, bowel evacuation before abdominal radiological procedures, endoscopy, and surgery.
- Caution elderly and debilitated, electrolyte disturbances, congestive heart failure, ascites, uncontrolled hypertension, maintain adequate hydration.
- Contra-indications acute gastro-intestinal conditions (including gastro-intestinal obstruction, inflammatory bowel disease, and conditions associated with increased colonic absorption).
- Renal impairment use with caution.
- Side-effects local irritation, electrolyte disturbances.
- See under preparations.
Bowel cleansing preparations are used before colonic surgery, colonoscopy, or radiological examination to ensure the bowel is free of solid contents. They are not treatments for constipation.

Cautions Bowel cleansing preparations should be used with caution in patients with fluid and electrolyte disturbances. Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances. Hypovolaemia should be corrected before administration of bowel cleansing preparations. Adequate hydration should be maintained during treatment. Bowel cleansing preparations should be used with caution in colitis (avoid if acute severe colitis), in children, in the elderly, or in those who are debilitated. They should also be used with caution in patients with impaired gag reflex or possibility of regurgitation or aspiration.

Other oral drugs should not be taken one hour before or after administration of bowel cleansing preparations because absorption may be impaired. Consider withholding ACE inhibitors, angiotensin-II receptor antagonists, and NSAIDs on the day that bowel cleansing preparations are given and for up to 72 hours after the procedure. Also consider withholding diuretics on the day that bowel cleansing preparations are given. See also Combined Hormonal Contraceptives (section 7.3.1) and Oral Progestogen-only Contraceptives (section 7.3.2.1).

Contra-indications Bowel cleansing preparations are contra-indicated in patients with gastro-intestinal obstruction or perforation, gastric retention, acute severe colitis, or toxic megacolon.

Side-effects Side-effects of bowel cleansing preparations include nausea, vomiting, abdominal pain (usually transient—reduced by taking more slowly), and abdominal distention. Less frequent side-effects include headache, dizziness, dehydrations, and electrolyte disturbances.

SODIUM CITRATE (RECTAL)

Indications Rectal use in constipation

Cautions Elderly and debilitated; see also notes above

Contra-indications Acute gastrointestinal conditions

Dose

- See under preparations

Micolette Micro-enema® (Pinewood)

Enema, sodium citrate 450 mg, sodium lauryl sulphocatetate 45 mg, glycercol 625 mg, together with potas-sium sorbate and sorbitol in a viscous solution, in 5-mL single-dose disposable packs with nozzle. Net price 5 mL = 41p

Dose ADULT and CHILD over 3 years, 5–10 mL (but see section 1.6)

Micralax Micro-enema® (RPH)

Enema, sodium citrate 450 mg, sodium alkylsulphocatetate 45 mg, sorbic acid 5 mg, together with glycerol and sorbitol in a viscous solution in 5-mL single-dose disposable packs with nozzle. Net price 5 mL = 41p

Dose ADULT and CHILD over 3 years, 5 mL (but see section 1.6)

Relaxit Micro-enema® (Crawford)

Enema, sodium citrate 450 mg, sodium lauryl sulphate 75 mg, sorbic acid 5 mg, together with glycercol and sorbitol in a viscous solution in 5-mL single-dose disposable packs with nozzle. Net price 5 mL = 43p

Dose ADULT and CHILD (but see section 1.6) 5 mL (insert only half nozzle length in child under 3 years)

MACROGOLS

Indications See notes above

Cautions See notes above; also heart failure

Contra-indications See notes above

Pregnancy Manufacturers advise use only if essential—no information available

Breast-feeding Manufacturers advise use only if essential—no information available

Side-effects See notes above; also fatigue, sleep disturbances, and anal discomfort

Dose

- See preparations

Klean-Prep® (Norgine)

Oral powder, sugar-free, macrogol ‘3350’ (polyethylene glycol ‘3350’) 59 g, anhydrous sodium sulfate 5.685 g, sodium bicarbonate 1.685 g, sodium chloride 1.465 g, potassium chloride 743 mg/sachet, net price 4 sachets = £9.07. Label: 10, patient information leaflet, 13, counselling

Excipients include aspartame (section 9.4.1)

Electrolytes 1 sachet when reconstituted with 1 litre of water provides Na⁺ 125 mmol, K⁺ 10 mmol, Cl⁻ 35 mmol, HCO₃⁻ 40 mmol

Dose bowel evacuation before surgery, colonoscopy, or radiological examination, 2 litres of reconstituted solution on the evening before procedure and 2 litres of reconstituted solution on the morning of procedure; alternatively, a glass (approx. 250 mL) of reconstituted solution every 10–15 minutes, or by nasogastric tube 20–30 mL/minute, starting on the day before procedure until 4 liters have been consumed. Treatment can be stopped if bowel motions become watery and clear; CHILD 12–18 years see BNF for Children

Counselling 1 sachet should be reconstituted with 1 litre of water. Flavouring such as clear fruit cordials may be added if required. Solid food should not be taken for at least 2 hours before starting treatment. After reconstitution, the solution should be kept in a refrigerator and discarded if unused after 24 hours.
Moviprep® (Norgine)

Oral powder, lemon- or orange-flavoured, Sachet A (containing macrogol ‘3350’ (polyethylene glycol ‘3350’)) 100 g, anhydrous sodium sulphate 7.5 g, sodium chloride 2.691 g, potassium chloride 1.015 g) and Sachet B (containing ascorbic acid 4.7 g, sodium ascorbate 5.9 g), net price 4-sachet pack (2 each of sachet A and B) = £9.87. Label: 10, patient information leaflet, 13, counselling, see below

Excipients include aspartame (section 9.4.1)

Electrolytes 1 pair of sachets (A+B) when reconstituted with 1 litre of water provides Na+ 181.6 mmol (Na+ 56.2 mmol absorbable), K+ 14.2 mmol, Cl– 59.8 mmol

Contra-indications G6PD deficiency

Renal impairment caution if eGFR less than 30 mL/minute/1.73 m²

Dose bowel evacuation for surgery, colonoscopy or radiological examination, ADULT over 18 years, 1 litre of reconstituted solution on the evening before procedure and 1 litre of reconstituted solution early on the morning of procedure; alternatively, 2 litres of reconstituted solution on the evening before procedure; treatment should be completed at least 1 hour before colonoscopy

Counselling. One pair of sachets (A and B) should be reconstituted in 1 litre of water and taken over 1–2 hours. Solid food should not be taken during treatment until procedure completed. 1 litre of other clear fluid should also be taken during treatment. Treatment can be stopped if bowel motions become watery and clear

**MAGNESIUM CITRATE**

Reconstitution of a sachet containing 11.57 g magnesium carbonate and 17.79 g anhydrous citric acid produces a solution containing magnesium citrate

Indications see preparations

Cautions see notes above

Contra-indications see notes above

Hepatic impairment avoid in hepatic coma if risk of renal failure

Renal impairment avoid if eGFR less than 30 mL/minute/1.73 m²—risk of hypermagnesaemia

Pregnancy caution

Breast-feeding caution

Side-effects see notes above; also chest pain, arrhythmias, asthma, and renal failure

Dose

- See preparations

**Citramag®** (Sanochemia)

Oral powder, sugar-free, effervescent, magnesium carbonate 11.57 g, anhydrous citric acid 17.79 g, sachet price 10-sachet pack (lemon and lime flavour) = £18.92. Label: 10, patient information leaflet, 13, counselling, see below

Electrolytes Mg2+ 118 mmol/tablet

Dose bowel evacuation for surgery, colonoscopy or radiological examination, on day before procedure; 1 sachet at 8 a.m. and 1 sachet between 2 and 4 p.m.; CHILD 5–10 years one-third adult dose; over 10 years and frail ELDERLY one-half adult dose

Counselling One sachet should be reconstituted with 200 mL of hot water; the solution should be allowed to cool for approx. 30 minutes before drinking. Low residue or fluid only diet (e.g. water, fruit squash, clear soup, black tea or coffee) recommended before procedure (according to prescriber’s advice) and copious intake of clear fluids recommended until procedure completed.

**PHOSPHATES (ORAL)**

Indications see preparations

Cautions see notes above; also cardiac disease (avoid in congestive cardiac failure)

Contra-indications see notes above; also ascites; congestive cardiac failure

**Hepatic impairment** use with caution in cirrhosis; avoid in ascites

**Renal impairment** avoid if eGFR less than 60 mL/minute/1.73 m²

**Pregnancy** caution

**Breast-feeding** caution

**Side-effects** see notes above; also chest pain, arrhythmias, asthma, and renal failure

**Dose**

- See preparations

**OsmoPrep®** (TMC)

Tablets, monobasic sodium phosphate monohydrate 1.102 g, disodium phosphate 398 mg, net price 32-tab pack = £8.50. Label: 10, patient information leaflet, counselling, see below

Electrolytes Na+ 13.6 mmol, Mg2+ 0.34 mmol, phosphate 10.8 mmol/tablet

Dose bowel evacuation before diagnostic procedure, ADULT over 18 years, 4 tablets every 15 minutes until a total of 20 tablets have been consumed on the evening before procedure, then on the next day (starting 3–5 hours before procedure) 4 tablets every 15 minutes until a total of 12 tablets have been consumed, do not repeat course within 7 days

Counselling On the day before procedure, a light, low-fibre breakfast may be consumed in the morning, clear liquid diet recommended after 12 noon. Each dose of 4 tablets to be taken with 250 mL clear liquid. Copious intake of water or other clear liquids recommended during treatment

**Fleet Phospho-soda®** (Casen-Fleet)

Oral solution, sugar-free, sodium dihydrogen phosphate dihydrate 24.4 g, disodium phosphate dodecahydrate 10.8 g/45 mL. Net price 2 x 45-mL bottles = £4.79. Label: 10, patient information leaflet, counselling

Electrolytes Na+ 217 mmol, phosphate 186 mmol/45 mL

Dose bowel evacuation before colonoscopy, colonoscopy or radiological examination, ADULT over 18 years, 45 mL diluted with half a glass (120 mL) of cold water, followed by one full glass (240 mL) of cold water Timing of doses is dependent on the time of the procedure

For morning procedure, first dose should be taken at 7 a.m. and second at 7 p.m. on day before the procedure

For afternoon procedure, first dose should be taken at 7 p.m. on day before and second dose at 7 a.m. on day of the procedure

Acts within half to 6 hours of first dose

Counselling Intake of solid food should be stopped for at least 6 hours before starting treatment and until procedure completed. Copious intake of water or other clear fluids (e.g. clear soup, strained fruit juice without pulp, black tea or coffee) recommended until midnight before morning procedure and until 8 a.m. before afternoon procedure. At least one glass (approx 240 mL) of water or other clear fluid should also be taken immediately before each dose

**SODIUM PICOSULFATE WITH MAGNESIUM CITRATE**

Indications see preparations

Cautions see notes above; also recent gastro-intestinal surgery; cardiac disease (avoid in congestive cardiac failure)

Contra-indications see notes above; also gastro-intestinal ulceration; ascites; congestive cardiac failure

Hepatic impairment avoid in hepatic coma if risk of renal failure

Renal impairment avoid if eGFR less than 30 mL/minute/1.73 m²—risk of hypermagnesaemia

Pregnancy caution

Breast-feeding caution

**Bowel cleansing preparations** BNF 68
Side-effects see notes above; also anal discomfort, sleep disturbances, fatigue, and rash

Dose

- See preparations

**CitraFleet**® (Cazen-Fleet)

| Oral powder, sodium picosulfate 10 mg/sachet, with magnesium citrate, net price 2-sachet pack (lemon-flavoured) = £3.25. Label: 10, patient information leaflet, 13, counselling, see below |

**Electrolytes**

- **K⁺** 5 mmol, **Mg²⁺ 86 mmol/sachet**

| Dose | bowel evacuation on day before radiological examination, endoscopy, or surgery, **ADULT** over 18 years, 1 sachet before 8 a.m. then 1 sachet 6–8 hours later |
| Acts within 3 hours of first dose |

Counselling

- One sachet should be reconstituted with 150 mL (approx. half a glass) of cold water; patients should be warned that heat is generated during reconstitution and that the solution should be allowed to cool before drinking. Low residue diet recommended on the day before procedure and copious intake of water or other clear fluids recommended during treatment

**Picolax**® (Ferring)

| Oral powder, sugar-free, sodium picosulfate 10 mg/sachet, with magnesium citrate, net price 20-sachet pack = £33.90. Label: 10, patient information leaflet, 13, counselling, see below |

**Electrolytes**

- **K⁺** 5 mmol, **Mg²⁺ 87 mmol/sachet**

| Dose | bowel evacuation on day before radiological procedure, endoscopy, or surgery, **ADULT** and **CHILD** over 9 years, 1 sachet before 8 a.m. then 1 sachet 6–8 hours later; **CHILD** 1–2 years, quarter sachet before 8 a.m. then quarter sachet 6–8 hours later; 2–4 years, half sachet before 8 a.m. then half sachet 6–8 hours later; 4–9 years, 1 sachet before 8 a.m. then half sachet 6–8 hours later |
| Acts within 3 hours of first dose |

Counselling

- One sachet should be reconstituted with 150 mL (approx. half a glass) of cold water; patients should be warned that heat is generated during reconstitution and that the solution should be allowed to cool before drinking. Low residue diet recommended on the day before procedure and copious intake of water or other clear fluids recommended during treatment

**1.6.6 Peripheral opioid-receptor antagonists**

Methylnaltrexone is a peripherally acting opioid-receptor antagonist that is licensed for the treatment of opioid-induced constipation in patients receiving palliative care, when response to other laxatives is inadequate; it should be used as an adjunct to existing laxative therapy. Methylnaltrexone does not alter the central analgesic effect of opioids. For the prevention of opioid-induced constipation in palliative care, see p. 22.

**METHYLNALTREXONE BROMIDE**

Indications opioid-induced constipation in terminally ill patients, when response to other laxatives is inadequate

Cautions diverticular disease; faecal impaction; patients with colostomy or peritoneal catheter

Contra-indications gastro-intestinal obstruction; acute surgical abdominal conditions

Hepatic impairment manufacturer advises avoid in severe hepatic impairment—no information available

Renal impairment if eGFR less than 30 mL/minute/1.73 m², reduce dose as follows: body-weight under 62 kg, 75 micrograms/kg on alternate days; body-weight 62–114 kg, 8 mg on alternate days; body-weight over 114 kg, 75 micrograms/kg on alternate days

Pregnancy toxicity at high doses in animal studies—manufacturer advises avoid unless essential

Breast-feeding manufacturer advises use only if potential benefit outweighs risk—present in milk in animal studies

Side-effects abdominal pain, nausea, diarrhoea, flatulence; dizziness; injection site reactions, hyperhidrosis; also reported gastro-intestinal perforation

Dose

- By subcutaneous injection, **ADULT** over 18 years, body-weight under 38 kg, 150 micrograms/kg on alternate days; body-weight 38–62 kg, 8 mg on alternate days; body-weight 62–114 kg, 12 mg on alternate days; body-weight over 114 kg, 150 micrograms/kg on alternate days; may be given less frequently depending on response; 2 consecutive doses may be given 24 hours apart if no response to treatment on the preceding day; rotate sites of injection; max. duration of treatment 4 months

Note May act within 30–60 minutes

**Relistor**® (Wyeth) Injection, methylnaltrexone bromide 20 mg/mL, net price 0.6-mL vial = £21.05, 7-vial pack (with syringes and needles) = £147.35

**Linaclotide** is a guanylate cyclase-C receptor agonist that is licensed for the treatment of moderate to severe irritable bowel syndrome associated with constipation. It increases intestinal fluid secretion and transit, and decreases visceral pain. It is metabolised within the gastro-intestinal tract and is virtually undetectable in the plasma after therapeutic doses. The **Scottish Medicines Consortium** (p. 4) has advised (May 2013) that linaclotide (Costello)® is accepted for restricted use within NHS Scotland for moderate to severe irritable bowel syndrome in patients whose condition has not responded adequately to all other treatments, or who are intolerant of them. For other treatments used in irritable bowel syndrome see section 1.5.

**Lubiprostone** is a chloride-channel activator that acts in the gut to increase intestinal fluid secretion, which increases motility. It is licensed for the treatment of chronic idiopathic constipation in adults whose condition has not responded adequately to lifestyle changes (including dietary changes).

**Prucalopride** is a selective serotonin 5HT₄-receptor agonist with prokinetic properties. It is licensed for the treatment of chronic constipation in women, when other laxatives have failed to provide an adequate response. Headache and gastro-intestinal symptoms (including abdominal pain, nausea, and diarrhoea) are the most frequent side-effects. The side-effects generally occur at the start of treatment and are usually transient. The **Scottish Medicines Consortium** (p. 4) has advised (November 2010) that prucalopride (Resolor)® is not recommended for use within NHS Scotland because weaknesses in the clinical data prevent an assessment of its efficacy in the target population.
1 Gastro-intestinal system

NICE guidance
Prucalopride for constipation in women (December 2010)
Prucalopride is recommended for the treatment of chronic constipation in women for whom treatment with at least 2 laxatives from different classes, at the highest tolerated recommended doses for at least 6 months, has failed and invasive treatment is being considered. Prucalopride should be prescribed only by clinicians experienced in the treatment of chronic constipation. Treatment should be reviewed if prucalopride is not effective after 4 weeks.
www.nice.org.uk/TA211

LINACLOTIDE

Indications moderate to severe irritable bowel syndrome with constipation
Cautions predisposition to fluid and electrolyte disturbances
Contra-indications gastro-intestinal obstruction; inflammatory bowel disease
Pregnancy manufacturer advises avoid
Breast-feeding unlikely to be present in milk in significant amounts, but manufacturer advises avoid
Side-effects diarrhoea (if severe or prolonged, consider suspending treatment), flatulence, abdominal pain or distension, dizziness; less commonly appetite, hypokalaemia, dehydration, orthostatic hypotension
Dose
• ADULT over 18 years, 290 micrograms once daily; review treatment if no response after 4 weeks
Constella® (Almirall) ▼ £38.69
Capsules, linaclotide 290 micrograms, net price 28-cap pack = £37.56. Label: 22.
Note Dispense in original container (contains desiccant); discard any capsules remaining 4 weeks after opening

LUBIPROSTONE

Indications chronic idiopathic constipation when response to lifestyle changes (including diet) inadequate
Contra-indications gastro-intestinal obstruction
Hepatic impairment initially 24 micrograms once daily in moderate to severe impairment; if tolerated, and if necessary, increased to 24 micrograms twice daily
Pregnancy manufacturer advises avoid—toxicity in animal studies
Breast-feeding manufacturer advises avoid
Side-effects nausea, diarrhoea, abdominal pain, dyspepsia, flatulence, palpitation, oedema, hot flush, dyspnoea, headache, dizziness, hyperhidrosis; less commonly vomiting, chest pain, syncope, muscle spasm; also reported tachycardia, influenza-like symptoms, rash
Dose
• ADULT over 18 years, 24 micrograms twice daily for 2 weeks

Amitiza® (Sucampo) ▼ £53.48
Note Dispense in original container; discard any capsules remaining 4 weeks after opening

PRUCALOPRIDE

Indications chronic constipation in women when other laxatives fail to provide an adequate response
Cautions history of arrhythmias or ischaemic heart disease; concomitant use with drugs that prolong QT interval; severe, unstable chronic illness
Contra-indications intestinal perforation or obstruction; severe inflammatory conditions of the intestinal tract (such as Crohn’s disease, ulcerative colitis, and toxic megacolon)
Hepatic impairment in severe impairment, initially 1 mg once daily, increased if necessary to 2 mg once daily
Renal impairment max. 1 mg daily if eGFR less than 30 mL/minute/1.73 m²
Pregnancy manufacturer advises avoid and recommends effective contraception during treatment
Breast-feeding manufacturer advises avoid—present in milk
Side-effects nausea, vomiting, abdominal pain, dyspepsia, flatulence, diarrhoea, rectal bleeding; headache, dizziness, fatigue; polyuria; less commonly anorexia, palpitation, tremor, and fever
Dose
• ADULT over 18 years, 2 mg once daily; ELDERLY over 65 years, initially 1 mg once daily; increased if necessary to 2 mg once daily
Note Review treatment if no response after 4 weeks
Resolor® (Shire) ▼ £38.69
Tablets, f/c, prucalopride (as succinate) 1 mg (white), net price 28-tab pack = £38.69; 2 mg (pink), 28-tab pack = £59.52

1.7 Local preparations for anal and rectal disorders

1.7.1 Soothing haemorrhoidal preparations
1.7.2 Compound haemorrhoidal preparations with corticosteroids
1.7.3 Rectal sclerosants
1.7.4 Management of anal fissures

Anal and perianal pruritus, soreness, and excoriation are best treated by application of bland ointments and suppositories (section 1.7.1). These conditions occur commonly in patients suffering from haemorrhoids, fissures, and proctitis. Cleansing with attention to any minor faecal soiling, adjustment of the diet to avoid hard stools, the use of bulk-forming materials such as bran (section 1.6.1) and a high residue diet are helpful. In proctitis these measures may supplement treatment with corticosteroids or sulfasalazine (see section 1.5).

When necessary, topical preparations containing local anaesthetics (section 1.7.1) or corticosteroids (section 1.7.2) are used, provided perianal thrush has been excluded. Perianal thrush is treated with a topical antifungal preparation (section 13.10.2).

For the management of anal fissures, see section 1.7.4.
**1.7.1 Soothing haemorrhoidal preparations**

Soothing preparations containing mild astringents such as bismuth subgallate, zinc oxide, and hamamelis may give symptomatic relief in haemorrhoids. Many proprietary preparations also contain lubricants, vaso-constrictors, or mild antisepsics.

Local anaesthetics are used to relieve pain associated with *haemorrhoids* and *pruritus ani* but good evidence is lacking. Lidocaine ointment (section 15.2) is used before emptying the bowel to relieve pain associated with anal fissure. Alternative local anaesthetics include tetracaine, cinchocaine (dibucaine), and pramocaine (pramoxine), but they are more irritant. Local anaesthetic ointments can be absorbed through the rectal mucosa therefore excessive application should be avoided, particularly in infants and children. Preparations containing local anaesthetics should be used for short periods only (no longer than a few days) since they may cause sensitisation of the anal skin.

**Suppositories**, benzyl benzoate 33 mg, bismuth oxide 24 mg, bismuth subgallate 59 mg, hydrocortisone acetate 10 mg, Peru balsam 49 mg, zinc oxide 296 mg. Net price $12 = £1.74

**Dose** insert 1 suppository night and morning and after a bowel movement; do not use for longer than 7 days; **CHILD** not recommended

**Note** A proprietary brand (*Anusol Plus HC*® suppositories) is on sale to the public

**Perinal®** (Dermal)

Spray application, hydrocortisone 0.2%, lidocaine hydrochloride 1%. Net price 30-mL pack = £6.11

**Dose** ADULT *and* **CHILD** over 14 years, spray once over the affected area up to 3 times daily; do not use for longer than 7 days without medical advice; **CHILD** under 14 years on medical advice only

**Proctofoam HC®** (Meda) *(Pbm)*

Foam in aerosol pack, hydrocortisone acetate 1%, pramocaine hydrochloride 1%. Net price 21.2-g pack (approx. 40 applications) with applicator = £6.07

**Dose** haemorrhoids and proctitis, 1 applicatorful (4–6 mg hydrocortisone acetate, 4–6 mg pramocaine hydrochloride) by rectum 2–3 times daily and after each bowel movement (max. 4 times daily); do not use for longer than 7 days

**Suppositories**, cinchocaine (dibucaine) hydrochloride 5 mg, hydrocortisone 5 mg. Net price $12 = £5.08

**Dose** insert 1 suppository night and morning and after a bowel movement; do not use for longer than 7 days

**Proctosedyl®** (Sanoﬁ-Aventis) *(Pbm)*

**Ointment**, cinchocaine (dibucaine) hydrochloride 0.5%, hydrocortisone 0.5%. Net price 30 g = £10.34 (with cannula)

**Dose** apply morning and night and after a bowel movement, externally or by rectum; do not use for longer than 7 days

**Suppositories**, cinchocaine (dibucaine) hydrochloride 1 mg, prednisolone hexanoate 1.3 mg. Net price $12 = £1.38

**Dose** insert 1 suppository daily after a bowel movement, externally or by rectum 2–3 times daily and after each bowel movement (max. 4 times daily), then once daily for a few days after symptoms have cleared

**Scheriproct®** (Bayer) *(Pbm)*

**Suppositories**, cinchocaine (dibucaine) hydrochloride 1 mg, prednisolone hexanoate 1.3 mg. Net price $12 = £1.38

**Dose** insert 1 suppository daily after a bowel movement, for 5–7 days (in severe cases initially 2–3 times daily)

**Ultraproct®** (Meadow) *(Pbm)*

**Ointment**, cinchocaine (dibucaine) hydrochloride 0.5%, fluocortolone caproate 0.095%, fluocortolone pivalate 0.092%, net price 30 g (with rectal nozzle) = £4.57

**Dose** apply twice daily for 5–7 days (3–4 times daily on 1st day if necessary), then once daily for a few days after symptoms have cleared

**Suppositories**, cinchocaine (dibucaine) hydrochloride 1 mg, fluocortolone caproate 630 micrograms, fluocortolone pivalate 610 micrograms. Net price $12 = £2.15

**Dose** insert 1 suppository daily after a bowel movement, for 5–7 days (in severe cases initially 2–3 times daily) then 1 suppository every other day for 1 week

**1.7.2 Compound haemorrhoidal preparations with corticosteroids**

Corticosteroids are often combined with local anaesthetics and soothing agents in preparations for haemorrhoids. They are suitable for occasional short-term use after exclusion of infections, such as herpes simplex; prolonged use can cause atrophy of the anal skin. See section 13.4 for general comments on topical corticosteroids and section 1.7.1 for comment on local anaesthetics.

**Children** Haemorrhoids in children are rare. Treatment is usually symptomatic and the use of a locally applied cream is appropriate for short periods; however, local anaesthetics can cause stinging initially and this may aggravate the child’s fear of defaecation.

**Anugesic-HC®** *(Pfizer)* *(Pbm)*

**Cream**, benzyl benzoate 1.2%, bismuth oxide 0.875%, hydrocortisone acetate 0.5%, Peru balsam 1.85%, pramocaine hydrochloride 1%, zinc oxide 12.35%. Net price 30 g (with rectal nozzle) = £3.71

**Dose** apply night and morning and after a bowel movement; do not use for longer than 7 days; **CHILD** not recommended

**Suppositories**, buff, benzyl benzoate 33 mg, bismuth oxide 24 mg, bismuth subgallate 59 mg, hydrocortisone acetate 5 mg, Peru balsam 49 mg, pramocaine hydrochloride 27 mg, zinc oxide 296 mg. Net price $12 = £2.69

**Dose** insert 1 suppository night and morning and after a bowel movement; do not use for longer than 7 days; **CHILD** not recommended

**Anusol-HC®** *(McNeil)* *(Pbm)*

**Ointment**, benzyl benzoate 1.25%, bismuth oxide 0.875%, bismuth subgallate 2.25%, hydrocortisone acetate 0.25%, Peru balsam 1.875%, zinc oxide 10.75%. Net price 30 g (with rectal nozzle) = £2.49

**Dose** apply night and morning and after a bowel movement; do not use for longer than 7 days; **CHILD** not recommended

**Note** A proprietary brand (*Anusol Plus HC*® ointment) is on sale to the public

**Perinal®** (Dermal)

Spray application, hydrocortisone 0.2%, lidocaine hydrochloride 1%. Net price 30-mL pack = £6.11

**Dose** ADULT *and* **CHILD** over 14 years, spray once over the affected area up to 3 times daily; do not use for longer than 7 days without medical advice; **CHILD** under 14 years on medical advice only
1.7.3 Rectal sclerosants

Uniroid-HC® (Chemidex) (PoM)

Ointment, cinchocaine (dibucaine) hydrochloride 0.5%, hydrocortisone 0.5%. Net price 30 g (with applicator) = £4.23

Dose ADULT and CHILD over 12 years, apply twice daily and after a bowel movement, externally or by rectum; do not use for longer than 7 days; CHILD under 12 years on medical advice only

Suppositories, cinchocaine (dibucaine) hydrochloride 5 mg, hydrocortisone 5 mg. Net price 12 = £1.91

Dose ADULT and CHILD over 12 years, insert 1 suppository twice daily and after a bowel movement; do not use for longer than 7 days

Xyloproct® (AstraZeneca) (PoM)

Ointment (water-miscible), aluminium acetate 3.5%, hydrocortisone acetate 0.275%, lidocaine 5%, zinc oxide 18%, net price 20 g (with applicator) = £4.19

Dose apply several times daily; short-term use only

1.7.4 Management of anal fissures

The management of anal fissures requires stool softening by increasing dietary fibre in the form of bran or by using a bulk-forming laxative. Short-term use of local anaesthetic preparations may help (section 1.7.1). If these measures are inadequate, the patient should be referred for specialist treatment in hospital. The use of a topical nitrate (e.g. glyceryl trinitrate 0.4% ointment) may be considered. Before considering surgery, topical diltiazem 2% may be used twice daily [unlicensed indication] in patients with chronic anal fissures unresponsive to topical nitrates.

The Scottish Medicines Consortium (p. 4) has advised (January 2008) that glyceryl trinitrate 0.4% ointment (Rectogesic®) is not recommended for use within NHS Scotland for the relief of pain associated with chronic anal fissure.

GLYCERYL TRINITRATE

Indications anal fissure; angina, left ventricular failure (section 2.6.1); extravasation (section 10.3)

Cautions section 2.6.1

Contra-indications section 2.6.1

Hepatic impairment section 2.6.1

Renal impairment section 2.6.1

Pregnancy section 2.6.1

Breast-feeding section 2.6.1

Side-effects section 2.6.1; also diarrhoea, burning, itching, and rectal bleeding

Dose

See preparations

Rectogesic® (ProStrakan) (PoM)

Rectal ointment, glyceryl trinitrate 0.4%, net price 30 g = £39.30

Excipients include lanolin, propylene glycol

Dose ADULT over 18 years, apply 2.5 cm of ointment to anal canal every 12 hours until pain stops; max. duration of use 8 weeks

Note 2.5 cm of ointment contains glyceryl trinitrate 1.5 mg; discard tube 8 weeks after first opening

1.8 Stoma care

Prescribing for patients with stoma calls for special care. The following is a brief account of some of the main points to be borne in mind.

Enteric-coated and modified-release preparations are unsuitable, particularly in patients with an ileostomy, as there may not be sufficient release of the active ingredient.

Laxatives Enemas and washouts should not be prescribed for patients with an ileostomy as they may cause rapid and severe loss of water and electrolytes.

Colostomy patients may suffer from constipation and whenever possible should be treated by increasing fluid intake or dietary fibre. Bulk-forming drugs (section 1.6.1) should be tried. If they are insufficient, as small a dose as possible of senna (section 1.6.2) should be used.

Antidiarrheals Drugs such as loperamide, codeine phosphate, or co-phenotrope (diphenoxylate with atropine) are effective. Bulk-forming drugs (section 1.6.1) may be tried but it is often difficult to adjust the dose appropriately.

Antibacterials should not be given for an episode of acute diarrhoea.

Antacids The tendency to diarrhoea from magnesium salts or constipation from aluminium salts may be increased in these patients.

Diuretics Diuretics should be used with caution in patients with an ileostomy as they may become excessively dehydrated and potassium depletion may easily occur. It is usually advisable to use a potassium-sparing diuretic (see section 2.2.3).

Digoxin Patients with a stoma are particularly susceptible to hypokalaemia if on digoxin therapy and potassium supplements or a potassium-sparing diuretic may be advisable (for comment see section 9.2.1.1).

Potassium supplements Liquid formulations are preferred to modified-release formulations (see above).

Analgesics Opioid analgesics (see section 4.7.2) may cause troublesome constipation in colostomy patients. When a non-opioid analgesic is required paracetamol is usually suitable but anti-inflammatory analgesics may cause gastric irritation and bleeding.

Iron preparations Iron preparations may cause loose stools and sore skin in these patients. If this is troublesome and if iron is definitely indicated an intramuscular iron preparation (see section 9.1.1.2) should
be used. Modified-release preparations should be avoided for the reasons given above.

**Care of stoma** Patients are usually given advice about the use of cleansing agents, protective creams, lotions, deodorants, or sealants whilst in hospital, either by the surgeon or by stoma care nurses. Voluntary organisations offer help and support to patients with stoma.

### 1.9 Drugs affecting intestinal secretions

#### 1.9.1 Drugs affecting biliary composition and flow

The use of laparoscopic cholecystectomy and of endoscopic biliary techniques has limited the place of the bile acid *ursodeoxycholic acid* in gallstone disease. Ursodeoxycholic acid is suitable for patients with unimpaired gall bladder function, small or medium-sized radiolucent stones, and whose mild symptoms are not amenable to medical treatment. Long-term prophylaxis may be needed after complete dissolution of the gallstones has been confirmed because they may recur in up to 25% of patients within one year of stopping treatment.

Ursodeoxycholic acid is also used in primary biliary cirrhosis; liver tests improve in most patients but the effect on overall survival is uncertain.

### URSODEOXYCHOLIC ACID

**Indications** see under Dose and under preparations

**Cautions** see notes above; in primary biliary cirrhosis, monitor liver function every 4 weeks for 3 months, then every 3 months; **interactions:** Appendix 1 (bile acids)

**Contra-indications** radio-opaque stones, non-functioning gall bladder, acute inflammation of the gall bladder, frequent episodes of biliary colic, inflammatory diseases and other conditions of the small intestine, colon and liver which interfere with entero-hepatic circulation of bile salts

**Hepatic impairment** avoid in chronic liver disease (but used in primary biliary cirrhosis)

**Pregnancy** no evidence of harm but manufacturer advises avoid

**Breast-feeding** not known to be harmful but manufacturer advises avoid

**Side-effects** diarrhoea; very rarely abdominal pain, gallstone calcification, urticaria; also reported nausea, vomiting, pruritus

**Dose**
- Dissolution of gallstones, 8–12 mg/kg daily as a single dose at bedtime or in two divided doses, for up to 2 years; treatment is continued for 3–4 months after stones dissolve
- Primary biliary cirrhosis, 12–16 mg/kg daily in 3 divided doses for 3 months, then 12–16 mg/kg once daily at bedtime

### Ursodeoxycholic Acid (Non-proprietary)

**Tablets**
- Ursodeoxycholic acid 150 mg, net price 60-tab pack = £13.45; 300 mg, 60-tab pack = £38.86. Label: 21

**Capsules**
- Ursodeoxycholic acid 250 mg, net price 60-cap pack = £25.29. Label: 21

**Destolit** (Norgine) **Tablets**
- Ursodeoxycholic acid 150 mg, net price 60-tab pack = £18.39. Label: 21

**Capsules**
- Ursodeoxycholic acid 250 mg, net price 60-cap pack = £31.88. Label: 21

**Rowachol** (Galen) **Tablets**
- Ursodeoxycholic acid 150 mg, net price 60-tab pack = £14.49. Label: 21

**Capsules**
- Ursodeoxycholic acid 250 mg, net price 60-cap pack = £25.93. Label: 21

#### Other preparations for biliary disorders

A terpene mixture (Rowachol®) raises biliary cholesterol solubility. It is not considered to be a useful adjunct.

**Rowachol** (Rowa) **Capsules**
- Green, e/c, borneol 5 mg, camphene 5 mg, cineole 2 mg, menthol 32 mg, menthone 6 mg, pinene 17 mg in olive oil. Net price 50-cap pack = £7.35. Label: 22

**Dose** 1–2 capsules 3 times daily before food (but see notes above)

#### 1.9.2 Bile acid sequestrants

**Colestyramine** is an anion-exchange resin that is not absorbed from the gastrointestinal tract. It relieves diarrhoea and pruritus by forming an insoluble complex with bile acids in the intestine. Colestyramine can interfere with the absorption of a number of drugs. Colestyramine is also used in hypercholesterolaemia (section 2.12).

**COLESTYRAMINE** (Cholestyramine)

**Indications** pruritus associated with partial biliary obstruction and primary biliary cirrhosis; diarrhoea associated with Crohn’s disease, ileal resection, vagotomy, diabetic vagal neuropathy, and radiation; hypercholesterolaemia (section 2.12)

**Cautions** section 2.12

**Contra-indications** section 2.12

**Pregnancy** section 2.12

**Breast-feeding** section 2.12

**Side-effects** section 2.12
1.9.3 Aprotinin

Aprotinin is no longer used for the treatment of acute pancreatitis.

1.9.4 Pancreatin

Supplements of pancreatin are given by mouth to compensate for reduced or absent exocrine secretion in cystic fibrosis, and following pancreatectomy, gastrectomy, or chronic pancreatitis. They assist the digestion of starch, fat, and protein. Pancreatin may also be necessary if a tumour (e.g. pancreatic cancer) obstructs outflow from the pancreas.

Pancreatin is inactivated by gastric acid therefore pancreatin preparations are best taken with food (or immediately before or after food). Gastric acid secretion may be reduced by giving cinetidine or ranitidine an hour beforehand (section 1.3). Concurrent use of antacids also reduces gastric acidity. Enteric-coated preparations deliver a higher enzyme concentration in the duodenum (provided the capsule contents are swallowed whole without chewing). Higher-strength preparations are also available (important: see advice below).

Since pancreatin is also inactivated by heat, excessive heat should be avoided if preparations are mixed with liquids or food; the resulting mixtures should not be kept for more than one hour.

Dosage is adjusted according to size, number, and consistency of stools, so that the patient thrives; extra moisture will be needed if snacks are taken between meals.

Pancreatin can irritate the perioral skin and buccal mucosa if retained in the mouth, and excessive doses can cause perianal irritation. The most frequent side-effects are gastro-intestinal, including nausea, vomiting, and abdominal discomfort; hyperuricaemia and hyperuricosuria have been associated with very high doses. Hypersensitivity reactions occur occasionally and may affect those handling the powder.

**PANCREATIN**

**Indications** see above

**Cautions** see above and (for higher-strength preparations) see below

**Pregnancy** not known to be harmful

**Side-effects** see above and (for higher-strength preparations) see below

---

Dose

- **Pruritus**, 4–8 g daily in a suitable liquid; **CHILD** 1–18 years see BNF for Children
- **Diarrhoea**, initially 4 g daily increased by 4 g at weekly intervals to 12–24 g daily in a suitable liquid in 1–4 divided doses, then adjusted as required: max. 36 g daily; **CHILD** 1–18 years see BNF for Children

**Counselling** Other drugs should be taken at least 1 hour beforehand or 4–6 hours after colestyramine to reduce possible interference with absorption

**Note** The contents of each sachet should be mixed with at least 150 mL of water or other suitable liquid such as fruit juice, skimmed milk, thin soups, and pulpy fruits with a high moisture content

**Preparations** Section 2.12

**Creon**

- **BNF 68**
- **10 000** (Abbott Healthcare)
  - **Capsules**, brown/clear, enclosing buff-coloured e/c granules of pancreatin (pork), providing: protease 600 units, lipase 10 000 units, amylase 8000 units. Net price 100-cap pack = £12.93. Counselling, see dose
  - **Dose** ADULT and CHILD initially 1–2 capsules with each meal either taken whole or mixed with acidic fluid or soft food (then swallowed immediately without chewing)

**Creon Micro** (Abbott Healthcare)

Gastro-resistant granules, brown, pancreatin (pork), providing: protease 200 units, lipase 5000 units, amylase 3600 units per 100 mg, net price 20 g = £31.50 Counselling, see dose

- **Dose** ADULT and CHILD initially 100 mg with each meal either taken whole or mixed with acidic fluid or soft food (then swallowed immediately without chewing)

**Pancrex** (Essential)

- **Granules**, pancreatin (pork), providing minimum of: protease 300 units, lipase 5000 units, amylase 4000 units/g. Net price 300 g = £57.00. Label: 25, counselling, see dose
  - **Dose** ADULT and CHILD over 1 year 2–6 capsules with each meal, swallowed whole or sprinkled on food, INFANT up to 1 year contents of 1–2 capsules mixed with feeds
  - **Capsules ‘125’**, pancreatin (pork), providing minimum of: protease 160 units, lipase 2950 units, amylase 3500 units, net price 300-cap pack = £42.07. Counselling, see dose
  - **Dose** NEONATE contents of 1–2 capsules mixed with feeds

**Pancrex V** (Essential)

- **Capsules**, pancreatin (pork), providing minimum of: protease 430 units, lipase 8000 units, amylase 9000 units. Net price 300-cap pack = £53.20. Counselling, see dose
  - **Dose** ADULT and CHILD over 1 year 2–6 capsules with each meal, swallowed whole or sprinkled on food, INFANT up to 1 year contents of 1–2 capsules mixed with feeds
  - **Tablets forte**, e/c, pancreatin (pork), providing minimum of: protease 330 units, lipase 5600 units, amylase 2500 units. Net price 300-tab pack = £48.11. Label: 5, 25, counselling, see dose
  - **Dose** ADULT and CHILD 5–10 g just before meals washed down or mixed with a little milk or water

**Creon® 22®** and **Pancrease HL®** have been associated with the development of large bowel strictures (fibrosing colonopathy) in children with cystic fibrosis aged between 2 and 13 years. No association was found with Creon® 25 000 and Creon® 40 000. The following is recommended:

- **Pancrease HL®** and **Nutrizym 22®** should not be used in children aged 15 years or less with cystic fibrosis;
the total dose of pancreatic enzyme supplements used in patients with cystic fibrosis should not usually exceed 10 000 units of lipase per kg body-weight daily.

if a patient on any pancreatin preparation develops new abdominal symptoms (or any change in existing abdominal symptoms) the patient should be reviewed to exclude the possibility of colonic damage. Possible risk factors are gender (boys at greater risk than girls), more severe cystic fibrosis, and concomitant use of laxatives. The peak age for developing fibrosing colonopathy is between 2 and 8 years.

Counselling It is important to ensure adequate hydration at all times in patients receiving higher-strength pancreatin preparations.

Creon® 25 000 (Abbott Healthcare) Capsules, orange/clear, enclosing brown-coloured e/c pellets of pancreatin (pork), providing: protease (total) 1000 units, lipase 25 000 units, amylase 18 000 units, net price 100-cap pack = £28.25. Counselling, see above and under dose

Dose ADULT and CHILD initially 1–2 capsules with meals either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

Creon® 40 000 (Abbott Healthcare) Capsules, brown/clear, enclosing brown-coloured e/c granules of pancreatin (pork), providing: protease (total) 1600 units, lipase 40 000 units, amylase 25 000 units, net price 100-cap pack = £41.80. Counselling, see above and under dose

Dose ADULT and CHILD initially 1–2 capsules with meals either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

Nutrizym 22® (Merck Serono) Capsules, red/yellow, enclosing e/c minitablets of pancreatin (pork), providing minimum of: protease 1100 units, lipase 22 000 units, amylase 19 800 units. Net price 100-cap pack = £33.33. Counselling, see above and under dose

Dose ADULT and CHILD over 15 years, 1–2 capsules with meals and 1 capsule with snacks, swallowed whole or contents taken with water or mixed with soft food (then swallowed immediately without chewing)

Pancrease HL® (Janssen) Capsules, enclosing light brown e/c minitablets of pancreatin (pork), providing minimum of: protease 1250 units, lipase 25 000 units, amylase 22 500 units. Net price 100 = £40.38. Counselling, see above and under dose

Dose ADULT and CHILD over 15 years, 1–2 capsules during each meal and 1 capsule with snacks swallowed whole or contents mixed with slightly acidic liquid or soft food (then swallowed immediately without chewing)
Positive inotropic drugs increase the force of contraction of the myocardium; for sympathomimetics with inotropic activity see section 2.7.1.

Cardiac glycosides

Digoxin is a cardiac glycoside that increases the force of myocardial contraction and reduces conductivity within the atrioventricular (AV) node.

Digoxin is most useful for controlling ventricular response in persistent and permanent atrial fibrillation and atrial flutter (section 2.3.1). For reference to the role of digoxin in heart failure, see section 2.5.5.

For management of atrial fibrillation the maintenance dose of digoxin can usually be determined by the ventricular rate at rest, which should not usually be allowed to fall persistently below 60 beats per minute.
Digoxin is now rarely used for rapid control of heart rate (see section 2.3 for the management of supraventricular arrhythmias). Even with intravenous administration, response may take many hours; persistence of tachycardia is therefore not an indication for exceeding the recommended dose. The intramuscular route is not recommended.

In patients with heart failure who are in sinus rhythm a loading dose is not required, and a satisfactory plasma-digoxin concentration can be achieved over a period of about a week.

Digoxin has a long half-life and maintenance doses need to be given only once daily (although higher doses may be divided to avoid nausea); renal function is the most important determinant of digoxin dosage.

Unwanted effects depend both on the concentration of digoxin in the plasma and on the sensitivity of the conducting system or of the myocardium, which is often increased in heart disease. It can sometimes be difficult to distinguish between toxic effects and clinical deterioration because symptoms of both are similar. The plasma concentration alone cannot indicate toxicity reliably, but the likelihood of toxicity increases progressively through the range 1.5 to 3 micrograms/litre for digoxin. Digoxin should be used with special care in the elderly, who may be particularly susceptible to digitalis toxicity.

Regular monitoring of plasma-digoxin concentration during maintenance treatment is not necessary unless problems are suspected. Hypokalaemia predisposes the patient to digitalis toxicity; it is managed by giving a potassium-sparing diuretic or, if necessary, potassium supplementation.

If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management. Digoxin-specific antibody fragments are available for reversal of life-threatening overdosage (see Digoxin-specific Antibody, below).

Dose

- Rapid digitalisation, for atrial fibrillation or flutter, by mouth, 0.75–1.5 mg over 24 hours in divided doses
- Maintenance, for atrial fibrillation or flutter, by mouth, according to renal function and initial loading dose; usual range 125–250 micrograms daily
- Heart failure (for patients in sinus rhythm), by mouth, 62.5–125 micrograms once daily
- Emergency loading dose, for atrial fibrillation or flutter, by intravenous infusion (but rarely necessary), 0.75–1 mg over at least 2 hours (see also Cautions) then maintenance dose by mouth on the following day

Note The above doses may need to be reduced if digoxin (or another cardiac glycoside) has been given in the preceding 2 weeks. When switching from intravenous to oral route may need to increase dose by 20–33% to maintain the same plasma-digoxin concentration. Digoxin doses in the BNF may differ from those in product literature. For plasma concentration monitoring, blood should be taken at least 6 hours after a dose.

Digoxin (Non-proprietary) Tablets, digoxin 62.5 micrograms, net price 28-tab pack = £1.28; 125 micrograms, 28-tab pack = 97p; 250 micrograms, 28-tab pack = 92p Injection, digoxin 250 micrograms/mL, net price 2-mL amp = 70p Paediatric injection, digoxin 100 micrograms/mL Available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104

Lanoxin® (Aspen) Tablets, digoxin 125 micrograms, net price 500-tab pack = £8.09; 250 micrograms (scored), 500-tab pack = £8.09 Injection, digoxin 250 micrograms/mL, net price 2-mL amp = 66p

Lanoxin-PG® (Aspen) Tablets, blue, digoxin 62.5 micrograms, net price 500-tab pack = £8.09 Elixir, yellow, digoxin 50 micrograms/mL. Do not dilute, measure with pipette. Net price 60 mL = £5.35. Counselling, use of pipette

Digoxin-specific antibody

Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service, p. 33. Digoxin-specific antibody fragments are indicated for the treatment of known or strongly suspected life-threatening digoxin toxicity associated with ventricular arrhythmias or bradyarrhythmias unresponsive to atropine and when measures beyond the withdrawal of digoxin and correction of any electrolyte abnormalities are considered necessary (see also notes above).

DigiFab® (BTG) Intravenous infusion, powder for reconstitution, digoxin-specific antibody fragments (F(ab)), net price 40-mg vial = £750.00 (hosp. only)

Dose consult product literature
2.1.2 Phosphodiesterase type-3 inhibitors

Enoximone and milrinone are phosphodiesterase type-3 inhibitors that exert most of their effect on the myocardium. Sustained haemodynamic benefit has been observed after administration, but there is no evidence of any beneficial effect on survival.

### ENOXIMONE

**Indications**
- Congestive heart failure where cardiac output reduced and filling pressures increased

**Cautions**
- Heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction; monitor blood pressure, heart rate, ECG, central venous pressure, fluid balance, renal function, platelet count, hepatic enzymes; avoid extravasation; **interactions:** Appendix 1 (phosphodiesterase type-3 inhibitors)

**Hepatic impairment**
- Dose reduction may be required

**Renal impairment**
- Consider dose reduction

**Pregnancy**
- Manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding**
- Manufacturer advises caution—no information available

**Side-effects**
- Ectopic beats; less frequently ventricular tachycardia, supraventricular arrhythmias (more likely in patients with pre-existing arrhythmias); hypotension; also headache, insomnia, nausea and vomiting, diarrhoea; occasionally, chills, oliguria, fever, urinary retention; upper and lower limb pain

**Dose**
- By slow intravenous injection (rate not exceeding 12.5 mg/minute), diluted before use, initially 0.5–1 mg/kg, then 500 micrograms/kg every 30 minutes until satisfactory response or total of 3 mg/kg given; maintenance, initial dose of up to 3 mg/kg may be repeated every 3–6 hours as required.
- By intravenous infusion, initially 90 micrograms/kg/minute over 10–30 minutes, followed by continuous or intermittent infusion of 5–20 micrograms/kg/minute

**Total dose over 24 hours should not usually exceed 24 mg/kg**

**Perfan® (INCA-Pharm)**
- **Injection,** enoximone 5 mg/mL. For dilution before use. Net price 20-ml amp = £15.02
- **Excipients** include alcohol, propylene glycol
- **Note:** Plastic apparatus should be used; crystal formation if glass used

### MILRINONE

**Indications**
- Short-term treatment of severe congestive heart failure unresponsive to conventional maintenance therapy (not immediately after myocardial infarction); acute heart failure, including low output states following heart surgery

**Cautions**
- See under Enoximone; also correct hypokalaemia; **interactions:** Appendix 1 (phosphodiesterase type-3 inhibitors)

**Contra-indications**
- Severe hypovolaemia

**Renal impairment**
- Reduce dose and monitor response if eGFR less than 50 mL/minute/1.73 m²—consult product literature for details

### Pregnancy
- Manufacturer advises use only if potential benefit outweighs risk

### Breast-feeding
- Manufacturer advises avoid—no information available

### Side-effects
- Ectopic beats, ventricular tachycardia, supraventricular arrhythmias (more likely in patients with pre-existing arrhythmias), hypotension; headache; less commonly ventricular fibrillation, chest pain, tremor, hypokalaemia, thrombocytopenia; very rarely bronchospar, anaphylaxis, and rash

### Dose
- By intravenous injection over 10 minutes, either undiluted or diluted before use, 50 micrograms/kg followed by **intravenous infusion** at a rate of 375–750 nanograms/kg/minute, usually for up to 12 hours following surgery or for 48–72 hours in congestive heart failure; max. daily dose 1.13 mg/kg

**Primacor® (Sanofi-Aventis)**
- **Injection,** milrinone (as lactate) 1 mg/mL, net price 10-ml amp = £19.91

2.2 Diuretics

#### 2.2.1 Thiazides and related diuretics

#### 2.2.2 Loop diuretics

#### 2.2.3 Potassium-sparing diuretics and aldosterone antagonists

#### 2.2.4 Potassium-sparing diuretics with other diuretics

#### 2.2.5 Osmotic diuretics

#### 2.2.6 Mercual diuretics

#### 2.2.7 Carbonic anhydrase inhibitors

#### 2.2.8 Diuretics with potassium

**Thiazides** (section 2.2.1) are used to relieve oedema due to chronic heart failure (section 2.5.5) and, in lower doses, to reduce blood pressure.

**Loop diuretics** (section 2.2.2) are used in pulmonary oedema due to left ventricular failure and in patients with chronic heart failure (section 2.5.5).

**Combination diuretic therapy** may be effective in patients with oedema resistant to treatment with one diuretic. Vigorous diuresis, particularly with loop diuretics, may induce acute hypotension; rapid reduction of plasma volume should be avoided.

**Elderly**
- Lower initial doses of diuretics should be used in the elderly because they are particularly susceptible to the side-effects. The dose should then be adjusted according to renal function. Diuretics should not be used continuously on a long-term basis to treat simple gravitational oedema (which will usually respond to increased movement, raising the legs, and support stockings).

**Potassium loss**
- Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic.

Hypokalaemia is dangerous in severe cardiovascular disease and in patients also being treated with cardiac glycosides. Often the use of potassium-sparing diuretics (section 2.2.3) avoids the need to take potassium supplements.
Thiazides and related compounds are moderately potent diuretics; they inhibit sodium reabsorption at the beginning of the distal convoluted tubule. They act within 1 to 2 hours of oral administration and most have a duration of action of 12 to 24 hours; they are usually administered early in the day so that the diuresis does not interfere with sleep.

In the management of hypertension a low dose of a thiazide produces a maximal or near-maximal blood pressure lowering effect, with very little biochemical disturbance. Higher doses cause more marked changes in plasma potassium, sodium, uric acid, glucose, and lipids, with little advantage in blood pressure control. Chlortalidone and indapamide are the preferred diuretics in the management of hypertension (see section 2.5).

For reference to the use of thiazides in chronic heart failure see section 2.5.5.

**Bendroflumethiazide** can be used for mild or moderate heart failure; it is licensed for the treatment of hypertension but is no longer considered the first-line diuretic for this indication (see section 2.5), although patients with stable and controlled blood pressure currently taking bendroflumethiazide can continue treatment.

Chlortalidone, a thiazide-related compound, has a longer duration of action than the thiazides and may be given on alternate days to control oedema. It is also useful if acute retention is liable to be precipitated by a more rapid diuresis or if patients dislike the altered pattern of micturition caused by other diuretics.

Xipamide and indapamide are chemically related to chlortalidone. Indapamide is claimed to lower blood pressure with less metabolic disturbance, particularly less aggravation of diabetes mellitus.

Metolazone is particularly effective when combined with a loop diuretic (even in renal failure); profound diuresis can occur and the patient should therefore be monitored carefully.

The thiazide diuretics benzthiazide, clopamide, cyclopenthiazide, and hydroflumethiazide do not offer any significant advantage over other thiazides and related diuretics.

**Cautions** See also section 2.2. Thiazides and related diuretics can exacerbate diabetes, gout, and systemic lupus erythematosus. Electrolytes should be monitored, particularly with high doses, long-term use, or in renal impairment. Thiazides and related diuretics should also be used with caution in nephrotic syndrome, hyperaldosteronism, and malnourishment; **interactions**: Appendix 1 (diuretics).

**Contra-indications** Thiazides and related diuretics should be avoided in refractory hypokalaemia, hypomagnesaemia and hypercalcaemia, symptomatic hyperuricaemia, and Addison’s disease.

**Hepatic impairment** Thiazides and related diuretics should be used with caution in mild to moderate impairment and avoided in severe liver disease. Hypokalaemia may precipitate coma, although hypokalaemia can be prevented by using a potassium-sparing diuretic. There is an increased risk of hypomagnesaemia in alcoholic cirrhosis.

**Renal impairment** Thiazides and related diuretics are ineffective if eGFR is less than 30 mL/minute/1.73 m² and should be avoided; metolazone remains effective but with a risk of excessive diuresis.

**Pregnancy** Thiazides and related diuretics should not be used to treat gestational hypertension. They may cause neonatal thrombocytopenia, bone marrow suppression, jaundice, electrolyte disturbances, and hypoglycaemia; placental perfusion may also be reduced. Stimulation of labour, uterine inertia, and meconium staining have also been reported.

**Breast-feeding** The amount of bendroflumethiazide, chlortalidone, cyclopenthiazide, and metolazone present in milk is too small to be harmful; large doses may suppress lactation. For indapamide and xipamide see individual drugs.

**Side-effects** Side-effects of thiazides and related diuretics include mild gastro-intestinal disturbances, postural hypotension, altered plasma-lipid concentrations, metabolic and electrolyte disturbances including hypokalaemia (see also notes above), hypernatraemia, hypomagnesaemia, hypercalcaemia, hyperglycaemia, hypochloraemic alkalosis, hyperuricaemia, and gout.

Less common side-effects include blood disorders such as agranulocytosis, leucopenia, and thrombocytopenia, and impotence. Pancreatitis, intrahepatic cholestasis, cardiac arrhythmias, headache, dizziness, paraesthesia, visual disturbances, and hypersensitivity reactions (including pneumonitis, pulmonary oedema, photosensitivity, and severe skin reactions) have also been reported.

---

**BENDROFLUMETHIAZIDE**
(Bendroflumazide)

**Indications** Oedema, hypertension (see also notes above)

**Cautions** See notes above

**Contra-indications** See notes above

**Hepatic impairment** See notes above

**Renal impairment** See notes above

**Pregnancy** See notes above

**Breast-feeding** See notes above

**Side-effects** See notes above

**Dose**
- Oedema, initially 5–10 mg daily in the morning or on alternate days; maintenance 5–10 mg 1–3 times weekly
- Hypertension, 2.5 mg daily in the morning; higher doses rarely necessary (see notes above)
Bendroflumethiazide (Non-proprietary)  
Tablets, bendroflumethiazide 2.5 mg, net price 28 = 88p; 5 mg, 28 = 81p  
Brands include Aprinox®, Neo-Naclex®

CHLORTALIDONE  
(Chlorthalidone)  
Indications  ascites due to cirrhosis in stable patients (under close supervision), oedema due to nephrotic syndrome, hypertension (see also notes above), mild to moderate chronic heart failure; diabetes insipidus (see section 6.5.2)  
Cautions  see notes above  
Contra-indications  see notes above  
Hepatic impairment  see notes above  
Renal impairment  see notes above  
Pregnancy  see notes above  
Breast-feeding  present in milk—manufacturer advises avoid  
Side-effects  see notes above; also palpitation, diarrhoea with doses above 2.5 mg daily  
Dose  
- 2.5 mg daily in the morning  
- Indapamide (Non-proprietary)  
Tablets, s/c, indapamide 2.5 mg, net price 28-tab pack = £3.07, 56-tab pack = £2.61  
Natrilix® (Servier)  
Tablets, f/c, indapamide 2.5 mg. Net price 30-tab pack = £3.40, 60-tab pack = £6.80  
- Modified release  
Ethibide XL® (Genus)  
Tablets, m/r, indapamide 1.5 mg, net price 30-tab pack = £4.05. Label: 25  
Dose hypertension, 1 tablet daily, preferably in the morning  
Natrilix SR® (Servier)  
Tablets, m/r, f/c, indapamide 1.5 mg, net price 30-tab pack = £3.40. Label: 25  
Dose hypertension, 1 tablet daily, preferably in the morning  
Tensaid XL® (Generics)  
Tablets, m/r, f/c, indapamide 1.5 mg, net price 30-tab pack = £3.40. Label: 25  
Dose hypertension, 1 tablet daily, preferably in the morning

CYCLOPENTHIAZIDE  
Indications  oedema, hypertension (see also notes above); heart failure  
Cautions  see notes above  
Contra-indications  see notes above  
Hepatic impairment  see notes above  
Renal impairment  see notes above  
Pregnancy  see notes above  
Breast-feeding  see notes above  
Side-effects  see notes above; also rarely jaundice and allergic interstitial nephritis  
Dose  
- Oedema, up to 50 mg daily  
- Hypertension, 25–50 mg daily in the morning, increased to 50 mg daily if necessary (but see notes above)  
- Heart failure, 25–50 mg daily in the morning, increased if necessary to 100–200 mg daily (reduce to lowest effective dose for maintenance)  
Hygroton® (Alliance)  
Tablets, yellow, scored, chlortalidone 50 mg, net price 28-tab pack = £1.64  
Note  May be difficult to obtain

INDAPAMIDE  
Indications  essential hypertension  
Cautions  see notes above; also acute porphyria (section 9.8.2)  
Contra-indications  see notes above; also hypersensitivity to sulfonamides  
Hepatic impairment  see notes above  
Renal impairment  see notes above  
Pregnancy  see notes above  
Breast-feeding  see notes above  
Side-effects  see notes above; also palpitation, diarrhoea with doses above 2.5 mg daily  
Dose  
- 2.5 mg daily in the morning  
- Indapamide (Non-proprietary)  
Tablets, s/c, indapamide 2.5 mg, net price 28-tab pack = £3.07, 56-tab pack = £2.61  
Natrilix® (Servier)  
Tablets, f/c, indapamide 2.5 mg. Net price 30-tab pack = £3.40, 60-tab pack = £6.80  
- Modified release  
Ethibide XL® (Genus)  
Tablets, m/r, indapamide 1.5 mg, net price 30-tab pack = £4.05. Label: 25  
Dose hypertension, 1 tablet daily, preferably in the morning  
Natrilix SR® (Servier)  
Tablets, m/r, f/c, indapamide 1.5 mg, net price 30-tab pack = £3.40. Label: 25  
Dose hypertension, 1 tablet daily, preferably in the morning  
Tensaid XL® (Generics)  
Tablets, m/r, f/c, indapamide 1.5 mg, net price 30-tab pack = £3.40. Label: 25  
Dose hypertension, 1 tablet daily, preferably in the morning

METOLAZONE  
Indications  oedema, hypertension (see also notes above)  
Cautions  see notes above; also acute porphyria (section 9.8.2)  
Contra-indications  see notes above  
Hepatic impairment  see notes above  
Renal impairment  see notes above  
Pregnancy  see notes above  
Breast-feeding  see notes above  
Side-effects  see notes above; also chills, chest pain  
Dose  
- Oedema, 5–10 mg daily in the morning, increased if necessary to 20 mg daily in resistant oedema, max. 80 mg daily  
- Hypertension, initially 5 mg daily in the morning; maintenance 5 mg on alternate days  
Metolazone (Non-proprietary)  
Tablets, metolazone 2.5 mg and 5 mg  
Available from ‘special-order’ manufacturers or specialist-importing companies, see p. 1104

XIPAMIDE  
Indications  oedema, hypertension (see also notes above)  
Cautions  see notes above; also acute porphyria (section 9.8.2)  
Contra-indications  see notes above  
Hepatic impairment  see notes above
Hypokalaemia induced by Hepatic impairment

Contra-indications
Loop diuretics should be avoided in severe hypokalaemia, severe hypoproteinaemia, anuria, coma, and precoma states associated with liver cirrhosis, and in renal failure due to nephrotoxic or hepatotoxic drugs.

Hepatic impairment Hypokalaemia induced by loop diuretics may precipitate hepatic encephalopathy and coma—potassium-sparing diuretics can be used to prevent this.

2.2.2 Loop diuretics
Loop diuretics are used in pulmonary oedema due to left ventricular failure; intravenous administration produces relief of breathlessness and reduces pre-load sooner than would be expected from the time of onset of diuresis. Loop diuretics are also used in patients with chronic heart failure. Diuretic-resistant oedema (except lymphoedema and oedema due to peripheral venous stasis or calcium-channel blockers) can be treated with a loop diuretic combined with a thiazide or related diuretic (e.g. bendroflumethiazide 5–10 mg daily or metolazone 5–20 mg daily).

If necessary, a loop diuretic can be added to antihypertensive treatment to achieve better control of blood pressure in those with resistant hypertension, or in patients with impaired renal function or heart failure.

Loop diuretics inhibit reabsorption from the ascending limb of the loop of Henle in the renal tubule and are powerful diuretics.

Furosemide and bumetanide are similar in activity; both act within 1 hour of oral administration and diuresis is complete within 6 hours so that, if necessary, they can be given twice in one day without interfering with sleep. Following intravenous administration they have a peak effect within 30 minutes. The diuresis associated with these drugs is dose related.

Torasemide has properties similar to those of furosemide and bumetanide, and is indicated for oedema and for hypertension.

Cautions Hypovolaemia and hypotension should be corrected before initiation of treatment with loop diuretics; electrolytes should be monitored during treatment (see also Potassium Loss, section 2.2). Loop diuretics can exacerbate diabetes (but hyperglycaemia is less likely than with thiazides) and gout. If there is an enlarged prostate, urinary retention can occur, although this is less likely if small doses and less potent diuretics are used initially; an adequate urinary output should be established before initiating treatment; interactions: Appendix 1 (diuretics).

Contra-indications Loop diuretics should be avoided in severe hypokalaemia, severe hypoproteinaemia, anuria, coma, and precoma states associated with liver cirrhosis, and in renal failure due to nephrotoxic or hepatotoxic drugs.

Hepatic impairment Hypokalaemia induced by loop diuretics may precipitate hepatic encephalopathy and coma—potassium-sparing diuretics can be used to prevent this.

Renal impairment High doses of loop diuretics may occasionally be needed; high doses or rapid intravenous administration can cause tinnitus and deafness; high doses of bumetanide can also cause musculoskeletal pain.

Pregnancy Furosemide and bumetanide should not be used to treat gestational hypertension because of the maternal hypovolaemia associated with this condition.

Side-effects Side-effects of loop diuretics include mild gastro-intestinal disturbances, pancreatitis, hepatic encephalopathy, postural hypotension, temporary increase in serum-cholesterol and triglyceride concentration, hyperglycaemia (less common than with thiazides), acute urinary retention, electrolyte disturbances (including hypernatraemia, hypokalaemia (see section 2.2), hypocalcaemia, hypochloraemia, and hypomagnesaemia), metabolic alkalosis, blood disorders (including bone-marrow depression, thrombocytopenia, and leucopenia), hyperuricaemia, visual disturbances, tinnitus and deafness (usually with high parenteral doses and rapid administration, and in renal impairment), and hypersensitivity reactions (including rash, photosensitivity, and pruritus).

BUMETANIDE

Indications oedema (see notes above)
Cautions see notes above
Contra-indications see notes above
Hepatic impairment see notes above
Renal impairment see notes above
Pregnancy see notes above
Breast-feeding no information available; may inhibit lactation
Side-effects see notes above; also gynaecomastia, breast pain, musculoskeletal pain (associated with high doses in renal failure)

Dose

- By mouth, 1 mg in the morning, repeated after 6–8 hours if necessary; severe cases, 5 mg daily increased by 5 mg every 12–24 hours according to response; ELDERLY, 500 micrograms daily may be sufficient;
- By intravenous injection, 1–2 mg, repeated after 20 minutes if necessary; ELDERLY, 500 micrograms daily may be sufficient;
- By intravenous infusion, 2–5 mg over 30–60 minutes; ELDERLY, 500 micrograms daily may be sufficient;
- By intramuscular injection, 1 mg initially then adjusted according to response; ELDERLY, 500 micrograms daily may be sufficient.

Bumetanide (Non-proprietary)

Oral liquid, bumetanide 1 mg/mL, net price £1.17; 5 mg, 28-tab pack = £6.85
Oral liquid, bumetanide 1 mg/5 mL, net price £150/mL = £128.00
Injection, bumetanide 500 micrograms/mL, net price 4-mL amp = £1.79

FUROSEMIDE
(Frusemide)

Indications oedema (see notes above); resistant hypertension (see notes above)
Cautions see notes above; also hypoproteinaemia may reduce diuretic effect and increase risk of side-effects; hepatorenal syndrome; intravenous administration rate should not usually exceed 4 mg/minute,
2 Cardiovascular system

2.2.3 Potassium-sparing diuretics

**Amiloride hydrochloride**

**Indications**
- Oedema; potassium conservation when used as an adjunct to thiazide or loop diuretics for hypertension, congestive heart failure, or hepatic cirrhosis with ascites

**Cautions**
- Monitor electrolytes; diabetes mellitus; elderly; interactions: Appendix 1 (diuretics)

**Contra-indications**
- Hyperkalaemia; anuria; Addison’s disease

**Renal impairment**
- Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment); manufacturers advise avoid in severe impairment

**Pregnancy**
- Not used to treat gestational hypertension

**Breast-feeding**
- Manufacturer advises avoid—no information available

**Side-effects**
- Abdominal pain, gastro-intestinal bleeding, dry mouth, thirst, diarrhoea, constipation, anorexia, jaundice, dyspepsia, flatulence, vomiting, nausea, angina, arrhythmias, palpitation, postural hypotension, dyspnoea, cough, nasal congestion, confusion, headache, insomnia, weakness, tremor, agitation, dizziness, malaise, paraesthesia, encephalopathy, urinary disturbances, sexual dysfunction, hyperkalaemia, muscle cramp, arthralgia, visual disturbance, raised intra-ocular pressure, tinnitus, alopecia, pruritus, rash

**Dose**
- Used alone, initially 10 mg daily or 5 mg twice daily, adjusted according to response; max. 20 mg daily
- With other diuretics, congestive heart failure and hypertension, initially 5–10 mg daily; cirrhosis with ascites, initially 5 mg daily

**Amiloride and triamterene**

Amiloride and triamterene on their own are weak diuretics. They cause retention of potassium and are therefore given with thiazide or loop diuretics as a more effective alternative to potassium supplements. See section 2.2.4 for compound preparations with thiazides or loop diuretics.

Potassium supplements must not be given with potassium-sparing diuretics. Administration of a potassium-sparing diuretic to a patient receiving an ACE inhibitor or an angiotensin-II receptor antagonist can also cause severe hyperkalaemia.

---

**Torasemide**

**Indications**
- Oedema (see notes above), hypertension

**Cautions**
- See notes above

**Contra-indications**
- See notes above

**Hepatic impairment**
- See notes above

**Renal impairment**
- See notes above

**Pregnancy**
- Manufacturer advises avoid—toxicity in animal studies

**Breast-feeding**
- Manufacturer advises avoid—no information available

**Side-effects**
- See notes above; also dry mouth; rarely limb paraesthesia

**Dose**
- Oedema, 5 mg once daily, preferably in the morning, increased if required to 20 mg once daily; usual max. 40 mg daily
- Hypertension, 2.5 mg daily, increased if necessary to 5 mg once daily

**Torasemide**

**Indications**
- Oedema, potassium conservation with thiazide and loop diuretics

**Cautions**
- See under Amiloride Hydrochloride; also gout; may cause blue fluorescence of urine

---

**Triamterene**

**Indications**
- Oedema, potassium conservation with thiazide and loop diuretics

**Cautions**
- See under Amiloride Hydrochloride; also gout; may cause blue fluorescence of urine

---

**Notes**

- However single doses of up to 80 mg may be administered more rapidly

**Contra-indications**
- See notes above

**Hepatic impairment**
- See notes above

**Renal impairment**
- See notes above; also lower rate of infusion may be necessary

**Pregnancy**
- See notes above

**Breast-feeding**
- Amount too small to be harmful; may inhibit lactation

**Side-effects**
- See notes above; also intrahepatic cholestasis and gout

**Dose**
- By mouth, oedema, initially 40 mg in the morning; maintenance 20–40 mg daily; child under 18 years see BNF for Children
  - Resistant oedema, 80–120 mg daily
  - Resistant hypertension, 40–80 mg daily
- By intramuscular injection or slow intravenous injection (rate of administration, see Cautions above), initially 20–50 mg, increased if necessary in steps of 20 mg not less than every 2 hours; doses greater than 50 mg by intravenous infusion only; max. 1.5 g daily; child under 18 years see BNF for Children

**Furosemide**

**(Non-proprietary)**

**Tablets**
- Furosemide 20 mg, net price 28 = 82p; 40 mg, 28 = 78p; 50 mg, 28 = £18.04
- Brands include Rumide®

**Oral solution**
- Sugar-free, furosemide, net price
  - 20 mg/5 mL, 150 mL = £14.36; 40 mg/5 mL, 150 mL = £18.54; 50 mg/5 mL, 150 mL = £20.03
- Brands include Furodi® (contains alcohol 10%)

**Injection**
- Furosemide 10 mg/mL, net price 2-mL amp = 35p, 5-mL amp = 32p, 25-mL amp = £2.50
- Lasix® (Sanofi-Aventis)
  - Injection, furosemide 10 mg/mL, net price 2-mL amp = 75p
  - Note: Large-volume furosemide injections also available; brands include Minijet®

---

**Torasemide**

**(Non-proprietary)**

**Tablets**
- Torasemide 2.5 mg, net price 28-tab pack = £3.78; 5 mg (scored), 28-tab pack = £5.53; 10 mg (scored), 28-tab pack = £8.14
- Brands include Torim® (Meda)

---

**Torem®**

**(Non-proprietary)**

**Tablets**
- Torem 2.5 mg, net price 28-tab pack = £14.40; 10 mg, 28-tab pack = £18.41

---

**Amiloride and triamterene**

Amiloride and triamterene on their own are weak diuretics. They cause retention of potassium and are therefore given with thiazide or loop diuretics as a more effective alternative to potassium supplements. See section 2.2.4 for compound preparations with thiazides or loop diuretics.

Potassium supplements must not be given with potassium-sparing diuretics. Administration of a potassium-sparing diuretic to a patient receiving an ACE inhibitor or an angiotensin-II receptor antagonist can also cause severe hyperkalaemia.

---

**Triamterene**

**Indications**
- Oedema, potassium conservation with thiazide and loop diuretics

**Cautions**
- See under Amiloride Hydrochloride; also gout; may cause blue fluorescence of urine

---

---
Contra-indications see under Amiloride Hydrochloride

Hepatic impairment use with caution; avoid in progressive impairment

Renal impairment monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment); avoid in progressive impairment

Pregnancy not used to treat gestational hypertension; avoid unless essential

Breast-feeding present in milk—manufacturer advises avoid

Side-effects nausea, vomiting, diarrhoea, hyperkalaemia; less commonly dry mouth, headache, hyperuricaemia, rash; rarely megaloblastic anaemia, pancreatitis, photosensitivity, serum-sickness; very rarely triamterene found in kidney stones, renal failure (reversible on discontinuation); also reported jaundice, slight decrease in blood pressure, malaise

Dose
- Initially 150–250 mg daily, reducing to alternate days after 1 week; taken in divided doses after breakfast and lunch; lower initial dose when given with other diuretics

Counselling Urine may look slightly blue in some lights

Triamterene (Non-proprietary) [A]

Capsules, triamterene 50 mg, net price 30-cap pack = £19.95. Label: 14, (see above), 21

Compound preparations with thiazides or loop diuretics

Section 2.2.4

Aldosterone antagonists

Spironolactone potentiates thiazide or loop diuretics by antagonising aldosterone; it is a potassium-sparing diuretic. Spironolactone is of value in the treatment of oedema and ascites caused by cirrhosis of the liver; furosemide (section 2.2.2) can be used as an adjunct. Low doses of spironolactone are beneficial in moderate to severe heart failure, see section 2.5.5, and when used in resistant hypertension [unlicensed indication], see section 2.5.

Spironolactone is also used in primary hyperaldosteronism (Conn’s syndrome). It is given before surgery or if surgery is not appropriate, in the lowest effective dose for maintenance.

Eplerenone is licensed for use as an adjunct in left ventricular dysfunction with evidence of heart failure after a myocardial infarction (see also section 2.5.5 and section 2.10.1); it is also licensed as an adjunct in chronic mild heart failure with left ventricular ejection fraction \( \leq 30\% \).

Potassium supplements must not be given with aldosterone antagonists.

EPLERENONE

Indications adjunct in stable patients with left ventricular ejection fraction \( \leq 40\% \) with evidence of heart failure, following myocardial infarction (start therapy within 3–14 days of event); adjunct in chronic mild heart failure with left ventricular ejection fraction \( \leq 30\% \)

Cautions measure plasma-potassium concentration before treatment, during initiation, and when dose changed; elderly; interactions: Appendix 1 (diuretics)

Contra-indications hyperkalaemia; concomitant use of potassium-sparing diuretics or potassium supplements

Hepatic impairment avoid in severe impairment

Renal impairment increased risk of hyperkalaemia—close monitoring required; initially 25 mg on alternate days if eGFR 30–60 mL/minute/1.73 m\(^2\), adjust dose according to serum-potassium concentration—consult product literature; avoid if eGFR less than 30 mL/minute/1.73 m\(^2\)

Pregnancy manufacturer advises caution—no information available

Breast-feeding manufacturer advises use only if potential benefit outweighs risk

Side-effects diarrhoea, constipation, nausea, hypotension, cough, dizziness, syncope, azotaemia, hyperkalaemia, renal impairment, muscle spasms, musculoskeletal pain, rash, pruritus; less commonly flatulence, vomiting, cholecystitis, tachycardia, atrial fibrillation, postural hypotension, arterial thrombosis, dyslipidaemia, pharyngitis, headache, insomnia, hypoaesthesia, hypothyroidism, hyperglycaemia, gynaecomastia, pyelonephritis, epidermal growth factor receptor decreased, hypotenaemia, dehydration, eosinophilia, malaise, back pain, sweating; also reported angioedema

Dose
- Initially 25 mg once daily, increased within 4 weeks to 50 mg once daily; CHILD not recommended

Inspra® (Pfizer) [A]

Tablets, yellow, f/c, eplerenone 25 mg, net price 28-tab pack = £42.72; 50 mg, 28-tab pack = £42.72

SPIRONOLACTONE

Indications oedema and ascites in cirrhosis of the liver; malignant ascites; nephrotic syndrome; oedema in congestive heart failure; moderate to severe heart failure (adjunct—see also section 2.5.5); resistant hypertension [unlicensed indication] (adjunct—see also section 2.5.5); treatment of primary hyperaldosteronism

Cautions potential metabolic products carcinogenic in rodents; elderly; monitor electrolytes—discontinue if hyperkalaemia occurs (in severe heart failure monitor potassium and creatinine 1 week after initiation and after any dose increase, monthly for first 3 months, then every 3 months for 1 year, and then every 6 months); acute porphyria (section 9.8.2); interactions: Appendix 1 (diuretics)

Contra-indications hyperkalaemia; anuria; Addison’s disease

Renal impairment monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment); avoid in acute renal insufficiency or severe impairment

Pregnancy use only if potential benefit outweighs risk—feminisation of male fetus in animal studies

Breast-feeding metabolites present in milk, but amount probably too small to be harmful

Side-effects gastro-intestinal disturbances, hepatotoxicity, malaise, confusion, drowsiness, dizziness, gynaecomastia, benign breast tumour, breast pain, menstrual disturbances, changes in libido, hypertrichosis, electrolyte disturbances including hyperkalaemia (discontinue) and hyponatraemia, acute renal failure, hyperuricaemia, leucopenia, agranulocytosis, thrombocytopenia, leg cramps, alopecia, rash, Stevens-Johnson syndrome
2.2.4 Potassium-sparing diuretics with other diuretics

Potassium-sparing diuretics with other diuretics

Although it is preferable to prescribe thiazides (section 2.2.1) and potassium-sparing diuretics (section 2.2.3) separately, the use of fixed combinations may be justified if compliance is a problem. Potassium-sparing diuretics are not usually necessary in the routine treatment of hypertension, unless hypokaemia develops. For interactions, see Appendix 1 (diuretics).

Amiloride with thiazides

2.2.4

Potassium-sparing diuretics with other diuretics

Dose

- Oedema and ascites in cirrhosis of the liver, 100–400 mg daily, adjusted according to response
- Malignant ascites, initially 100–200 mg daily, increased to 400 mg daily if required; maintenance dose adjusted according to response
- Nephrotic syndrome, 100–200 mg daily
- Oedema in congestive heart failure, initially 100 mg (range 25–200 mg) daily in single or divided doses; maintenance dose adjusted according to response
- Moderate to severe heart failure (adjunct), initially 25 mg once daily, increased according to response to max. 50 mg once daily (see section 2.5.5)
- Resistant hypertension (adjunct), 25 mg once daily
- Primary hyperaldosteronism in patients awaiting surgery, 100–400 mg daily; long-term maintenance if surgery inappropriate, use lowest effective dose
- CHILD under 18 years see BNF for Children

Spironolactone (Non-proprietary) (Pharmacia)

Tablets, spironolactone 25 mg, net price 28 = £1.24; 50 mg, 28 = £1.64; 100 mg, 28 = £2.06. Label: 21
Oral suspensions, spironolactone 5 mg/5 mL, 10 mg/5 mL, 25 mg/5 mL, 50 mg/5 mL, and 100 mg/5 mL. Label: 21
Available from special-order manufacturers or specialist importing companies, see p. 1104

Aldactone® (Pharmacia) (Pharm)

Tablets, f/c, spironolactone 25 mg (buff), net price 100-tab pack = £8.89; 50 mg (white), 100-tab pack = £17.78; 100 mg (buff), 28-tab pack = £9.96. Label: 21

With thiazides or loop diuretics

Section 2.2.4

Amiloride with loop diuretics

Co-amilofruse (Non-proprietary) (Pharm)

Tablets, co-amilofruse 2.5/20 (amiloride hydrochloride 2.5 mg, furosemide 20 mg), net price 28-tab pack = 92p, 56-tab pack = £1.86
Brands include Prumil LS®
Dose oedema, 1–2 tablets in the morning
Tablets, co-amilofruse 5/40 (amiloride hydrochloride 5 mg, furosemide 40 mg), net price 28-tab pack = £1.00, 56-tab pack = £2.16
Brands include Prumil®
Dose oedema, 1–2 tablets in the morning
Tablets, co-amilofruse 10/80 (amiloride hydrochloride 10 mg, furosemide 80 mg), net price 28-tab pack = £7.38
Dose oedema, 1 tablet in the morning

Amiloride with bumetanide (Non-proprietary) (Pharm)
Tablets, amiloride hydrochloride 5 mg, bumetanide 1 mg, net price 28-tab pack = £30.30
Dose oedema, 1–2 tablets daily

Triamterene with thiazides

Counselling Urine may look slightly blue in some lights

Co-triamteride (Non-proprietary) (Pharm)
Tablets, co-triamteride 50/25 (triame terene 50 mg, hydrochlorothiazide 25 mg), net price 30-tab pack = 95p. Label: 14, (see above), 21
Brands include Triam-Co®
Dose hypertension, 1 tablet daily after breakfast, increased if necessary, max. 4 daily
Oedema, 2 tablets daily (1 after breakfast and 1 after midday meal) increased to 3 daily if necessary (2 after breakfast and 1 after midday meal), usual maintenance in oedema, 1 tablet or 2 on alternate days, max. 4 daily

Dyazide® (AMCo) (Pharm)
Tablets, peach, scored, co-triamteride 50/25 (triame terene 50 mg, hydrochlorothiazide 25 mg), net price 30-tab pack = 95p. Label: 14, (see above), 21
Dose hypertension, 1 tablet daily after breakfast, increased if necessary, max. 4 daily
Oedema, 2 tablets daily (1 after breakfast and 1 after midday meal) increased to 3 daily if necessary (2 after breakfast and 1 after midday meal), usual maintenance in oedema, 1 daily or 2 on alternate days, max. 4 daily

Kalspare® (DHP Healthcare) (Pharm)
Tablets, orange, f/c, scored, triame terene 50 mg, chlortalidone 50 mg, net price 28-tab pack = £9.90. Label: 14, (see above), 21
Dose hypertension, oedema, 1–2 tablets in the morning

Triamterene with loop diuretics

Counselling Urine may look slightly blue in some lights

Frusene® (Orion) (Pharm)
Tablets, yellow, scored, triame terene 50 mg, furosemide 40 mg, net price 56-tab pack = £4.34. Label: 14, (see above)
Dose oedema, ½–2 tablets daily in the morning

Congestive heart failure, initially ½ tablet daily, increased if necessary to max. 2 tablets daily, reduce for maintenance if possible
Oedema and ascites in cirrhosis of the liver, initially 1 tablet daily, increased if necessary to max. 2 tablets daily, reduce for maintenance if possible

Navispare® (AMCo) (Pharm)
Tablets, f/c, orange, amiloride hydrochloride 2.5 mg, cyclopenthiazide 250 micrograms, net price 28-tab pack = £3.24
Excipients include gluten
Dose hypertension, 1–2 tablets in the morning

Frisone® (Orion) (Pharm)
Tablets, yellow, scored, triame terene 50 mg, furosemide 40 mg, net price 56-tab pack = £4.34. Label: 14, (see above)
Dose oedema, ½–2 tablets daily in the morning

Available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104
2.2.5 Osmotic diuretics

Mannitol is an osmotic diuretic that can be used to treat cerebral oedema and raised intra-ocular pressure.

**MANNITOL**

**Indications** see notes above; glaucoma (section 11.6)

**Cautions** extravasation causes inflammation and thrombophlebitis; monitor fluid and electrolyte balance, serum osmolality, and pulmonary and renal function; assess cardiac function before and during treatment; interactions: Appendix 1 (mannitol)

**Contra-indications** severe cardiac failure; severe pulmonary oedema; intracranial bleeding (except during craniotomy); anaemia; severe dehydration

**Renal impairment** use with caution in severe impairment

**Pregnancy** manufacturer advises avoid unless essential—no information available

**Breast-feeding** manufacturer advises avoid unless essential—no information available

**Side-effects** less commonly hypotension, thrombophlebitis, fluid and electrolyte imbalance; rarely dry mouth, thirst, nausea, vomiting, oedema, raised intracranial pressure, arrhythmia, hypertension, pulmonary oedema, chest pain, headache, convulsions, dizziness, chills, fever, urinary retention, focal osmotic nephrosis, dehydration, cramp, blurred vision, rhinitis, skin necrosis, and hypersensitivity reactions (including urticaria and anaphylaxis); very rarely congestive heart failure and acute renal failure

**Dose**

- Cerebral oedema and raised intra-ocular pressure, by intravenous infusion over 30–60 minutes, 0.25–2 g/kg repeated if necessary 1–2 times after 4–8 hours

**Note** For mannitol 20%, an in-line filter is recommended (15-micron filters have been used)

**Mannitol** (Baxter) (Pharma)

Intravenous infusion, mannitol 10%, net price 500-mL Viaflex® bag = £3.20; 20%, net price 250-mL Viaflex® bag = £3.78, 500-mL Viaflex® bag = £5.80

---

2.2.6 Mercurial diuretics

Mercurial diuretics are effective but are now almost never used because of their nephrotoxicity.

2.2.7 Carbonic anhydrase inhibitors

The carbonic anhydrase inhibitor acetazolamide is a weak diuretic and is little used for its diuretic effect. It is used for prophylaxis against mountain sickness [unlicensed indication] but is not a substitute for acclimatisation.

Acetazolamide and eye drops of dorzolamide and brinzolamide inhibit the formation of aqueous humour and are used in glaucoma (section 11.6).

2.2.8 Diuretics with potassium

Many patients on diuretics do not need potassium supplements (section 9.2.1.1). For many of those who do, the amount of potassium in combined preparations may not be enough, and for this reason their use is to be discouraged.

Diuretics with potassium and potassium-sparing diuretics should not usually be given together.

**Counselling** Modified-release potassium tablets should be swallowed whole with plenty of fluid during meals while sitting or standing

**Diumide-K Continus** (Teofarma) (Pharma)

Tablets, white/orange, f/c, furosemide 40 mg, potassium 8 mmol for modified release, net price 30-tab pack = £3.00. Label: 25, 27, counselling, see above

---

2.3 Anti-arrhythmic drugs

2.3.1 Management of arrhythmias

Management of an arrhythmia requires precise diagnosis of the type of arrhythmia, and electrocardiography is essential; underlying causes such as heart failure require appropriate treatment.

**Ectopic beats** If ectopic beats are spontaneous and the patient has a normal heart, treatment is rarely required and reassurance to the patient will often suffice. If they are particularly troublesome, beta-blockers are sometimes effective and may be safer than other suppressant drugs.

**Atrial fibrillation** All patients with atrial fibrillation should be assessed for their risk of stroke and thromboembolism, and thromboprophylaxis given if necessary (see below). Atrial fibrillation can be managed by either controlling the ventricular rate or by attempting to restore and maintain sinus rhythm.

---

1 Cardiovacular system

2.2.5 Osmotic diuretics

Mannitol is an osmotic diuretic that can be used to treat cerebral oedema and raised intra-ocular pressure.

**MANNITOL**

**Indications** see notes above; glaucoma (section 11.6)

**Cautions** extravasation causes inflammation and thrombophlebitis; monitor fluid and electrolyte balance, serum osmolality, and pulmonary and renal function; assess cardiac function before and during treatment; interactions: Appendix 1 (mannitol)

**Contra-indications** severe cardiac failure; severe pulmonary oedema; intracranial bleeding (except during craniotomy); anaemia; severe dehydration

**Renal impairment** use with caution in severe impairment

**Pregnancy** manufacturer advises avoid unless essential—no information available

**Breast-feeding** manufacturer advises avoid unless essential—no information available

**Side-effects** less commonly hypotension, thrombophlebitis, fluid and electrolyte imbalance; rarely dry mouth, thirst, nausea, vomiting, oedema, raised intracranial pressure, arrhythmia, hypertension, pulmonary oedema, chest pain, headache, convulsions, dizziness, chills, fever, urinary retention, focal osmotic nephrosis, dehydration, cramp, blurred vision, rhinitis, skin necrosis, and hypersensitivity reactions (including urticaria and anaphylaxis); very rarely congestive heart failure and acute renal failure

**Dose**

- Cerebral oedema and raised intra-ocular pressure, by intravenous infusion over 30–60 minutes, 0.25–2 g/kg repeated if necessary 1–2 times after 4–8 hours

**Note** For mannitol 20%, an in-line filter is recommended (15-micron filters have been used)

**Mannitol** (Baxter) (Pharma)

Intravenous infusion, mannitol 10%, net price 500-mL Viaflex® bag = £3.20; 20%, net price 250-mL Viaflex® bag = £3.78, 500-mL Viaflex® bag = £5.80

Atrial fibrillation can be managed by either controlling the ventricular rate or by attempting to restore and maintain sinus rhythm.

---

1 Cardiovacular system
All haemodynamically unstable patients with acute-onset atrial fibrillation should undergo electrical cardioversion. Intravenous amiodarone, or alternatively flecainide, can be used in non-life-threatening cases when electrical cardioversion is delayed. If urgent ventricular rate control is required, a beta-blocker, verapamil, or amiodarone can be given intravenously.

In haemodynamically stable patients, a rhythm-control treatment strategy is preferred for patients with paroxysmal atrial fibrillation; rate-control is preferred for those with permanent atrial fibrillation. For patients with persistent atrial fibrillation, the treatment strategy should be based on criteria such as age, co-morbidities, presence of symptoms, and the relative advantages and disadvantages of each treatment.

Ventricular rate can be controlled with a beta-blocker (section 2.4), or diltiazem [unlicensed indication], or verapamil. Digoxin is usually only effective for controlling the ventricular rate at rest, and should therefore only be used as monotherapy in predominantly sedentary patients. When a single drug fails to adequately control the ventricular rate, patients should receive digoxin with either a beta-blocker, diltiazem, or verapamil. If ventricular function is diminished, the combination of a beta-blocker (that is licensed for use in heart failure) and digoxin is preferred (see section 2.5.5, and interactions: Appendix 1 (cardiac glycosides)). Digoxin is also used when atrial fibrillation is accompanied by congestive heart failure.

Sinus rhythm can be restored by electrical cardioversion, or pharmacological cardioversion with an oral or intravenous anti-arrhythmic drug e.g. flecainide or amiodarone. If necessary, sotalol or amiodarone can be started 4 weeks before electrical cardioversion to increase success of the procedure. If atrial fibrillation has been present for more than 48 hours, cardioversion should not be attempted until the patient has been fully anticoagulated (see section 2.8.2) for at least 3 weeks; if this is not possible, parenteral anticoagulation (section 2.8.1) should be commenced and a left atrial thrombus ruled out immediately before cardioversion; oral anticoagulation should be given after cardioversion and continued for at least 4 weeks. For atrial fibrillation of over 48 hours duration, electrical cardioversion is preferred to pharmacological methods. If drug treatment is required to maintain sinus rhythm, a beta-blocker is used. If a standard beta-blocker is not appropriate or is ineffective, an oral anti-arrhythmic drug such as sotalol (section 2.4), flecainide, propafenone, or amiodarone, is required.

In symptomatic paroxysmal atrial fibrillation, ventricular rhythm is controlled with a beta-blocker. Alternatively, if symptoms persist or a beta-blocker is not appropriate, an oral anti-arrhythmic drug such as sotalol, flecainide, propafenone, or amiodarone can be given (see also Paroxysmal Supraventricular Tachycardia below, and Supraventricular Arrhythmias). In selected patients with infrequent episodes of symptomatic paroxysmal atrial fibrillation, sinus rhythm can be restored using the ‘pill-in-the-pocket’ approach; this involves the patient taking oral flecainide or propafenone to self-treat an episode of atrial fibrillation when it occurs.

All patients with atrial fibrillation should be assessed for their risk of stroke and the need for thromboprophylaxis. Anticoagulants (section 2.8) are indicated for those with a history of ischaemic stroke, transient ischaemic attacks, or thromboembolic events, and those with valve disease, heart failure, or impaired left ventricular function; anticoagulants should be considered for those with cardiovascular disease, diabetes, hypertension, or thyrotoxicosis, and in the elderly. Anticoagulants are also indicated during cardioversion procedures (see above). Aspirin (section 2.9) is less effective than warfarin at preventing emboli, but may be appropriate if there are no other risk factors for stroke, or if warfarin is contra-indicated.

Atrial flutter Like atrial fibrillation, treatment options for atrial flutter involve either controlling the ventricular rate or attempting to restore and maintain sinus rhythm. However, atrial flutter generally responds less well to drug treatment than atrial fibrillation.

Control of the ventricular rate is usually an interim measure pending restoration of sinus rhythm. Ventricular rate can be controlled by administration of a beta-blocker (section 2.4), diltiazem [unlicensed indication], or verapamil (section 2.6.2); an intravenous beta-blocker or verapamil is preferred for rapid control. Digoxin (section 2.1.1) can be added if rate control remains inadequate, and may be particularly useful in those with heart failure.

Conversion to sinus rhythm can be achieved by electrical cardioversion (by cardiac pacing or direct current), pharmacological cardioversion, or catheter ablation. If the duration of atrial flutter is unknown, or it has lasted for over 48 hours, cardioversion should not be attempted until the patient has been fully anticoagulated (see section 2.8.2) for at least 3 weeks; if this is not possible, parenteral anticoagulation (section 2.8.1) should be commenced and a left atrial thrombus ruled out immediately before cardioversion; oral anticoagulation should be given after cardioversion and continued for at least 4 weeks.

Direct current cardioversion is usually the treatment of choice when rapid conversion to sinus rhythm is necessary (e.g. when atrial flutter is associated with haemodynamic compromise); catheter ablation is preferred for the treatment of recurrent atrial flutter. There is a limited role for anti-arrhythmic drugs as their use is not always successful. Flecainide or propafenone can slow atrial flutter, resulting in 1:1 conduction to the ventricles, and should therefore be prescribed in conjunction with a ventricular rate controlling drug such as a beta-blocker, diltiazem [unlicensed indication], or verapamil. Amiodarone can be used when other drug treatments are contra-indicated or ineffective.

All patients should be assessed for their risk of stroke and the need for thromboprophylaxis; the choice of anticoagulant is based on the same criteria as for atrial fibrillation (see notes above).

Paroxysmal supraventricular tachycardia This will often terminate spontaneously or with reflex vagal stimulation such as a Valsalva manoeuvre, immersing the face in ice-cold water, or carotid sinus massage; such manoeuvres should be performed with ECG monitoring.

If the effects of reflex vagal stimulation are transient or ineffective, or if the arrhythmia is causing severe symptoms, intravenous adenosine (section 2.3.2) should be given. If adenosine is ineffective or contra-indicated, intravenous verapamil (section 2.6.2) is an alternative, but it should be avoided in patients recently treated with beta-blockers (see p. 137).
Failure to terminate paroxysmal supraventricular tachycardia with reflex vagal stimulation or drug treatment may suggest an arrhythmia of atrial origin, such as focal atrial tachycardia or atrial flutter.

Treatment with direct current cardioversion is needed in haemodynamically unstable patients or when the above measures have failed to restore sinus rhythm (and an alternative diagnosis has not been found).

Recurrent episodes of paroxysmal supraventricular tachycardia can be treated by catheter ablation, or prevented with drugs such as diltiazem, verapamil, beta-blockers including sotalol (section 2.4), flecainide, or propafenone (section 2.3.2).

Arrhythmias after myocardial infarction In patients with a paroxysmal tachycardia or rapid irregularity of the pulse it is best not to administer an anti-arrhythmic until an ECG record has been obtained. Bradycardia, particularly if complicated by hypotension, should be treated with 500 micrograms of atropine sulfate given intravenously; the dose may be repeated every 3–5 minutes if necessary up to a maximum total dose of 3 mg. If there is a risk of asystole, or if the patient is unstable and has failed to respond to atropine, adrenaline should be given by intravenous infusion in a dose of 2–10 micrograms/minute, adjusted according to response.

For further advice, refer to the most recent recommendations of the Resuscitation Council (UK) available at www.resus.org.uk.

Ventricular tachycardia Pulseless ventricular tachycardia or ventricular fibrillation should be treated with immediate defibrillation (see Cardiopulmonary Resuscitation, section 2.7.3).

Patients with unstable sustained ventricular tachycardia, who continue to deteriorate with signs of hypotension or reduced cardiac output, should receive direct current cardioversion to restore sinus rhythm. If this fails, intravenous amiodarone (section 2.3.2) should be administered and direct current cardioversion repeated.

Patients with sustained ventricular tachycardia who are haemodynamically stable can be treated with intravenous anti-arrhythmic drugs. Amiodarone is the preferred drug. Flecainide, propafenone (section 2.3.2), and, although less effective, lidocaine (section 2.3.2) have all been used. If sinus rhythm is not restored, direct current cardioversion or pacing should be considered. Catheter ablation is an alternative if cessation of the arrhythmia is not urgent. Non-sustained ventricular tachycardia can be treated with a beta-blocker (section 2.4).

All patients presenting with ventricular tachycardia should be referred to a specialist. Following restoration of sinus rhythm, patients who remain at high risk of cardiac arrest will require maintenance therapy. Most patients will be treated with an implantable cardioverter defibrillator. Beta-blockers or sotalol (in place of a standard beta-blocker), or amiodarone (in combination with a standard beta-blocker), can be used in addition to the device in some patients; alternatively, they can be used alone when use of an implantable cardioverter defibrillator is not appropriate.

Torsade de pointes is a form of ventricular tachycardia associated with a long QT syndrome (usually drug-induced, but other factors including hypokalaemia, severe bradycardia, and genetic predisposition are also implicated). Episodes are usually self-limiting, but are frequently recurrent and can cause impairment or loss of consciousness. If not controlled, the arrhythmia can progress to ventricular fibrillation and sometimes death. Intravenous infusion of magnesium sulfate (section 9.5.1.3) is usually effective. A beta-blocker (but not sotalol) and atrial (or ventricular) pacing can be considered. Anti-arrhythmics can further prolong the QT interval, thus worsening the condition.

2.3.2 Drugs for arrhythmias

Anti-arrhythmic drugs can be classified clinically into those that act on supraventricular arrhythmias (e.g. verapamil), those that act on both supraventricular and ventricular arrhythmias (e.g. amiodarone), and those that act on ventricular arrhythmias (e.g. lidocaine).

Anti-arrhythmic drugs can also be classified according to their effects on the electrical behaviour of myocardial cells during activity (the Vaughan Williams classification) although this classification is of less clinical significance:

Class I: membrane stabilising drugs (e.g. lidocaine, flecainide)
Class II: beta-blockers
Class III: amiodarone; sotalol (also Class II)
Class IV: calcium-channel blockers (includes verapamil but not dihydropyridines)

Cautions The negative inotropic effects of anti-arrhythmic drugs tend to be additive. Therefore special care should be taken if two or more are used, especially if myocardial function is impaired. Most drugs that are effective in countering arrhythmias can also provoke them in some circumstances; moreover, hypokalaemia enhances the arrhythmogenic (pro-arrhythmic) effect of many drugs.

Supraventricular arrhythmias

Adenosine is usually the treatment of choice for terminating paroxysmal supraventricular tachycardia. As it has a very short duration of action (half-life only about 8 to 10 seconds, but prolonged in those taking dipyrone), most side-effects are short lived. Unlike verapamil, adenosine can be used after a beta-blocker. Verapamil may be preferable to adenosine in asthma.

Dronedarone is a multi-channel blocking anti-arrhythmic drug; it is licensed for the maintenance of sinus rhythm after cardioversion in clinically stable patients with paroxysmal or persistent atrial fibrillation, when alternative treatments are unsuitable; dronedarone should be initiated and monitored under specialist supervision.
Cardiovascular system

2.3.2 Drugs for arrhythmias

**NICE guidance**

**Dronedarone for the treatment of non-permanent atrial fibrillation (December 2012)**

Dronedarone is an option for the maintenance of sinus rhythm after successful cardioversion in paroxysmal or persistent atrial fibrillation which is not controlled by first-line therapy (usually including beta-blockers), and after alternative options have been considered in patients:

- who have at least 1 of the following cardiovascular risk factors: hypertension requiring drugs of at least 2 different classes, diabetes mellitus, previous transient ischaemic attack, stroke or systemic embolism, left atrial diameter of 50 mm or greater, or age 70 years or older and
- who do not have left ventricular systolic dysfunction nor a history of, or current, heart failure

Patients who do not meet the above criteria who are currently receiving dronedarone should have the option to continue treatment until they and their clinicians consider it appropriate to stop.

www.nice.org.uk/TA197

Oral administration of a cardiac glycoside (such as digoxin, section 2.1.1) slows the ventricular response in cases of atrial fibrillation and atrial flutter. However, intravenous infusion of digoxin is rarely effective for rapid control of ventricular rate. Cardiac glycosides are contra-indicated in supraventricular arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome).

**Verapamil** (section 2.6.2) is usually effective for supraventricular tachycardias. An initial intravenous dose (important: serious beta-blocker interaction hazard, see p. 137) may be followed by oral treatment; hypertension may occur with large doses. It should not be used for tachyarrhythmias where the QRS complex is wide (i.e. broad complex) unless a supraventricular origin has been established beyond reasonable doubt. It is also contra-indicated in atrial fibrillation or atrial flutter associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome).

Intravenous administration of a beta-blocker (section 2.4) such as esmolol or propranolol, can achieve rapid control of the ventricular rate.

Drugs for both supraventricular and ventricular arrhythmias include amiodarone, beta-blockers (see p. 102), disopyramide, flecainide, procainamide (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104), and propafenone, see below Under Supraventricular and Ventricular Arrhythmias.

**ADENOSINE**

**Indications** rapid reversion to sinus rhythm of paroxysmal supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome); aid to diagnosis of broad or narrow complex supraventricular tachycardias; in conjunction with radionuclide myocardial perfusion imaging in patients who cannot exercise adequately or for whom exercise is inappropriate

**Cautions** monitor ECG and have resuscitation facilities available; atrial fibrillation or flutter with accessory pathway (conduction down anomalous pathway may increase); first-degree AV block; bundle branch block; QT-interval prolongation; left main coronary artery stenosis; uncorrected hypovolaemia; stenotic valvular heart disease; left to right shunt; pericarditis; pericardial effusion; autonomic dysfunction; stenotic carotid artery disease with cerebrovascular insufficiency; recent myocardial infarction; severe heart failure; heart transplant (see below); **interactions:** Appendix 1 (adenosine)

**Contra-indications** second- or third-degree AV block and sick sinus syndrome (unless pacemaker fitted); long QT syndrome; severe hypotension; decompensated heart failure; chronic obstructive lung disease (including asthma)

**Pregnancy** large doses may produce fetal toxicity; manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** no information available—unlikely to be present in milk owing to short half-life

**Side-effects** nausea, arrhythmia (discontinue if asymptomatic or severe bradycardia occurs), sinus pause, AV block, flushing, angina (discontinue), dizziness, dyspnoea, headache, apprehension; less commonly metallic taste, palpitation, hyperventilation, weakness, blurred vision, sweating; very rarely transient worsening of intracranial hypertension, bronchospasm, injection-site reactions; also reported vomiting, syncope, hypotension (discontinue if severe), cardiac arrest, respiratory failure (discontinue), convulsions

**Dose**

- By rapid intravenous injection into central or large peripheral vein, 6 mg over 2 seconds with cardiac monitoring; if necessary followed by 12 mg after 1–2 minutes, and then by 12 mg after a further 1–2 minutes; increments should not be given if high level AV block develops at any particular dose

  **Important** Patients with a heart transplant are very sensitive to effects of adenosine and should receive initial dose of 3 mg over 2 seconds, followed if necessary by 6 mg after 1–2 minutes, and then by 12 mg after a further 1–2 minutes.

  Also, if essential to give dipyridamole reduce adenosine dose to a quarter of the usual dose

  **Note** Adenosine doses in the BNF may differ from those in product literature

  **By intravenous infusion** in conjunction with radionuclide myocardial perfusion imaging—consult product literature

**Adenosine (Non-proprietary)**

**Injection**

- adenosine 3 mg/mL, net price 2-mL vial = £4.45 (hosp. only)

**Intravenous infusion**

- adenosine 3 mg/mL, net price 10-mL vial = £11.67 (hosp. only)

**Adenocor®** (Sanofi-Aventis)

**Injection**

- adenosine 3 mg/mL, net price 2-mL vial = £4.99 (hosp. only)

**Electrolytes**

- Na⁺ 0.15 mmol/mL

**Adenoscan®** (Sanofi-Aventis)

**Intravenous infusion**

- adenosine 3 mg/mL, net price 10-mL vial = £14.26 (hosp. only)

**Electrolytes**

- Na⁺ 0.15 mmol/mL

**DRONEDARONE**

**Indications** see notes above

**Cautions** monitor liver function (see Hepatic Disorders below); monitor for heart failure (see Heart Failure section 2.1.1)

**Contra-indications** second- or third-degree AV block and sick sinus syndrome (unless pacemaker fitted); long QT syndrome; severe hypotension; decompensated heart failure; chronic obstructive lung disease (including asthma)
Failure below); perform ECG at least every 6 months—consider discontinuation if atrial fibrillation reoccurs; coronary artery disease; correct hypokalaemia and hypomagnesaemia before starting and during treatment; measure serum creatinine before treatment and 7 days after initiation—if raised, measure again after a further 7 days and consider discontinuation if creatinine continues to rise; interactions: Appendix 1 (dronedarone)

- **Hepatic disorders** Liver injury, including life-threatening acute liver failure reported rarely; monitor liver function before treatment, 1 week and 1 month after initiation of treatment, then monthly for 6 months, then every 3 months for 6 months and periodically thereafter—discontinue treatment if 2 consecutive alanine aminotransferase concentrations exceed 3 times upper limit of normal. Patients or their carers should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as abdominal pain, anorexia, nausea, vomiting, fever, malaise, itching, dark urine, or jaundice develop.

- **Heart failure** New-onset or worsening heart failure reported, patients or their carers should be told how to recognise signs of heart failure and advised to seek prompt medical attention if symptoms such as weight gain, dependent oedema, or dyspnoea develop or worsen; if heart failure or left ventricular systolic dysfunction develops, discontinue treatment.

**Contra-indications** liver or lung toxicity associated with previous amiodarone use; second- or third-degree AV block, complete bundle branch block, diastolic block, sinus node dysfunction, atrial conduction defects, or sick sinus syndrome (unless pacemaker fitted); permanent atrial fibrillation; bradycardia; prolonged QT interval; existing or previous heart failure or left ventricular systolic dysfunction (see also Heart Failure above); haemodynamically unstable patients.

**Hepatic impairment** avoid in severe impairment; see also Hepatic Disorders above.

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m².

**Pregnancy** manufacturer advises avoid—toxicity in breast-feeding. Breast-feeding manufacturer advises avoid—present in milk in animal studies.

**Side-effects** gastro-intestinal disturbances, QT-interval prolongation, bradycardia, heart failure (see also Heart Failure above), malaise, rash, pruritus, raised serum creatinine, less commonly taste disturbance, extraintestinal lung disease including pneumonitis and pulmonary fibrosis (investigate if symptoms such as dyspnoea or dry cough develop and discontinue treatment if confirmed); erythema, eczema, dermatitis, photosensitivity; rarely liver injury (including life-threatening acute liver failure—see also Hepatic Disorders above).

**Dose**
- **ADULT** over 18 years, 400 mg twice daily.

**Multaq®** (Sanoft-Aventis) ▼ (Prot)

- **Tablets, 1/2 c. dronedarone (as hydrochloride) 400 mg, net price 20-tab pack = £22.50, 60-tab pack = £67.50. Label: 21, counselling, hepatic disorders, heart failure.

**Supraventricular and ventricular arrhythmias**

Amiodarone is used in the treatment of arrhythmias, particularly when other drugs are ineffective or contra-indicated. It can be used for paroxysmal supraventricular, nodal and ventricular tachycardias, atrial fibrillation and flutter, and ventricular fibrillation. It can also be used for tachyarrhythmias associated with Wolff-Parkinson-White syndrome. It should be initiated only under hospital or specialist supervision. Amiodarone may be given by intravenous infusion as well as by mouth, and has the advantage of causing little or no myocardial depression. Unlike oral amiodarone, intravenous amiodarone acts relatively rapidly.

Intravenous injection of amiodarone can be used in cardiopulmonary resuscitation for ventricular fibrillation or pulseless tachycardia unresponsive to other interventions (section 2.7.3).

Amiodarone has a very long half-life (extending to several weeks) and only needs to be given once daily (but high doses can cause nausea unless divided). Many weeks or months may be required to achieve steady-state plasma-amiodarone concentration; this is particularly important when drug interactions are likely (see also Appendix 1).

Most patients taking amiodarone develop corneal microdeposits (reversible on withdrawal of treatment); these rarely interfere with vision, but drivers may be dazzled by headlights at night. However, if vision is impaired or if optic neuritis or optic neuropathy occur, amiodarone must be stopped to prevent blindness and expert advice sought. Because of the possibility of phototoxic reactions, patients should be advised to shield the skin from light during treatment and for several months after discontinuing amiodarone; a wide-spectrum sunscreen (section 13.8.1) to protect against both long-wave ultraviolet and visible light should be used.

Amiodarone contains iodine and can cause disorders of thyroid function; both hypothyroidism and hyperthyroidism may occur. Clinical assessment alone is unreliable, and laboratory tests should be performed before treatment and every 6 months. Thyroxine (T4) may be raised in the absence of hyperthyroidism; therefore tri-iodothyronine (T3), T4, and thyroid-stimulating hormone (thyrotrophin, TSH) should all be measured. A raised T3 and T4 with a very low or undetectable TSH concentration suggests the development of thyrotoxicosis. The thyrotoxicosis may be very refractory, and amiodarone should usually be withdrawn at least temporarily to help achieve control; treatment with carbimazole may be required. Hypothyroidism can be treated with replacement therapy without withdrawing amiodarone if it is essential; careful supervision is required.

Pneumonitis should always be suspected if new or progressive shortness of breath or cough develops in a patient taking amiodarone. Fresh neurological symptoms should raise the possibility of peripheral neuropathy.

Amiodarone is also associated with hepatotoxicity and treatment should be discontinued if severe liver function abnormalities or clinical signs of liver disease develop.

- **Beta-blockers** act as anti-arrhythmic drugs principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart, for details see section 2.4. For special reference to the role of sotalol in ventricular arrhythmias, see p. 102.

Disopyramide can be given by intravenous injection to control arrhythmias after myocardial infarction (including those not responding to lidocaine), but it impairs cardiac contractility. Oral administration of disopyramide is useful, but it has an antimuscarinic effect.
which limits its use in patients susceptible to angle-closure glaucoma or with prostatic hyperplasia.

**Flecainide** belongs to the same general class as lidocaine and may be of value for serious symptomatic ventricular arrhythmias. It may also be indicated for junctional re-entry tachycardias and for paroxysmal atrial fibrillation. However, it can precipitate serious arrhythmias in a small minority of patients (including those with otherwise normal hearts).

**Propafenone** is used for the prophylaxis and treatment of ventricular arrhythmias and also for some supraventricular arrhythmias. It has complex mechanisms of action, including weak beta-blocking activity (therefore caution is needed in obstructive airways disease—contra-indicated if severe).

Drugs for supraventricular arrhythmias include adenosine, cardiac glycosides, and verapamil; see above under Supraventricular Arrhythmias. Drugs for ventricular arrhythmias include lidocaine; see under Ventricular Arrhythmias, p. 100.

Mexiletine and procainamide are both available from 'special-order' manufacturers or specialist importing companies, see p. 1104. Mexiletine can be used for special-order manufacturers or specialist importing Mexiletine and procainamide are both available from 'special-order' manufacturers or specialist importing companies.

**AMIODARONE HYDROCHLORIDE**

*Indications* see notes above (should be initiated in hospital or under specialist supervision)

*Caution* liver-function and thyroid-function tests required before treatment and then every 6 months (see notes above for tests of thyroid function); hypokalaemia (measure serum-potassium concentration before treatment); chest x-ray required before treatment; heart failure; elderly; severe bradycardia and conduction disturbances in excessive dosage; intravenous use may cause moderate and transient fall in blood pressure (circulatory collapse precipitated by rapid administration or overdosage) or severe hepatoxicity; monitor transaminases closely; infusion by central venous catheter recommended in patients with severe respiratory failure; infusion via peripheral veins may cause pain and inflammation; ECG monitoring and resuscitation facilities must be available during intravenous use; acute porphyria (section 9.8.2); extreme caution or avoidance concomitant use of drugs that prolong QT interval; interactions: Appendix 1 (amiodarone)

**Contra-indications** (except in cardiac arrest) sinus bradycardia, sino-atrial heart block; unless pacemaker fitted avoid in severe conduction disturbances or sinus node disease; thyroid dysfunction; iodine sensitivity; avoid intravenous use in severe respiratory failure, circulatory collapse, or severe arterial hypotension; avoid bolus injection in congestive heart failure or cardiomyopathy

**Pregnancy** possible risk of neonatal goitre; use only if no alternative

**Breast-feeding** avoid; present in milk in significant amounts; theoretical risk of neonatal hypothyroidism from release of iodine

**Side-effects** nausea, vomiting, taste disturbances, raised serum transaminases (may require dose reduction or withdrawal if accompanied by acute liver disorders), jaundice; bradycardia (see Cautions); pulmonary toxicity (including pneumonitis and fibrosis); tremor, sleep disorders; hypothyroidism, hyperthyroidism; reversible corneal microdeposits (sometimes with night glare); phototoxicity, persistent slate-grey skin discolouration (see also notes above), injection-site reactions; less commonly onset or worsening of arrhythmia, conduction disturbances (see Cautions), peripheral neuropathy and myopathy (usually reversible on withdrawal); very rarely chronic liver disease including cirrhosis, sinus arrest, bronchospasm (in patients with severe respiratory failure), ataxia, benign intracranial hypertension, headache, vertigo, epididymo-orchitis, impotence, haemolytic or aplastic anaemia, thrombocytopenia, rash (including exfoliative dermatitis), hypersensitivity including vasculitis, alopecia, impaired vision due to optic neuritis or optic neuropathy (including blindness), anaphylaxis on rapid injection, also hypotension, respiratory distress syndrome, sweating, and hot flushes

**Dose**
- By mouth, 200 mg 3 times daily for 1 week reduced to 200 mg twice daily for a further week; maintenance, usually 200 mg daily or the minimum required to control the arrhythmia
- By intravenous infusion (see Cautions above), initially 5 mg/kg over 20–120 minutes with ECG monitoring; subsequent infusion given if necessary according to response up to max. 1.2 g in 24 hours
- Ventricular fibrillation or pulseless ventricular tachycardia refractory to defibrillation, section 2.7.3

**Amiodarone** (Non-proprietary) *(Pol)*

**Tablets**, amiodarone hydrochloride 100 mg, net price 28-tab pack = £1.18; 200 mg, 28-tab pack = £1.63. Label: 11

**Injection**, amiodarone hydrochloride 30 mg/mL, net price 10-mL prefilled syringe = £13.50

**Excipients** may include benzyl alcohol (avoid in neonates unless no safer alternative available, see Excipients, p. 2)

**Sterile concentrate**, amiodarone hydrochloride 50 mg/mL, net price 3-mL amp = £1.33; 6-mL amp = £2.86. For dilution and use as an infusion

**Excipients** may include benzyl alcohol (avoid in neonates unless no safer alternative available, see Excipients, p. 2)

**Cordarone X** *(Sanofi-Aventis)* *(Pol)*

**Tablets**, scored, amiodarone hydrochloride 100 mg, net price 28-tab pack = £4.28; 200 mg, 28-tab pack = £6.99. Label: 11

**Sterile concentrate**, amiodarone hydrochloride 50 mg/mL, net price 3-mL amp = £1.60. For dilution and use as an infusion

**Excipients** include benzyl alcohol (avoid in neonates unless no safer alternative available, see Excipients, p. 2)

**DISOPYRAMIDE**

*Indications* prevention and treatment of ventricular and supraventricular arrhythmias, including after myocardial infarction; maintenance of sinus rhythm after cardioversion

*Caution* monitor for hypotension, hypoglycaemia, ventricular tachycardia, ventricular fibrillation, QT prolongation (tor-sade de pointes (discontinue if occur)); monitor serum potassium; atrial flutter or atrial tachycardia with partial block, structural heart disease, heart failure (avoid if severe); prostatic enlargement; susceptibility to angle-closure glaucoma; myasthenia gravis;
elderly; avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (disopyramide)

Contra-indications second- and third-degree AV block or bifascicular block (unless pacemaker fitted), bundle-branch block associated with first-degree AV block; severe sinus node dysfunction; severe heart failure (unless secondary to arrhythmia)

Hepatic impairment half-life prolonged—may need dose reduction; avoid modified-release preparation

Renal impairment reduce dose by increasing dose interval; adjust according to response; avoid modified-release preparation

Pregnancy manufacturer advises use only if potential benefit outweighs risk; may induce labour if used in third trimester

Breast-feeding present in milk—use only if essential and monitor infant for antimuscarinic effects

Side-effects ventricular tachycardia, ventricular fibrillation or torsade de pointes (usually associated with prolongation of QRS complex or QT interval—see Cautions above), myocardial depression, hypotension, AV block; antimuscarinic effects include dry mouth, blurred vision, urinary retention, and very rarely angle-closure glaucoma; gastrointestinal irritation; psychosis, cholestatic jaundice, hypoglycaemia also reported (see Cautions above)

Dose
- By mouth, 300–800 mg daily in divided doses
- By slow intravenous injection, 2 mg/kg over at least 5 minutes to a max. of 150 mg, with ECG monitoring, followed immediately either by 200 mg by mouth, then 200 mg every 8 hours for 24 hours or 400 micrograms/kg/hour by intravenous infusion; max. 300 mg in first hour and 800 mg daily

Disopyramide (Non-proprietary) Capsules, disopyramide (as phosphate) 100 mg, net price £20.72; 150 mg, 84-cap pack = £18.76

Rythmodan® (Sanofi-Aventis) Capsules, disopyramide 100 mg (green/beige), net price 84-cap pack = £14.14; 150 mg, 84-cap pack = £18.76

Injection, disopyramide (as phosphate) 10 mg/mL, net price 5-mL amp = £2.61

Modified release

Rythmodan Retard® Tablets, m/r, scored, f/c, disopyramide (as phosphate) 250 mg, net price 60-tab pack = £32.08. Label: 25
Dose 250–375 mg every 12 hours

**FLECAINIDE ACETATE**

Indications capsules, tablets, and injection: AV nodal reciprocating tachycardia, arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome), disabling symptoms of paroxysmal atrial fibrillation in patients without left ventricular dysfunction (arrhythmias of recent onset will respond more readily)

Immediate-release tablets only: symptomatic sustained ventricular tachycardia, disabling symptoms of premature ventricular contractions or non-sustained ventricular tachycardia in patients resistant to or intolerant of other therapy

Injection only: ventricular tachyarrhythmias resistant to other treatment

Cautions patients with pacemakers (especially those who may be pacemaker dependent because stimulation threshold may rise appreciably); atrial fibrillation following heart surgery; elderly (accumulation may occur); ECG monitoring and resuscitation facilities must be available during intravenous use; interactions: Appendix 1 (flecainide)

Contra-indications heart failure; abnormal left ventricular function; history of myocardial infarction and either asymptomatic ventricular ectopics or asymptomatic non-sustained ventricular tachycardia; long-standing atrial fibrillation where conversion to sinus rhythm not attempted; haemodynamically significant valvular heart disease; avoid in sinus node dysfunction, atrial conduction defects, second-degree or greater AV block, bundle branch block or distal block unless pacing rescue available

Hepatic impairment avoid (or reduce dose) in severe liver disease

Renal impairment reduce initial oral dose to max. 100 mg daily or reduce intravenous dose by 50%, if eGFR less than 35 mL/minute/1.73 m²

Pregnancy used in pregnancy to treat maternal and fetal arrhythmias in specialist centres; toxicity reported in animal studies; infant hypothyroidism also reported

Breast-feeding significant amount present in milk but not known to be harmful

Side-effects oedema, pro-arrhythmic effects; dyspnoea; dizziness, asthenia, fatigue, fever, visual disturbances; rarely pneumonitis, hallucinations, depression, confusion, amnesia, dyskinesia, convulsions, peripheral neuropathy; also reported gastrointestinal disturbances, anorexia, hepatic dysfunction, flushing, syncope, drowsiness, tremor, vertigo, headache, anxiety, insomnia, ataxia, paraesthesia, anaemia, leucopenia, thrombocytopenia, corneal deposits, tinnitus, increased antinuclear antibodies, hypersensitivity reactions (including rash, urticaria, and photosensitivity), increased sweating

Dose
- By mouth (initiated under direction of hospital consultant), ventricular arrhythmias, initially 100 mg twice daily (max. 400 mg daily usually reserved for rapid control or in heavily built patients), reduced afterward 3–5 days to the lowest dose that controls arrhythmia

Supraventricular arrhythmias, 50 mg twice daily, increased if required to max. 300 mg daily
- By slow intravenous injection (in hospital), 2 mg/kg over 10–30 minutes, max. 150 mg, with ECG monitoring; followed if required by infusion at a rate of 1.5 mg/kg/hour for 1 hour, subsequently reduced to 100–250 micrograms/kg/hour for up to 24 hours; max. cumulative dose in first 24 hours, 600 mg; transfer to oral treatment, as above

Flecainide (Non-proprietary) Tablets, flecainide acetate 50 mg, net price 60-tab pack = £3.28; 100 mg, 60-tab pack = £4.78

Tambocor® (Meda) Tablets, flecainide acetate 50 mg, net price 60-tab pack = £11.57; 100 mg (scored), 60-tab pack = £16.53

Injection, flecainide acetate 10 mg/mL, net price 15-mL amp = £4.40
## Cardiovascular system

### Drugs for arrhythmias

#### Lidocaine Hydrochloride

**Indications** ventricular arrhythmias, especially after myocardial infarction; eye (section 11.7); local anaesthesia (section 15.2)

**Cautions** lower doses in congestive cardiac failure and following cardiac surgery; monitor ECG and have resuscitation facilities available; elderly; **interactions**: Appendix 1 (lidocaine)

**Contra-indications** sino-atrial disorders, all grades of atrioventricular block, severe myocardial depression

**Hepatic impairment** caution—increased risk of side-effects

**Renal impairment** possible accumulation of lidocaine and active metabolite; caution in severe impairment

**Pregnancy** crosses the placenta but not known to be harmful in animal studies—use if benefit outweighs risk

**Breast-feeding** present in milk but amount too small to be harmful

**Side-effects** dizziness, paraesthesia, or drowsiness (particularly if injection too rapid); other CNS effects include confusion, respiratory depression and convulsions; hypotension and bradycardia (may lead to cardiac arrest); rarely hypersensitivity reactions including anaphylaxis

**Dose**
- **Adult** over 18 years, initially 150 mg 3 times daily after food under direct hospital supervision with ECG monitoring and blood pressure control (if QRS interval prolonged by more than 20%, reduce dose or discontinue until ECG returns to normal limits); may be increased at intervals of at least 3 days (ELDERLY at least 5 days) to 300 mg twice daily and, if necessary, to max. 300 mg 3 times daily; body-weight under 70 kg, reduce total daily dose
- **Anythrom®** (Abbott Healthcare) Tablets, f/c, propafenone hydrochloride 150 mg, net price 90-tab pack = £7.37; 300 mg, 60-tab pack = £9.54. Label: 21, 25, counselling, driving

#### Propafenone Hydrochloride

**Indications** ventricular arrhythmias; paroxysmal supraventricular tachyarrhythmias which include paroxysmal atrial flutter or fibrillation and paroxysmal re-entrant tachycardias involving the AV node or accessory pathway, where standard therapy ineffective or contra-indicated

**Cautions** heart failure; elderly; pacemaker patients; potential for conversion of paroxysmal atrial fibrillation to atrial flutter with 2:1 or 1:1 conduction block; great caution in obstructive Airways disease owing to beta-blocking activity (contra-indicated if severe); **interactions**: Appendix 1 (lidocaine)

**Contra-indications** sino-atrial disorders, all grades of atrioventricular block, severe myocardial depression

**Hepatic impairment** caution—increased risk of side-effects

**Renal impairment** possible accumulation of lidocaine and active metabolite; caution in severe impairment

**Pregnancy** crosses the placenta but not known to be harmful in animal studies—use if benefit outweighs risk

**Breast-feeding** present in milk but amount too small to be harmful

**Side-effects** dizziness, paraesthesia, or drowsiness (particularly if injection too rapid); other CNS effects include confusion, respiratory depression and convulsions; hypotension and bradycardia (may lead to cardiac arrest); rarely hypersensitivity reactions including anaphylaxis

**Dose**
- **By intravenous injection**, in patients without gross circulatory impairment, 100 mg as a bolus over a few minutes (50 mg in lighter patients or those whose circulation is severely impaired), followed immediately by infusion of 4 mg/minute for 30 minutes, 2 mg/minute for 2 hours, then 1 mg/minute; reduce concentration further if infusion continued beyond 24 hours (ECG monitoring and specialist advice for infusion)

**Note** Following intravenous injection lidocaine has a short duration of action (lasting for 15–20 minutes). If an intravenous infusion is not immediately available the initial intravenous injection of 50–100 mg can be repeated if necessary once or twice at intervals of not less than 10 minutes

#### Lidocaine (Non-proprietary)

**Injection 1%, lidocaine hydrochloride 10 mg/mL**, net price 2-mL amp = 26p; 5-mL amp = 27p; 10-mL amp = 42p; 20-mL amp = 83p

**Injection 2%, lidocaine hydrochloride 20 mg/mL**, net price 2-mL amp = 35p; 5-mL amp = 32p; 10-mL amp = 60p; 20-mL amp = 80p

**Infusion, lidocaine hydrochloride 0.1% (1 mg/mL)** and 0.2% (2 mg/mL) in glucose intravenous infusion 5%, 500-mL containers

#### Ventricular arrhythmias

Intravenous lidocaine can be used for the treatment of ventricular tachycardia in haemodynamically stable patients (section 2.3.1), and ventricular fibrillation and pulseless ventricular tachycardia in cardiac arrest refractory to defibrillation (section 2.7.3), however it is no longer the anti-arrhythmic drug of first choice.

Drugs for both supraventricular and ventricular arrhythmias include amiodarone, beta-blockers, disopyramide, flecainide, procainamide (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104), and propafenone, see above under Supraventricular and Ventricular Arrhythmias.

**Mexiteline** is available from ‘special-order’ manufacturers or specialist importing companies (see p. 1104) for treatment of life-threatening ventricular arrhythmias.
2.4 Beta-adrenoceptor blocking drugs

Beta-adrenoceptor blocking drugs (beta-blockers) block the beta-adrenoceptors in the heart, peripheral vasculature, bronchi, pancreas, and liver.

Many beta-blockers are now available and in general they are all equally effective. There are, however, differences between them, which may affect choice in treating particular diseases or individual patients.

Intrinsic sympathomimetic activity (ISA, partial agonist activity) represents the capacity of beta-blockers to stimulate as well as to block adrenergic receptors. Oxprenolol, pindolol, acebutolol, and celiprolol have intrinsic sympathomimetic activity; they tend to cause less bradycardia than the other beta-blockers and may also cause less coldness of the extremities.

Some beta-blockers are lipid soluble and some are water soluble. Atenolol, celiprolol, nadolol, and sotalol are the most water-soluble; they are less likely to enter the brain, and may therefore cause less sleep disturbance and nightmares. Water-soluble beta-blockers are excreted by the kidneys and dosage reduction is often necessary in renal impairment.

Beta-blockers with a relatively short duration of action have to be given two or three times daily. Many of these are, however, available in modified-release formulations so that administration once daily is adequate for hypertension. For angina twice-daily treatment may sometimes be needed even with a modified-release formulation. Some beta-blockers, such as atenolol, bisoprolol, celiprolol, and nadolol, have an intrinsically longer duration of action and need to be given only once daily.

Beta-blockers slow the heart and can depress the myocardium; they are contra-indicated in patients with second- or third-degree heart block. Beta-blockers should also be avoided in patients with worsening unstable heart failure; care is required when initiating a beta-blocker in those with stable heart failure (see also section 2.5.5). Sotalol may prolong the QT interval, and it occasionally causes life-threatening ventricular arrhythmias (important: particular care is required to avoid hypokalaemia in patients taking sotalol).

Labetalol, celiprolol, carvedilol, and nebivolol are beta-blockers that have, in addition, an arteriolar vasodilating action, by diverse mechanisms, and thus lower peripheral resistance. There is no evidence that these drugs have important advantages over other beta-blockers in the treatment of hypertension.

Beta-blockers can precipitate bronchospasm and should therefore usually be avoided in patients with a history of asthma. When there is no suitable alternative, it may be necessary for a patient with well-controlled asthma, or chronic obstructive pulmonary disease (without significant reversible airways obstruction), to receive treatment with a beta-blocker for a co-existing condition (e.g. heart failure or following myocardial infarction). In this situation, a cardioselective beta-blocker should be selected and initiated at a low dose by a specialist; the patient should be closely monitored for adverse effects.

Atenolol, bisoprolol, metoprolol, nebivolol, and (to a lesser extent) acebutolol, have less effect on the beta₂ (bronchial) receptors and are, therefore, relatively cardioselective, but they are not cardioselective. They have a lesser effect on airways resistance but are not free of this side-effect.

Beta-blockers are also associated with fatigue, coldness of the extremities (may be less common with those with ISA, see above), and sleep disturbances with nightmares (may be less common with the water-soluble beta-blockers, see above).

Beta-blockers can affect carbohydrate metabolism, causing hypoglycaemia or hyperglycaemia in patients with or without diabetes; they can also interfere with metabolic and autonomic responses to hypoglycaemia, thereby masking symptoms such as tachycardia. However, beta-blockers are not contra-indicated in diabetes, although the cardioselective beta-blockers (see above) may be preferred. Beta-blockers should be avoided altogether in those with frequent episodes of hypoglycaemia. Beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or in those at high risk of developing diabetes.

Pregnancy Beta-blockers may cause intra-uterine growth restriction, neonatal hypoglycaemia, and bradycardia; the risk is greater in severe hypertension. The use of labetalol in maternal hypertension is not known to be harmful, except possibly in the first trimester. Information on the safety of carvedilol during pregnancy is lacking. If beta-blockers are used close to delivery, infants should be monitored for signs of beta-blockade (and alpha-blockade with labetalol or carvedilol). For the treatment of hypertension in pregnancy, see section 2.5.

Breast-feeding Infants should be monitored as there is a risk of possible toxicity due to beta-blockade (and alpha-blockade with labetalol or carvedilol), but the amount of most beta-blockers present in milk is too small to affect infants. Acebutolol, atenolol, nadolol, and sotalol are present in milk in greater amounts than other beta-blockers. The manufacturers of celiprolol, esmolol, nebivolol, and timolol advise avoidance if breast-feeding.

Hypertension The mode of action of beta-blockers in hypertension is not understood, but they reduce cardiac output, alter baroreceptor reflex sensitivity, and block peripheral adrenoceptors. Some beta-blockers depress plasma renin secretion. It is possible that a central effect may also partly explain their mode of action.

Beta-blockers are effective for reducing blood pressure but other antihypertensives (section 2.5) are usually more effective for reducing the incidence of stroke, myocardial infarction, and cardiovascular mortality, especially in the elderly. Other antihypertensives are therefore preferred for routine initial treatment of uncomplicated hypertension.

In general, the dose of a beta-blocker does not have to be high; for example, atenolol is given in a dose of 25–50 mg daily and it is rarely necessary to increase the dose to 100 mg.

Beta-blockers can be used to control the pulse rate in patients with phaeochromocytoma (section 2.5.4). However, they should never be used alone as beta-blockade.
without concurrent alpha-blockade may lead to a hypertensive crisis. For this reason phenoxycbenzamine should always be used together with the beta-blocker.

**Angina** By reducing cardiac work beta-blockers improve exercise tolerance and relieve symptoms in patients with angina (for further details on the management of stable angina and acute coronary syndromes, see section 2.10.1). As with hypertension there is no good evidence of the superiority of any one drug, although occasionally a patient will respond better to one beta-blocker than to another. There is some evidence that sudden withdrawal may cause an exacerbation of angina and therefore gradual reduction of dose is preferable when beta-blockers are to be stopped. There is a risk of precipitating heart failure when beta-blockers and verapamil are used together in established ischaemic heart disease (important: see p. 137).

**Myocardial infarction** For advice on the management of ST-segment elevation myocardial infarction and non-ST-segment elevation myocardial infarction, see section 2.10.1. Several studies have shown that some beta-blockers can reduce the recurrence rate of myocardial infarction. However, uncontrolled heart failure, hypotension, bradyarrhythmias, and obstructive airways disease render beta-blockers unsuitable in some patients following a myocardial infarction.

**Arrhythmias** Beta-blockers act as anti-arrhythmic drugs principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. They can be used in conjunction with digoxin to control the ventricular response in atrial fibrillation, especially in patients with thyrotoxicosis. Beta-blockers are also useful in the management of supraventricular tachycardias, and are used to control those following myocardial infarction (see above).

**Esmolol** is a relatively cardioselective beta-blocker with a very short duration of action, used intravenously for the short-term treatment of supraventricular arrhythmias, sinus tachycardia, or hypertension, particularly in the peri-operative period. It may also be used in other situations, such as acute myocardial infarction, when sustained beta-blockade might be hazardous.

**Sotalol** is a non-cardioselective beta-blocker with additional class III anti-arrhythmic activity, is used for prophylaxis in paroxysmal supraventricular arrhythmias. It also suppresses ventricular ectopic beats and non-sustained ventricular tachycardia. It has been shown to be more effective than lidocaine in the termination of spontaneous sustained ventricular tachycardia due to coronary disease or cardiomyopathy. However, it may induce torsade de pointes in susceptible patients.

**Heart failure** Beta-blockers may produce benefit in heart failure by blocking sympathetic activity. Bisoprolol and carvedilol reduce mortality in any grade of stable heart failure; nebivolol is licensed for stable mild to moderate heart failure in patients over 70 years. Treatment should be initiated by those experienced in the management of heart failure (section 2.5.5).

**Thyrotoxicosis** Beta-blockers are used in pre-operative preparation for thyroidectomy. Administration of propranolol can reverse clinical symptoms of thyrotoxicosis within 4 days. Routine tests of increased thyroid function remain unaltered. The thyroid gland is rendered less vascular thus making surgery easier (section 6.2.2).

**Other uses** Beta-blockers have been used to alleviate some symptoms of anxiety; probably patients with palpitation, tremor, and tachycardia respond best (see also section 4.1.2 and section 4.9.3). Beta-blockers are also used in the prophylaxis of migraine (section 4.7.4.2). Betaxolol, carteolol, levobunolol, and timolol are used topically in glaucoma (section 11.6).

---

**PROPRANOLOL HYDROCHLORIDE**

**Indications** see under Dose

**Cautions** see notes above; also avoid abrupt withdrawal especially in ischaemic heart disease; first-degree AV block; portal hypertension (risk of deterioration in liver function); diabetes; history of obstructive airways disease (introduce cautiously and monitor lung function—see notes above); myasthenia gravis; symptoms of hypoglycaemia and thyrotoxicosis may be masked (also see notes above); psoriasis; history of hypersensitivity—may increase sensitivity to allergens and result in more serious hypersensitivity response, also may reduce response to epinephrine (see also section 3.4.3); interactions: Appendix 1 (beta-blockers), important: verapamil interaction, see also p. 137

**Contra-indications** asthma (but see notes above), uncontrolled heart failure, Prinzmetal’s angina, marked bradycardia, hypotension, sick sinus syndrome, second- or third-degree AV block, cardiogenic shock, metabolic acidosis, severe peripheral arterial disease; pheochromocytoma (apart from specific use with alpha-blockers, see also notes above)

**Bronchospasm** Beta-blockers, including those considered to be cardioselective, should usually be avoided in patients with a history of asthma or bronchospasm. However, when there is no alternative, a cardioselective beta-blocker can be given to these patients with caution and under specialist supervision.

**Hepatic impairment** reduce oral dose

**Renal impairment** manufacturer advises caution—dose reduction may be required

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also gastro-intestinal disturbances; bradycardia, heart failure, hypotension, conduction disorders, peripheral vasocostriction (including exacerbation of intermittent claudication and Raynaud’s phenomenon); bronchospasm (see above), dyspnoea, headache, fatigue, sleep disturbances, paraesthesia, dizziness, vertigo, psychoses; sexual dysfunction; purpura, thrombocytopenia; visual disturbances; exacerbation of psoriasis, alopecia; rarely rashes and dry eyes (reversible on withdrawal); **overdosage:** see Emergency Treatment of Poisoning, p. 39.
**Dose**

- **By mouth,** hypertension, initially 80 mg twice daily, increased at weekly intervals as required; maintenance 160–320 mg daily

Prophylaxis of variceal bleeding in portal hypertension, initially 40 mg twice daily, increased to 80 mg twice daily according to heart rate; max. 160 mg twice daily

Phaeochromocytoma (only with an alpha-blocker), 60 mg daily for 3 days before surgery or 30 mg daily in patients unsuitable for surgery

Angina, initially 40 mg 2–3 times daily; maintenance 120–240 mg daily

Arrhythmias, hypertrophic cardiomyopathy, anxiety tachycardia, and thyrotoxicosis (adjunct), 10–40 mg 3–4 times daily

Anxiety with symptoms such as palpitation, sweating, tremor, 40 mg once daily, increased to 40 mg 3 times daily if necessary

Prophylaxis after myocardial infarction, 40 mg 4 times daily for 2–3 days, then 80 mg twice daily, beginning 5 to 21 days after infarction

Essential tremor, initially 40 mg 2–3 times daily; maintenance 80–160 mg daily

Migraine prophylaxis, 80–240 mg daily in divided doses

- **By intravenous injection,** arrhythmias and thyrotoxic crisis, 1 mg over 1 minute; if necessary repeat at 2-minute intervals; max. total dose 10 mg (5 mg in anaesthesia)

**Note** Excessive bradycardia can be countered with intravenous injection of atropine sulfate 0.6–2.4 mg in divided doses of 600 micrograms; for overdosage see Emergency Treatment of Poisoning, p. 39

**Propranolol (Non-proprietary)**

- **Tablets,** propranolol hydrochloride 10 mg, net price 28 = £3.15; 40 mg, 28 = £2.98; 80 mg, 56 = £3.24; 160 mg, 56 = £6.40. Label: 8

**Brands include**

- **Angiold®**

**Oral solution,** propranolol hydrochloride 5 mg/5 mL, net price 150 mL = £12.50; 10 mg/5 mL, 150 mL = £16.45; 40 mg/5 mL, 150 mL = £31.50; 50 mg/5 mL, 150 mL = £19.98. Label: 8

**Brands include**

- **Sperol®**

**Injection,** propranolol hydrochloride 1 mg/mL. Available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104

**Modified release**

**Note** Modified-release preparations can be used for once daily administration

**Propranolol m/r preparations**

- **Capsules,** m/r, propranolol hydrochloride 80 mg. Label: 8, 25

**Brands include**

- **Bedranol SR®, Half Beta Prograne®**

- **Tablets,** propranolol hydrochloride 160 mg. Label: 8, 25

**Brands include**

- **Bedranol SR®, Beta Prograne®, Slo-Pro®**

**ACEBUTOLOL**

**Indications** see under Dose

**Cautions** see under Propranolol Hydrochloride

**Contra-indications** see under Propranolol Hydrochloride

**Renal impairment** half dose if eGFR 25–50 mL/minute/1.73 m²; use quarter dose if eGFR less than 25 mL/minute/1.73 m²; do not administer more than once daily

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see under Propranolol Hydrochloride

**Dose**

- Hypertension, initially 400 mg once daily or 200 mg twice daily, increased after 2 weeks to 400 mg twice daily if necessary; up to 1.2 g daily has been used

- Angina, initially 400 mg once daily or 200 mg twice daily; 300 mg 3 times daily in severe angina; up to 1.2 g daily has been used

- Arrhythmias, 0.4–1.2 g daily in 2–3 divided doses

**Sectral® (Sanofi-Aventis)**

- **Capsules,** acebutolol (as hydrochloride) 100 mg (buff/white), net price 84-cap pack = £14.97; 200 mg (buff/pink), 56-cap pack = £19.18. Label: 8

- **Tablets,** f/c, acebutolol 400 mg (as hydrochloride), net price 28-tab pack = £18.62. Label: 8

**ATENOLOL**

**Indications** see under Dose

**Cautions** see under Propranolol Hydrochloride

**Contra-indications** see under Propranolol Hydrochloride

**Renal impairment** max. 50 mg daily (10 mg on alternate days intravenously) if eGFR 15–35 mL/minute/1.73 m²; max. 25 mg daily or 50 mg on alternate days (10 mg every 4 days intravenously) if eGFR less than 15 mL/minute/1.73 m²

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see under Propranolol Hydrochloride

**Dose**

- **By mouth,** hypertension, 25–50 mg daily (higher doses rarely necessary)

- Angina, 100 mg daily in 1 or 2 doses

- Arrhythmias, 50–100 mg daily

- Migraine prophylaxis [unlicensed], 50–200 mg daily in divided doses

- **By intravenous injection,** arrhythmias, 2.5 mg at a rate of 1 mg/minute, repeated at 5-minute intervals to a max. of 10 mg

**Note** Excessive bradycardia can be countered with intravenous injection of atropine sulfate 0.6–2.4 mg in divided doses of 600 micrograms; for overdosage see Emergency Treatment of Poisoning, p. 39

- **By intravenous infusion,** arrhythmias, 150 micrograms/kg over 20 minutes, repeated every 12 hours if required

Early intervention within 12 hours of myocardial infarction (section 2.10.1), by intravenous injection over 5 minutes, 5 mg, then by mouth, 50 mg after 15 minutes, 50 mg after 12 hours, then 100 mg daily

**Atenolol (Non-proprietary)**

- **Tablets,** atenolol 25 mg, net price 28-tab pack = 98p; 50 mg, 28-tab pack = £1.03; 100 mg, 28-tab pack = £1.09. Label: 8

**Tenormin® (AstraZeneca)**

- **LS tablets,** orange, f/c, scored, atenolol 50 mg, net price 28-tab pack = £5.11. Label: 8

- **Tablets,** f/c, scored, atenolol 100 mg, net price 28-tab pack = £6.49. Label: 8

- **Syrup,** sugar-free, atenolol 25 mg/5 mL, net price 300 mL = £13.55. Label: 8

- **Injection,** atenolol 500 micrograms/mL, net price 10-mL amp = £3.45 (hosp. only)
With diuretic

**Co-tenidone** (Non-proprietary) 
Tablets, co-tenidone 50/12.5 (atenolol 50 mg, chlorothalidone 12.5 mg), net price 28-tab pack = £1.03; co-tenidone 100/25 (atenolol 100 mg, chlorothalidone 25 mg), 28-tab pack = £1.16. 

**Dose** 
hypertension, 1 tablet daily (but see also Under Dose above) 

**Kalten** (BPC 100) 
Capsules, red/ivory, atenolol 50 mg, amiloride hydrochloride 2.5 mg, hydrochlorothiazide 25 mg, net price 28-cap pack = £10.58. 

**Dose** 
hypertension, 1 capsule daily 

**Tenoret 50** (AstraZeneca) 
Tablets, brown, f/c, co-tenidone 50/12.5 (atenolol 50 mg, chlorothalidone 12.5 mg), net price 28-tab pack = £5.18. 

**Dose** 
hypertension, 1 tablet daily (but see also Under Dose above) 

With calcium-channel blocker

**Beta-Adalat** (Bayer) 
Capsules, reddish-brown, atenolol 50 mg, nifedipine 20 mg (m/r), net price 28-cap pack = £9.00. 

**Dose** 
hypertension, 1 capsule daily, increased if necessary to twice daily; **ELDERLY**, 1 daily 

Angina, 1 capsule twice daily 

**Tenif** (AstraZeneca) 
Capsules, reddish-brown, atenolol 50 mg, nifedipine 20 mg (m/r), net price 28-cap pack = £12.76. 

**Dose** 
hypertension, 1 capsule daily, increased if necessary to twice daily; **ELDERLY**, 1 daily 

Angina, 1 capsule twice daily 

**BISOPROLOL FUMARATE**

**Indications** see under **Dose** 

**Cautions** see under Propranolol Hydrochloride; ensure heart failure not worsening before increasing dose 

**Contra-indications** see under Propranolol Hydrochloride; also acute or decompensated heart failure requiring intravenous inotropes; sino-atrial block 

**Hepatic impairment** max. 10 mg daily in severe impairment 

**Renal impairment** reduce dose if eGFR less than 20 mL/minute/1.73 m² (max. 10 mg daily) 

**Pregnancy** see notes above 

**Breast-feeding** see notes above 

**Side-effects** see under Propranolol Hydrochloride; also less commonly depression, muscle weakness, and cramp; rarely hypertriglyceridaemia, syncope, and hearing impairment; very rarely conjunctivitis 

**Dose** 
- Hypertension and angina, usually 10 mg once daily (5 mg may be adequate in some patients); max. 20 mg daily 
- Adjunct in heart failure (section 2.5.5), initially 1.25 mg once daily (in the morning) for 1 week then, if well tolerated, increased to 2.5 mg once daily for 1 week, then 3.75 mg once daily for 1 week, then 5 mg once daily for 4 weeks, then 7.5 mg once daily for 4 weeks, then 10 mg once daily; max. 10 mg daily 

**Bisoprolol Fumarate** (Non-proprietary) 
Tablets, bisoprolol fumarate 5 mg, net price 28-tab pack = 90p; 10 mg, 28-tab pack = 97p. 

**Cardicor** (Merk Serono) 
Tablets, f/c, bisoprolol fumarate 1.25 mg (white), net price 28-tab pack = £2.35; 2.5 mg (scored, white), 28-tab pack = £2.35; 3.75 mg (scored, off-white), 28-tab pack = £4.90; 5 mg (scored, light yellow), 28-tab pack = £5.90; 7.5 mg (scored, yellow), 28-tab pack = £5.90; 10 mg (scored, orange), 28-tab pack = £5.90. 

**CARVEDILOL**

**Indications** hypertension; angina; adjunct to diuretics, digoxin, or ACE inhibitors in symptomatic chronic heart failure 

**Cautions** see under Propranolol Hydrochloride; monitor renal function during dose titration in patients with heart failure who also have renal impairment, low blood pressure, ischaemic heart disease, or diffuse vascular disease 

**Contra-indications** see under Propranolol Hydrochloride; acute or decompensated heart failure requiring intravenous inotropes 

**Hepatic impairment** avoid 

**Pregnancy** see notes above 

**Breast-feeding** see notes above 

**Side-effects** postural hypotension, dizziness, headache, fatigue, gastro-intestinal disturbances, bradycardia; occasionally diminished peripheral circulation, peripheral oedema and painful extremities, dry mouth, dry eyes, eye irritation or disturbed vision, impotence, disturbances of micturition, influenza-like symptoms; rarely angina, AV block, exacerbation of intermittent claudication or Raynaud’s phenomenon; allergic skin reactions, exacerbation of psoriasis, nasal stuffiness, wheezing, depressed mood, sleep disturbances, paraesthesia, heart failure, changes in liver enzymes, thrombocytopenia, leucopenia also reported 

**Dose** 
- Hypertension, initially 12.5 mg once daily, increased after 2 days to usual dose of 25 mg once daily; if necessary may be further increased at intervals of at least 2 weeks to max. 50 mg daily in single or divided doses; **ELDERLY** initial dose of 12.5 mg daily may provide satisfactory control 
- Angina, initially 12.5 mg twice daily, increased after 2 days to 25 mg twice daily 
- Adjunct in heart failure (section 2.5.5) initially 3.125 mg twice daily (with food), dose increased at intervals of at least 2 weeks to 6.25 mg twice daily, then to 12.5 mg twice daily, then to 25 mg twice daily; increase to highest dose tolerated, max. 25 mg twice daily in patients with severe heart failure or body-weight less than 85 kg and 50 mg twice daily in patients over 85 kg 

**Carvedilol** (Non-proprietary) 
Tablets, carvedilol 3.125 mg, net price 28-tab pack = £1.27; 6.25 mg, 28-tab pack = £1.46; 12.5 mg, 28-tab pack = £1.23; 25 mg, 28-tab pack = 94p.

CELPYROLOL HYDROCHLORIDE

Indications mild to moderate hypertension
Cautions see under Propranolol Hydrochloride
Contra-indications see under Propranolol Hydrochloride
Hepatic impairment consider dose reduction
Renal impairment reduce dose by half if eGFR 15–40 mL/minute/1.73 m²; avoid if eGFR less than 15 mL/minute/1.73 m²
Pregnancy see notes above
Breast-feeding see notes above
Side-effects see under Propranolol Hydrochloride; also hot flushes; rarely depression, pneumonitis
Dose
- 200 mg once daily in the morning, increased to 400 mg once daily if necessary

Celiprolol (Non-proprietary) Tablets, celiprolol hydrochloride 200 mg, net price 28-tab pack = £3.32; 400 mg, 28-tab pack = £9.91. Label: 8, 22

Celcetol® (Zentiva) Tablets, 1/2 c, scored, celiprolol hydrochloride 200 mg, net price 28-tab pack = £19.83; 400 mg, 28-tab pack = £39.65. Label: 8, 22

ESMOLOL HYDROCHLORIDE

Indications short-term treatment of supraventricular arrhythmias (including atrial fibrillation, atrial flutter, sinus tachycardia); tachycardia and hypertension in peri-operative period
Cautions see under Propranolol Hydrochloride
Contra-indications see under Propranolol Hydrochloride
Renal impairment manufacturer advises caution
Pregnancy see notes above
Breast-feeding see notes above
Side-effects see under Propranolol Hydrochloride; also on infusion venous irritation and thrombophlebitis
Dose
- By intravenous infusion, usually within range 50–200 micrograms/kg/minute (consult product literature for details of dose titration and doses during peri-operative period)

Brevibloc® (Baxter) Injection, esmolol hydrochloride 10 mg/mL, net price 10-mL vial = £7.79; 250-mL infusion bag = £89.69

METAPROLOL TARTRATE

Indications see under Dose
Cautions see under Propranolol Hydrochloride
Contra-indications see under Propranolol Hydrochloride
Hepatic impairment reduce dose in severe impairment
Pregnancy see notes above
Breast-feeding see notes above
Side-effects see under Propranolol Hydrochloride
Dose
- By mouth, hypertension, initially 100 mg daily, increased if necessary to 200 mg daily in 1–2 divided doses; max. 400 mg daily (but high doses rarely necessary)

Angina, 50–100 mg 2–3 times daily
Arrhythmias, usually 50 mg 2–3 times daily; up to 300 mg daily in divided doses if necessary
Migraine prophylaxis, 100–200 mg daily in divided doses
Hyperthyroidism (adjunct), 50 mg 4 times daily

- By intravenous injection, arrhythmias, up to 5 mg at rate 1–2 mg/minute, repeated after 5 minutes if necessary, total dose 10–15 mg

Note: Excessive bradycardia can be countered with intravenous injection of atropine sulphate 0.6–2.4 mg in divided doses of 600 micrograms; for overdosage see Emergency Treatment of Poisoning, p. 39

In surgery, by slow intravenous injection 2–4 mg at induction or to control arrhythmias developing during anaesthesia; 2-mg doses may be repeated to a max. of 10 mg

Early intervention within 12 hours of infarction, by intravenous injection 5 mg every 2 minutes to a max. of 15 mg, followed after 15 minutes by 50 mg by mouth every 6 hours for 48 hours; maintenance 200 mg daily in divided doses

Metoprolol Tartrate (Non-proprietary) ✪

Tablets, metoprolol tartrate 50 mg, net price 28 = £0.42; 100 mg, 28 = £1.03, 56 = £1.55. Label: 8

Betacol® (AstraZeneca)
Injection, metoprolol tartrate 1 mg/mL, net price 5 mL amp = £1.00

Lopresor® (Recordati) ✪

Tablets, f/c, scored, metoprolol tartrate 50 mg (pink), net price 56-tab pack = £2.57; 100 mg (blue), 56-tab pack = £6.68. Label: 8

Modified release

Lopresor SR® (Recordati) ✪

Tablets, m/r, yellow, f/c, metoprolol tartrate 200 mg, net price 28-tab pack = £9.80. Label: 8

Dose hypertension, 200 mg daily; angina, 200–400 mg daily; migraine prophylaxis, 200 mg daily

NADOLOL

Indications see under Dose
Cautions see under Propranolol Hydrochloride
Contra-indications see under Propranolol Hydrochloride
Hepatic impairment manufacturer advises caution
Renal impairment increase dosage interval if eGFR less than 50 mL/minute/1.73 m²
Pregnancy see notes above
Breast-feeding see notes above
Side-effects see under Propranolol Hydrochloride

Dose

- Hypertension, initially 80 mg once daily, increased in increments of up to 80 mg at weekly intervals if required; max. 240 mg daily (higher doses rarely necessary)
- Angina, initially 40 mg once daily, increased at weekly intervals if required; usual max. 160 mg daily (rarely up to 240 mg may be required)
- Arrhythmias, initially 40 mg once daily, increased at weekly intervals up to 160 mg if required; reduce to 40 mg if bradycardia occurs
- Migraine prophylaxis, initially 40 mg once daily, increased in 40 mg increments at weekly intervals according to response; usual maintenance dose 80–160 mg once daily
- Thyrotoxicosis (adjunct), 80–160 mg once daily

Corgard® (Sanofi-Aventis) ✪
Tablets, blue, scored, nadolol 80 mg, net price 28-tab pack = £5.00. Label: 8

NEBIVOLOL

Indications essential hypertension; adjunct in stable mild to moderate heart failure in patients over 70 years
Cautions see under Propranolol Hydrochloride
Contra-indications see under Propranolol Hydrochloride
Hepatic impairment no information available—manufacturer advises avoid
Renal impairment for hypertension, initially 2.5 mg once daily, increased to 5 mg once daily if required; for heart failure, manufacturer advises avoid if serum creatinine greater than 250 micromol/litre
Pregnancy see notes above
Breast-feeding see notes above
Side-effects see under Propranolol Hydrochloride; also oedema and depression

Dose

- Hypertension, 5 mg daily; ELDERLY initially 2.5 mg daily, increased if necessary to 5 mg daily
- Adjunct in heart failure (section 2.5.5), initially 1.25 mg once daily, then if tolerated increased at intervals of 1–2 weeks to 2.5 mg once daily, then to 5 mg once daily, then to max. 10 mg once daily

Nebivolol (Non-proprietary) ✪
Tablets, nebivolol (as hydrochloride) 5 mg, net price 28-tab pack = £1.55. Label: 8

Nebilet® (Menarini)
Tablets, scored, nebivolol (as hydrochloride) 5 mg, net price 28-tab pack = £9.23. Label: 8

Note Also available as Hypoloc®

OXPRENOLOL HYDROCHLORIDE

Indications see under Dose
Cautions see under Propranolol Hydrochloride
Contra-indications see under Propranolol Hydrochloride
Hepatic impairment reduce dose
Pregnancy see notes above
Breast-feeding see notes above
Side-effects see under Propranolol Hydrochloride

Dose

- Hypertension, 80–160 mg daily in 2–3 divided doses, increased as required; max. 320 mg daily
- Angina, 80–160 mg daily in 2–3 divided doses; max. 320 mg daily
- Arrhythmias, 40–240 mg daily in 2–3 divided doses; max. 240 mg daily
- Anxiety symptoms (short-term use), 40–80 mg daily in 1–2 divided doses

Oxprene (Non-proprietary) ✪
Tablets, coated, oxprenolol hydrochloride 20 mg, net price 56 = £5.37; 40 mg, 56 = £7.22; 80 mg, 56 = £11.70; 160 mg, 20 = £2.36. Label: 8
\section*{Sotalol Hydrochloride}

**Indications**  life-threatening arrhythmias including ventricular tachyarrhythmias; symptomatic non-sustained ventricular tachyarrhythmias; prophylaxis of paroxysmal atrial tachycardia or fibrillation, paroxysmal AV re-entrant tachycardias (both nodal and involving accessory pathways), and paroxysmal supraventricular tachycardia after cardiac surgery; maintenance of sinus rhythm following cardioversion of atrial fibrillation or flutter

**Cautions**  see under Propranolol Hydrochloride; correct hypokalaemia, hypomagnesaemia, or other electrolyte disturbances; severe or prolonged diarrhoea; extreme caution or avoid concomitant use of drugs that prolong QT interval

**Contra-indications**  see under Propranolol Hydrochloride; congenital or acquired long QT syndrome; torsade de pointes; renal failure

**Renal impairment**  use half normal dose if eGFR 30–60 mL/minute/1.73 m²; use one-quarter normal dose if eGFR 10–30 mL/minute/1.73 m²; avoid if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy**  see notes above

**Breast-feeding**  see notes above

**Side-effects**  see under Propranolol Hydrochloride; arrhythmogenic (pro-arrhythmic) effect (torsade de pointes—increased risk in women)

**Dose**

- **By mouth**  with ECG monitoring and measurement of corrected QT interval, arrhythmias, initially 80 mg daily in 1–2 divided doses increased gradually at intervals of 2–3 days to usual dose of 160–320 mg daily in 2 divided doses; higher doses of 480–640 mg daily for life-threatening ventricular arrhythmias under specialist supervision

- **Sotalol (Non-proprietary)**
  - **Tablets**, sotalol hydrochloride 40 mg, net price 28 tablets = £1.38; 80 mg, 28 = £1.31; 160 mg, 28 = £5.74. Label: 8

- **Beta-Cardone** (PharSafer)
  - **Tablets**, scored, sotalol hydrochloride 40 mg (green), net price 56 tablets = £1.29; 80 mg (pink), 56 tablets = £1.91; 200 mg, 28 tablets = £2.40. Label: 8

- **Sotacor** (Bristol-Myers Squibb)
  - **Tablets**, sotalol hydrochloride 80 mg, net price 30 tablets = £2.28. Label: 8

\section*{Timolol Maleate}

**Indications**  see under Dose; glaucoma (section 11.6)

**Cautions**  see under Propranolol Hydrochloride

**Contra-indications**  see under Propranolol Hydrochloride

**Hepatic impairment**  dose reduction may be necessary

**Renal impairment**  manufacturer advises caution—dose reduction may be required

**Pregnancy**  see notes above

**Breast-feeding**  see notes above

**Side-effects**  see under Propranolol Hydrochloride

**Dose**

- **By mouth**  with ECG monitoring and measurement of corrected QT interval, arrhythmias, initially 80 mg daily in 1–2 divided doses increased gradually at intervals of 2–3 days to usual dose of 160–320 mg daily in 2 divided doses; higher doses of 480–640 mg daily for life-threatening ventricular arrhythmias under specialist supervision

- **Timolol with amiloride and hydrochlorothiazide** (Non-proprietary)
  - **Tablets**, scored, timolol maleate 10 mg, timolol maleate hydrochloride 2.5 mg, hydrochlorothiazide 25 mg, net price 28 tablets = £29.87. Label: 8

- **Dose**  hypertension, 1–2 tablets daily

- **Timolol with bendroflu- methiazide** 2.5 mg, net price 30 tablets = £3.49. Label: 8

- **Dose**  hypertension, 1–2 tablets daily; max. 4 daily
Hypertension** Lowering raised blood pressure decreases the risk of stroke, coronary events, heart failure, and renal impairment. Advice on antihypertensive therapy in this section takes into account the recommendations of the Joint British Societies (JBS2: British Societies’ guidelines on prevention of cardiovascular disease in clinical practice. *Heart* 2005; 91 (Suppl V): v1–v52) and NICE clinical guidance 127 (August 2011). Hypertension—Clinical management of primary hypertension in adults.

Possible causes of hypertension (e.g. renal disease, endocrine causes), contributory factors, risk factors, and the presence of any complications of hypertension, such as left ventricular hypertrophy, should be established. Patients should be given advice on lifestyle changes to reduce blood pressure or cardiovascular risk; these include smoking cessation, weight reduction, reduction of excessive intake of alcohol and caffeine, reduction of dietary salt, reduction of total and saturated fat, increasing exercise, and increasing fruit and vegetable intake.

**Thresholds and targets for treatment** Patients presenting with a blood pressure of 140/90 mmHg or higher when measured in a clinic setting, should be offered ambulatory blood pressure monitoring (or home blood pressure monitoring if ambulatory blood pressure monitoring is unsuitable) to confirm the diagnosis and stage of hypertension.

**Stage 1 hypertension:**
- Clinic blood pressure 140/90 mmHg or higher, and ambulatory daytime average or home blood pressure average 135/85 mmHg or higher
- Treat patients under 80 years who have stage 1 hypertension and target-organ damage (e.g. left ventricular hypertrophy, chronic kidney disease, hypertensive retinopathy), cardiovascular disease, renal disease, diabetes, or a 10 year cardiovascular risk ≥20%; in the absence of these conditions, advise lifestyle changes to reduce blood pressure or cardiovascular risk; these include smoking cessation, weight reduction, reduction of excessive intake of alcohol and caffeine, reduction of dietary salt, reduction of total and saturated fat, increasing exercise, and increasing fruit and vegetable intake.

**Stage 2 hypertension:**
- Clinic blood pressure 160/100 mmHg or higher, and ambulatory daytime average or home blood pressure average 150/95 mmHg or higher
- Treat all patients who have stage 2 hypertension, regardless of age
- Severe hypertension:
  - Clinic systolic blood pressure ≥180 mmHg or clinic diastolic blood pressure ≥110 mmHg; treat promptly—see Hypertensive Crises, p. 110

A target clinic blood pressure below 140/90 mmHg is suggested for patients under 80 years; a target ambulatory or home blood pressure average (during the patient’s waking hours) of below 135/85 mmHg is suggested for patients under 80 years; see also Hypertension in the Elderly, below. A target clinic blood pressure below 130/80 mmHg should be considered for those with established atherosclerotic cardiovascular disease, or diabetes in the presence of kidney, eye, or cerebrovascular disease. In some individuals it may not be possible to reduce blood pressure below the suggested targets despite the use of appropriate therapy.

**Drug treatment of hypertension** A single antihypertensive drug is often inadequate in the management of hypertension, and additional antihypertensive drugs are usually added in a step-wise manner until control is achieved. Unless it is necessary to lower the blood pressure urgently (see Hypertensive Crises, below), an interval of at least 4 weeks should be allowed to determine response; clinicians should ensure antihypertensive drugs are titrated to the optimum or maximum tolerated dose at each step of treatment. Response to drug treatment may be affected by age and ethnicity.

**Patients under 55 years:**

**Step 1**
- **ACE inhibitor** (section 2.5.5.1); if not tolerated, offer an angiotensin-II receptor antagonist (section 2.5.5.2). If both ACE inhibitors and angiotensin-II receptor antagonists are contra-indicated or not tolerated, consider a beta-blocker (section 2.4); beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or at high risk of developing diabetes.

**Step 2**
- ACE inhibitor or angiotensin-II receptor antagonist in combination with a calcium-channel blocker (section 2.6.2). If a calcium-channel blocker is not tolerated or if there is evidence of, or a high risk of, heart failure, give a thiazide-related diuretic (e.g. chlorothalidone or indapamide) (section 2.2.1). If a beta-blocker was given at Step 1, add a calcium-channel blocker in preference to a thiazide-related diuretic (see Step 1 above).

**Step 3**
- ACE inhibitor or angiotensin-II receptor antagonist in combination with a calcium-channel blocker and a thiazide-related diuretic

**Step 4 (resistant hypertension)**
- Consider seeking specialist advice
- Add low-dose spironolactone (section 2.2.3) [unlicensed indication], or use high-dose thiazide-related diuretic if plasma-potassium concentration above 4.5 mmol/litre
- Monitor renal function and electrolytes

1. Cardiovascular disease risk may be determined from the chart issued by the Joint British Societies (*Heart* 2005; 91 (Suppl V): v1–v52)—see inside back cover. The Joint British Societies’ Cardiac Risk Assessor computer programme may also be used to determine cardiovascular disease risk.
Hypertension in diabetes

For patients with diabetes, a target clinic blood pressure below 140/90 mmHg is suggested (below 130/80 mmHg is advised in patients with chronic kidney disease and diabetes, or if proteinuria exceeds 1 g in 24 hours). An ACE inhibitor (or an angiotensin-II receptor antagonist) should be considered for patients with proteinuria; however, ACE inhibitors should be used with caution in renal impairment, see section 2.5.5.1. Thiazide diuretics may be ineffective and high doses of loop diuretics may be required.

Hypertension in renal disease

Hypertension usually indicates the presence of diabetic nephropathy. An ACE inhibitor (or an angiotensin-II receptor antagonist) may have a specific role in the management of diabetic nephropathy (section 6.1.5); in patients with type 2 diabetes, an ACE inhibitor (or an angiotensin-II receptor antagonist) can delay progression of microalbuminuria to nephropathy.

Hypertension in renal disease

A target clinic blood pressure below 140/90 mmHg is suggested (below 130/80 mmHg is advised in patients with chronic kidney disease and diabetes, or if proteinuria exceeds 1 g in 24 hours). An ACE inhibitor (or an angiotensin-II receptor antagonist) should be considered for patients with proteinuria; however, ACE inhibitors should be used with caution in renal impairment, see section 2.5.5.1. Thiazide diuretics may be ineffective and high doses of loop diuretics may be required.

Hypertension in pregnancy

Hypertensive complications in pregnancy can be hazardous for both the mother and the fetus, and are associated with a significant risk of morbidity and mortality; complications can occur in pregnant women with pre-existing chronic hypertension, or in those who develop hypertension in the latter half of pregnancy.

Labetalol (section 2.4) is widely used for treating hypertension in pregnancy. Methyldopa (section 2.5.1) is considered safe for use in pregnancy. Modified-release preparations of nifedipine [unlicensed] are also used, but see section 2.6.2 (p. 136) for warnings on use during pregnancy.

The following advice takes into account the recommendations of NICE Clinical Guideline 107 (August 2010), Hypertension in Pregnancy.

Pregnant women with chronic hypertension who are already receiving antihypertensive treatment should have their drug therapy reviewed. In uncomplicated chronic hypertension, a target blood pressure of <150/100 mmHg is recommended; women with target-organ damage as a result of chronic hypertension, and in women with chronic hypertension who have given birth, a target blood pressure of <140/90 mmHg is advised. Long-term antihypertensive treatment should be reviewed 2 weeks following the birth. Women managed with methyldopa during pregnancy should discontinue treatment and restart their original antihypertensive medication within 2 days of the birth. Pregnant women are at high risk of developing pre-eclampsia if they have chronic kidney disease, diabetes mellitus, autoimmune disease, chronic hypertension, or if they have had hypertension during a previous pregnancy; these women are advised to take aspirin (section 2.9) in a dose of 75 mg once daily [unlicensed indication] from week 12 of pregnancy until the baby is born. Women with more than one moderate risk factor (first pregnancy, aged ≥40 years, pregnancy interval >10 years, BMI ≥35 kg/m² at first visit, multiple pregnancy, or family history of pre-eclampsia) for developing pre-eclampsia are also advised to take aspirin 75 mg once daily [unlicensed indication] from week 12 of pregnancy until the baby is born.

Women with pre-eclampsia or gestational hypertension who present with a blood pressure over 150/100 mmHg, should receive initial treatment with...
oral labetalol to achieve a target blood pressure of 150 mmHg systolic and 80–100 mmHg. If labetalol is unsuitable, methyldopa or modified-release nifedipine may be considered. Women with gestational hypertension or pre-eclampsia who have been managed with methyldopa during pregnancy should discontinue treatment within 2 days of the birth. Women with a blood pressure of >160/110 mmHg who require critical care during pregnancy or after birth should receive immediate treatment with either oral or intravenous labetalol, intravenous hydralazine (section 2.5.1), or oral modified-release nifedipine to achieve a target blood pressure of <150 mmHg systolic, and diastolic 80–100 mmHg. For use of magnesium sulfate in pre-eclampsia and eclampsia, see section 9.5.1.3.

Hypertensive crises. If blood pressure is reduced too quickly in the management of hypertensive crises, there is a risk of reduced organ perfusion leading to cerebral infarction, blindness, deterioration in renal function, and myocardial ischaemia.

A hypertensive emergency is defined as severe hypertension with acute damage to the target organs (e.g. signs of papilloedema or retinal haemorrhage, or the presence of clinical conditions such as acute coronary syndromes, acute aortic dissection, acute pulmonary oedema, hypertensive encephalopathy, acute cerebral infarction, intracerebral or subarachnoid haemorrhage, eclampsia, or rapidly progressing renal failure); prompt treatment with intravenous antihypertensive therapy is generally required. Over the first few minutes or within 2 hours, blood pressure should be reduced by 20–25%. When intravenous therapy is indicated, treatment options include sodium nitroprusside [unlicensed] (section 2.5.1), labetalol (section 2.4), glyceryl trinitrate (section 2.6.1), phentolamine (section 2.5.4), hydralazine (section 2.5.1), or esmolol (section 2.4); choice of drug is dependent on concomitant conditions and clinical status of the patient.

Severe hypertension (blood pressure >180/110 mmHg) without acute target-organ damage is defined as a hypertensive urgency; blood pressure should be reduced gradually over 24–48 hours with oral antihypertensive therapy, such as labetalol, or the calcium-channel blockers (section 2.6.2) amlopidine or felodipine. Use of sublingual nifedipine is not recommended. For advice on short-term management of hypertensive episodes in phaeochromocytoma, see under Phaeochromocytoma, section 2.5.4.

2.5.1 Vasodilator antihypertensive drugs

Vasodilators have a potent hypotensive effect, especially when used in combination with a beta-blocker and a thiazide. Important: for a warning on the hazards of a very rapid fall in blood pressure, see Hypertensive crises, above.

Hydralazine is given by mouth as an adjunct to other antihypertensives for the treatment of resistant hypertension but is rarely used; when used alone it causes tachycardia and fluid retention. The incidence of side-effects is lower if the dose is kept below 100 mg daily, but systemic lupus erythematosus should be suspected if there is unexplained weight loss, arthritis, or any other unexplained ill health.

Sodium nitroprusside [unlicensed] is given by intravenous infusion to control severe hypertensive emergencies when parenteral treatment is necessary.

Minoxidil should be reserved for the treatment of severe hypertension resistant to other drugs. Vasodilation is accompanied by increased cardiac output and tachycardia and the patients develop fluid retention. For this reason the addition of a beta-blocker and a diuretic (usually furosemide, in high dosage) are mandatory. Hypertrichosis is troublesome and renders this drug unsuitable for women.

Frazosin, doxazosin, and terazosin (section 2.5.4) have alpha-blocking and vasodilator properties.

Ambrisentan, bosentan, iloprost, macitentan, sildenafil, tadalafil, and ambrisentan are licensed for the treatment of pulmonary arterial hypertension and chronic thromboembolic pulmonary hypertension; it should be used under specialist supervision.

Sitaxsentan has been withdrawn from the market because the benefit of treatment does not outweigh the risk of severe hepatotoxicity.

The Scottish Medicines Consortium (p. 4) has advised (November 2005) that iloprost (Ventavis®) is accepted for restricted use within NHS Scotland in patients in whom bosentan is ineffective or not tolerated, and should only be prescribed by specialists in the Scottish Pulmonary Vascular Unit.

The Scottish Medicines Consortium (p. 4) has advised (October 2008) that ambrisentan (Volibris®) should be prescribed only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

The Scottish Medicines Consortium (p. 4) has advised (January 2010 and February 2011) that sildenafil tablets (Revatio®) should be initiated only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists and that sildenafil injection (Revatio®) should be prescribed only on the advice of specialists in the Scottish Pulmonary Vascular Unit or the Scottish Adult Congenital Cardiac Service.

The Scottish Medicines Consortium (p. 4) has advised (June 2012) that tadalafil (Adcirca®) should be initiated only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

The Scottish Medicines Consortium (p. 4) has advised (March 2014) that macitentan (Opsumit®) should be initiated and prescribed only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

AMBRISENANT

Indications: pulmonary arterial hypertension

Cautions: not to be initiated in significant anaemia; monitor haemoglobin concentration or haematocrit after 1 month and 3 months of starting treatment, and periodically thereafter (reduce dose or discontinue
treatment if significant decrease in haemoglobin concentration or haematocrit observed; monitor liver function before treatment, and monthly thereafter—discontinue if liver enzymes raised significantly or if symptoms of liver impairment develop; interactions: Appendix 1 (ambrisentan)

Contra-indications idiopathic pulmonary fibrosis

Hepatic impairment avoid in severe impairment

Renal impairment use with caution if eGFR less than 30 mL/minute/1.73 m²

Pregnancy avoid (teratogenic in animal studies); exclude pregnancy before treatment and ensure effective contraception during treatment; monthly pregnancy tests advised

Breast-feeding manufacturer advises avoid—no information available

Side-effects abdominal pain, constipation, diarrhoea, nausea, vomiting, palpitation, flushing, hypotension, peripheral oedema, chest pain, heart failure, upper respiratory-tract disorders, dyspnoea, epistaxis, headache, dizziness, malaise, anaemia; less commonly hepatic injury, autoimmune hepatitis, syncope

Dose

● ADULT over 18 years, 5 mg once daily, increased if necessary to 10 mg once daily

Note Max 5 mg daily with concomitant ciclosporin

Volibris® (GSK) Tablets, f/c, ambrisentan 5 mg (pale pink), net price 30-tab pack = £1618.08; 10 mg (dark pink), 30-tab pack = £1618.08

BOSENTAN

Indications pulmonary arterial hypertension; systemic sclerosis with ongoing digital ulcer disease (to reduce number of new digital ulcers)

Cautions not to be initiated if systemic systolic blood pressure is below 85 mmHg; monitor haemoglobin before and during treatment (monthly for first 4 months, then 3-monthly); avoid abrupt withdrawal; monitor liver function before treatment, at monthly intervals during treatment, and 2 weeks after dose increase (reduce dose or suspend treatment if liver enzymes raised significantly)—discontinue if symptoms of liver impairment; interactions: Appendix 1 (bosentan)

Contra-indications acute porphyria (section 9.8.2)

Hepatic impairment avoid in moderate and severe impairment

Pregnancy avoid (teratogenic in animal studies); effective contraception during administration (hormonal contraception not considered effective); monthly pregnancy tests advised

Breast-feeding manufacturer advises avoid—no information available

Side-effects diarrhoea, gastro-oesophageal reflux, flushing, hypotension, palpitation, oedema, syncope, headache, anaemia; less commonly thrombocytopenia, neutropenia, leucopenia; rarely liver cirrhosis, liver failure (see cautions above)

Dose

● Pulmonary arterial hypertension, initially 62.5 mg twice daily increased after 4 weeks to 125 mg twice daily; max. 250 mg twice daily; CHILD under 18 years see BNF for Children

● Systemic sclerosis with ongoing digital ulcer disease, initially 62.5 mg twice daily increased after 4 weeks to 125 mg twice daily

Tracleer® (Actelion) Tablets, f/c, orange, bosentan (as monohydrate) 62.5 mg, net price 56-tab pack = £1510.21; 125 mg, 56-tab pack = £1510.21

HYDRALAZINE HYDROCHLORIDE

Indications moderate to severe hypertension (adjunct); heart failure (with long-acting nitrate, but see section 2.5.5); hypertensive emergencies (including during pregnancy) (see section 2.5)

Cautions coronary artery disease (may provoke angina, avoid after myocardial infarction until stabilised), cerebrovascular disease; occasionally blood pressure reduction too rapid even with low parenteral doses; manufacturer advises test for antinuclear factor and for proteinuria every 6 months and check acetyl-CoA carboxylase status before increasing dose above 100 mg daily, but evidence of clinical value unsatisfactory; interactions: Appendix 1 (hydralazine)

Contra-indications idiopathic systemic lupus erythematosus, severe tachycardia, high output heart failure, myocardial insufficiency due to mechanical obstruction, cor pulmonale, dissecting aortic aneurysm; acute porphyria (section 9.8.2)

Hepatic impairment reduce dose

Renal impairment reduce dose if eGFR less than 30 mL/minute/1.73 m²

Pregnancy neonatal thrombocytopenia reported, but risk should be balanced against risk of uncontrolled maternal hypertension; manufacturer advises avoid before third trimester

Breast-feeding present in milk but not known to be harmful; monitor infant

Side-effects tachycardia, palpitation, flushing, hypotension, fluid retention, gastro-intestinal disturbances; headache, dizziness; systemic lupus erythematosus-like syndrome after long-term therapy with over 100 mg daily (or less in women and in slow acetylator individuals) (see also notes above); rarely rashes, fever, peripheral neuritis, polyneuritis, paraesthesia, arthralgia, myalgia, increased lactic acidosis, nasal congestion, dyspnoea, agitation, anxiety, anorexia; blood disorders (including leucopenia, thrombocytopenia, haemolytic anaemia), abnormal liver function, jaundice, raised plasma creatine, proteinuria and haematuria reported

Dose

● By mouth, hypertension, 25 mg twice daily, increased to usual max. 50 mg twice daily (see notes above) Heart failure (initiated in hospital) 25 mg 3–4 times daily, increased every 2 days if necessary; usual maintenance dose 50–75 mg 4 times daily

● By slow intravenous injection, hypertensive emergencies and hypertension with renal complications, 5–10 mg diluted with 10 mL sodium chloride 0.9%; may be repeated after 20–30 minutes (see Cautions)

● By intravenous infusion, hypertensive emergencies and hypertension with renal complications, initially 200–300 micrograms/minute; maintenance usually 50–150 micrograms/minute

Hydralazine (Non-proprietary) Tablets, hydralazine hydrochloride 25 mg, net price 56 = £8.94; 50 mg, 56 = £16.97

2.5.1 Vasodilator antihypertensive drugs 111

Cardiovascular system

BNF 68
2 Cardiovascular system

Apresoline\textsuperscript{\textregistered} (AMCo) (\textregistered)

\textbf{Tablets}, yellow, s/c, hydralazine hydrochloride 25 mg, net price 84-tab pack = £3.38

\textbf{Excipients} include propylene glycol (see Excipients, p. 2)

\textbf{Injection}, powder for reconstitution, hydralazine hydrochloride, net price 20-mg amp = £2.22

\section*{ILOPROST}

\textbf{Indications} idiopathic or familial pulmonary arterial hypertension

\textbf{Cautions} unstable pulmonary hypertension with advanced right heart failure; hypotension (do not initiate if systolic blood pressure below 85 mmHg); acute pulmonary infection; chronic obstructive pulmonary disease; severe asthma; to minimise accidental exposure use only with nebulisers listed under Ventavis\textsuperscript{\textregistered} preparation in a well ventilated room;

\textbf{Contra-indications} unstable angina; within 6 months of myocardial infarction; decompensated cardiac failure (unless under close medical supervision); severe arhythmias; congenital or acquired heart-valve defects; within 3 months of cerebrovascular events; pulmonary veno-occlusive disease; conditions which increase risk of bleeding

\textbf{Hepatic impairment} elimination reduced—initially 2.5 micrograms at intervals of 3–4 hours (max. 6 times daily), adjusted according to response (consult product literature)

\textbf{Pregnancy} use if potential benefit outweighs risk

\textbf{Breast-feeding} manufacturer advises avoid—no information available

\textbf{Side-effects} nausea, vomiting, diarrhoea, oral irritation, taste disturbance, bronchospasm, wheezing, thrombocytopenia

\textbf{Dose}• By inhalation of nebulised solution, initial dose 2.5 micrograms increased to 5 micrograms for second dose, if tolerated maintain at 5 micrograms 6–9 times daily according to response; reduce to 2.5 micrograms 6–9 times daily if higher dose not tolerated; CHILD 6–18 years see BNF for Children

\textbf{Ventavis\textsuperscript{\textregistered} \textsuperscript{\textregistered} (Bayer) \textregistered}

\textbf{Nebuliser solution}, Oploprest (as tromethamine) 10 micrograms/mL, net price 30 x 1-mL (10 microgram) unit-dose vials = £400.19, 168 x 1-mL = £2241.08.

For use with HaloLite\textsuperscript{\textregistered} \textregistered, I-Neb AAD\textsuperscript{\textregistered} \textsuperscript{\textregistered}, Prodose\textsuperscript{\textregistered} \textsuperscript{\textregistered}, or Venta-Neb AAD\textsuperscript{\textregistered} \textsuperscript{\textregistered} nebuliser

\textbf{Note} Delivery characteristics of nebuliser devices may vary—only switch devices under medical supervision

\section*{MACITENTAN}

\textbf{Indications} pulmonary arterial hypertension

\textbf{Cautions} patients over 75 years; pulmonary veno-occlusive disease; monitor liver function before treatment, then monthly thereafter (discontinue if unexplained persistent raised serum transaminases or signs of hepatic injury—can restart on advice if hepatologist if liver function tests return to normal and no hepatic injury); monitor haemoglobin concentration before treatment and then as indicated;

\textbf{Contra-indications} severe anaemia

\textbf{Hepatic impairment} do not initiate if serum transaminases exceed 3 times upper limit of normal; avoid in moderate and severe impairment

\textbf{Renal impairment} consider monitoring blood pressure (risk of hypotension); manufacturer advises caution in severe impairment and avoid in patients undergoing dialysis (no information available)

\textbf{Pregnancy} toxicity in animal studies; manufacturer advises exclude pregnancy before treatment and ensure effective contraception during and for one month after stopping treatment; monthly pregnancy tests advised

\textbf{Breast-feeding} manufacturer advises avoid—present in milk in animal studies

\textbf{Side-effects} hypotension, upper respiratory-tract disorders, bronchitis, headache, urinary-tract infection, anaemia; also reported leucopenia, thrombocytopenia

\textbf{Dose}• ADULT over 18 years, 10 mg once daily

\textbf{Opsumit\textsuperscript{\textregistered} \textsuperscript{\textregistered} (Actelion) \textregistered}

\textbf{Tablets}, IV/c, macitentan 10 mg, net price 30-tab pack = £2306.00.

Counselling, hepatotoxicity, patient card

\section*{MINOXIDIL}

\textbf{Indications} severe hypertension, in addition to a diuretic and a beta-blocker

\textbf{Cautions} see notes above; angina; after myocardial infarction (until stabilised); acute porphyria (section 9.8.2); \textbf{interactions}: Appendix 1 (vasodilator antihypertensives)

\textbf{Contra-indications} phaeochromocytoma

\textbf{Renal impairment} use with caution in significant impairment

\textbf{Pregnancy} avoid—possible toxicity including reduced placental perfusion; neonatal hirsutism reported

\textbf{Breast-feeding} present in milk but not known to be harmful

\textbf{Side-effects} sodium and water retention; weight gain, peripheral oedema, tachycardia, hyponatraemia; reversible rise in creatinine and blood urea nitrogen; occasionally, gastrointestinal disturbances, breast tenderness, rashes

\textbf{Dose}• Initially 5 mg (ELDERLY, 2.5 mg) daily, in 1–2 divided doses, increased in steps of 5–10 mg at intervals of at least 3 days; max. 100 mg daily (seldom necessary to exceed 50 mg daily)

\textbf{Loniten\textsuperscript{\textregistered} \textsuperscript{\textregistered} (Pharmacia) \textregistered}

\textbf{Tablets}, scored, minoxidil 2.5 mg, net price 60-tab pack = £8.88; 5 mg, 60-tab pack = £15.83; 10 mg, 60-tab pack = £30.89

\section*{RIOCGUAT}

\textbf{Indications} chronic thromboembolic pulmonary hypertension that is recurrent or persistent following surgery, or is inoperable; monotherapy or in combination with an endothelin receptor antagonist for idiopathic or hereditary pulmonary arterial hyper-
tension, or pulmonary arterial hypertension associated with connective tissue disease

Cautions hypotension (do not initiate if systolic blood pressure below 95 mmHg); hypovolaemia; severe left ventricular outflow obstruction; autonomic dysfunction; smoking cessation advised (response possibly reduced); dose adjustment may be necessary if smoking started or stopped during treatment; elderly (risk of hypotension); interactions: Appendix 1 (riociguat)

Contra-indications pulmonary veno-occlusive disease; history of serious haemoptysis; previous bronchial artery embolisation

Hepatic impairment titrate dose cautiously in moderate impairment; manufacturer advises avoid in severe impairment—no information available

Renal impairment titrate dose cautiously—risk of hypotension; manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m²—limited information available

Pregnancy avoid—toxicity in animal studies; effective contraception recommended during treatment; monthly pregnancy tests advised

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects nausea, vomiting, diarrhoea, constipation, dyspepsia, gastro-oesophageal reflux, gastritis, dysphagia, peripheral oedema, palpitation, hypotension, haemoptysis, anaemia, less commonly pulmonary haemorrhage

Dose

- ADULT over 18 years, initially 1 mg three times daily for 2 weeks, increased in steps of 0.5 mg three times daily every 2 weeks up to max. 2.5 mg three times daily if systolic blood pressure ≥ 95 mmHg and no signs of hypotension; if treatment interrupted for 3 or more days, restart at 1 mg three times daily for 2 weeks and titrate as before

Note During titration, reduce dose by 0.5 mg three times daily if systolic blood pressure falls below 95 mmHg and patient shows signs of hypotension

Adempas® (Bayer) Tablets, f/c, riociguat 0.5 mg (white), net price 42-tab pack = £997.36, 84-tab pack = £1994.72; 1 mg (pale yellow), 42-tab pack = £997.36, 84-tab pack = £1994.72; 1.5 mg (yellow-orange), 42-tab pack = £997.36, 84-tab pack = £1994.72; 2 mg (pale orange), 42-tab pack = £997.36, 84-tab pack = £1994.72; 2.5 mg (red-orange), 42-tab pack = £997.36, 84-tab pack = £1994.72

SILDENAFIL

Indications pulmonary arterial hypertension; erectile dysfunction (section 7.4.5)

Cautions hypotension (avoid if systolic blood pressure below 90 mmHg); intravascular volume depletion; left ventricular outflow obstruction; cardiovascular disease; autonomic dysfunction; pulmonary veno-occlusive disease; anatomical deformation of the penis, predisposition to priapism; bleeding disorders or active peptic ulceration; consider gradual withdrawal; interactions: Appendix 1 (sildenafil)

Contra-indications recent history of stroke or myocardial infarction, history of non-arteritic anterior ischaemic optic neuropathy; hereditary degenerative retinal disorders; sickle-cell anaemia; avoid concomitant use of nitrates

Hepatic impairment for pulmonary hypertension, if usual dose not tolerated, reduce oral dose to 20 mg twice daily, or reduce intravenous dose to 10 mg twice daily, manufacturer advises avoid in severe impairment

Renal impairment for pulmonary hypertension, if usual dose not tolerated, reduce oral dose to 20 mg twice daily, or reduce intravenous dose to 10 mg twice daily

Pregnancy use only if potential benefit outweighs risk—no evidence of harm in animal studies

Breast-feeding manufacturer advises avoid—no information available

Side-effects diarrhoea, dyspepsia, gastritis, abdominal distension, gastro-oesophageal reflux, haemorrhoids, dry mouth, flushing, oedema, bronchitis, cough, headache, migraine, night sweats, paraesthesia, insomnia, anxiety, tremor, vertigo, fever, influenza-like symptoms, anaemia, back and limb pain, myalgia, visual disturbances, retinal haemorrhage, photophobia, painful red eyes, nasal congestion, epistaxis, cellularis, alopecia; less commonly gynaecomastia, priapism, haematuria, penile haemorrhage; also reported rash, retinal vascular occlusion, non-arteritic anterior ischaemic optic neuropathy (discontinue if sudden visual impairment occurs), and sudden hearing loss (advise patient to seek medical help)

Dose

- By mouth, 20 mg 3 times daily; CHILD under 18 years see BNF for Children
- By intravenous injection, when oral route not appropriate, 10 mg 3 times daily

Revatio® (Pfizer) Tablets, f/c, sildenafil (as citrate), 20 mg, net price 90-tab pack = £446.33

Oral suspension, sildenafil (as citrate) 10 mg/mL when reconstituted with water, net price 112-mL = £186.75

Injection, sildenafil (as citrate), 800 micrograms/mL, net price 20-mL vial = £45.28

Preparations for erectile dysfunction Section 7.4.5

SODIUM NITROPRUSSIDE

Indications hypertensive emergencies (see section 2.5); controlled hypotension in anaesthesia; acute or chronic heart failure

Cautions hypothyroidism, hyponatraemia, ischaemic heart disease, impaired cerebral circulation, elderly; hypothermia; monitor blood pressure (including intra-arterial blood pressure) and blood-cyanide concentration, and if treatment exceeds 3 days, also blood-thiocyanate concentration; avoid sudden withdrawal—terminate infusion over 15–30 minutes; protect infusion from light; interactions: Appendix 1 (sodium nitroprusside)

Contra-indications severe vitamin B₁₂ deficiency; Leber’s optic atrophy; compensatory hypertension

Hepatic impairment use with caution; avoid in hepatic failure—cyanide or thiocyanate metabolites may accumulate

Renal impairment avoid prolonged use—cyanide or thiocyanate metabolites may accumulate
2 Cardiovascular system

2.5.2 Centrally acting antihypertensive drugs

Pregnancy  avoid prolonged use—potential for accumulation of cyanide in fetus
Breast-feeding  no information available; caution advised due to thiocyanate metabolite
Side-effects  associated with over rapid reduction in blood pressure (reduce infusion rate); headache, dizziness, nausea, retching, abdominal pain, perspiration, palpitation, anxiety, retrosternal discomfort; occasionally reduced platelet count, acute transient plebitis

Cyanide  Side-effects caused by excessive plasma concentration of the cyanide metabolite include tachycardia, sweating, hyperventilation, arrhythmias, marked metabolic acidosis (discontinue and give antidote, see p. 41)

Dose
- Hypertensive emergencies, by intravenous infusion, initially 0.5–1.5 micrograms/kg/minute, then increased in steps of 500 nanograms/kg/minute every 5 minutes within range 0.5–8 micrograms/kg/minute (lower doses if already receiving other antihypertensives); stop if response unsatisfactory with max. dose in 10 minutes
Note  Lower initial dose of 300 nanograms/kg/minute has been used
- Maintenance of blood pressure at 30–40% lower than pretreatment diastolic blood pressure, 20–40 micrograms/minute (lower doses for patients being treated with other antihypertensives)
- Controlled hypotension in surgery, by intravenous infusion, max. 1.5 micrograms/kg/minute
- Heart failure, by intravenous infusion, initially 10–15 micrograms/minute, increased every 5–10 minutes as necessary; usual range 10–200 micrograms/minute normally for max. 3 days

Sodium Nitroprusside (Non-proprietary) Tablets, f/c, tadalafil 20 mg (orange), net price 56-tab pack = £49.22

2.5.2 Centrally acting antihypertensive drugs

Methyldopa is a centrally acting antihypertensive; it may be used for the management of hypertension in pregnancy. Side-effects are minimised if the daily dose is kept below 1 g.
Clonidine has the disadvantage that sudden withdrawal of treatment may cause severe rebound hypertension.
Moxonidine, a centrally acting drug, is licensed for mild to moderate essential hypertension. It may have a role when thiazides, calcium-channel blockers, ACE inhibitors, and beta-blockers are not appropriate or have failed to control blood pressure.

CLONIDINE HYDROCHLORIDE

Indications  hypertension; migraine (section 4.7.4.2); Tourette syndrome [unlicensed] (section 4.9.3); menopausal flushing (section 6.4.1.1); sedation [unlicensed] (section 15.1.4.4)
Cautions  must be withdrawn gradually to avoid severe rebound hypertension; mild to moderate bradyarrhythmia; constipation; polyneuropathy; Raynaud’s syndrome or other occlusive peripheral vascular disease; history of depression; interactions: Appendix 1 (clonidine)
Driving  Drowsiness may affect performance of skilled tasks (e.g. driving), effects of alcohol may be enhanced
Contra-indications  severe bradyarrhythmia secondary to second- or third-degree AV block or sick sinus syndrome
Renal impairment  use with caution
Pregnancy  may lower fetal heart rate, but risk should be balanced against risk of uncontrolled maternal hypertension; avoid intravenous injection
Breast-feeding  avoid—present in milk
Side-effects  constipation, nausea, dry mouth, vomiting, salivary gland pain, postural hypotension, dizziness, sleep disturbances, headache, malaise, drowsiness, depression, sexual dysfunction, less commonly bradycardia, Raynaud’s syndrome, delusion, hallucination, paraesthesia, pruritus, rash, urticaria; rarely colonic pseudo-obstruction, AV block, gynaecomastia, decreased lactation, nasal dryness, alopecia; also reported hepatitis, fluid retention, bradycardia, confusion, impaired visual accommodation
Dose
- By mouth, 50–100 micrograms 3 times daily, increased every second or third day; usual max. dose 1.2 mg daily
**2.5.3 Adrenergic neurone blocking drugs**

Adrenergic neurone blocking drugs prevent the release of noradrenaline from postganglionic adrenergic neurones. These drugs do not control supine blood pressure and may cause postural hypotension. For this reason they have largely fallen from use, but may be necessary with other therapy in resistant hypertension.

**Guanethidine** which also depletes the nerve endings of noradrenaline, is licensed for rapid control of blood pressure, however alternative treatments are preferred (see section 2.5).

**GUANETHIDINE MONOSULFATE**

**Indications** hypertensive crisis (but no longer recommended—see section 2.5)

**Cautions** coronary or cerebral arteriosclerosis; asthma, history of peptic ulceration; **interactions**: Appendix 1 (adrenergic neurone blockers)

**Contra-indications** phaeochromocytoma, heart failure

**Renal impairment** reduce dose if eGFR 40–65 mL/minute/1.73 m²; avoid if eGFR less than 40 mL/minute/1.73 m²

**Pregnancy** postural hypotension and reduced uteroplacental perfusion; should not be used to treat hypertension in pregnancy

**Side-effects** postural hypotension, failure of ejaculation, impotence, decreased libido, gynaecomastia, hyperprolactinaemia, bone-marrow depression, leucopenia, depression, impaired mental acuity, parkinsonism, arthralgia, paraesthesia, nightmares, mild psychosis, sedation, headache, dizziness, somnolence, insomnia, back pain, rash, pruritus; less commonly Bradycardia, tinnitus, angioedema, oedema, nervousness, neck pain

**Dose**
- By intramuscular injection, 10–20 mg, repeated after 3 hours if required

**Guanethidine Monosulfate (Non-proprietary)**

**Injection, guanethidine monosulfate 10 mg/mL, net price 1-mL amp = £44.83**

---

**MOXONIDINE**

**Indications** mild to moderate essential hypertension

**Cautions** avoid abrupt withdrawal (if concomitant treatment with beta-blocker has to be stopped, discontinue beta-blocker first, then moxonidine after a few days); severe coronary artery disease; unstable angina; first-degree AV block; moderate heart failure; **interactions**: see Appendix 1 (moxonidine)

**Contra-indications** conduction disorders (sick sinus syndrome, sino-atrial block, second- or third-degree AV block); bradycardia; severe heart failure

**Renal impairment** max. single dose 200 micrograms and max. daily dose 400 micrograms if eGFR 30–60 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** present in milk—manufacturer advises avoid

**Side-effects** dry mouth, diarrhoea, nausea, vomiting, dyspepsia, dizziness, somnolence, insomnia, back pain, rash, pruritus; less commonly Bradycardia, tinnitus, angioedema, oedema, nervousness, neck pain

**Dose**
- 200 micrograms once daily in the morning, increased if necessary after 3 weeks to 400 micrograms daily in 1–2 divided doses; max. 600 micrograms daily in 2 divided doses (max. single dose 400 micrograms)

**Moxonidine (Non-proprietary)**

**Tablets, f/c, moxonidine 200 micrograms, net price 28-tab pack = £2.29; 300 micrograms, net price 28-tab pack = £2.46; 400 micrograms, net price 28-tab pack = £2.56. Label: 3**

**Physiotens** (Abbott Healthcare)

**Tablets, f/c, moxonidine 200 micrograms (pink), net price 28-tab pack = £9.72; 300 micrograms (red), 28-tab pack = £11.49; 400 micrograms (red), 28-tab pack = £13.26. Label: 3**

---

**METHYLDOPA**

**Indications** hypertension

**Cautions** monitor blood counts and liver-function before treatment and at intervals during first 6–12 weeks or if unexplained fever occurs; history of depression; positive direct Coombs’ test in up to 20% of patients (may affect blood cross-matching); interference with laboratory tests; **interactions**: Appendix 1 (methyldopa)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced

**Contra-indications** depression, phaeochromocytoma, acute porphyria (section 9.8.2)

**Hepatic impairment** manufacturer advises caution in history of liver disease; avoid in active liver disease

**Renal impairment** start with small dose; increased sensitivity to hypotensive and sedative effect

**Pregnancy** not known to be harmful

**Breast-feeding** amount too small to be harmful

**Side-effects** gastro-intestinal disturbances, dry mouth, stomatitis, sialadenitis; bradycardia, exacerbation of angina, postural hypotension, oedema; sedation, headache, dizziness, asthena, myalgia, arthralgia, paraesthesia, nightmares, mild psychosis, depression, impaired mental acuity, parkinsonism, Bell’s palsy; hepatitis, jaundice; pancreatitis; haemolytic anaemia; bone-marrow depression, leucopenia, thrombocytopenia, eosinophilia; hypersensitivity reactions including lupus erythematosus-like syndrome, drug fever, myocarditis, pericarditis; rashes (including toxic epidermal necrolysis); nasal congestion, failure of ejaculation, impotence, decreased libido, gynaecomastia, hyperprolactinaemia, amenorrhoea

**Dose**
- Initially 250 mg 2–3 times daily, increased gradually at intervals of at least 2 days, max. 3 g daily; **ELDERLY** initially 125 mg twice daily, increased gradually, max. 2 g daily

**Methyldopa (Non-proprietary)**

**Tablets, coated, methyldopa (anhydrous) 125 mg, net price 56-tab pack = £62.92; 250 mg, 56-tab pack = £63.33; 500 mg, 56-tab pack = £9.83. Label: 3, 8**

**Aldomet** (Aspen)

**Tablets, all yellow, f/c, methyldopa (anhydrous) 250 mg, net price 60 = £6.15; 500 mg, 30 = £4.55. Label: 3, 8**

---

**2.5.3 Adrenergic neurone blocking drugs**

Adrenergic neurone blocking drugs prevent the release of noradrenaline from postganglionic adrenergic neurones. These drugs do not control supine blood pressure and may cause postural hypotension. For this reason they have largely fallen from use, but may be necessary with other therapy in resistant hypertension.

**Guanethidine** which also depletes the nerve endings of noradrenaline, is licensed for rapid control of blood pressure, however alternative treatments are preferred (see section 2.5).
2.5.4 Alpha-adrenoceptor blocking drugs

Prazosin has post-synaptic alpha-blocking and vasodilator properties and rarely causes tachycardia. It may, however, reduce blood pressure rapidly after the first dose and should be introduced with caution. Doxazosin, indoramin, and terazosin have properties similar to those of prazosin.

Alpha-blockers can be used with other antihypertensive drugs in the treatment of resistant hypertension (section 2.5).

Prostatic hyperplasia Alfuzosin, doxazosin, indoramin, prazosin, tamsulosin, and terazosin are indicated for benign prostatic hyperplasia (section 7.4.1).

DOXAZOSIN

Indications hypertension (see notes above); benign prostatic hyperplasia (section 7.4.1)

Cautions care with initial dose (postural hypotension); pulmonary oedema due to aortic or mitral stenosis; catareac surgery (risk of intra-operative floppy iris syndrome); heart failure; interactions: Appendix 1 (alpha-blockers)

Contra-indications history of postural hypotension; monotherpay in overflow bladder or anuria

Hepatic impairment use with caution; manufacturer advises avoid in severe impairment—no information available

Pregnancy no evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk

Breast-feeding no information available

Breast-feeding in milk—manufacturer advises avoid

Side-effects see section 7.4.1; also dyspnoea, coughing; fatigue, vertigo, paraesthesia, sleep disturbance, anxiety; influenza-like symptoms; back pain, myalgia; less commonly weight changes, angina, myocardial infarction, hypoanesthesia, tremor, agitation, micturition disturbance, epistaxis, arthralgia, tinnitus, and gout; very rarely cholestasis, hepatitis, jaundice, bradycardia, arrhythmias, bronchospasm, hot flashes, gynaecomastia, abnormal ejaculation, leucopenia, thrombocytopenia, and alopecia

Dose
- Hypertension, 1 mg daily, increased after 1–2 weeks to 2 mg once daily, and thereafter to 4 mg once daily, if necessary; max. 16 mg daily
- Benign prostatic hyperplasia (see also section 7.4.1)

Doxazosin (Non-proprietary) Tablets, m/r, doxazosin (as mesilate) 1 mg, net price 28-tab pack = £5.00; 8 mg, 28-tab pack = £21.00. Label: 25, counselling, initial dose, driving

Brands include: Doxadura® XL, Doxazogen® XL, Raporsin® XL, Slocinx® XL

Dose hypertension, benign prostatic hyperplasia, 4 mg once daily, increased to 8 mg once daily after 4 weeks if necessary

Cardura® XL (Pfizer) Tablets, m/r, doxazosin (as mesilate) 4 mg, net price 28-tab pack = £5.00; 8 mg, 28-tab pack = £9.98. Label: 25, counselling, driving, initial dose

Dose hypertension, benign prostatic hyperplasia, 4 mg once daily, increased to 8 mg once daily after 4 weeks if necessary

INDORAMIN

Indications hypertension (see notes above); benign prostatic hyperplasia (section 7.4.1)

Cautions avoid alcohol (enhances rate and extent of absorption); control incipient heart failure before initiating indoramin; elderly; Parkinson’s disease (extrapyramidal disorders reported); epilepsy (conclusions in animal studies); history of depression; cataract surgery (risk of intra-operative floppy iris syndrome); interactions: Appendix 1 (alpha-blockers)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving), effects of alcohol may be enhanced

Contra-indications established heart failure

Hepatic impairment manufacturer advises caution

Renal impairment manufacturer advises caution

Pregnancy no evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk

Breast-feeding no information available

Side-effects see section 7.4.1; also sedation; less commonly fatigue, weight gain, failure of ejaculation; also reported extrapyramidal disorders, urinary frequency, and incontinence

Dose
- Hypertension, initially 25 mg twice daily, increased by 25–50 mg daily at intervals of 2 weeks; max. daily dose 200 mg in 2–3 divided doses

Indoramin (Non-proprietary) Tablets, indoramin (as hydrochloride) 25 mg, net price 84-tab pack = £60.26. Label: 2

Doralese® (Pfizer) Section 7.4.1 (prostatic hyperplasia)

PRAZOSIN

Indications hypertension (see notes above); congestive heart failure (but see section 2.5.5); Raynaud’s syndrome (see also section 2.6.4); benign prostatic hyperplasia (section 7.4.1)

Cautions first dose may cause collapse due to hypotension (therefore should be taken on retiring to bed); elderly; cataract surgery (risk of intra-operative floppy iris syndrome); interactions: Appendix 1 (alpha-blockers)

Driving May affect performance of skilled tasks (e.g. driving)

Contra-indications not recommended for congestive heart failure due to mechanical obstruction (e.g. aortic stenosis)

Modified-release

Doxazosin (Non-proprietary) Tablets, m/r, doxazosin (as mesilate) 4 mg, net price 28-tab pack = £5.00. Label: 25, counselling, initial dose, driving

Brands include: Doxadura® XL, Doxazogen® XL, Raporsin® XL, Slocinx® XL

Dose hypertension, benign prostatic hyperplasia, 4 mg once daily, increased to 8 mg once daily after 4 weeks if necessary

Cardura® XL (Pfizer) Tablets, m/r, doxazosin (as mesilate) 4 mg, net price 28-tab pack = £5.00; 8 mg, 28-tab pack = £9.98. Label: 25, counselling, driving, initial dose

Dose hypertension, benign prostatic hyperplasia, 4 mg once daily, increased to 8 mg once daily after 4 weeks if necessary
**Hepatic impairment** initially 500 micrograms daily; increased with caution

**Renal impairment** initially 500 micrograms daily in moderate to severe impairment; increased with caution

**Pregnancy** no evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk

**Breast-feeding** amount probably too small to be harmful

**Side-effects** see section 7.4.1; also dyspnoea; nervousness; urinary frequency; less commonly insomnia, paraesthesia, sweating, arthralgia, eye disorders, tinnitus, and epistaxis; rarely pancreatitis, flushing, vasculitis, bradycardia, hallucinations, worsening of narcolepsy, gynaecomastia, urinary incontinence, and alopecia

**Dose**

- Hypertension (see notes above), 500 micrograms 2–3 times daily for 3–7 days, the initial dose on retiring to bed at night (to avoid collapse, see Cautions); increased to 1 mg 2–3 times daily for a further 3–7 days; further increased if necessary to max. 20 mg daily in divided doses
- Congestive heart failure (but see section 2.5.5), 500 micrograms 2–4 times daily (initial dose at bedtime, see above), increasing to 4 mg daily in divided doses; maintenance 4–20 mg daily in divided doses (but rarely used)
- Raynaud’s syndrome (but efficacy not established, see section 2.6.4), initially 500 micrograms twice daily (initial dose at bedtime, see above) increased, if necessary, after 3–7 days to usual maintenance 1–2 mg twice daily

**Prazosin** (Non-proprietary) Tablets, prazosin (as hydrochloride) 500 micrograms, net price 56-tab pack = £2.51; 1 mg, 56-tab pack = £3.23; 2 mg, 56-tab pack = £4.39; 5 mg, 56-tab pack = £8.75. Counselling, initial dose, driving

**Hypovase** (Pfizer) Tablets, prazosin (as hydrochloride) 500 micrograms, net price 60-tab pack = £2.69; 1 mg, scored, 60-tab pack = £3.46. Counselling, initial dose, driving

**TÉRAXOSIN**

**Indications** mild to moderate hypertension (see notes above); benign prostatic hyperplasia (section 7.4.1)

**Cautions** first dose may cause collapse due to hypotension (within 30–90 minutes, therefore should be taken on retiring to bed) (may also occur with rapid dose increase); cataract surgery (risk of intra-opera-
tive flopsy iris syndrome); **Interactions**: Appendix 1 (alpha-blockers)

**Driving** May affect performance of skilled tasks e.g. driving

**Pregnancy** no evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk

**Breast-feeding** no information available

**Side-effects** see section 7.4.1; also reported weight gain, dyspnoea, paraesthesia, nervousness, decreased libido, thrombocytopenia, back pain, and pain in extremities

**Dose**

- Hypertension, 1 mg at bedtime (compliance with bedtime dose important, see Cautions); dose doubled after 7 days if necessary; usual maintenance dose 2–10 mg once daily; more than 20 mg daily rarely improves efficacy

**Phaeochromocytoma**

Long-term management of phaeochromocytoma involves surgery. However, surgery should not take place until there is adequate blockade of both alpha- and beta-adrenoceptors; the optimal choice of drug therapy remains unclear. Alpha-blockers are used in the short-term management of hypertensive episodes in phaeochromocytoma. Once alpha blockade is established, tachycardia can be controlled by the cautious addition of a beta-blocker (section 2.4); a cardioselective beta-blocker is preferred.

**Phenoxybenzamine**, a powerful alpha-blocker, is effective in the management of phaeochromocytoma but it has many side-effects. **Phentolamine** is a short-acting alpha-blocker used mainly during surgery of phaeochromocytoma; its use for the diagnosis of phaeochromocytoma has been superseded by measurement of catecholamines in blood and urine.

**Metirosine** (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) inhibits the enzyme tyrosine hydroxylase, and hence the synthesis of catecholamines. It is rarely used in the pre-operative management of phaeochromocytoma, and long term in patients unsuitable for surgery; an alpha-adrenoceptor blocking drug may also be required. Metirosine should not be used to treat essential hypertension.

**PHENOXYBENZAMINE HYDROCHLORIDE**

**Indications** hypertensive episodes in phaeochromocytoma

**Cautions** elderly; congestive heart failure; severe ischaemic heart disease (see also Contra-indications); cerebrovascular disease (avoid if history of cerebrovascular accident); monitor blood pressure regularly during infusion; carcinogenic in animals; avoid in acute porphyria (section 9.8.2); avoid extravasation (irritant to tissues)

**Contra-indications** history of cerebrovascular accident; during recovery period after myocardial infarction (usually 3–4 weeks); avoid infusion in hypovolaemia

**Renal impairment** use with caution

**Pregnancy** hypotension may occur in newborn

**Breast-feeding** may be present in milk

**Side-effects** marked hypotension with dizziness and marked compensatory tachycardia, lassitude, nasal congestion, miosis, inhibition of ejaculation; rarely gastro-intestinal disturbances; decreased sweating and dry mouth after intravenous infusion; idiosyncratic profound hypotension within few minutes of
starting infusion; convulsions following rapid intravenous infusion also reported.

**Dose**
- See under preparations

**Phenoxybenzamine** (Non-proprietary) {Phenoxybenzamine hydrochloride 10 mg, net price 30-cap pack = £32.87}

**Capsules**

**Dose by mouth**, phaeochromocytoma, initially 10 mg daily, increased by 10 mg daily until hypertension controlled or treatment not tolerated, usual dose 1–2 mg/kg daily in 2 divided doses

**Injection concentrate**, phenoxybenzamine hydrochloride 50 mg/mL. To be diluted before use, net price 2-mL amp = £57.14 (hosp. only)

**Dose by intravenous infusion** (preferably through large vein), adjust in severe shock (but rarely used) and phaeochromocytoma, 1 mg/kg daily over at least 2 hours; do not repeat within 24 hours (intensive care facilities needed)

**Caution** Owing to risk of contact sensitisation healthcare professionals should avoid contamination of hands

**PHENTOLAMINE MESILATE**

**Indications**
- Hypertensive episodes due to phaeochromocytoma e.g. during surgery; diagnosis of phaeochromocytoma (but see notes above)

**Cautions**
- Monitor blood pressure (avoid in hypertension), heart rate; gastritis, peptic ulcer; elderly; interactions: Appendix 1 (alpha-blockers)

**Contra-indications**
- Hypotension; history of myocardial infarction; coronary insufficiency, angina, or other evidence of coronary artery disease

**Renal impairment**
- Manufacturer advises caution—no information available

**Pregnancy**
- Use with caution—may cause marked decrease in maternal blood pressure with resulting fetal anoxia

**Breast-feeding**
- Manufacturer advises avoid—no information available

**Side-effects**
- Postural hypotension, tachycardia, dizziness, flushing; nausea and vomiting, diarrhoea, nasal congestion; also acute or prolonged hypotension, angina, chest pain, arrhythmias

**Dose**
- Hypertensive episodes, by intravenous injection, 2–5 mg repeated if necessary

- Diagnosis of phaeochromocytoma, consult product literature

**Phentolamine** (Non-proprietary) {Phentolamine}

**Injection**, phentolamine mesilate 10 mg/mL

Available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104

---

### 2.5.5 Drugs affecting the renin-angiotensin system

#### 2.5.5.1 Angiotensin-converting enzyme inhibitors

#### 2.5.5.2 Angiotensin-II receptor antagonists

#### 2.5.5.3 Renin inhibitors

**Heart failure**

Drug treatment of heart failure associated with a reduced left ventricular ejection fraction (left ventricular systolic dysfunction) is covered below; optimal management of heart failure with a preserved left ventricular ejection fraction has not been established.

The treatment of chronic heart failure aims to relieve symptoms, improve exercise tolerance, reduce the incidence of acute exacerbations, and reduce mortality. An **ACE inhibitor**, titrated to a ‘target dose’ (or the maximum tolerated dose if lower), together with a **beta-blocker**, form the basis of treatment for all patients with heart failure due to left ventricular systolic dysfunction.

An ACE inhibitor (section 2.5.5.1) is generally advised for patients with asymptomatic left ventricular systolic dysfunction or symptomatic heart failure. An angiotensin-II receptor antagonist (section 2.5.5.2) may be a useful alternative for patients who, because of side-effects such as cough, cannot tolerate ACE inhibitors; a relatively high dose of the angiotensin-II receptor antagonist may be required to produce benefit. Candesartan, an angiotensin-II receptor antagonist, can also be added to an ACE inhibitor and a beta-blocker in patients who continue to remain symptomatic (particularly in those with mild to moderate heart failure).

The beta-blockers bisoprolol and carvedilol (section 2.4) are of value in any grade of stable heart failure due to left ventricular systolic dysfunction; nebivolol (section 2.4) is licensed for stable mild to moderate heart failure in patients over 70 years. Beta-blocker treatment should be started by those experienced in the management of heart failure, at a very low dose and titrated very slowly over a period of weeks or months. Symptoms may deteriorate initially, calling for adjustment of concomitant therapy.

The aldosterone antagonist spironolactone can be added to an ACE inhibitor and a beta-blocker in patients who continue to remain symptomatic (particularly in those with moderate to severe heart failure); low doses of spironolactone (section 2.2.3, p. 91) reduce symptoms and mortality in these patients. If spironolactone cannot be used, eplerenone (section 2.2.3) may be considered for the management of heart failure after an acute myocardial infarction with evidence of left ventricular systolic dysfunction, or for chronic mild heart failure with left ventricular systolic dysfunction.

Close monitoring of serum creatinine, eGFR, and potassium is necessary, particularly following any change in treatment or any change in the patient’s clinical condition.

Patients who cannot tolerate an ACE inhibitor or an angiotensin-II receptor antagonist, or in whom they are contra-indicated, may be given **isosorbide dinitrate** (section 2.6.1) with **hydralazine** (section 2.5.1), but this combination may be poorly tolerated. The combination of isosorbide dinitrate and hydralazine may be considered in addition to standard therapy with an ACE inhibitor and a beta-blocker in patients who continue to remain symptomatic (particularly in patients of African or Caribbean origin who have moderate to severe heart failure).

**Digoxin** (section 2.1.1) improves symptoms of heart failure and exercise tolerance and reduces hospitalisation due to acute exacerbations but it does not reduce mortality. Digoxin is reserved for patients with worsening or severe heart failure due to left ventricular systolic dysfunction who remain symptomatic despite treatment with an ACE inhibitor and a beta-blocker in combination with either an aldosterone antagonist, candesartan, or isosorbide dinitrate with hydralazine.
Patients with fluid overload should also receive either a loop or a thiazide diuretic (with salt or fluid restriction where appropriate). A thiazide diuretic (section 2.2.1) may be of benefit in patients with mild heart failure and good renal function; however, thiazide diuretics are ineffective in patients with poor renal function (eGFR less than 30 mL/minute/1.73 m², see Renal Impairment, section 2.2.1) and a loop diuretic (section 2.2.2) is preferred. If diuresis with a single diuretic is insufficient, a combination of a loop diuretic and a thiazide diuretic may be tried; addition of metolazone (section 2.2.1) may also be considered but the resulting diuresis may be profound and care is needed to avoid potentially dangerous electrolyte disturbances.

**2.5.5.1 Angiotensin-converting enzyme inhibitors**

Angiotensin-converting enzyme inhibitors (ACE inhibitors) inhibit the conversion of angiotensin I to angiotensin II. They have many uses and are generally well tolerated. The main indications of ACE inhibitors are shown below.

**Heart failure** ACE inhibitors are used in all grades of heart failure, usually combined with a beta-blocker (section 2.5.5). Potassium supplements and potassium-sparing diuretics should be discontinued before introducing an ACE inhibitor because of the risk of hyperkalaemia. However, a low dose of spironolactone may be beneficial in severe heart failure (section 2.5.5) and can be used with an ACE inhibitor provided serum potassium is monitored carefully. Profound first-dose hypotension may occur when ACE inhibitors are introduced to patients with heart failure who are already taking a high dose of a loop diuretic (e.g. furosemide 80 mg daily or more). Temporary withdrawal of the loop diuretic reduces the risk, but may cause severe rebound pulmonary oedema. Therefore, for patients on high doses of loop diuretics, the ACE inhibitor may need to be initiated under specialist supervision, see below. An ACE inhibitor can be initiated in the community in patients who are receiving a low dose of a diuretic or who are not otherwise at risk of serious hypotension; nevertheless, care is required and a very low dose of the ACE inhibitor is given initially.

**Hypertension** An ACE inhibitor may be the most appropriate initial drug for hypertension in younger Caucasian patients; Afro-Caribbean patients, those aged over 55 years, and those with primary aldosteronism respond less well (see section 2.5). ACE inhibitors are particularly indicated for hypertension in patients with type 1 diabetes with nephropathy (see also section 6.1.5). They may reduce blood pressure very rapidly in some patients particularly in those receiving diuretic therapy (see Cautions, below); the first dose should preferably be given at bedtime.

**Diabetic nephropathy** For comment on the role of ACE inhibitors in the management of diabetic nephropathy, see section 6.1.5.

**Prophylaxis of cardiovascular events** ACE inhibitors are used in the early and long-term management of patients who have had a myocardial infarction, see section 2.10.1. ACE inhibitors may also have a role in preventing cardiovascular events.

**Initiation under specialist supervision** ACE inhibitors should be initiated under specialist supervision and with careful clinical monitoring in those with severe heart failure or in those:
- receiving multiple or high-dose diuretic therapy (e.g. more than 80 mg of furosemide daily or its equivalent);
- with hypovolaemia;
- with hyponatraemia (plasma-sodium concentration below 130 mmol/litre);
- with hypotension (systolic blood pressure below 90 mmHg);
- with unstable heart failure;
- receiving high-dose vasodilator therapy;
- known renovascular disease.

**Renal effects** Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if features mentioned below present); hyperkalaemia and other side-effects of ACE inhibitors are more common in those with impaired renal function and the dose may need to be reduced (see Renal impairment below and individual drugs). Although ACE inhibitors now have a specialised role in some forms of renal disease, including chronic kidney disease, they also occasionally cause impairment of renal function which may progress and become severe in other circumstances (at particular risk are the elderly). A specialist should be involved if renal function is significantly reduced as a result of treatment with an ACE inhibitor. Concomitant treatment with NSAIDs increases the risk of renal damage, and potassium-sparing diuretics (or potassium-containing salt substitutes) increase the risk of hyperkalaemia.

In patients with severe bilateral renal artery stenosis (or severe stenosis of the artery supplying a single functioning kidney), ACE inhibitors reduce or abolish glomerular filtration and are likely to cause severe and progressive renal failure. They are therefore not recommended in patients known to have these forms of critical renovascular disease.

ACE inhibitor treatment is unlikely to have an adverse effect on overall renal function in patients with severe unilateral renal artery stenosis and a normal contralateral kidney, but glomerular filtration is likely to be reduced (or even abolished) in the affected kidney and the long-term consequences are unknown.

ACE inhibitors are therefore best avoided in patients with known or suspected renovascular disease, unless the blood pressure cannot be controlled by other drugs. If ACE inhibitors are used, they should be initiated only under specialist supervision and renal function should be monitored regularly.

ACE inhibitors should also be used with particular caution in patients who may have undiagnosed and clinically silent renovascular disease. This includes patients with peripheral vascular disease or those with severe generalised atherosclerosis.

**Cautions** ACE inhibitors need to be initiated with care in patients receiving diuretics (important: see Concomitant diuretics, below); first doses can cause hypotension especially in patients taking high doses of diuretics, on a low-sodium diet, on dialysis, dehydrated, or with heart failure (see above). They should also be used with caution in peripheral vascular disease or generalised atherosclerosis owing to risk of clinically
ACE inhibitors should be avoided in patients with severe or symptomatic aortic stenosis (risk of hypotension) and in hypertrophic cardiomyopathy. They should also be used with care (or avoided) in those with a history of idiopathic or hereditary angioedema. If jaundice or marked elevations of hepatic enzymes occur during treatment then the ACE inhibitor should be discontinued—risk of hepatic necrosis (see also Hepatic impairment, below).

**Side-effects**

ACE inhibitors should be used with care in patients with severe renal impairment (including angioedema).

**Breast-feeding**

Breastfeeding is limited. Captopril, enalapril, lisinopril, moexipril, perindopril, quinapril, ramipril, and trandolapril are not recommended; alternative treatment options, with better established safety information during breastfeeding, are available. Captopril, enalapril, and quinapril should be avoided in the first few weeks after delivery, particularly in preterm infants, due to the risk of profound neonatal hypotension; if essential, they may be used in mothers breast-feeding older infants—the infant’s blood pressure should be monitored.

**Side-effects**

ACE inhibitors can cause profound hypotension (see Caution) and renal impairment (see Renal effects above), and a persistent dry cough. They can also cause angioedema (onset may be delayed; higher incidence reported in Afro-Caribbean patients), rash (which may be associated with pruritus and urticaria), pancreatitis, and upper respiratory-tract symptoms such as sinusitis, rhinitis, and sore throat. Gastrointestinal effects reported with ACE inhibitors include nausea, vomiting, dyspepsia, diarrhoea, constipation, and abdominal pain. Altered liver function tests, cholestatic jaundice, hepatitis, fulminant hepatic necrosis, and hepatic failure have been reported—discontinue if marked elevation of hepatic enzymes or jaundice. Hyperkalaemia, hypoglycaemia, and blood disorders including thrombocytopenia, leucopenia, neutropenia, and haemolytic anaemia have also been reported. Other reported side-effects include headache, dizziness, fatigue, malaise, taste disturbance, paraesthesia, bronchospasm, fever, serositis, vasculitis, myalgia, arthralgia, positive antinuclear antibody, raised erythrocyte sedimentation rate, eosinophilia, leukocytosis, and photosensitivity.

**Combination products**

Products incorporating an ACE inhibitor with a thiazide diuretic or a calcium-channel blocker are available for the management of hypertension. Use of these combination products should be reserved for patients whose blood pressure has not responded adequately to a single antihypertensive drug and who have been stabilised on the individual components of the combination in the same proportions.

**Captopril**

**Indications**

Essential hypertension; chronic heart failure (adjunct—see section 2.5.5); following myocardial infarction, see dose below; diabetic nephropathy in type 1 diabetes

**Cautions**

see notes above

**Contra-indications**

see notes above

**Renal impairment**

see notes above; reduce dose; max. initial dose 50 mg if eGFR above 40 mL/min/1.73 m²; max. initial dose 25 mg daily (do not exceed 100 mg daily) if eGFR 20–40 mL/min/1.73 m²; max. initial dose 12.5 mg daily (do not exceed 75 mg daily) if eGFR 10–20 mL/min/1.73 m²; max. initial dose 6.25 mg daily (do not exceed 37.5 mg daily) if eGFR less than 10 mL/min/1.73 m².

**Pregnancy**

see notes above

**Breast-feeding**

see notes above

**Side-effects**

see notes above; also dry mouth, dysphonia, sleep disorder, alopecia; less commonly tachycardia, palpitation, arthrythmia, angina, pallor, flushing, Raynaud’s syndrome; rarely stomatitis, anorexia; very rarely glossectis, peptic ulcer, syncope, cerebrovascular events, cardiac arrest, cardiogenic shock, allergic alveolitis, eosinophilic pneumonia, confusion, depression, impotence, gynaecomastia, hyponatraemia, blurred vision, photosensitivity, Stevens-Johnson syndrome

**Dose**

- Hypertension, initially 12.5–25 mg twice daily;
- Elderly initially 6.25 mg twice daily; in volume depletion (see Concomitant diuretics), cardiac decompensation, or renovascular hypertension, initially 6.25–12.5 mg as a single dose preferably under close medical supervision, then twice daily; increased if necessary at intervals of at least 2 weeks up to max. 150 mg daily in 2 divided doses (max. 100 mg daily in 1–2 divided doses in volume depletion, cardiac decompensation, or renovascular hypertension);
once-daily dosing may be appropriate if other concomitant antihypertensive drugs taken

- Heart failure (adjunct), initially 6.25–12.5 mg 2–3 times daily under close medical supervision (see notes above), increased gradually at intervals of at least 2 weeks up to max. 150 mg daily in divided doses if tolerated

- Short-term treatment within 24 hours of onset of myocardial infarction in clinically stable patients, initially 6.25 mg, then 12.5 mg after 2 hours, followed by 25 mg 12 hours later; if tolerated, continue at 50 mg twice daily for 4 weeks

- Prophylaxis of symptomatic heart failure after myocardial infarction in clinically stable patients with asymptomatic left ventricular dysfunction, initially 6.25 mg once daily, starting 3–16 days after infarction under close medical supervision, then 12.5 mg 3 times daily for 2 days, then 25 mg 3 times daily if tolerated; increase gradually to 75–150 mg daily in 2–3 divided doses if tolerated

- Diabetic nephropathy, 75–100 mg daily in divided doses

**Captopril** (Non-proprietary) \(\bigcirc\) (Squibb) \(\bigcirc\)

- **Tablets**, captopril 12.5 mg, net price 56-tab pack = £2.44; 25 mg, 56-tab pack = £1.28; 50 mg, 56-tab pack = £2.47

**Brands include** Ecopace \(\bigcirc\), Kaplon \(\bigcirc\)

**Capoten**\(\bigcirc\) (Squibb) \(\bigcirc\)

- **Tablets**, scored, captopril 25 mg, net price 28-tab pack = £5.26

**Noyada** \(\bigcirc\) (Martindale) \(\bigcirc\)

- **Oral solution**, captopril 5 mg/5 mL, net price 100 mL = £98.21; 25 mg/5 mL, 100 mL = £108.94

**Electrolytes**

**With diuretic**

**Note**

For mild to moderate hypertension in patients stabilised on the individual components in the same proportions. For prescribing information on thiazides, see section 2.2.1

**Co-zidocapt** (Non-proprietary) \(\bigcirc\)

- **Tablets**, co-zidocapt 12.5/25 (hydrochlorothiazide 12.5 mg, captopril 25 mg), net price 28-tab pack = £14.10

**Brands include** Captop-co \(\bigcirc\)

- **Tablets**, co-zidocapt 25/50 (hydrochlorothiazide 25 mg, captopril 50 mg), net price 28-tab pack = £14.00

**Brands include** Captop-co \(\bigcirc\)

**Capozide** \(\bigcirc\) (Squibb) \(\bigcirc\)

- **Tablets**, scored, co-zidocapt 25/50 (hydrochlorothiazide 25 mg, captopril 50 mg), net price 30-tab pack = £7.52

**CILAZAPRIL**

**Indications** essential hypertension; congestive heart failure (adjunct—see section 2.5.5)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above; \(^1\) max. dose 500 micrograms daily in liver cirrhosis; manufacturer advises avoid in ascites

**Renal impairment** see notes above; \(^1\) max. initial dose 500 micrograms once daily (do not exceed 2.5 mg once daily) if eGFR 10–40 mL/minute/1.73 m\(^2\); avoid if eGFR less than 10 mL/minute/1.73 m\(^2\)

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also less commonly dry mouth, decreased appetite, aphthous stomatitis, angina, tachycardia, palpitation, flushing, dyspnoea, impotence, excessive sweating; rarely glossitis, bronchitis, interstitial lung disease, gynaecomastia, peripheral neuropathy, Stevens-Johnson syndrome, toxic epidermal necrolysis

**Dose**

- Hypertension, \(^1\) initially 1 mg once daily (reduced to 500 micrograms daily if used in addition to diuretic (see notes above), or in cardiac decompensation, in severe hypertension, in volume depletion, in the elderly, or in renal impairment), then adjusted according to response; usual maintenance dose 2.5–5 mg once daily; max. 5 mg daily

- Heart failure (adjunct), \(^1\) initially 500 micrograms once daily under close medical supervision (see notes above), increased at weekly intervals to 1–2.5 mg once daily if tolerated; max. 5 mg once daily

**Vascace** \(\bigcirc\) (Roche) \(\bigcirc\)

- **Tablets**, brown, f/c, cilazapril 5 mg, net price 28-tab pack = £12.51

**ENALAPRIL MALEATE**

**Indications** hypertension; symptomatic heart failure (adjunct—see section 2.5.5); prevention of symptomatic heart failure in patients with asymptomatic left ventricular dysfunction

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above; max. initial dose 2.5 mg daily if eGFR less than 30 mL/minute/1.73 m\(^2\)

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also dyspnoea; depression, anaemia; blurred vision; less commonly dry mouth, peptic ulcer, anorexia, ileus; arrhythmias, palpitation, flushing; confusion, nervousness, drowsiness, insomnia, vertigo; impotence; muscle cramps; tinnitus; alopecia, sweating; hyponatraemia; rarely stomatitis, glossitis, Raynaud’s syndrome; pulmonary infiltrates, allergic alveolitis, dream abnormalities, gynaecomastia, Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis, pemphigus; very rarely gastro-intestinal angioedema

**Dose**

- Hypertension, used alone, initially 5 mg once daily; if used in addition to diuretic (see notes above), or in renal impairment, lower initial doses may be required; usual maintenance dose 20 mg once daily; max. 40 mg once daily

- Heart failure (adjunct), asymptomatic left ventricular dysfunction, initially 2.5 mg once daily under close medical supervision (see notes above), increased gradually over 2–4 weeks to 10–20 mg twice daily if tolerated

**Enalapril Maleate** (Non-proprietary) \(\bigcirc\)

- **Tablets**, enalapril maleate 2.5 mg, net price 28-tab pack = £1.02; 5 mg, 28-tab pack = 90p; 10 mg, 28-tab pack = 97p; 20 mg, 28-tab pack = £1.04

**Brands include** Ednyt \(\bigcirc\)
FOSINOPRIL SODIUM

Indications hypertension; congestive heart failure (adjunct—see section 2.5.5)

Cautions see notes above

Contra-indications see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; chest pain; musculoskeletal pain

Dose

● Hypertension, initially 10 mg daily, increased if necessary after 4 weeks; usual dose range 10–40 mg (doses over 40 mg not shown to increase efficacy), if used in addition to diuretic see notes above

● Heart failure (adjunct), initially 10 mg once daily under close medical supervision (see notes above), increased gradually to 40 mg once daily if tolerated

Fosinopril sodium (Non-proprietary)

Tablets, fosinopril sodium 10 mg, net price 28-tab pack = £1.85; 20 mg, 28-tab pack = £1.66

IMIDAPRIL HYDROCHLORIDE

Indications essential hypertension

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment see notes above; initial dose 2.5 mg daily if eGFR 30–80 mL/minute/1.73 m², avoid if eGFR less than 30 mL/minute/1.73 m²

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; dry mouth, glositis, ileus; bronchitis, dyspnoea; sleep disturbances, depression, confusion, blurred vision, tinnitus, impotence

Dose

● Initially 5 mg daily before food; if used in addition to diuretic (see notes above), in elderly, in patients with heart failure, angina or cerebrovascular disease, or in renal or hepatic impairment, initially 2.5 mg daily; if necessary increase dose at intervals of at least 3 weeks; usual maintenance dose 10 mg once daily; max. 20 mg daily (elderly, 10 mg daily)

LISINOPRIL

Indications hypertension (but see notes above); symptomatic heart failure (adjunct—see section 2.5.5); short-term treatment following myocardial infarction in haemodynamically stable patients; renal complications of diabetes mellitus

Cautions see notes above

Contra-indications see notes above

Renal impairment see notes above; max. initial doses 5–10 mg daily if eGFR 30–80 mL/minute/1.73 m² (max. 40 mg daily); 2.5–5 mg daily if eGFR 10–30 mL/minute/1.73 m² (max. 40 mg daily); 2.5 mg daily if eGFR less than 10 mL/minute/1.73 m²

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; also less commonly tachycardia, palpitation, cerebrovascular accident, myocardial infarction, Raynaud’s syndrome, confusion, mood changes, vertigo, sleep disturbances, asthenia, impotence; rarely dry mouth, gynaecomastia, alopecia, psoriasis; very rarely allergic alveolitis, pulmonary infiltrates, profuse sweating, pemphigus, Stevens-Johnson syndrome, and toxic epidermal necrolysis

Dose

● Hypertension, initially 10 mg once daily; if used in addition to diuretic (see notes above) or in cardiac decompensation or in volume depletion, initially 2.5–5 mg once daily; usual maintenance dose 20 mg once daily; max. 80 mg once daily

● Heart failure (adjunct), initially 2.5 mg once daily under close medical supervision (see notes above); increased in steps no greater than 10 mg at intervals of at least 2 weeks up to max. 35 mg once daily if tolerated

● Prophylaxis after myocardial infarction, systolic blood pressure over 120 mmHg, 5 mg within 24 hours, followed by further 5 mg 24 hours later, then 10 mg after a further 24 hours, and continuing with 10 mg once daily for 6 weeks (or continued if heart failure); systolic blood pressure 100–120 mmHg, initially 2.5 mg once daily, increased to maintenance dose of 5 mg once daily

Note Should not be started after myocardial infarction if systolic blood pressure less than 100 mmHg; temporarily reduce maintenance dose to 5 mg and if necessary 2.5 mg daily if systolic blood pressure 100 mmHg or less during treatment; withdraw if prolonged hypotension occurs (systolic blood pressure less than 90 mmHg for more than 1 hour)

● Renal complications of diabetes mellitus, initially 2.5–5 mg once daily adjusted according to response; usual dose range 10–20 mg once daily

Lisinopril (Non-proprietary)

Tablets, lisinopril (as dihydrate) 2.5 mg, net price 28-tab pack = £1.04; 5 mg, 28-tab pack = £1.03; 10 mg, 28-tab pack = 98p; 20 mg, 28-tab pack = £1.04

Zestril® (AstraZeneca)

Tablets, lisinopril (as dihydrate) 5 mg (pink), net price = 28-tab pack = £4.71; 10 mg (pink), 28-tab pack = £7.38; 20 mg (pink), 28-tab pack = £8.67

With diuretic

Note For mild to moderate hypertension in patients stabilised on the individual components in the same proportions. For prescribing information on thiazides, see section 2.2.1

Innozide® (MSD)

Tablets, yellow, scored, enalapril maleate 20 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £13.90

Note Non-proprietary tablets containing enalapril maleate (20 mg) and hydrochlorothiazide (12.5 mg) are available

IMIDAPRIL HYDROCHLORIDE

Indications hypertension; congestive heart failure (adjunct—see section 2.5.5)

Cautions see notes above

Contra-indications see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; dry mouth, glossitis, ileus; bronchitis, dyspnoea; sleep disturbances, depression, confusion, blurred vision, tinnitus, impotence

Dose

● Initially 5 mg daily before food; if used in addition to diuretic (see notes above), in elderly, in patients with heart failure, angina or cerebrovascular disease, or in renal or hepatic impairment, initially 2.5 mg daily; if necessary increase dose at intervals of at least 3 weeks; usual maintenance dose 10 mg once daily; max. 20 mg daily (elderly, 10 mg daily)
**With diuretic**

**Note** For mild to moderate hypertension in patients stabilised on the individual components in the same proportions. For prescribing information on thiazides, see section 2.2.1

**Carace Plus**<sup>(MSD)</sup> (Finn)

Carace 20 Plus tablets, yellow, scored, lisinopril 20 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £11.43

**Zestoretic**<sup>(AstraZeneca)</sup> (Finn)

Zestoretic 10 tablets, peach, lisinopril (as dihydrate) 10 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £6.81

Zestoretic 20 tablets, lisinopril (as dihydrate) 20 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £11.52

**MOEXIPRIL HYDROCHLORIDE**

**Indications** essential hypertension

**Cautions** see notes above; also significant mitral valve stenosis

**Contra-indications** see notes above

**Hepatic impairment** see notes above; initial dose 3.75 mg once daily

**Renal impairment** see notes above; if eGFR less than 40 mL/minute/1.73 m², initial dose 3.75 mg once daily titrated to max. 15 mg once daily

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also arrhythmias, tachycardia, palpitation, angina, syncope, flushing, cerebrovascular accident, myocardial infarction, dyspnoea, appetite and weight changes, dry mouth, confusion, depression, numbness, drowsiness, sleep disturbances, impotence, hyperuricaemia, blurred vision, tinnitus, sweating, pemphigus, Stevens-Johnson syndrome, toxic epidermal necrolysis, alopecia

**Dose**

- Monotherapy, initially 7.5 mg once daily adjusted according to response; usual range 7.5–15 mg once daily (max. 30 mg once daily); if used in addition to diuretic (see notes above), with nifedipine or other antihypertensive drug, or in elderly, initially 3.75 mg once daily

**Peridopril** (Non-proprietary) (Finn)

Peridopril erbumine (= tert-butylamine) 2 mg, net price 30-tab pack = £1.28; 4 mg, 30-tab pack = £1.32; 8 mg, 30-tab pack = £1.43. Label: 22

**PERINDOPRIL ARGININE**

**Indications** see under Perindopril Erbumine and notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above; max. initial dose 2.5 mg once daily if eGFR 30–60 mL/minute/1.73 m²; 2.5 mg once daily on alternate days if eGFR 15–30 mL/minute/1.73 m²

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also asthenia, mood and sleep disturbances

**Dose**

- Hypertension, initially 4 mg once daily in the morning for 1 month, subsequently adjusted according to response; if used in addition to diuretic (see notes above), in elderly, in renal impairment, in cardiac decompensation, or in volume depletion, initially 2 mg once daily; max. 8 mg daily

- Heart failure (adjunct), initially 2 mg once daily in the morning under close medical supervision (see notes above), increased after at least 2 weeks to max. 4 mg once daily if tolerated

- Following myocardial infarction or revascularisation, initially 4 mg once daily in the morning increased after 2 weeks to 8 mg once daily if tolerated; **ELDERLY** 2 mg once daily for 1 week, then 4 mg once daily for 1 week, thereafter increased to 8 mg once daily if tolerated

**Coversyl** (Servier) (Finn)

Coversyl, f/c, perindopril arginine 2.5 mg (white), net price 30-tab pack = £4.45; 5 mg (light green, scored), 30-tab pack = £6.28; 10 mg (green), 30-tab pack = £10.65. Label: 22

**Perindopril arginine with diuretic**

**Note** For hypertension not adequately controlled by perindopril alone. For prescribing information on indapamide, see section 2.2.1

**Coversyl**<sup>®</sup> Arginine Plus (Servier) (Finn)

Coversyl, f/c, perindopril arginine 5 mg, indapamide 1.25 mg, net price 30-tab pack = £9.51. Label: 22
QUINAPRIL

**Indications**  
essential hypertension; congestive heart failure (adjunct—see section 2.5.5)

**Cautions**  
see notes above

**Contra-indications**  
see notes above

**Hepatic impairment**  
see notes above

**Renal impairment**  
see notes above; max. initial dose 2.5 mg once daily if eGFR less than 40 mL/minute/1.73 m²

**Pregnancy**  
see notes above

**Breast-feeding**  
see notes above

**Side-effects**  
see notes above; asthenia, chest pain, oedema, flatulence, nervousness, depression, insomnia, blurred vision, impotence, and back pain

**Dose**
- Hypertension, initially 10 mg once daily; with a diuretic (see notes above), in elderly, or in renal impairment initially 2.5 mg daily; usual maintenance dose 20–40 mg daily in single or 2 divided doses; up to 80 mg daily has been given.
- Heart failure (adjunct), initial dose 2.5 mg daily under close medical supervision (see notes above), increased gradually to 10–20 mg daily in 1–2 divided doses if tolerated; max. 40 mg daily

**Quinapril** *(Non-proprietary)*

**Tablets**, quinapril (as hydrochloride) 5 mg, net price 28-tab pack = £7.81; 10 mg, 28-tab pack = £7.73; 20 mg, 28-tab pack = £1.90; 40 mg, 28-tab pack = £2.36

**Brands include** Quinil®

**Accupro®** *(Pfizer)*

**Tablets**, f/c, quinapril (as hydrochloride) 5 mg (brown), net price 28-tab pack = £8.60; 10 mg (brown), 28-tab pack = £10.79; 40 mg (red-brown), 28-tab pack = £9.75

**With diuretic**

**Note**  
For hypertension in patients stabilised on the individual components in the same proportions. For prescribing information on thiazides, see section 2.2.1

**Accuretic®** *(Pfizer)*

**Tablets**, pink, f/c, scored, quinapril (as hydrochloride) 10 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £11.75

RAMIPRIL

**Indications**  
hypertension; symptomatic heart failure (adjunct—see section 2.5.5); following myocardial infarction in patients with clinical evidence of heart failure; prevention of cardiovascular events in patients with atherosclerotic cardiovascular disease or with diabetes mellitus and at least one additional risk factor for cardiovascular disease; nephropathy (consult product literature)

**Cautions**  
see notes above

**Contra-indications**  
see notes above

**Hepatic impairment**  
max. daily dose 2.5 mg; see also notes above

**Renal impairment**  
see notes above; max. daily dose 5 mg if eGFR 30–60 mL/minute/1.73 m²; max. initial dose 1.25 mg once daily (do not exceed 5 mg daily) if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy**  
see notes above

**Breast-feeding**  
see notes above

**Side-effects**  
see notes above; also stomatitis, syncope, dyspnoea, bronchitis, muscle cramps; less commonly dry mouth, arrhythmias, tachycardia, palpitations, angina, chest pain, myocardial infarction, peripheral oedema, flushing, loss of appetite, nervousness, depression, anxiety, impotence, decreased libido, visual disturbances, sweating; rarely confusion, tremor, conjunctivitis, impaired hearing, tinnitus, onycholysis; also reported cerebrovascular accident, precipitation or exacerbation of Raynaud’s syndrome, sleep disturbance, gynaecomastia, hyponatraemia, skin reactions including erythema multiforme, pemphigoid exanthema, Stevens-Johnson syndrome, and toxic epidermal necrolysis, alopecia

**Dose**
- Hypertension, initially 1.25–2.5 mg once daily, increased at intervals of 2–4 weeks to max. 10 mg once daily; if used in addition to diuretic see notes above
- Heart failure (adjunct), initially 1.25 mg once daily under close medical supervision (see notes above), increased gradually at intervals of 1–2 weeks to max. 10 mg daily if tolerated (preferably taken in 2 divided doses)
- Prophylaxis after myocardial infarction (started at least 48 hours after infarction), initially 2.5 mg twice daily, increased after 3 days to 5 mg twice daily

**RAMIPRIL** *(Non-proprietary)*

**Capsules**, ramipril 1.25 mg, net price 28-cap pack = £0.99; 2.5 mg, 28-cap pack = £1.05; 5 mg, 28-cap pack = £1.12; 10 mg, 28-cap pack = £1.19

**Tablets**, ramipril 1.25 mg, net price 28-tab pack = £1.12; 2.5 mg, 28-tab pack = £1.21; 5 mg, 28-tab pack = £1.34

**Oral solution**, ramipril 2.5 mg/5 mL, net price 150 mL = £89.15

**Tritate®** *(Sanofi-Aventis)*

**Tablets**, scored, ramipril 1.25 mg (white), net price 28-tab pack = £0.99; 2.5 mg (yellow), 28-tab pack = £1.22; 5 mg (red), 28-tab pack = £10.05; 10 mg (white), 28-tab pack = £13.68

**Titration pack, tablets**, 35-day starter pack of ramipril 7 × 2.5 mg with 21 × 5 mg and 7 × 10 mg, net price = £13.00

**With calcium-channel blocker**

**Note**  
For hypertension in patients stabilised on the individual components in the same proportions. For prescribing information on felodipine, see section 2.6.2

**Triapin®** *(Sanofi-Aventis)*

**Tablets**, f/c, brown, ramipril 5 mg, felodipine 5 mg (m/r), net price 28-tab pack = £16.13.

**Label**: 25

**Triapin mite® tablets**, f/c, orange, ramipril 2.5 mg, felodipine 2.5 mg (m/r), net price 28-tab pack = £24.55.

**Label**: 25
**2.5.5 Drugs affecting the renin-angiotensin system**

**TRANLAPRIL**

**Indications** mild to moderate hypertension; following myocardial infarction in patients with left ventricular dysfunction.

**Cautions** see notes above.

**Contra-indications** see notes above.

**Hepatic impairment** see notes above.

**Renal impairment** see notes above; max. 2 mg daily if eGFR less than 10 mL/minute/1.73 m².

**Pregnancy** see notes above.

**Breast-feeding** see notes above.

**Side-effects** see notes above; also ileus, dry mouth; tachycardia, palpitation, arrhythmias, angina, transient ischaemic attacks, cerebral haemorrhage, myocardial infarction, syncope; dyspnoea, bronchitis; asthenia, nervousness, sleep disturbances; hot flushes; alopecia, sweating, skin reactions including Stevens-Johnson syndrome, toxic epidermal necrolysis, and psoriasis-like efflorescence.

**Dose**

- Hypertension, initially 500 micrograms once daily, increased at intervals of 2–4 weeks; usual range 1–2 mg once daily; max. 4 mg daily; if used in addition to diuretic see notes above.
- Prophylaxis after myocardial infarction (starting as early as 3 days after infarction), initially 500 micrograms once daily, gradually increased to max. 4 mg once daily.

**Note** If symptomatic hypotension develops during titration, do not increase dose further; if possible, reduce dose of any adjunctive treatment and if this is not effective or feasible, reduce dose of trandolapril.

**Trandolapril** (Non-propietary) 7 tablet packs

- Capsules, trandolapril 500 micrograms, net price 14-cap pack = £1.45; 1 mg, 28-cap pack = £5.31; 2 mg, 28-cap pack = £1.69; 4 mg, 28-cap pack = £9.71.

**2.5.5.2 Angiotensin-II receptor antagonists**

Azilsartan, candesartan, eprosartan, irbesartan, losartan, olmesartan, telmisartan, and valsartan are angiotensin-II receptor antagonists with many properties similar to those of the ACE inhibitors. However, unlike ACE inhibitors, they do not inhibit the breakdown of bradykinin and other kinins, and thus are less likely to cause the persistent dry cough which can complicate ACE inhibitor therapy. They are therefore a useful alternative for patients who have to discontinue an ACE inhibitor because of persistent cough.

An angiotensin-II receptor antagonist may be used as an alternative to an ACE inhibitor in the management of heart failure (section 2.5.5) or diabetic nephropathy (section 6.1.5).

**Cautions** Angiotensin-II receptor antagonists should be used with caution in renal artery stenosis (see also Renal Effects under ACE Inhibitors, section 2.5.5.1). Monitoring of plasma-potassium concentration is advised, particularly in the elderly and in patients with renal impairment; lower initial doses may be appropriate in these patients. Angiotensin-II receptor antagonists should be used with caution in aortic or mitral valve stenosis and in hypertrophic cardiomyopathy. Those with primary aldosteronism, and Afro-Caribbean patients (particularly those with left ventricular hypertrophy), may not benefit from an angiotensin-II receptor antagonist. **Interactions** Appendix 1 (angiotensin-II receptor antagonists).

**Pregnancy** Angiotensin-II receptor antagonists should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; skull defects and oligohydramnios have also been reported.

**Breast-feeding** Information on the use of angiotensin-II receptor antagonists in breast-feeding is limited. They are not recommended in breast-feeding and alternative treatment options, with better established safety information during breast-feeding, are available.

**Side-effects** Side-effects are usually mild. Symptomatic hypotension including dizziness may occur, particularly in patients with intravascular volume depletion (e.g. those taking high-dose diuretics). Hyperkalaemia occurs occasionally; angioedema has also been reported with some angiotensin-II receptor antagonists.

**AZILSARTAN MEDOXOMIL**

**Indications** hypertension (see also notes above).

**Cautions** see notes above; heart failure.

**Hepatic impairment** manufacturer advises monitor closely and consider initial dose of 20 mg in mild to moderate impairment (limited information available), and to avoid in severe impairment (no information available).

**Renal impairment** manufacturer advises caution in severe impairment—no information available.

**Pregnancy** see notes above.

**Breast-feeding** see notes above.

**Side-effects** see notes above; also diarrhoea, raised creatine kinase, less commonly peripheral oedema, malaise, raised creatinine, hyperuricaemia.

**Dose**

- Initially 40 mg once daily, increased if necessary to max. 80 mg once daily (in intravascular volume depletion or in ELDERLY over 75 years, consider initial dose of 20 mg once daily); CHILD not recommended.

**Edarbi** (Takeda) 7 tablet packs

- Tablets, azilsartan medoxomil (as potassium salt) 20 mg, net price 28-tab pack = £16.80; 40 mg, 28-tab pack = £16.80; 80 mg, 28-tab pack = £19.95.

**Candesartan Cilexetil**

**Indications** hypertension; heart failure with impaired left ventricular systolic function in conjunction with an ACE inhibitor, or when ACE inhibitors are not tolerated (see also section 2.5.5).

**Cautions** see notes above.

**Contra-indications** cholestasis.

**Hepatic impairment** initially 4 mg once daily in mild or moderate impairment; avoid in severe impairment.

**Renal impairment** initially 4 mg daily; use with caution if eGFR less than 15 mL/minute/1.73 m²—limited experience.

**Pregnancy** see notes above.

**Breast-feeding** see notes above.

**Side-effects** see notes above; also vertigo, headache; very rarely nausea, hepatitis, cough, blood disorders, hyponatraemia, back pain, arthralgia, myalgia, rash, urticaria, pruritus.
Dose

- Hypertension, initially 8 mg (intravascular volume depletion 4 mg) once daily, increased if necessary at intervals of 4 weeks to max. 32 mg once daily; usual maintenance dose 8 mg once daily
- Heart failure, initially 4 mg once daily, increased at intervals of at least 2 weeks to ‘target’ dose of 32 mg once daily or to max. tolerated dose

Candesartan Cilexetil (Non-proprietary) Tablets, candesartan cilexetil 2 mg, net price 7-tab pack = £2.11; 4 mg, 7-tab pack = £0.84, 28-tab pack = £1.08; 8 mg, 28-tab pack = £1.62; 16 mg, 28-tab pack = £1.97; 32 mg, 28-tab pack = £3.01

Amias® (Takeda) Tablets, candesartan cilexetil 2 mg (white), net price 7-tab pack = £3.58; 4 mg (white, scored), 7-tab pack = £3.88, 28-tab pack = £9.78; 8 mg (pink, scored), 28-tab pack = £9.89; 16 mg (pink, scored), 28-tab pack = £12.72; 32 mg (pink, scored), 28-tab pack = £16.13

EPROSARTAN

Indications hypertension (see also notes above)

Cautions see notes above

Hepatic impairment halve initial dose in mild or moderate liver disease; avoid if severe

Renal impairment halve initial dose if eGFR less than 60 mL/minute/1.73 m²

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; also flatulence, hypertriglyceridaemia, arthralgia, rinitis; rarely headache, asthenia, anaemia, hypersensitivity reactions (including rash, pruritus, urticaria); very rarely nausea

Dose

- 600 mg once daily (elderly over 75 years, initially 300 mg once daily); if necessary increased after 2–3 weeks to 800 mg once daily

Teveten® (Abbott Healthcare) Tablets, f/c, eprosartan (as mesilate) 300 mg, net price 28-tab pack = £7.31; 600 mg, 28-tab pack = £14.31. Label: 21

IRBESARTAN

Indications hypertension; renal disease in hypertensive type 2 diabetes mellitus (see also notes above)

Cautions see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; also nausea, vomiting; fatigue; musculoskeletal pain; less commonly diarrhoea, dyspepsia, flushing, tachycardia, chest pain, cough, and sexual dysfunction; rarely rash, urticaria; very rarely headache, myalgia, arthralgia, tinnitus, taste disturbance, hepatitis, renal dysfunction, and cutaneous vasculitis

Dose

- Hypertension, initially 150 mg once daily, increased if necessary to 300 mg once daily in haemodialysis or in ELDERLY over 75 years, initial dose of 75 mg once daily may be used); CHILD not recommended
- Renal disease in hypertensive type 2 diabetes mellitus, initially 150 mg once daily, increased to 300 mg once daily if tolerated (in haemodialysis or in ELDERLY over 75 years, consider initial dose of 75 mg once daily); CHILD not recommended

Irbesartan (Non-proprietary) Tablets, irbesartan 75 mg, net price 28-tab pack = £1.34; 150 mg, 28-tab pack = £1.57; 300 mg, 28-tab pack = £2.23

Brands include Sabervel®

Aprovel® (Bristol-Myers Squibb, Sanofi-Aventis) Tablets, f/c, irbesartan 75 mg, net price 28-tab pack = £9.69; 150 mg, 28-tab pack = £11.84; 300 mg, 28-tab pack = £15.93

With diuretic

Note For hypertension not adequately controlled with irbesartan alone. For prescribing information on thiazides, see section 2.2.1

Irbesartan with hydrochlorothiazide (Non-proprietary) Tablets, irbesartan 150 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £10.67; irbesartan 300 mg, hydrochlorothiazide 12.5 mg, 28-tab pack = £14.35; irbesartan 300 mg, hydrochlorothiazide 25mg, 28-tab pack = £14.35

CoAprovel® (Bristol-Myers Squibb, Sanofi-Aventis) Tablets, f/c, irbesartan 150 mg, hydrochlorothiazide 12.5 mg (peach), net price 28-tab pack = £11.84; irbesartan 300 mg, hydrochlorothiazide 12.5 mg (peach), 28-tab pack = £15.93; irbesartan 300 mg, hydrochlorothiazide 25 mg (pink), 28-tab pack = £15.93

LOSARTAN POTASSIUM

Indications hypertension (including reduction of stroke risk in hypertension with left ventricular hypertrophy); chronic heart failure when ACE inhibitors are unsuitable or contra-indicated; diabetic nephropathy in type 2 diabetes mellitus (see also notes above)

Cautions see notes above; severe heart failure

Hepatic impairment consider dose reduction in mild to moderate impairment; manufacturer advises avoid in severe impairment—no information available

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; vertigo; less commonly gastrointestinal disturbances, angina, palpitation, oedema, dyspnoea, headache, sleep disorders, malaise, urticaria, pruritus, rash; rarely hepatitis, atrial fibrillation, cerebrovascular accident, syncope, pancreatitis; also reported pancreatitis, anaphylaxis, cough, depression, erectile dysfunction, anaemia, thrombocytopenia, hyponatraemia, arthralgia, myalgia, renal impairment, rhabdomyolysis, tinnitus, photosensitivity, and vasculitis (including Henoch-Schönlein purpura)

Dose

- Hypertension, diabetic nephropathy in type 2 diabetes mellitus, usually 50 mg once daily (intravascular volume depletion, initially 25 mg once daily); if necessary increased after several weeks to 100 mg once daily; ELDERLY over 75 years initially 25 mg daily
- Chronic heart failure, initially 12.5 mg once daily, increased at weekly intervals to max. 150 mg once daily if tolerated

Note For hypertension not adequately controlled with irbesartan alone. For prescribing information on thiazides, see section 2.2.1

Irbesartan with hydrochlorothiazide (Non-proprietary) Tablets, irbesartan 150 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £10.67; irbesartan 300 mg, hydrochlorothiazide 12.5 mg, 28-tab pack = £14.35; irbesartan 300 mg, hydrochlorothiazide 25 mg, 28-tab pack = £14.35
Losartan Potassium (Non-proprietary) (TM)
Tablets, losartan potassium 12.5 mg, net price 28-tab pack = £5.15; 25 mg, 28-tab pack = £1.11; 50 mg, 28-tab pack = £1.12; 100 mg, 28-tab pack = £1.27.

Cozaar® (MSD) (TM)
Tablets, f/c, losartan potassium 12.5 mg (blue), net price 28-tab pack = £8.09; 25 mg (white), net price 28-tab pack = £16.18; 50 mg (white), scored, 28-tab pack = £12.80; 100 mg (white), 28-tab pack = £16.18.

Oral suspension, losartan potassium 12.5 mg/5 mL when reconstituted with solvent provided, net price 200 mL (berry-citrus flavour) = £53.68.

With diuretic
Note For hypertension not adequately controlled with losartan alone. For prescribing information on thiazides, see section 2.2.1.

Losartan potassium with hydrochlorothiazide (Non-proprietary) (TM)
Tablets, losartan potassium 100 mg, hydrochlorothiazide 25 mg, net price 28–tab pack = £1.74.

Cozaar-Comp® (MSD) (TM)
Tablets 50/12.5, yellow, f/c, losartan potassium 50 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £12.80.
Tablets 100/12.5, white, f/c, losartan potassium 100 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £16.18.
Tablets 100/25, yellow, f/c, losartan potassium 100 mg, hydrochlorothiazide 25 mg, net price 28-tab pack = £16.18.

OLMESARTAN MEDOXOMIL
Indications hypertension (see also notes above)
Cautions see notes above
Contra-indications biliary obstruction
Hepatic impairment dose should not exceed 20 mg daily in moderate impairment; manufacturer advises avoid in severe impairment—no information available
Renal impairment max. 20 mg daily if eGFR 20–60 mL/minute/1.73 m²; avoid if eGFR less than 20 mL/minute/1.73 m²

Pregnancy see notes above
Breastfeeding see notes above
Side-effects see notes above; also gastrointestinal disturbances; chest pain, peripheral oedema, hypertriglyceridaemia; fatigue; influenza-like symptoms, cough, pharyngitis, rhinitis; urinary-tract infection; haematuria, hyperuricaemia; arthritis, musculoskeletal pain; less commonly angina, vertigo, rash; very rarely headache, thrombocytopenia, myalgia, pruritus, urticaria

Dose
- Initially 10 mg once daily; if necessary increased to 20 mg once daily; max. 40 mg daily

Olmetec® (Daiichi Sankyo) (TM)
Tablets, f/c, olmesartan medoxomil 10 mg, net price 28-tab pack = £10.95; 20 mg, 28-tab pack = £12.95; 40 mg, 28-tab pack = £17.50.

With calcium-channel blocker
Note For hypertension in patients stabilised on the individual components in the same proportions. For prescribing information on amlodipine, see section 2.6.2.

Sevikar® (Daiichi Sankyo) (TM)
Tablets 20/5, white, f/c, olmesartan medoxomil 20 mg, amlodipine (as besilate) 5 mg, net price 28-tab pack = £16.95.

With calcium-channel blocker and diuretic
Note For hypertension in patients stabilised on the individual components in the same proportions, or for hypertension not adequately controlled with olmesartan and amlodipine. For prescribing information on amlodipine, see section 2.6.2; for prescribing information on thiazides, see section 2.2.1.

Sevikar HCT® (Daiichi Sankyo) (TM)
Tablets 20/5/12.5, light orange, f/c, olmesartan medoxomil 20 mg, amlodipine (as besilate) 5 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £16.95.
Tablets 40/5/12.5, light yellow, f/c, olmesartan medoxomil 40 mg, amlodipine (as besilate) 5 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £16.95.
Tablets 40/10/12.5, greyish-red, f/c, olmesartan medoxomil 40 mg, amlodipine (as besilate) 10 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £16.95.
Tablets 40/5/25, light yellow, f/c, olmesartan medoxomil 40 mg, amlodipine (as besilate) 5 mg, hydrochlorothiazide 25 mg, net price 28-tab pack = £16.95.
Tablets 40/10/25, greyish-red, f/c, olmesartan medoxomil 40 mg, amlodipine (as besilate) 10 mg, hydrochlorothiazide 25 mg, net price 28-tab pack = £16.95.

The other medicines in this section are also available over the counter (section 2.6.12).

Telmisartan
Indications hypertension (see also notes above); prevention of cardiovascular events in patients with established atherosclerotic cardiovascular disease, or type 2 diabetes mellitus with target-organ damage
Cautions see notes above
Hepatic impairment 20–40 mg once daily in mild or moderate impairment; avoid in severe impairment or biliary obstruction
Renal impairment manufacturer advises initial dose of 20 mg once daily in severe impairment
Pregnancy see notes above
Breastfeeding see notes above
Side-effects see notes above; also gastrointestinal disturbances; chest pain; influenza-like symptoms including pharyngitis and sinusitis; urinary-tract infection; arthralgia, myalgia, back pain, leg cramps; eczema; less commonly dry mouth, flatulence, anxiety, vertigo, tendinitis-like symptoms, abnormal vision, increased sweating; rarely bradycardia, tachycardia,
dyspnoea, insomnia, depression, blood disorders, increase in uric acid, eosinophilia, rash, and pruritus; syncope and asthenia also reported

**Dose**
- Hypertension, usually 40 mg once daily (but 20 mg may be sufficient), increased if necessary after at least 4 weeks, to max. 80 mg once daily
- Prevention of cardiovascular events, 80 mg once daily

**Micards®** (Boehringer Ingelheim) ▼

**Tablets**, telmisartan 20 mg, net price 28-tab pack = £11.10; 40 mg, 28-tab pack = £13.61; 80 mg, 28-tab pack = £17.00

**With diuretic**

**Note** For patients with hypertension not adequately controlled by telmisartan alone. For prescribing information on thiazides, see section 2.2.1

**Micards Plus®** (Boehringer Ingelheim) ▼

**Tablets 40/12.5**, red/white, telmisartan 40 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £13.61

**Tablets 80/12.5**, red/white, telmisartan 80 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £17.00

**Tablets 80/25**, yellow/white, telmisartan 80 mg, hydrochlorothiazide 25 mg, net price 28-tab pack = £17.00

**Valsartan with hydrochlorothiazide (Non-proprietary)** ▼

**Tablets 80/12.5**, valsartan 80 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £8.36

**Tablets 160/12.5**, valsartan 160 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £2.54

**Tablets 160/25**, valsartan 160 mg, hydrochlorothiazide 25 mg, net price 28-tab pack = £1.27

**Co-Diovan** (Novartis) ▼

**Tablets 80/12.5**, orange, f/c, valsartan 80 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £13.97

**Tablets 160/12.5**, red, f/c, valsartan 160 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £18.41

**Tablets 160/25**, brown-orange, f/c, valsartan 160 mg, hydrochlorothiazide 25 mg, net price 28-tab pack = £18.41

**With amlodipine**

Section 2.6.2

---

**2.5.5 Drugs affecting the renin-angiotensin system**

**Valsartan**

**Indications** hypertension; heart failure when ACE inhibitors cannot be used, or in conjunction with an ACE inhibitor when a beta-blocker cannot be used (see also section 2.5.5); myocardial infarction with left ventricular failure or left ventricular systolic dysfunction (adjunct—see section 2.5.5 and section 2.10.1)

**Cautions** see notes above

**Contra-indications** biliary cirrhosis, cholestasis

**Hepatic impairment** max. dose 80 mg daily in mild to moderate impairment; avoid if severe

**Renal impairment** use with caution if eGFR less than 10 mL/minute/1.73 m²—no information available

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; renal impairment; less commonly gastro-intestinal disturbance, syncope, fatigue, cough, headache, acute renal failure, neutropenia, thrombocytopenia, myalgia, and hypersensitivity reactions (including rash, pruritus, vasculitis, and serum sickness) also reported

**Dose**
- Hypertension, usually 80 mg once daily (initially 40 mg once daily in intravascular volume depletion); if necessary increased at intervals of 4 weeks up to max. 320 mg daily
- Heart failure, initially 40 mg twice daily increased at intervals of at least 2 weeks up to max. 160 mg twice daily
- Myocardial infarction, initially 20 mg twice daily increased over several weeks to 160 mg twice daily if tolerated

**Valsartan (Non-proprietary)** ▼

**Tablets**, valsartan 40 mg, net price 7-tab pack = £2.23; 80 mg, 28-tab pack = £13.97; 160 mg, 28-tab pack = £18.41; 320 mg, 28-tab pack = £10.49

**Diovan** (Novartis) ▼

**Capsules**, valsartan 40 mg (grey), net price 28-cap pack = £13.97; 80 mg (grey/pink), 28-cap pack = £13.97; 160 mg (dark grey/pink), 28-cap pack = £18.41

**Tablets**, f/c, valsartan 40 mg (yellow, scored), net price 7-tab pack = £3.49; 320 mg (dark grey-violet), 28-tab pack = £20.23

**With diuretic**

**Note** For hypertension not adequately controlled by valsartan alone. For prescribing information on thiazides, see section 2.2.1

**Valsartan with hydrochlorothiazide** (Non-proprietary)

**Tablets 80/12.5**, valsartan 80 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £8.36

**Tablets 160/12.5**, valsartan 160 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £2.54

**Tablets 160/25**, valsartan 160 mg, hydrochlorothiazide 25 mg, net price 28-tab pack = £1.27

**Co-Diovan** (Novartis)

**Tablets 80/12.5**, orange, f/c, valsartan 80 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £13.97

**Tablets 160/12.5**, red, f/c, valsartan 160 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £18.41

**Tablets 160/25**, brown-orange, f/c, valsartan 160 mg, hydrochlorothiazide 25 mg, net price 28-tab pack = £18.41

**With amlodipine**

Section 2.6.2

---

**2.5.5.3 Renin inhibitors**

Renin inhibitors inhibit renin directly; renin converts angiotensinogen to angiotensin I. **Aliskiren** is licensed for the treatment of hypertension, either alone or in combination with other antihypertensives. Combination treatment with an ACE inhibitor or an angiotensin-II receptor antagonist is contra-indicated in patients with diabetes mellitus or if eGFR is less than 60 mL/minute/1.73m²; in all other patients, combination treatment with an ACE inhibitor or an angiotensin-II receptor antagonist is not recommended. The [Scottish Medicines Consortium](p. 4) has advised (January 2010) that alisikren (Rasilez®) is not recommended for use within NHS Scotland.

**Aliskiren**

**Indications** essential hypertension

**Cautions** see notes above; patients taking concomitant diuretics, on a low-sodium diet, or who are dehydrated (first doses may cause hypotension—initiate with care); renal artery stenosis; patients at risk of renal impairment; diabetes mellitus; monitor glucose tolerance and renal function; moderate to severe heart failure; history of angioedema (avoid in hereditary or idiopathic angioedema); **interactions**: Appendix 1 (alisikren)

**Contra-indications** see notes above
Renal impairment see notes above; caution in renal artery stenosis—no information available; avoid if eGFR less than 30 mL/minute/1.73m²—no information available; monitor plasma-potassium concentration

Pregnancy manufacturer advises avoid—no information available; other drugs acting on the renin-angiotensin system have been associated with fetal malformations and neonatal death

Breast-feeding present in milk in animal studies—manufacturer advises avoid

Side-effects diarrhoea, dizziness, hyperkalaemia, arthralgia; less commonly hypotension, palpitation, peripheral oedema, acute renal failure (reversible on discontinuation of treatment), anaemia, rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis); rarely angioedema

Dose
• ADULT over 18 years, 150 mg once daily, increased if necessary to 300 mg once daily

Rasilez® (Novartis) Tablets, 1.5/1.25 mg, aliskiren (as hemifumarate) 150 mg (pink), net price 28-tab pack = £23.76; 300 mg (red), net price 28-tab pack = £28.56. Label: 21

2.6 Nitrates, calcium-channel blockers, and other antianginal drugs

2.6.1 Nitrates

Nitrates, calcium-channel blockers, and potassium-channel activators have vasodilating effects. Vasodilators can act in heart failure by arteriolar dilatation which reduces both peripheral vascular resistance and left ventricular pressure during systole resulting in improved cardiac output. They can also cause venous dilatation which results in dilatation of capacitance vessels, increase of venous return, and diminution of venous return to the heart (decreasing left ventricular end-diastolic pressure).

For details on the management of stable angina and acute coronary syndromes, see section 2.10.1.

2.6.2 Calcium-channel blockers

Nitroglycerine is one of the most effective drugs for providing rapid symptomatic relief of angina, but its effect lasts only for 20 to 30 minutes; the 300-microgram tablet is often appropriate when glyceryl trinitrate is first used. The aerosol spray provides an alternative method of rapid relief of symptoms for those who find difficulty in dissolving sublingual preparations. Duration of action may be prolonged by transdermal preparations (but tolerance may develop, see below).

Isosorbide dinitrate is active sublingually and is a more stable preparation for those who only require nitrates infrequently. It is also effective by mouth for prophylaxis; although the effect is slower in onset, it may persist for several hours. Duration of action of up to 12 hours is claimed for modified-release preparations. The activity of isosorbide dinitrate may depend on the production of active metabolites, the most important of which is isosorbide mononitrate. Isosorbide mononitrate itself is also licensed for angina prophylaxis; modified-release formulations (for once daily administration) are available.

Glyceryl trinitrate or isosorbide dinitrate may be tried by intravenous injection when the sublingual form is ineffective in patients with chest pain due to myocardial infarction or severe ischaemia. Intravenous injections are also useful in the treatment of congestive heart failure.

Tolerance Many patients on long-acting or transdermal nitrates rapidly develop tolerance (with reduced therapeutic effects). Reduction of blood-nitrate concentrations to low levels for 4 to 12 hours each day usually maintains effectiveness in such patients. If tolerance is suspected during the use of transdermal patches they should be left off for 8–12 hours (usually overnight) in each 24 hours; in the case of modified-release tablets of isosorbide dinitrate (and conventional formulations of isosorbide mononitrate), the second of the two daily doses should be given after about 8 hours rather than after 12 hours. Conventional formulations of isosorbide mononitrate should not usually be given more than twice daily unless small doses are used; modified-release formulations of isosorbide mononitrate should only be given once daily, and used in this way do not produce tolerance.

2.6.3 Other antianginal drugs

Nitroglycerine is one of the most effective drugs for providing rapid symptomatic relief of angina, but its effect lasts only for 20 to 30 minutes; the 300-microgram tablet is often appropriate when glyceryl trinitrate is first used. The aerosol spray provides an alternative method of rapid relief of symptoms for those who find difficulty in dissolving sublingual preparations. Duration of action may be prolonged by transdermal preparations (but tolerance may develop, see below).

Isosorbide dinitrate is active sublingually and is a more stable preparation for those who only require nitrates infrequently. It is also effective by mouth for prophylaxis; although the effect is slower in onset, it may persist for several hours. Duration of action of up to 12 hours is claimed for modified-release preparations. The activity of isosorbide dinitrate may depend on the production of active metabolites, the most important of which is isosorbide mononitrate. Isosorbide mononitrate itself is also licensed for angina prophylaxis; modified-release formulations (for once daily administration) are available.

Glyceryl trinitrate or isosorbide dinitrate may be tried by intravenous injection when the sublingual form is ineffective in patients with chest pain due to myocardial infarction or severe ischaemia. Intravenous injections are also useful in the treatment of congestive heart failure.

Tolerance Many patients on long-acting or transdermal nitrates rapidly develop tolerance (with reduced therapeutic effects). Reduction of blood-nitrate concentrations to low levels for 4 to 12 hours each day usually maintains effectiveness in such patients. If tolerance is suspected during the use of transdermal patches they should be left off for 8–12 hours (usually overnight) in each 24 hours; in the case of modified-release tablets of isosorbide dinitrate (and conventional formulations of isosorbide mononitrate), the second of the two daily doses should be given after about 8 hours rather than after 12 hours. Conventional formulations of isosorbide mononitrate should not usually be given more than twice daily unless small doses are used; modified-release formulations of isosorbide mononitrate should only be given once daily, and used in this way do not produce tolerance.

GLYCERYL TRINITRATE

Indications anal fissure (section 1.7.4); extravasation (section 10.3)

Sublingual: prophylaxis and treatment of angina

Injection: control of hypertension and myocardial ischaemia during and after cardiac surgery; induction of controlled hypotension during surgery; congestive heart failure; unstable angina

Transdermal: see under preparations below

Cautions hypothyroidism; malnutrition; hypothermia; recent history of myocardial infarction; heart failure due to obstruction; hypoxaemia or other ventilation and perfusion abnormalities; susceptibility to angle-closure glaucoma; metal-containing transdermal systems should be removed before magnetic resonance imaging procedures; cardioversion, or diathermy; avoid abrupt withdrawal; monitor blood pressure and heart rate during intravenous infusion; tolerance (see notes above); interactions: Appendix 1 (nitrates)

Contra-indications hypersensitivity to nitrates; hypotensive conditions and hypovolaemia; hyper-
Glyceryl Trinitrate

Nitrolingual Pump Spray®

GTN 300 mcg

Coro-Nitro Pump Spray®

Glyceryl Trinitrate (Non-proprietary)

Sublingual tablets, glyceryl trinitrate 300 micrograms, net price 100 = £2.71; 500 micrograms, 100 = £1.93; 600 micrograms, 100 = £13.11. Label: 16

Note Glyceryl trinitrate tablets should be supplied in glass containers of not more than 100 tablets, closed with a foil-lined cap, and containing no cotton wool wadding; they should be discarded after 8 weeks in use

Aerosol spray, glyceryl trinitrate 400 micrograms/metered dose, net price 200-dose unit = £3.29

Dose treatment or prophylaxis of angina, spray 1–2 doses under tongue and then close mouth

Coro-Nitro Pump Spray®

Aerosol spray, glyceryl trinitrate 400 micrograms/metered dose, net price 200-dose unit = £1.25

Dose treatment or prophylaxis of angina, spray 1–2 doses under tongue and then close mouth

GTN 300 mcg

Sublingual tablets, glyceryl trinitrate 300 micrograms, net price 100 = £2.71. Label: 16

Nitrolingual Pump Spray®

Aerosol spray, glyceryl trinitrate 400 micrograms/metered dose, net price 180-dose unit = £2.63, 200-dose unit = £2.71

Dose treatment or prophylaxis of angina, spray 1–2 doses under tongue and then close mouth

Nitromin® (Egis)

Aerosol spray, glyceryl trinitrate 400 micrograms/metered dose, net price 180-dose unit = £2.63, 200-dose unit = £2.71

Dose treatment or prophylaxis of angina, spray 1–2 doses under tongue and then close mouth

Transdermal preparations

Deponit® (UCB Pharma)

Patches, self-adhesive, transparent, glyceryl trinitrate, ‘5’ patch (releasing approx. 5 mg/24 hours when in contact with skin), net price 28 = £12.77; ‘10’ patch (releasing approx. 10 mg/24 hours), 28 = £14.06

Dose prophylaxis of angina, apply one ‘5’ or one ‘10’ patch to lateral chest wall, upper arm, thigh, abdomen, or shoulder; increase to two ‘10’ patches every 24 hours if necessary; replace every 24 hours, siting replacement patch on different area; see also notes above (Tolerance)

Minitran® (Meda)

Patches, self-adhesive, transparent, glyceryl trinitrate, ‘5’ patch (releasing approx. 5 mg/24 hours when in contact with skin), net price 30 = £11.62; ‘10’ patch (releasing approx. 10 mg/24 hours), 30 = £12.87; ‘15’ patch (releasing approx. 15 mg/24 hours), 30 = £14.19

Dose prophylaxis of angina, apply one ‘5’ patch to chest or upper arm, replace every 24 hours, siting replacement patch on different area; adjust dose according to response; see also notes above (Tolerance)

Maintenance of venous patency (‘5’ patch only), consult product literature

Nitro-Dur® (MSD)

Patches, self-adhesive, buff, glyceryl trinitrate, ‘0.2 mg/h’ patch (releasing approx. 5 mg/24 hours when in contact with skin), net price 28 = £10.59; ‘0.4 mg/h’ patch (releasing approx. 10 mg/24 hours), 28 = £11.72; ‘0.6 mg/h’ patch (releasing approx. 15 mg/24 hours), 28 = £12.90

Dose prophylaxis of angina, apply one ‘0.2 mg/h’ patch to chest or outer upper arm, replace every 24 hours, siting replacement patch on different area; adjust dose according to response; max. 15 mg in 24 hours; see also notes above (Tolerance)

Percutol® (Aspire)

Ointment, glyceryl trinitrate 2%, net price 60 g = £79.00. Counselling, see administration below

Excipients include wool fat

Dose prophylaxis of angina, usual dose 1–2 inches of ointment measured on to Applirule®, and applied (usually to chest, arm, or thigh) without rubbing in and secured with surgical tape, every 3–4 hours as required; to determine dose, ½ inch on first day then increased by ½ inch/day until headache occurs, then reduced by ½ inch

Note Approx. 800 micrograms/hour absorbed from 1 inch of ointment
Breast-feeding  see under Glyceryl Trinitrate

Side-effects  see under Glyceryl Trinitrate

Dose

- Initially 20 mg 2–3 times daily or 40 mg twice daily (10 mg twice daily in those who have not previously received nitrates); up to 120 mg daily in divided doses if required.

isosorbide Mononitrate (Non-proprietary)

- **Tablets**, isosorbide mononitrate 10 mg, net price 56 = £6.24; 20 mg, 56 = £5.71; 40 mg, 56 = £9.28. Label: 25

- **Note** May be difficult to obtain

## Isosorbide Dinitrate

### Indications

- prophylaxis and treatment of angina; left ventricular failure

### Cautions

- see under Glyceryl Trinitrate

### Contra-indications

- see under Glyceryl Trinitrate

### Hepatic impairment

- see under Glyceryl Trinitrate

### Renal impairment

- see under Glyceryl Trinitrate

### Pregnancy

- may cross placenta—manufacturers advise avoid unless potential benefit outweighs risk

### Breast-feeding

- see under Glyceryl Trinitrate

### Side-effects

- see under Glyceryl Trinitrate

### Dose

- **By mouth**, daily in divided doses, angina 30–120 mg, left ventricular failure 40–160 mg, up to 240 mg if required
- **By intravenous infusion**, 2–10 mg/hour; higher doses up to 20 mg/hour may be required

### Short-acting tablets and sprays

- **Isosorbide Dinitrate (Non-proprietary)**
- **Tablets**, isosorbide dinitrate 10 mg, net price 56-tab pack = £13.40; 20 mg, 56-tab pack = £14.37

- **Angitak® (UCB)**
- **Aerosol spray**, isosorbide dinitrate 1.25 mg/metered dose, net price 200-dose unit = £4.51
- **Dose** treatment or prophylaxis of angina, spray 1–3 doses under tongue whilst holding breath; allow 30 second interval between each dose

### Modified-release preparations

- **Isoket Retard® (UCB Pharma)**
- **Retard-20 tablets**, m/r, scored, isosorbide dinitrate 20 mg, net price 56-tab pack = £2.58. Label: 25
- **Retard-40 tablets**, m/r, scored, isosorbide dinitrate 40 mg, net price 56-tab pack = £6.36. Label: 25
- **Dose** prophylaxis of angina, 40 mg daily in 1–2 divided doses, increased if necessary to 60–80 mg daily in 2–3 divided doses

### Parenteral preparations

- **Isoket® (UCB Pharma)**
- **Injection 0.1%**, isosorbide dinitrate 1 mg/mL. To be diluted before use. Net price 10-ml amp = £2.69
- **Note** Glass or polyethylene infusion apparatus is preferable; loss of potency if PVC used

### Isosorbide Mononitrate

### Indications

- prophylaxis of angina; adjunct in congestive heart failure

### Cautions

- see under Glyceryl Trinitrate

### Contra-indications

- see under Glyceryl Trinitrate

### Hepatic impairment

- see under Glyceryl Trinitrate

### Renal impairment

- see under Glyceryl Trinitrate

### Pregnancy

- manufacturers advise avoid unless potential benefit outweighs risk

### Breast-feeding

- see under Glyceryl Trinitrate

### Side-effects

- see under Glyceryl Trinitrate

### Dose

- **Initial** 20 mg 2–3 times daily or 40 mg twice daily (10 mg twice daily in those who have not previously received nitrates); up to 120 mg daily in divided doses if required.

- **isosorbide Mononitrate (Non-proprietary)**
- **Tablets**, isosorbide mononitrate 10 mg, net price 56 = £6.24; 20 mg, 56 = £5.71; 40 mg, 56 = £9.28. Label: 25

- **Note** May be difficult to obtain
2.6.2 Calcium-channel blockers

Calcium-channel blockers differ in their predilection for the various possible sites of action and, therefore, their therapeutic effects are disparate, with much greater variation than those of beta-blockers. There are important differences between verapamil, diltiazem, and the dihydropyridine calcium-channel blockers (amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, and nimodipine). Verapamil and diltiazem should usually be avoided in heart failure because they may further depress cardiac function and cause clinically significant deterioration.

Verapamil is used for the treatment of angina (section 2.10.1), hypertension (section 2.5), and arrhythmias (section 2.3.2). It is a highly negatively inotropic calcium channel-blocker and it reduces cardiac output, slows the heart rate, and may impair atrioventricular conduction. It may precipitate heart failure, exacerbate conduction disorders, and cause hypotension at high doses and should not be used with beta-blockers (see p. 137). Constriction is the most common side-effect.

Nifedipine relaxes vascular smooth muscle and dilates coronary and peripheral arteries. It has more influence on vessels and less on the myocardium than does verapamil, and unlike verapamil has no anti-arrhythmic activity. It rarely precipitates heart failure because any negative inotropic effect is offset by a reduction in left ventricular work. Short-acting formulations of nifedipine are not recommended for angina or long-term management of hypertension; their use may be associated with large variations in blood pressure and reflex tachycardia. Nicardipine has similar effects to those of nifedipine and may produce less reduction of myocardial contractility. Amlodipine and felodipine also resemble nifedipine and nicardipine in their effects and do not reduce myocardial contractility and they do not produce clinical deterioration in heart failure. They have a longer duration of action and can be given once daily. Nifedipine, nicardipine, amlodipine, and felodipine are used for the treatment of angina (section 2.10.1) or hypertension. All are valuable in forms of angina associated with coronary vasospasm. Side-effects associated with vasodilatation such as flushing and headache (which become less obtrusive after a few days), and ankle swelling (which may respond only partially to diuretics) are common.

Lacidipine and lercanidipine have similar effects to those of nifedipine and nicardipine; they are indicated for hypertension only.

Nimodipine is related to nifedipine but the smooth muscle relaxant effect preferentially acts on cerebral arteries. Its use is confined to prevention and treatment of vascular spasm following aneurysmal subarachnoid haemorrhage.

Diltiazem is effective in most forms of angina (section 2.10.1); the longer-acting formulation is also used for hypertension. It may be used in patients for whom beta-blockers are contra-indicated or ineffective. It has a less negative inotropic effect than verapamil and significant myocardial depression occurs rarely. Nevertheless because of the risk of bradycardia it should be used with caution in association with beta-blockers.

Unstable angina Calcium-channel blockers do not reduce the risk of myocardial infarction in unstable angina. The use of diltiazem or verapamil should be

---

### Isotard
- **ProStrakan**
  - 25XL tablets, m/r, ivy, isosorbide mononitrate 25 mg, net price 28-tab pack = £6.75. Label: 25
  - 40XL tablets, m/r, ivy, isosorbide mononitrate 40 mg, net price 28-tab pack = £6.75. Label: 25
  - 50XL tablets, m/r, ivy, isosorbide mononitrate 50 mg, net price 28-tab pack = £6.75. Label: 25
  - 60XL tablets, m/r, ivy, isosorbide mononitrate 60 mg, net price 28-tab pack = £5.75. Label: 25
  - **Dose**: prophylaxis of angina, 25–60 mg daily in the morning (half a 60-mg tablet may be given for 2–4 days), increased if necessary to 50–120 mg daily

### Modisol XL
- **Sandoz**
  - Tablets, m/r, ivy, isosorbide mononitrate 60 mg, net price 28-tab pack = £11.14. Label: 25
  - **Dose**: prophylaxis of angina, 40–60 mg daily in the morning (half a tablet for first 2–4 days to minimise possibility of headache), increased if necessary to 2 tablets once daily

### Monomax
- **Chiesi**
  - Tablets, m/r, ivy, isosorbide mononitrate 60 mg, net price 28-tab pack = £6.52. Label: 25
  - **Dose**: prophylaxis of angina, 40–60 mg daily in the morning (half a tablet for first 2–4 days to minimise possibility of headache), increased if necessary to 2 tablets once daily

### Monomax XL
- **Teva UK**
  - Tablets, m/r, ivy, isosorbide mononitrate 60 mg, net price 28-tab pack = £3.49. Label: 25
  - **Dose**: prophylaxis of angina, 1 tablet daily in the morning (half a tablet for first 2–4 days to minimise possibility of headache), increased if necessary to 2 tablets once daily

### Monosorb XL 60°
- **Dexcel**
  - Tablets, m/r, f/c, isosorbide mononitrate 60 mg, net price 28-tab pack = £15.25. Label: 25
  - **Dose**: prophylaxis of angina, 1 tablet daily in the morning (half a tablet for first 2–4 days to minimise possibility of headache), increased if necessary to 2 tablets once daily

### Zemon
- **Neolab**
  - 40XL tablets, m/r, ivy, isosorbide mononitrate 40 mg, net price 28-tab pack = £14.25. Label: 25
  - 60XL tablets, scored, m/r, ivy, isosorbide mononitrate 60 mg, net price 28-tab pack = £11.14. Label: 25
  - **Dose**: prophylaxis of angina, 40–60 mg daily in the morning (half a 60-mg tablet may be given for 2–4 days to minimise possibility of headache), increased if necessary to 80–120 mg once daily
reserved for patients resistant to treatment with beta-blockers.

**Withdrawal** There is some evidence that sudden withdrawal of calcium-channel blockers may be associated with an exacerbation of angina.

### AMLODIPINE

**Indications** Hypertension, prophylaxis of angina

**Cautions** Interactions: Appendix 1 (calcium-channel blockers)

**Contra-indications** Cardiogenic shock, unstable angina, significant aortic stenosis

**Hepatic impairment** May need dose reduction—half-life prolonged

**Pregnancy** No information available—manufacturer advises avoid, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension

**Breast-feeding** No information available—manufacturer advises avoid, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension

**Side-effects** Abdominal pain, nausea; palpitation, flushing, oedema; headache, dizziness, sleep disturbances, fatigue; less commonly gastrointestinal disturbances, dry mouth, taste disturbances, hypotension, syncope, chest pain, dyspnoea, rhinitis, mood changes, asthenia, tremor, paraesthesia, urinary disturbances, impotence, gynaecomastia, weight changes, myalgia, muscle cramps, back pain, arthralgia, visual disturbances, tinnitus, pruritus, rashes (including isolated reports of erythema multiforme), sweating, alopecia, purpura, and skin discoloration; very rarely gastritis, pancreatitis, hepatitis, jaundice, cholestasis, gingival hyperplasia, myocardial infarction, arrhythmias, tachycardia, vasculitis, coughing, peripheral neuropathy, hyperglycaemia, thrombocytopenia, angioedema, and urticaria; *overdosage*, see Emergency Treatment of Poisoning, p. 39

**Dose**
- Hypertension or angina, initially 5 mg once daily; max. 10 mg once daily
- Note: Tablets from various suppliers may contain different salts (e.g. amlodipine besilate, amlodipine maleate, and amlodipine mesilate) but the strength is expressed in terms of amlodipine (base); tablets containing different salts are considered interchangeable

#### Amlodipine (Non-proprietary) (Pfizer)

<table>

#### DILTIAZEM HYDROCHLORIDE

**Indications** Prophylaxis and treatment of angina; hypertension

**Cautions** Heart failure or significantly impaired left ventricular function, bradycardia (avoid if severe), first degree AV block, or prolonged PR interval; interactions: Appendix 1 (calcium-channel blockers)

**Contra-indications** Severe bradycardia, left ventricular failure with pulmonary congestion, second- or third-degree AV block (unless pacemaker fitted), sick sinus syndrome; acute porphyria (section 9.8.2)

**Hepatic impairment** Reduce dose

**Renal impairment** Start with smaller dose

**Pregnancy** Avoid

**Breast-feeding** Significant amount present in milk—no evidence of harm but avoid unless no safer alternative

**Side-effects** Bradycardia, sino-atrial block, AV block, palpitation, dizziness, hypotension, malaise, asthenia, headache, hot flushes, gastrointestinal disturbances, oedema (notably of ankles); rarely rashes (including erythema multiforme and exfoliative dermatitis), photosensitivity; hepatitis, gynaecomastia, gum hyperplasia, extrapyramidal symptoms, depression reported; *overdosage*, see Emergency Treatment of Poisoning, p. 39

**Dose**
- Angina, 60 mg 3 times daily (elderly initially twice daily); increased if necessary to 360 mg daily
- Longer-acting formulations, see under preparations below

#### Standard formulations

**Note** These formulations are licensed as generics and there is no requirement for brand name dispensing. Although their means of formulation has called for the strict designation ‘modified-release’ their duration of action corresponds to that of tablets requiring administration 3 times daily

**Diltiazem** (Non-proprietary) (Sanofi-Aventis)

<table>
<thead>
<tr>
<th>Tablets</th>
<th>m/r (but see note above), diltiazem hydrochloride 60 mg, net price 84 = £14.23. Label: 25</th>
</tr>
</thead>
</table>

**Tildiem®** (Sanofi-Aventis) (Sanofi-Aventis)

| Tablets | m/r (but see note above), off-white, diltiazem hydrochloride 60 mg, net price 90-tab pack = £7.96. Label: 25 |

#### Longer-acting formulations

**Note** Different versions of modified-release preparations containing more than 60 mg diltiazem hydrochloride may not have the same clinical effect. To avoid confusion between these different formulations of diltiazem, prescribers should specify the brand to be dispensed

**Adizem-SR®** (Napp) (Pfizer)

| Capsules | m/r, diltiazem hydrochloride 90 mg (white), net price 56-cap pack = £8.50; 120 mg (brown/white), net price 56-cap pack = £9.45; 180 mg (brown/white), net price 56-cap pack = £14.15. Label: 25 |

| Tablets | m/r, f/c, scored, diltiazem hydrochloride 120 mg, net price 56-tab pack = £14.72. Label: 25 |

**Dose** Mild to moderate hypertension, usually 120 mg twice daily (dose form not appropriate for initial dose titration)

Angina, initially 90 mg twice daily (elderly, dose form not appropriate for initial dose titration), increased to 180 mg twice daily if required
### Calcium-channel blockers

**Adizem-XL®** (Napp)
- **Capsules**, m/r, diltiazem hydrochloride 120 mg (pink/blue), net price 28-cap pack = £9.14; 180 mg (dark pink/blue), 28-cap pack = £10.37; 200 mg (brown), 28-cap pack = £6.30; 240 mg (red/blue), 28-cap pack = £11.52; 300 mg (maroon/blue), 28-cap pack = £9.14. Label: 25
- **Dose** angina and mild to moderate hypertension, initially 240 mg once daily, increased if necessary to 300 mg once daily; in elderly and in hepatic or renal impairment, initially 120 mg daily

**Angitil SR®** (Chiesi)
- **Capsules**, m/r, diltiazem hydrochloride 90 mg (white), net price 56-cap pack = £7.03; 120 mg (brown), 56-cap pack = £6.91; 180 mg (brown), 56-cap pack = £13.27. Label: 25
- **Dose** angina and mild to moderate hypertension, initially 90 mg twice daily, increased if necessary to 120 mg or 180 mg twice daily

**Angitil XL®** (Chiesi)
- **Capsules**, m/r, diltiazem hydrochloride 240 mg (white), net price 28-cap pack = £7.94; 300 mg (yellow), 28-cap pack = £6.98. Label: 25
- **Dose** angina and mild to moderate hypertension, initially 240 mg once daily (elderly and in hepatic and renal impairment, dose form not appropriate for initial dose titration); increased if necessary to 300 mg once daily

**Diltocardia SR®** (Generics)
- **Capsules**, m/r, diltiazem hydrochloride 60 mg (pink/white), net price 56-cap pack = £6.03; 90 mg (pink/yellow), 56-cap pack = £9.61; 120 mg (pink/orange), 56-cap pack = £10.69. Label: 25
- **Dose** angina and mild to moderate hypertension, initially 90 mg twice daily; increased if necessary to 180 mg twice daily, ELDERLY and in hepatic or renal impairment, initially 60 mg twice daily, max. 90 mg twice daily

**Diltzem SR®** (TEVA UK)
- **Capsules**, m/r, all beige, diltiazem hydrochloride 60 mg, net price 56-cap pack = £6.04; 90 mg (pink/yellow), 56-cap pack = £11.29; 120 mg, 56-cap pack = £12.89. Label: 25
- **Dose** angina and mild to moderate hypertension, initially 90 mg twice daily (elderly 60 mg twice daily), up to 180 mg twice daily may be required

**Diltzem XL®** (TEVA UK)
- **Capsules**, m/r, diltiazem hydrochloride 120 mg, net price 28-cap pack = £7.78; 180 mg, 28-cap pack = £11.55; 240 mg, 28-cap pack = £11.03. Label: 25
- **Dose** angina and mild to moderate hypertension, initially 180 mg once daily (elderly and in hepatic and renal impairment, 120 mg once daily), if necessary may be increased to 360 mg once daily

**Flozem®** (Merck Serono)
- **Capsules**, m/r, diltiazem hydrochloride 120 mg (pink/clear), net price 28-cap pack = £7.00; 180 mg (pink/clear), 28-cap pack = £7.80; 240 mg (red/clear), 28-cap pack = £8.20; 300 mg (red/white), 28-cap pack = £8.50. Label: 25
- **Dose** angina and mild to moderate hypertension, initially 240 mg once daily (elderly and in hepatic and renal impairment, 120 mg once daily), if necessary may be increased to 360 mg once daily

**Tildiem Retard®** (Sanofi-Aventis)
- **Tablets**, m/r, diltiazem hydrochloride 90 mg, net price 56-tab pack = £7.27; 120 mg, 56-tab pack = £7.15. Label: 25
- **Counselling** Tablet membrane may pass through gastrointestinal tract unchanged, but being porous has no effect on efficacy
- **Dose** mild to moderate hypertension, initially 90 mg or 120 mg twice daily; increased if necessary to 360 mg daily in divided doses; ELDERLY and in hepatic or renal impairment, initially 120 mg once daily; increased if necessary to 120 mg twice daily
- **Angina**, initially 90 mg or 120 mg twice daily; increased if necessary to 480 mg daily in divided doses; ELDERLY and in hepatic or renal impairment, dose form not appropriate for initial titration; up to 120 mg twice daily may be required

**Viazem XL®** (Genus)
- **Capsules**, m/r, diltiazem hydrochloride 120 mg (lavender), net price 28-cap pack = £6.60; 180 mg (white/blue/green), 28-cap pack = £7.36; 240 mg (blue/green/lavender), 28-cap pack = £7.74; 300 mg (white/lavender), 28-cap pack = £8.03; 360 mg (blue/green), 28-cap pack = £13.85. Label: 25
- **Dose** angina and mild to moderate hypertension, initially 180 mg once daily, adjusted according to response to 240 mg once daily; max. 360 mg once daily; ELDERLY and in hepatic or renal impairment, initially 120 mg once daily, adjusted according to response

**Zemtard®** (Galen)
- **Zemtard 120XL capsules**, m/r, brown/orange, diltiazem hydrochloride 120 mg, net price 28-cap pack = £5.19. Label: 25
- **Zemtard 180XL capsules**, m/r, grey/pink, diltiazem hydrochloride 180 mg, net price 28-cap pack = £5.27. Label: 25
- **Zemtard 240XL capsules**, m/r, blue, diltiazem hydrochloride 240 mg, net price 28-cap pack = £5.36. Label: 25
- **Zemtard 300XL capsules**, m/r, white/blue, diltiazem hydrochloride 300 mg, net price 28-cap pack = £5.70. Label: 25
- **Zemtard 360XL capsules**, m/r, white/pink, diltiazem hydrochloride 360 mg, net price 28-cap pack = £6.70. Label: 25
- **Dose** angina and mild to moderate hypertension, 180–300 mg once daily, increased if necessary to 360 mg once daily in hypertension and to 480 mg once daily in angina; ELDERLY and in hepatic or renal impairment, initially 120 mg once daily

### FELODIPINE

**Indications** hypertension, prophylaxis of angina

**Cautions** withdraw if ischaemic pain occurs or existing pain worsens shortly after initiating treatment or if cardiogenic shock develops; severe left ventricular dysfunction; predisposition to tachycardia; interactions: Appendix 1 (calcium-channel blockers)

**Contra-indications** unstable angina, uncontrolled heart failure; significant cardiac valvular obstruction (e.g. aortic stenosis); cardiac outflow obstruction; within 1 month of myocardial infarction

**Hepatic impairment** dose reduction may be required

**Pregnancy** avoid; toxicity in animal studies; may inhibit labour

**Breast-feeding** present in milk but amount probably too small to be harmful

**Side-effects** flushing, peripheral oedema, headache; less commonly nausea, abdominal pain, palpitation, tachycardia, dizziness, paraesthesia, malaise, rash, pruritus; rarely vomiting, syncope, impotence, arthralgia, myalgia; very rarely gum hyperplasia, urinary frequency, leucocytoclastic vasculitis, photosensitivity; overdosage, see Emergency Treatment of Poisoning, p. 39
Dose
- Hypertension, initially 5 mg (ELDERLY 2.5 mg) daily in the morning; usual maintenance 5–10 mg once daily; doses above 20 mg daily rarely needed
- Angina, initially 5 mg (ELDERLY 2.5 mg) daily in the morning, increased if necessary to 10 mg once daily

Felodipine (Non-proprietary) (Rep)
Tablets, m/r, felodipine 2.5 mg, net price 28-tab pack = £6.31; 5 mg, 28-tab pack = £4.21; 10 mg, 28-tab pack = £5.66, 30-tab pack = £6.99. Label: 25
Brands include: Cardiopen XL®, Felogen XL®, Feloten XL®, Kelic SR®, Neofel XL®, Parmid XL®, Vascalpha®

Plendil® (AstraZeneca) (Rep)
Tablets, m/r, f/c, felodipine 2.5 mg (yellow), net price 28-tab pack = £4.21; 5 mg (pink), 28-tab pack = £5.66. Label: 25

With ramipril
Section 2.5.5.1

LACIDIPINE

Indications hypertension
Cautions cardiac conduction abnormalities; poor cardiac reserve; interactions: Appendix 1 (calcium-channel blockers)
Contra-indications cardiogenic shock, unstable angina, aortic stenosis; avoid within 1 month of myocardial infarction; acute porphyria (section 9.8.2)
Hepatic impairment antihypertensive effect possibly increased
Pregnancy manufacturer advises avoid; may inhibit labour
Breast-feeding manufacturer advises avoid—no information available
Side-effects flushing, palpitation, oedema, headache, dizziness; rarely gastro-intestinal disturbances, gum hyperplasia, aggravation of angina, mood disturbances, asthaenia, polyuria, muscle cramps, skin rash (including pruritus and erythema); overdosage, see Emergency Treatment of Poisoning, p. 39
Dose
- Initially 2 mg as a single daily dose, preferably in the morning; increased after 3–4 weeks to 4 mg daily, then if necessary to 6 mg daily
Motens® (GSK) (Rep)
Tablets, both f/c, lacidipine 2 mg, net price 28-tab pack = £2.95; 4 mg (scored), 28-tab pack = £3.10

LERCANIDIPINE HYDROCHLORIDE

Indications mild to moderate hypertension
Cautions left ventricular dysfunction; sick sinus syndrome (if pacemaker not fitted); interactions: Appendix 1 (calcium-channel blockers)
Contra-indications aortic stenosis; unstable angina, uncontrolled heart failure; within 1 month of myocardial infarction; acute porphyria (section 9.8.2)
Hepatic impairment avoid in severe disease
Renal impairment avoid if eGFR less than 30 mL/minute/1.73 m²
Pregnancy manufacturer advises avoid—no information available
Breast-feeding manufacturer advises avoid
Side-effects less commonly flushing, peripheral oedema, palpitation, tachycardia, headache, dizziness; rarely gastro-intestinal disturbances, angina, asthenia, drowsiness, polyuria, myalgia, rash; very rarely gingival hyperplasia, myocardial infarction, hypotension; overdosage, see Emergency Treatment of Poisoning, p. 39
Dose
- Initially 10 mg once daily; increased, if necessary, after at least 2 weeks to 20 mg daily
Lercanidipine Hydrochloride (Non-proprietary) (Rep)
Tablets, lercanidipine hydrochloride 10 mg, net price 28-tab pack = £1.44; 20 mg, 28-tab pack = £1.79. Label: 22
Zanidip® (Recordati) (Rep)
Tablets, f/c, lercanidipine hydrochloride 10 mg (yellow), net price 28-tab pack = £5.70; 20 mg (pink), 28-tab pack = £10.82. Label: 22

NICARDIPINE HYDROCHLORIDE

Indications prophylaxis of angina; mild to moderate hypertension
Cautions withdraw if ischaemic pain occurs or existing pain, worsens within 30 minutes of initiating treatment or increasing dose; congestive heart failure or significantly impaired left ventricular function; elderly; interactions: Appendix 1 (calcium-channel blockers)
Contra-indications cardiogenic shock; advanced aortic stenosis; unstable or acute attacks of angina; avoid within 1 month of myocardial infarction; acute porphyria (section 9.8.2)
Hepatic impairment half-life prolonged in severe impairment—may need dose reduction
Renal impairment start with small dose
Pregnancy may inhibit labour; toxicity in animal studies; manufacturer advises avoid, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension
Breast-feeding manufacturer advises avoid—no information available
Side-effects dizziness, headache, peripheral oedema, flushing, palpitation, nausea; also gastro-intestinal disturbances, drowsiness, insomnia, tinnitus, hypotension, rash, dyspnoea, paraesthesia, frequency of micturition; thrombocytopenia, depression and impotence reported; overdosage, see Emergency Treatment of Poisoning, p. 39
Dose
- Initially 20 mg 3 times daily, increased, after at least 2 weeks to 20 mg daily
Nicardipine (Non-proprietary) (Rep)
Capsules, nicardipine hydrochloride 20 mg, net price 56-cap pack = £4.91; 30 mg, 56-cap pack = £5.96
Cardene® (Astellas) (Rep)
Capsules, nicardipine hydrochloride 20 mg (blue/white), net price 56-cap pack = £6.00; 30 mg (blue/pale blue), 56-cap pack = £6.96

Modified release
Cardene SR® (Astellas) (Rep)
Capsules, m/r, nicardipine hydrochloride 30 mg, net price 56-cap pack = £7.15; 45 mg (blue), 56-cap pack = £10.40. Label: 25
Dose mild to moderate hypertension, initially 30 mg twice daily; usual effective dose 45 mg twice daily (range 30–60 mg twice daily)
NIFEDIPINE

Indications prophyaxis of angina; hypertension; Raynaud’s phenomenon; premature labour (section 7.1.3)

Cautions see notes above; also withdraw if ischaemic pain occurs or existing pain worsens shortly after initiating treatment; poor cardiac reserve; heart failure or significantly impaired left ventricular function (heart failure deterioration observed); severe hypotension; elderly; diabetes mellitus; interactions: Appendix 1 (calcium-channel blockers)

Contra-indications cardiogenic shock; advanced aortic stenosis; within 1 month of myocardial infarction; unstable or acute attacks of angina

Hepatic impairment dose reduction may be required in severe liver disease

Pregnancy may inhibit labour; manufacturer advises avoid before week 20; risk to fetus should be balanced against risk of uncontrolled maternal hypertension; use only if other treatment options are not indicated or have failed

Breast-feeding amount too small to be harmful but manufacturers advise avoid

Side-effects gastro-intestinal disturbance; hypotension; oedema; vasodilatation, palpitation; headache, dizziness, lethargy, asthma; less commonly tachycardia, syncope, chills, nasal congestion, dyspnoea, anxiety, sleep disturbance, vertigo, migraine, paraesthesia, tremor, polyuria, dysuria, nocturia, erectile dysfunction, epistaxis, myalgia, joint swelling, visual disturbance, sweating, hypersensitivity reactions (including angioedema, jaundice, pruritus, urticaria, and rash); rarely anorexia, gum hyperplasia, mood disturbances, hyperglycaemia, male infertility, purpura, and photosensitivity reactions; also reported dysphagia, intestinal obstruction, intestinal ulcer, bezoar formation (with some modified-release preparations), gynaecomastia, agranulocytosis, and anaphylaxis; overdose, see Emergency Treatment of Poisoning, p. 39

Dose

● See preparations below

Nifedipine (Non-proprietary) Tablets

Capsules, nifedipine 5 mg, net price 84-cap pack = £10.26; 10 mg, 84-cap pack = £6.95

Dose angina prophylaxis (but not recommended, see notes above) and Raynaud’s phenomenon, initially 5 mg 3 times daily, adjusted according to response to 20 mg 3 times daily

Hypertension, not recommended therefore no dose stated

Adalat® (Bayer) Tablets

Capsules, orange, nifedipine 5 mg, net price 90-cap pack = £5.73; 10 mg, 90-cap pack = £7.30

Dose angina prophylaxis (but not recommended, see notes above) and Raynaud’s phenomenon, initially 5 mg 3 times daily, adjusted according to response to max. 20 mg 3 times daily

Hypertension, not recommended therefore no dose stated

Modified release

Note Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of nifedipine, prescribers should specify the brand to be dispensed. Modified-release formulations may not be suitable for dose titration in hepatic disease

Adalat® (Bayer) Tablets

LA 20 tablets, m/r, f/c, pink, nifedipine 20 mg, net price 28-tab pack = £5.27. Label: 25

LA 30 tablets, m/r, f/c, pink, nifedipine 30 mg, net price 28-tab pack = £6.85. Label: 25

LA 60 tablets, m/r, f/c, pink, nifedipine 60 mg, net price 28-tab pack = £9.03. Label: 25

Counselling Tablet membrane may pass through gastro-intestinal tract unchanged, but being porous has no effect on efficacy

Cautions dose form not appropriate for use in hepatic impairment or where there is a history of oesophageal or gastro-intestinal obstruction, decreased lumen diameter of the gastro-intestinal tract, or inflammatory bowel disease (including Crohn’s disease)

Dose hypertension, 20–30 mg once daily, increased if necessary to max. 90 mg once daily

Angina prophylaxis, 30 mg once daily, increased if necessary to max. 90 mg once daily

Adalat® Retard (Bayer) Tablets

Retard 10 tablets, m/r, f/c, grey-pink, nifedipine 10 mg, net price 56-tab pack = £7.34. Label: 25

Retard 20 tablets, m/r, f/c, grey-pink, nifedipine 20 mg, net price 56-tab pack = £8.81. Label: 25

Dose hypertension and angina prophylaxis, 10 mg twice daily, adjusted according to response to 40 mg twice daily

Adipine® MR (Chiesi) Tablets

m/r, nifedipine 10 mg (pink), net price 56-tab pack = £3.73; 20 mg (pink), 56-tab pack = £5.21. Label: 25

Dose hypertension and angina prophylaxis, 10 mg twice daily, adjusted according to response to 40 mg twice daily

Adipine® XL (Chiesi) Tablets

m/r, red, nifedipine 30 mg, net price 28-tab pack = £4.70; 60 mg, 28-tab pack = £7.10. Label: 25

Dose hypertension and angina prophylaxis, 30 mg once daily, increased if necessary; max. 90 mg once daily

Coracten SR® (UCB Pharma) Tablets

m/r, nifedipine 10 mg (grey/pink, enclosing yellow pellets), net price 60-cap pack = £3.90; 20 mg (pink/brown, enclosing yellow pellets), 60-cap pack = £5.41. Label: 25

Dose hypertension and angina prophylaxis, initially 10 mg twice daily, increased if necessary to max. 40 mg twice daily

Coracten XL® (UCB Pharma) Tablets

m/r, nifedipine 30 mg (brown), net price 28-cap pack = £4.89; 60 mg (orange), 28-cap pack = £7.34. Label: 25

Dose hypertension and angina prophylaxis, 30 mg once daily, increased if necessary, max. 90 mg once daily

Fortipine LA 40® (AMCo) Tablets

m/r, red, nifedipine 40 mg, net price 30-tab pack = £14.40. Label: 21, 25

Dose hypertension and angina prophylaxis, 40 mg once daily, increased if necessary to 80 mg daily in 1–2 divided doses

Nifedipress® MR (Dexcel) Tablets

m/r, pink, nifedipine 10 mg, net price 56-tab pack = £9.23; 20 mg, 56-tab pack = £10.06. Label: 25

Dose hypertension and angina prophylaxis, initially 10 mg twice daily adjusted according to response to 40 mg twice daily

Note Also available as Calchan® MR, Kentipine® MR
Nimotop® (Genus) Tablets, m/r, pink-grey, nifedipine 10 mg, net price 56-tab pack = £4.30; 20 mg, 56-tab pack = £5.49. Label: 25

Dose hypertension and angina prophylaxis, initially 10 mg twice daily adjusted according to response to 40 mg twice daily

Valni XL® (Zentiva) Tablets, m/r, red, nifedipine 30 mg, net price 28-tab pack = £7.29; 60 mg, 28-tab pack = £9.14. Label: 25

Cautions dose form not appropriate for use in hepatic impairment, or where there is a history of oesophageal or gastro-intestinal obstruction, decreased lumen diameter of the gastro-intestinal tract, inflammatory bowel disease, or ileostomy after proctocolectomy.

Dose severe hypertension and prophylaxis of angina, 30 mg once daily, increased if necessary to max. 90 mg once daily

With atenolol Section 2.4

NIMODIPINE

Indications prevention and treatment of ischaemic neurological deficits following aneurysmal subarachnoid haemorrhage

Cautions cerebral oedema or severely raised intracranial pressure; hypotension; avoid concomitant administration of nimodipine tablets and infusion, other calcium-channel blockers, or beta-blockers; concomitant nephrotoxic drugs; interactions: Appendix 1 (calcium-channel blockers, alcohol (infusion only))

Contra-indications within 1 month of myocardial infarction; unstable angina; acute porphyria (section 9.8.2)

Hepatic impairment elimination reduced in cirrhosis—monitor blood pressure

Renal impairment manufacturer advises monitor renal function closely with intravenous administration

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises avoid—present in milk

Side-effects hypotension, variation in heart-rate, flushing, headache, gastro-intestinal disorders, nausea, sweating and feeling of warmth; thrombocytopenia and ileus reported; overdosage, see Emergency Treatment of Poisoning, p. 39

Dose

- Prevention, by mouth, 60 mg every 4 hours, starting within 4 days of aneurysmal subarachnoid haemorrhage and continued for 21 days
- Treatment, by intravenous infusion via central catheter, initially 1 mg/hour (up to 500 micrograms/hour if body-weight less than 70 kg or if blood pressure unstable), increased after 2 hours to 2 mg/hour if no severe fall in blood pressure; continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days

Nimodipine Tablets, yellow, f/c, nimodipine 30 mg, net price 100-tab pack = £40.00

Intravenous infusion, nimodipine 200 micrograms/mL also contains ethanol 20% and macrogol ‘400’ 17%. Net price 50-mL vial (with polyethylene infusion catheter) = £13.60

Note Polyethylene, propylene, or glass apparatus should be used. PVC should be avoided

VERAPAMIL HYDROCHLORIDE

Indications see under Dose and preparations

Cautions first-degree AV block; acute phase of myocardial infarction (avoid if bradycardia, hypotension, left ventricular failure); patients taking beta-blockers (important: see below); interactions: Appendix 1 (calcium-channel blockers)

Verapamil and beta-blockers Verapamil injection should not be given to patients recently treated with beta-blockers because of the risk of hypotension and asystole. The suggestion that when verapamil injection has been given first, an interval of 30 minutes before giving a beta-blocker is sufficient has not been confirmed. It may also be hazardous to give verapamil and a beta-blocker together by mouth (should only be contemplated if myocardial function well preserved).

Contra-indications hypotension, bradycardia, second- and third-degree AV block, sick sinus syndrome, cardiogenic shock, sino-atrial block; history of heart failure or significantly impaired left ventricular function, even if controlled by therapy; atrial flutter or fibrillation associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome); acute porphyria (section 9.8.2)

Hepatic impairment oral dose may need to be reduced

Pregnancy may reduce uterine blood flow with fetal hypoxia; manufacturer advises avoid in first trimester unless absolutely necessary; may inhibit labour

Breast-feeding amount too small to be harmful

Side-effects constipation; less commonly nausea, vomiting, flushing, headache, dizziness, fatigue, ankle oedema; rarely allergic reactions (erythema, pruritus, urticaria, angioedema, Stevens-Johnson syndrome); myalgia, arthralgia, paraesthesia, erythromelalgia; increased prolactin concentration; rarely glynaecomastia and gingival hyperplasia after long-term treatment; after intravenous administration or high doses, hypotension, heart failure, bradycardia, heart block, and asystole; overdosage, see Emergency Treatment of Poisoning, p. 39

Dose

- By mouth, supraventricular arrhythmias (but see also Contra-indications), 40–120 mg 3 times daily
- Angina, 80–120 mg 3 times daily
- Hypertension, 240–480 mg daily in 2–3 divided doses
- Prophylaxis of cluster headache [unlicensed] (under specialist supervision), 240–960 mg daily in 3–4 divided doses

- By slow intravenous injection over 2 minutes (3 minutes in elderly), supraventricular arrhythmias (but see also Contra-indications), 5–10 mg (preferably with ECG monitoring); in paroxysmal tachyarrhythmias a further 5 mg after 5–10 minutes if required

Verapamil (Non-proprietary) Tablets, coated, verapamil hydrochloride 40 mg, net price 84-tab pack = £1.51; 80 mg, 84-tab pack = £1.92; 120 mg, 28-tab pack = £1.43; 160 mg, 56-tab pack = £2.80

Oral solution, verapamil hydrochloride 40 mg/5 mL, net price 150 mL = £36.90

Brands include Zolvera®

Cordilox® (Dexcel) Tablets, yellow, f/c, verapamil hydrochloride 40 mg, net price 84-tab pack = £1.51; 80 mg, 84-tab pack = £2.05; 120 mg, 28-tab pack = £1.15; 160 mg, 56-tab pack = £2.80

Injection, verapamil hydrochloride 2.5 mg/mL, net price 2-mL amp = £1.11
2 Cardiovascular system

2.6.3 Other antianginal drugs

Securon® (Abbott Healthcare) \( \text{TM} \)
Injection, verapamil hydrochloride 2.5 mg/mL, net price 2-mL amp = £1.08

\section{Modified release}

Half Securon SR® (Abbott Healthcare) \( \text{TM} \)
Tablets, m/r, f/c, verapamil hydrochloride 120 mg, net price 28-tab pack = £7.71. Label: 25

Dose see Securon SR®

Securon SR® (Abbott Healthcare) \( \text{TM} \)
Tablets, m/r, pale green, f/c, scored, verapamil hydrochloride 240 mg, net price 28-tab pack = £5.55. Label: 25

Dose hypertension, 240 mg daily (new patients initially 120 mg), increased if necessary to max. 480 mg daily (doses above 240 mg daily as 2 divided doses)

Angina, 240 mg twice daily (may sometimes be reduced to once daily)

Prophylaxis after myocardial infarction where beta-blockers not appropriate (started at least 1 week after infarction), 360 mg daily in divided doses, given as 240 mg in the morning and 120 mg in the evening or 120 mg 3 times daily

Univer® (TEVA UK) \( \text{TM} \)
Capsules, m/r, verapamil hydrochloride 120 mg (yellow/dark blue), net price 28-cap pack = £4.86; 180 mg (yellow), 56-cap pack = £11.38; 240 mg (yellow/dark blue), 28-cap pack = £7.67. Label: 25

Excipients include propylene glycol (see Excipients, p. 2)

Dose hypertension, 240 mg daily, max. 480 mg daily (new patients, initial dose 120 mg); angina, 360 mg daily, max. 480 mg daily

Verapress MR® (Dexcel) \( \text{TM} \)
Tablets, m/r, pale green, f/c, verapamil hydrochloride 240 mg, net price 28-tab pack = £9.90. Label: 25

Dose hypertension, 1 tablet daily, increased to twice daily if necessary; angina, 1 tablet twice daily (may sometimes be reduced to once daily)

\section{Note}

Also available as Cordilox® MR

Vertab® SR 240 (Chiesi) \( \text{TM} \)
Tablets, m/r, pale green, f/c, scored, verapamil hydrochloride 240 mg, net price 28-tab pack = £6.45. Label: 25

Dose mild to moderate hypertension, 240 mg daily, increased to twice daily if necessary; angina, 240 mg twice daily (may sometimes be reduced to once daily)

2.6.3 Other antianginal drugs

Noricandil, a potassium-channel activator with a nitrate component, has both arterial and venous vasodilating properties and is licensed for the prevention and treatment of angina (section 2.10.1). Nicorandil has similar efficacy to other antianginal drugs in controlling symptoms; it may produce additional symptomatic benefit in combination with other antianginal drugs [unlicensed indication].

Ivabradine lowers the heart rate by its action on the sinus node. It is licensed for the treatment of angina in patients who are in normal sinus rhythm in combination with a beta-blocker, or when beta-blockers are contra-indicated or not tolerated. Ivabradine, in combination with standard therapy including a beta-blocker (unless contra-indicated or not tolerated), is also licensed for mild to severe stable chronic heart failure in patients who are in sinus rhythm. The Scottish Medicines Consortium (p. 4) has advised (September 2012) that ivabradine (Procuralan®) is accepted for restricted use with

in NHS Scotland in accordance with its licensed indication for heart failure only if resting heart rate remains ≥ 75 beats per minute despite optimal standard therapy.

\section{NICE guidance}

Ivabradine for the treatment of chronic heart failure (November 2012)

Ivabradine, in combination with standard therapy including a beta-blocker (unless contra-indicated or not tolerated), an ACE inhibitor, and an aldosterone antagonist, is an option for treating mild to severe stable chronic heart failure in patients who:

\begin{itemize}
  \item have a left ventricular ejection fraction of < 35%, \emph{and}
  \item are in sinus rhythm with a heart rate of ≥ 75 beats per minute
\end{itemize}

Ivabradine should be initiated only by a heart failure specialist after 4 weeks of stable optimal standard therapy; monitoring and dose titration should be carried out by a heart failure specialist, or a GP with special interest in heart failure, or by a heart failure specialist nurse.

www.nice.org.uk/TA267

Ranolazine is licensed as adjunctive therapy in patients who are inadequately controlled or intolerant of first-line antianginal drugs. The Scottish Medicines Consortium (p. 4) has advised (October 2012) that ranolazine (Ranexa®) is not recommended for use within NHS Scotland.

\section{IVABRADINE}

\section{Indications}

treatment of angina in patients in normal sinus rhythm (see notes above); mild to severe chronic heart failure (see notes above)

\section{Cautions}

monitor for atrial fibrillation or other arrhythmias (treatment ineffective); intraventricular conduction defects; hypotension (avoid if severe); retinitis pigmentosa; elderly; \emph{interactions}: Appendix 1 (iva-

\section{Contra-indications}

for angina, do not initiate if heart rate below 60 beats per minute; for heart failure, do not initiate if heart rate below 75 beats per minute; unstable or acute heart failure; cardiogenic shock; acute myocardial infarction; unstable angina; immediately after cerebrovascular accident; sick-sinus syndrome; sino-atrial block; patients dependent on pacemaker; second- and third-degree heart block; congenital QT syndrome

\section{Hepatic impairment}

manufacturer advises caution in moderate impairment; avoid in severe impairment

\section{Renal impairment}

manufacturer advises use with caution if eGFR less than 15 mL/minute/1.73 m²—no information available

\section{Pregnancy}

manufacturer advises avoid—toxicity in animal studies

\section{Breast-feeding}

present in milk in animal studies—manufacturer advises avoid

\section{Side-effects}

bradycardia, first-degree heart block, ventricular extrasystoles, headache, dizziness, visual disturbances including phosphenes and blurred vision; \emph{less commonly} nausea, constipation, diarrhoea, palpitations, supraventricular extrasystoles, dyspnoea, angioedema, vertigo, muscle cramps, eosinophilia, hyperuricaemia, raised plasma-creatinine concentration, rash; \emph{very rarely} atrial fibrillation, second- and third-degree heart block, sick sinus syndrome
### 2.6.4 Peripheral vasodilators and related drugs

**BNF 68**

**Dose**
- Angina, initially 5 mg twice daily, increased if necessary after 2–4 weeks to 7.5 mg twice daily (if not tolerated reduce dose to 2.5–5 mg twice daily); **ELDERLY** initially 2.5 mg twice daily
- Heart failure, initially 5 mg twice daily, increased if necessary after 2 weeks to 7.5 mg twice daily (if not tolerated reduce dose to 2.5 mg twice daily)

**Note** Ventricular rate at rest should not be allowed to fall below 50 beats per minute

**Procoralan®** (Servier) (Nicorandil)
- **Tablets** pink, f/c, isosorbide (as hydrochloride) 5 mg (scored), net price 56-tab pack = £40.17; 7.5 mg, 56-tab pack = £40.17

**NICORANDIL**

**Indications** prophylaxis and treatment of stable angina (including risk reduction of acute coronary syndromes in patients at high risk)

**Cautions** hypovolaemia; low systolic blood pressure; acute pulmonary oedema; acute myocardial infarction with acute left ventricular failure and low filling pressures; **interactions**: Appendix 1 (nicorandil)

**Driving** Patients should be warned not to drive or operate machinery until it is established that their performance is unimpaired

**Contra-indications** cardiogenic shock; left ventricular failure with low filling pressures; hypotension

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding** no information available—manufacturer advises avoid

**Side-effects** nausea, vomiting, rectal bleeding, cutaneous vasodilatation with flushing, increase in heart rate (at high doses), dizziness, headache (especially on initiation, usually transitory), weakness; **less commonly** oral ulceration, hypotension, myalgia, angioedema; **rarely** intestinal ulceration, anal ulceration, abdominal pain, hepatitis, cholestasis, jaundice, skin ulceration, rash, pruritus

**Dose**
- Initially 10 mg twice daily (if susceptible to headache 5 mg twice daily); usual dose 10–20 mg twice daily; up to 30 mg twice daily may be used

**Nicorandil** (Non-proprietary) (Sanofi-Aventis)
- **Tablets** nicorandil 10 mg, net price 60-tab pack = £3.34; 20 mg, 60-tab pack = £6.55

**Ikorel®** (Sanofi-Aventis) (Nicorandil) Tablets, scored, nicorandil 10 mg, net price 60-tab pack = £7.71; 20 mg, 60-tab pack = £14.64

**RANOLAZINE**

**Indications** as adjunctive therapy in the treatment of stable angina in patients inadequately controlled or intolerant of first-line antianginal therapies

**Cautions** moderate to severe congestive heart failure; QT interval prolongation; elderly; body-weight less than 60 kg; **interactions**: Appendix 1 (ranolazine)

**Hepatic impairment** use with caution in mild impairment; avoid in moderate and severe impairment

**Renal impairment** use with caution if eGFR 30–80 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid unless essential—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** constipation, nausea, vomiting, dizziness, headache, asthenia; **less commonly** abdominal pain, weight loss, dry mouth, dyspepsia, flatulence, hot flush, hypotension, syncope, prolonged QT interval, peripheral oedema, dyspnoea, cough, epistaxis, lethargy, hypoaesthesia, drowsiness, tremor, anxiety, confusion, hallucination, insomnia, anorexia, dysuria, haematuria, chromaturia, dehydration, pain in extremities, muscle cramp, joint swelling, visual disturbance, tinnitus, pruritus, sweating; **rarely** pancreatitis, erosive duodenitis, cold extremities, throat tightness, angioedema, amnesia, loss of consciousness, erectile dysfunction, renal failure, parosmia, impaired hearing, allergic dermatitis, urticaria, rash

**Dose**
- **ADULT** over 18 years, initially 375 mg twice daily, increased after 2–4 weeks to 500 mg twice daily and then adjusted according to response to max. 750 mg twice daily (reduce dose to 375–500 mg twice daily if not tolerated)

**Ranexa®** (Menarini) (Ranolazine)
- **Tablets** m/r, ranolazine 375 mg (blue), net price 60-tab pack = £48.98; 500 mg (orange), 60-tab pack = £48.98, 750 mg (green), 60-tab pack = £48.98. Label: 25, patient alert card

**Ranexa®** (Menarini) (Ranolazine)
- **Tablets** m/r, ranolazine 375 mg (blue), net price 60-tab pack = £48.98; 500 mg (orange), 60-tab pack = £48.98, 750 mg (green), 60-tab pack = £48.98. Label: 25, patient alert card

**NICE guidance**

Cilostazol, naftidrofuryl oxalate, pentoxyfylline and inositol nicotinate for the treatment of intermittent claudication in people with peripheral arterial disease (May 2011)

Naftidrofuryl oxalate is an option for the treatment of intermittent claudication in patients with peripheral arterial disease in whom vasodilator therapy is considered appropriate.

Cilostazol, pentoxyfylline, and inositol nicotinate are not recommended for the treatment of intermittent claudication in patients with peripheral arterial disease; patients currently receiving these treatments should have the option to continue until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA223

2.6.4 Peripheral vasodilators and related drugs

Peripheral vascular disease can be either occlusive (e.g. **intermittent claudication**) in which occlusion of the peripheral arteries is caused by atherosclerosis, or vasospastic (e.g. **Raynaud’s syndrome**).

Peripheral arterial occlusive disease is associated with an increased risk of cardiovascular events; this risk is reduced by measures such as smoking cessation (section 4.10.2), effective control of blood pressure (section 2.5), regulating blood lipids (section 2.12), optimising glycaemic control in diabetes (section 2.9), and possibly weight reduction in obesity (section 4.5). Exercise training can improve symptoms of intermittent claudication, revascularisation procedures may be appropriate.
2 Cardiovascular system

Naftidrofuryl can alleviate symptoms of intermittent claudication and improve pain-free walking distance in moderate disease. Patients taking naftidrofuryl should be assessed for improvement after 3–6 months.

Cilostazol is licensed for use in intermittent claudication to improve walking distance in patients without peripheral tissue necrosis who do not have pain at rest; use is restricted to second-line treatment where lifestyle modifications and other appropriate interventions have failed to improve symptoms. Cilostazol should be initiated by those experienced in the management of intermittent claudication. Patients receiving cilostazol should be assessed for improvement after 3 months; consider discontinuation of treatment if there is no clinically relevant improvement in walking distance. The Scottish Medicines Consortium (p. 4) has advised that cilostazol is not recommended for the treatment of intermittent claudication within NHS Scotland.

Inositol nicotinate and pentoxifylline are not established as being effective for the treatment of intermittent claudication. Management of Raynaud’s syndrome includes avoidance of exposure to cold and stopping smoking. More severe symptoms may require vasodilator treatment, which is most often successful in primary Raynaud’s syndrome.

Nifedipine (section 2.6.2) is useful for reducing the frequency and severity of vasospastic attacks. Alternatively, naftidrofuryl may produce symptomatic improvement: inositol nicotinate (a nicotinic acid derivative) may also be considered. Pentoxifylline, prazosin, inositol nicotinate and pentoxifylline are not established for use in Raynaud’s syndrome.

Vasodilator therapy is not established as being effective for chilblains (section 13.13).

**Side-effects**
- diarrhoea, nausea, vomiting, dyspepsia, flatulence, abdominal pain, anorexia, tachycardia, palpitation, angina, arrhythmia, oedema, rhinitis, pharyngitis, dizziness, headache, malaise, rash, pruritus, ecchymosis; less commonly gastritis, myocardial infarction, congestive heart failure, postural hypotension, dyspnoea, pneumonia, cough, insomnia, abnormal dreams, anxiety, hyperglycaemia, diabetes mellitus, anaemia, haemorrhage, myalgia; rarely increased urinary frequency, bleeding disorders, thrombocythaemia, renal impairment; also reported hypertension, pyrexia, hot flushes, thrombocytopenia, agranulocytosis, leucopenia, pancytopenia, aplastic anaemia, hepatitis, conjunctivitis, tinnitus, Stevens-Johnson syndrome, toxic epidermal necrolysis

**Dose**
- 100 mg twice daily 30 minutes before food

**Note**
Reduce dose to 50 mg twice daily with concomitant use of potent inhibitors of cytochrome P450 enzymes CYP3A4 (e.g. clarithromycin, itraconazole, protease inhibitors) or CYP2C19, or with erythromycin or omeprazole

**Pletal** (Otsuka) Tablets, cilostazol 50 mg, net price 56-tab pack = £33.37. Counselling, blood disorders, see above

**INOSITOL NICOTINATE**

**Indications**
- peripheral vascular disease (but see notes above); hyperlipidaemia (section 2.12)

**Cautions**
- cerebrovascular insufficiency, unstable angina

**Contra-indications**
- recent myocardial infarction, acute phase of a cerebrovascular accident

**Pregnancy**
- no information available—manufacturer advises avoid unless potential benefit outweighs risk

**Side-effects**
- nausea, vomiting, hypotension, flushing, syncope, oedema, headache, dizziness, paraesthesia, rash

**Dose**
- 3 g daily in 2–3 divided doses; max. 4 g daily

**Hexopal** (Genus) Tablets, scored, inositol nicotinate 500 mg, net price 100 = £30.76

**Tablets forte**, scored, inositol nicotinate 750 mg, net price 112-tab pack = £51.03

**MOXISYLYTE**

**Indications**
- primary Raynaud’s syndrome (short-term treatment)

**Cautions**
- diabetes mellitus

**Contra-indications**
- active liver disease

**Pregnancy**
- manufacturer advises avoid

**Side-effects**
- nausea, diarrhoea, flushing, headache, dizziness; hepatic reactions including cholestatic jaundice and hepatitis reported to CSM

**Dose**
- Initially 40 mg 4 times daily, increased to 80 mg 4 times daily if poor initial response; discontinue after 2 weeks if no response

**Opion** (Archimedes) Tablets, yellow, f/c, moxisylyte 40 mg (as hydrochloride), net price 112-tab pack = £90.22. Label: 21
### NAFTIDROFURYL OXALATE

**Indications** see under Dose

**Side-effects** nausea, epigastric pain, rash, hepatitis, hepatic failure

**Dose**
- Peripheral vascular disease (see notes above), 100–200 mg 3 times daily
- Cerebral vascular disease, 100 mg 3 times daily

**Naftidrofuryl** (Non-proprietary) ®

- **Capsules**, naftidrofuryl oxalate 100 mg, net price 84-cap pack = £5.92. Label: 25, 27
- **Praxilene** (Merck Serono) ®
  - **Capsules**, pink, naftidrofuryl oxalate 100 mg, net price 84-cap pack = £8.10. Label: 25, 27

### PENTOXIFYLLINE

(Orpentifylline)

**Indications** peripheral vascular disease (but see notes above); venous leg ulcer (unlicensed indication) (Appendix A5.8.7)

**Cautions** hypotension, coronary artery disease; avoid in acute porphyria (section 9.8.2); **Interactions**: Appendix 1 (pentoxifylline)

**Contra-indications** cerebral haemorrhage, extensive retinal haemorrhage, acute myocardial infarction, severe cardiac arrhythmias

**Hepatic impairment** manufacturer advises reduce dose in severe impairment

**Renal impairment** reduce dose by 30–50% if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** present in milk—manufacturer advises use only if potential benefit outweighs risk

**Side-effects** nausea, vomiting, diarrhoea, dizziness, agitation, sleep disturbances, headache; rarely angina, hypotension; very rarely bleeding; also reported intrahepatic cholestasis, tachycardia, flushing, thrombocytopenia

**Dose**
- 400 mg 2–3 times daily

**Trental** (Sanofi-Aventis) ®

- **Tablets**, m/r, pink, s/c, pentoxifylline 400 mg, net price 90-tab pack = £19.39. Label: 21, 25

### Other preparations used in peripheral vascular disease

Rutosides (oxerutins, Paroven ®) are not vasodilators and are not generally regarded as effective preparations as capillary sealants or for the treatment of cramps; side-effects include headache, flushing, rashes, mild gastro-intestinal disturbances.

**Paroven** (Novartis Consumer Health) ®

- **Capsules**, yellow, oxerutins 250 mg, net price 120-cap pack = £14.62.

**Dose** relief of symptoms of oedema associated with chronic venous insufficiency, 500 mg twice daily

### 2.7 Sympathomimetics

#### 2.7.1 Inotropic sympathomimetics

The cardiac stimulants dobutamine and dopamine act on beta; receptors in cardiac muscle, and increase contractility with little effect on rate.

Dopexamine acts on beta1 receptors in cardiac muscle to produce its positive inotropic effect; and on peripheral dopamine receptors to increase renal perfusion; it is reported not to induce vasoconstriction.

**Isoprenaline** injection is available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104.

**Shock** Shock is a medical emergency associated with a high mortality. The underlying causes of shock such as haemorrhage, sepsis, or myocardial insufficiency should be corrected. The profound hypotension of shock must be treated promptly to prevent tissue hypoxia and organ failure. Volume replacement is essential to correct the hypovolaemia associated with haemorrhage and sepsis but may be detrimental in cardiogenic shock. Depending on haemodynamic status, cardiac output may be improved by the use of sympathomimetic inotropes such as adrenaline (epinephrine), dobutamine or dopamine (see notes above). In septic shock, when fluid replacement and inotropic support fail to maintain blood pressure, the vasconstrictor noradrenaline (nor-epinephrine) (section 2.7.2) may be considered. In cardiogenic shock peripheral resistance is frequently high and to raise it further may worsen myocardial performance and exacerbate tissue ischaemia.

The use of sympathomimetic inotropes and vasoconstrictors should preferably be confined to the intensive care setting and undertaken with invasive haemodynamic monitoring.

For advice on the management of anaphylactic shock, see section 3.4.3.

#### 2.7.2 Vasoconstrictor sympathomimetics

The properties of sympathomimetics vary according to whether they act on alpha or on beta adrenergic receptors. Adrenaline (epinephrine) (section 2.7.3) acts on both alpha and beta receptors and increases both heart rate and contractility (beta₁ effects); it can cause peripheral vasodilatation (a beta₂ effect) or vasoconstriction (an alpha effect).

#### 2.7.3 Cardiopulmonary resuscitation

The cardiac stimulants dobutamine and dopamine act on beta; receptors in cardiac muscle, and increase contractility with little effect on rate.

Dopexamine acts on beta₁ receptors in cardiac muscle to produce its positive inotropic effect; and on peripheral dopamine receptors to increase renal perfusion; it is reported not to induce vasoconstriction.

Isoprenaline injection is available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104.

**Shock** Shock is a medical emergency associated with a high mortality. The underlying causes of shock such as haemorrhage, sepsis, or myocardial insufficiency should be corrected. The profound hypotension of shock must be treated promptly to prevent tissue hypoxia and organ failure. Volume replacement is essential to correct the hypovolaemia associated with haemorrhage and sepsis but may be detrimental in cardiogenic shock. Depending on haemodynamic status, cardiac output may be improved by the use of sympathomimetic inotropes such as adrenaline (epinephrine), dobutamine or dopamine (see notes above). In septic shock, when fluid replacement and inotropic support fail to maintain blood pressure, the vasconstrictor noradrenaline (nor-epinephrine) (section 2.7.2) may be considered. In cardiogenic shock peripheral resistance is frequently high and to raise it further may worsen myocardial performance and exacerbate tissue ischaemia.

The use of sympathomimetic inotropes and vasoconstrictors should preferably be confined to the intensive care setting and undertaken with invasive haemodynamic monitoring.

For advice on the management of anaphylactic shock, see section 3.4.3.

### 2.7.1 Inotropic sympathomimetics

**DOBUTAMINE**

**Indications** inotropic support in infarction, cardiac surgery, cardiomyopathies, septic shock, cardiogenic shock; and during positive end expiratory pressure ventilation; cardiac stress testing (consult product literature)

**Cautions** arrhythmias; occlusive vascular disease; ischaemic heart disease; acute myocardial infarction; acute heart failure; severe hypotension; extreme caution or avoid in marked obstruction of cardiac ejection (such as idiopathic hypertrophic subaortic stenosis); tachycardia; correct hypovolaemia, metab-
2 Cardiovascular system

**Cardiovascular system**

olic acidosis, hypoxia, and hypercapnia before starting and during treatment; monitor serum-potassium concentration; tolerance may develop with continuous infusions longer than 72 hours; hyperthyroidism; diabetes mellitus; susceptibility to angle-closure glaucoma; elderly; extravasation may cause tissue necrosis; **interactions:** Appendix 1 (sympathomimetics)

**Contra-indications**

- Phaeochromocytoma
- Pregnancy: no evidence of harm in animal studies—manufacturers advise use only if potential benefit outweighs risk
- Breast-feeding: manufacturers advise avoid—no information available

**Side-effects**

- Nausea, hypotension, hypertension (marked increase in systolic blood pressure indicates overdose), arrhythmias, tachycardia, palpitation, chest pain, dyspnoea, bronchospasm, headache, fever, eosinophilia, reduced platelet aggregation (on prolonged use), rash, phlebitis; rarely psychosis; very rarely bradycardia, cardiac arrest, AV block, myocardial infarction, coronary artery spasm, hypokalemia, angle-closure glaucoma, petechial bleeding; also reported vomiting, cerebral haemorrhage, pulmonary oedema, anxiety, paraesthesia, tremor, myclonic spasm, increased urinary urgency, pruritus of scalp

**Dose**

- By intravenous infusion, usual dose 2.5–10 micrograms/kg/minute, adjusted according to response; dose range 0.5–40 micrograms/kg/minute has been used

**Dobutamine** (Non-proprietary) (SH)

- Injection, dobutamine (as hydrochloride) 5 mg/mL. To be diluted before use or given undiluted with syringe pump. Net price 50-mL vial = £1.75

- Concentrate for intravenous infusion, dobutamine (as hydrochloride) 12.5 mg/mL. To be diluted before use. Net price 20-mL amp = £5.20

- Excipients may include sulfites

**DOPAMINE HYDROCHLORIDE**

**Indications**

- Cardiogenic shock in infarction or cardiac surgery

**Cautions**

- Correct hypovolaemia; low dose in shock due to acute myocardial infarction—see notes above; hyperthyroidism; **interactions:** Appendix 1 (sympathomimetics)

**Contra-indications**

- Tachyarrhythmia, phaeochromocytoma
- Pregnancy: no information available—manufacturer advises avoid

**Side-effects**

- Nausea, vomiting, chest pain, palpitation, tachycardia, arrhythmias, angina, myocardial infarction; tremor, headache; dyspnoea; reversible thrombocytopenia; sweating

**Dose**

- By intravenous infusion, into central or large peripheral vein, 500 nanograms/kg/minute, may be increased to 1 microgram/kg/minute and further increased up to 6 micrograms/kg/minute in increments of 0.5–1 microgram/kg/minute at intervals of not less than 15 minutes

**Dopacard®** (TEVA UK) (SH)

- Concentrate for intravenous infusion, dopexamine hydrochloride 10 mg/mL (1%). To be diluted before use. Net price 5-mL amp = £25.20

**Note**

- Contact with metal in infusion apparatus should be minimised

**2.7.2 Vasoconstrictor sympathomimetics**

**Vasoconstrictor sympathomimetics**

Vasoconstrictor sympathomimetics raise blood pressure transiently by acting on alpha-adrenergic receptors to constrict peripheral vessels. They are sometimes used as an emergency method of elevating blood pressure where other measures have failed (see also section 2.7.1).

The danger of vasoconstrictors is that although they raise blood pressure they also reduce perfusion of vital organs such as the kidney.

Spinal and epidural anaesthesia may result in sympathetic block with resultant hypotension. Management may include intravenous fluids (which are usually given prophylactically), oxygen (section 3.6), elevation of the legs, and injection of a pressor drug such as ephedrine. As well as constricting peripheral vessels ephedrine also accelerates the heart rate (by acting on beta receptors). Use is made of this dual action of ephedrine to manage associated bradycardia (although intravenous injection of atropine sulfate 400 to 600 micrograms may also be required if bradycardia persists).

**EPHEDRINE HYDROCHLORIDE**

**Indications**

- See under Dose

**Cautions**

- Hyperthyroidism, diabetes mellitus, ischaemic heart disease, hypertension, susceptibility

**Intravenous infusion, dopamine hydrochloride**

1.6 mg/mL in glucose 5% intravenous infusion

Available from ‘special-order manufacturers or specialist importing companies’, see p. 1104

**DOPEXAMINE HYDROCHLORIDE**

**Indications**

- Inotropic support and vasodilator in exacerbations of chronic heart failure and in heart failure associated with cardiac surgery

**Cautions**

- Myocardial infarction, recent angina, hypokalaemia, hyperglycaemia; correct hypovolaemia before and during treatment, monitor blood pressure, pulse, plasma potassium, and blood glucose; hyperthyroidism; avoid abrupt withdrawal; **interactions:** Appendix 1 (sympathomimetics)

**Contra-indications**

- Left ventricular outlet obstruction such as hypertrophic cardiomyopathy or aortic stenosis; phaeochromocytoma, thrombocytopenia

**Pregnancy**

- No information available—manufacturer advises avoid

**Side-effects**

- Nausea, vomiting, tachycardia, bradycardia, arrhythmias, angina, myocardial infarction; tremor, headache; dyspnoea; reversible thrombocytopenia; sweating

**Dose**

- By intravenous infusion, from central or large peripheral vein, 500 nanograms/kg/minute, may be increased to 1 microgram/kg/minute and further increased up to 6 micrograms/kg/minute in increments of 0.5–1 microgram/kg/minute at intervals of not less than 15 minutes

**Note**

- Contact with metal in infusion apparatus should be minimised

**2.7.2 Vasoconstrictor sympathomimetics**

Vasoconstrictor sympathomimetics raise blood pressure transiently by acting on alpha-adrenergic receptors to constrict peripheral vessels. They are sometimes used as an emergency method of elevating blood pressure where other measures have failed (see also section 2.7.1).

The danger of vasoconstrictors is that although they raise blood pressure they also reduce perfusion of vital organs such as the kidney.

Spinal and epidural anaesthesia may result in sympathetic block with resultant hypotension. Management may include intravenous fluids (which are usually given prophylactically), oxygen (section 3.6), elevation of the legs, and injection of a pressor drug such as ephedrine. As well as constricting peripheral vessels ephedrine also accelerates the heart rate (by acting on beta receptors). Use is made of this dual action of ephedrine to manage associated bradycardia (although intravenous injection of atropine sulfate 400 to 600 micrograms may also be required if bradycardia persists).

**EPHEDRINE HYDROCHLORIDE**

**Indications**

- See under Dose

**Cautions**

- Hyperthyroidism, diabetes mellitus, ischaemic heart disease, hypertension, susceptibility
to angle-closure glaucoma, elderly; may cause acute urine retention in prostatic hypertrophy; interactions: Appendix 1 (sympathomimetics)

Renal impairment use with caution

Pregnancy increased fetal heart rate reported with parental ephedrine

Breast-feeding irritability and disturbed sleep reported

Side-effects nausea, vomiting, anorexia, tachycardia (sometimes bradycardia), arrhythmias, anginal pain, vasoconstriction with hypertension, vasodilatation with hypotension, dizziness and flushing; dyspnoea; headache, anxiety, restlessess, confusion, psychoses, insomnia, tremor; difficulty in micturition, urine retention; sweating, hypersalivation; changes in blood-glucose concentration; very rarely angle-closure glaucoma

Dose● Reversal of hypotension from spinal or epidural anaesthesia, by slow intravenous injection of a solution containing ephedrine hydrochloride 3 mg/mL, 3–6 mg (max. 9 mg) repeated every 3–4 minutes according to response to max. 30 mg

Ephedrine Hydrochloride (Non-proprietary) 

Injection, ephedrine hydrochloride 3 mg/mL, net price 10-mL amp = £6.34; 30 mg/mL, net price 1-mL amp = 41p

METARAMINOL

Indications acute hypotension (see notes above); priapism (section 7.4.5) [unlicensed indication]

Cautions see under Noradrenaline; longer duration of action than noradrenaline (norepinephrine), see below; cirrhosis

Hypertensive response Metaraminol has a longer duration of action than noradrenaline, and an excessive vasopressor response may cause a prolonged rise in blood pressure

Contra-indications see under Noradrenaline

Pregnancy may reduce placental perfusion—manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises caution—no information available

Side-effects see under Noradrenaline; also tachycardia; fatal ventricular arrhythmia reported in Lendenec’s cirrhosis

Dose● By intravenous infusion, 15–100 mg, adjusted according to response
● In emergency, by intravenous injection, 0.5–5 mg then by intravenous infusion, 15–100 mg, adjusted according to response

Metaraminol (Non-proprietary) 

Injection, metaraminol 10 mg (as tartrate)/mL. Available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104

NORADRENALINE/NOREPINEPHRINE

Indications see under dose

Cautions coronary, mesenteric, or peripheral vascular thrombosis; following myocardial infarction, Prinzmetal’s variant angina, hyperthyroidism, diabetes mellitus; hypoxia or hypercapnia; uncorrected hypovolaemia; elderly; extravasation at injection site may cause necrosis; interactions: Appendix 1 (sympathomimetics)

Contra-indications hypertension (monitor blood pressure and rate of flow frequently)

Pregnancy avoid—may reduce placental perfusion

Side-effects anorexia, nausea, vomiting, hypoxia, arrhythmias, peripheral ischaemia, palpitation, hypertension, bradycardia, tachycardia, dyspnoea, headache, insomnia, confusion, anxiety, psychosis, weakness, tremor, urinary retention, angle-closure glaucoma

Dose● Acute hypotension, by intravenous infusion, via central venous catheter, of a solution containing noradrenaline 40 micrograms (base)/mL at an initial rate of 0.16–0.33 mL/minute, adjusted according to response

Note 1 mg of noradrenaline base is equivalent to 2 mg of noradrenaline acid tartrate. Dose expressed as the base

Noradrenaline/Norepinephrine (Non-proprietary) 

Injection, noradrenaline base 1 mg/mL (as noradrenaline acid tartrate 2 mg/mL). For dilution before use. Net price 2-mL amp = £2.20, 4-mL amp = £4.40, 20-mL amp = £6.35

Note For a period of time, preparations on the UK market may be described as ephedrine base or noradrenaline acid tartrate, doses above are expressed as the base

PHENYLEPHRINE HYDROCHLORIDE

Indications acute hypotension (see notes above); priapism (section 7.4.5) [unlicensed indication]

Cautions see under Noradrenaline; longer duration of action than noradrenaline (norepinephrine), see below; coronary disease

Hypertensive response Phenylephrine has a longer duration of action than noradrenaline, and an excessive vasopressor response may cause a prolonged rise in blood pressure

Contra-indications see under Noradrenaline: severe hyperthyroidism

Pregnancy avoid if possible; malformations reported following use in first trimester; fetal hypoxia and bradycardia reported in late pregnancy and labour

Side-effects see under Noradrenaline; also tachycardia or reflex bradycardia

Dose● By subcutaneous or intramuscular injection, 2–5 mg, followed if necessary after at least 15 minutes by further doses of 1–10 mg
● By slow intravenous injection of a 1 mg/mL solution, 100–500 micrograms repeated as necessary after at least 15 minutes
● By intravenous infusion, initial rate up to 180 micrograms/minute reduced to 30–60 micrograms/minute according to response

Phenylephrine (Non-proprietary) 

Injection, phenylephrine hydrochloride 10 mg/mL (1%), net price 1-mL amp = £9.91

The algorithm for cardiopulmonary resuscitation (see inside back cover) reflects the most recent recommendations of the Resuscitation Council (UK). These guidelines are available at www.resus.org.uk.
Cardiac arrest can be associated with ventricular fibrillation, pulseless ventricular tachycardia, asystole, and pulseless electrical activity (electromechanical dissociation). Adrenaline (epinephrine) 1 in 10 000 (100 micrograms/mL) is recommended in a dose of 1 mg (10 mL) by intravenous injection repeated every 3–5 minutes if necessary. Administration through a central line results in a faster response than peripheral administration, however placement of a central line must not interfere with chest compressions; drugs administered peripherally must be followed by a flush of at least 20 mL Sodium Chloride 0.9% injection to aid entry into the central circulation. Intravenous injection of amiodarone 300 mg (from a prefilled syringe or diluted in 20 mL Glucose 5%) should be considered after adrenaline to treat ventricular fibrillation or pulseless ventricular tachycardia in cardiac arrest refractory to defibrillation. An additional dose of amiodarone 150 mg can be given by intravenous injection if necessary, followed by an intravenous infusion of amiodarone 900 mg over 24 hours. Lidocaine, in a dose of 1 mg/kg, is an alternative if amiodarone is not available; a total dose of 3 mg/kg lidocaine should not be exceeded during the first hour. Atropine is no longer recommended in the treatment of asystole or pulseless electrical activity.

During cardiopulmonary arrest if intravenous access cannot be obtained, the intraosseous route can be used instead. Drug administration via the endotracheal route is no longer recommended.

For the management of acute anaphylaxis see section 3.4.3.

**ADRENALINE/EPINEPHRINE**

**Indications** see notes above

**Cautions** ischaemic heart disease, severe angina, obstructive cardiomyopathy, hypertension, arrhythmias, cerebrovascular disease, occlusive vascular disease, arteriosclerosis, monitor blood pressure and ECG; cor pulmonale; organic brain damage, psycho-neurosis; hyperreflexia; diabetes mellitus, hypothyroidism, phaeochromocytoma; prostate disorders; sympathectomy; hyperkalaemia, hypercalcaemia; susceptibility to angle-closure glaucoma; elderly; **interactions:** Appendix 1 (sympathomimetics)

**Renal impairment** manufacturers advise use with caution in severe impairment

**Pregnancy** may reduce placental perfusion and cause tachycardia, cardiac irregularities, and extrastoles in fetus; can delay second stage of labour; manufacturers advise use only if benefit outweighs risk

**Breast-feeding** present in milk but unlikely to be harmful as poor oral bioavailability

**Side-effects** nausea, vomiting, dry mouth, anorexia, hypersalivation; arrhythmias, tachycardia, angina, myocardial infarction, pallor, palpitation, cold extremities, hypertension (risk of cerebral haemorrhage); dyspnoea, pulmonary oedema (on excessive dosage or extreme sensitivity); anxiety, tremor, restlessness, headache, insomnia, confusion, weakness, dizziness, psychosis; hyperglycaemia; urinary retention, difficulty in micturition; metabolic acidosis; hyperkalaemia; tissue necrosis at injection site and of extremities, bowel, liver and kidneys; mydriasis, angle-closure glaucoma, sweating

**Dose** see notes above
2.8.1 Parenteral anticoagulants

Heparin

Heparin initiates anticoagulation rapidly but has a short duration of action. It is often referred to as ‘standard’ or ‘unfractionated heparin’ to distinguish it from the low molecular weight heparins (see p. 148), which have a longer duration of action. Although a low molecular weight heparin is generally preferred for routine use, unfractionated heparin can be used in those at high risk of bleeding because its effect can be terminated rapidly by stopping the infusion.

Treatment For the initial treatment of deep-vein thrombosis and pulmonary embolism a low molecular weight heparin is used; alternatively, unfractionated heparin (if patient in renal failure), or fondaparinux. Prophylaxis should continue until the patient is no longer considered to be at significant risk of venous thromboembolism. Mechanical prophylaxis (e.g. anti-embolism stockings) can be offered to medical patients in whom pharmacological prophylaxis is contra-indicated, and continued until the patient is sufficiently mobile.

Prophylaxis For details on the use of heparins in the prophylaxis of venous thromboembolism see section 2.8.

Pregnancy Heparins are used for the management of venous thromboembolism because they do not cross the placenta. Low molecular weight heparins are preferred because they have a lower risk of osteoporosis and of heparin-induced thrombocytopenia. Low molecular weight heparins are eliminated more rapidly in pregnancy, requiring alteration of the dosage regimen for drugs such as dalteparin, enoxaparin, and tinzaparin; see also under individual drugs. Treatment should be stopped at the onset of labour and advice sought from a specialist on continuing therapy after birth.

Extracorporeal circuits Unfractionated heparin is also used in the maintenance of extracorporeal circuits in cardiopulmonary bypass and haemodialysis.

Haemorrhage If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin, but if rapid reversal of the effects of the heparin is required, protamine sulfate (section 2.8.3) is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

HEPARIN

Indications see under Dose

Cautions see notes above; also elderly; concomitant use of drugs that increase risk of bleeding; interactions: Appendix 1 (heparin)

Heparin-induced thrombocytopenia Clinically important heparin-induced thrombocytopenia is immune-mediated and does not usually develop until after 5–10 days; it can be complicated by thrombosis. Platelet counts should be measured just before treatment with unfractionated or low molecular weight heparin, and regular monitoring of platelet counts may be required if given for longer than 4 days. Signs of heparin-induced thrombocytopenia include a 30% reduction of platelet count, thrombosis, or skin allergy. If heparin-induced thrombocytopenia is strongly suspected or confirmed, the heparin should be stopped and an alternative anticoagulant, such as argatroban or danaparoid, should be given. Ensure platelet counts return to normal range in those who require warfarin.

Hyperkalaemia Inhibition of aldosterone secretion by unfractionated or low molecular weight heparin can result in hyperkalaemia; patients with diabetes mellitus, chronic renal failure, acidosis, raised plasma potassium or those taking potassium-sparing drugs seem to be more susceptible. The risk appears to increase with duration of therapy, and plasma-potassium concentration should be measured in patients at risk of hyperkalaemia before starting the heparin and monitored regularly thereafter, particularly if treatment is to be continued for longer than 7 days.

Contra-indications haemophilia and other haemorrhagic disorders; thrombocytopenia (including history of heparin-induced thrombocytopenia), recent cerebral haemorrhage, severe hypertension; peptic ulcer; after major trauma or recent surgery to eye or nervous system; acute bacterial endocarditis; spinal or epidural anaesthesia with treatment doses of unfractionated or low molecular weight heparin; hyper-sensitivity to unfractionated or low molecular weight heparin

Hepatic impairment risk of bleeding increased—reduce dose or avoid in severe impairment (including oesophageal varices)

Renal impairment risk of bleeding increased in severe impairment—dose may need to be reduced

2 Cardiovascular system

2.8.1 Parenteral anticoagulants

**Heparin Sodium**

**Dosage**
- **Dose**
  - Treatment of pulmonary embolism, unstable angina, and acute peripheral arterial occlusion, by *intravenous injection*, loading dose of 5000 units or 75 units/kg (10 000 units in severe pulmonary embolism), followed by *continuous intravenous infusion* of 18 units/kg/hour (laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly); **CHILD** under 18 years see **BNF for Children**
  - Thromboprophylaxis in medical patients (see also notes above), by *subcutaneous injection*, 5000 units every 8–12 hours
  - Thromboprophylaxis in surgical patients (see also notes above), by *subcutaneous injection*, 5000 units 2 hours before surgery, then every 8–12 hours
  - Thromboprophylaxis during pregnancy, (but see notes above), by *subcutaneous injection*, 5000–10 000 units every 12 hours (with monitoring); **important**: prevention of prosthetic heart-valve thrombosis in pregnancy calls for specialist management
- **Haemodialysis** by *intravenous injection* initially 1000–5000 units, followed by *continuous intravenous infusion* of 250–1000 units/hour
- **Myocardial infarction**, see section 2.10.1
- **Prevention of clotting in extracorporeal circuits**, consult product literature

**Doses above take into account the guidelines of the British Society for Haematology; for doses of the low molecular weight heparins, see below**

**Side-effects**
- **Haemorrhage** (see notes above), thrombocytopenia (see **Cautions**), rarely rebound hyperlipidaemia following unfractionated heparin withdrawal, priapism, hyperkalaemia (see **Cautions**), osteoporosis (risk lower with low molecular weight heparins), alopecia on prolonged use, injection-site reactions, skin necrosis, and hypersensitivity reactions (including urticaria, angioedema, and anaphylaxis)

**Breast-feeding** not excreted into milk due to high molecular weight

**Pregnancy** does not cross the placenta; maternal osteoporosis reported after prolonged use; multidose vials may contain benzyl alcohol—some manufacturers advise avoid; see also notes above

**Heparin Calcium**

**Indications**
- Treatment, above), and are also used in the treatment of myocardial infarction (section 2.10.1), unstable coronary artery disease (section 2.10.1) and for the prevention of clotting in extracorporeal circuits.

**Contra-indications**
- see **Prophylaxis of Venous Thromboembolism**, p. 144. The standard prophylactic regimen does not require anticoagulant monitoring. The duration of action of low molecular weight heparins is longer than that of unfractionated heparin and *once-daily subcutaneous* administration is possible for some indications, making them convenient to use.

**Low molecular weight heparins**

Low molecular weight heparins (dalteparin, enoxaparin, and tinzaparin) are usually preferred over unfractionated heparin in the prevention of venous thromboembolism because they are as effective and they have a lower risk of heparin-induced thrombocytopenia; see **Prophylaxis of Venous Thromboembolism**, p. 144. The standard prophylactic regimen does not require anticoagulant monitoring. The duration of action of low molecular weight heparins is longer than that of unfractionated heparin and *once-daily subcutaneous* administration is possible for some indications, making them convenient to use.

Low molecular weight heparins are generally preferred over unfractionated heparin in the treatment of deep-vein thrombosis and pulmonary embolism (see also **Treatment**, above), and are also used in the treatment of myocardial infarction (section 2.10.1), unstable coronary artery disease (section 2.10.1) and for the prevention of clotting in extracorporeal circuits.

Dalteparin is also licensed for the extended treatment and prophylaxis of venous thromboembolism in patients with solid tumours; treatment is recommended for a duration of 6 months. The **Scottish Medicines Consortium** (p. 4) has advised (February 2011) that dalteparin *(Fragmin)* is accepted for restricted use within NHS Scotland as extended treatment of symptomatic venous thromboembolism and prevention of its recurrence in patients with solid tumours; treatment should be initiated by healthcare professionals experienced in the treatment of venous thromboembolism.

Routine monitoring of anti-Factor Xa activity is not usually required during treatment with low molecular weight heparins, but may be necessary in patients at increased risk of bleeding (e.g. in renal impairment and those who are underweight or overweight).

**Haemorrhage** See under Heparin.

**Pregnancy** See under Heparin.

**Dalteparin Sodium**

**Indications** see notes above and under preparations

**Cautions** see under Heparin and notes above

**Contra-indications** see under Heparin

**Hepatic impairment** dose reduction may be required in severe impairment

**Renal impairment** risk of bleeding may be increased—dose reduction, and monitoring of anti-Factor Xa may be required; use of unfractionated heparin may be preferable

**Pregnancy** not known to be harmful; multidose vial contains benzyl alcohol—manufacturer advises avoid; see also **Pregnancy**, p. 145

**Breast-feeding** no information available

**Side-effects** see under Heparin

**Dose**
- See under preparations below

**Fragmin** *(Pfizer)*

**Injection** (single-dose syringe), dalteparin sodium 12 500 units/mL, net price 2500-unit (0.2-mL) syringe = £1.86; 25 000 units/mL, 5000-unit (0.2-
**ENOXAPARIN SODIUM**

**Indications** see notes above and under preparations

**Cautions** see under Heparin and notes above; low body-weight (increased risk of bleeding)

**Contra-indications** see under Heparin

**Hepatic impairment** manufacturer advises caution—no information available

**Renal impairment** risk of bleeding increased; reduce dose if eGFR less than 30 mL/minute/1.73 m²—consult product literature for details; monitoring of anti-factor Xa may be required; use of unfractionated heparin may be preferable

**Pregnancy** not known to be harmful; see also Pregnancy, p. 145

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see under Heparin

**Dose**

- See under preparation below

**Clexane® (Sanofi-Aventis)**

**Injection**, enoxaparin sodium 100 mg/mL, net price 20-mg (0.2-mL, 2000-units) syringe = £2.27, 40-mg (0.4-mL, 4000-units) syringe = £3.03, 60-mg (0.6-mL, 6000-units) syringe = £4.57, 80-mg (0.8-mL, 8000-units) syringe = £6.49, 100-mg (1-mL, 10 000-units) syringe = £8.03; 300 mg (3-mL, 30 000-units) vial (Clexane® Multidose) = £21.33; 150 mg/mL (Clexane® Forte), 120-mg (0.8-mL, 12 000-units) syringe = £9.77, 150-mg (1-mL, 15 000-units) syringe = £11.10

**Excipients** include benzyl alcohol (in 300 mg multidose vials) (avoid in neonates, see Excipients, p. 2)

**Dose** prophyaxis of deep-vein thrombosis especially in surgical patients, by subcutaneous injection, moderate risk, 20 mg (2000 units) approx. 2 hours before surgery then 20 mg (2000 units) every 24 hours; high risk (e.g. orthopaedic surgery), 40 mg (4000 units) 12 hours before surgery then 40 mg (4000 units) every 24 hours

**Prophylaxis of deep-vein thrombosis in medical patients, by subcutaneous injection, 40 mg (4000 units) every 24 hours**

**Treatment of deep-vein thrombosis or pulmonary embolism**

- **ADULT**
  - Moderate risk, 30 mg (3000 units) followed by subcutaneous injection, 1 mg/kg (100 units/kg) for first two subcutaneous doses only; ELDERLY over 75 years, by subcutaneous injection only, 80 mg (8000 units) every 12 hours for up to 8 days (max. 100 mg (10 000 units) for first two subcutaneous doses only); patients undergoing percutaneous coronary intervention, additional dose, by intravenous injection, 40 mg (4000 units) at time of procedure if last subcutaneous dose given more than 8 hours previously

**Note** When administered in conjunction with a thrombolytic, enoxaparin should be given between 15 minutes before and 30 minutes after the start of thrombolytic therapy

**Unstable angiia and non-ST-segment-elevation myocardial infarction, by subcutaneous injection, 1 mg/kg (100 units/kg) every 12 hours usually for 2–8 days (minimum 2 days)**

**Prevention of clotting in extracorporeal circuits, consult product literature**

**Treatment of venous thromboembolism in pregnancy [unlicensed indication], by subcutaneous injection, early pregnancy body-weight under 50 kg, 40 mg (4000 units) twice daily; body-weight 50–70 kg, 60 mg (6000 units) twice daily; body-weight 70–90 kg, 80 mg (8000 units) twice daily; body-weight over 90 kg, 100 mg (10 000 units) twice daily**

**Injection**, dalteparin sodium 2500 units/mL (for subcutaneous or intravenous use), net price 4-mL (10 000-unit) amp = £5.12; 10 000-units/mL (for subcutaneous or intravenous use), 1-mL (10 000-unit) amp = £5.12; 25 000 units/mL (for subcutaneous use only), 4-mL (100 000-unit) vial = £48.66

**Excipients** include benzyl alcohol (in 100 000-unit/4 mL multidose vial) (avoid in neonates, see Excipients, p. 2)

**Dose** treatment of deep-vein thrombosis and of pulmonary embolism, by subcutaneous injection, 200 units/kg (max. 18 000 units) as a single daily dose (or 100 units/kg twice daily if increased risk of haemorrhage) unless adequate oral anticoagulation established

**Note** For monitoring, blood should be taken 3–4 hours after a dose (recommended plasma concentration of anti-Factor Xa 0.5–1 unit/mL), monitoring not required for once-daily treatment regimen and not generally necessary for twice-daily regimen

**Unstable coronary artery disease, by subcutaneous injection, 120 units/kg every 12 hours (max. 10 000 units twice daily) for 5–8 days**

**Prevention of clotting in extracorporeal circuits, consult product literature**

**Injection** (graduated syringe), dalteparin sodium 10 000 units/mL, net price 1-mL (10 000-unit) syringe = £5.65

**Dose** unstable coronary artery disease (including non-ST-segment-elevation myocardial infarction), by subcutaneous injection, 120 units/kg every 12 hours (max. 10 000 units twice daily) for up to 8 days; beyond 8 days (if awaiting angiography or revascularisation) women body-weight less than 60 kg and men less than 70 kg, 5000 units every 12 hours; women body-weight greater than 80 kg and men greater than 70 kg, 7500 units every 12 hours, until day of procedure (max. 45 days)
TINZAPARIN SODIUM

**Indications** see notes above and under preparations

**Cautions** see under Heparin and notes above

**Contra-indications** see under Heparin

**Hepatic impairment** manufacturer advises avoid in severe impairment

**Renal impairment** risk of bleeding may be increased; monitoring of anti-Factor Xa may be required if eGFR less than 30 mL/minute/1.73 m²; dose reduction may be required if eGFR less than 20 mL/minute/1.73 m²; unfractionated heparin may be preferable

**Pregnancy** 

- Not known to be harmful; vials contain benzyl alcohol—manufacturer advises avoid; see also Pregnancy, p. 145

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see under Heparin; also less commonly headache

**Dose**
- See under preparations below

Innohep® (LEO) (FM)

- **Injection**, tinzaparin sodium 10 000 units/mL, net price 2500-unit (0.25-mL) syringe = £1.98, 3500-unit (0.35-mL) syringe = £2.77, 4500-unit (0.45-mL) syringe = £3.56, 20 000-unit (2-mL) vial = £10.57

- **Excipients** include benzyl alcohol (in vial) (avoid in neonates, see Excipients, p. 2)

- **Dose** prophylaxis of deep-vein thrombosis, by subcutaneous injection, general surgery, 3500 units 2 hours before surgery, then 3500 units every 24 hours; orthopaedic surgery, 50 units/kg 2 hours before surgery, then 50 units/kg every 24 hours or 4500 units 12 hours before surgery, then 4500 units every 24 hours

Prevention of clotting in extracorporeal circuits, consult product literature

- **Injection**, tinzaparin sodium 20 000 units/mL, net price 0.5-mL (10 000-unit) syringe = £8.50, 0.7-mL (14 000-unit) syringe = £11.90, 0.9-mL (18 000-unit) syringe = £15.30, 2-mL (40 000-unit) vial = £34.20

- **Excipients** include benzyl alcohol (in vial) (avoid in neonates, see Excipients, p. 2), sulfites (in 20 000 units/mL vial and syringe)

- **Dose** treatment of deep-vein thrombosis and of pulmonary embolism, by subcutaneous injection, 175 units/kg once daily until adequate oral anticoagulation established

Treatment of venous thromboembolism in pregnancy [unlicensed indication], by subcutaneous injection, 175 units/kg once daily (based on early pregnancy body-weight)

**Note** Treatment regimens do not require anticoagulation monitoring

**ARGATROBAN MONOHYDRADE**

**Indications** see notes above

**Cautions** risk of bleeding including severe hypertension, diabetic retinopathy, spinal anaesthesia, major surgery (especially of brain, spinal cord, or eye), immediately after lumbar puncture, bleeding disorders, and gastro-intestinal ulceration; concomitant use of drugs that increase risk of bleeding; determine activated partial thromboplastin time 2 hours after start of treatment, then 2 or 4 hours after infusion rate altered (consult product literature), and at least once daily thereafter

**Hepatic impairment** reduce initial dose to 500 nanograms/kg/minute in moderate impairment; avoid in severe impairment or in patients with hepatic impairment undergoing percutaneous coronary intervention

**Argatroban**

Argatroban monohydrate, a direct thrombin inhibitor, is licensed for anticoagulation in patients with heparin-induced thrombocytopenia type II who require percutaneous antithrombotic treatment. The dose of argatroban is adjusted according to activated partial thromboplastin time (APTT). An oral anticoagulant can be given with argatroban, but it should only be started once thrombocytopenia has substantially resolved.

**Heparinoids**

**Danaparoid** is a heparinoid used for prophylaxis of deep-vein thrombosis in patients undergoing general or orthopaedic surgery. Providing there is no evidence of cross-reactivity, it also has a role in patients who develop heparin-induced thrombocytopenia.

**DANAPAROID SODIUM**

**Indications** prevention of deep-vein thrombosis in general or orthopaedic surgery; thromboembolic disease in patients with history of heparin-induced thrombocytopenia

**Cautions** recent bleeding or risk of bleeding; concomitant use of drugs that increase risk of bleeding; antibodies to heparins (risk of antibody-induced thrombocytopenia); body-weight over 90 kg (monitor anti factor Xa activity)

**Contra-indications** haemophilia and other haemorrhagic disorders, thrombocytopenia (unless patient has heparin-induced thrombocytopenia), recent cerebral haemorrhage, severe hypertension, active peptic ulcer (unless this is the reason for operation), diabetic retinopathy, acute bacterial endocarditis, spinal or epidural anaesthesia with treatment doses of danaparoid

**Hepatic impairment** caution in moderate impairment (increased risk of bleeding); avoid in severe impairment unless patient has heparin-induced thrombocytopenia and no alternative available

**Renal impairment** caution in moderate impairment; increased risk of bleeding (monitor anti-Factor Xa activity); avoid in severe impairment unless patient has heparin-induced thrombocytopenia and no alternative available

**Pregnancy** manufacturer advises avoid—limited information available but not known to be harmful

**Breast-feeding** amount probably too small to be harmful but manufacturer advises avoid

**Side-effects** bleeding; hypersensitivity reactions (including rash)

**Dose**
- Prevention of deep-vein thrombosis, by subcutaneous injection, 750 units twice daily for 7–10 days; initiate treatment before operation (with last pre-operative dose 1–4 hours before surgery)

- Thromboembolic disease in patients with history of heparin-induced thrombocytopenia, by intravenous injection, 2500 units (1250 units if body-weight under 55 kg, 3750 units if over 90 kg), followed by intravenous infusion of 400 units/hour for 2 hours, then 300 units/hour for 2 hours, then 200 units/hour for 5 days

**Orgaran® (MSD) (IM)**

- **Injection**, danaparoid sodium 1250 units/mL, net price 0.6-mL amp (750 units) = £26.67
Pregnancy  manufacturer advises avoid unless essen-
tial—limited information available
Breast-feeding  avoid—no information available
Side-effects  nausea, haemorrhage, purpura; less
commonly hiccups, vomiting, constipation, diarrhoea,
gastritis, hepatic failure, hepatomegaly, hyperbiliru-
binaemia, tachycardia, hypertension, hypotension,
dizziness, syncope, headache, fever, malaise, hypo-
glycaemia, hyponatraemia, renal impairment, muscle
weakness, myalgia, visual disturbance, deafness, rash,
swelling, alopecia

Dose
• ADULT over 18 years, by continuous intravenous
  infusion, initially 2 micrograms/kg/minute, adjusted
  according to activated partial thromboplastin time, up
to max. 10 micrograms/kg/minute, max. duration of
treatment 14 days

  Note  For dose in cardiac surgery, percutaneous coronary
  intervention, or critically ill patients, consult product
  literature

  Note  When initiating concomitant warfarin treatment,
  argatroban dose should be temporarily reduced to
  2 micrograms/kg/minute and INR measured after 4–6
  hours; warfarin should be initiated at intended mainten-
  ance dose (do not give loading dose of warfarin); consult product
  literature for further details

Exembol®  (Mitsubishi)  
Concentrate for intravenous infusion, argatroban
monohydrate 100 mg/mL, net price 2.5-mL vial =
£248.50  

Note  Contains ethanol

Hirudins

Bivalirudin, a hirudin analogue, is a thrombin inhibitor
which is licensed for unstable angina or non-ST-seg-
ment elevation myocardial infarction in patients
planned for urgent or early intervention, and as an
anticoagulant for patients undergoing percutaneous
coronary intervention (including patients with ST-seg-
ment elevation myocardial infarction undergoing pri-
mary percutaneous coronary intervention—see also
section 2.10.1); bivalirudin should be administered in
combination with aspirin and clopidogrel. The Scottish
Medicines Consortium (p. 4) has advised (November
2008) that bivalirudin (Angiox®) is accepted for
restricted use within NHS Scotland for patients with
acute coronary syndromes planned for urgent or early
intervention who would have been considered for treat-
ment with unfractionated heparin in combination with a
glycoprotein IIb/IIIa inhibitor; it should not be used as
an alternative to heparin alone. The Scottish Medicines
Consortium (p. 4) has advised (August 2010) that bivaliru-
din (Angiox®) is accepted for restricted use within NHS
Scotland as an anticoagulant in patients undergoing
percutaneous coronary intervention who would have
been considered for treatment with unfractionated hepa-
rin in combination with a glycoprotein IIb/IIIa inhibi-
tor; it should not be used as an alternative to heparin
alone.

NICE guidance
Bivalirudin for the treatment of ST-segment
elevation myocardial infarction (July 2011)

Bivalirudin in combination with aspirin and clopi-
dogrel is recommended for the treatment of adults with
ST-segment elevation myocardial infarction under-
going primary percutaneous coronary intervention.
www.nice.org.uk/TA230

2.8.1 Parenteral anticoagulants 149

BIVALIRUDIN

Indications  unstable angina or non-ST-segment ele-
vation myocardial infarction in patients planned for
urgent or early intervention; anticoagulation for
patients undergoing percutaneous coronary inter-
vention (including patients with ST-segment elevation
myocardial infarction undergoing primary percuta-
neous coronary intervention)

Cautions  previous exposure to lepirudin (theoretical
risk from lepirudin antibodies); brachytherapy proce-
dures; concomitant use of drugs that increase risk of
bleeding

Contra-indications  severe hypertension; subacute
bacterial endocarditis; active bleeding; bleeding dis-
orders

Renal impairment  for percutaneous coronary interven-
tion, reduce rate of infusion to 1.4 mg/kg/hour if
eGFR 30–60 mL/minute/1.73 m² and monitor blood
clotting parameters; for acute coronary syndromes and
percutaneous coronary intervention, avoid if eGFR less
than 30 mL/minute/1.73 m²

Pregnancy  manufacturer advises avoid unless poten-
tial benefit outweighs risk—no information available

Breast-feeding  manufacturer advises caution—no
information available

Side-effects  bleeding (discontinue), ecchymosis; less
commonly nausea, hypotension, allergic reactions
(including isolated reports of anaphylaxis), headache,
thrombocytopenia, anaemia; rarely vomiting,
thrombosis, bradycardia, tachycardia, dyspnoea, back
pain

Dose
• Unstable angina or non-ST-segment elevation myo-
cardial infarction (in addition to aspirin and clopi-
dogrel), initially by intravenous injection, 100 micro-
grams/kg then by intravenous infusion
  250 micrograms/kg/hour (for up to 72 hours in
  medically managed patients); patients proceeding to
  percutaneous coronary intervention or coronary
  artery bypass surgery without cardiopulmonary
  bypass, additional bolus dose by intravenous injection
  500 micrograms/kg, then by intravenous infusion
  1.75 mg/kg/hour for duration of procedure; following
  percutaneous coronary intervention, reduce infusion
  rate to 250 micrograms/kg/hour for 4–12 hours as
  necessary; patients proceeding to coronary artery
  bypass surgery with cardiopulmonary bypass, dis-
  continue intravenous infusion 1 hour before proce-
  dure and treat with unfractionated heparin
• Anticoagulation in patients undergoing percutaneous
  coronary intervention (in addition to aspirin and clopi-
dogrel), initially by intravenous injection, 750 micro-
  grams/kg followed immediately by intravenous
  infusion 1.75 mg/kg/hour during procedure and for
  up to 4 hours after procedure; a reduced infusion rate
  of 250 micrograms/kg/hour may be continued for a
  further 4–12 hours if necessary

Angiox®  (The Medicines Company)  
Injection, powder for reconstitution, bivalirudin, net
price 250-mg vial = £310.00

Heparin flushes

The use of heparin flushes should be kept to a minimum.
For maintaining patency of peripheral venous catheters,
sodium chloride injection 0.9% is as effective as heparin
flushes. The role of heparin flushes in maintaining patency of arterial and central venous catheters is unclear.

**Heparin Sodium** (Non-proprietary) (Fondaparinux sodium is a synthetic pentasaccharide)

**Solution**, heparin sodium 10 units/mL, net price 5-mL amp = £1.50; 100 units/mL, 2-mL amp = £1.57

**Excipients** may include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

**Dose** to maintain patency of catheters, cannulas, etc. 10–200 units flushed through every 4–8 hours. Not for therapeutic use

**Epoprostenol**

Epoprostenol (prostacyclin) can be given to inhibit platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated. It is also licensed for the treatment of primary pulmonary hypertension resistant to oral anticoagulation; it should be initiated by specialists in pulmonary hypertension. Epoprostenol is a potent vasodilator. It has a short half-life of approximately 3 minutes and therefore it must be administered by continuous intravenous infusion.

**EPOPROSTENOL**

**Indications** see notes above

**Cautions** anticoagulant monitoring required when given with anticoagulants; haemorrhagic diathesis; concomitant use of drugs that increase risk of bleeding; dose titration for pulmonary hypertension should be in hospital (risk of pulmonary oedema); avoid abrupt withdrawal when used for primary pulmonary hypertension (risk of rebound pulmonary hypertension)

**Contra-indications** severe left ventricular dysfunction

**Pregnancy** manufacturer advises caution—no information available

**Breast-feeding** present in milk in animal studies—manufacturer advises avoid

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain, bleeding, bradycardia, tachycardia, hypotension, flushing, chest pain, anxiety, headache, syncope, jaw pain, arthralgia; less commonly agitation, pallor

**Dose**

- See product literature
- **Fiolan® (GSK)** (Flolan®)
  - Infusion, powder for reconstitution, epoprostenol (as sodium salt), net price 500-microgram vial (with diluent) = £22.22; 1.5-mg vial (with diluent) = £44.76

**Fondaparinux**

Fondaparinux sodium is a synthetic pentasaccharide that inhibits activated factor X.

For details on the use of fondaparinux in the prophylaxis of venous thromboembolism, see section 2.8, p. 144.

**FONDAPARINUX SODIUM**

**Indications** prophylaxis of venous thromboembolism in medical patients immobilised because of acute illness, and patients undergoing major orthopaedic surgery of the hip or leg, or abdominal surgery; treatment of deep-vein thrombosis, superficial-vein thrombosis, and pulmonary embolism; treatment of unstable angina or non-ST-segment elevation myocardial infarction; treatment of ST-segment elevation myocardial infarction

**Cautions** bleeding disorders, active gastro-intestinal ulcer disease; recent intracranial haemorrhage; brain, spinal, or ophthalmic surgery; spinal or epidural anaesthesia (risk of spinal haematoma—avoid if using treatment doses); risk of catheter thrombus during percutaneous coronary intervention; low body-weight; elderly patients; concomitant use of drugs that increase risk of bleeding

**Contra-indications** active bleeding; bacterial endocarditis

**Hepatic impairment** caution in severe impairment (increased risk of bleeding)

**Renal impairment** increased risk of bleeding; for treatment of acute coronary syndromes avoid if eGFR less than 20 mL/minute/1.73 m²; for treatment of venous thromboembolism use with caution if eGFR 30–50 mL/minute/1.73 m², avoid if eGFR less than 30 mL/minute/1.73 m²; for prophylaxis of venous thromboembolism and treatment of superficial-vein thrombosis reduce dose to 1.5 mg daily if eGFR 20–50 mL/minute/1.73 m², avoid if eGFR less than 20 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs possible risk—no information available

**Breast-feeding** present in milk in animal studies—manufacturer advises avoid

**Side-effects** bleeding, purpura, anaemia; less commonly gastro-intestinal disturbances, oedema, hepatic impairment, chest pain, dyspnoea, thrombocytopenia, thrombocytopenia, rash, pruritus; rarely hypertension, flushing, cough, vertigo, dizziness, anxiety, drowsiness, confusion, headache, hypokalaemia, hyperbilirubinaemia, injection-site reactions; also reported atrial fibrillation, tachycardia, and pyrexia

**Dose**

- Prophylaxis of venous thromboembolism after surgery, by subcutaneous injection, 2.5 mg 6 hours after surgery then 2.5 mg once daily; **CHILD** under 17 years not recommended
- Prophylaxis of venous thromboembolism in medical patients, by subcutaneous injection, 2.5 mg once daily; **CHILD** under 17 years not recommended
- Treatment of superficial-vein thrombosis, by subcutaneous injection, ADULT body-weight over 50 kg, 2.5 mg once daily for at least 30 days (max. 45 days if high risk of thromboembolic complications); treatment should be stopped 24 hours before surgery and restarted at least 6 hours post operatively; **CHILD** under 17 years not recommended
- Unstable angina and non-ST-segment elevation myocardial infarction, by subcutaneous injection, 2.5 mg once daily for up to 8 days (or until hospital discharge if sooner); treatment should be stopped 24 hours before coronary artery bypass graft surgery (where possible) and restarted 48 hours post operatively; **CHILD** under 17 years not recommended
- ST-segment elevation myocardial infarction, initially by intravenous injection or infusion, 2.5 mg for first day, thereafter by subcutaneous injection 2.5 mg once daily for up to 8 days (or until hospital discharge if sooner); treatment should be stopped 24 hours before coronary artery bypass graft surgery (where possible) and restarted 48 hours post operatively; **CHILD** under 17 years not recommended
Treatment of deep-vein thrombosis and of pulmonary embolism, by subcutaneous injection, ADULT body-weight under 50 kg, 5 mg every 24 hours; body-weight 50–100 kg, 7.5 mg every 24 hours; body-weight over 100 kg, 10 mg every 24 hours; CHILD under 17 years not recommended.

Note: An oral anticoagulant (usually warfarin, section 2.8.2) is started at the same time as fondaparinux (fondaparinux should be continued for at least 5 days and until INR > 2 for at least 24 hours).

**Arrixtra**

Injection, fondaparinux sodium 5 mg/mL, net price 0.2-mL (1.5-mg) prefilled syringe = £6.28; 0.5-mL (2.5-mg) prefilled syringe = £6.28

Injection, fondaparinux sodium 12.5 mg/mL, net price 0.4-mL (5-mg) prefilled syringe = £11.65, 0.6-mL (7.5-mg) prefilled syringe = £11.65, 0.8-mL (10-mg) prefilled syringe = £11.65

### 2.8.2 Oral anticoagulants

#### Coumarins and phenindione

The oral anticoagulants warfarin, acenocoumarol and phenindione, antagonise the effects of vitamin K, and take at least 48 to 72 hours for the anticoagulant effect to develop fully; warfarin is the drug of choice. If an immediate effect is required, unfractionated or low molecular weight heparin must be given concomitantly.

**Uses**

Indications for these oral anticoagulants include deep-vein thrombosis, pulmonary embolism, atrial fibrillation in those who are at risk of embolisation (see also section 2.10.1), and mechanical prosthetic heart valves (to prevent emboli developing on the valves).

These oral anticoagulants should not be used in cerebral artery thrombosis or peripheral artery occlusion as first-line therapy; aspirin is more appropriate for reduction of risk in transient ischaemic attacks (see p. 158). Unfractionated or a low molecular weight heparin (section 2.8.1) is usually preferred for the prophylaxis of venous thromboembolism in patients undergoing surgery; alternatively, warfarin can be continued in selected patients currently taking long-term warfarin and who are at high risk of thromboembolism (seek expert advice).

**Dose**

The base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.

For patients who require rapid anticoagulation the usual adult induction dose of warfarin is 5–10 mg on the first day (elderly patients should receive a lower induction dose); subsequent doses depend upon the prothrombin time, reported as INR (international normalised ratio). For patients who do not require rapid anticoagulation, a lower loading dose can be used over 3–4 weeks. The daily maintenance dose of warfarin is usually 3–9 mg (taken at the same time each day).

**Target INR**

The following indications and target INRs are recommended:

- **Treatment of deep-vein thrombosis or pulmonary embolism:**
  - Acute venous thromboembolism (treat for at least 3 months); or in patients with a history of venous thromboembolism (treat for 3 months), or with a left atrial thrombus at surgery (treat until clot resolves), or with other risk factors (e.g. atrial fibrillation or a low ventricular ejection fraction).
  - Mechanical prosthetic heart valves:
    - the recommended target INR depends on the type of valve,
    - and the location of the valve, and patient-related risk factors.
  - Consider increasing the INR target or adding an antplatelet drug, if an embolic event occurs whilst anticoagulated at the target INR.

**Duration**

The risks of thromboembolism recurrence and anticoagulant-related bleeding should be considered when deciding the duration of anticoagulation.

The following durations of warfarin for the treatment of deep-vein thrombosis and pulmonary embolism reflect the recommendations of the British Society for Haematology:

- 6 weeks for isolated calf-vein deep-vein thrombosis
- 3 months for venous thromboembolism provoked by surgery or other transient risk factor (e.g. combined oral contraceptive use, pregnancy, plaster cast)
- At least 3 months for unprovoked proximal deep-vein thrombosis or pulmonary embolism; long-term anticoagulation may be required.
Haemorrhage The main adverse effect of all oral anticoagulants is haemorrhage. Checking the INR and omitting doses when appropriate is essential; if the anticoagulant is stopped but not reversed, the INR should be measured 2–3 days later to ensure that it is falling. The cause of an elevated INR should be investigated. The following recommendations (which take into account the recommendations of the British Society for Haematology\(^1\)) are based on the result of the INR and whether there is major or minor bleeding; the recommendations apply to patients taking warfarin:

- **Major bleeding—stop warfarin; give phytonadione (vitamin K\(_1\)) 5 mg by slow intravenous injection; give dried prothrombin complex (factors II, VII, IX, and X—section 2.11) 25–50 units/kg (if dried prothrombin complex unavailable, fresh frozen plasma 15 mL/kg can be given but is less effective); recombinant factor VIIa is not recommended for emergency anticoagulation reversal**

- **INR > 8.0, minor bleeding—stop warfarin; give phytonadione (vitamin K\(_1\)) 1–3 mg by slow intravenous injection; repeat dose of phytonadione if INR still too high after 24 hours; restart warfarin when INR < 5.0**

- **INR > 8.0, no bleeding—stop warfarin; give phytonadione (vitamin K\(_1\)) 1–5 mg by slow intravenous injection using the intravenous preparation orally [unlicensed use]; repeat dose of phytonadione if INR still too high after 24 hours; restart warfarin when INR < 5.0**

- **INR 5.0–8.0, minor bleeding—stop warfarin; give phytonadione (vitamin K\(_1\)) 1–3 mg by slow intravenous injection; restart warfarin when INR < 5.0**

- **INR 5.0–8.0, no bleeding—withdraw 1 or 2 doses of warfarin and reduce subsequent maintenance dose**

- **Unexpected bleeding at therapeutic levels—always investigate possibility of underlying cause e.g. unsuspected renal or gastro-intestinal tract pathology**

**Peri-operative anticoagulation** Warfarin should usually be stopped 5 days before elective surgery; phytonadione (vitamin K\(_1\)) 1–5 mg by mouth (using the intravenous preparation orally [unlicensed use]) should be given the day before surgery if the INR is > 1.5. If haemostasis is adequate, warfarin can be resumed at the normal maintenance dose on the evening of surgery or the next day.

Patients stopping warfarin prior to surgery who are considered to be at high risk of thromboembolism (e.g. those with a venous thromboembolic event within the last 3 months, atrial fibrillation with previous stroke or transient ischaemic attack, or mitral mechanical heart valve) may require interim therapy (‘bridging’) with a low molecular weight heparin (using treatment dose). The low molecular weight heparin should be stopped at least 24 hours before surgery; if the surgery carries a high risk of bleeding, the low molecular weight heparin should not be restarted until at least 48 hours after surgery.

Patients on warfarin who require emergency surgery that can be delayed for 6–12 hours can be given intravenous phytonadione (vitamin K\(_1\)) 5 mg to reverse the anticoagulant effect. If surgery cannot be delayed, dried prothrombin complex (e.g. 25 units/kg) can be given in addition to intravenous phytonadione (vitamin K\(_1\)) and the INR checked before surgery.

**Combined anticoagulant and antiplatelet therapy** Existing antiplatelet therapy following an acute coronary syndrome or percutaneous coronary intervention should be continued for the necessary duration according to the indication being treated (see section 2.9). The addition of warfarin, when indicated (e.g. for venous thromboembolism or atrial fibrillation) should be considered following an assessment of the patient’s risk of bleeding and discussion with a cardiologist. The duration of treatment with dual therapy (e.g. aspirin and warfarin) or triple therapy (e.g. aspirin with clopidogrel and warfarin) should be kept to a minimum where possible. The risk of bleeding with aspirin and warfarin dual therapy is lower than with clopidogrel and warfarin. Depending on the indications being treated and the patient’s risk of thromboembolism, it may be possible to withhold antiplatelet therapy until warfarin therapy is complete, or vice versa (on specialist advice) in order to reduce the length of time on dual or triple therapy.

**Hepatic impairment** Acenocoumarol should be used with caution in mild to moderate impairment; warfarin, acenocoumarol, and phenindione should be avoided in severe impairment, especially if prothrombin time is already prolonged.

**Renal impairment** Warfarin, acenocoumarol, and phenindione should be used with caution in mild to moderate impairment. In severe impairment, monitor INR more frequently with warfarin, and avoid acenocoumarol and phenindione.

**Pregnancy** Warfarin, acenocoumarol, and phenindione are teratogenic and should not be given in the first trimester of pregnancy. Women of child-bearing age should be warned of this danger since stopping these drugs before the sixth week of gestation may largely avoid the risk of fetal abnormality. These oral anticoagulants cross the placenta with risk of congenital malformations, and placental, fetal, or neonatal haemorrhage, especially during the last few weeks of pregnancy and at delivery. Therefore, if at all possible, they should be avoided in pregnancy, especially in the first and third trimesters. Difficult decisions may have to be made, particularly in women with prosthetic heart valves, atrial fibrillation, or with a history of recurrent venous thrombosis or pulmonary embolism.

**Breast-feeding** With warfarin, acenocoumarol, and phenindione there is a risk of haemorrhage which is increased by vitamin-K deficiency. Warfarin is not present in milk in significant amounts, and appears safe, but phenindione should be avoided; the manufacturer of acenocoumarol recommends prophylactic vitamin K for the infant (consult product literature).

**Treatment booklets** Anticoagulant treatment booklets should be issued to all patients; these booklets include advice for patients on anticoagulant treatment, an alert card to be carried by the patient at all times, and a section for recording of INR results and dosage information. In England, Wales, and Northern Ireland, they are available for purchase from:

WARFARIN SODIUM

Indications prophyllaxis of embolisation in rheumatic heart disease and atrial fibrillation; prophyllaxis after insertion of prosthetic heart valve; prophyllaxis and treatment of venous thrombosis and pulmonary embolism; transient ischaemic attacks

Cautions see notes above; also conditions in which risk of bleeding is increased, e.g. history of gastrointestinal bleeding, peptic ulcer, recent surgery, recent ischaemic stroke, postpartum (delay warfarin until risk of haemorrhage is low—usually 5–7 days after delivery), bacterial endocarditis (use only if warfarin otherwise indicated); uncontrolled hypertension; concomitant use of drugs that increase risk of bleeding; avoid cranberry juice; interactions: Appendix 1 (coumarins)

Contra-indications haemorrhagic stroke; significant bleeding; avoid use within 48 hours postpartum

Hepatic impairment see notes above
Renal impairment see notes above
Breast-feeding see notes above
Side-effects haemorrhage—see notes above; also nausea, vomiting, diarrhoea, jaundice, hepatic dysfunction, pancreatitis, pyrexia, alopecia, purpura, rash, ‘purple toes’, skin necrosis (increased risk in patients with protein C or protein S deficiency)

Dose
- See notes above

Warfarin (Non-proprietary) Tablets, warfarin sodium 500 micrograms (white), net price 28-tab pack = £1.29; 1 mg (brown), 28-tab pack = 88p; 5 mg (pink), 28-tab pack = 91p. Label: 10, anticoagulant card

Brands include Maravel® Oral suspension, warfarin sodium 1 mg/mL, net price 150 mL = £90.00. Label: 10, anticoagulant card

Note Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription

ACENOCOUMAROL
(Nicoumalone)

Indications see under Warfarin Sodium

Cautions see under Warfarin Sodium; also patients over 65 years

Contra-indications see under Warfarin Sodium

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see under Warfarin Sodium; also rarely anorexia; very rarely vasculitis

PHENINDIONE

Indications prophyllaxis of embolisation in rheumatic heart disease and atrial fibrillation; prophyllaxis after insertion of prosthetic heart valve; prophyllaxis and treatment of venous thrombosis and pulmonary embolism

Cautions see under Warfarin Sodium; interactions: Appendix 1 (phenindione)

Contra-indications see under Warfarin Sodium

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see under Warfarin Sodium; also hypersensitivity reactions including exfoliative dermatitis, exanthema, fever, leucopenia, agranulocytosis, eosinophilia, and renal damage; micro-adenopathy and urine coloured pink or orange

Dose
- 200 mg on day 1; 100 mg on day 2, then adjusted according to response; maintenance dose usually 50–150 mg daily

Phenindione (Non-proprietary) Tablets, phenindione 10 mg, net price 28-tab pack = £79.01; 25 mg, 28-tab pack = £99.89; 50 mg, 28-tab pack = £51.84. Label: 10, anticoagulant card, 14,

Dabigatran etexilate

Dabigatran etexilate, a direct thrombin inhibitor, is given orally for prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery. It is also available for the prevention of stroke and systemic embolism in patients with non-valvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age ≥ 75 years, diabetes mellitus, or hypertension. Dabigatran etexilate has a rapid onset of action and does not require routine anticoagulant monitoring (INR tests are unreliable in patients taking dabigatran etexilate). The most common side-effect is haemorrhage and patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.

NICE guidance Dabigatran etexilate for the prevention of venous thromboembolism after hip or knee replacement surgery in adults (September 2008) Dabigatran etexilate is an option for the prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery. www.nice.org.uk/TA157
### NICE guidance

**Dabigatran etexilate for the prevention of stroke and systemic embolism in atrial fibrillation (March 2012)**

Dabigatran etexilate is an option for the prevention of stroke and systemic embolism in patients with non-valvular atrial fibrillation and with one or more of the following risk factors:

- previous stroke, transient ischaemic attack, or systemic embolism
- left ventricular ejection fraction < 40%
- symptomatic heart failure
- age ≥ 75 years
- age ≥ 55 years in patients with diabetes mellitus, coronary artery disease, or hypertension

The risks and benefits of dabigatran compared to warfarin should be discussed with the patient.

[www.nice.org.uk/TA249](http://www.nice.org.uk/TA249)

---

### DABIGATRAN ETEXILATE

**Indications**

see notes above

**Cautions**

see notes above; also elderly; body-weight less than 50 kg; anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—give initial dose at least 2 hours after catheter removal and monitor neurological signs); bacterial endocarditis; bleeding disorders; thrombocytopenia; recent biopsy or major trauma; oesophagitis, gastritis, gastro-oesophageal reflux; assess renal function (manufacturer recommends Cockroft and Gault formula to calculate creatinine clearance) before treatment in all patients and at least annually in elderly and patients with renal impairment; concomitant use of drugs that increase risk of bleeding; **Interactions:** Appendix 1 (dabigatran)

**Contra-indications**

active bleeding; significant risk of major bleeding (e.g. recent gastro-intestinal ulcer, oesophageal varices, recent brain, spine, or ophthalmic surgery, recent intracranial haemorrhage, malignant neo-plasms, vascular aneurysm); do not use as anticoagulant for prosthetic heart valve

**Hepatic impairment**

avoid in severe liver disease, especially if prothrombin time already prolonged

**Renal impairment**

for prophylaxis of venous thromboembolism following knee or hip replacement surgery, reduce initial dose to 75 mg and subsequent doses to 150 mg once daily if creatinine clearance 30–50 mL/minute; reduce dose to 75 mg once daily if creatinine clearance 30–50 mL/minute and patient receiving concomitant treatment with verapamil; avoid if creatinine clearance less than 30 mL/minute; for prophylaxis of stroke and systemic embolism in atrial fibrillation, avoid if creatinine clearance less than 30 mL/minute; monitor renal function at least annually (manufacturer recommends Cockroft and Gault formula to calculate creatinine clearance)

**Pregnancy**

manufacturer advises avoid unless essential—**toxicity in animal studies**

**Breast-feeding**

manufacturer advises avoid—**no information available**

**Side-effects**

nausea, dyspepsia, diarrhoea, abdominal pain, anaemia, haemorrhage—see notes above; less commonly hepatobiliary disorders, vomiting, dysphagia, gastro-intestinal ulcer, gastro-oesophageal reflux, oesophagitis, thrombocytopenia

---

### NICE guidance

**Apixaban for the prevention of venous thromboembolism after total hip or knee replacement surgery in adults (January 2012)**

Apixaban is an option for the prevention of venous thromboembolism in adults after hip or knee replacement surgery.

[www.nice.org.uk/TA245](http://www.nice.org.uk/TA245)

---

### Apixaban

**Apixaban**, a direct inhibitor of activated factor X (factor Xa), is given orally for the prophylaxis of venous thromboembolism in adults after hip or knee replacement surgery. Apixaban is also licensed for the prophylaxis of stroke and systemic embolism in patients with non-valvular atrial fibrillation and at least one risk factor such as previous stroke or transient ischaemic attack, symptomatic heart failure, diabetes mellitus, hypertension, or age ≥ 75 years. Apixaban does not require routine anticoagulant monitoring (INR tests are unreliable in patients taking apixaban). Haemorrhage is a common side-effect and patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.

---

### NICE guidance

**Apixaban for the prevention of stroke and systemic embolism in non-valvular atrial fibrillation (February 2013)**

Apixaban is an option for the prevention of stroke and systemic embolism in non-valvular atrial fibrillation in accordance with its licensed indication (see notes above).

The risks and benefits of apixaban compared to warfarin, dabigatran etexilate, and rivaroxaban should be discussed with the patient.

[www.nice.org.uk/TA275](http://www.nice.org.uk/TA275)
APIXABAN

Indications  see notes above

Cautions  see notes above; also risk of bleeding; concurrent use of drugs that increase risk of bleeding; prosthetic heart valve (efficacy not established); anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—monitor neurological signs and wait 20–30 hours after apixaban dose before removing catheter and do not give next dose until at least 5 hours after catheter removal); interactions: Appendix 1 (apixaban)

Contra-indications  active bleeding; significant risk of major bleeding (e.g. recent gastro-intestinal ulcer, oesophageal varices, recent brain, spine, or ophthalmic surgery, recent intracranial haemorrhage, malignant neoplasms, vascular aneurysm)

Hepatic impairment  avoid in severe impairment and in hepatic disease associated with coagulopathy

Renal impairment  for prophyllaxis of venous thromboembolism following knee or hip replacement surgery, use with caution if creatinine clearance 15–29 mL/minute; for prophylaxis of stroke and systemic embolism in atrial fibrillation, reduce dose to 2.5 mg twice daily if creatinine clearance 15–29 mL/minute, or if serum-creatinine > 133 micromol/litre and age > 80 years or body-weight ≤ 60kg; manufacturer advises avoid if creatinine clearance less than 15 mL/minute—no information available

Pregnancy  manufacturer advises avoid—no information available

Breast-feeding  manufacturer advises avoid—present in milk in animal studies

Side-effects  nausea, haemorrhage (see notes above), bruising, anaemia; less commonly hypotension, thrombocytopenia

Dose
- Prophylaxis of venous thromboembolism following knee replacement surgery, ADULT over 18 years, 2.5 mg twice daily for 10–14 days, starting 12–24 hours after surgery
- Prophylaxis of venous thromboembolism following hip replacement surgery, ADULT over 18 years, 2.5 mg twice daily for 32–38 days, starting 12–24 hours after surgery
- Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation (see notes above), ADULT over 18 years, 5 mg (ELDERLY over 80 years with body-weight ≤ 60 kg, 2.5 mg) twice daily

Note  For information on changing from, or to, other anticoagulants, consult product literature

Eliquis® (Bristol-Myers Squibb) Tablets, yellow, f/c, apixaban 2.5 mg, net price 10-tab pack = £10.98, 20-tab pack = £21.96, 60-tab pack = £56.90; 5 mg, 56-tab pack = £61.50

Rivaroxaban

Rivaroxaban, a direct inhibitor of activated factor X (factor Xa), is given orally for prophylaxis of venous thromboembolism in adults after hip or knee replacement surgery—see Prophylaxis of Venous Thromboembolism, p. 144; it is also given for the treatment of deep-vein thrombosis and pulmonary embolism, and prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism, although it should not be used as an alter-native to unfractionated heparin in pulmonary embolism in patients with haemodynamic instability, or who may receive thrombolysis or pulmonary embolectomy.

Rivaroxaban is also licensed for the prophylaxis of stroke and systemic embolism in patients with non-valvular atrial fibrillation and with at least one of the following risk factors: congestive heart failure, hypertension, previous stroke or transient ischaemic attack, age ≥ 75 years, or diabetes mellitus. Rivaroxaban does not require routine anticoagulant monitoring (INR tests are unreliable in patients taking rivaroxaban). The common side-effects are nausea and haemorrhage, and patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.

The Scottish Medicines Consortium (p. 4) has advised (January 2012) that rivaroxaban (Xarelto®) is accepted for restricted use within NHS Scotland for the prevention of stroke and systemic embolism in accordance with the licensed indication; use is restricted to patients with poor INR control despite compliance with coumarin-anticoagulant therapy, or to patients who are allergic to, or unable to tolerate, a coumarin anticoagulant.

NICE guidance

Rivaroxaban for the prevention of venous thromboembolism after total hip or total knee replacement in adults (April 2009)

Rivaroxaban is an option for the prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery.

www.nice.org.uk/TA170

NICE guidance

Rivaroxaban for the prevention of stroke and systemic embolism in atrial fibrillation (May 2012)

Rivaroxaban is an option for the prevention of stroke and systemic embolism in accordance with its licensed indication (see notes above). The risks and benefits of rivaroxaban compared with warfarin should be discussed with the patient.

www.nice.org.uk/TA256

NICE guidance

Rivaroxaban for the treatment of deep-vein thrombosis and prevention of recurrent deep-vein thrombosis and pulmonary embolism (July 2012)

Rivaroxaban is an option for the treatment of deep-vein thrombosis and prevention of recurrent deep-vein thrombosis and pulmonary embolism in adults after diagnosis of acute deep-vein thrombosis.

www.nice.org.uk/TA261

NICE guidance

Rivaroxaban for treating pulmonary embolism and preventing recurrent venous thromboembolism (June 2013)

Rivaroxaban is an option for treating pulmonary embolism and preventing recurrent deep-vein thrombosis and pulmonary embolism in adults.

www.nice.org.uk/TA287
2 Cardiovascular system

RIVAROXABAN

Indications  see notes above

Cautions  see notes above; also risk of bleeding; concomitant use of drugs that increase risk of bleeding; severe hypertension; prosthetic heart valve (efficacy not established); vascular retinopathy; anaesthesia with postoperative indwelling epidural catheter (risk of paralyse—monitor neurological signs and wait at least 18 hours after rivaroxaban dose before removing catheter and do not give next dose until at least 6 hours after catheter removal); bronchiectasis; interactions  Appendix 1 (rivaroxaban)

Contra-indications  active bleeding; significant risk of major bleeding (e.g. recent gastro-intestinal ulcer, oesophageal varices, recent brain, spine, or ophthalmic surgery, recent intracranial haemorrhage, malignant neoplasms, vascular aneurysm)

Hepatic impairment  avoid in liver disease with coagulopathy

Renal impairment  for prophylaxis of venous thromboembolism following knee or hip replacement surgery, use with caution if creatinine clearance 15–29 mL/minute; for treatment of deep-vein thrombosis or pulmonary embolism and prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism, initially 15 mg twice daily for 21 days, then 20 mg once daily (but consider reducing to 15 mg once daily if risk of bleeding outweighs risk of recurrent deep-vein thrombosis or pulmonary embolism) if creatinine clearance 15–49 mL/minute; for prophylaxis of stroke and systemic embolism in atrial fibrillation, reduce dose to 15 mg once daily if creatinine clearance 15–49 mL/minute; use with caution if concomitant use of drugs that increase plasma-rivaroxaban concentration (consult product literature); avoid if creatinine clearance less than 15 mL/minute; manufacturer recommends Cockroft and Gault formula to calculate creatinine clearance

Pregnancy  manufacturer advises avoid—toxicity in animal studies

Breast-feeding  manufacturer advises avoid—toxicity in animal studies

Side-effects  nausea, vomiting, diarrhoea, constipation, dyspepsia, abdominal pain, hypotension, dizziness, headache, renal impairment, haemorrhage (see notes above), pain in extremities, pruritus, rash; less commonly dry mouth, thrombocythaemia, tachycardia, syncope, angioedema, malaise; rarely jaundice, oedema

Dose
- Prophylaxis of venous thromboembolism following knee replacement surgery, ADULT over 18 years, 10 mg once daily for 2 weeks starting 6–10 hours after surgery
- Prophylaxis of venous thromboembolism following hip replacement surgery, ADULT over 18 years, 10 mg once daily for 5 weeks starting 6–10 hours after surgery
- Treatment of deep-vein thrombosis or pulmonary embolism, ADULT over 18 years, initial treatment 15 mg twice daily with food for 21 days, then for continued treatment and prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism, 20 mg once daily with food
- Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation (see notes above), ADULT over 18 years, 20 mg once daily with food

Note  For information on changing from, or to, other anticoagulants, consult product literature

Xarelto® (Bayer)

Tablets, F/c, rivaroxaban 10 mg (light red), net price 10-tab pack = £21.00, 30-tab pack = £63.00, 100-tab pack = £210.00; 15 mg (red), 14-tab pack = £29.40, 28-tab pack = £58.80, 42-tab pack = £88.20, 100-tab pack = £210.00; 20 mg (brown-red), 28-tab pack = £58.80, 100-tab pack = £210.00

Note  Tablets may be crushed and mixed with water or apple puree just before administration

2.8.3 Protamine sulfate

Protamine sulfate is used to treat overdosage of unfractionated or low molecular weight heparin. The long half-life of low molecular weight heparins should be taken into consideration when determining the dose of protamine sulfate; the effects of low molecular weight heparins can persist for up to 24 hours after administration. Excessive doses of protamine sulfate can have an anticoagulant effect.

PROTAMINE SULFATE

Indications  see above

Cautions  see above; also monitor activated partial thromboplastin time or other appropriate blood clotting parameters; increased risk of allergic reaction to protamine (including previous treatment with protamine or protamine insulin, allergy to fish, men who are infertile or who have had a vasectomy)

Side-effects  nausea, vomiting, lassitude, flushing, hypotension, hypertension, bradycardia, dyspnkoa, rebound bleeding, back pain; hypersensitivity reactions (including angioedema, anaphylaxis) and pulmonary oedema reported

Dose
- Overdosage with intravenous injection of unfractionated heparin, by intravenous injection (rate not exceeding 5 mg/minute), 1 mg neutralises 80–100 units heparin when given within 15 minutes of heparin; if longer than 15 minutes since heparin, less protamine required (consult product literature for details) as heparin rapidly excreted; max. 50 mg
- Overdosage with intravenous infusion of unfractionated heparin, by intravenous injection (rate not exceeding 5 mg/minute), 25–50 mg once heparin infusion stopped
- Overdosage with subcutaneous injection of unfractionated heparin, 1 mg neutralises 100 units heparin; give 25–50 mg by intravenous injection (rate not exceeding 5 mg/minute) then any remaining dose given by intravenous infusion over 8–16 hours; max. total dose 50 mg
- Overdosage with subcutaneous injection of low molecular weight heparin, by intermittent intravenous injection (rate not exceeding 5 mg/minute) or by continuous intravenous infusion, 1 mg neutralises approx. 100 units low molecular weight heparin (consult product literature of low molecular weight heparin for details); max. 50 mg

Protamine Sulfate (Non-proprietary)

Injection, protamine sulfate 10 mg/mL, net price 5-mL amp = £1.14, 10-mL amp = £3.96
2.9 Antiplatelet drugs

Antiplatelet drugs decrease platelet aggregation and inhibit thrombus formation in the arterial circulation, because in faster-flowing vessels, thrombi are composed mainly of platelets with little fibrin.

Use of aspirin in primary prevention of cardiovascular events, in patients with or without diabetes, is of unproven benefit. Long-term use of aspirin, in a dose of 75 mg daily, is of benefit in established cardiovascular disease (secondary prevention); unduly high blood pressure must be controlled before aspirin is given. If the patient is at a high risk of gastro-intestinal bleeding, a proton pump inhibitor (section 1.3.5) can be added.

Aspirin in a dose of 75–300 mg daily is given following coronary bypass surgery. For details on the use of aspirin in atrial fibrillation see section 2.3.1; for intermittent claudication see section 2.6.4; for stable angina and acute coronary syndromes see section 2.10.1; for use following placement of coronary stents see below; for use in stroke see also below.

Clopidogrel is licensed for the prevention of atherothrombotic events in patients with a history of symptomatic ischaemic disease. Clopidogrel, in combination with low-dose aspirin, is also licensed for acute coronary syndrome without ST-segment elevation (section 2.10.1); in these circumstances the combination is given for up to 12 months (most benefit occurs during the first 3 months; there is no evidence of benefit beyond 12 months). Clopidogrel, in combination with low-dose aspirin, is also licensed for acute myocardial infarction with ST-segment elevation (section 2.10.1); the combination is licensed for at least 4 weeks, but the optimum treatment duration has not been established. In patients undergoing percutaneous coronary intervention, clopidogrel is used as an adjunct with aspirin (see also below). Patients, who are not already taking clopidogrel, should receive a 300 mg loading dose prior to the procedure; alternatively, a 600 mg [unlicensed] loading dose may produce a greater and more rapid inhibition of platelet aggregation.

Clopidogrel is also licensed, in combination with low-dose aspirin, for the prevention of atherothrombotic and thromboembolic events in patients with atrial fibrillation (and at least one risk factor for a vascular event), and for whom warfarin is unsuitable.

Use of clopidogrel with aspirin increases the risk of bleeding. Clopidogrel monotherapy may be an alternative when aspirin is contra-indicated, for example in those with aspirin hypersensitivity, or when aspirin is not tolerated despite the addition of a proton pump inhibitor (see also NICE guidance, below).

For details on the use of clopidogrel in stroke, see below.

The Scottish Medicines Consortium (p. 4) has advised (February 2004) that clopidogrel be accepted for restricted use for the treatment of confirmed acute coronary syndrome (without ST-segment elevation), in combination with aspirin. Clopidogrel should be initiated in hospital inpatients only. The Scottish Medicines Consortium has also advised (July 2007) that clopidogrel be accepted for restricted use for patients with ST-segment elevation acute myocardial infarction in combination with aspirin; treatment with clopidogrel is restricted to 4 weeks only.

Dipyridamole is used by mouth as an adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves. Modified-release preparations are licensed for secondary prevention of ischaemic stroke and transient ischaemic attacks (see also Long-term Management, under Ischaemic Stroke, below).

NICE guidance

Prasugrel for the treatment of acute coronary syndromes with percutaneous coronary intervention (October 2009)

Prasugrel, in combination with aspirin, is an option for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention, only when:

- immediate primary percutaneous coronary intervention is necessary for ST-segment elevation myocardial infarction, or
- stent thrombosis occurred during treatment with clopidogrel, or
- the patient has diabetes mellitus.

www.nice.org.uk/TA182

Prasugrel, in combination with aspirin, is licensed for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention (section 2.10.1); in these circumstances the combination is given for up to 12 months (most benefit occurs during the first 3 months; there is no evidence of benefit beyond 12 months).

Modified-release dipyridamole, in combination with aspirin, is recommended as an option to prevent occlusive vascular events in patients who have had:

- an ischaemic stroke, or who have peripheral arterial disease or multivascular disease, or
- a myocardial infarction, only if aspirin is contra-indicated or not tolerated.

Modified-release dipyridamole monotherapy is recommended as an option to prevent occlusive vascular events in patients who have had:

- an ischaemic stroke, only if aspirin and clopidogrel are contra-indicated or not tolerated, or
- a transient ischaemic attack, only if aspirin is contra-indicated or not tolerated.

www.nice.org.uk/TA210

NICE guidance

Prasugrel for the treatment of acute coronary syndromes with percutaneous coronary intervention (December 2010)

The guidance applies to patients who have had an occlusive vascular event, or who have established peripheral arterial disease. The guidance does not apply to patients who have had, or are at risk of, stroke associated with atrial fibrillation, or who need prophylaxis for occlusive events following coronary revascularisation or carotid artery procedures.

Clopidogrel monotherapy is recommended as an option to prevent occlusive vascular events in patients who have had:

- an ischaemic stroke, or who have peripheral arterial disease or multivascular disease, or
- a myocardial infarction, only if aspirin is contra-indicated or not tolerated.

Modified-release dipyridamole, in combination with aspirin, is recommended as an option to prevent occlusive vascular events in patients who have had:

- an ischaemic stroke, only if aspirin and clopidogrel are contra-indicated or not tolerated, or
- a transient ischaemic attack, only if aspirin is contra-indicated or not tolerated.

www.nice.org.uk/TA182

NICE guidance

Prasugrel for the treatment of acute coronary syndromes with percutaneous coronary intervention (December 2010)

Prasugrel, in combination with aspirin, is an option for the prevention of atherothrombotic events in patients who have had, or are at risk of, stroke associated with atrial fibrillation, or who need prophylaxis for occlusive events following coronary revascularisation or carotid artery procedures.

Clopidogrel monotherapy is recommended as an option to prevent occlusive vascular events in patients who have had:

- an ischaemic stroke, or who have peripheral arterial disease or multivascular disease, or
- a myocardial infarction, only if aspirin is contra-indicated or not tolerated.

Modified-release dipyridamole, in combination with aspirin, is recommended as an option to prevent occlusive vascular events in patients who have had:

- an ischaemic stroke, only if aspirin and clopidogrel are contra-indicated or not tolerated, or
- a transient ischaemic attack, only if aspirin is contra-indicated or not tolerated.

www.nice.org.uk/TA210
Ticagrelor, in combination with aspirin, is licensed for the prevention of atherothrombotic events in patients with acute coronary syndrome; the combination is usually given for up to 12 months.

**NICE guidance**

**Ticagrelor for the treatment of acute coronary syndromes (October 2011)**

Ticagrelor, in combination with low-dose aspirin, is recommended for up to 12 months as a treatment option in adults with acute coronary syndromes, that is, people:

- with ST-segment elevation myocardial infarction—defined as ST elevation or new left bundle branch block on electrocardiogram—that cardiologists intend to treat with primary percutaneous coronary intervention, or
- with non-ST-segment elevation myocardial infarction (NSTEMI), or
- admitted to hospital with unstable angina—defined as ST or T wave changes on electrocardiogram suggestive of ischaemia plus one of the characteristics defined below. Before ticagrelor is continued beyond the initial treatment, the diagnosis of unstable angina should first be confirmed, ideally by a cardiologist. Characteristics to be used in defining treatment with ticagrelor for unstable angina are:
  - age 60 years or older;
  - previous myocardial infarction or previous coronary artery bypass grafting;
  - coronary artery disease with stenosis of 50% or more in at least two vessels;
  - previous ischaemic stroke;
  - previous transient ischaemic attack, carotid stenosis of at least 50%, or cerebral recanalisation;
  - diabetes mellitus;
  - peripheral arterial disease, or
  - chronic renal dysfunction (creatinine clearance less than 60 ml/minute/1.73 m²).

For use of epoprostenol, see section 2.8.1.

**Management of stroke**

Stroke is associated with a significant risk of morbidity and mortality. Patients presenting with acute symptoms should be immediately transferred to hospital for accurate diagnosis of stroke type, and urgent initiation of appropriate treatment; patients should be managed by a specialist multidisciplinary stroke team.

The following notes give an overview of the initial and long-term management of transient ischaemic attack, ischaemic stroke, and intracerebral haemorrhage.

**Transient ischaemic attack**

Patients suspected of having a transient ischaemic attack should immediately receive aspirin 300 mg once daily (patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor, should receive clopidogrel 75 mg once daily [unlicensed use] as an alternative).

Following a confirmed diagnosis, patients should receive treatment for secondary prevention (see Long-term Management, under Ischaemic Stroke, below).

**Ischaemic stroke**

**Initial management**

Alteplase (section 2.10.2) is recommended in the treatment of acute ischaemic stroke if it can be administered within 4.5 hours of symptom onset; it should be given by medical staff experienced in the administration of thrombolysis and the treatment of acute stroke, preferably within a specialist stroke centre. Treatment with aspirin 300 mg once daily for 14 days should be initiated 24 hours after thrombolysis (or as soon as possible within 48 hours of symptom onset in patients not receiving thrombolysis); patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor, should receive clopidogrel 75 mg once daily [unlicensed use] as an alternative.

Anticoagulants are not recommended as an alternative to antiplatelet drugs in acute ischaemic stroke in patients who are in sinus rhythm. However, parenteral anticoagulants (section 2.8.1) may be indicated in patients who are symptomatic of, or at high risk of developing, deep vein thrombosis or pulmonary embolism; warfarin should not be commenced in the acute phase of ischaemic stroke.

**Antiplaete drugs and coronary stents**

Patients selected for percutaneous coronary intervention, with the placement of a coronary stent, will require dual antiplatelet therapy with aspirin and either clopidogrel, prasugrel, or ticagrelor. Aspirin therapy should continue indefinitely. Clopidogrel is recommended for 1 month following elective percutaneous coronary intervention with placement of a bare-metal stent, and for 12 months if percutaneous coronary intervention with placement of a bare-metal stent was for an acute coronary syndrome; clopidogrel should be given for 12 months following placement of a drug-eluting stent. Clopidogrel should not be discontinued prematurely in patients with a drug-eluting stent—there is an increased risk of stent thrombosis as a result of the eluted drug slowing the re-endothelialisation process. Patients considered to be at high risk of developing late stent thrombosis with a drug-eluting stent may require a longer duration of treatment with clopidogrel. Prasugrel or ticagrelor are alternatives to clopidogrel in certain patients undergoing percutaneous coronary intervention (see notes above).

**Glycoprotein Ilb/IIIa inhibitors**

Glycoprotein Ilb/IIIa inhibitors prevent platelet aggregation by blocking the binding of fibrinogen to receptors on platelets. Abciximab is a monoclonal antibody which binds to glycoprotein Ilb/IIIa receptors and to other related sites; it is licensed as an adjunct to unfractionated heparin and aspirin for the prevention of ischaemic complications in high-risk patients undergoing percutaneous transluminal coronary intervention. Abciximab should be used once only (to avoid additional risk of thrombocytopenia). Eptifibatide (in combination with unfractionated heparin and aspirin) and tirofiban (in combination with unfractionated heparin, aspirin, and clopidogrel) also inhibit glycoprotein Ilb/IIIa receptors; they are licensed for use to prevent early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction (section 2.10.1). Tirofiban is also licensed for use in combination with unfractionated heparin, aspirin, and clopidogrel, for the reduction of major cardiovascular events in patients with ST-segment elevation myocardial infarction intended for primary percutaneous coronary intervention. Abciximab, eptifibatide and tirofiban should be used by specialists only.

www.nice.org.uk/TA236
Anticoagulants (section 2.8.2) should be considered after cardio-embolic ischaemic stroke in patients with atrial fibrillation, however patients presenting with atrial fibrillation following a disabling ischaemic stroke should receive aspirin 300 mg once daily for 14 days, before being considered for anticoagulant treatment. Patients already receiving anticoagulation for a prosthetic heart valve who experience a disabling ischaemic stroke and are at significant risk of haemorrhagic transformation, should have their anticoagulant treatment stopped for 7 days and substituted with aspirin 300 mg once daily.

Treatment of hypertension in the acute phase of ischaemic stroke can result in reduced cerebral perfusion, and should therefore only be instituted in the event of a hypertensive emergency (see section 2.5), or in those patients considered for thrombolysis.

**Long-term management** Patients should receive long-term treatment following a transient ischaemic attack or an ischaemic stroke to reduce the risk of further cardiovascular events.

Following a *transient ischaemic attack*, long-term treatment with modified-release dipyridamole 200 mg twice daily in combination with aspirin 75 mg once daily is recommended. If patients are intolerant of aspirin, or it is contra-indicated, then modified-release dipyridamole alone is recommended; if patients are intolerant of dipyridamole, or it is contra-indicated, then aspirin alone is recommended. Patients who are intolerant of both aspirin and dipyridamole should receive clopidogrel alone (unlicensed use).

Following an *ischaemic stroke* (not associated with atrial fibrillation—see below), clopidogrel 75 mg once daily is recommended as long-term treatment. If clopidogrel is contra-indicated or not tolerated, patients should receive modified-release dipyridamole 200 mg twice daily in combination with aspirin 75 mg once daily; if both aspirin and clopidogrel are contra-indicated or not tolerated, then modified-release dipyridamole alone is recommended; if both dipyridamole and clopidogrel are contra-indicated or not tolerated, then aspirin alone is recommended.

Patients with stroke associated with atrial fibrillation should be reviewed for long-term treatment with warfarin or an alternative anticoagulant (see Initial Management under Ischaemic Stroke, above, and section 2.3). Anticoagulants are not routinely recommended in the long-term prevention of recurrent stroke, except in patients with atrial fibrillation (section 2.3).

A statin (section 2.12) should be initiated 48 hours after stroke symptom onset, irrespective of the patient’s serum-cholesterol concentration.

Following the acute phase of ischaemic stroke, blood pressure should be measured and treatment initiated to achieve a target blood pressure of <130/80 mmHg (see section 2.5). Beta-blockers should not be used in the management of hypertension following a stroke, unless they are indicated for a co-existing condition.

All patients should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight, alcohol intake, and smoking.

**Intracerebral haemorrhage**

**Initial management** Surgical intervention may be required following intracerebral haemorrhage to remove the haematoma and relieve intracranial pressure. Patients taking anticoagulants should have this treatment stopped and reversed (see section 2.8.2); anticoagulant therapy has, however, been used in patients with intracerebral haemorrhage who are symptomatic of deep vein thrombosis or pulmonary embolism; placement of a caval filter is an alternative in this situation.

**Long-term management** Aspirin therapy should only be given to patients at a high risk of a cardiac ischaemic event. Anticoagulant therapy is not recommended following an intracerebral haemorrhage, even in those with atrial fibrillation, unless the patient is at very high risk of an ischaemic stroke or cardiac ischaemic events; advice from a specialist should be sought in this situation. Blood pressure should be measured and treatment initiated where appropriate (see section 2.5), taking care to avoid hypoperfusion. Statins should be avoided following intracerebral haemorrhage, however they can be used with caution when the risk of a vascular event outweighs the risk of further haemorrhage.

---

**ABCIXIMAB**

**Indications** prevention of ischaemic cardiac complications in patients undergoing percutaneous coronary intervention; short-term prevention of myocardial infarction in patients with unstable angina not responding to conventional treatment and who are scheduled for percutaneous coronary intervention (use under specialist supervision)

**Cautions** measure baseline prothrombin time, activated partial thromboplastin time, platelet count, haemoglobin and haematocrit; monitor haemoglobin and haematocrit 12 hours and 24 hours after start of treatment and platelet count 2–4 hours and 24 hours after start of treatment; concomitant use of drugs that increase risk of bleeding; discontinue if uncontrollable serious bleeding occurs or emergency cardiac surgery needed; consult product literature for details of procedures to minimise bleeding; elderly

**Contra-indications** active internal bleeding; major surgery, intracranial or intraspinal surgery or trauma within last 2 months; stroke within last 2 years; intracranial neoplasm, arteriovenous malformation or aneurysm, severe hypertension, haemorrhagic diathesis, thrombocytopenia, vasculitis, hypertensive retinopathy

**Hepatic impairment** avoid in severe liver disease—increased risk of bleeding

**Renal impairment** caution in severe impairment—increased risk of bleeding

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** bleeding manifestations; nausea, vomiting, hypotension, bradycardia, chest pain, back pain, headache, fever, puncture site pain, thrombocytopenia; rarely cardiac tamponade, adult respiratory distress, hypersensitivity reactions

**Dose**

- **ADULT** initially by intravenous injection over 1 minute, 250 micrograms/kg, then by intravenous infusion, 125 nanograms/kg/minute (max. 10 micrograms/minute); for prevention of ischaemic complications
start 10–60 minutes before percutaneous coronary intervention and continue infusion for 12 hours; for unstable angina start up to 24 hours before possible percutaneous coronary intervention and continue infusion for 12 hours after intervention

RePro® (Lilly) (PMS)
Injection, abciximab 2 mg/mL, net price 5-mL vial = £250.24

ASPIRIN (antiplatelet)
(Acetylsalicylic Acid)

Indications secondary prevention of thrombotic cerebrovascular or cardiovascular disease, and following by-pass surgery (see also section 2.10.1 and notes above)

Cautions asthma; uncontrolled hypertension; previous peptic ulceration (but manufacturers may advise avoidance of low-dose aspirin in history of peptic ulceration); concomitant use of drugs that increase risk of bleeding; G6PD deficiency (section 9.1.5); dehydration; elderly; interactions: Appendix 1 (aspirin)

Contra-indications use other than as an antiplatelet in children and adolescents under 16 years (Reye’s syndrome, section 4.7.1); active peptic ulceration; haemophilia and other bleeding disorders

Hypersensitivity Aspirin and other NSAIDs are contra-indicated in history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria, or rhinitis have been precipitated by aspirin or any other NSAID

Hepatic impairment avoid in severe impairment—increased risk of gastro-intestinal bleeding

Renal impairment use with caution; avoid in severe impairment; sodium and water retention; deterioration in renal function; increased risk of gastrointestinal bleeding

Pregnancy use with caution during third trimester; impaired platelet function and risk of haemorrhage; delayed onset and increased duration of labour with increased blood loss; avoid analgesic doses if possible in last few weeks (low doses probably not harmful); with high doses, closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of newborn; kernicterus in jaundiced neonates

Breast-feeding avoid—possible risk of Reye’s syndrome; regular use of high doses could impair platelet function and produce hypoprothrombinaemia in infant if neonatal vitamin K stores low

Side-effects bronchospasm; gastro-intestinal irritation, gastro-intestinal haemorrhage (occasionally major), also other haemorrhage (e.g. subconjunctival)

Dose

1. Aspirin tablets 75 mg may be sold to the public in packs of up to 100 tablets; for details relating to other strengths see section 4.7.1 and Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition)

ASPIRIN (antiplatelet)
(Acetylsalicylic Acid)

Indications secondary prevention of thrombotic cerebrovascular or cardiovascular disease, and following by-pass surgery (see also section 2.10.1 and notes above)

Cautions asthma; uncontrolled hypertension; previous peptic ulceration (but manufacturers may advise avoidance of low-dose aspirin in history of peptic ulceration); concomitant use of drugs that increase risk of bleeding; G6PD deficiency (section 9.1.5); dehydration; elderly; interactions: Appendix 1 (aspirin)

Contra-indications use other than as an antiplatelet in children and adolescents under 16 years (Reye’s syndrome, section 4.7.1); active peptic ulceration; haemophilia and other bleeding disorders

Hypersensitivity Aspirin and other NSAIDs are contra-indicated in history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria, or rhinitis have been precipitated by aspirin or any other NSAID

Hepatic impairment avoid in severe impairment—increased risk of gastro-intestinal bleeding

Renal impairment use with caution; avoid in severe impairment; sodium and water retention; deterioration in renal function; increased risk of gastrointestinal bleeding

Pregnancy use with caution during third trimester; impaired platelet function and risk of haemorrhage; delayed onset and increased duration of labour with increased blood loss; avoid analgesic doses if possible in last few weeks (low doses probably not harmful); with high doses, closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of newborn; kernicterus in jaundiced neonates

Breast-feeding avoid—possible risk of Reye’s syndrome; regular use of high doses could impair platelet function and produce hypoprothrombinaemia in infant if neonatal vitamin K stores low

Side-effects bronchospasm; gastro-intestinal irritation, gastro-intestinal haemorrhage (occasionally major), also other haemorrhage (e.g. subconjunctival)

Dose

1. Aspirin tablets 75 mg may be sold to the public in packs of up to 100 tablets; for details relating to other strengths see section 4.7.1 and Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition)

Nu-Seals® Aspirin (Alliance) (PMS)
Tablets, e/c, aspirin 75 mg, net price 56-tab pack = £3.12; 300 mg, see section 4.7.1. Label: 5, 25, 32

Note Tablets may be chewed at diagnosis for rapid absorption

With dipyridamole See under Dipyridamole, p. 161

CLOPIDOGREL

Indications prevention of atherothrombotic events in peripheral arterial disease, or within 35 days of myocardial infarction, or within 6 months of ischaemic stroke; prevention of artherothrombotic events in acute coronary syndrome without ST-segment elevation (given with aspirin—see notes above) and in acute myocardial infarction with ST-segment elevation (given with aspirin—see notes above); prevention of atherothrombotic and thromboembolic events in patients with atrial fibrillation (given with aspirin—see notes above) and for whom warfarin is unsuitable

Cautions patients at risk of increased bleeding from trauma, surgery, or other pathological conditions; concomitant use of drugs that increase risk of bleeding; discontinue 7 days before elective surgery if antiplatelet effect not desirable; history of hypersensitivity reactions to thienopyridines (e.g. prasugrel); interactions: Appendix 1 (clopidogrel)

Contra-indications active bleeding

Hepatic impairment manufacturer advises caution (risk of bleeding); avoid in severe impairment

Renal impairment manufacturer advises caution

Pregnancy manufacturer advises avoid—no information available

Breast-feeding manufacturer advises avoid

Side-effects dyspepsia, abdominal pain, diarrhoea; bleeding disorders (including gastro-intestinal and intracranial); less commonly nausea, vomiting, gastritis, flatulence, constipation, gastric and duodenal ulcers, headache, dizziness, paraesthesia, leucopenia, decreased platelets (very rarely severe thrombocytopenia), eosinophilia, rash, and pruritus; rarely vertigo; very rarely colitis, pancreatitis, hepatitis, acute liver failure, vasculitis, confusion, hallucinations, taste disturbance, stomatitis, bronchospasm, interstitial pneumonia, eosinophilic pneumonia, blood disorders (including thrombocytopenic purpura, agranulocytosis, pancytopenia, acquired haemophilia), and hypersensitivity-like reactions (including fever, glomerulonephritis, arthralgia, Stevens-Johnson syndrome, toxic epidermal necrolysis, lichen planus)

Dose

• Prevention of atherothrombotic events in peripheral arterial disease or after myocardial infarction or ischaemic stroke, 75 mg once daily

• Acute coronary syndrome (without ST-segment elevation), initially 300 mg then 75 mg daily (with aspirin—see notes above)

• Acute myocardial infarction (with ST-segment elevation), initially 300 mg then 75 mg daily (with aspirin—see notes above); initial dose omitted if patient over 75 years

• Prevention of atherothrombotic and thromboembolic events in patients with atrial fibrillation (with aspirin—see notes above), 75 mg once daily
Dipyridamole

Indications  see notes above and under Dose

Cautions  rapidly worsening angina, aortic stenosis, recent myocardial infarction, left ventricular outflow obstruction, heart failure; may exacerbate migraine; hypotension; myasthenia gravis (risk of exacerbation); coagulation disorders; concomitant use of drugs that increase risk of bleeding; interactions: Appendix 1 (dipyridamole)

Pregnancy  not known to be harmful

Breast-feeding  manufacturers advise use only if essential—small amount present in milk

Side-effects  gastro-intestinal effects, dizziness, myalgia, throbbing headache, hypotension, hot flushes and tachycardia; worsening symptoms of coronary heart disease; hypersensitivity reactions such as rash, urticaria, severe bronchospasm and angioedema; increased bleeding during or after surgery; thrombocytopenia reported

Dose  
- By mouth, 300–600 mg daily in 3–4 divided doses
- Modified-release preparations, see under preparation below
- By intravenous injection, diagnostic only, consult product literature

Dipyridamole (Non-proprietary) Tablets, coated, dipyridamole 25 mg, net price 84 = £2.67; 100 mg, 84 = £3.46. Label: 22
Oral suspension, dipyridamole 50 mg/5 mL, net price 150 mL = £39.41

Persantin® (Boehringer Ingelheim) Tablets, s/c, dipyridamole 100 mg, net price 84-tab pack = £6.30. Label: 22
Injection, dipyridamole 5 mg/mL, net price 2-mL amp = 16p

Modified release

Persantin® Retard (Boehringer Ingelheim) Capsules, m/r, red/orange containing yellow pellets, dipyridamole 200 mg, net price 60-cap pack = £10.06. Label: 21, 25

Note  Dispense in original container (pack contains a desiccant) and discard any capsules remaining 6 weeks after opening

With aspirin

For prescribing information on aspirin, see under Aspirin, p. 160

Asasantin® Retard (Boehringer Ingelheim) Capsules, red/ivory, aspirin 25 mg, dipyridamole

Eptifibatide

Indications  in combination with aspirin and unfractionated heparin for the prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction and with last episode of chest pain within 24 hours (use under specialist supervision)

Cautions  risk of bleeding, concomitant drugs that increase risk of bleeding—discontinue immediately if uncontrolled serious bleeding; measure baseline prothrombin time, activated partial thromboplastin time, platelet count, haemoglobin, haematocrit and serum creatinine; monitor haemoglobin, haematocrit and platelets within 6 hours after start of treatment then at least once daily; discontinue if thrombolytic therapy, intra-aortic balloon pump or emergency cardiac surgery necessary

Contra-indications  abnormal bleeding within 30 days, major surgery or severe trauma within 6 weeks, stroke within last 30 days or any history of haemorrhagic stroke, intracranial disease (aneurysm, neoplasm or arteriovenous malformation), severe hypertension, haemorrhagic diathesis, increased prothrombin time or INR, thrombocytopenia

Hepatic impairment  avoid in severe liver disease—increased risk of bleeding

Renal impairment  reduce infusion to 1 microgram/kg/minute for up to 72 hours (up to 96 hours if percutaneous coronary intervention during treatment)

Pregnancy  manufacturer advises use only if potential benefit outweighs risk—no information available

Breast-feeding  manufacturer advises avoid—no information available

Side-effects  bleeding manifestations; very rarely anaphylaxis and rash

Dose  
- Initially by intravenous injection, 180 micrograms/kg, then by intravenous infusion, 2 micrograms/kg/minute for up to 72 hours (up to 96 hours if percutaneous coronary intervention during treatment)

Integrilin® (GSK) Injection, eptifibatide 2 mg/mL, net price 10-mL (20-mg) vial = £13.61
Infusion, eptifibatide 750 micrograms/mL, net price 100-mL (75-mg) vial = £42.79

Prasugrel

Indications  in combination with aspirin for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention

Cautions  patients at increased risk of bleeding (e.g. from recent trauma, surgery, gastro-intestinal bleeding, or active peptic ulcer disease); concomitant use of drugs that increase risk of bleeding; discontinue at least 7 days before elective surgery if antiplatelet effect not desirable; elderly; body-weight less than
2 Cardiovascular system

2.9 Antiplatelet drugs

60 kg; history of hypersensitivity reactions to thienopyridines (e.g. clopidogrel); **interactions**: Appendix 1 (prasugrel)

**Contra-indications** active bleeding; history of stroke or transient ischaemic attack

**Hepatic impairment** use with caution in moderate to severe impairment

**Renal impairment** use with caution in moderate to severe impairment

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid—present

**Side-effects** haemorrhage (including gastro-intestinal and intracranial), haematomata, haematuria, anaemia, rash; less commonly hypersensitivity reactions including angioedema; rarely thrombocytopaenia; also reported thrombotic thrombocytopaenic purpura

**Dose**

- **ADULT** over 18 years, (with aspirin—see notes above) initially 60 mg as a single dose then body-weight over 60 kg, 10 mg once daily or body-weight under 60 kg or **ELDERLY** over 75 years, 5 mg once daily

**Note** Patients undergoing coronary angiography within 48 hours of admission for unstable angina or NSTEMI should be given the initial 60-mg dose at the time of percutaneous coronary intervention to minimise the risk of bleeding

**Effent®** (Lilly)

**Tablets, f/c, prasugrel (as hydrochloride) 5 mg (yellow), net price 28-tab pack = £47.56; 10 mg (beige), 28-tab pack = £47.56**

**TICAGRELOR**

**Indications** in combination with aspirin for the prevention of atherothrombotic events in patients with acute coronary syndrome

**Cautions** patients at increased risk of bleeding (e.g. from recent trauma, surgery, gastrointestinal bleeding, or coagulation disorders); concomitant use of drugs that increase risk of bleeding; discontinue 7 days before elective surgery if antiplatelet effect not desirable; bradycardia, sick sinus syndrome, or second- or third-degree AV block (unless pacemaker fitted); asthma or chronic obstructive pulmonary disease; history of hyperuricaemia; monitor renal function 1 month after initiation

**Contra-indications** active bleeding; history of intracranial haemorrhage

**Hepatic impairment** avoid in moderate or severe impairment—no information available

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid—present

**Side-effects** nausea, headache, fever, bleeding manifestations, reversible thrombocytopenia

**Dose**

- **ADULT** over 18 years, (with aspirin—see notes above) initially 180 mg as a single dose, then 90 mg twice daily

**Brilique®** (AstraZeneca)

**Tablets, yellow, f/c, ticagrelor 90 mg, net price 56-tab pack = £54.60**

**TIROFIAN**

**Indications** in combination with unfractionated heparin, aspirin, and clopidogrel for prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction (NSTEMI) and with last episode of chest pain within 12 hours (use under specialist supervision); in combination with unfractionated heparin, aspirin, and clopidogrel for reduction of major cardiovascular events in patients with ST-segment elevation myocardial infarction (STEMI) intended for primary percutaneous coronary intervention (PCI) (use under specialist supervision)

**Cautions** major surgery or severe trauma within 3 months (avoid if within 6 weeks); traumatic or protracted cardiopulmonary resuscitation, organ biopsy or lithotripsy within last 2 weeks; risk of bleeding including active peptic ulcer within 3 months, uncontrolled severe hypertension, acute pericarditis, aortic dissection, haemorrhagic retinopathy, vasculitis, haematuria, faecal occult blood, elderly, low body-weight; severe heart failure, cardiogenic shock; anaemia; puncture of non-compressible vessel within 24 hours; concomitant drugs that increase risk of bleeding (including within 48 hours of thrombolytic administration); monitor platelet count, haemoglobin and haematocrit before treatment, 2–6 hours after start of treatment and then at least once daily; discontinue if thrombolytic therapy, intra-aortic balloon pump or emergency cardiac surgery necessary; discontinue immediately if serious or uncontrollable bleeding occurs; **interactions**: Appendix 1 (tirofiban)

**Contra-indications** abnormal bleeding within 30 days; stroke within 30 days or any history of haemorrhagic stroke, intracranial disease (aneurysm, neoplasm or arteriovenous malformation); severe hypertension; increased prothrombin time or INR; thrombocytopenia

**Hepatic impairment** caution in mild to moderate liver disease; avoid in severe liver disease—increased risk of bleeding

**Renal impairment** increased risk of bleeding; monitor carefully if eGFR less than 60 mL/minute/1.73 m²; use half normal dose if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, headache, fever, bleeding manifestations, reversible thrombocytopenia

**Dose**

- Unstable angina or NSTEMI with angiography within 48 hours of diagnosis, **by intravenous infusion**, initially 400 nanograms/kg/minute for 30 minutes, then 100 nanograms/kg/minute for at least 48 hours (continue during and for 12–24 hours after percutaneous coronary intervention); max. duration of treatment 108 hours

- Unstable angina or NSTEMI with angiography within 4 hours of diagnosis or STEMI intended for primary PCI, **by intravenous injection**, 25 micrograms/kg, given over 3 minutes at start of percutaneous coron-
Management of stable angina and acute coronary syndromes

Stable angina

It is important to distinguish stable angina from unstable angina. Stable angina usually results from atherosclerotic plaques in the coronary arteries that restrict blood flow and oxygen supply to the heart; it is often precipitated by exertion and relieved by rest. Treatment involves management of acute anginal pain, and long-term management to prevent angina attacks and to reduce the risk of cardiovascular events.

Management of stable angina

Acute attacks of stable angina should be managed with sublingual glyceryl trinitrate (section 2.6.1); sublingual glyceryl trinitrate can also be taken immediately before performing activities that are known to bring on an attack. If attacks occur more than twice a week, regular drug therapy is required and should be introduced in a step-wise manner according to response.

Patients with stable angina should be given a beta-blocker (section 2.4) or a calcium-channel blocker (section 2.6.2). In those with left-ventricular dysfunction, beta-blocker treatment should be started at a very low dose and titrated very slowly over a period of weeks or months (section 2.5.5); the rate-limiting calcium-channel blockers, diltiazem and verapamil, are contra-indicated in patients with left-ventricular dysfunction because they may precipitate heart failure. If a beta-blocker or a calcium-channel blocker alone fails to control symptoms adequately, a combination of a beta-blocker and a dihydropyridine calcium-channel blocker (e.g. amlodipine, felodipine, modified-release nifedipine) should be used; if this combination is not appropriate due to intolerance of, or contra-indication to, either beta-blockers or calcium-channel blockers, addition of a long-acting nitrate (section 2.6.1), ivabradine, nisoran, or ranolazine (section 2.6.3) can be considered.

For those patients in whom both beta-blockers and calcium-channel blockers are not tolerated or are contra-indicated, monotherapy with a long-acting nitrate, ivabradine, nisoran, or ranolazine should be considered.

Response to treatment should be assessed every 2–4 weeks after initiating or changing drug therapy; the drug should be titrated (according to symptom control) to the maximum tolerated dose. Consider referring the patient to a specialist if a combination of two drugs fails to control symptoms. Addition of a third antianginal drug should only be considered if symptom control is not achieved with two drugs and the patient is either due to undergo a revascularisation procedure, or a revascularisation procedure is considered inappropriate. See section 2.9 for the use of antiplatelet drugs in patients undergoing coronary stenting.

For long-term prevention of cardiovascular events, see Prevention of cardiovascular events, p. 164.

Acute coronary syndromes

Acute coronary syndromes encompass a spectrum of conditions which include unstable angina, and myocardial infarction with or without ST-segment elevation. Patients with different acute coronary syndromes may present similarly; definitive diagnosis is made on the basis of clinical presentation, ECG changes, and measurement of biochemical cardiac markers.

Unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI) are related acute coronary syndromes that fall between the classifications of stable angina and ST-segment elevation myocardial infarction (STEMI). They usually occur as a result of atheromatous plaque rupture, and are often characterised by stable angina that suddenly worsens, recurring or prolonged angina at rest, or new onset of severe angina. Patients with unstable angina have no evidence of myocardial necrosis, whereas in NSTEMI, myocardial necrosis (less significant than with STEMI) will be evident. There is a risk of progression to STEMI or sudden death, particularly in patients who experience pain at rest.

ST-segment elevation myocardial infarction (STEMI) is an acute coronary syndrome where atheromatous plaque rupture leads to thrombosis and myocardial ischaemia, with irreversible necrosis of the heart muscle, often leading to long-term complications. STEMI can also occasionally occur as a result of coronary spasm or embolism, arteritis, spontaneous thrombosis, or sudden severe elevation in blood pressure.

Management of unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI)

These conditions are managed similarly; the aims of management are to provide supportive care and pain relief during the acute attack and to prevent further cardiac events and death. For advice on the management of patients with acute ST-segment elevation myocardial infarction (STEMI), see below.
Initial management  Oxygen (section 3.6) should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hyperoxia should be avoided and particular care is required in patients with chronic obstructive airways disease.

Nitrates (section 2.6.1) are used to relieve ischaemic pain. If sublingual glyceryl trinitrate is not effective, intravenous or buccal glyceryl trinitrate or intravenous isosorbide dinitrate is given. If pain continues, diamorphine or morphine (section 4.7.2) can be given by slow intravenous injection; an antemetic such as metoclopramide should also be given (section 4.6).

Aspirin (chewed or dispersed in water) is given for its antiplatelet effect in a dose of 300 mg (section 2.9). If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. Clopidogrel in a dose of 300 mg (or 600 mg [unlicensed] if used prior to percutaneous coronary intervention) should also be given (see section 2.9). Prasugrel, in a dose of 60 mg, is an alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention (see NICE guidance, p. 157). Ticagrelor, in a dose of 180 mg, is also an alternative to clopidogrel (see NICE guidance, p. 158). Patients should also receive either unfractionated heparin, a low molecular weight heparin, or fondaparinux (section 2.6.1). Patients without contra-indications should receive beta-blockers (section 2.4) which should be continued indefinitely. In patients without left ventricular dysfunction and in whom beta-blockers are inappropriate, dilatazem or verapamil can be given (section 2.6.2).

The glycoprotein IIb/IIIa inhibitors eptifibatide (in combination with unfractionated heparin and aspirin) and tirofiban (in combination with unfractionated heparin, aspirin, and clopidogrel) (section 2.9) can be used for unstable angina or for NSTEMI in patients at a high risk of either myocardial infarction or death. In intermediate- and high-risk patients, abciximab or eptifibatide (in combination with unfractionated heparin and aspirin), or tirofiban (in combination with unfractionated heparin, aspirin, and clopidogrel) can also be used in patients undergoing percutaneous coronary intervention, to reduce the immediate risk of vascular occlusion. In intermediate- and high-risk patients in whom early intervention is planned, bivalirudin (section 2.8.1) can be considered as an alternative to the combination of a glycoprotein IIb/IIIa inhibitor plus a heparin.

Revascularisation procedures are often appropriate for patients with unstable angina or NSTEMI; see section 2.9 for the use of antiplatelet drugs in patients undergoing coronary stenting.

Long-term management  The need for long-term angina treatment or for coronary angiography should be assessed. Most patients will require standard angina treatment (see management of stable angina, above) to prevent recurrence of symptoms.

Prevention of cardiovascular events  Patients with stable angina, unstable angina, or NSTEMI should be given advice and treatments to reduce their cardiovascular risk. The importance of life-style changes, especially stopping smoking, should be emphasised. Aspirin should be given indefinitely in a dose of 75 mg daily. Antihypertensive treatment should be initiated if appropriate (see section 2.5), and a statin (section 2.12) should also be given.

In patients with stable angina, addition of an ACE inhibitor (section 2.5.5.1) should be considered for patients with diabetes (and should be continued if indicated for a co-morbidity).

In patients with unstable angina or NSTEMI, clopidogrel (section 2.9) is given, in combination with aspirin, for up to 12 months—most benefit occurs during the first 3 months. Prasugrel or ticagrelor are alternatives to clopidogrel in certain patients (see section 2.9). An ACE inhibitor should also be given.

Management of ST-segment elevation myocardial infarction (STEMI)

These notes give an overview of the initial and long-term management of myocardial infarction with ST-segment elevation (STEMI). For advice on the management of non-ST-segment elevation myocardial infarction (NSTEMI) and unstable angina, see above. The aims of management of STEMI are to provide supportive care and pain relief, to promote reperfusion and to reduce mortality. Oxygen, nitrates, and diamorphine or morphine can provide initial support and pain relief; aspirin and percutaneous coronary intervention or thrombolytics promote reperfusion; anticoagulants help to reduce re-occlusion and systemic embolisation; long-term use of aspirin, beta-blockers, ACE inhibitors, and statins help to reduce mortality further.

Initial management  Oxygen (section 3.6) should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hyperoxia should be avoided and particular care is required in patients with chronic obstructive airways disease.

The pain (and anxiety) of myocardial infarction is managed with slow intravenous injection of diamorphine or morphine (section 4.7.2); an antemetic such as metoclopramide (or, if left ventricular function is not compromised, cyclizine) by intravenous injection should also be given (section 4.6).

Aspirin (chewed or dispersed in water) is given for its antiplatelet effect (section 2.9); a dose of 300 mg is suitable. If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. Clopidogrel, in a dose of 300 mg (or 600 mg [unlicensed] if used prior to percutaneous coronary intervention), should also be given (section 2.9). Prasugrel, in a dose of 60 mg, is an alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention (see NICE guidance, p. 157). Ticagrelor, in a dose of 180 mg, is also an alternative to clopidogrel (see NICE guidance, p. 158).

Patency of the occluded artery can be restored by percutaneous coronary intervention or by giving a thrombolytic drug (section 2.10.2), unless contra-indicated. Percutaneous coronary intervention is the preferred method; a glycoprotein IIb/IIIa inhibitor (section 2.9) can be used to reduce the risk of immediate vascular occlusion in intermediate- and high-risk patients. Patients undergoing percutaneous coronary intervention should also receive either unfractionated heparin or a low molecular weight heparin (e.g. enoxaparin); bivalirudin (section 2.8.1) is an alternative to the
BNF 68

2.10.2 Fibrinolytic drugs

Fibrinolytic drugs act as thrombolytics by activating plasminogen to form plasmin, which degrades fibrin and so breaks up thrombi.

The value of fibrinolytic drugs for the treatment of myocardial infarction has been established (section 2.10.1). Streptokinase and alteplase have been shown to reduce mortality. Reteplase and tenecteplase are also licensed for acute myocardial infarction. Thrombolytic drugs are indicated for any patient with acute myocardial infarction for whom the benefit is likely to outweigh the risk of treatment. Trials have shown that the benefit is greatest in those with ECG changes that include ST segment elevation (especially in those with anterior infarction) and in patients with bundle branch block. Patients should not be denied thrombolytic treatment on account of age alone because mortality in the elderly is high and the reduction in mortality is the same as in younger patients. Alteplase should be given within 6–12 hours of symptom onset, reteplase and streptokinase within 12 hours of symptom onset, but ideally all should be given within 1 hour; use after 12 hours requires specialist advice. Tenecteplase should be given as early as possible and usually within 6 hours of symptom onset.

Alteplase, streptokinase, and urokinase can be used for other thromboembolic disorders such as deep-vein thrombosis and pulmonary embolism. Alteplase is also used for acute ischaemic stroke (see section 2.9). Urokinase is also licensed to reduce the patency of occluded intravenous catheters and cannulas blocked with fibrin clots.

Cautions

Thrombolytic drugs should be used with caution if there is a risk of bleeding including that from venepuncture or invasive procedures. They should also be used with caution in external chest compression, elderly, hypertension, conditions in which thrombolysis might give rise to embolic complications such as enlarged left atrium with atrial fibrillation (risk of dislocation of clot and subsequent embolisation), and recent or concurrent use of drugs that increase the risk of bleeding.

Contra-indications

Thrombolytic drugs are contra-indicated in recent haemorrhage, trauma, or surgery (including dental extraction), coagulation defects, bleeding diatheses, aortic dissection, aneurysm, coma, history of cerebrovascular disease especially recent events or with any residual disability, recent symptoms of possible peptic ulceration, heavy vaginal bleeding,
severe hypertension, active pulmonary disease with caviation, acute pancreatitis, pericarditis, bacterial endocarditis, and oesophageal varices; also in the case of streptokinase, previous allergic reactions to either streptokinase or anistreplase (no longer available). Prolonged persistence of antibodies to streptokinase and anistreplase (no longer available) can reduce the effectiveness of subsequent treatment; therefore, streptokinase should not be used again beyond 4 days of first administration of either streptokinase or anistreplase.

**Hepatic impairment** Thrombolytic drugs should be avoided in severe hepatic impairment as there is an increased risk of bleeding.

**Pregnancy** Thrombolytic drugs can possibly lead to premature separation of the placenta in the first 18 weeks of pregnancy. There is also a risk of maternal haemorrhage throughout pregnancy and post-partum, and also a theoretical risk of fetal haemorrhage through-out pregnancy.

**Side-effects** Side-effects of thrombolytics are mainly nausea and vomiting and bleeding. When thrombolytics are used in myocardial infarction, reperfusion arrhythmias and recurrent ischaemia and angina may occur. Reperfusion may also cause cerebral and pulmonary oedema. Hypotension can also occur and can usually be controlled by elevating the patient’s legs, or by reducing the rate of infusion or stopping it temporarily. Back pain, fever, and convulsions have been reported. Bleeding is usually limited to the site of injection, but intracerebral haemorrhage or bleeding from other sites can occur. Serious bleeding calls for discontinuation of the thrombolytic and may require administration of coagulation factors and antifibrinolytic drugs (e.g. tranexamic acid). Rarely further embolism may occur (either due to clots that break away from the original thrombus or to cholesterol crystal emboli). Thrombolytics can cause allergic reactions (including rash, flushing and uveitis) and anaphylaxis has been reported (for details of management see Allergic Emergencies, section 3.4.3). Guillain-Barré syndrome has been reported rarely after streptokinase treatment.

**Contra-indications** see notes above; hypersensitivity to gentamicin (residue from manufacturing process); in acute stroke, convolution accompanying stroke, severe stroke, history of stroke in patients with diabetes, stroke in last 3 months, hypoglycaemia, hyperglycaemia

**Hepatic impairment** see notes above

**Pregnancy** see notes above

**Side-effects** see notes above; also risk of cerebral bleeding increased in acute stroke

**Dose**
- See under preparations below

**Actilyse** (Boehringer Ingelheim) **Firm**

**Injection**, powder for reconstitution, alteplase 10 mg (5.8 million units)/vial, net price per vial (with diluent) = £144.00; 20 mg (11.6 million units)/vial (with diluent and transfer device) = £216.00; 50 mg (29 million units)/vial (with diluent and transfer device) = £360.00

**Dose** myocardial infarction, accelerated regimen (initiated within 6 hours of symptom onset), 15 mg by intravenous injection, followed by intravenous infusion of 50 mg over 30 minutes, then 35 mg over 60 minutes (total dose 100 mg over 90 minutes); in patients less than 65 kg, 15 mg by intravenous injection, followed by intravenous infusion of 0.75 mg/kg over 30 minutes, then 0.5 mg/kg over 60 minutes (max. total dose 100 mg over 90 minutes)

Myocardial infarction, initiated within 6–12 hours of symptom onset, 10 mg by intravenous injection, followed by intravenous infusion of 50 mg over 60 minutes, then 4 infusions each of 10 mg over 30 minutes (total dose 100 mg over 3 hours; max. 1.5 mg/kg in patients less than 65 kg).

Pulmonary embolism, 10 mg by intravenous injection over 1–2 minutes, followed by intravenous infusion of 90 mg over 2 hours, max. 1.5 mg/kg in patients less than 65 kg

Acute stroke (treatment must begin within 4.5 hours of symptom onset), by intravenous administration over 60 minutes, 900 micrograms/kg (max. 90 mg); initial 10% of dose by intravenous injection, remainder by intravenous infusion; ELDERLY over 80 years not recommended

**Actilyse Cathflo** (Boehringer Ingelheim) **Firm**

**Injection**, powder for reconstitution, alteplase 2 mg (1.16 million units)/vial, net price per vial (with diluent) = £45.00

**Dose** thrombolytic treatment of occluded central venous access devices, consult product literature

**RETEPLASE**

**Indications** acute myocardial infarction (see notes above and section 2.10.1)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** manufacturer advises avoid breast-feeding for 24 hours after dose (express and discard milk during this time)

**Side-effects** see notes above

**Dose**
- By intravenous injection (initiated within 12 hours of symptom onset), 10 units over not more than 2 minutes, followed after 30 minutes by a further 10 units

**Rapilysin** (Actavis) **Firm**

**Injection**, powder for reconstitution, retelopase 10 units/vial, net price pack of 2 vials (with 2 prefilled syringes of diluent and transfer device) = £566.00
2.11 Antifibrinolytic drugs and haemostatics

Fibrin dissolution can be impaired by the administration of tranexamic acid, which inhibits fibrinolysis. It can be used to prevent bleeding or to treat bleeding associated with excessive fibrinolysis (e.g. in surgery, dental extraction, obstetric disorders, and traumatic haemophilia) and in the management of menorrhagia. Tranexamic acid may also be used in hereditary angioedema, epistaxis, and in thrombolytic overdose.

Desmopressin (section 6.5.2) is used in the management of mild to moderate haemophilia and von Willebrand’s disease. It is also used for fibrinolytic response testing.

Etamsylate reduces capillary bleeding in the presence of a normal number of platelets; it does not act by fibrin stabilisation, but probably by correcting abnormal adhesion. Etamsylate is less effective than other treatments in the management of heavy menstrual bleeding and its use is no longer recommended.
2 Cardiovascular system

**Tranexamic acid** (Non-proprietary) *(®)*

**Tablets**, tranexamic acid 500 mg, net price 60-tab pack = £6.23

**Injection**, tranexamic acid 100 mg/mL, net price 5-ML amp = £1.50 (hosp. only)

**Cyklokapron** *(Meda) *(®)*

**Tablets**, 1/C, scored, tranexamic acid 500 mg, net price 60-tab pack = £14.30

**Injection**, tranexamic acid 100 mg/mL, net price 5-ML amp = £1.55

### Blood-related products

**DRIED PROTHROMBIN COMPLEX** (Human Prothrombin Complex)

Dried prothrombin complex is prepared from human plasma by a suitable fractionation technique, and contains factor IX, together with variable amounts of factors II, VII, and X

**Indications** treatment and peri-operative prophylaxis of haemorrhage in patients with congenital deficiency of factors II, VII, IX, or X if purified specific coagulation factors not available; treatment and peri-operative prophylaxis of haemorrhage in patients with acquired deficiency of factors II, VII, IX, or X (e.g. during warfarin treatment—see section 2.8.2)

**Cautions** risk of thrombosis; disseminated intravascular coagulation; history of myocardial infarction or coronary heart disease; postoperative use

**Contra-indications** angina; recent myocardial infarction (except in life-threatening haemorrhage following overdosage of oral anticoagulants, and before induction of fibrinolytic therapy); history of heparin-induced thrombocytopenia

**Hepatic impairment** monitor closely (risk of thrombomembolic complications)

**Side-effects** thrombotic events (including disseminated intravascular coagulation); rarely headache; very rarely pyrexia, antibody formation, hypersensitivity reactions (including anaphylaxis); nephrotic syndrome also reported

Available from CSL Behring *(Berplex® P/N)*, Octapharma *(Octoplex®)*

**FACTOR VIIa (RECOMBINANT)**

**Epactog alfa** (activated)

**Indications** treatment and prophylaxis of haemorrhage in patients with haemophilia A or B with inhibitors to factors VIII or IX, acquired haemophilia, factor VII deficiency, or Glanzmann’s thrombasthenia

**Cautions** risk of thrombosis or disseminated intravascular coagulation

**Side-effects** less commonly fever, venous thromboembolic events (including deep vein thrombosis and pulmonary embolism), rash; rarely nausea, angina, headache, arterial thrombotic events (including myocardial infarction and cerebrovascular accident), coagulation disorders; also reported flushing, angioedema, anaphylaxis

Available from Novo Nordisk *(NovoSeven®)*

---

**ETAMSYLATE** *(Ethamsylate)*

**Indications** short-term blood loss in menorrhagia

**Cautions** exclude structural or histological causes of menorrhagia, or fibroids causing distortion of the uterine cavity, before initiating treatment

**Contra-indications** acute porphyria (see section 9.8.2)

**Breast-feeding** present in milk—manufacturer advises avoidance

**Side-effects** nausea, vomiting, diarrhoea, fever (discontinue); rarely flushing, angioedema, anaphylaxis

**Dose**

- By mouth, local fibrinolysis, 1–1.5 g (or 15–25 mg/kg) 2–3 times daily
- Menorrhagia (initiated when menstruation has started), 1 g 3 times daily for up to 4 days; max. 4 g daily
- Hereditary angioedema, 1–1.5 g 2–3 times daily
- Epistaxis, 1 g 3 times daily for 7 days
- By slow intravenous injection (rate not exceeding 100 mg/minute), local fibrinolysis, 0.5–1 g 2–3 times daily
- General fibrinolysis, 1 g (or 15 mg/kg) every 6–8 hours
- By continuous intravenous infusion, local fibrinolysis [unlicensed route], following initial treatment by intravenous injection, 25–50 mg/kg over 24 hours

**Dicynene** *(Sanofi-Aventis) *(®)*

**Tablets**, scored, ethamsylate 500 mg, net price 100-tab pack = £8.44

**Excipients** include sulfites

---

**TRANEXAMIC ACID**

**Indications** see notes above

**Cautions** massive haematuria (avoid if risk of ureteric obstruction); irregular menstrual bleeding (exclude structural or histological causes of menorrhagia, or fibroids causing distortion of the uterine cavity, before initiating treatment); patients receiving oral contraceptives (increased risk of thrombosis); regular liver function tests in long-term treatment of hereditary angioedema

**Contra-indications** thromboembolic disease; fibrinolytic conditions following disseminated intravascular coagulation (unless predominant activation of fibrinolytic system with severe bleeding); history of convulsions

**Renal impairment** reduce dose—consult product literature for details

**Pregnancy** no evidence of teratogenicity in animal studies; manufacturer advises use only if potential benefit outweighs risk—crosses the placenta

**Breast-feeding** small amount present in milk—anti-fibrinolytic effect in infant unlikely

**Side-effects** nausea, vomiting, diarrhoea (reduce dose); less commonly dermatitis; rarely thromboembolic events, visual disturbances including impairment of colour vision (discontinue); also reported malaise and hypotension on rapid intravenous injection, convulsions (usually with high doses)

**Dose**

- By mouth, local fibrinolysis, 1–1.5 g (or 15–25 mg/kg) 2–3 times daily
- Menorrhagia (initiated when menstruation has started), 1 g 3 times daily for up to 4 days; max. 4 g daily
- Hereditary angioedema, 1–1.5 g 2–3 times daily
- Epistaxis, 1 g 3 times daily for 7 days
- By slow intravenous injection (rate not exceeding 100 mg/minute), local fibrinolysis, 0.5–1 g 2–3 times daily
- General fibrinolysis, 1 g (or 15 mg/kg) every 6–8 hours
- By continuous intravenous infusion, local fibrinolysis [unlicensed route], following initial treatment by intravenous injection, 25–50 mg/kg over 24 hours

---

**DICYNENE** *(Sanofi-Aventis) *(®)*

**Tablets**, scored, etamsylate 500 mg, net price 100–tab pack = £8.44

**Excipients** include sulfites

---

**ANTELOXAMIC ACID** *(Sanofi-Aventis) *(®)*

**Tablets** *(f/c), scored, tranexamic acid 500 mg, net price 60-tab pack = £14.30

**Excipients** include sulfites

---

**TRANEXAMIC ACID** *(Sanofi-Aventis) *(®)*

**Tablets** *(f/c), scored, tranexamic acid 500 mg, net price 60-tab pack = £14.30

**Excipients** include sulfites

---

**ETAMSYLATE** *(Ethamsylate)*

**Indications** short-term blood loss in menorrhagia

**Cautions** exclude structural or histological causes of menorrhagia, or fibroids causing distortion of the uterine cavity, before initiating treatment

**Contra-indications** acute porphyria (see section 9.8.2)

**Breast-feeding** present in milk—manufacturer advises avoid

**Side-effects** nausea, vomiting, diarrhoea (reduce dose—consult product literature for details)

**Dose**

- 500 mg 4 times daily during menstruation

**Dicynene®** *(Sanofi-Aventis) *(®)*

**Tablets**, scored, ethamsylate 500 mg, net price 100–tab pack = £8.44

**Excipients** include sulfites

---

**TRANEXAMIC ACID**

**Indications** see notes above

**Cautions** massive haematuria (avoid if risk of ureteric obstruction); irregular menstrual bleeding (exclude structural or histological causes of menorrhagia, or fibroids causing distortion of the uterine cavity, before initiating treatment); patients receiving oral contraceptives (increased risk of thrombosis); regular liver function tests in long-term treatment of hereditary angioedema

**Contra-indications** thromboembolic disease; fibrinolytic conditions following disseminated intravascular coagulation (unless predominant activation of fibrinolytic system with severe bleeding); history of convulsions

**Renal impairment** reduce dose—consult product literature for details

**Pregnancy** no evidence of teratogenicity in animal studies; manufacturer advises use only if potential benefit outweighs risk—crosses the placenta

**Breast-feeding** small amount present in milk—anti-fibrinolytic effect in infant unlikely

**Side-effects** nausea, vomiting, diarrhoea (reduce dose); less commonly dermatitis; rarely thromboembolic events, visual disturbances including impairment of colour vision (discontinue); also reported malaise and hypotension on rapid intravenous injection, convulsions (usually with high doses)

**Dose**

- By mouth, local fibrinolysis, 1–1.5 g (or 15–25 mg/kg) 2–3 times daily
- Menorrhagia (initiated when menstruation has started), 1 g 3 times daily for up to 4 days; max. 4 g daily
- Hereditary angioedema, 1–1.5 g 2–3 times daily
- Epistaxis, 1 g 3 times daily for 7 days
- By slow intravenous injection (rate not exceeding 100 mg/minute), local fibrinolysis, 0.5–1 g 2–3 times daily
- General fibrinolysis, 1 g (or 15 mg/kg) every 6–8 hours
- By continuous intravenous infusion, local fibrinolysis [unlicensed route], following initial treatment by intravenous injection, 25–50 mg/kg over 24 hours

**Dicynene®** *(Sanofi-Aventis) *(®)*

**Tablets**, scored, etamsylate 500 mg, net price 100–tab pack = £8.44

**Excipients** include sulfites

---

**TRANEXAMIC ACID**

**Indications** see notes above

**Cautions** massive haematuria (avoid if risk of ureteric obstruction); irregular menstrual bleeding (exclude structural or histological causes of menorrhagia, or fibroids causing distortion of the uterine cavity, before initiating treatment); patients receiving oral contraceptives (increased risk of thrombosis); regular liver function tests in long-term treatment of hereditary angioedema

**Contra-indications** thromboembolic disease; fibrinolytic conditions following disseminated intravascular coagulation (unless predominant activation of fibrinolytic system with severe bleeding); history of convulsions

**Renal impairment** reduce dose—consult product literature for details

**Pregnancy** no evidence of teratogenicity in animal studies; manufacturer advises use only if potential benefit outweighs risk—crosses the placenta

**Breast-feeding** small amount present in milk—anti-fibrinolytic effect in infant unlikely

**Side-effects** nausea, vomiting, diarrhoea (reduce dose); less commonly dermatitis; rarely thromboembolic events, visual disturbances including impairment of colour vision (discontinue); also reported malaise and hypotension on rapid intravenous injection, convulsions (usually with high doses)
**FACTOR VIII FRACTION, DRIED**  
(Human Coagulation Factor VIII, Dried)

Dried factor VIII fraction is prepared from human plasma by a suitable fractionation technique; it may also contain varying amounts of von Willebrand factor.

**Indications** treatment and prophylaxis of haemorrhage in congenital factor VIII deficiency (haemophilia A), acquired factor VIII deficiency, von Willebrand's disease.

**Cautions** monitor for development of factor VIII inhibitors; intravascular haemolysis after large or frequently repeated doses in patients with blood groups A, B, or AB—less likely with high potency concentrates.

**Side-effects** gastro-intestinal disturbances, taste disturbances; flushing, palpitation; dyspnoea, coughing; headache, dizziness, paraesthesia, drowsiness; blurred vision; antibody formation; hypersensitivity reactions including hypotension, angioedema, chills, fever, urticaria, and anaphylaxis.

Available from Baxter (Ceprotin®), CSL Behring (Hemate® FVIII, FVIII:C, Optima®, Optiplast®, Optifirst®), Octapharma (Octanate®, Wilate®), Haemoctin®.

**Note** Preparation of recombinant human coagulation factor VIII (octocog alfa) available from CSL Behring (Helixate® VIII, NexGen®), Bayer (Adivate®), Bayer (Kogenate® Bayer; preparation of recombinant human coagulation factor VIII (morococog alfa) available from Wyeth (ReFacto AF®); octocog alfa and morococog alfa are not indicated for use in von Willebrand's disease.

---

**FACTOR VIII INHIBITOR BYPASSING FRACTION**

Preparations with factor VIII inhibitor bypassing activity are prepared from human plasma.

**Indications** treatment and prophylaxis of haemorrhage in patients with congenital factor VIII deficiency (haemophilia A) and factor VIII inhibitors; treatment of haemorrhage in non-haemophilic patients with acquired factor VIII inhibitors.

**Contra-indications** disseminated intravascular coagulation.

**Side-effects** thrombosis, disseminated intravascular coagulation, myocardial infarction; paraesthesia; pyrexia; hypersensitivity reactions including hypotension, flushing, urticaria, rash, and anaphylaxis.

Available from Baxter (FEIBA®).

---

**FACTOR IX FRACTION, DRIED**

Dried factor IX fraction is prepared from human plasma by a suitable fractionation technique; it may also contain clotting factors II, VII, and X.

**Indications** treatment and prophylaxis of haemorrhage in congenital factor IX deficiency (haemophilia B).

**Cautions** risk of thrombosis—principally with former low purity products.

**Contra-indications** disseminated intravascular coagulation.

---

**FACTOR XIII FRACTION, DRIED**

(Human Fibrin-stabilising Factor, Dried)

**Indications** congenital factor XIII deficiency.

**Side-effects** rarely, allergic reactions and fever.

Available from CSL Behring (Fibregammin® P).

---

**FIBRINOGEN, DRIED**

(Human Fibrinogen)

Fibrinogen is prepared from human plasma.

**Indications** treatment of haemorrhage in congenital hypofibrinogenemia or afibrinogenemia.

**Cautions** risk of thrombosis.

**Pregnancy** manufacturer advises not known to be harmful—no information available.

**Breast-feeding** manufacturer advises avoid—no information available.

**Side-effects** rarely fever, allergic reactions; very rarely thromboembolic events (including myocardial infarction and pulmonary embolism).

Available from CSL Behring (Fibastap®).

---

**FRESH FROZEN PLASMA**

Fresh frozen plasma is prepared from the supernatant liquid obtained by centrifugation of one donation of whole blood.

**Indications** to replace coagulation factors or other plasma proteins where their concentration or functional activity is critically reduced.

**Cautions** need for compatibility; cardiac decompensation; pulmonary oedema; severe protein S deficiency (avoid products with low protein S activity e.g. OctaplasLG®).

**Contra-indications** avoid use as a volume expander; IgA deficiency with confirmed antibodies to IgA.

**Side-effects** nausea, rash, pruritus; less commonly vomiting, oedema; rarely tachycardia, agitation, allergic reactions (including chills, fever, bronchospasm, cardiorespiratory collapse); very rarely arrhythmia, thromboembolism, hypertension.

Available from Regional Blood Transfusion Services.

**Note** A preparation of solvent/detergent treated human plasma (frozen) from pooled donors is available from Octapharma (OctaplasLG®).

---

**PROTEIN C CONCENTRATE**

Protein C is prepared from human plasma.

**Indications** congenital protein C deficiency.

**Cautions** hypersensitivity to heparins.

**Side-effects** very rarely fever, bleeding, dizziness, and hypersensitivity reactions.

Available from Baxter (Ceprotin®).
2.12 Lipid-regulating drugs

Preventative measures should be taken in individuals with a high risk of developing cardiovascular disease (primary prevention) and to prevent recurrence of events in those with established cardiovascular disease (secondary prevention).

Individuals at high risk include those who already have atherosclerotic disease, those with diabetes mellitus aged over 40 years, and those with familial hypercholesterolaemia. The risk also increases with age; those over 75 years are at particularly high risk, especially if they smoke or have hypertension.

Preventative measures are also required for other individuals who may be at high risk of developing atherosclerotic cardiovascular disease; those with a 10-year risk of cardiovascular disease1 of 20% or more stand to benefit most from drug treatment. The risk is assessed on the basis of lipid concentration as well as smoking status, blood pressure, gender, and age; other risk factors, such as premature menopause, ethnicity, obesity, triglyceride concentration, chronic kidney disease, impaired glucose tolerance, and a family history of premature cardiovascular disease, should also be taken into account when assessing risk in individual patients.

Patients with hypothyroidism should receive adequate thyroid replacement therapy before assessing the requirement for lipid-regulating treatment because correcting hypothyroidism itself may resolve the lipid abnormality. Untreated hypothyroidism increases the risk of myositis with lipid-regulating drugs.

Lowering the concentration of low-density lipoprotein (LDL) cholesterol and raising high-density lipoprotein (HDL) cholesterol slows the progression of atherosclerosis and may even induce regression. All patients at high risk of cardiovascular disease should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight management, alcohol consumption, and smoking cessation. Lipid-regulating drug treatment must be combined with advice on diet and lifestyle measures, lowering of raised blood pressure (section 2.5), the use of low-dose aspirin (section 2.9), and management of diabetes (section 6.1).

A statin (see below) reduces the risk of cardiovascular disease events, irrespective of serum cholesterol concentration, and is the drug of first choice for primary and secondary prevention of cardiovascular disease. If statins are contra-indicated or not tolerated, a fibrate (p. 175) or a bile acid sequestrant (p. 174) may be considered for primary or secondary prevention; nicotinic acid (p. 177) is also an option for secondary prevention. Fibrates, bile acid sequestrants, or nicotinic acid should not be used in combination with a statin for primary prevention of cardiovascular disease. In secondary prevention of cardiovascular events, if a total cholesterol concentration of less than 4 mmol/litre or a LDL-cholesterol concentration of less than 2 mmol/litre is not achieved with initial treatment, consider treating patients with a ‘high-intensity’ statin (e.g. simvastatin or atorvastatin)—a ‘high-intensity’ statin is one that produces a greater LDL-cholesterol reduction than simvastatin 40 mg; ‘high-intensity’ statins are associated with an increased risk of muscle toxicity—see Muscle Effects, p. 171. Patients with an acute coronary syndrome should also receive treatment with a ‘high-intensity’ statin where appropriate.

A statin is also the drug of first choice for treating hypercholesterolaemia and moderate hypertriglyceridaemia. Severe hyperlipidaemia not adequately controlled with a maximal dose of a statin may require the use of an additional lipid-regulating drug such as ezetimibe or colestyramine: such treatment should generally be supervised by a specialist.

A number of conditions, some familial, are characterised by very high LDL-cholesterol concentration, high triglyceride concentration, or both. Fenofibrate may be added to statin therapy if triglycerides remain high even after the LDL-cholesterol concentration has been reduced adequately; nicotinic acid may also be used to further lower triglyceride or LDL-cholesterol concentration.

Combination of a statin with a fibrate or with nicotinic acid carries an increased risk of side-effects (including rhabdomyolysis—see Muscle Effects, p. 171) and should be used under specialist supervision; monitoring of liver function and creatine kinase should also be considered. The concomitant administration of gemfibrozil with a statin increases the risk of rhabdomyolysis considerably—this combination should not be used.

A statin is recommended for all patients with familial hypercholesterolaemia. A ‘high-intensity’ statin (e.g. rosuvastatin (initiated by a specialist), simvastatin, or atorvastatin) should be considered in order to achieve the recommended reduction in LDL-cholesterol concentration of greater than 50% from baseline; a ‘high-intensity’ statin is one that produces a greater LDL-cholesterol reduction than simvastatin 40 mg—‘high-intensity’ statins are associated with an increased risk of muscle toxicity—see Muscle Effects, p. 171. Patients with heterozygous familial hypercholesterolaemia who have contra-indications to, or are intolerant of, statins should receive ezetimibe. The combination of a statin and ezetimibe can be considered if a statin alone fails to provide adequate control (or if intolerance limits dose titration), and when a switch to an alternative statin is being considered. Patients for whom statins and ezetimibe are inappropriate, should be referred to a specialist for the consideration of treatment with a bile acid sequestrant, nicotinic acid, or a fibrate.

The prescribing of drug therapy in homozygous familial hypercholesterolaemia should be undertaken in a specialist centre. Lomitapide is licensed as an adjunct to dietary measures and other lipid-regulating drugs for the treatment of homozygous familial hypercholesterolaemia.

1. Cardiovascular disease risk may be determined from the chart issued by the Joint British Societies (Heart 2005, 91 (Suppl V): v1–v52)—see inside back cover. The Joint British Societies’ ‘Cardiac Risk Assessor’ computer programme may also be used to determine cardiovascular disease risk.

Statins

The statins (atorvastatin, fluvastatin, pravastatin, rosuvastatin, and simvastatin) competitively inhibit 3-Hydroxy-3-methylglutaryl coenzyme A (HMG CoA) reductase, an enzyme involved in cholesterol synthesis, especially in the liver. Statins are more effective than other lipid-regulating drugs at lowering LDL-cholesterol concentration but they are less effective than the fibrates in reducing triglyceride concentration. However, statins reduce cardiovascular disease events and
total mortality irrespective of the initial cholesterol concentration.

Statins should be considered for all patients, including the elderly, with symptomatic cardiovascular disease such as those with coronary heart disease (including history of angina or acute myocardial infarction), occlusive arterial disease (including peripheral vascular disease, non-haemorrhagic stroke, or transient ischaemic attacks).

In patients with diabetes mellitus, the risk of developing cardiovascular disease depends on the duration and complications of diabetes, age, and concomitant risk factors. Statin therapy should be considered for all patients over 40 years with diabetes mellitus (type 1 and 2). In younger patients with diabetes, treatment with a statin should be considered if there is target-organ damage, poor glycaemic control (HbA1c greater than 9%), low HDL-cholesterol and raised triglyceride concentration, hypertension, or a family history of premature cardiovascular disease.

Statins are also used for the prevention of cardiovascular disease events in asymptomatic individuals who are at increased risk (see p. 170). Statin treatment should also be considered if the total cholesterol concentration to HDL-cholesterol ratio exceeds 6.

**Cautions**

Hypothyroidism should be managed adequately before starting treatment with a statin (see p. 170). Statins should be used with caution in those with a history of liver disease or with a high alcohol intake—see also Hepatic impairment, below. There is little information available on a rational approach to liver-function monitoring; however, a NICE guideline suggests that liver enzymes should be measured before treatment, and repeated within 3 months and at 12 months of starting treatment, unless indicated at other times by signs or symptoms suggestive of hepatotoxicity. Those with serum transaminases that are raised, but less than 3 times the upper limit of the reference range, should not be routinely excluded from statin therapy. Those with serum transaminases of more than 3 times the upper limit of the reference range, should be not be routinely excluded from statin therapy. Those with serum transaminases of more than 3 times the upper limit of the reference range should discontinue statin therapy. Statins should be used with caution in those with risk factors for myopathy or rhabdomyolysis (see Muscle Effects below); patients should be advised to report unexplained muscle pain. **Interactions:** Appendix 1 (statins).

**Hepatic impairment** Statins should be used with caution in those with a history of liver disease and avoided in active liver disease or when there are unexplained persistent elevations in serum transaminases.

**Pregnancy** Statins should be avoided in pregnancy as congenital anomalies have been reported and the decreased synthesis of cholesterol possibly affects fetal development. Adequate contraception is required during treatment and for 1 month afterwards.

**Breast-feeding** The manufacturers of atorvastatin, fluvastatin, rosuvastatin, and simvastatin advise avoiding use in mothers who are breast-feeding as there is no information available. The manufacturers of pravastatin advise against use in breast-feeding mothers as a small amount of drug is present in breast milk.

**Side-effects** The statins have been associated with myalgia, myopathy, myositis, and rhabdomyolysis (see Muscle Effects below). Statins can alter liver function tests, and rarely cause hepatitis and jaundice; pancreaticitis and hepatic failure have been reported very rarely. Other side-effects include gastro-intestinal disturbances, sleep disturbance, headache, dizziness, depression, paraesthesia, asthenia, peripheral neuropathy, amnesia, fatigue, sexual dysfunction, thrombocytopenia, arthralgia, visual disturbance, alopecia, and hypersensitivity reactions (including rash, pruritus, urticaria, and very rarely lupus erythematosus-like reactions). In very rare cases, statins can cause intestinal limb disease; if patients develop symptoms such as dyspnoea, cough, and weight loss, they should seek medical attention. Statins can cause hyperglycaemia and may be associated with the development of diabetes mellitus, particularly in those already at risk of the condition.

**Muscle effects** The risk of myopathy, myositis, and rhabdomyolysis associated with statin use is rare. Although myalgia has been reported commonly in patients receiving statins, muscle toxicity truly attributable to statin use is rare. Muscle toxicity can occur with all statins, however the likelihood increases with higher doses and in certain patients (see below). Statins should be used with caution in patients at increased risk of muscle toxicity, including those with a personal or family history of muscular disorders, previous history of muscular toxicity, a high alcohol intake, renal impairment, hypothyroidism, and in the elderly. There is an increased incidence of myopathy if a statin is given at a high dose, or if it is given with a fibrate (the combination of a statin and gemfibrozil should preferably be avoided), with lipid-lowering doses of nicotinic acid, with fusic acid (risk of rhabdomyolysis—the combination of a statin and fusidic acid should be avoided: temporarily discontinue statin and restart 7 days after last fusidic acid dose), or with drugs that increase the plasma-statim concentration, such as macrolide antibiotics, imidazole and triazole antifungals, and ciclosporin—see **interactions** Appendix 1 (statins); close monitoring of liver function and, if muscular symptoms occur, of creatine kinase is necessary. In patients at increased risk of muscle effects, a statin should not usually be started if the baseline creatine kinase concentration is more than 5 times the upper limit of normal (some patients may present with an extremely elevated baseline creatine kinase concentration, due to e.g. a physical occupation, or rigorous exercise—specialist advice should be sought regarding consideration of statin therapy in these patients). If muscular symptoms or raised creatine kinase occur during treatment, other possible causes (e.g. rigorous physical activity, hypothyroidism, infection, recent trauma, and drug or alcohol addiction) should be excluded before statin therapy is implicated. When a statin is suspected to be the cause of myopathy, and creatine kinase concentration is markedly elevated (more than 5 times upper limit of normal), or if muscular symptoms are severe, treatment should be discontinued. If symptoms resolve and creatine kinase concentrations return to normal, the statin should be reintroduced at a lower dose and the patient monitored closely; an alternative statin should be prescribed if unacceptable side-effects are experienced with a particular statin. Statins should not be discontinued in the event of small, asymptomatic elevations of creatine kinase. Routine monitoring of creatine kinase is unnecessary in asymptomatic patients.

**Counselling** Advise patient to report promptly unexplained muscle pain, tenderness, or weakness.

**ATORVASTATIN**

**Indications** primary hypercholesterolaemia, heterozygous familial hypercholesterolaemia, homozygous familial hypercholesterolaemia or combined (mixed) hyperlipidaemia in patients who have not responded adequately to diet and other appropriate measures; prevention of cardiovascular events in patients at high risk of a first cardiovascular event.
FLUVASTATIN

Note The Scottish Medicines Consortium (p. 4) has advised (February 2004) that fluvastatin is accepted for restricted use for the secondary prevention of coronary events after percutaneous coronary angioplasty; if the patient has previously been receiving another statin, then there is no need to change the statin

Indications adjunct to diet in primary hypercholesterolaemia or combined (mixed) hyperlipidaemias in patients who have not responded adequately to dietary control; prevention of cardiovascular events in patients with previous myocardial infarction or unstable angina; prevention of hyperlipidaemia in patients receiving immunosuppressive therapy following solid-organ transplantation

Cautions see notes above

Hepatic impairment see notes above

Renal impairment manufacturer advises initial dose of 10 mg once daily in moderate to severe impairment

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; very rarely focal weakness, hearing loss

Dose

Hypercholesterolaemia or combined hyperlipidaemia, 10–40 mg once daily at night, increased if necessary (under close medical supervision) to max. 40 mg once daily at night

Post-transplantation hyperlipidaemia, initially 20 mg once daily at night, increased if necessary (under close medical supervision) to max. 40 mg once daily at night

SUCRALFATE

Indications prophylaxis or treatment of upper gastrointestinal ulceration

Cautions see notes above; very rarely transient mild to moderately severe acute disorientation, agitation, hallucinations

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects very rarely abdominal pain; very rarely transient abnormalities in liver function tests

Dose prophylaxis or treatment, 1 g (4–8 tablets) every 8 hours

PATANOL

Indications reduction of intraocular pressure in primary open-angle glaucoma or ocular hypertension

Cautions see notes above; very rarely transient abnormalities in liver function tests; very rarely visual disturbances

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects very rarely sweating; very rarely allergic reactions

Dose 1 or 2 drops once daily for at least 5 minutes

LORATADINE

Indications symptomatic relief of seasonal allergic rhinitis (hayfever) and of chronic idiopathic urticaria

Cautions see notes above; very rarely blurred vision, headache

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects very rarely headache, fatigue, dizziness; very rarely rash

Dose 10 mg once daily in the evening

SALOSPRONE

Indications symptomatic relief of vertigo in patients with benign paroxysmal positional vertigo

Cautions see notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects very rarely headache, flushing, dizziness

Dose 1 mg once daily in the morning, increased if necessary to max. 4 mg once daily
BNF 68

Pravastatin (Non-proprietary) (Pat.)
Tablets, pravastatin sodium 10 mg, net price 28-tab pack = £1.16; 20 mg, 28-tab pack = £1.41; 40 mg, 28-tab pack = £1.77. Counselling, muscle effects, see notes above

Lipostat® (Squibb) (Pat.)
Tablets, all yellow, pravastatin sodium 10 mg, net price 28-tab pack = £14.18; 20 mg, 28-tab pack = £26.01; 40 mg, 28-tab pack = £26.01. Counselling, muscle effects, see notes above

☆ ROSUVASTATIN

Indications primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures; prevention of cardiovascular events in patients at high risk of a first cardiovascular event

Cautions see notes above; patients of Asian origin (see under Dose); patients with risk factors for myopathy or rhabdomyolysis, including personal or family history of muscular disorders or toxicity (see under Dose)

Hepatic impairment see notes above

Renal impairment initially 5 mg once daily (do not exceed 20 mg daily) if eGFR 30–60 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; also proteinuria; rarely gynaecomastia, haematuria; also reported oedema, Stevens-Johnson syndrome

Dose
- Hypercholesterolaemia, initially 5–10 mg once daily increased if necessary at intervals of at least 4 weeks to 20 mg once daily, increased after further 4 weeks to 40 mg daily only in severe hypercholesterolaemia with high cardiovascular risk and under specialist supervision; ELDERLY over 70 years, initially 5 mg once daily
- patient of ASIAN origin or with risk factors for myopathy or rhabdomyolysis, initially 5 mg once daily increased if necessary to max. 20 mg daily; CHILD under 18 years see BNF for Children
- Prevention of cardiovascular events, 20 mg once daily; ELDERLY over 70 years, patient of ASIAN origin or with risk factors for myopathy or rhabdomyolysis, initially 5 mg once daily increased if necessary to max. 20 mg daily

Note Initially 5 mg once daily with concomitant fibrates increased if necessary to max. 20 mg daily. For dose adjustments with concomitant atazanavir, darunavir, dronedarone, eltorbropag, ezetimibe, irtraconazole, lopinavir, or tizanidine, consult product literature

Crestor® (AstraZeneca) (Pat.)
Tablets, 1/1c, rosuvastatin (as calcium salt) 5 mg (yellow), net price 28-tab pack = £18.03; 10 mg (pink), 28-tab pack = £18.03; 20 mg (pink), 28-tab pack = £26.02; 40 mg (pink), 28-tab pack = £29.69. Counselling, muscle effects, see notes above

SIMVASTATIN

Indications primary hypercholesterolaemia, homozygous familial hypercholesterolaemia or combined (mixed) hyperlipidaemia in patients who have not responded adequately to diet and other appropriate measures; prevention of cardiovascular events in patients with atherosclerotic cardiovascular disease or diabetes mellitus

Cautions see notes above; also 80-mg dose only for those with severe hypercholesterolaemia and at high risk of cardiovascular complications

Hepatic impairment see notes above

Renal impairment doses above 10 mg daily should be used with caution if eGFR less than 30 mL/minute/1.73 m²

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; also rarely anaemia; also reported tendinopathy

Dose
- Primary hypercholesterolaemia, combined hyperlipidaemia, 10–20 mg daily at night, adjusted at intervals of at least 4 weeks; max. 80 mg once daily at night; CHILD under 18 years see BNF for Children
- Homozygous familial hypercholesterolaemia, initially 40 mg daily at night, adjusted at intervals of at least 4 weeks; max. 80 mg once daily at night
- Heterozygous familial hypercholesterolaemia, CHILD under 18 years see BNF for Children
- Prevention of cardiovascular events, initially 20–40 mg once daily at night, adjusted at intervals of at least 4 weeks; max. 80 mg once daily at night

Note Max. 10 mg daily with concomitant bezafibrate or ciprofibrate (see also Appendix 1). Max. 20 mg daily with concomitant amiodarone, verapamil, diltiazem, amlodipine, or ranolazine. Max. 40 mg daily with concomitant lomitapide

☆ Simvastatin (Non-proprietary) (Pat.)
Tablets, simvastatin 10 mg, net price 28-tab pack = 80p; 20 mg, 28-tab pack = 86p; 40 mg, 28-tab pack = £1.09; 80 mg, 28-tab pack = £1.65. Counselling, muscle effects, see notes above

Brands include Simador®

Oral suspension, simvastatin 20 mg/5 mL, net price 150 mL = £111.44, 40 mg/5 mL, 150 mL = £170.24. Counselling, muscle effects, see notes above

Excipients may include propylene glycol

☆ Zocor® (MSD) (Pat.)
Tablets, all f/c, simvastatin 10 mg (peach), net price 28-tab pack = £16.03; 20 mg (tan), 28-tab pack = £29.69; 40 mg (red), 28-tab pack = £29.69; 80 mg (red), 28-tab pack = £29.69. Counselling, muscle effects, see notes above

With ezetimibe

Note For homozygous familial hypercholesterolaemia, primary hypercholesterolaemia, and mixed hyperlipidaemia in patients stabilised on the individual components in the same proportions, or for patients not adequately controlled by statin alone. For prescribing information on ezetimibe, see Ezetimibe

Inegy® (MSD) (Pat.)
Tablets, simvastatin 20 mg, ezetimibe 10 mg, net price 28-tab pack = £33.42. simvastatin 40 mg, ezetimibe 10 mg, 28-tab pack = £38.98; simvastatin 80 mg, ezetimibe 10 mg, 28-tab pack = £41.21. Counselling, muscle effects, see notes above

1. Simvastatin 10 mg tablets can be sold to the public to reduce risk of first coronary event in individuals at moderate risk of coronary heart disease (approx. 10–15% risk of major event in 10 years), max. daily dose 10 mg and pack size of 28 tablets; treatment should form part of a programme to reduce risk of coronary heart disease
**Bile acid sequestrants**

Colestyramine, colestipol, and colestyramine are bile acid sequestrants used in the management of hypercholesterolaemia. They act by binding bile acids, preventing their reabsorption; this promotes hepatic conversion of cholesterol into bile acids; the resultant increased LDL-receptor activity of liver cells increases the clearance of LDL-cholesterol from the plasma. Bile acid sequestrants effectively reduce LDL-cholesterol but can aggravate hypertriglyceridaemia.

**Cautions** Bile acid sequestrants interfere with the absorption of fat-soluble vitamins; supplements of vitamins A, D, K, and folic acid may be required when treatment is prolonged. **Interactions:** Appendix 1 (bile acid sequestrants)

**Pregnancy and breast-feeding** Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.

**Side-effects** As bile acid sequestrants are not absorbed, gastro-intestinal side-effects predominate. Constipation is common, but diarrhoea has occurred, as have nausea, vomiting, and gastro-intestinal discomfort. Hypertriglyceridaemia may be aggravated. An increased bleeding tendency has been reported due to hypoprothrombinemia associated with vitamin K deficiency.

**Counselling** Other drugs should be taken at least 1 hour before (4 hours before colestyramine), or 4–6 hours after bile acid sequestrants to reduce possible interference with absorption. Colesevelam can be taken at the same time as a statin or ezetimibe.

---

**COLESEVELAM HYDROCHLORIDE**

**Indications** primary hypercholesterolaemia as an adjunct to dietary measures, either alone or with a statin; primary and familial hypercholesterolaemia, in combination with ezetimibe, either with or without a statin

**Cautions** see notes above; also gastro-intestinal motility disorders, major gastro-intestinal surgery, inflammatory bowel disease; patients receiving ciclosporin should have their blood-ciclosporin concentration monitored before, during, and after treatment with colesevelam; **interactions:** Appendix 1 (colesevelam)

**Contra-indications** bowel or biliary obstruction

**Breast-feeding** see notes above

**Side-effects** see notes above; also headache; myalgia

**Dose**
- Monotherapy, 3.75 g daily in 1–2 divided doses; max. 4.375 g daily
- Combination therapy with a statin, or ezetimibe, or both, 2.5–3.75 g daily in 1–2 divided doses

**Cholestagel** (Genzyme)

**Tablets,** f/c, colesevelam hydrochloride 625 mg, net price 180-cap pack = £96.10. Label: 21, counselling, avoid other drugs at same time (see notes above)

---

**COLESTIPOL HYDROCHLORIDE**

**Indications** hyperlipidaemias, particularly type IIa, in patients who have not responded adequately to diet and other appropriate measures

**Cautions** see notes above; **interactions:** Appendix 1 (colestipol)

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; intestinal obstruction reported rarely and hyperchloraemic acidosis reported on prolonged use

**Dose**
- Lipid reduction, initially 4 g daily increased by 4 g at weekly intervals to 12–24 g daily in 1–4 divided doses, then adjusted as required; max. 36 g daily
- Pruritus, see section 1.9.2
- Diarrhoeal disorders, see section 1.9.2
- CHILD 6–12 years, see **BNF for Children**

**Note** The contents of each sachet should be mixed with at least 150 mL of water or other suitable liquid such as fruit juice, skimmed milk, thin soups, and pulpy fruits with a high moisture content

**Colestyramine (Non-proprietary)**

**Powder,** sugar-free, colestyramine (anhydrous) 4 g/sachet, net price 50-sachet pack = £29.62. Label: 13, counselling, avoid other drugs at same time (see notes above)

**Excipients** may include aspartame (see section 9.4.1)

**Questran** (Bristol-Myers Squibb)

**Powder,** colestyramine (anhydrous) 4 g/sachet, net price 50-sachet pack = £10.76. Label: 13, counselling, avoid other drugs at same time (see notes above)

**Excipients** include sucrose 3.79 g/sachet

**Questran Light** (Bristol-Myers Squibb)

**Powder,** sugar-free, colestyramine (anhydrous) 4 g/sachet, net price 50-sachet pack = £16.15. Label: 13, counselling, avoid other drugs at same time (see notes above)

**Excipients** include aspartame (see section 9.4.1)
those with low HDL-cholesterol or with raised triglycerides can reduce the risk of coronary heart disease events in adults with primary hypercholesterolaemia in combination with a statin, and in patients with homozygous familial hypercholesterolaemia in combination with a statin, if triglyceride concentration is greater than 2.3 mmol/litre.

**Ezetimibe**

Ezetimibe inhibits the intestinal absorption of cholesterol. It is licensed as an adjunct to dietary manipulation in patients with primary hypercholesterolaemia in combination with a statin or alone (if a statin is inappropriate), in patients with homozgyous familial hypercholesterolaemia in combination with a statin, and in patients with homozgyous familial sitosterolaemia (phytosterolaemia). If ezetimibe is used in combination with a statin, there is an increased risk of rhabdomyolysis (see also Muscle Effects, p. 171).

**Ezetimibe for the treatment of primary hypercholesterolaemia (November 2007)**

Ezetimibe, used in accordance with the licensed indications for Ezetrol®, is an option for the treatment of adults with primary hypercholesterolaemia. www.nice.org.uk/TA132

**BEZAFIBRATE**

**Indications**
adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated, or in severe hypertriglyceridaemia; also see notes above

**Contra-indications**
hyperbilirubinaemia; gall bladder disease; nephrotic syndrome; photosensitivity to fibrates

**Hepatic impairment**
avoid in severe liver disease

**Renal impairment**
reduce dose to 400 mg daily if eGFR 40–60 mL/minute/1.73 m²; reduce dose to 200 mg every 1–2 days if eGFR 15–40 mL/minute/1.73 m²; avoid immediate-release preparations if eGFR less than 15 mL/minute/1.73 m²; avoid modified-release preparations if eGFR less than 60 mL/minute/1.73 m²

**Myotoxicity**
Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration on failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis), discontinue if myotoxicity suspected or creatine kinase concentration increases significantly

**Pregnancy**
manufacurers advise avoid—no information available

**Breast-feeding**
manufacturer advises avoid—no information available

**Side-effects**
abdominal distension, diarrhoea, nausea, anorexia; less commonly cholestasis, dizziness, headache, renal failure, erectile dysfunction, myotoxicity (with myasthenia, myalgia, or very rarely rhabdomyolysis)—special risk in renal impairment (see Myotoxicity above), urticaria, pruritis, rash, photosensitivity reactions, alopecia; rarely pancreatitis, peripheral neuropathy; very rarely gallstones, intermittent sludgelry, anaemia, leucopenia, pancytopenia, increased platelet count, thrombocytopenic purpura, Stevens-Johnson syndrome, toxic epidermal necrolysis

**Dose**
See preparations below

**Fibrates**

Bezafibrate, cipofibrate, fenofibrate, and gemfibrozil act mainly by decreasing serum triglycerides; they have variable effects on LDL-cholesterol. Although a fibrate can reduce the risk of coronary heart disease events in those with low HDL-cholesterol or with raised triglycerides, a statin should be used first. Fibrates are first-line therapy only in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin. In type 2 diabetes, fenofibrate can be added to a statin for those with a serum-triglyceride concentration exceeding 2.3 mmol/litre, despite 6 months of treatment with a statin and optimal glycaemic control.

Fibrates can cause a myositis-like syndrome, especially if renal function is impaired. Also, combination of a fibrate with a statin increases the risk of muscle effects (especially rhabdomyolysis) and should be used with caution (see Muscle Effects, p. 171) and monitoring of liver function and creatine kinase should be considered; gemfibrozil and statins should not be used concomitantly.
2 Cardiovascular system

Bezafibrate

Pregnancy avoid—embryotoxicity in children

Hepatic impairment avoid

Contra-indications gall bladder disease; pancreatitis

see under Bezafibrate; liver function tests recommended every 3 months for first year (discontinue treatment if significantly raised)

Contra-indications see under Bezafibrate

Hepatic impairment use with caution in mild to moderate impairment; avoid in severe impairment

Renal impairment reduce dose to 100 mg on alternate days in moderate impairment; avoid in severe impairment; see also Myotoxicity under Bezafibrate

Breast-feeding manufacturers advise avoid—present in milk in animal studies

Side-effects see under Bezafibrate; also reported pneumonitis, pulmonary fibrosis

Dose • 100 mg daily

Ciprofibrate (Non-proprietary) £84.91

Tablets, f/c, bezafibrate 200 mg, net price 100-tab pack = £8.63. Label: 21

Dose 200 mg 3 times daily, CHILD over 18 years, see BNF for Children

Modified release

Bezafibrate (Non-proprietary) £3.25

Brands include Fibrinate® XL

Dose 400 mg once daily (dose form not appropriate in patients with renal impairment)

Bezafibrate® Mono (Actavis) £6.69

Tablets, m/r, bezafibrate 400 mg, net price 28-tab pack = £7.63. Label: 21; 25

Fibrazate Tablets

Modified release 200 mg 3 times daily; pack = £8.63. Label: 21

Dose see under Bezafibrate; statin

Side-effects also reported interstitial pneumopathies

Cautions see under Bezafibrate; also reported interstitial pneumonitis, pulmonary fibrosis

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Dose • 100 mg daily

Ciprofibrate (Non-proprietary) £84.91

Tablets, ciprofibrate 100 mg, net price 28-tab pack = £7.63. Label: 21; 25

Dose 400 mg once daily (dose form not appropriate in patients with renal impairment)

CIPROFIBRATE

Indications adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated, or in severe hypertriglyceridaemia; also see notes above

Cautions see under Bezafibrate; also liver function tests recommended every 3 months for first year (discontinue treatment if significantly raised)

Contra-indications see under Bezafibrate

Hepatic impairment use with caution in mild to moderate impairment; avoid in severe impairment

Renal impairment reduce dose to 100 mg on alternate days in moderate impairment; avoid in severe impairment; see also Myotoxicity under Bezafibrate

Pregnancy manufacturers advise avoid—toxicity in animal studies

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects see under Bezafibrate; also reported pneumonitis, pulmonary fibrosis

Dose • 100 mg daily

Ciprofibrate (Non-proprietary) £84.91

Tablets, ciprofibrate 100 mg, net price 28-tab pack = £7.63. Label: 21; 25

Dose 400 mg once daily (dose form not appropriate in patients with renal impairment)

FENOFIBRATE

Indications adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated, or in severe hypertriglyceridaemia; adjunct to statin in mixed hyperlipidaemia if triglycerides and HDL-cholesterol inadequately controlled in patients at high cardiovascular risk; also see notes above

Cautions see under Bezafibrate; liver function tests recommended every 3 months for first year (discontinue treatment if significantly raised)

Contra-indications gall bladder disease; pancreatitis (unless due to severe hypertriglyceridaemia); photosensitivity to ketoprofen

Hepatic impairment avoid

Renal impairment reduce dose to 134 mg daily if eGFR less than 60 mL/minute/1.73 m²; reduce dose to 67 mg daily if eGFR less than 20 mL/minute/1.73 m²; avoid if eGFR less than 15 mL/minute/1.73 m²; see also Myotoxicity under Bezafibrate

Pregnancy avoid—embryotoxicity in animal studies

Fenofibrate

See preparations below

Dose • See preparations below

Lipantil® (Abbott Healthcare) £14.23

Lipantil® Micro 267 capsules, orange, fenofibrate (micronised) 200 mg, net price 28-cap pack = £14.23. Label: 21

Dose initially 3 capsules daily, increased if necessary to 4 capsules daily (max. 3 capsules daily with concomitant statin); CHILD under 18 years see BNF for Children

Lipantil® Micro 200 capsules, orange, fenofibrate (micronised) 200 mg, net price 28-cap pack = £14.23. Label: 21

Dose initially 1 capsule daily (dose form not appropriate for children or in renal impairment)

Lipantil® Micro 267 capsules, orange, fenofibrate (micronised) 267 mg, net price 28-cap pack = £21.75. Label: 21

Dose 1 capsule daily (dose form not appropriate for initial dose titration, with concomitant statin, for children, or in renal impairment)

Supralip® 160 (Abbott Healthcare) £6.69

Tablets, f/c, fenofibrate (micronised) 160 mg, net price 28-tab pack = £6.69. Label: 21

Dose 160 mg daily (dose form not appropriate for children or in renal impairment)

GEMFIBROZIL

Indications adjunct to diet and other appropriate measures in mixed hyperlipidaemia or primary hypercholesterolaemia if statin contra-indicated or not tolerated, or in severe hypertriglyceridaemia; adjunct to diet and other appropriate measures in primary prevention of cardiovascular disease in men with hyperlipidaemias if statin contra-indicated or not tolerated; also see notes above

Cautions monitor blood counts for first year; monitor liver-function (discontinue treatment if abnormalities persist); preferably avoid use with statins (high risk of rhabdomyolysis); correct hypothyroidism before initiating treatment (see p. 170); elderly; interactions: Appendix 1 (fibrates)

Contra-indications history of gall-bladder or biliary-tract disease including gallstones; photosensitivity to fibrates

Hepatic impairment avoid

Renal impairment initially 900 mg daily if eGFR 30–80 mL/minute/1.73 m²; avoid if eGFR less than...
30 mL/minute/1.73 m²; see also Myotoxicity under Bezafibrate

**Pregnancy** manufacturers advise avoid unless essential—toxicity in animal studies

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** dyspepsia, diarrhoea, constipation, nausea, vomiting, abdominal pain, flatulence, headache, fatigue, vertigo, eczema, rash; less commonly atrial fibrillation; rarely pancreatitis, appendicitis, disturbances in hepatic function including hepatitis and cholestatic jaundice, angioedema, dizziness, paraesthesia, depression, drowsiness, sexual dysfunction, thrombocytopaenia, anaemia, leucopenia, eosinophilia, bone-marrow suppression, myalgia, myopathy, myasthenia, myositis accompanied by increase in creatine kinase (discontinue if raised significantly), blurred vision, pruritus, urticaria, exfoliative dermatitis, alopecia, photosensitivity

**Dose**
- 1.2 g daily, usually in 2 divided doses; range 0.9–1.2 g daily; CHILD not recommended

**Gemfibrozil** (Non-proprietary) (£)
- *Capsules*, gemfibrozil 300 mg, net price 112-cap pack = £35.57. Label: 22
- *Tablets*, gemfibrozil 600 mg, net price 30-cap pack = £16.23, 56-cap pack = £34.75. Label: 22

**Lopid** (£)
- *‘300’ capsules*, white/maroon, gemfibrozil 300 mg, net price 100-caps pack = £31.76. Label: 22
- *‘600’ tablets*, f/c, gemfibrozil 600 mg, net price 56-caps pack = £35.57. Label: 22

**Lomitapide**

Lomitapide, an inhibitor of microsomal triglyceride transfer protein (MTP), reduces lipoprotein secretion and circulating concentrations of lipoprotein-borne lipids such as cholesterol and triglycerides. Lomitapide is licensed for the treatment of homozygous familial hypercholesterolaemia and should be used under specialist supervision. Lomitapide can interfere with the absorption of fat-soluble nutrients and supplementation of vitamin E and fatty acids is required.

**LOMITAPIDE**

**Indications** adjunct to dietary measures and other lipid-regulating drugs with or without low-density lipoprotein apheresis in homozygous familial hypercholesterolaemia (see notes above)

**Cautions** see notes above; patients over 65 years; monitor liver function tests before treatment, then at least monthly and before each dose increase for first year, then at least every 3 months and before each dose increase thereafter; screen for hepatic steatosis and fibrosis before treatment, then annually thereafter; concomitant use of hepatotoxic drugs; interactions: Appendix 1 (lomitapide)

**Contra-indications** significant or chronic bowel disease

**Hepatic impairment** reduce dose if serum transaminases raised during treatment (consult product literature); max. 40 mg daily in mild impairment; avoid in moderate to severe impairment, or if unexplained persistent abnormal liver function tests

**Renal impairment** max. 40 mg daily in end-stage renal disease

**Pregnancy** avoid—teratogenicity and embryotoxicity in animal studies; manufacturer advises exclude pregnancy before treatment and ensure effective contraception used

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** hepatic steatosis, hepatomegaly, raised serum transaminases (see Hepatic Impairment), diarrhoea, constipation, nausea, vomiting, dyspepsia, gastro-oesophageal reflux disease, abdominal pain, bloating, flatulence, eructation, tenesmus, haemorrhoids, gastroenteritis, appetite changes, weight loss, dizziness, headache, migraine, malaise, hypokalaemia, neutropenia, leucopenia, muscle spasms, ecchymosis, erythematous rash; less commonly dry mouth, haematemesis, gastrointestinal haemorrhage, hyperbilirubinaemia, chest pain, drowsiness, paraesthesia, vertigo, pyrexia, haematuria, anaemia, proteinuria, arthralgia, myalgia, pain in extremities, joint swelling, abnormal gut, eye swelling, dry skin, sweating

**Dose**
- ADULT over 18 years, initially 5 mg once daily at least 2 hours after evening meal, increased if necessary after 2 weeks to 10 mg once daily, then increased after at least 4 weeks to 20 mg once daily, then in steps of 20 mg daily at intervals of at least 4 weeks up to max. 60 mg once daily

**Note** With concomitant weak inhibitors of cytochrome P450 enzyme CYP3A4 (e.g. cimetidine, ranolazine, and fosaprepitant), reduce lomitapide dose to 5 mg once daily (if taking less than 40 mg once daily), or to 10 mg once daily (if taking 40–60 mg once daily), then adjust as necessary

**Lojuxta** (£)
- *Capsules*, lomitapide (as mesilate) 5 mg (orange), net price 28-cap pack = £17765.00; 10 mg (orange-white), 28-cap pack = £17765.00; 20 mg (white), 28-cap pack = £17765.00

**Nicotinic acid group**

The value of nicotinic acid is limited by its side-effects, especially vasodilatation. In doses of 1.5 to 3 g daily it lowers both cholesterol and triglyceride concentrations by inhibiting synthesis; it also increases HDL-cholesterol. Nicotinic acid is used by specialists in combination with a statin if the statin alone cannot adequately control dyslipidaemia (raised LDL-cholesterol, triglyceridaemia, and low HDL-cholesterol); nicotinic acid can also be used alone if the patient is intolerant of statins (for advice on treatment of dyslipidaemia, including use of combination treatment, see p. 170).

**Acipimox** seems to have fewer side-effects than nicotinic acid but may be less effective in its lipid-regulating capabilities.

**ACIPIMOX**

**Indications** hyperlipidaemias of types IIb and IV in patients who have not responded adequately to diet and other appropriate measures

**Contra-indications** peptic ulcer

**Renal impairment** reduce dose if eGFR 30–60 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid
2 Cardiovascular system

178

2.12 Lipid-regulating drugs

Breast-feeding

manufacturer advises avoid

Side-effects

vasodilatation, flushing, itching, rashes, urticaria, erythema; heartburn, epigastric pain, nausea, diarrhoea, headache, malaise, dry eyes; rarely angioedema, bronchospasm, anaphylaxis

Dose

• Usually 500–750 mg daily in divided doses

Olmetab® (Pharmacia) Capsules, brown/pink, acipimox 250 mg, net price 90-cap pack = £46.33. Label: 21

NICOTINIC ACID

Indications

adjunct to statin in dyslipidaemia or used alone if statin not tolerated (see also p. 170)

Cautions

unstable angina, acute myocardial infarction, diabetes mellitus, gout, history of peptic ulceration; interactions: Appendix 1 (nicotinic acid)

Contra-indications

bleeding; active peptic ulcer disease

Hepatic impairment

manufacturer advises monitor liver function in mild to moderate impairment and avoid in severe impairment; discontinue if severe abnormalities in liver function tests

Renal impairment

manufacturer advises use with caution—no information available

Pregnancy

no information available—manufacturer advises avoid unless potential benefit outweighs risk

Breast-feeding

present in milk—avoid

Side-effects

diarrhoea, nausea, vomiting, abdominal pain, dyspepsia; flushing; pruritis, rash; less commonly tachycardia, palpitation, shortness of breath, peripheral oedema, headache, dizziness, increase in uric acid, hypophosphataemia, prolonged prothrombin time, and reduced platelet count; rarely hypotension, syncope, rhinitis, insomnia, reduced glucose tolerance, myalgia, myopathy, myasthenia; very rarely anorexia, rhombomylolysis, visual disturbance, and jaundice also reported

Note

Prostaglandin-mediated symptoms (such as flushing) can be reduced by low initial doses taken with meals or, if patient taking aspirin, aspirin dose should be taken 30 minutes before nicotinic acid

Dose

• See under preparation

Modified release

Niaspan® Tablets, m/r, nicotinic acid 500 mg; 750 mg; 1 g

Available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104

Omega-3 fatty acid compounds

The omega-3 fatty acid compounds comprise omega-3-acid ethyl esters (Omacer® and Prestylon®) and omega-3-marine triglycerides (Maxepa®). Omega-3 fatty acid compounds may be used to reduce triglycerides, as an alternative to a fibrate and in addition to a statin, in patients with combined (mixed) hyperlipidaemia not adequately controlled with a statin alone. A triglyceride concentration exceeding 10 mmol/litre is associated with acute pancreatitis and lowering the concentration reduces this risk. The fat content of omega-3 fatty acid compounds (including excipients in the preparations) should be taken into consideration when treating hypertriglyceridaemia. There is little clinical trial evidence that the triglyceride lowering effect decreases the risk of cardiovascular disease.

The Scottish Medicines Consortium (p. 4) has advised (November 2002) that omega-3-acid ethyl esters are not recommended for use within NHS Scotland for the treatment of hypertriglyceridaemia.

OMEGA-3-ACID ETHYL ESTERS

Indications

adjunct to diet and statin in type Iib or III hypertriglyceridaemia; adjunct to diet in type IV hypertriglyceridaemia; adjunct in secondary prevention in those who have had a myocardial infarction in the preceding 3 months

Cautions

haemorrhagic disorders, anticoagulant treatment (bleeding time increased)

Hepatic impairment

monitor liver function

Pregnancy

manufacturers advise use only if potential benefit outweighs risk—no information available

Breast-feeding

manufacturers advise avoid—no information available

Side-effects

dyspepsia, nausea; less commonly taste disturbances, abdominal pain, gastritis, dizziness; rarely hepatic disorders, headache, hyperglycaemia, acne, rash; very rarely gastro-intestinal haemorrhage, hypotension, nasal dryness, urticaria, and increased white cell count

Dose

• See under preparations below

Omacer® (Abbott Healthcare) Capsules, 1 g of omega-3-acid ethyl esters 90 containing eicosapentaenoic acid 460 mg and docosahexaenoic acid 380 mg, net price 28-cap pack = £14.24, 100-cap pack = £50.84. Label: 21

Dose

hypertriglyceridaemia, initially 2 capsules daily with food, increased if necessary to 4 capsules daily

Secondary prevention after myocardial infarction, 1 capsule daily with food

Prestylon® (TEVA UK) Capsules, 1 g of omega-3-acid ethyl esters 90 containing eicosapentaenoic acid 460 mg and docosahexaenoic acid 380 mg, net price 28-cap pack = £10.68, 100-cap pack = £38.13. Label: 21

Dose

hypertriglyceridaemia, initially 2 capsules daily with food, increased if necessary to 4 capsules daily

Secondary prevention after myocardial infarction, 1 capsule daily with food

OMEGA-3-MARINE TRIGLYCERIDES

Indications

adjunct in the reduction of plasma triglycerides in severe hypertriglyceridaemia

Cautions

haemorrhagic disorders, anticoagulant treatment; aspirin-sensitive asthma; type 2 diabetes

Side-effects

occasional nausea and belching

Dose

• See under preparations below

Maxepa® (Seven Seas) Capsules, 1 g concentrated fish oils containing eicosapentaenoic acid 170 mg, docosahexaenoic acid 115 mg, net price 200-cap pack = £29.28. Label: 21

Dose

5 capsules twice daily with food

Liquid, golden-coloured, concentrated fish oils containing approx. eicosapentaenoic acid 157 mg, docosahexaenoic acid 106 mg/1 mL, net price 150 mL = £21.59. Label: 21

Dose

5 mL twice daily with food
Local sclerosants

Sodium tetradecyl sulfate is used in sclerotherapy of spider veins and varicose veins, and phenol is used in haemorrhoids (section 1.7.3).

**SODIUM TETRADECYL SULFATE**

**Indications** sclerotherapy of reticular veins and spider veins in legs and varicose veins

**Cautions** arterial disease; asymptomatic patent foramen ovale (use smaller volumes and avoid Valsalva manoeuvre immediately after administration); history of migraine (use smaller volumes); extravasation may cause necrosis of tissues; test dose recommended before each treatment; resuscitation facilities must be available; venous insufficiency with lymphoedema (pain and inflammation may worsen)

**Contra-indications** inability to walk; high risk of thromboembolism; recent acute superficial thrombophlebitis, deep vein thrombosis, or pulmonary embolism; varicose veins caused by tumours (unless tumour removed); uncontrolled diabetes mellitus, hyperthyroidism, asthma, neoplasm, blood disorders, respiratory or skin disease; significant valvular incompetence in deep veins; occlusive arterial disease; phlebitis; acute infection; symptomatic patent foramen ovale (if administered as foam)

**Pregnancy** avoid unless benefits outweigh risks—no information available

**Breast-feeding** use with caution—no information available

**Side-effects** superficial thrombophlebitis, phlebitis, telangiectatic matting, skin discoloration, local pain and burning; less commonly deep-vein thrombosis, scotoma; rarely vasovagal reactions, chest pain, cough, shortness of breath, headache, migraine, paraesthesia; very rarely nausea, vomiting, diarrhoea, swollen tongue, dry mouth, transient ischaemic attack, stroke, palpitation, pulmonary embolism, vasculitis, circulatory collapse, weakness, fever, hot flashes, hypersensitivity reactions (including anaphylaxis), sloughing and necrosis of skin and tissues

**Dose**

Asthma

Drugs used in the management of asthma include beta₂ agonists (section 3.1.1), antimuscarinic bronchodilators (section 3.1.2), theophylline (section 3.1.3), corticosteroids (section 3.2), cromoglicate and nedocromil (section 3.3.1), leukotriene receptor antagonists (section 3.3.2), and, in specialist centres, omalizumab (section 3.4.2).

For tables outlining the management of chronic and acute asthma, see p. 182 and p. 183. For advice on the management of medical emergencies in dental practice, see p. 28.

Administration of drugs for asthma

Inhalation This route delivers the drug directly to the airways; the dose required is smaller than when given by mouth and side-effects are reduced. See also Inhaler devices, section 3.1.5.

Solutions for nebulisation are available for use in severe acute asthma. They are administered over 5–10 minutes from a nebuliser, usually driven by oxygen in hospital. See also Nebulisers, section 3.1.5.

Oral The oral route is used when administration by inhalation is not possible. Systemic side-effects occur more frequently when a drug is given orally rather than by inhalation. Drugs given by mouth for the treatment of asthma include beta₂ agonists, corticosteroids, theophylline, and leukotriene receptor antagonists.

Parenteral Drugs such as beta₂ agonists, corticosteroids, and aminophylline can be given by injection in acute severe asthma when administration by nebulisation is inadequate or inappropriate. If the patient is being treated in the community, urgent transfer to hospital should be arranged.
Pregnancy and breast-feeding

Severe acute asthma can be fatal and must be treated promptly. All patients with severe acute asthma should be given high-flow oxygen (if available) and an inhaled short-acting beta₂ agonist via a large-volume spacer or nebuliser; give 2–10 puffs of salbutamol 100 micrograms/metered inhalation, each puff inhaled separately via a large-volume spacer, and repeat at 10–20 minute intervals or as necessary. If there are life-threatening features, give salbutamol or terbutaline via an oxygen-driven nebuliser every 20–30 minutes or as necessary, see p. 187 and p. 189. In all cases, a systemic corticosteroid (section 6.3.2) should be given. For adults, give prednisolone 40–50 mg by mouth for at least 5 days, or intravenous hydrocortisone (preferably as sodium succinate) 100 mg every 6 hours until conversion to oral prednisolone is possible. For children, give prednisolone 1–2 mg/kg by mouth (max. 40 mg) for up to 3 days, or longer if necessary, or intravenous hydrocortisone (preferably as sodium succinate) 4 mg/kg (max. 100 mg) every 6 hours (alternatively, if weight unavailable, child under 2 years 25 mg every 6 hours, 2–5 years 50 mg every 6 hours, 5–12 years 100 mg every 6 hours) until conversion to oral prednisolone is possible. If the child has been taking an oral corticosteroid for more than a few days, then give prednisolone 2 mg/kg (max. 60 mg). In severe or life-threatening asthma, also consider initial treatment with ipratropium by nebuliser, 500 micrograms every 4–6 hours (child under 12 years 250 micrograms repeated every 20–30 minutes for the first 2 hours, then every 4–6 hours as necessary). Most patients do not require and do not benefit from the addition of intravenous aminophylline or of intravenous beta₂ agonist; both cause more adverse effects than nebulised beta₂ agonists. Nevertheless, an occasional patient who has not been taking theophylline may benefit from aminophylline infusion (see p. 192). A single dose of magnesium sulfate injection (see section 9.5.1.3) [unlicensed indication] 1.2–2 g (equivalent to approx. 4.8–8 mmol Mg²⁺) by intravenous infusion over 20 minutes can be used for patients with severe acute asthma, but evidence of benefit is limited.

Follow up in all cases

Episodes of acute asthma should be regarded as a failure of preventative therapy. A careful history should be taken to establish the reason for the exacerbation. Inhaler technique should be checked and regular treatment should be reviewed in accordance with the Management of Chronic Asthma table, p. 182. Patients should be given a written asthma action plan aimed at preventing relapse, optimising treatment, and preventing delay in seeking assistance in future exacerbations. Follow-up within 48 hours should be arranged with the general practitioner or appropriate primary care health professional. Patients should also be reviewed by a respiratory specialist within one month of the exacerbation.

Chronic obstructive pulmonary disease

Smoking cessation (section 4.10.2) reduces the progressive decline in lung function in chronic obstructive pulmonary disease (COPD, chronic bronchitis, or emphysema). Infection can complicate chronic obstructive pulmonary disease and may be prevented by vaccination (pneumococcal vaccine and influenza vaccine, section 14.4).

A trial of a high-dose inhaled corticosteroid or an oral corticosteroid is recommended for patients with moderate or severe airflow obstruction if the diagnosis is in doubt.

Symptoms of chronic obstructive pulmonary disease may be alleviated by an inhaled short-acting beta₂ agonist (section 3.1.1.1) or a short-acting anti-muscarinic bronchodilator (section 3.1.2) used as required.

When the airways obstruction is more severe, regular inhaled therapy should be used, see also Use of Inhaled Therapies in Chronic Obstructive Pulmonary Disease, p. 184. It is important to check compliance and inhaler technique before initiating a new drug.

If the Forced Expiratory Volume in 1 second (FEV₁) is 50% of predicted or more, either a long-acting anti-muscarinic bronchodilator (section 3.1.2) or a long-acting beta₂ agonist (section 3.1.1.1) should be used. Short-acting anti-muscarinic bronchodilators should be discontinued when a long-acting anti-muscarinic bronchodilator is started. A long-acting beta₂ agonist with a corticosteroid (section 3.2) in a combination inhaler can be...
### Management of chronic asthma

**Important** Start at **step most appropriate** to initial severity; before initiating a new drug consider whether diagnosis is correct, check compliance and inhaler technique, and eliminate trigger factors for acute exacerbations.

### Follow up in all cases

Monitor symptoms and peak flow. Set up asthma action plan and check inhaler technique. Review by general practitioner or appropriate primary care health professional within 48 hours, see also p. 181.

Advice on the management of acute asthma is based on the recommendations of the British Thoracic Society and Scottish Intercollegiate Guidelines Network (updated January 2012); updates available at [www.brit-thoracic.org.uk](http://www.brit-thoracic.org.uk)
used for patients who remain symptomatic despite regular treatment with a long-acting beta₂ agonist. If FEV₁ is less than 50% of predicted, either a long-acting antimuscarinic bronchodilator or a long-acting beta₂ agonist with a corticosteroid in a combination inhaler should be used.

In any patient who remains breathless or continues to have exacerbations, triple therapy with a long-acting beta₂ agonist and a corticosteroid in a combination inhaler plus a long-acting antimuscarinic bronchodilator should be used.

If an inhaled corticosteroid is not appropriate, a long-acting antimuscarinic bronchodilator can be used with a long-acting beta₂ agonist.

If symptoms persist or if the patient is unable to use an inhaler, oral modified-release aminophylline or theophylline (section 3.1.3) can be used.

Indacaterol (section 3.1.1) is a long-acting beta₂ agonist licensed for the maintenance treatment of chronic obstructive pulmonary disease.

In patients with severe chronic obstructive pulmonary disease associated with chronic bronchitis and a history of frequent exacerbations, roflumilast (section 3.3.3) is licensed as an adjunct to existing bronchodilator treatment.

A mucolytic drug (section 3.7) may be considered for a patient with a chronic productive cough.

Long-term oxygen therapy (section 3.6) prolongs survival in patients with severe chronic obstructive pulmonary disease and hypoxaemia.

During an exacerbation of chronic obstructive pulmonary disease, bronchodilator therapy can be administered through a nebuliser if necessary and oxygen given if appropriate. Aminophylline can be given intravenously if response to nebulised bronchodilators is poor. A short course of oral corticosteroid (section 6.3.2), such as prednisolone 30 mg daily for 7–14 days, should be given if increased breathlessness interferes with daily activities. Antibacterial treatment (Table 1, section 5.1) is required if sputum becomes more purulent than usual, or if there are other signs of infection.

Patients who have had an episode of hypercapnic respiratory failure should be given a 24% or 28% Venturi mask and an oxygen alert card (see p. 185) endorsed with the oxygen saturations required during previous exacerbations. Patients and their carers should be instructed to show the card to emergency healthcare providers in the event of an exacerbation, see also section 3.6.
short-acting beta 2 agonist is used for immediate relief for patients requiring prophylactic treatment. Selective beta 2 agonists produce bronchodilation. A short-acting beta2 agonist inhaled immediately before exertion reduces exercise-induced asthma; however, frequent exercise-induced asthma probably reflects poor overall control and calls for reassessment of asthma treatment.

Croup
Mild croup is largely self-limiting, but treatment with a single dose of a corticosteroid (e.g. dexamethasone 150 micrograms/kg) by mouth may be of benefit. More severe croup (or mild croup that might cause complications) calls for hospital admission; a single dose of a corticosteroid (e.g. dexamethasone 150 micrograms/kg or prednisolone 1–2 mg/kg by mouth, section 6.3.2) should be administered before transfer to hospital. In hospital, dexamethasone 150 micrograms/kg (by mouth or by injection) or budesonide 2 mg (by nebulisation, section 3.2) will often reduce symptoms; the dose may need to be repeated after 12 hours if necessary. For severe croup not effectively controlled with corticosteroid treatment, nebulised adrenaline solution 1 in 1000 (1 mg/mL) should be given with close clinical monitoring in a dose of 400 micrograms/kg (max. 5 mg) repeated after 30 minutes if necessary; the effects of nebulised adrenaline last 2–3 hours and the child needs to be monitored carefully for recurrence of the obstruction.

Short-acting beta2 agonists
Mild to moderate symptoms of asthma respond rapidly to the inhalation of a selective short-acting beta2 agonist such as salbutamol or terbutaline. If beta2 agonist inhalation is needed more often than twice a week, or if night-time symptoms occur at least once a week, or if the patient has suffered an exacerbation in the last 2 years, then prophylactic treatment should be considered using a stepped approach as outlined in the Management of Chronic Asthma table, p. 182.

Long-acting beta2 agonists
Formoterol (eformoterol) and salmeterol are longer-acting beta2 agonists which are administered by inhalation. They should be used for asthma only in patients who regularly use an inhaled corticosteroid (see CHM advice below). They have a role in the long-term control of chronic asthma (see Management of Chronic Asthma table, p. 182) and they can be useful in nocturnal asthma. Salmeterol should not be used for the relief of an asthma attack; it has a slower onset of action than salbutamol or terbutaline. Formoterol is licensed for short-term symptom relief and for the prevention of exercise-induced bronchospasm; its speed of onset of action is similar to that of salbutamol.

CHM advice
To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta2 agonists (formoterol and salmeterol) should:
- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- not be initiated in patients with rapidly deteriorating asthma;
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- be discontinued in the absence of benefit;
- not be used for the relief of exercise-induced asthma symptoms unless regular inhaled corticosteroids are also used;
- be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.

A daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age groups; higher doses should be used rarely, and only when control is not maintained on the lower dose. Patients should be advised to report any deterioration in symptoms following initiation of treatment with a long-acting beta2 agonist, see Management of Chronic Asthma table, p. 182.

Indacaterol is a long-acting beta2 agonist licensed for chronic obstructive pulmonary disease; it is not indicated for the relief of acute bronchospasm. Vilanterol is a long-acting beta2 agonist available only in a combination inhaler with fluticasone furoate (see section 3.2).
Inhalation Pressurised-metered dose inhalers are an effective and convenient method of drug administration in mild to moderate asthma. A spacer device (section 3.1.5) may improve drug delivery. At recommended inhaled doses, the duration of action of salbutamol and terbutaline is about 3 to 5 hours, and 12 hours for salmeterol and formoterol. The dose, the frequency, and the maximum number of inhalations in 24 hours of the beta₂ agonist should be stated explicitly to the patient. The patient should be advised to seek medical advice when the prescribed dose of beta₂ agonist fails to provide the usual degree of symptomatic relief because this usually indicates a worsening of the asthma and the patient may require a prophylactic drug such as an inhaled corticosteroid (see Management of Chronic Asthma table, p. 182).

Nebuliser (or respirator) solutions of salbutamol and terbutaline are used for the treatment of severe acute asthma in hospital or in general practice. Patients with a severe attack of asthma should preferably have oxygen during nebulisation since beta₂ agonists can increase arterial hypoxaemia. For the use of nebulisers in chronic obstructive pulmonary disease, see section 3.1.5. The dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution, see also section 3.1.5.

Oral Oral preparations of beta₂ agonists may be used by patients who cannot manage the inhaled route. They are sometimes used for children and the elderly, but inhaled beta₂ agonists are more effective and have fewer side-effects. The longer-acting oral preparations, including bumberterol, may be of value in nocturnal asthma but they have a limited role and inhaled long-acting beta₂ agonists are usually preferred.

Parenteral Salbutamol or terbutaline can be given intravenously for severe or life-threatening acute asthma; patients should be carefully monitored and the dose adjusted according to response and heart rate. The regular use of beta₂ agonists by the subcutaneous route is not recommended since the evidence of benefit is uncertain and it may be difficult to withdraw such treatment once started. Beta₂ agonists may also be given by intramuscular injection.

Children Selective beta₂ agonists are useful even in children under the age of 18 months. They are most effective by the inhaled route; a pressurised metered-dose inhaler should be used with a spacer device in children under 5 years (see NICE guidance, section 3.1.5). A beta₂ agonist may also be given by mouth but administration by inhalation is preferred; a long-acting inhaled beta₂ agonist may be used where appropriate (see Management of Chronic Asthma table, p. 182). In severe attacks nebulisation using a selective beta₂ agonist or ipratropium is advisable (see also Management of Chronic Asthma table, p. 182 and p. 183).

Cautions Beta₂ agonists should be used with caution in hyperthyroidism, cardiovascular disease, arrhythmias, susceptibility to QT-interval prolongation, and hypertension. Beta₂ agonists should be used with caution in diabetes—monitor blood glucose (risk of ketoacidosis, especially when beta₂ agonist given intravenously). Interactions: Appendix 1 (sympathomimetics, beta₂).

Hypokalaemia Potentially serious hypokalaemia may result from beta₂ agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium concentration should therefore be monitored in severe asthma.

Side-effects Side-effects of the beta₂ agonists include fine tremor (particularly in the hands), nervous tension, headache, muscle cramps, and palpitation. Other side-effects include tachycardia, arrhythmias, peripheral vasodilation, myocardial ischaemia, and disturbances of sleep and behaviour. Paradoxical bronchospasm (occasionally severe), urticaria, angioedema, hypotension, and collapse have also been reported. High doses of beta₂ agonists are associated with hypokalaemia (see Hypokalaemia above).

**BAMBUTEROL HYDROCHLORIDE**

Note Bambuterol is a pro-drug of terbutaline

**Indications** asthma and other conditions associated with reversible airways obstruction

**Cautions** see notes above

**Hepatic impairment** avoid in severe impairment

**Renal impairment** reduce initial dose by half if eGFR less than 50 mL/minute/1.73m²

**Pregnancy** manufacturer advises avoid—no information available; see also p. 181

**Breast-feeding** see p. 181

**Side-effects** see notes above

**Dose**
- 20 mg once daily at bedtime if patient has previously tolerated beta₂ agonists; other patients, initially 10 mg once daily at bedtime, increased if necessary after 1–2 weeks to 20 mg once daily; CHILD not recommended

**Bambec® (AstraZeneca) (pH 5)**

**Tablets** both scored, bambuterol hydrochloride 10 mg, net price 28-tab pack = £14.46; 20 mg, 28-tab pack = £15.77

**FORMOTEROL FUMARATE**

(Eformoterol fumarate)

**Indications** reversible airways obstruction (including nocturnal asthma and prophylaxis of exercise-induced bronchospasm) in patients requiring long-term regular bronchodilator therapy, see also Management of Chronic Asthma table, p. 182; chronic obstructive pulmonary disease

**Note** For use in asthma only in patients who regularly use an inhaled corticosteroid, see notes above

**Cautions** see notes above

**Pregnancy** see p. 181

**Breast-feeding** see p. 181

**Side-effects** see notes above; very rarely QT-interval prolongation; taste disturbances, nausea, dizziness, rash, and pruritus also reported

**Dose**
- See under preparations below

**Counselling** Advise patients not to exceed prescribed dose, and to follow manufacturer’s directions; if a previously effective dose of inhaled formoterol fails to provide adequate relief, a doctor’s advice should be obtained as soon as possible
Formoterol

**Dry powder for inhalation**, formoterol fumarate 12 micrograms/metered inhalation, net price £23.75. Counselling, administration

*Brands include* Easyhaler® Formoterol

**Dose** by inhalation of powder, asthma, ADULT and CHILD over 12 years, 12 micrograms twice daily, increased to 24 micrograms twice daily in more severe airways obstruction, CHILD 6–12 years, 12 micrograms twice daily.

**Chronic obstructive pulmonary disease**, 12 micrograms twice daily

**Atimos Modulite®** (Chiesi)®

**Aerosol inhalation**, formoterol fumarate 12 micrograms/metered inhalation, net price £30.06. Counselling, administration

**Dose** by aerosol inhalation, asthma, ADULT and CHILD over 12 years, 12 micrograms twice daily, increased to max. 24 micrograms twice daily in more severe airways obstruction.

**Chronic obstructive pulmonary disease**, ADULT over 18 years, 12 micrograms twice daily; for symptom relief additional doses may be taken to total max. 48 micrograms daily (max. single dose 24 micrograms)

**Foradil®** (Novartis)®

**Dry powder for inhalation**, formoterol fumarate 12 micrograms/capsule, net price 60-cap pack (with inhaler device) = £23.38. Counselling, administration

**Dose** by inhalation of powder, asthma, ADULT and CHILD over 12 years, 12 micrograms twice daily, increased to 24 micrograms twice daily in more severe airways obstruction, CHILD 6–12 years, 12 micrograms twice daily.

**Chronic obstructive pulmonary disease**, 12 micrograms twice daily

**Oxis®** (AstraZeneca)®

**Turbohaler®** (= dry powder inhaler), formoterol fumarate 6 micrograms/metered inhalation, net price 60-dose unit = £24.80; 12 micrograms/metered inhalation, 60-dose unit = £24.80. Counselling, administration

**Dose** by inhalation of powder, chronic asthma, 6–12 micrograms 1–2 times daily, increased up to 24 micrograms twice daily if necessary, occasionally up to 72 micrograms daily may be needed (max. single dose 36 micrograms); reassess treatment if additional doses required on more than 2 days a week; CHILD 6–18 years, 6–12 micrograms 1–2 times daily; occasionally up to 48 micrograms daily may be needed (max. single dose 12 micrograms) (see also CHM advice, p. 185).

Relief of bronchospasm, ADULT and CHILD over 6 years, 6–12 micrograms.

Prophylaxis of exercise-induced bronchospasm, 12 micrograms before exercise; CHILD 6–18 years, 6–12 micrograms before exercise.

**Chronic obstructive pulmonary disease**, 12 micrograms 1–2 times daily; for symptom relief additional doses can be taken to total max. 48 micrograms daily (max. single dose 24 micrograms)

**Compound preparations**

For compound preparations containing formoterol, see Flutiform®, Foradil® and Symbicort®, section 3.2

**INDACATEROL**

**Indications** maintenance treatment of chronic obstructive pulmonary disease

**Cautions** see notes above; convulsive disorders

**Hepatic impairment** use with caution in severe impairment—no information available

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** see notes above; also peripheral oedema, cough, oropharyngeal pain, nasopharyngitis, dizziness, sinusitis, rhinorrhea; less commonly atrial fibrillation, chest pain, hyperglycaemia, paraesthesia, pruritus, rash

**Dose**

**By inhalation of powder**

- ADULT over 18 years, 150 micrograms once daily, increased to max. 300 micrograms once daily

**Onbrez Breezhaler®** (Novartis)®

**Inhalation powder, hard capsule** (for use with Onbrez Breezhaler® device), indacaterol (as maleate) 150 micrograms, net price 30-cap pack with Onbrez Breezhaler® device = £29.26; 300 micrograms, net price 30-cap pack with Onbrez Breezhaler® device = £29.26. Counselling, administration

---

**SALBUTAMOL**

**Albuterol**

**Indications** asthma and other conditions associated with reversible airways obstruction; premature labour (section 7.1.3)

**Cautions** see notes above

**Pregnancy** see p. 181

**Breast-feeding** see p. 181

**Side-effects** see notes above; also lactic acidosis with high doses

**Dose**

- **By mouth** (but use by inhalation preferred), **ADULT** over 18 years, 4 mg (elderly and sensitive patients initially 2 mg) 3–4 times daily; max. single dose 8 mg (but unlikely to provide much extra benefit or to be tolerated); **CHILD** under 2 years see BNF for Children, 2–6 years 1–2 mg 3–4 times daily, 6–12 years 2 mg 3–4 times daily, 12–18 years 2–4 mg 3–4 times daily

- **By subcutaneous or intramuscular injection**, 500 micrograms, repeated every 4 hours if necessary

- **By slow intravenous injection** (but see also Management of Acute Asthma table, p. 183), (dilute to a concentration of 50 micrograms/mL), 250 micrograms, repeated if necessary; **CHILD** under 18 years see BNF for Children

- **By intravenous infusion** (but see also Management of Acute Asthma table, p. 183), initially 5 micrograms/minute, adjusted according to response and heart-rate usually in range 3–20 micrograms/minute, or more if necessary; **CHILD** under 18 years see BNF for Children

- **By aerosol inhalation** (but see also Management of Acute Asthma table, p. 183, or Management of Chronic Asthma table, p. 182), 100–200 micrograms (1–2 puffs); for persistent symptoms up to 4 times daily; **CHILD** 100 micrograms (1 puff), increased to 200 micrograms (2 puffs) if necessary; for persistent symptoms up to 4 times daily.

**Prophylaxis of allergen- or exercise-induced bronchospasm, 200 micrograms (2 puffs); **CHILD** 100 micrograms (1 puff), increased to 200 micrograms (2 puffs)** if necessary

- **By inhalation of powder** (but see also Management of Chronic Asthma table, p. 182) see under individual preparations

- **By inhalation of nebulised solution**, **ADULT** and **CHILD** over 5 years 2.5–5 mg, repeated up to 4 times daily or more frequently in severe cases; **CHILD** under 5 years 2.5 mg, repeated up to 4 times daily or more fre-
3.1.1 Adrenoceptor agonists

resently in severe cases; see also Management of Acute Asthma table, p. 183 and Management of Chronic Asthma table, p. 182

### Oral

**Salbutamol (Non-proprietary)**

Tablets, salbutamol (as sulfate) 2 mg, net price 28-tab pack = £7.97. 4 mg, 28-tab pack = £75.70

**Oral solution**, salbutamol (as sulfate) 2 mg/5 mL, net price 150 mL = 72p

**Brands include** Salbutamol®

**Ventolin®**

**Airomir**

(Non-proprietary)

Salbutamol

**Ventmax**

Dry powder for inhalation, salbutamol (as sulfate) 100 micrograms/metered inhalation, net price 200-dose unit = £3.31. 200 micrograms/metered inhalation, 200-dose unit = £6.63. Counselling, administration

**Dose** acute bronchospasm, by inhalation of powder, **ADULT** and **CHILD**

**ADULT** over 12 years, initially 100–200 micrograms, increased to 400 micrograms if necessary, max. 800 micrograms daily (but see also Management of Chronic Asthma table, p. 182). **CHILD** 5–12 years, 100–200 micrograms; max. 800 micrograms daily (but see also Management of Chronic Asthma table, p. 182)

**Prophylaxis of allergen- or exercise-induced bronchospasm, by inhalation of powder, ADULT and CHILD over 12 years, 200 micrograms; CHILD 5–12 years, 100–200 micrograms

**Pulvinal® Salbutamol** (Chiesi)®

Dry powder for inhalation, salbutamol 200 micrograms/metered inhalation, net price 100-dose unit = £4.85. Counselling, administration

**Dose** acute bronchospasm, by inhalation of powder, **ADULT** and **CHILD** over 5 years, 200 micrograms; for persistent symptoms up to 800 micrograms daily (but see also Management of Chronic Asthma table, p. 182)

**Prophylaxis of allergen- or exercise-induced bronchospasm, ADULT and CHILD** over 5 years, 200 micrograms

**Salimol Easi-Breathe®** (TEVA UK)®

Aerosol inhalation, salbutamol 100 micrograms/metered inhalation, net price 200-dose breath-activated unit = £6.30. Counselling, administration

**Salbutin Novolizer®** (Meda)®

Dry powder for inhalation, salbutamol (as sulfate) 100 micrograms/metered inhalation, net price refillable 200-dose unit = £4.95. 200-dose refill = £2.75. Counselling, administration

**Dose** acute bronchospasm, by inhalation of powder, **ADULT** 100–200 micrograms; for persistent symptoms up to 800 micrograms daily (but see also Management of Chronic Asthma table, p. 182). **CHILD** 6–12 years 100–200 micrograms; for persistent symptoms up to 400 micrograms daily (but see also Management of Chronic Asthma table, p. 182)

**Prophylaxis of allergen- or exercise-induced bronchospasm, by inhalation of powder, ADULT 200 micrograms; CHILD 6–12 years 100–200 micrograms

**Ventolin® (A&H)®**

**Syrup**, sugar-free, salbutamol (as sulfate) 2 mg/5 mL, net price 150 mL = £73.97. 4 mg, 28-tab pack = £75.70

**Brands include** Salbutamol®

**Ventolin® (A&H)®**

Dry powder for inhalation, salbutamol (as sulfate) 95 micrograms/metered inhalation, net price 200-dose unit = £5.65. Counselling, administration

**Dose** acute bronchospasm, by inhalation of powder, **ADULT** and **CHILD** over 5 years, 1–2 puffs; for persistent symptoms up to 4 times daily (but see also Management of Chronic Asthma table, p. 182)

**Prophylaxis of allergen- or exercise-induced bronchospasm, by inhalation of powder, ADULT and CHILD over 5 years, 1–2 puffs

### Parenteral

**Ventolin® (A&H)®**

**Injection**, salbutamol (as sulfate) 500 micrograms/mL, net price 1 mL amp = 38p

**Solution for intravenous infusion**, salbutamol (as sulfate) 1 mg/mL, net price 150 mL = 72p

### Inhalation

**Counselling**. Advise patients not to exceed prescribed dose and to follow manufacturer’s directions; if a previously effective dose of inhaled salbutamol fails to provide at least 3 hours relief, a doctor’s advice should be obtained as soon as possible.

**Salbutamol (Non-proprietary)**

**Aerosol inhalation**, salbutamol (as sulfate) 100 micrograms/metered inhalation, net price 200-dose unit = £1.50. Counselling, administration

**Brands include** AirSal®®, Salamol®

**Nebuliser solution**, salbutamol (as sulfate) 1 mg/mL, net price 20 × 2.5 mL (2.5 mg) = £1.91; 2 mg/mL, 20 × 2.5 mL (5 mg) = £3.82. May be diluted with sterile sodium chloride 0.9%

**Brands include** Salamol Sieri-Ne®

**Aironi® (TEVA UK)**®

(Aerosol inhalation, salbutamol (as sulfate) 100 micrograms/metered inhalation, net price 200-dose unit = £1.97. Counselling, administration

**Autohaler** (breath-actuated aerosol inhalation), salbutamol (as sulfate) 100 micrograms/metered inhalation, net price 200-dose unit = £6.02. Counselling, administration

**Asmasal Clickhaler® (RPH)**®

(Dry powder for inhalation, salbutamol (as sulfate) 95 micrograms/metered inhalation, net price 200-dose unit = £5.65. Counselling, administration

**Dose** acute bronchospasm, by inhalation of powder, **ADULT** and **CHILD** over 5 years, 1–2 puffs; for persistent symptoms up to 4 times daily (but see also Management of Chronic Asthma table, p. 182)

**Prophylaxis of allergen- or exercise-induced bronchospasm, by inhalation of powder, ADULT and CHILD over 5 years, 1–2 puffs

**Easyhaler® Salbutamol** (Orion)®

Dry powder for inhalation, salbutamol (as sulfate) 100 micrograms/metered inhalation, net price 200-dose unit = £3.31. 200 micrograms/metered inhalation, 200-dose unit = £6.63. Counselling, administration

**Dose** acute bronchospasm, by inhalation of powder, **ADULT and CHILD** over 12 years, initially 100–200 micrograms, increased to 400 micrograms if necessary, max. 800 micrograms daily (but see also Management of Chronic Asthma table, p. 182). **CHILD** 5–12 years, 100–200 micrograms; max. 800 micrograms daily (but see also Management of Chronic Asthma table, p. 182)

**Prophylaxis of allergen- or exercise-induced bronchospasm, by inhalation of powder, ADULT and CHILD over 12 years, 200 micrograms; CHILD 5–12 years, 100–200 micrograms

**Pulvinal® Salbutamol** (Chiesi)®

Dry powder for inhalation, salbutamol 200 micrograms/metered inhalation, net price 100-dose unit = £4.85. Counselling, administration

**Dose** acute bronchospasm, by inhalation of powder, **ADULT and CHILD** over 5 years, 200 micrograms; for persistent symptoms up to 800 micrograms daily (but see also Management of Chronic Asthma table, p. 182)

**Prophylaxis of allergen- or exercise-induced bronchospasm, ADULT and CHILD** over 5 years, 200 micrograms

**Salamol Easi-Breathe®** (TEVA UK)®

Aerosol inhalation, salbutamol 100 micrograms/metered inhalation, net price 200-dose breath-activated unit = £6.30. Counselling, administration

**Salbutin Novolizer®** (Meda)®

Dry powder for inhalation, salbutamol (as sulfate) 100 micrograms/metered inhalation, net price refillable 200-dose unit = £4.95. 200-dose refill = £2.75. Counselling, administration

**Dose** acute bronchospasm, by inhalation of powder, **ADULT** 100–200 micrograms; for persistent symptoms up to 800 micrograms daily (but see also Management of Chronic Asthma table, p. 182). **CHILD** 6–12 years 100–200 micrograms; for persistent symptoms up to 400 micrograms daily (but see also Management of Chronic Asthma table, p. 182)

**Prophylaxis of allergen- or exercise-induced bronchospasm, by inhalation of powder, ADULT 200 micrograms; CHILD 6–12 years 100–200 micrograms

**Ventolin® (A&H)®**

**Accuhaler®** (dry powder for inhalation, disk containing 60 blisters of salbutamol (as sulfate) 200 micrograms/b blister with Accuhaler® device, net price = £3.00. Counselling, administration

**Dose** acute bronchospasm, by inhalation of powder, **ADULT and CHILD** over 5 years, 200 micrograms; for persistent symptoms up to 4 times daily (but see also Management of Chronic Asthma table, p. 182)

**Prophylaxis of allergen- or exercise-induced bronchospasm, by inhalation of powder, ADULT and CHILD** over 5 years, 200 micrograms

**Evohaler®** (aerosol inhalation, salbutamol (as sulfate) 100 micrograms/metered inhalation, net price 200-dose unit = £1.50. Counselling, administration

**Nebules®** (for use with nebuliser), salbutamol (as sulfate) 1 mg/mL, net price 20 × 2.5 mL (2.5 mg) = £1.65; 2 mg/mL, 20 × 2.5 mL (5 mg) = £2.78. May be diluted with sterile sodium chloride 0.9% if administration time in excess of 10 minutes is required

**Respirator solution** (for use with a nebuliser or ventilator), salbutamol (as sulfate) 5 mg/mL, net price 20 mL = £2.18 (hospital only). May be diluted with sterile sodium chloride 0.9%
BNF 68

3 Respiratory system

3.1 Adrenoceptor agonists

3.1.1 Adrenoceptor agonists

SALMETEROL

Indications reversible airways obstruction (including nocturnal asthma and prevention of exercise-induced bronchospasm) in patients requiring long-term regular bronchodilator therapy, see also Management of Chronic Asthma. Note Not for immediate relief of acute asthma attacks; for use in asthma only in patients who regularly use an inhaled corticosteroid, see notes above

Cautions see notes above

Pregnancy see p. 181

Breast-feeding see p. 181

Side-effects see notes above; nausea, dizziness, arthralgia, and rash also reported

Dose

By inhalation, asthma, 50 micrograms (2 puffs or 1 blister) twice daily; up to 100 micrograms (4 puffs or 2 blisters) twice daily in more severe airways obstruction; CHILD 5–12 years, 50 micrograms (2 puffs or 1 blister) twice daily

Chronic obstructive pulmonary disease 50 micrograms (2 puffs or 1 blister) twice daily

Counselling Advise patients that salmeterol should not be used for relief of acute attacks, not to exceed prescribed dose, and to follow manufacturer’s directions; if a previously effective dose of inhaled salmeterol fails to provide adequate relief, a doctor’s advice should be obtained as soon as possible

Salmeterol (Non-proprietary) 

Aerosol inhalation, salmeterol (as xinafoate) 25 micrograms/metered inhalation, net price 120-dose unit = £27.80. Counselling, administration

Brands include Neovent®

Serevent® (A&H) 

Accuhaler® (dry powder for inhalation), disk containing 60 blisters of salmeterol (as xinafoate) 50 micrograms/blister with Accuhaler® device, net price = £29.26. Counselling, administration

Evohaler® (aerosol inhalation), salmeterol (as xinafoate) 25 micrograms/metered inhalation, net price 120-dose unit = £29.26. Counselling, administration

Compound preparations

For compound preparations containing salbutamol, see section 3.1.4

Management of Chronic Asthma table, see p. 182

Management of Acute Asthma table, see p. 183

TERBUTALINE SULFATE

Indications asthma and other conditions associated with reversible airways obstruction; premature labour (section 7.1.3)

Cautions see notes above

Pregnancy see p. 181

Breast-feeding see p. 181

Side-effects see notes above

Dose

By mouth (but use by inhalation preferred), initially 2.5 mg 3 times daily for 1–2 weeks, then up to 5 mg 3 times daily; CHILD 1 month–7 years 75 micrograms/kg 3 times daily; 7–15 years 2.5 mg 2–3 times daily

By subcutaneous or slow intravenous injection, 250–500 micrograms up to 4 times daily; CHILD 2–15 years 10 micrograms/kg to a max. of 300 micrograms

By continuous intravenous infusion as a solution containing 3–5 micrograms/mL, 90–300 micrograms/hour for 8–10 hours; CHILD 1 month–18 years, initially 2–4 micrograms/kg as a loading dose, then 1–10 micrograms/kg/hour according to response and heart rate (max. 300 micrograms/hour); high doses with close monitoring

By inhalation of powder (Turbohaler®), ADULT and CHILD over 5 years, 500 micrograms (1 inhalation); for persistent symptoms up to 4 times daily (but see Management of Chronic Asthma, p. 182)

By inhalation of nebulised solution (but see also Management of Acute Asthma, p. 183), 5–10 mg 2–4 times daily; additional doses may be necessary in severe acute asthma; CHILD under 5 years 5 mg 2–4 times daily, 5–12 years 5–10 mg 2–4 times daily [unlicensed dose]

Oral and parenteral

Bricanyl® (AstraZeneca) 

Tablets, scored, terbutaline sulfate 5 mg, net price 100-tab pack= £4.91

Injection, terbutaline sulfate 500 micrograms/mL, net price 1-mL amp = 43p; 5-mL amp = £1.87

Inhalation

Counselling Advise patients not to exceed prescribed dose and to follow manufacturer’s directions; if a previously effective dose of inhaled terbutaline fails to provide at least 3 hours relief, a doctor’s advice should be obtained as soon as possible

Bricanyl® (AstraZeneca) 

Turbohaler® (= dry powder inhaler), terbutaline sulfate 500 micrograms/metered inhalation, net price 100-dose unit = £6.92. Counselling, administration

Respules® (= single-dose units for nebulisation), terbutaline sulfate 2.5 mg/mL, net price 20 × 2-mL units (5-mg) = £5.82

3.1.1.2 Other adrenoceptor agonists

Ephedrine is less suitable and less safe for use as a bronchodilator than the selective beta2 agonists, because it is more likely to cause arrhythmias and other side-effects; it should be avoided whenever possible.

Adrenaline (epinephrine) injection (1 in 1000) is used in the emergency treatment of acute allergic and anaaphylactic reactions (section 3.4.3), in angioedema (section 3.4.3), and in cardiopulmonary resuscitation (section 2.7.3). Adrenaline solution (1 in 1000) is used by nebulisation in the management of severe croup (section 3.1).

EPHEDRINE HYDROCHLORIDE

Indications reversible airways obstruction, but see notes above

Cautions hyperthyroidism; diabetes mellitus; ischaemic heart disease; hypertension; elderly; prostatic hypertrophy (risk of acute retention); interactions: Appendix 1 (sympathomimetics)
3 Respiratory system

Acute angle-closure glaucoma is a potential hazard of antimuscarinic bronchodilators. Seebri Breezhaler® and Glycopyrronium Bromide BNF 68

Acute angle-closure glaucoma

ACLIDINIUM BROMIDE

Indications maintenance treatment of chronic obstructive pulmonary disease

Cautions see notes above; also unstable ischaemic heart disease.

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises avoid

Side-effects see notes above; also sinusitis

Dose

See under preparation below

Eklira Genuair® (Almirall) ▼ (Atomise)

Ipratropium Bromide (Non-proprietary) (Proprietary) Tablets, ipratropium bromide 150 μg, net price 28 = £12.77; 30 mg, 28 = £19.51

Ipratropium can provide short-term relief in chronic asthma, but short-acting beta; agonists act more quickly and are preferred. Ipratropium by nebulisation can be added to other standard treatment in life-threatening asthma or if acute asthma fails to improve with standard therapy (see Management of Acute Asthma table, p. 183).

The aerosol inhalation of ipratropium can be used for short-term relief in mild chronic obstructive pulmonary disease in patients who are not using a long-acting antimuscarinic drug. Its maximal effect occurs 30–60 minutes after use; its duration of action is 3 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day.

Acclidinium, glycopyrronium, and tiotropium are licensed for the maintenance treatment of patients with chronic obstructive pulmonary disease. They are not suitable for the relief of acute bronchospasm.

Cautions Antimuscarinic bronchodilators should be used with caution in patients with prostatic hyperplasia, bladder outflow obstruction, and those susceptible to angle-closure glaucoma (see below); interactions: Appendix 1 (antimuscarinics).

Glaucoma Acute angle-closure glaucoma has been reported with nebulised ipratropium, particularly when given with nebulised salbutamol (and possibly other beta; agonists); care needed to protect patient’s eyes from nebulised drug or from drug powder.

Side-effects Dry mouth is the most common side-effect of antimuscarinic bronchodilators; also gastrointestinal motility disorder (including constipation and diarrhoea), cough, and headache; less commonly nausea, gastro-oesophageal reflux disease, dysphagia, tachycardia, palpitation, atrial fibrillation, throat irritation, pharyngitis, dysphonia, bronchospasm, including paradoxical bronchospasm, urinary retention, mydriasis, angle-closure glaucoma, blurred vision, and nasopharyngitis can occur. Dental caries and dry skin have occurred rarely.

3.1.2 Antimuscarinic bronchodilators

Ipratropium can provide short-term relief in chronic asthma, but short-acting beta; agonists act more quickly and are preferred. Ipratropium by nebulisation can be added to other standard treatment in life-threatening asthma or if acute asthma fails to improve with standard therapy (see Management of Acute Asthma table, p. 183).

The aerosol inhalation of ipratropium can be used for short-term relief in mild chronic obstructive pulmonary disease in patients who are not using a long-acting antimuscarinic drug. Its maximal effect occurs 30–60 minutes after use; its duration of action is 3 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day.

Acclidinium, glycopyrronium, and tiotropium are licensed for the maintenance treatment of patients with chronic obstructive pulmonary disease. They are not suitable for the relief of acute bronchospasm.

Cautions Antimuscarinic bronchodilators should be used with caution in patients with prostatic hyperplasia, bladder outflow obstruction, and those susceptible to angle-closure glaucoma (see below); interactions: Appendix 1 (antimuscarinics).

Glaucoma Acute angle-closure glaucoma has been reported with nebulised ipratropium, particularly when given with nebulised salbutamol (and possibly other beta; agonists); care needed to protect patient’s eyes from nebulised drug or from drug powder.

Side-effects Dry mouth is the most common side-effect of antimuscarinic bronchodilators; also gastrointestinal motility disorder (including constipation and diarrhoea), cough, and headache; less commonly nausea, gastro-oesophageal reflux disease, dysphagia, tachycardia, palpitation, atrial fibrillation, throat irritation, pharyngitis, dysphonia, bronchospasm, including paradoxical bronchospasm, urinary retention, mydriasis, angle-closure glaucoma, blurred vision, and nasopharyngitis can occur. Dental caries and dry skin have occurred rarely.

ACRIDINIUM BROMIDE

Indications maintenance treatment of chronic obstructive pulmonary disease

Cautions see notes above; also myocardial infarction within last 6 months, unstable angina, newly diagnosed arrhythmia within last 3 months, hospitalisation with moderate or severe heart failure within last 12 months

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises avoid

Side-effects see notes above; also sinusitis

Dose

See under preparation below

Eklira Genuair® (Almirall) ▼ (Atomise)

Ipratropium Bromide (Non-proprietary) (Proprietary) Tablets, ipratropium bromide 150 μg, net price 28 = £12.77; 30 mg, 28 = £19.51

Ipratropium can provide short-term relief in chronic asthma, but short-acting beta; agonists act more quickly and are preferred. Ipratropium by nebulisation can be added to other standard treatment in life-threatening asthma or if acute asthma fails to improve with standard therapy (see Management of Acute Asthma table, p. 183).

The aerosol inhalation of ipratropium can be used for short-term relief in mild chronic obstructive pulmonary disease in patients who are not using a long-acting antimuscarinic drug. Its maximal effect occurs 30–60 minutes after use; its duration of action is 3 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day.

Acclidinium, glycopyrronium, and tiotropium are licensed for the maintenance treatment of patients with chronic obstructive pulmonary disease. They are not suitable for the relief of acute bronchospasm.

Cautions Antimuscarinic bronchodilators should be used with caution in patients with prostatic hyperplasia, bladder outflow obstruction, and those susceptible to angle-closure glaucoma (see below); interactions: Appendix 1 (antimuscarinics).

Glaucoma Acute angle-closure glaucoma has been reported with nebulised ipratropium, particularly when given with nebulised salbutamol (and possibly other beta; agonists); care needed to protect patient’s eyes from nebulised drug or from drug powder.

Side-effects Dry mouth is the most common side-effect of antimuscarinic bronchodilators; also gastrointestinal motility disorder (including constipation and diarrhoea), cough, and headache; less commonly nausea, gastro-oesophageal reflux disease, dysphagia, tachycardia, palpitation, atrial fibrillation, throat irritation, pharyngitis, dysphonia, bronchospasm, including paradoxical bronchospasm, urinary retention, mydriasis, angle-closure glaucoma, blurred vision, and nasopharyngitis can occur. Dental caries and dry skin have occurred rarely.

3.1.3 Theophylline

Theophylline is a xanthine used as a bronchodilator in asthma (see Management of Chronic Asthma table, p. 182) and stable chronic obstructive pulmonary disease (see p. 181); it is not generally effective in exacerbations of chronic obstructive pulmonary disease. Theophylline may have an additive effect when used in conjunction with small doses of beta 2 agonists; the combination may increase the risk of side-effects, including hypokalaemia (see p. 186).

Theophylline is given by injection as aminophylline, a mixture of theophylline with ethylenediamine, which is 20 times more soluble than theophylline alone. Aminophylline injection is needed rarely for severe acute asthma, see Management of Acute Asthma table, p. 183. It must be given by very slow intravenous injection (over at least 20 minutes); it is too irritant for intramuscular use. Measurement of plasma-theophylline concentration is needed rarely for severe acute asthma.

Theophylline concentration is increased in heart failure, hepatic impairment, viral infections, in the elderly, and by drugs that inhibit its metabolism. The plasma-theophylline concentration is decreased in smokers, by alcohol consumption, and by drugs that induce its metabolism. Differences in the half-life of theophylline are important because the toxic dose is close to the therapeutic dose. For interactions: see Appendix 1 (theophylline).

Plasma-theophylline concentration In most individuals, a plasma-theophylline concentration of 10–20 mg/litre (55–110 micromol/litre) is required for satisfactory bronchodilation, although a lower plasma-theophylline concentration may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.

Plasma-theophylline concentration is measured 5 days after starting oral treatment and at least 3 days after any dose adjustment. A blood sample should usually be taken 4–6 hours after an oral dose of a modified-release preparation (sampling times may vary—consult local guidelines). If aminophylline is given intravenously, a
blood sample should be taken 4–6 hours after starting treatment.

Caffeine is a xanthine derivative used as a respiratory stimulant in neonatal apnoea, see BNF for Children section 3.5.1.

### THEOPHYLLINE

#### Indications
reversible airways obstruction, severe acute asthma; see also Management of Chronic Asthma table p. 182 and Management of Asthma table p. 183

#### Cautions
see notes above, also cardiac arrhythmias or other cardiac disease; hypertension; hyperthyroidism; peptic ulcer; epilepsy; elderly; fever; hypokalaemia risk, see p. 186; monitor plasma-theophylline concentration (see notes above); dose adjustment may be necessary if smoking started or stopped during treatment

#### Hepatic impairment
reduce dose

#### Pregnancy
neonatal irritability and apnoea have been reported; see also p. 181

#### Breast-feeding
present in milk—irritability in infant reported; modified-release preparations preferable; see also p. 181

#### Side-effects
nausea, vomiting, gastric irritation, diarrhoea, palpitation, tachycardia, arrhythmias, headache, CNS stimulation, insomnia, convulsions;
overdosage: see Emergency Treatment of Poisoning, p. 40

#### Dose
- See under preparations below

  **Note** Plasma-theophylline concentration for optimum response 10–20 mg/litre (55–110 micromol/litre); narrow margin between therapeutic and toxic dose, see also notes above

#### Modified release

  **Note** The rate of absorption from modified-release preparations can vary between brands. If a prescription for a modified-release oral theophylline preparation does not specify a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as an in-patient.

#### Nuelin SA® (Meda)

- **SA tablets**, m/r, theophylline 175 mg, net price 60-tab pack = £6.38. Label: 21, 25
  - Dose: 175–350 mg every 12 hours; **CHILD** 6–12 years 175 mg every 12 hours
  - **SA 250 tablets**, m/r, scored, theophylline 250 mg, net price 60-tab pack = £8.92. Label: 21, 25
    - Dose: 250–500 mg every 12 hours; **CHILD** 6–12 years 125–250 mg every 12 hours

#### Slo-Phyllin® (Merck Serono)

- **Capsules**, m/r, theophylline 60 mg (white/clear, enclosing white pellets), net price 56-cap pack = £2.76; 125 mg (brown/clear, enclosing white pellets), 56-cap pack = £3.48; 250 mg (purple/clear, enclosing white pellets), 56-cap pack = £4.34. Label: 25, or counselling, see below
  - Dose: 250–500 mg every 12 hours; **CHILD** 2–6 years 60–120 mg every 12 hours, 6–12 years 125–250 mg every 12 hours

#### Uniphyllin Continus® (Napp)

- **Tablets**, m/r, theophylline 200 mg, net price 56-tab pack = £29.6; 300 mg, 56-tab pack = £47.7; 400 mg, 56-tab pack = £56.5. Label: 25
  - **Dose** 200 mg every 12 hours, increased according to response to 400 mg every 12 hours; **CHILD** 2–12 years, 9 mg/kg (up to 200 mg) every 12 hours; some children with chronic asthma may require 10–16 mg/kg (max. 400 mg) every 12 hours
  - **Note** May be appropriate to give larger evening or morning dose to achieve optimum therapeutic effect when symptoms most severe; in patients whose night or daytime symptoms persist despite other therapy, who are not currently receiving theophylline, total daily requirement may be added as single evening or morning dose

#### Aminophylline

**Note** Aminophylline is a stable mixture or combination of theophylline and ethylenediamine; the ethylenediamine confers greater solubility in water

#### Indications
reversible airways obstruction, severe acute asthma

#### Cautions
see under Theophylline

#### Hepatic impairment
see under Theophylline

#### Pregnancy
see under Theophylline

#### Breast-feeding
see under Theophylline

#### Side-effects
see under Theophylline; also allergy to ethylenediamine can cause urticaria, erythema, and exfoliative dermatitis; hypotension, arrhythmias, and convulsions especially if given rapidly by intravenous injection

#### Dose
- See under preparations, below

  **Note** Plasma-theophylline concentration for optimum response: 10–20 mg/litre (55–110 micromol/litre), narrow margin between therapeutic and toxic dose, see also notes above

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal weight for height

#### Aminophylline (Non-proprietary) (Pat)

- **Injection**, aminophylline 25 mg/mL, net price 10-mL amp = 65p
  - **Dose** severe acute asthma or acute exacerbation of chronic obstructive pulmonary disease in patients not previously treated with theophylline, by slow intravenous injection over at least 20 minutes (with close monitoring). 250–500 mg (5 mg/kg), then see below, **CHILD** under 12 years 5 mg/kg, then see below
  - Severe acute asthma or acute exacerbation of chronic obstructive pulmonary disease by intravenous infusion (with close monitoring). 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration; **ELDERLY** 300 micrograms/kg/hour; **CHILD** under 12 years 1 mg/kg/hour, adjusted according to plasma-theophylline concentration

  **Note** Patients taking oral theophylline or aminophylline should not normally receive a loading dose of intravenous aminophylline, plasma-theophylline concentration should be measured in all patients receiving intravenous aminophylline (see notes above)

#### Modified release

  **Note** Advice about modified-release theophylline preparations (see above) also applies to modified-release aminophylline preparations

#### Phyllocontin Continus® (Napp)

- **Tablets**, m/r, yellow, f/c, aminophylline hydrate 225 mg, net price 56-tab pack = £2.40. Label: 25
  - **Dose** ADULT and **CHILD** body-weight over 40 kg initially 1 tablet twice daily, increased after 1 week to 2 tablets twice daily according to plasma-theophylline concentration
### 3.1.4 Compound bronchodilator preparations

In general, patients are best treated with single-ingredient preparations, such as a selective beta₂ agonist (section 3.1.1.1) or ipratropium bromide (section 3.1.2), so that the dose of each drug can be adjusted. This flexibility is lost with compound bronchodilator preparations. However, a combination product may be appropriate for patients stabilised on individual components in the same proportion.

For prescribing information, see under individual drugs.

**Ipratropium bromide with salbutamol (Non-proprietary)**  

_**Nebuliser solution**, ipratropium bromide 500 micrograms, salbutamol (as sulfate) 2.5 mg/2.5-mL vial, net price 60 unit-dose vials = £23.75  
_Brands include _Sulipraneh_, _Proamol_  
_**Dose**_ bronchospasm in chronic obstructive pulmonary disease, by inhalation of nebulised solution, ADULT and CHILD over 12 years, 1 vial (2.5 mL) 3–4 times daily  
_Glaucoma_ in addition to other potential side-effects, acute angle-closure glaucoma has been reported with nebulised ipratropium—for details, see p. 190  

**Combivent®** (Boehringer Ingelheim)  

_**Nebuliser solution**, isotonic, ipratropium bromide 500 micrograms, salbutamol (as sulfate) 2.5 mg/2.5-mL vial, net price 60 unit-dose vials = £24.10  
_**Dose**_ bronchospasm in chronic obstructive pulmonary disease, by inhalation of nebulised solution, ADULT and CHILD over 12 years, 1 vial (2.5 mL) 3–4 times daily  
_Glaucoma_ In addition to other potential side-effects, acute angle-closure glaucoma has been reported with nebulised ipratropium—for details, see p. 190

### 3.1.5 Peak flow meters, inhaler devices and nebulisers

**Peak flow meters**  

When used in addition to symptom-based monitoring, peak flow monitoring has not been proven to improve asthma control in either adults or children, however measurement of peak flow may be of benefit in adult patients who are ‘poor perceivers’ and hence slow to detect deterioration in their asthma, and for those with more severe asthma.

When peak flow meters are used, patients must be given clear guidelines as to the action they should take if their peak flow falls below a certain level. Patients can be encouraged to adjust some of their own treatment (within specified limits) according to changes in peak flow rate.

Peak flow charts should be issued to patients who appropriate, and are available to purchase from:

- **For prescribing information, see under individual drugs.**

**Inhaler devices**  

These include pressurised metered-dose inhalers, breath-actuated inhalers, and dry powder inhalers. Many patients can be taught to use a pressurised metered-dose inhaler effectively but some patients, particularly the elderly and children, find them difficult to use. _Spacer devices_ (see below) can help such patients because they remove the need to coordinate actuation with inhalation. Dry powder inhalers may be useful in adults and children over 5 years who are unwilling or unable to use a pressurised metered-dose inhaler. Alternatively, breath-actuated inhalers are suitable for adults and older children provided they can use the device effectively.

On changing from a pressurised metered-dose inhaler to a dry powder inhaler, patients may notice a lack of...
sensation in the mouth and throat previously associated with each actuation. Coughing may also occur.

The patient should be instructed carefully on the use of the inhaler and it is important to check that the inhaler continues to be used correctly because inadequate inhalation technique may be mistaken for a lack of response to the drug.

**NICE guidance**

**Inhaler devices for children under 5 years with chronic asthma (August 2000)**

A child’s needs and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered.

- corticosteroid and bronchodilator therapy should be delivered by pressurised metered-dose inhaler and spacer device, with a facemask if necessary;
- if this is not effective, and depending on the child’s condition, nebulised therapy may be considered and, in children over 3 years, a dry powder inhaler may also be considered [see notes above].

www.nice.org.uk/TA10

**NICE guidance**

**Inhaler devices for children 5–15 years with chronic asthma (March 2002)**

A child’s needs, ability to develop and maintain effective technique, and likelihood of good compliance should govern the choice of inhaler device; only then should cost be considered.

- corticosteroid therapy should be routinely delivered by a pressurised metered-dose inhaler and spacer device;
- for other inhaled drugs, particularly bronchodilators, a wider range of devices should be considered;
- children and their carers should be trained in the use of the chosen device; suitability of the device should be reviewed at least annually. Inhaler technique and compliance should be monitored.

www.nice.org.uk/TA38

**Spacer devices**

Spacer devices remove the need for coordination between actuation of a pressurised metered-dose inhaler and inhalation. The spacer device reduces the velocity of the aerosol and subsequent impaction on the oropharynx and allows more time for evaporation of the propellant so that a larger proportion of the particles can be inhaled and deposited in the lungs. Spacer devices are particularly useful for patients with poor inhalation technique, for children, for patients requiring high doses of inhaled corticosteroids (see Management of Chronic Asthma table, p. 182), for nocturnal asthma, and for patients prone to candidiasis with inhaled corticosteroids. The size of the spacer is important, the larger spacers with a one-way valve (Volumatic®) being most effective. It is important to prescribe a spacer device that is compatible with the metered-dose inhaler, see devices below. Spacer devices should not be regarded as interchangeable; patients should be advised not to switch between spacer devices.

**Use and care of spacer devices**

Patients should inhale from the spacer device as soon as possible after actuation because the drug aerosol is very short-lived; single-dose actuation is recommended. Tidal breathing is as effective as single breaths. The device should be cleaned once a month by washing in mild detergent and then allowed to dry in air without rinsing; the mouthpiece should be wiped clean of detergent before use.

Some manufacturers recommend more frequent cleaning, but this should be avoided since any electrostatic charge may affect drug delivery. Spacer devices should be replaced every 6–12 months.

**A2A Spacer®** (Clement Clarke)

Spacer device, for use with all pressurised (aerosol) inhalers, net price = £4.15; with small or medium mask = £6.68

**Able Spacer®** (Clement Clarke)

Spacer device, small-volume device. For use with all pressurised (aerosol) inhalers, net price standard device = £4.39; with infant or child mask = £7.16

**AeroChamber® Plus** (GSK)

Spacer device, medium-volume device. For use with all pressurised (aerosol) inhalers, net price standard device (blue) = £4.75, with mask (blue) = £7.92; infant device (orange) with mask = £7.92; child device (yellow) with mask = £7.92

**Babyhaler® (A&H)**

Spacer device, for paediatric use with Flixotide®, and Ventolin® inhalers, net price = £11.34

**Haleraid® (A&H)**

Inhalation aid, device to place over pressurised (aerosol) inhalers to aid when strength in hands is impaired (e.g. in arthritis). For use with Flixotide®, Seretide®, Serevent®, and Ventolin® inhalers. Available as Haleraid®-120 for 120-dose inhalers and Haleraid®-200 for 200-dose inhalers, net price = 80p

**OptiChamber®** (Respironics)

Spacer device, for use with all pressurised (aerosol) inhalers, net price standard device = £4.49; with small, medium, or large mask = £7.49

**Pocket Chamber®** (nSPIRE Health)

Spacer device, small-volume device. For use with all pressurised (aerosol) inhalers, net price = £4.18; with infant, small, medium, or large mask = £9.75

**Space Chamber Plus®** (Medical Developments)

Spacer device, for use with all pressurised (aerosol) inhalers, net price standard device = £4.26; compact device = £4.26

**Volumatic® (A&H)**

Spacer inhaler, large-volume device. For use with Clenil Modulite®, Flixotide®, Seretide®, Serevent®, and Ventolin® inhalers, net price = £3.81; with paediatric mask = £8.70

**Vortex®** (Pari)

Spacer device, medium-volume device. For use with all pressurised (aerosol) inhalers, net price with mouthpiece = £6.28; with mask for infant or child = £7.99; with adult mask = £9.97

**Nebulisers**

In England and Wales nebulisers and compressors are not available on the NHS (but they are free of VAT); some nebulisers (but not compressors) are available on form GP10A in Scotland (for details consult Scottish Drug Tariff).
A nebuliser converts a solution of a drug into an aerosol for inhalation. It is used to deliver higher doses of drug to the airways than is usual with standard inhalers. The main indications for use of a nebuliser are to deliver:

- a beta 2 agonist or ipratropium to a patient with an acute exacerbation of asthma or of chronic obstructive pulmonary disease;
- a beta agonist, corticosteroid, or ipratropium on a regular basis to a patient with severe asthma or reversible airways obstruction when the patient is unable to use other inhalational devices;
- an antibiotic (such as colistimethate sodium) or a mucoolytic to a patient with cystic fibrosis;
- budesonide or adrenaline to a child with severe croup;
- pentamidine for the prophylaxis and treatment of pneumocystis pneumonia.

The use of nebulisers in chronic persistent asthma and chronic obstructive pulmonary disease should be considered only:

- after a review of the diagnosis;
- after review of therapy (see Management of Chronic Asthma table, p. 182) and the patient’s ability to use hand-held devices;
- after increased doses of inhaled therapy from hand-held inhalers (with a spacer if necessary) have been tried for 2 weeks;
- if the patient remains breathless, despite correctly using optimal therapy

Before prescribing a nebuliser, a home trial should preferably be undertaken to monitor response for up to 2 weeks on standard treatment and up to 2 weeks on nebulised treatment. If prescribed, patients must:

- have clear instructions from a doctor, specialist nurse, physiotherapist, or pharmacist on the use of the nebuliser (including maintenance and cleaning) and on peak-flow monitoring;
- be instructed not to treat acute attacks at home without also seeking help;
- have regular follow up by a doctor, specialist nurse or physiotherapist after about 1 month and annually thereafter

The proportion of a nebuliser solution that reaches the lungs depends on the type of nebuliser and although it can be as high as 30%, it is more frequently close to 10% and sometimes below 10%. The remaining solution is left in the nebuliser as residual volume or is deposited in the mouthpiece and tubing. The extent to which the nebulised solution is deposited in the airways or alveoli depends on the droplet size, pattern of breath inhalation, and condition of the lung. Droplets with a mass median diameter of 1–5 microns are deposited in the airways and are therefore appropriate for asthma, whereas a particle size of 1–2 microns is needed for alveolar deposition of pentamidine to combat pneumocystis infection. The type of nebuliser is therefore chosen according to the deposition required and according to the viscosity of the solution.

Jet nebulisers are more widely used than ultrasonic nebulisers. Most jet nebulisers require an optimum gas flow rate of 6–8 litres/minute and in hospital can be driven by piped air or oxygen; in acute asthma the nebuliser should be driven by oxygen. Domiciliary oxygen cylinders do not provide an adequate flow rate therefore an electrical compressor is required for domiciliary use.

For patients at risk of hypercapnia, such as those with chronic obstructive pulmonary disease, oxygen can be dangerous and the nebuliser should be driven by air (see section 3.1). If oxygen is required, it should be given simultaneously by nasal cannula.

### Tubing

The Department of Health has reminded users of the need to use the correct grade of tubing when connecting a nebuliser to a medical gas supply or compressor.

Ultrasonic nebulisers produce an aerosol by ultrasonic vibration of the drug solution and therefore do not require a gas flow; they are not suitable for the nebulisation of some drugs, such as domnase alfa and nebulised suspensions.

### Nebuliser diluent

Nebulisation may be carried out using an undiluted nebuliser solution or it may require dilution beforehand. The usual diluent is sterile sodium chloride 0.9% (physiological saline).

**Sodium Chloride** (Non-proprietary) (Ph Eur)

Nebuliser solution, sodium chloride 0.9%, net price

\[ 20 \times 2.5 \text{ mL} = £20.60 \]

**Brands include** Saline Steripoule®, Saline Steri-Neb®

### 3.2 Corticosteroids

Corticosteroids are used for the management of reversible and irreversible airways disease. An inhaled corticosteroid used for 3–4 weeks may help to distinguish asthma from chronic obstructive pulmonary disease; clear improvement over 3–4 weeks suggests asthma.

**Asthma**  Corticosteroids are effective in asthma; they reduce airway inflammation and hence reduce oedema and secretion of mucus into the airway.

An inhaled corticosteroid is used regularly for prophylaxis of asthma when patients require a beta 2 agonist more than twice a week, or if symptoms disturb sleep at least once a week, or if the patient has suffered an exacerbation in the last 2 years requiring a systemic corticosteroid (see Management of Chronic Asthma table, p. 182). Regular use of inhaled corticosteroids reduces the risk of exacerbation of asthma.

Current and previous smoking reduces the effectiveness of inhaled corticosteroids and higher doses may be necessary.

Corticosteroid inhalers must be used regularly for maximum benefit; alleviation of symptoms usually occurs 3 to 7 days after initiation. Beclometasone dipropionate, budesonide, fluticasone propionate, and mometasone furoate appear to be equally effective. Preparations that combine a corticosteroid with a long-acting beta 2 agonist may be helpful for patients stabilised on the individual components in the same proportion.

In adults using an inhaled corticosteroid and a long-acting beta 2 agonist for the prophylaxis of asthma, but
who are poorly controlled, (see step 3 of the Management of Chronic Asthma table, p. 182) Symbicort® (budesonide with formoterol) can be used as a reliever (instead of a short-acting beta₂ agonist), in addition to its regular use for the prophylaxis of asthma. Symbicort® can also be used in this way in adults using an inhaled corticosteroid with a dose greater than beclometasone dipropionate 400 micrograms daily, but who are poorly controlled (see step 2 of the Management of Chronic Asthma table, p. 182). When starting this treatment, the total regular daily dose of inhaled corticosteroid should not be reduced. Patients must be carefully instructed on the appropriate dose and management of exacerbations before initiating this therapy, see Symbicort® p. 199. Patients using budesonide with formoterol as a reliever once a day or more should have their treatment reviewed regularly. The use of Symbicort® for both reliever and maintenance therapy is also used by some specialists in children 12–18 years [unlicensed]. Fostair® can also be used in adults as a reliever (instead of a short-acting beta₂ agonist) in addition to its regular use for the prophylaxis of asthma, see Fostair® p. 198. It may be particularly useful for patients with poorly controlled asthma requiring reliever therapy, or for those who have had previous exacerbations of asthma which needed medical intervention. Patients requiring frequent daily use of Fostair® as a reliever should have their maintenance treatment reviewed. This approach has not been investigated with combination inhalers containing other corticosteroids and long-acting beta₂ agonists.

High doses of inhaled corticosteroid can be prescribed for patients who respond only partially to standard doses with a long-acting beta₂ agonist or another long-acting bronchodilator (see Management of Chronic Asthma table, p. 182). High doses should be continued only if there is clear benefit over the lower dose. The recommended maximum dose of an inhaled corticosteroid should not generally be exceeded. However, if a higher dose is required, then it should be initiated and supervised by a specialist. The use of high doses of inhaled corticosteroid can minimise the requirement for an oral corticosteroid (see also Side-effects of Inhaled Corticosteroids, below).

Systemic corticosteroid therapy may be necessary during episodes of stress, such as severe infection, or if the asthma is worsening, when higher doses are needed and access of inhaled drug to small airways may be reduced; patients may need a reserve supply of corticosteroid tablets.

Chronic obstructive pulmonary disease In chronic obstructive pulmonary disease inhaled corticosteroid therapy may reduce exacerbations when given in combination with an inhaled long-acting beta₂ agonist, see section 3.1, p. 181.

Cautions of inhaled corticosteroids

**Paradoxical bronchospasm** The potential for paradoxical bronchospasm (calling for discontinuation and alternative therapy) should be borne in mind—mild bronchospasm may be prevented by inhalation of a short-acting beta₂ agonist beforehand (or by transfer from an aerosol inhalation to a dry powder inhalation).

1. For standard doses of other inhaled corticosteroids, see Management of Chronic Asthma table, p. 182.

CFC-free inhalers Chlorofluorocarbon (CFC) propellants in pressurised aerosol inhalers have been replaced by hydrofluoroalkane (HFA) propellants.

Doses for corticosteroid CFC-free pressurised metered-dose inhalers may be different from traditional CFC-containing inhalers and may differ between brands, see MHRA/CHM advice below.

For interactions: see Appendix 1 (corticosteroids)

**MHRA/CHM advice (July 2008)**

- Beclometasone dipropionate CFC-free pressurised metered-dose inhalers (Qvar® and Clenil Modulite®) are not interchangeable and should be prescribed by brand name; Qvar® has extra-fine particles, is more potent than traditional beclometasone dipropionate CFC-containing inhalers, and is approximately twice as potent as Clenil Modulite®.
- Fostair® is a combination beclometasone dipropionate and formoterol fumarate CFC-free pressurised metered-dose inhaler; Fostair® has extra-fine particles and is more potent than traditional beclometasone dipropionate CFC-free inhalers.

**Side-effects of inhaled corticosteroids** Inhaled corticosteroids have considerably fewer systemic effects than oral corticosteroids (section 6.3.2), but adverse effects have been reported.

High doses of inhaled corticosteroids (see Management of Chronic Asthma table, p. 182) used for prolonged periods can induce adrenal suppression. Inhaled corticosteroids have been associated with adrenal crisis and coma in children; excessive doses should be avoided. Consider giving a ‘steroid card’ (section 6.3.2) to support communication of the risks associated with treatment, and specific written advice to consider corticosteroid replacement during an episode of stress, such as severe intercurrent illness or an operation, to patients using greater than maximum licensed doses of inhaled corticosteroids. Use of other corticosteroid therapy (including topical) or concurrent use of drugs which inhibit corticosteroid metabolism should be taken into account when assessing systemic risk.

High doses of inhaled corticosteroid have been associated with lower respiratory tract infections, including pneumonia, in older patients with chronic obstructive pulmonary disease.

Bone mineral density may be reduced following long-term inhalation of higher doses of corticosteroids, predisposing patients to osteoporosis (section 6.6). It is therefore sensible to ensure that the dose of an inhaled corticosteroid is no higher than necessary to keep a patient’s asthma under good control.

In children, growth restriction associated with systemic corticosteroid therapy does not seem to occur with recommended doses of inhaled therapy; although initial growth velocity may be reduced, there appears to be no effect on achieving normal adult height. However, the height and weight of children receiving prolonged treatment with inhaled corticosteroid should be monitored annually; if growth is slowed, referral to a paediatrician should be considered. Large-volume spacer devices should be used for administering inhaled corticosteroids in children under 15 years (see NICE guidance, section 3.1.5); they are also useful in older children and adults, particularly if high doses are required. Spacer devices increase airway deposition and reduce oropharyngeal deposition.
A small risk of glaucoma with prolonged high doses of inhaled corticosteroids has been reported. Hoarseness, dysphonia, throat irritation, and candidiasis of the mouth or throat may occur with inhaled corticosteroids (see Candidiasis below). Paradoxical bronchospasm has been reported very rarely. Anxiety, depression, sleep disturbances, behavioural changes including hyperactivity, irritability, and aggression (particularly in children) have been reported; hyperglycaemia (usually only with high doses), cataracts, skin thinning and bruising have also been reported.

**Candidiasis** The risk of oral candidiasis can be reduced by using a spacer device with the corticosteroid inhaler; rinsing the mouth with water after inhalation of a dose may also be helpful. Antifungal oral suspension or oral gel (section 12.3.2) can be used to treat oral candidiasis without discontinuing therapy.

**Oral** An acute attack of asthma should be treated with a short course of an oral corticosteroid starting with a high dose. See Management of Acute Asthma table, p. 183. Patients whose asthma has deteriorated rapidly usually respond quickly to corticosteroids. The dose can usually be stopped abruptly; tapering is not needed provided that the patient receives an inhaled corticosteroid in an adequate dose (apart from those on maintenance oral corticosteroid treatment or where oral corticosteroids are required for 3 or more weeks; see also Withdrawal of Corticosteroids, section 6.3.2. In patients who have needed several courses of oral corticosteroids and in whom the possibility of a period on maintenance corticosteroids is being considered, it may be useful to taper the corticosteroid dose gradually to identify a threshold dose for asthma control. This should only be done after other standard options for controlling asthma have been tried (see the Management of Chronic Asthma table, p. 182).

In chronic asthma, when the response to other drugs has been inadequate, longer term administration of an oral corticosteroid may be necessary; in such cases high doses of an inhaled corticosteroid should be continued to minimise oral corticosteroid requirements, see Management of Chronic Asthma table, p. 182. Patients taking long-term oral corticosteroids for asthma can often be transferred to an inhaled corticosteroid but the transfer must be slow, with gradual reduction in the dose of the oral corticosteroid, and at a time when the asthma is well controlled.

During an acute exacerbation of chronic obstructive pulmonary disease, prednisolone 30 mg daily should be given for 7–14 days; treatment can be stopped abruptly. Prolonged treatment with oral prednisolone is not of benefit and maintenance treatment is not normally recommended.

An oral corticosteroid should normally be taken as a single dose in the morning to reduce the disturbance to circadian cortisol secretion. Dosage should always be titrated to the lowest dose that controls symptoms. Regular peak-flow measurements help to optimise the dose.

**Parenteral** For the use of hydrocortisone injection in the emergency treatment of acute severe asthma, see Management of Acute Asthma table, p. 183.

---

**NICE guidance**

**Inhaled corticosteroids for the treatment of chronic asthma in children under 12 years (November 2007)**

For children under 12 years with chronic asthma in whom treatment with an inhaled corticosteroid is considered appropriate, the least costly product that is suitable for an individual (taking into consideration NICE TAs 38 and 10), within its marketing authorisation is recommended.

For children under 12 years with chronic asthma in whom treatment with an inhaled corticosteroid and a long-acting beta, agonist is considered appropriate, the following apply:

- the use of a combination inhaler within its marketing authorisation is recommended as an option;
- the decision to use a combination inhaler or two agents in separate inhalers should be made on an individual basis, taking into consideration therapeutic need, and the likelihood of treatment adherence;
- if a combination inhaler is chosen, then the least costly inhaler that is suitable for the individual is recommended.

www.nice.org.uk/TA131

---

**NICE guidance**

**Inhaled corticosteroids for the treatment of chronic asthma in adults and children over 12 years (March 2008)**

For adults and children over 12 years with chronic asthma in whom treatment with an inhaled corticosteroid is considered appropriate, the least costly product that is suitable for an individual (taking into consideration NICE TAs 38 and 10), within its marketing authorisation is recommended.

For adults and children over 12 years with chronic asthma in whom treatment with an inhaled corticosteroid and a long-acting beta, agonist is considered appropriate, the following apply:

- the use of a combination inhaler within its marketing authorisation is recommended as an option;
- the decision to use a combination inhaler or two agents in separate inhalers should be made on an individual basis, taking into consideration therapeutic need, and the likelihood of treatment adherence;
- if a combination inhaler is chosen, then the least costly inhaler that is suitable for the individual is recommended.

www.nice.org.uk/TA138

**BECLOMETASONE DIPROPIONATE**

*(Beclometasone Dipropionate)*

**Indications** prophylaxis of asthma (see also Management of Chronic Asthma table, p. 182)

**Cautions** see notes above

**Pregnancy** see p. 181

**Breast-feeding** see p. 181

**Side-effects** see notes above

**Dose**

- **By aerosol inhalation**, see Management of Chronic Asthma table, p. 182 (important: for Clenil Modulite®, and Qvar®, see under preparations)
- **By inhalation of dry powder** (important: for Asma-bec®, see under preparation), 200–400 micrograms twice daily, adjusted as necessary up to 800 micrograms twice daily; **CHILD** over 5 years 100–200 micrograms twice daily, adjusted as necessary
3 Respiratory system

Beclometasone (Non-proprietary) \( ^{\text{BNF 68}} \)

Dry powder for inhalation, beclometasone dipropionate 100 micrograms/metered inhalation, net price 100-dose unit = £5.36; 200 micrograms/metered inhalation, 100-dose unit = £9.89, 200-dose unit = £14.93; 400 micrograms/metered inhalation, 100-dose unit = £19.61. Label: 8, counselling, administration; also 10 and steroid card with high doses

Brands include Pulvinal® Beclometasone Dipropionate, Easyhaler® Beclometasone Dipropionate

Asmabec Clickhaler® (RPH) \( ^{\text{BNF}} \)

Dry powder for inhalation, beclometasone dipropionate 100 micrograms/metered inhalation, net price 200-dose unit = £9.81; 250 micrograms/metered inhalation, 100-dose unit = £12.31. Label: 8, counselling, administration; also 10 and steroid card with high doses

Dose by inhalation of powder, prophylaxis of asthma, 100–400 micrograms twice daily, adjusted as necessary; max. 1 mg twice daily. CHILD 6–12 years 100–200 micrograms twice daily, adjusted as necessary

Clenil Modulite® (Chiesi) \( ^{\text{BNM}} \)

Aerosol inhalation, beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £3.70; 100 micrograms/metered inhalation = £7.42; 200 micrograms/metered inhalation = £16.17; 250 micrograms/metered inhalation = £16.29. Label: 8, counselling, administration; also 10 and steroid card with high doses

Dose by aerosol inhalation, 200–400 micrograms twice daily, adjusted as necessary up to 1 mg twice daily. CHILD under 12 years 100–200 micrograms twice daily

Note: Clenil Modulite® is not interchangeable with other CFC-free beclometasone dipropionate inhalers; the MHRA has advised (July 2008) that CFC-free beclometasone dipropionate inhalers should be prescribed by brand name, see p. 196

Dental prescribing on NHS Clenil Modulite®

50 micrograms/metered inhalation may be prescribed

Qvar® (TEVA UK) \( ^{\text{BNM}} \)

Aerosol inhalation, beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £7.87; 100 micrograms/metered inhalation, 200-dose unit = £17.21. Label: 8, counselling, administration; also 10 and steroid card with high doses

Autohaler® (breath-actuated aerosol inhalation), beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £7.87; 100 micrograms/metered inhalation, 200-dose unit = £17.21. Label: 8, counselling, administration; also 10 and steroid card with high doses

Easi-Breathe® (breath-actuated aerosol inhalation), beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £7.74; 100 micrograms/metered inhalation, 200-dose unit = £16.95. Label: 8, counselling, administration; also 10 and steroid card with high doses

Dose by aerosol inhalation, prophylaxis of asthma, ADULT and CHILD over 12 years, 50–200 micrograms twice daily, increased if necessary to max. 400 micrograms twice daily

Important: When switching a patient with poorly controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of Qvar® should be prescribed for:

- 200–250 micrograms of beclometasone dipropionate or budesonide
- 100 micrograms of fluticasone propionate

When switching a patient with poorly controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of Qvar® should be prescribed for 100 micrograms of beclometasone dipropionate, budesonide, or fluticasone propionate; the dose of Qvar® should be adjusted according to response

Note: Qvar® is not interchangeable with other CFC-free beclometasone dipropionate inhalers; the MHRA has advised (July 2008) that beclometasone dipropionate CFC-free inhalers should be prescribed by brand name, see p. 196

Compound preparations

For prescribing information on formoterol fumarate, see section 3.1.1.1

Fostair® (Chiesi) \( ^{\text{BNF}} \)

Aerosol inhalation, beclometasone dipropionate 100 micrograms, formoterol fumarate 6 micrograms/metered inhalation, net price 120-dose unit = £29.32. Label: 8, counselling, administration, 10, steroid card with high doses

Dose by aerosol inhalation, asthma maintenance therapy, ADULT over 18 years, 1–2 puffs twice daily; max. 4 puffs daily

Asthma, maintenance and reliever therapy (but see p. 195), ADULT over 18 years, 1 puff twice daily; for relief of symptoms, 1 puff as needed, max. 8 puffs daily

When switching patients from other beclometasone dipropionate and formoterol fumarate inhalers, Fostair® 100/6 can be prescribed for patients already using beclometasone dipropionate 250 micrograms in another CFC-free inhaler; the dose of Fostair® should be adjusted according to response

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 50% of predicted (but see notes, p. 181), ADULT over 18 years, 2 puffs twice daily

Note: The MHRA has advised (July 2008) that beclometasone dipropionate CFC-free inhalers should be prescribed by brand name, see p. 196

BUDESONIDE

Indications

prophylaxis of asthma (see also Management of Chronic Asthma table, p. 182), croup

Cautions

see notes above

Pregnancy

see p. 181

Breast-feeding

see p. 181

Side-effects

see notes above

Dose

- See preparations below

Budesonide (Non-proprietary) \( ^{\text{BNM}} \)

Dry powder for inhalation, budesonide 100 micrograms/metered inhalation, net price 200-dose unit = £8.86; 200 micrograms/metered inhalation, 200-dose unit = £17.71; 400 micrograms/metered inhalation, 100-dose unit = £17.71. Label: 8, counselling, administration; also 10 and steroid card with high doses

Brands include Easyhaler® Budesonide

Dose by inhalation of powder, ADULT and CHILD over 12 years, 100–800 micrograms twice daily, adjusted as necessary, Alternatively, in mild to moderate asthma, for patients previously stabilised on a twice daily dose, 200–400 micrograms (max. 800 micrograms) as a single dose in the evening. CHILD 6–12 years 100–400 micrograms twice daily, adjusted as necessary, alternatively, in mild to moderate asthma, for patients previously stabilised on a twice daily dose, 200–400 micrograms as a single dose in the evening

Budelin Novolizer® (Meda) \( ^{\text{BNM}} \)

Dry powder for inhalation, budesonide 200 micrograms, net price refillable inhaler device and 100-dose cartridge = £14.86; 100-dose refill cartridge = £9.59. Label: 8, counselling, administration; also 10 and steroid card with high doses

Dose by inhalation of powder, ADULT and CHILD over 12 years, 200–800 micrograms twice daily, adjusted as necessary, Alternatively, in mild to moderate asthma, for patients previously stabilised on a twice daily dose,
BNF 68

3.2 Corticosteroids

200–400 micrograms (max. 800 micrograms) as a single dose in the evening; CHILD 6–12 years 200–400 micrograms twice daily; adjusted as necessary; alternatively, in mild to moderate asthma, for patients previously stabilised on a twice daily dose, 200–400 micrograms as a single dose in the evening

Pulmicort® (AstraZeneca) (Takeda)

Turbohaler® (= dry powder inhaler), budesonide 100 micrograms/metered inhalation, net price 200-dose unit = £11.84; 200 micrograms/metered inhalation, 100-dose unit = £11.84; 400 micrograms/metered inhalation, 50-dose unit = £13.86. Label: 8, counselling, administration; also 10 and steroid card with high doses

Dose by inhalation of powder, ADULT and CHILD over 12 years, 1–2 puffs twice daily increased if necessary to max. 2 puffs twice daily, reduced to 1 puff once daily if control maintained; CHILD 6–12 years, 100–400 micrograms twice daily, adjusted as necessary, alternatively, in mild to moderate asthma, for patients previously stabilised on a twice daily dose, 200–400 micrograms as a single dose in the evening

Respules® (= single-dose units for nebulisation), budesonide 250 micrograms/mL, net price 20 × 2-mL (500-microgram) unit = £26.42; 500 micrograms/mL, 20 × 2-mL (1-mg) unit = £40.00. May be diluted with sterile sodium chloride 0.9%. Label: 6 mL (500-microgram) unit = £26.42; 500 micrograms/mL, net price 20 × 2-mL (1-mg) unit = £32.83; 160 micrograms/metered inhalation, 60-dose unit = £19.31, 120-dose unit = £38.62. Label: 8, counselling, administration; also label 10 and steroid card with high doses

Dose by inhalation of powder, asthma maintenance therapy, 1 puff twice daily increased if necessary to max. 4 puffs twice daily, reduced to 1 puff once daily if control maintained; CHILD 6–12 years, 1–2 puffs twice daily; for relief of symptoms, 1 puff as needed up to max. 6 puffs at a time; max. 8 puffs daily; up to 12 puffs daily can be used for a limited time but medical assessment should be considered; CHILD 12–18 years, see BNF for Children

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second <50% of predicted, 2 puffs twice daily

Symbicort 400/12 Turbohaler® (= dry powder inhaler), budesonide 400 micrograms, formoterol fumarate 12 micrograms/metered inhalation, net price 60-dose unit = £38.00. Label: 8, counselling, administration; also 10 and steroid card with high doses

Dose by inhalation of powder, asthma maintenance therapy, 1 puff twice daily increased if necessary to max. 2 puffs twice daily, reduced to 1 puff once daily if control maintained; CHILD 12–17 years 1 puff twice daily reduced to 1 puff once daily if control maintained

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second <50% of predicted, 1 puff twice daily

Ciclesonide

Indications prophylaxis of asthma

Cautions see notes above

Pregnancy see p. 181

Breast-feeding see p. 181

Side-effects see notes above; also nausea, taste disturbance

Dose

• By aerosol inhalation, 160 micrograms daily as a single dose reduced to 80 micrograms daily if control maintained; dose may be increased to max. 320 micrograms twice daily if necessary in severe asthma [unlicensed]; CHILD 12–18 years, 160 micrograms daily as a single dose reduced to 80 micrograms daily if control maintained

Alvesco® (Takeda) (Takeda)

Aerosol inhalation, ciclesonide 80 micrograms/metered inhalation, net price 120-dose unit = £32.83; 160 micrograms/metered inhalation, 60-dose unit = £19.31, 120-dose unit = £38.62. Label: 8, counselling, administration

Fluticasone

Indications prophylaxis of asthma (see also Management of Chronic Asthma table, p. 182)

Cautions see notes above

Pregnancy see p. 181

Breast-feeding see p. 181

Side-effects see notes above; also dyspepsia and arthralgia

Dose

• See preparations below

Flutixide® (A&H) (Takeda)

Accuhaler® (dry powder for inhalation), disk containing 60 blisters of fluticasone propionate 50 micrograms/blower with Accuhaler® device, net price = £6.38; 100 micrograms/blower with Accuhaler® device = £8.93; 250 micrograms/blower with Accuhaler® device = £21.26; 500 micrograms/blower with Accuhaler® device = £36.14. Label: 8, counselling, administration; also label 10 and steroid card with high doses

Note Flutixide Accuhaler® 250 micrograms and 500 micrograms are not indicated for children

Dose by inhalation of powder, prophylaxis of asthma, ADULT and CHILD over 16 years, 100–500 micrograms twice daily, increased according to severity of asthma;
max. 1 mg twice daily (doses above 500 micrograms twice daily initiated by a specialist). CHILD 5–16 years, 50–
100 micrograms twice daily adjusted as necessary; max. 200 micrograms twice daily

**Evoluhal® aerosol inhalation**, fluticasone propionate 50 micrograms/metered inhalation, net price 120-
dose unit = £5.44; 125 micrograms/metered inhalation, 120–dose unit = £21.26; 250 micrograms/
metered inhalation, 120–dose unit = £36.14. Label: 8, counselling, administration; also label 10 and steroid
card with high doses

**Note** Flixotide Evoluhal® 125 micrograms and 250 micrograms not indicated for children

**Dose** by aerosol inhalation, prophylaxis of asthma, ADULT and CHILD over 16 years, 180–500 micrograms twice daily, increased according to severity of asthma; max. 1 mg twice daily; (doses above 500 micrograms twice daily initiated by a specialist). CHILD 4–16 years, 50–
100 micrograms twice daily adjusted as necessary; max. 200 micrograms twice daily

**Note** Nebules® (= single-dose units for nebulisation), fluticasone propionate 250 micrograms/mL, net price
10 × 2-mL (500-microgram) unit = £9.34; 1 mg/mL, 10 × 2-mL (2-mg) unit = £33.35. May be
diluted with sterile sodium chloride 0.9%. Label: 8, counselling, administration, 10, steroid card

**Dose** by inhalation of nebulised suspension, prophylaxis of asthma, ADULT and CHILD over 16 years, 0.5–2 mg twice daily; CHILD 4–16 years, 1 mg twice daily

**Note** Not suitable for use in ultrasonic nebulisers

**Compound preparations**

For prescribing information on formoterol and salmeterol, see Formoterol Fumurate and Salmeterol, section 3.1.1.1.

**Flutiform® (Napp) ▼ (Pulv)**

Flutiform® 50 micrograms/5 micrograms (aerosol inhalation), fluticasone propionate 50 micrograms, formoterol fumurate 5 micrograms/metered inhalation, net price 120–dose unit = £18.00. Label: 8, counselling, administration

**Dose** by aerosol inhalation, prophylaxis of asthma, ADULT and CHILD over 12 years, 2 puffs twice daily

Flutiform® 125 micrograms/5 micrograms (aerosol inhalation), fluticasone propionate 125 micrograms, formoterol fumurate 5 micrograms/metered inhalation, net price 120–dose unit = £29.26. Label: 8, counselling, administration, 10, steroid card

**Dose** by aerosol inhalation, prophylaxis of asthma, ADULT and CHILD over 12 years, 2 puffs twice daily

Flutiform® 250 micrograms/10 micrograms (aerosol inhalation), fluticasone propionate 250 micrograms, formoterol fumurate 10 micrograms/metered inhalation, net price 120–dose unit = £45.56. Label: 8, counselling, administration, 10, steroid card

**Dose** by aerosol inhalation, prophylaxis of asthma, ADULT over 18 years, 2 puffs twice daily

**Relvar Ellipta® (GSK) ▼ (Pulv)**

Relvar Ellipta® 93 micrograms/22 micrograms (dry powder for inhalation), fluticasone furoate 92 micro-
grams, vilanterol (as trifenatate) 22 micrograms/metered inhalation (delivered dose), net price 30–dose unit = £27.80. Label: 8, counselling, administration, 10, steroid card

**Cautions** see notes above and also section 3.1.1.1

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see under Fluticasone and also section 3.1.1.1; also abdominal pain, back pain

**Dose** by inhalation of powder, prophylaxis of asthma, ADULT and CHILD over 12 years, 1 inhalation once daily

**Chronic obstructive pulmonary disease with forced expiratory volume in 1 second ≤ 70% of predicted (but see notes, p. 181, ADULT over 18 years, 1 inhalation once daily**

**Important** 1 inhalation (delivered dose) of fluticasone furoate 92 micrograms once daily is approximately equivalent to fluticasone propionate 250 micrograms twice daily

**Note** The Scottish Medicines Consortium (p. 4) has advised (March 2014) that fluticasone furoate/vilanterol (Relvar Ellipta®) is accepted for restricted use within NHS Scotland in patients with severe chronic obstructive pulmonary disease with a forced expiratory volume in 1 second (FEV1) less than 50% of the predicted normal value

Relvar Ellipta® 184 micrograms/22 micrograms (dry powder for inhalation), fluticasone furoate 184 micro-
grams, vilanterol (as trifenatate) 22 micrograms/metered inhalation (delivered dose), net price 30–dose unit = £38.87. Label: 8, counselling, administration, 10, steroid card

**Hepatic impairment** avoid in moderate to severe impairment; max. dose fluticasone furoate 92 micrograms, vilanterol 22 micrograms

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see under Fluticasone and also section 3.1.1.1; also abdominal pain, back pain

**Dose** by inhalation of powder, prophylaxis of asthma, ADULT and CHILD over 12 years, 1 inhalation once daily

**Important** 1 inhalation (delivered dose) of fluticasone furoate 184 micrograms once daily is approximately equivalent to fluticasone propionate 500 micrograms twice daily

Seretide® (A&H) ▼ (Pulv)

Seretide 100 Accuhaler® (dry powder for inhalation), disk containing 60 blisters of fluticasone propionate 100 micrograms, salmeterol (as xinafo-
ate) 50 micrograms/bilister with Accuhaler® device, net price = £18.00. Label: 8, counselling, administration

**Dose** by inhalation of powder, prophylaxis of asthma, ADULT and CHILD over 5 years, 1 inhalation twice daily, reduced to 1 inhalation once daily if control maintained Seretide 250 Accuhaler® (dry powder for inhalation), disk containing 60 blisters of fluticasone propionate 250 micrograms, salmeterol (as xinafo-
ate) 50 micrograms/bilister with Accuhaler® device, net price = £35.00. Label: 8, counselling, administration, 10, steroid card

**Dose** by inhalation of powder, prophylaxis of asthma, ADULT and CHILD over 12 years, 1 inhalation twice daily Seretide 500 Accuhaler® (dry powder for inhalation), disk containing 60 blisters of fluticasone propionate 500 micrograms, salmeterol (as xinafo-
ate) 50 micrograms/bilister with Accuhaler® device, net price = £40.92. Label: 8, counselling, administration, 10, steroid card

**Dose** by inhalation of powder, prophylaxis of asthma, ADULT and CHILD over 12 years, 1 inhalation twice daily Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 60% of predicted (but see notes, p. 181, ADULT over 18 years, 1 inhalation once daily

**Note** The Scottish Medicines Consortium has advised (December 2008) that Seretide 500 Accuhaler® is not recommended for use within NHS Scotland for chronic obstructive pulmonary disease in patients with a forced expiratory volume in 1 second (FEV1) less than 60% and greater than 50% of the predicted normal value, with significant symptoms despite regular bronchodilator therapy, and a history of repeated exacerbations

Seretide 50 Evoluhal® (aerosol inhalation), fluticasone propionate 50 micrograms, salmeterol (as xinafoate) 25 micrograms/metered inhalation, net
The mode of action of sodium cromoglicate and nedocromil is not completely understood. They may be of value in asthma with an allergic basis, but, in practice, it is difficult to predict who will benefit; they could probably be given for 4 to 6 weeks to assess response. Dose frequency is adjusted according to response but is usually 3 to 4 times a day initially; this may subsequently be reduced. Withdrawal of sodium cromoglicate or nedocromil should be done gradually over a period of one week—symptoms of asthma may recur.

In general, prophylaxis with sodium cromoglicate is less effective than prophylaxis with corticosteroid inhalations (see Management of Chronic Asthma table, p. 182). There is evidence of efficacy of nedocromil in children aged 5–12 years. Sodium cromoglicate and nedocromil are of no value in the treatment of acute attacks of asthma.

Sodium cromoglicate can prevent exercise-induced asthma. However, exercise-induced asthma may reflect poor overall control and the patient should be reassessed.

Paradoxical bronchospasm If paradoxical bronchospasm occurs, a short-acting beta agonist such as salbutamol or terbutaline (section 3.1.1.1) should be used to control symptoms; treatment with sodium cromoglicate or nedocromil should be discontinued.

Side-effects Side-effects associated with inhalation of sodium cromoglicate and nedocromil include throat irritation, cough, bronchospasm (including paradoxical bronchospasm—see above), and headache.

Sodium Cromoglicate (Sodium Cromoglycate)

Indications prophylaxis of asthma (see also Management of Chronic Asthma table, p. 182); food allergy (section 1.5.4); allergic conjunctivitis (section 11.4.2); allergic rhinitis (section 12.2.1)

Cautions see notes above; also discontinue if eosinophilic pneumonia occurs

Pregnancy see p. 181

Breast-feeding see p. 181

Side-effects see notes above; also rhinitis, eosinophilic pneumonia

Dose

By inhalation of powder, ADULT and CHILD over 12 years, 400 micrograms as a single dose in the evening or in 2 divided doses, reduced to 200 micrograms once daily if control maintained; dose may be increased to max. 400 micrograms twice daily in severe asthma

Asmanex® (MSD) 

Twisthaler (dry powder inhaler), mometasone furoate 200 micrograms/metered inhalation, net price 112-dose unit = £36.05. Label: 8, counselling, administration, 10, steroid card

Note The Scottish Medicines Consortium has advised (November 2003) that Asmanex® is restricted for use following failure of first-line inhaled corticosteroids

Nedocromil Sodium

Indications prophylaxis of asthma (see also Management of Chronic Asthma table, p. 182)

Cautions see notes above

Pregnancy see p. 181

Breast-feeding see p. 181

Side-effects see notes above; also nausea, vomiting, dyspepsia, abdominal pain, pharyngitis; rarely taste disturbances

Dose

By aerosol inhalation, ADULT and CHILD over 6 years 4 mg (2 puffs) 4 times daily, when control achieved may be possible to reduce to twice daily

Counselling Regular use is necessary

Cromoglicate and related therapy

The mode of action of sodium cromoglicate and nedocromil is not completely understood. They may be of value in asthma with an allergic basis, but, in practice, it is difficult to predict who will benefit; they could probably be given for 4 to 6 weeks to assess response. Dose

3.3 Cromoglicate and related therapy, leukotriene receptor antagonists, and phosphodiesterase type-4 inhibitors

3.3.1 Cromoglicate and related therapy

3.3.2 Leukotriene receptor antagonists

3.3.3 Phosphodiesterase type-4 inhibitors

Dose by aerosol inhalation, prophylaxis of asthma, ADULT and CHILD over 12 years, 2 puffs twice daily

Dose by aerosol inhalation, prophylaxis of asthma, ADULT and CHILD over 12 years, 2 puffs twice daily
3.3.2 Leukotriene receptor antagonists

The leukotriene receptor antagonists, montelukast and zafirlukast, block the effects of cysteinyl leukotrienes in the airways. They are effective in asthma when used alone or with an inhaled corticosteroid (see Management of Chronic Asthma table p. 182).

Montelukast has not been shown to be more effective than a standard dose of inhaled corticosteroid, but the two drugs appear to have an additive effect. The leukotriene receptor antagonists may be of benefit in exercise-induced asthma and in those with concomitant rhinitis, but they are less effective in those with severe asthma who are also receiving high doses of other drugs.

Churg-Strauss syndrome has occurred very rarely in association with the use of leukotriene receptor antagonists; in many of the reported cases the reaction followed the reduction or withdrawal of oral corticosteroid therapy. Prescribers should be alert to the development of eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, or peripheral neuropathy.

Pregnancy There is limited evidence for the safe use of leukotriene receptor antagonists during pregnancy; however, they can be taken as normal in women who have shown a significant improvement in asthma not achievable with other drugs before becoming pregnant, see also p. 181.

**MONTELUKAST**

**Indications** prophylaxis of asthma, see notes above and Management of Chronic Asthma table, p. 182; symptomatic relief of seasonal allergic rhinitis in patients with asthma

**Cautions** interactions: Appendix 1 (leukotriene receptor antagonists)

**Pregnancy** manufacturer advises avoid unless essential, see also notes above

**Breast-feeding** manufacturer advises avoid unless essential

**Side-effects** abdominal pain, thirst, headache, hyperkinesia (in young children); less commonly dry mouth, dyspepsia, oedema, dizziness, drowsiness, malaise, sleep disturbances, sleep-walking, abnormal dreams, anxiety, agitation (including aggressive behaviour or hostility), depression, psychomotor hyperactivity (including irritability and restlessness), paraesthesia, hypoaesthesia, seizures, arthralgia, myalgia (including muscle cramps), epistaxis, bruising; rarely palpitation, tremor, disturbance in attention, memory impairment, increased bleeding tendency; very rarely hepatic eosinophilic infiltration, hepatic disorders, hallucinations, suicidal thoughts and behaviour, disorientation, Churg-Strauss syndrome (see notes above), erythema nodosum, erythema multiforme

**Dose**

- Prophylaxis of asthma, ADULT and CHILD over 15 years, 10 mg once daily in the evening; CHILD 6 months–6 years 4 mg once daily in the evening, 6–15 years 5 mg once daily in the evening
- Seasonal allergic rhinitis, ADULT and CHILD over 15 years, 10 mg once daily in the evening

**Montelukast** (Non-proprietary) Chewable tablets, montelukast (as sodium salt) 4 mg, net price 28-tab pack = £1.96; 5 mg, 28-tab pack = £2.35. Label: 23, 24

**Excipients** include aspartame (section 9.4.1)

Granules, montelukast (as sodium salt) 4 mg, net price 28-sachet pack = £4.01. Counselling, administration

**Counselling** Granules may be swallowed or mixed with cold, soft food (not liquid) and taken immediately

**Tablets**, montelukast (as sodium salt) 10 mg, net price 28-tab pack = £2.33

**SINGULAR** (MSD) Chewable tablets, pink, cherry-flavoured, montelukast (as sodium salt) 4 mg, net price 28-tab pack = £25.69; 5 mg, 28-tab pack = £25.69. Label: 23, 24

**Excipients** include aspartame equivalent to phenylalanine 674 micrograms/4-mg tablet and 842 micrograms/5-mg tablet (section 9.4.1)

Granules, montelukast (as sodium salt) 4 mg, net price 28-sachet pack = £25.69. Counselling, administration

**Counselling** Granules may be swallowed or mixed with cold, soft food (not liquid) and taken immediately

**Tablets**, beige, f/c, montelukast (as sodium salt) 10 mg, net price 28-tab pack = £26.97

**Note** The Scottish Medicines Consortium has advised (June 2007) that Singular® chewable tablets and granules are restricted for use as an alternative to low-dose inhaled corticosteroids for children 2–14 years with mild persistent asthma who have not recently had serious asthma attacks that required oral corticosteroid use and who are not capable of using inhaled corticosteroids. Singular® chewable tablets and granules should be initiated by a specialist in paediatric asthma

**ZAFIRLUKAST**

**Indications** prophylaxis of asthma, see notes above and Management of Chronic Asthma table, p. 182

**Cautions** elderly; interactions: Appendix 1 (leukotriene receptor antagonists)

**Hepatic disorders** Patients or their carers should be told how to recognise development of liver disorder and advised to seek medical attention if symptoms or signs such as persistent nausea, vomiting, malaise, or jaundice develop

**Hepatic impairment** manufacturer advises avoid

**Renal impairment** manufacturer advises caution in moderate to severe impairment

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk; see also notes above

**Breast-feeding** present in milk—manufacturer advises avoid

**Side-effects** gastro-intestinal disturbances, respiratory infections, headache, insomnia, malaise; rarely bleeding disorders, hypersensitivity reactions including angioedema and skin reactions, arthralgia, myalgia, hepatitis, hyperbilirubinaemia, thrombocytopenia; very rarely Churg-Strauss syndrome (see notes above), agranulocytosis

**Dose**

- ADULT and CHILD over 12 years, 20 mg twice daily

**Accolate®** (AstraZeneca) Tablets, f/c, zafirlukast 20 mg, net price 56-tab pack = £17.75. Label: 23
**3.3.3 Phosphodiesterase type-4 inhibitors**

Roflumilast is a phosphodiesterase type-4 inhibitor with anti-inflammatory properties; it is licensed as an adjunct to bronchodilators for the treatment of patients with severe chronic obstructive pulmonary disease associated with chronic bronchitis and a history of frequent exacerbations.

**NICE guidance**

Roflumilast for the management of severe chronic obstructive pulmonary disease (January 2012)

Roflumilast is recommended only in the context of research as part of a clinical trial for adults with severe chronic obstructive pulmonary disease associated with chronic bronchitis with a history of frequent exacerbations as an add-on to bronchodilator treatment.

Patients receiving roflumilast should have the option to continue treatment until they and their clinicians consider it appropriate to stop.

www.nice.org.uk/TA244

---

**ROFLUMILAST**

**Indications** see notes above

**Cautions** monitor body-weight; latent infection (such as tuberculosis, viral hepatitis, herpes infection); history of psychiatric illness, or concomitant use of drugs likely to cause psychiatric events (discontinue if new or worsening psychiatric symptoms occur); interactions: Appendix 1 (roflumilast)

**Contra-indications** severe immunological disease; severe acute infectious disease; cancer (except basal cell carcinoma); concomitant treatment with immunosuppressive drugs (except short-term systemic corticosteroids); moderate to severe cardiac failure; history of depression associated with suicidal ideation or behaviour

**Hepatic impairment** caution in mild impairment; avoid in moderate to severe impairment

**Pregnancy** manufacturer advises avoid—tobacco use effective contraception

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** diarrhoea, nausea, abdominal pain, weight loss, decreased appetite, headache, insomnia; less commonly gastritis, vomiting, gastro-oesophageal reflux, dyspepsia, palpitation, anxiety, tremor, vertigo, dizziness, malaise, muscle spasm, myalgia, back pain, rash; rarely taste disturbances, haematochezia, constipation, respiratory tract infections, depression, nervousness, suicidal ideation and behaviour, gynaecomastia, raised creatine kinase, urticaria

**Dose**

- **ADULT** over 18 years, 500 micrograms once daily

- **Daexas®** (Takeda) ▲ Pain

  Tablets, yellow, f/c, roflumilast 500 micrograms, net price 30-tab pack = £37.71, 90-tab pack = £113.14.

  Counselling. Patients should be given a patient card before starting treatment and advised to record body-weight at regular intervals

---

**3.4 Antihistamines, hyposensitisation, and allergic emergencies**

**3.4.1 Antihistamines**

**3.4.2 Allergen immunotherapy**

**3.4.3 Allergic emergencies**

---

**3.4.1 Antihistamines**

All antihistamines are of potential value in the treatment of nasal allergies, particularly seasonal allergic rhinitis (hay fever), and they may be of some value in vaso-motor rhinitis. They reduce rhinorrhoea and sneezing but are usually less effective for nasal congestion. Antihistamines are used topically in the eye (section 11.4.2), in the nose (section 12.2.1), and on the skin (section 13.3).

Oral antihistamines are also of some value in preventing urticaria and are used to treat urticarial rash, pruritus, and insect bites and stings; they are also used in drug allergies. Injections of chlorphenamine or promethazine are used as an adjunct to adrenaline (epinephrine) in the emergency treatment of anaphylaxis and angioedema (section 3.4.3). For the use of antihistamines (including cinnarizine, cyclizine, and promethazine teoclote) in nausea and vomiting, see section 4.6. Buclizine is included as an anti-emetic in a preparation for migraine (section 4.7.4.1). For reference to the use of antihistamines for occasional insomnia, see section 4.1.1.

All older antihistamines cause sedation but alimemazine and promethazine may be more sedating whereas chlorphenamine and cyclizine (section 4.6) may be less so. This sedating activity is sometimes used to manage the pruritus associated with some allergies. There is little evidence that any one of the older, ‘sedating’ antihistamines is superior to another and patients vary widely in their response.

Non-sedating antihistamines such as acrivastine, bilastine, cetirizine, desloratadine (an active metabolite of loratadine), fexofenadine (an active metabolite of terfenadine), levocetirizine (an isomer of cetirizine), loratadine, mizolastine, and rupatadine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

**Cautions and contra-indications** Sedating antihistamines have significant antimuscarinic activity and they should therefore be used with caution in prostatic hypertrophy, urinary retention, susceptibility to angle-closure glaucoma, and pyloroduodenal obstruction. Caution may be required in epilepsy. Children and the elderly are more susceptible to side-effects. Many antihistamines should be avoided in acute porphyria but some are thought to be safe, see section 9.8.2. **Interactions:** Appendix 1 (antihistamines).

**Hepatic impairment** Sedating antihistamines should be avoided in severe liver disease—a increased risk of coma.

**Pregnancy** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity except for hydroxyzine where toxicity has been reported with
3 Respiratory system

high doses in animal studies. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

Breast-feeding Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

Side-effects Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines (see also notes above). Side-effects that are more common with the older antihistamines include headache, psychomotor impairment, and antimuscarinic effects such as urinary retention, dry mouth, blurred vision, and gastrointestinal disturbances.

Other rare side-effects of antihistamines include hypotension, palpitation, arrhythmias, extrapyramidal effects, dizziness, confusion, depression, sleep disturbances, tremor, convulsions, hypersensitivity reactions (including bronchospasm, angioedema, and anaphylaxis, rash, and photosensitivity reactions), blood disorders, liver dysfunction, and angle-closure glaucoma.

Non-sedating antihistamines

Driving Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. driving); excess alcohol should be avoided.

ACRIVASTINE

Indications symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria

Cautions see notes above

Contra-indications see notes above; also hypersensitivity to triprolidine; elderly

Renal impairment avoid in severe impairment

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Dose

• ADULT and CHILD over 12 years, 8 mg 3 times daily

Acrivastine (Non-proprietary)

Capsules, acrivastine 8 mg, net price 12-cap pack = £2.75, 24-cap pack = £4.76. Counselling, driving

Brands include Benadryl® Allergy Relief

BILASTINE

Indications symptomatic relief of allergic rhinoconjunctivitis and urticaria

Cautions see notes above

Contra-indications see notes above

Pregnancy avoid—limited information available; see also notes above

Breast-feeding avoid—limited information available; see also notes above

Side-effects headache, malaise; less commonly abdominal pain, diarrhoea, increased appetite, weight gain, thirst, gastritis, prolongation of the QT interval, dyspnoea, anxiety, insomnia, vertigo, dizziness, pyrexia, oral herpes, tinnitus

Dose

• ADULT and CHILD over 12 years, 20 mg once daily

Counselling Advise patient to take tablet 1 hour before or 2 hours after food or fruit juice

Ixten® (Menarini) Tablets, scored, bilastine 20 mg, net price 30-tab pack = £15.09. Label: 23, counselling, administration

CETIRIZINE HYDROCHLORIDE

Indications symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria

Cautions see notes above

Contra-indications see notes above

Renal impairment use half normal dose if eGFR 30–50 mL/minute/1.73 m²; use half normal dose and reduce dose frequency to alternate days if eGFR 10–30 mL/minute/1.73 m²; avoid if eGFR less than 10 mL/minute/1.73 m²

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Dose

• ADULT and CHILD over 12 years, 10 mg once daily;

CHILD 1–2 years see BNF for Children, 2–6 years 2.5 mg twice daily, 6–12 years 5 mg twice daily

Cetirizine (Non-proprietary)

Tablets, cetirizine hydrochloride 10 mg, net price 30-tab pack = £1.06. Counselling, driving

Dental prescribing on NHS Cetirizine Tablets 10 mg may be prescribed

Oral solution, cetirizine hydrochloride 5 mg/5 mL, net price 200 mL = £1.70. Counselling, driving

Note Sugar-free versions are available and can be ordered by specifying sugar-free on the prescription

Excipients may include propylene glycol (see Excipients, p. 2)

Dental prescribing on NHS Cetirizine Oral Solution 5 mg/5 mL may be prescribed

DESLORATADINE

Note Desloratadine is a metabolite of loratadine

Indications symptomatic relief of allergic rhinitis and urticaria

Cautions see notes above

Contra-indications see notes above; also hypersensitivity to loratadine

Renal impairment use with caution in severe impairment

Pregnancy use with caution in severe impairment

Breast-feeding see notes above

Side-effects see notes above

Dose

• ADULT and CHILD over 12 years, 5 mg once daily;

CHILD 1–6 years 1.25 mg once daily, 6–12 years 2.5 mg once daily

Desloratadine (Non-proprietary)

Tablets, desloratadine 5 mg, net price 30-tab pack = £1.35. Counselling, driving
BNF 68

3.4.1 Antihistamines

205

**FEXOFENADINE HYDROCHLORIDE**

**Note** Fexofenadine is a metabolite of terfenadine

**Indications** symptomatic relief of allergy such as hay fever, urticaria

**Contra-indications** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**
- Seasonal allergic rhinitis, 120 mg once daily; **CHILD** 6–12 years, 30 mg twice daily
- Chronic idiopathic urticaria, **ADULT** and **CHILD** over 12 years, 180 mg once daily

**Fexofenadine Hydrochloride (Non-proprietary)**

**Tablets, 1/25 mg, net price 30-tab pack = £2.85; 180 mg, 30-tab pack = £13.70. Label: 5, counselling, driving**

**Telfast** (Sanofi-Aventis)

**Tablets, 1/25 mg/5 mL, net price 100 mL = £6.77. Counselling, driving**

**LEVOCETIRIZINE HYDROCHLORIDE**

**Note** Levocetirizine is an isomer of cetirizine

**Indications** symptomatic relief of allergy such as hay fever, urticaria

**Cautions** see notes above

**Contra-indications** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; very rarely weight gain

**Dose**
- **ADULT** and **CHILD** over 6 years, 5 mg once daily; **CHILD** under 6 years see BNF for Children

**Levocetirizine Hydrochloride (Non-proprietary)**

**Tablets, 1/25 mg, net price 30-tab pack = £3.94. Counselling, driving**

**Xyzal** (UCB Pharma)

**Tablets, 1/25 mg, net price 30-tab pack = £8.00. Counselling, driving**

**LORATADINE**

**Indications** symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** reduce dose frequency to alternate days in severe impairment

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**
- **ADULT** and **CHILD** over 12 years 10 mg once daily; **CHILD** 2–12 years, body-weight under 30 kg, 5 mg once daily; body-weight over 30 kg, 10 mg once daily

**Loratadine (Non-proprietary)**

**Tablets, loratadine 10 mg, net price 30-tab pack = £1.00. Counselling, driving**

**Dentally prescribing on NHS** Loratadine 10 mg Tablets may be prescribed

**Syrup, loratadine 5 mg/5 mL, net price 100 mL = £2.19. Counselling, driving**

**Excipients** may include propylene glycol (see Excipients, p. 2)

**Dentally prescribing on NHS** Loratadine Syrup 5 mg/5 mL may be prescribed

**MIZOLASTINE**

**Indications** symptomatic relief of allergy such as hay fever, urticaria

**Cautions** see notes above

**Contra-indications** see notes above; also susceptibility to QT-interval prolongation (including cardiac disease and hypokalaemia)

**Hepatic impairment** manufacturer advises avoid in significant impairment

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; weight gain; anxiety, asthma, less commonly arthralgia and myalgia

**Dose**
- **ADULT** and **CHILD** over 12 years, 10 mg once daily

**Mizollen** (Sanofi-Aventis)

**Tablets, m/r, f/c, scored, mizolastine 10 mg, net price 30-tab pack = £6.92. Label: 25, counselling, driving**

**RUPATADINE**

**Indications** symptomatic relief of allergic rhinitis, urticaria

**Cautions** see notes above; also susceptibility to QT-interval prolongation (including cardiac disease and hypokalaemia); elderly

**Hepatic impairment** manufacturer advises avoid—no information available

**Renal impairment** manufacturer advises avoid—no information available

**Pregnancy** manufacturer advises caution—limited information available; see also notes above

**Breast-feeding** manufacturer advises caution; see also notes above

**Side-effects** see notes above; also asthenia; less commonly pyrexia, irritability, increased appetite, arthralgia, and myalgia

**Dose**
- **ADULT** and **CHILD** over 12 years, 10 mg once daily

**Rupafin** (GSK)

**Tablets, pink, rupatadine (as fumarate) 10 mg, net price 30-tab pack = £5.00. Counselling, driving**
**Sedating antihistamines**

**Driving**  Drowsiness may affect performance of skilled tasks (e.g. driving); sedating effects enhanced by alcohol.

### ALIMEMAZINE TARTRATE

**(Trimeprazine tartrate)**

**Indications**  urticaria and pruritus, premedication

**Cautions**  see notes above; see also section 4.2.1

**Contra-indications**  see notes above; see also section 4.2.1

**Hepatic impairment**  see notes above

**Renal impairment**  avoid

**Pregnancy**  see notes above

**Breast-feeding**  see notes above

**Side-effects**  see notes above; see also section 4.2.1

**Dose**

- Urticaria and pruritus, 10 mg 2–3 times daily, in severe cases up to max. 100 mg daily has been used;
  - **ELDERLY** 10 mg 1–2 times daily;
  - **CHILD** under 2 years, see BNF for Children, 2–5 years 2.5 mg 3–4 times daily, 5–12 years 5 mg 3–4 times daily
- Premedication, **CHILD** 2–7 years up to 2 mg/kg 1–2 hours before operation

### CHLORPHENAMINE MALEATE

**(Chlorpheniramine maleate)**

**Indications**  symptomatic relief of allergy such as hay fever, urticaria

**Cautions**  see notes above

**Contra-indications**  see notes above

**Hepatic impairment**  see notes above

**Pregnancy**  see notes above

**Breast-feeding**  see notes above

**Side-effects**  see notes above; also exfoliative dermatitis and tinnitus reported; injections may cause transient hypotension or CNS stimulation and may be irritant

**Dose**

- By **mouth**, 4 mg every 4–6 hours, max. 24 mg daily (ELDERLY) max. 12 mg daily; **CHILD** under 1 year see BNF for Children; 1–2 years 1 mg twice daily; 2–6 years 1 mg every 4–6 hours, max. 6 mg daily; 6–12 years 2 mg every 4–6 hours, max. 12 mg daily
- By intramuscular injection or by intravenous injection over 1 minute, 10 mg, repeated if required up to max. 4 doses in 24 hours; **CHILD** under 6 months 250 micrograms/kg (max. 2.5 mg); 6 months–6 years 2.5 mg; 6–12 years 5 mg; these doses may be repeated if required up to max. 4 doses in 24 hours

**Note**  Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription

### CYPROHEPTADINE HYDROCHLORIDE

**Indications**  symptomatic relief of allergy such as hay fever, urticaria; pruritus

**Cautions**  see notes above

**Contra-indications**  see notes above

**Hepatic impairment**  see notes above

**Pregnancy**  see notes above

**Breast-feeding**  see notes above

**Side-effects**  see notes above

**Dose**

- 4 mg 3 times daily; usual range 4–20 mg daily, max. 32 mg daily; **CHILD** 2–6 years 2 mg 2–3 times daily, max. 12 mg daily; 7–14 years 4 mg 2–3 times daily, max. 16 mg daily

**Periactin®**  (Auden Mckenzie)

**Indications**  symptomatic relief of allergy such as hay fever, urticaria; pruritus

**Cautions**  see notes above

**Contra-indications**  see notes above

**Hepatic impairment**  see notes above

**Pregnancy**  see notes above

**Breast-feeding**  see notes above

**Side-effects**  see notes above

**Dose**

- 4 mg 3 times daily; usual range 4–20 mg daily, max. 32 mg daily; **CHILD** 2–6 years 2 mg 2–3 times daily, max. 12 mg daily; 7–14 years 4 mg 2–3 times daily, max. 16 mg daily

**Note**  Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription

**Injection**

- **Periactin®**, chlorphenamine maleate 10 mg/mL, net price 1-mL amp = £2.80
**HYDROXYZINE HYDROCHLORIDE**

**Indications** pruritus

**Cautions** see notes above; also susceptibility to QT-interval prolongation

**Contra-indications** see notes above

**Hepatic impairment** reduce daily dose by one-third; see also notes above

**Renal impairment** reduce daily dose by half

**Pregnancy** toxicity in animal studies with high doses; see also notes above

**Breast-feeding** manufacturer advises avoid; see also notes above

**Side-effects** see notes above

**Dose**
- Pruritus, initially 25 mg at night increased if necessary to 25 mg 3–4 times daily; **CHILD** 1–6 years initially 5–15 mg at night increased if necessary to 50 mg daily in 3–4 divided doses; 6–12 years initially 15–25 mg at night increased if necessary to 50–100 mg daily in 3–4 divided doses; **CHILD** under 1 year see BNF for Children

**Atarax®** (Alliance) 
Tablets, both f/c, hydroxyzine hydrochloride 10 mg (orange), net price 28-tab pack = £2.18; 25 mg (green), 28-tab pack = £1.22. Label: 2

**Ucerax®** (UCB Pharma) 
Tablets, both f/c, scored, hydroxyzine hydrochloride 25 mg, net price 25-tab pack = £1.22. Label: 2

**Syrup**, hydroxyzine hydrochloride 10 mg/5 mL, net price 200-mL pack = £1.78. Label: 2

**KETOTIFEN**

**Indications** allergic rhinitis

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** use with caution

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also excitation, irritability, nervousness; less commonly cystitis; rarely weight gain; very rarely Stevens-Johnson syndrome

**Dose**
- 1 mg twice daily with food increased if necessary to 2 mg twice daily; initial treatment in readily sedated patients 0.5–1 mg at night; **CHILD** 3 years and over, 1 mg twice daily

**Zaditen®** (Swedish Orphan) 
Tablets, scored, ketotifen (as hydrogen fumarate) 1 mg, net price 60-tab pack = £7.53. Label: 2, 21

**Elixir**, ketotifen (as hydrogen fumarate), 1 mg/5 mL, net price 300 mL (strawberry-flavoured) = £8.91. Label: 2, 21

**PROMETHAZINE HYDROCHLORIDE**

**Indications** symptomatic relief of allergy such as hay fever and urticaria; emergency treatment of anaphylactic reactions; sedation (section 4.1.1); nausea and vomiting (section 4.6)

**Cautions** see notes above; avoid extravasation with intravenous injection; severe coronary artery disease

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** use with caution

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also restlessness; intramuscular injection may be painful

**Dose**
- By mouth, 10–20 mg 2–3 times daily; **CHILD** 2–5 years 5–15 mg daily in 1–2 divided doses, 5–10 years 10–25 mg daily in 1–2 divided doses
- By deep intramuscular injection, 25–50 mg, max. 100 mg; **CHILD** 5–10 years 6.25–12.5 mg
- By slow intravenous injection in emergencies, 25–50 mg as a solution containing 2.5 mg/mL in water for injections; max. 100 mg

**Promethazine** (Non-proprietary) 
*Injection*, promethazine hydrochloride 25 mg/mL, net price 1-mL amp = 68p, 2-mL amp = £1.20

**Excipients** may include sulfites

**Phenergan®** (Sanofi-Aventis) 
Tablets, both blue, f/c, promethazine hydrochloride 10 mg, net price 56-tab pack = £2.96; 25 mg, 56-tab pack = £4.65. Label: 2

**Dental prescribing on NHS** May be prescribed as Promethazine Hydrochloride Tablets 10 mg or 25 mg

**Elixir**, golden, promethazine hydrochloride 5 mg/5 mL, net price 100 mL = £2.85. Label: 2

**Excipients** include sulfites

**Electrolytes** Na+ 1.6 mmol/5 mL

**Dental prescribing on NHS** May be prescribed as Promethazine Hydrochloride Oral Solution 5 mg/5 mL

**Injection**, promethazine hydrochloride 25 mg/mL, net price 1-mL amp = 67p

**Excipients** include sulfites

---

**3.4.2 Allergen immunotherapy**

Immunotherapy using allergen vaccines containing house dust mite, animal dander (cat or dog), or extracts of grass and tree pollen can reduce symptoms of asthma and allergic rhinoconjunctivitis. A vaccine containing extracts of wasp and bee venom is used to reduce the risk of severe anaphylaxis and systemic reactions in individuals with hypersensitivity to wasp and bee stings. An oral preparation of grass pollen extract (Grazax®) is also licensed for disease-modifying treatment of grass pollen-induced rhinitis and conjunctivitis. Those requiring immunotherapy must be referred to a hospital specialist for accurate diagnosis, assessment, and treatment.

**Desensitising vaccines**

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:
- seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs;
- hypersensitivity to wasp and bee venoms

Desensitising vaccines should generally be avoided or used with particular care in patients with asthma.

---

1. *Phenergan* restriction does not apply where administration is for saving life in emergency
Desensitising vaccines should be avoided in pregnant women, in children under five years old, and in those taking beta-blockers (adrenaline may be ineffective in case of a hypersensitivity reaction), or ACE inhibitors (risk of severe anaphylactoid reactions).

Hypersensitivity reactions to immunotherapy (especially to wasp and bee venom extracts) can be life-threatening; bronchospasm usually develops within 1 hour and anaphylaxis within 30 minutes of injection. Therefore, cardiopulmonary resuscitation must be immediately available and patients need to be monitored for at least 1 hour after injection. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), even when mild, the patient should be observed until these have resolved completely.

The first dose of oral grass pollen extract (Grazax®) should be taken under medical supervision and the patient should be monitored for 20–30 minutes. For details on the management of anaphylaxis, see section 3.4.3.

Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hyposensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.

### NICE guidance

**Pharmalgen® for bee and wasp venom allergy (February 2012)**

Pharmalgen® is an option for the treatment of IgE-mediated bee and wasp venom allergy in those who have had:

- a severe systemic reaction to bee or wasp venom;
- a moderate systemic reaction to bee or wasp venom and who have a raised baseline serum-tryptase concentration, a high risk of future stings, or anxiety about future stings.

Treatment with Pharmalgen® should be initiated and monitored in a specialist centre experienced in venom immunotherapy.

[www.nice.org.uk/TA246](http://www.nice.org.uk/TA246)

### BEE AND WASP ALLERGEN EXTRACTS

#### Indications

hypersensitivity to wasp or bee venom

(see notes above)

#### Cautions

see notes above and consult product literature

#### Contra-indications

see notes above and consult product literature

#### Pregnancy

avoid

#### Side-effects

consult product literature

#### Dose

- By subcutaneous injection, consult product literature

**Pharmalgen® (ALK-Abello©)**

Bee venom extract (Apis mellifera) or wasp venom extract (Vespula spp.), net price initial treatment set = £65.77 (bee), £80.64 (wasp); maintenance treatment set = £76.51 (bee), £98.44 (wasp)

---

**GRASS AND TREE POLLEN EXTRACTS**

#### Indications

treatment of seasonal allergic hay fever due to grass or tree pollen in patients who have failed to respond to anti-allergy drugs (see notes above)

#### Cautions

see notes above and consult product literature

#### Contra-indications

see notes above and consult product literature

#### Pregnancy

consult product literature

#### Side-effects

see notes above and consult product literature

#### Dose

- See under preparations below

**Pollinex® (Allergy)**

Grasses and rye or tree pollen extract, net price initial treatment set (3 vials) and extension course treatment (1 vial) = £450.00

**Dose**

By subcutaneous injection, consult product literature

**Grass pollen extract**

**Grazax® (ALK-Abello©)**

Oral lyophilisates (= freeze-dried tablets), grass pollen extract 75 000 units, net price 30-tab pack = £80.12. Counselling, administration

**Dose**

- Adult and Child over 5 years, 1 tablet daily; start treatment at least 4 months before start of pollen season and continue for up to 3 years

**Counselling**

Tables should be placed under the tongue and allowed to disperse. Advise patient not to swallow for 1 minute, or eat or drink for 5 minutes after taking the tablet

---

**Omalizumab**

Omalizumab is a monoclonal antibody that binds to immunoglobulin E (IgE). It is used as additional therapy in individuals with proven IgE-mediated sensitivity to inhaled allergens, whose severe persistent allergic asthma cannot be controlled adequately with high-dose inhaled corticosteroid together with a long-acting beta, agonist. Omalizumab should be initiated by physicians in specialist centres experienced in the treatment of severe persistent asthma.

Churg-Strauss syndrome has occurred rarely in patients given omalizumab; the reaction is usually associated with the reduction of oral corticosteroid therapy. Churg-Strauss syndrome can present as eosinophilia, vasculitic rash, cardiac complications, worsening pulmonary symptoms, or peripheral neuropathy. Hypersensitivity reactions can also occur immediately following treatment with omalizumab or sometimes more than 24 hours after the first injection.

For details on the management of anaphylaxis, see section 3.4.3.

The **Scottish Medicines Consortium** p. 4 has advised (May 2011) that omalizumab is accepted for restricted use within NHS Scotland as add-on therapy to improve asthma control in children (6 to 12 years), adolescents, and adults with severe persistent allergic asthma. Omalizumab is restricted to patients who are prescribed chronic systemic corticosteroids and in whom all other treatments have failed. The response should be assessed at 16 weeks and omalizumab treatment discontinued in patients who have not shown a marked improvement in overall asthma control.
3.4.3 Allergic emergencies

Adrenaline (epinephrine) provides physiological reversal of the immediate symptoms associated with hypersensitivity reactions such as anaphylaxis and angioedema.

OMALIZUMAB

Indications prophylaxis of allergic asthma (see notes above)

Cautions autoimmune disease; susceptibility to helminth infection—discontinue if infection does not respond to anthelmintic

Hepatic impairment manufacturer advises caution—no information available

Renal impairment manufacturer advises caution—no information available

Pregnancy manufacturer advises avoid unless essential

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects abdominal pain, headache, pyrexia; less commonly dyspepsia, nausea, diarrhoea, weight gain, postural hypotension, flushing, pharyngitis, bronchospasm, cough, syncope, paraesthesia, dizziness, drowsiness, malaise, influenza-like illness, photosensitivity, urticaria, rash, pruritus; rarely laryngoedema, parasitic infection, antibody formation; also reported arterial thromboembolic events, Churg-Strauss syndrome (see notes above), thrombocytopenia, arthralgia, myalgia, joint swelling, alopecia, serum sickness (including fever and lymphadenopathy)

Dose

- By subcutaneous injection, ADULT and CHILD over 6 years, according to immunoglobulin E concentration and body-weight, consult product literature

Xolair® (Novartis) 

Injection, omalizumab 150 mg/mL, net price 0.5 mL (75-mg) prefilled syringe = £128.07; 1 mL (150-mg) prefilled syringe = £256.15

BNF 68 3.4.3 Allergic emergencies 209

Anaphylaxis

Anaphylaxis is a severe, life-threatening, generalised or systemic hypersensitivity reaction. It is characterised by the rapid onset of respiratory and/or circulatory problems and is usually associated with skin and mucosal changes; prompt treatment is required. Patients with pre-existing asthma, especially poorly controlled asthma, are at particular risk of life-threatening reactions. Insect stings are a recognised risk (in particular wasp and bee stings). Late-induced stings, including eggs, fish, cow’s milk protein, peanuts, sesame, shellfish, soy, and tree nuts may also precipitate anaphylaxis.

Medicinal products particularly associated with anaphylaxis include blood products, vaccines, hypo-osmolarising (allergen) preparations, antibacterials, aspirin and other NSAIDs, and neuromuscular blocking drugs. In the case of drugs, anaphylaxis is more likely after parenteral administration; resuscitation facilities must always be available for injections associated with special risk. Anaphylactic reactions may also be associated with additives and excipients in foods and medicines. Refined arachid (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergens.

First-line treatment of anaphylaxis includes securing the airway, restoration of blood pressure (laying the patient flat and raising the legs, or in the recovery position if unconscious and nauseated and at risk of vomiting) and administration of adrenaline (epinephrine) injection. Adrenaline is given intramuscularly in a dose of 500 micrograms (0.5 mL adrenaline injection 1 in 1000); a dose of 300 micrograms (0.3 mL adrenaline injection 1 in 1000) may be appropriate for immediate self-administration. The dose is repeated if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function (important: possible need for intravenous route using dilute solution, see p. 210).

Patients receiving beta-blockers require special consideration (see under Adrenaline, p. 210). High-flow oxygen administration (section 3.6) and intravenous fluids (section 9.2.2) are also of primary importance. An antihistamine (e.g. chlorphenamine, given by slow intravenous injection or intramuscular injection in a dose of 10 mg, see p. 206) is a useful adjunctive treatment, given after adrenaline. An intravenous corticosteroid e.g. hydrocortisone (preferably as sodium succinate) in a dose of 200 mg (section 6.3.2) is of secondary value in the initial management of anaphylaxis because the onset of action is delayed for several hours, but should be given to prevent further deterioration in severely affected patients.

Continuing respiratory deterioration requires further treatment with bronchodilators including inhaled or intravenous salbutamol (see p. 187), inhaled ipratropium (see p. 190), intravenous aminophylline (see p. 192), or intravenous magnesium sulfate [unlicensed indication] (see Acute Severe Asthma, p. 181); in addition to oxygen, assisted respiration and possibly emergency tracheotomy may be necessary.

When a patient is so ill that there is doubt about the adequacy of the circulation, the initial injection of adrenaline may need to be given as a dilute solution by the intravenous route; for details of cautions, dose, and strength, see under Intravenous Adrenaline (Epinephrine), p. 210.
Cardiopulmonary arrest may follow an anaphylactic reaction; resuscitation should be started immediately (see p. 143).

For advice on the management of medical emergencies in dental practice, see p. 27.

On discharge, patients should be considered for further treatment with an oral antihistamine (section 3.4.1) and an oral corticosteroid (section 6.3.2) for up to 3 days to reduce the risk of further reaction. Patients should be instructed to return to hospital if symptoms recur and to contact their general practitioner for follow-up.

Patients who are suspected of having had an anaphylactic reaction should be referred to a specialist for specific allergy diagnosis. Avoidance of the allergen is the principal treatment; if appropriate, an adrenaline auto-injector should be given or a replacement supplied (see Self-administration of Adrenaline).

**Intramuscular adrenaline (epinephrine)**

The intramuscular route is the first choice route for the administration of adrenaline (epinephrine) in the management of anaphylaxis. Adrenaline is best given as an intramuscular injection into the anterolateral aspect of the middle third of the thigh; it has a rapid onset of action after intramuscular administration and in the shocked patient its absorption from the intramuscular site is faster and more reliable than from the subcutaneous site.

Patients with severe allergy should be instructed in the self-administration of adrenaline by intramuscular injection (for details see under Self-administration of Adrenaline (Epinephrine), below).

**Prompt injection** of adrenaline is of paramount importance. The following adrenaline doses are recommended for the emergency treatment of anaphylaxis by appropriately trained healthcare professionals and are based on the revised recommendations of the Working Group of the Resuscitation Council (UK).

### Dose of intramuscular injection of adrenaline (epinephrine) for the emergency treatment of anaphylaxis by healthcare professionals

<table>
<thead>
<tr>
<th>Age</th>
<th>Dose</th>
<th>Volume of adrenaline 1 in 1000 (1 mg/mL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Child under 6 years</td>
<td>150 micrograms</td>
<td>0.15 mL&lt;sup&gt;1&lt;/sup&gt;</td>
</tr>
<tr>
<td>Child 6–12 years</td>
<td>300 micrograms</td>
<td>0.3 mL</td>
</tr>
<tr>
<td>Adult and child 12–18 years</td>
<td>500 micrograms</td>
<td>0.5 mL&lt;sup&gt;2&lt;/sup&gt;</td>
</tr>
</tbody>
</table>

These doses may be repeated several times if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function.

1. Use suitable syringe for measuring small volume
2. 300 micrograms (0.3 mL) if child is small or prepubertal

**Intravenous adrenaline (epinephrine)**

Intravenous adrenaline should be given only by those experienced in its use, in a setting where patients can be carefully monitored. When the patient is severely ill and there is real doubt about the adequacy of the circulation and absorption after intramuscular injection, adrenaline (epinephrine) can be given by slow intravenous injection in a dose of 50 micrograms (0.5 mL of the dilute 1 in 10,000 adrenaline injection) repeated according to response; if multiple doses are required, adrenaline should be given as a slow intravenous infusion stopping when a response has been obtained; children may respond to as little as 1 microgram/kg (0.01 mL/kg of the dilute 1 in 10,000 adrenaline injection) by slow intravenous injection.

Great vigilance is needed to ensure that the correct strength of adrenaline injection is used; anaphylactic shock kits need to make a very clear distinction between the 1 in 10,000 strength and the 1 in 1000 strength. It is also important that, where intramuscular injection might still succeed, time should not be wasted seeking intravenous access.

For reference to the use of the intravenous route for cardiac resuscitation, see section 2.7.3.

**Self-administration of adrenaline (epinephrine)**

Individuals at considerable risk of anaphylaxis need to carry adrenaline (epinephrine) at all times and need to be instructed in advance when and how to inject it. In addition, the packs need to be clearly labelled with instructions on how to administer adrenaline (intramuscularly, preferably at the midpoint of the outer thigh, through light clothing if necessary) so that in the case of rapid collapse someone else is able to give it. It is important to ensure individuals at risk and carers understand that:

- two injection devices should be carried at all times to treat symptoms until medical assistance is available; if, after the first injection, the individual does not start to feel better, the second injection should be given 5 to 15 minutes after the first,
- an ambulance should be called after every administration, even if symptoms improve,
- the individual should lie down with their legs raised (unless they have breathing difficulties, in which case they should sit up) and, if possible, should not be left alone.

Adrenaline for administration by intramuscular injection is available in ‘auto-injectors’ (e.g. Emerade<sup>®</sup>, EpiPen<sup>®</sup>, and Jext<sup>®</sup>), pre-assembled syringes fitted with a needle suitable for very rapid administration (if necessary by a bystander or a healthcare provider if it is the only preparation available); injection technique is device specific.

For doses of adrenaline for self-administration, see individual preparations under Adrenaline/Epinephrine (Intramuscular Injection for Self-administration, p. 211).

**ADRENALINE/EPIINEPHRINE**

**Indications** emergency treatment of acute anaphylaxis; angioedema; cardiopulmonary resuscitation (section 2.7.3); priapism [unlicensed] (section 7.4.5)

**Cautions** for cautions in non-life-threatening situations, see section 2.7.3

**Interactions** severe anaphylaxis in patients taking beta-blockers may not respond to adrenaline—consider bronchodilator therapy, see intravenous salbutamol (p. 187); adrenaline can cause severe hypertension and bradycardia in those taking non-cardioselective beta-blockers. Other interactions, see Appendix 1 (sympathomimetics).

**Renal impairment** section 2.7.3
**Pharyngitis** section 2.7.3

**Breast-feeding** section 2.7.3

**Side-effects** section 2.7.3

**Dose**

- Acute anaphylaxis, by intramuscular injection (preferably mid-point in anterolateral thigh) of 1 in 1000 (1 mg/mL) solution for administration by healthcare professionals, see notes and table above.
- Acute anaphylaxis, by intramuscular injection for self-administration, see under preparations.
- Acute anaphylaxis when there is doubt as to the adequacy of the circulation, by slow intravenous injection of 1 in 10 000 (100 micrograms/mL) solution (extreme caution—specialist use only), see notes above.

**Important** Intravenous route should be used with extreme care by specialists only, see notes above.

**Intramuscular or subcutaneous**

1. **Adrenaline/Epinephrine 1 in 1000 (Non-proprietary)**

   **Injection** adrenaline (as acid tartrate) 1 mg/mL, net price 0.5-mL amp = £4.72; 1-mL amp = 39p

   **Excipients** may include sulfites

2. **Minijet® Adrenaline 1 in 1000 (UCB Pharma)**

   **Injection** adrenaline (as hydrochloride) 1 in 1000 (1 mg/mL), net price 1 mL (with 25 gauge × 0.25 inch needle for subcutaneous injection) = £13.90, 1 mL (with 21 gauge × 1.5 inch needle for intramuscular injection) = £15.00 (both disposable syringes)

   **Excipients** include sulfites

**Intravenous**

Extreme caution, see notes above.

**Adrenaline/Epinephrine 1 in 10 000, Dilute (Non-proprietary)**

**Injection** adrenaline (as acid tartrate) 100 micrograms/mL, 10-mL amp, 1-mL and 10-mL prefilled syringe

**Excipients** may include sulfites

**Minijet® Adrenaline 1 in 10 000 (UCB Pharma)**

**Injection** adrenaline (as hydrochloride) 1 in 10 000 (100 micrograms/mL), net price 3-mL prefilled syringe = £7.54; 10-mL prefilled syringe = £6.99

**Excipients** include sulfites

**Intramuscular injection for self-administration**

**Note** Injection technique is device specific. To ensure patients receive the auto-injector device that they have been appropriate for some children) repeated after 5–15 minutes as necessary; CHILD body-weight under 15 kg [unlicensed], 150 micrograms repeated after 5–15 minutes as necessary.

**Jext® (ALK-Abelló)**

1. **Jext® 150 micrograms** (delivering a single dose of adrenaline (as tartrate) 150 micrograms), adrenaline 1 mg/mL (1 in 1000), net price 1.4-mL auto-injector device = £22.99

   **Excipients** include sulfites

   **Note** 1.25 mL of the solution remains in the auto-injector device after use.

   **Dose** by intramuscular injection, CHILD body-weight 15–30 kg, 150 micrograms (but on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children) repeated after 5–15 minutes as necessary; CHILD body-weight under 15 kg [unlicensed], 150 micrograms repeated after 5–15 minutes as necessary.

2. **Jext® 300 micrograms** (delivering a single dose of adrenaline (as tartrate) 300 micrograms), adrenaline 1 mg/mL (1 in 1000), net price 1.4-mL auto-injector device = £23.99

   **Excipients** include sulfites

   **Note** 1 mL of the solution remains in the auto-injector device after use.

   **Dose** by intramuscular injection, ADULT and CHILD body-weight over 30 kg, 300 micrograms repeated after 5–15 minutes as necessary.

**Angioedema**

Angioedema is dangerous if laryngeal oedema is present. In this circumstance adrenaline (epinephrine) injection and oxygen should be given as described under.
Anaphylaxis (see p. 209); antihistamines and corticosteroids should also be given. Tracheal intubation may be necessary.

**Hereditary angioedema** The treatment of hereditary angioedema should be under specialist supervision. Unlike allergic angioedema, adrenaline, corticosteroids, and antihistamines should not be used for the treatment of acute attacks, including attacks involving laryngeal oedema, as they are ineffective and may delay appropriate treatment—intubation may be necessary. The administration of C1-esterase inhibitor, an endogenous complement blocker derived from human plasma, (in fresh frozen plasma or in partially purified form) can terminate acute attacks of *hereditary angioedema*; it can also be used for short-term prophylaxis before dental, medical or surgical procedures. Cinryze® and icatibant are licensed for the treatment of acute attacks of hereditary angioedema in adults with C1-esterase inhibitor deficiency.

**Tranexamic acid** (section 2.11) and *danazol* (section 6.7.2) [unlicensed indication] are used for short-term and long-term prophylaxis of hereditary angioedema. Short-term prophylaxis with tranexamic acid or danazol is started several days before planned procedures (e.g. dental work) and continued for 2–5 days afterwards. Danazol should be avoided in children because of its androgenic effects.

### C1-ESTERASE INHIBITOR

C1-esterase inhibitor is prepared from human plasma

**Indications** see under preparations

**Cautions** vaccination against hepatitis A, p. 836 and hepatitis B, p. 836 may be required

**Pregnancy** manufacturer advises avoid unless essential

**Side-effects** thrombosis (with high doses), headache, fever

**Dose**

- **ADULT**
  - See under preparations

- **Berinert®** (CSL Behring) ®
  - Injection, powder for reconstitution, C1-esterase inhibitor, net price 500-unit vial (with solvent) = £467.50
  - **Electrolytes** Na⁺ approx. 2.1 mmol/vial
  - **Dose by slow intravenous injection or intravenous infusion**, acute attacks of hereditary angioedema, **ADULT** and **CHILD** 20 units/kg
  - Short-term prophylaxis of hereditary angioedema before dental, medical or surgical procedures, **ADULT** 1000 units as a single dose less than 6 hours before procedure, **CHILD** 15–30 units/kg (max. 1000 units) as a single dose less than 6 hours before procedure

- **Cinryze®** (ViroPharma) ®
  - Injection, powder for reconstitution, C1-esterase inhibitor, net price 500-unit vial (with solvent) = £668.00
  - **Electrolytes** Na⁺ approx. 0.5 mmol/vial
  - **Dose by slow intravenous injection**, acute attacks of hereditary angioedema, **ADULT** and **CHILD** over 12 years, 1000 units as a single dose; dose may be repeated if necessary
  - Short-term prophylaxis of hereditary angioedema before dental, medical, or surgical procedures, **ADULT** and **CHILD** over 12 years, 1000 units up to 24 hours before procedure
  - **Long-term prophylaxis** of severe, recurrent attacks of hereditary angioedema where acute treatment is inadequate, or when oral prophylaxis is inadequate or not tolerated, **ADULT** and **CHILD** over 12 years, 1000 units every 3–4 days, interval between doses adjusted according to response

### CONESTAT ALFA

**Indications** acute attacks of hereditary angioedema in patients with C1-esterase inhibitor deficiency

**Cautions** ischaemic heart disease, stroke

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—octoxicity in animal studies

**Breast-feeding** manufacturer advises avoid for 12 hours after administration

**Side-effects** nausea, dizziness, headache, pyrexia, injection-site reactions, rash, pruritus, erythema

**Dose**

- **By slow intravenous injection** over 5 minutes, **ADULT** over 18 years, body-weight under 84 kg, 50 units/kg as a single dose; body-weight over 84 kg, 4200 units as a single dose; dose may be repeated if necessary (max. 2 doses in 24 hours)

- **Ruconest®** (Swedish Orphan) ®
  - **Injection**, powder for reconstitution, conestat alfa, net price 2100-unit vial = £750.00

### ICATIBANT

**Indications** acute attacks of hereditary angioedema in patients with C1-esterase inhibitor deficiency

**Cautions** ischaemic heart disease, stroke

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—octoxicity in animal studies

**Breast-feeding** manufacturer advises avoid for 12 hours after administration

**Side-effects** nausea, dizziness, headache, pyrexia, injection-site reactions, rash, pruritus, erythema

**Dose**

- **By subcutaneous injection**, **ADULT** over 18 years, 30 mg as a single dose, repeated after 6 hours if necessary; a third dose may be given after a further 6 hours (max. 3 doses in 24 hours)

- **Firazyr®** (Shire HGT) ®
  - **Injection**, icatibant (as acetate) 10 mg/mL, net price 3-mL prefilled syringe = £1395.00

### 3.5 Respiratory stimulants and pulmonary surfactants

#### 3.5.1 Respiratory stimulants

Respiratory stimulants (analeptic drugs) have a limited place in the treatment of ventilatory failure in patients with chronic obstructive pulmonary disease. They are effective only when given by intravenous injection or infusion and have a short duration of action. Their use has largely been replaced by ventilatory support including nasal intermittent positive pressure ventilation.
However, occasionally when ventilatory support is contra-indicated and in patients with hypercapnic respiratory failure who are becoming drowsy or comatose, respiratory stimulants in the short term may arouse patients sufficiently to co-operate and clear their secretions.

Respiratory stimulants can also be harmful in respiratory failure since they stimulate non-respiratory as well as respiratory muscles. They should only be given under expert supervision in hospital and must be combined with active physiotherapy. There is at present no oral respiratory stimulant available for long-term use in chronic respiratory failure.

Doxapram is given by continuous intravenous infusion. Frequent arterial blood gas and pH measurements are necessary during treatment to ensure correct dosage. For the use of caffeine citrate in the management of neonatal apnoea, see BNF for Children.

**DOXAPRAM HYDROCHLORIDE**

**Indications** see under Dose

**Cautions** give with oxygen in severe irreversible airways obstruction or severely decreased lung compliance (because of increased work load of breathing); give with beta, agonist in bronchoconstriction; hypotension (avoid if severe), impaired cardiac reserve; pheochromocytoma; Interactions: Append 1 (doxapram)

**Contra-indications** severe hypotension; status asthmaticus; coronary artery disease; hyperthyroidism; epilepsy and other convulsive disorders; physical obstruction of respiratory tract; cerebral oedema, cerebrovascular accident

**Hepatic impairment** use with caution

**Pregnancy** no evidence of harm, but manufacturer advises avoid unless benefit outweighs risk

**Side-effects** nausea, vomiting, hypertension, tachycardia, bradycardia, extrastoles, arrhythmias, chest pain, flushing; dyspnoea, cough, bronchospasm, laryngospasm; pyrexia, headache, dizziness, hyperactivity, confusion, hallucination, convulsions; urinary retention, incontinence, perineal warmth; muscle spasms

**Dose**

- Postoperative respiratory depression, by intravenous injection over at least 30 seconds, 1–1.5 mg/kg repeated if necessary after intervals of 1 hour or alternatively by intravenous infusion, 2–3 mg/minute adjusted according to response; CHILD not recommended
- Acute respiratory failure, by intravenous infusion, 1.5–4 mg/minute adjusted according to response (given concurrently with oxygen and whenever possible monitor with frequent measurement of blood gas tensions); CHILD not recommended
- Doxapram Hydrochloride (Non-proprietary) Fam Injection, doxapram hydrochloride 20 mg/mL, net price 5-mL amp = £6.00

**3.5.2 Pulmonary surfactants**

Pulmonary surfactants are used in the management of respiratory distress syndrome (hyaline membrane disease) in neonates and preterm neonates. They may also be given prophylactically to preterm neonates at risk of developing the syndrome.

**Side-effects** Pulmonary surfactants have been associated with intracranial haemorrhage. Bradycardia, pulmonary haemorrhage, and decreased oxygen saturation have been reported rarely; hypoxia and obstruction of the endotracheal tube by mucous secretions have also been reported.

**BERACTANT**

**Indications** (specialist use only); treatment of respiratory distress syndrome in preterm neonates over 700 g; prophylaxis of respiratory distress syndrome in preterm neonates less than 32 weeks corrected gestational age

**Cautions** consult product literature

**Side-effects** see notes above

**Dose**

- Treatment of respiratory distress syndrome, by endotracheal tube, phospholipid 100 mg/kg equivalent to a volume of 4 mL/kg, preferably within 8 hours of birth; dose may be repeated within 48 hours at intervals of at least 6 hours for up to 4 doses
- Prophylaxis of respiratory distress syndrome, by endotracheal tube, phospholipid 100 mg/kg equivalent to a volume of 4 mL/kg soon after birth, preferably within 15 minutes; dose may be repeated within 48 hours at intervals of at least 6 hours for up to 4 doses

**Surveda** (AbbVie) Fam Suspension, beractant (bovine lung extract) providing phospholipid 25 mg/mL, with lipids and proteins, net price 8-mL vial = £306.43

**PORACTANT ALFA**

**Indications** (specialist use only); treatment of respiratory distress syndrome in neonates over 700 g; prophylaxis of respiratory distress syndrome in preterm neonates 24–31 weeks corrected gestational age

**Cautions** consult product literature

**Side-effects** see notes above; also rarely hypotension

**Dose**

- Treatment of respiratory distress syndrome, by endotracheal tube, 100–200 mg/kg, further doses of 100 mg/kg may be repeated at intervals of 12 hours; max. total dose 300–400 mg/kg
- Prophylaxis of respiratory distress syndrome, by endotracheal tube, 100–200 mg/kg soon after birth, preferably within 15 minutes; further doses of 100 mg/kg may be repeated 6–12 hours later and after a further 12 hours if still intubated; max. total dose 300–400 mg/kg

**Curosurf®** (Chiesi) Fam Suspension, poractant alfa (porcine lung phospholipid fraction) 80 mg/mL, net price 1.5-mL vial = £281.64, 5-mL vial = £547.40

**3.6 Oxygen**

Oxygen should be regarded as a drug. It is prescribed for hypoxaemic patients to increase alveolar oxygen tension and decrease the work of breathing. The concentration of oxygen required depends on the condition being treated; the administration of an inappropriate
concentration of oxygen can have serious or even fatal consequences.

Oxygen is probably the most common drug used in medical emergencies. It should be prescribed initially to achieve a normal or near-normal oxygen saturation; in most acutely ill patients with a normal or low arterial carbon dioxide ($P_{\text{a}CO_2}$), oxygen saturation should be 94–98% oxygen saturation. However, in some clinical situations such as cardiac arrest and carbon monoxide poisoning (see also Emergency Treatment of Poisoning, p. 42) it is more appropriate to aim for the highest possible oxygen saturation until the patient is stable. A lower target of 88–92% oxygen saturation is indicated for patients at risk of hypercapnic respiratory failure, see below.

**High concentration oxygen therapy** is safe in uncomplicated cases of conditions such as pneumonia, pulmonary thromboembolism, pulmonary fibrosis, shock, severe trauma, sepsis, or anaphylaxis. In such conditions low arterial oxygen ($P_{\text{a}O_2}$) is usually associated with low or normal arterial carbon dioxide ($P_{\text{a}CO_2}$), and therefore there is little risk of hypoventilation and carbon dioxide retention.

In acute severe asthma, the arterial carbon dioxide ($P_{\text{a}CO_2}$) is usually subnormal but as asthma deteriorates it may rise steeply (particularly in children). These patients usually require high concentrations of oxygen and if the arterial carbon dioxide ($P_{\text{a}CO_2}$) remains high despite other treatment, intermittent positive-pressure ventilation needs to be considered urgently.

**Low concentration oxygen therapy** (controlled oxygen therapy) is reserved for patients at risk of hypercapnic respiratory failure, which is more likely in those with:

- chronic obstructive pulmonary disease;
- advanced cystic fibrosis;
- severe non-cystic fibrosis bronchiectasis;
- severe kyphoscoliosis or severe ankylosing spondylitis;
- severe lung scarring caused by tuberculosis;
- musculoskeletal disorders with respiratory weakness, especially if on home ventilation;
- an overdose of opioids, benzodiazepines, or other drugs causing respiratory depression.

Until blood gases can be measured, initial oxygen should be given using a controlled concentration of 28% or less, titrated towards a target oxygen saturation of 88–92%. The aim is to provide the patient with enough oxygen to achieve an acceptable arterial oxygen tension without worsening carbon dioxide retention and respiratory acidosis. Patients may carry an oxygen alert card, see section 3.1.

**Domiciliary oxygen** Oxygen should only be prescribed for use in the home after careful evaluation in hospital by respiratory experts.

Patients should be advised of the risks of continuing to smoke when receiving oxygen therapy, including the risk of fire. Smoking cessation therapy (section 4.10.2) should be recommended before home oxygen prescription.

**Air travel** Some patients with arterial hypoxaemia require supplementary oxygen for air travel. The patient’s requirement should be discussed with the airline before travel.

**Long-term oxygen therapy**

Long-term administration of oxygen (usually at least 15 hours daily) prolongs survival in some patients with chronic obstructive pulmonary disease. Assessment for long-term oxygen therapy requires measurement of arterial blood gas tensions. Measurements should be taken on 2 occasions at least 3 weeks apart to demonstrate clinical stability, and not sooner than 4 weeks after an acute exacerbation of the disease. Long-term oxygen therapy should be considered for patients with:

- chronic obstructive pulmonary disease with $P_{\text{a}O_2} < 7.3$ kPa when breathing air during a period of clinical stability;
- chronic obstructive pulmonary disease with $P_{\text{a}O_2}$ 7.3–8 kPa in the presence of secondary polycythemia, nocturnal hypoxaemia, peripheral oedema, or evidence of pulmonary hypertension;
- severe chronic asthma with $P_{\text{a}O_2} < 7.3$ kPa or persistent disabling breathlessness;
- interstitial lung disease with $P_{\text{a}O_2} < 8$ kPa and in patients with $P_{\text{a}O_2} > 8$ kPa with disabling dyspnoea;
- cystic fibrosis when $P_{\text{a}O_2} < 7.3$ kPa or if $P_{\text{a}O_2}$ 7.3–8 kPa in the presence of secondary polycythemia, nocturnal hypoxaemia, pulmonary hypertension, or peripheral oedema;
- pulmonary hypertension, without parenchymal lung involvement when $P_{\text{a}O_2} < 8$ kPa;
- neuromuscular or skeletal disorders, after specialist assessment;
- obstructive sleep apnoea despite continuous positive airways pressure therapy, after specialist assessment;
- pulmonary malignancy or other terminal disease with disabling dyspnoea;
- heart failure with daytime $P_{\text{a}O_2} < 7.3$ kPa when breathing air or with nocturnal hypoxaemia;
- paediatric respiratory disease, after specialist assessment.

Increased respiratory depression is seldom a problem in patients with stable respiratory failure treated with low concentrations of oxygen although it may occur during exacerbations; patients and relatives should be warned to call for medical help if drowsiness or confusion occur.

**Short-burst oxygen therapy**

Oxygen is occasionally prescribed for short-burst (intermittent) use for episodes of breathlessness not relieved by other treatment in patients with severe chronic obstructive pulmonary disease, interstitial lung disease, heart failure, and in palliative care. It is important, however, that the patient does not rely on oxygen instead of obtaining medical help or taking more specific treatment. Short-burst oxygen therapy can be used to improve exercise capacity and recovery; it should only be continued if there is proven improvement in breathlessness or exercise tolerance.

**Ambulatory oxygen therapy**

Ambulatory oxygen is prescribed for patients on long-term oxygen therapy who need to be away from home on a regular basis. Patients who are not on long-term
Oxygen therapy can be considered for ambulatory oxygen therapy if there is evidence of exercise-induced oxygen desaturation and of improvement in blood oxygen saturation and exercise capacity with oxygen. Ambulatory oxygen therapy is not recommended for patients with heart failure or those who smoke.

Oxygen therapy equipment

Under the NHS oxygen may be supplied as oxygen cylinders. Oxygen flow can be adjusted as the cylinders are equipped with an oxygen flow meter with 'medium' (2 litres/minute) and 'high' (4 litres/minute) settings.

Oxygen concentrators are more economical for patients who require oxygen for long periods, and in England and Wales can be ordered on the NHS on a regional tendering basis (see below). A concentrator is recommended for a patient who requires oxygen for more than 8 hours a day (or 21 cylinders per month). Exceptionally, if a higher concentration of oxygen is required the output of 2 oxygen concentrators can be combined using a 'Y' connection.

A nasal cannula is usually preferred for long-term oxygen therapy from an oxygen concentrator. It can, however, produce dermatitis and mucosal drying in sensitive individuals.

Giving oxygen by nasal cannula allows the patient to talk, eat, and drink, but the concentration of oxygen is not controlled; this may not be appropriate for acute respiratory failure. When oxygen is given through a nasal cannula at a rate of 1–2 litres/minute the inspiratory oxygen concentration is usually low, but it varies with ventilation and can be high if the patient is under-ventilating.

Arrangements for supplying oxygen

The following oxygen services may be ordered in England and Wales:

- emergency oxygen;
- short-burst (intermittent) oxygen therapy;
- long-term oxygen therapy;
- ambulatory oxygen.

The type of oxygen service (or combination of services) should be ordered on a Home Oxygen Order Form (HOOF); the amount of oxygen required (hours per day) and flow rate should be specified. The clinician will determine the appropriate equipment to be provided. Special needs or preferences should be specified on the HOOF.

The clinician should obtain the patient’s consent to pass on the patient’s details to the supplier, the fire brigade, and other relevant organisations. The supplier will contact the patient to make arrangements for delivery, installation, and maintenance of the equipment. The supplier will also train the patient to use the equipment.

The clinician should send the HOOF to the supplier who will continue to provide the service until a revised HOOF is received, or until notified that the patient no longer requires the home oxygen service.

In Scotland refer the patient for assessment by a respiratory consultant. If the need for a concentrator is confirmed the consultant will arrange for the provision of a concentrator through the Common Services Agency. In Northern Ireland oxygen concentrators and cylinders should be prescribed on form HS21; oxygen concentrators are supplied by a local contractor. In Scotland and Northern Ireland prescriptions for oxygen cylinders and accessories can be dispensed by pharmacists contracted to provide domiciliary oxygen services.
**Respiratory system**

- **Carbocisteine** (Non-proprietary) [98]
  - **Capsules**, carbocisteine 375 mg, net price 120-cap pack = £16.64
  - **Brands include** Mucodyne®
  - **Oral liquid**, carbocisteine 125 mg/5 mL, net price 300 mL = £5.98; 250 mg/5 mL, 300 mL = £6.99
  - **Brands include** Mucodyne® Paediatric 125 mg/5 mL (cherry- and raspberry-flavoured) and Mucodyne® 250 mg/5 mL (cinnamon- and rum-flavoured)

**ERDOSTEINE**

- **Indications** symptomatic treatment of acute exacerbations of chronic bronchitis
- **Cautions** see notes above
- **Hepatic impairment** manufacturer advises max. 300 mg daily in mild to moderate impairment; avoid in severe impairment
- **Renal impairment** avoid if eGFR less than 25 mL/minute/1.73 m²—no information available
- **Pregnancy** manufacturer advises avoid—no information available
- **Breast-feeding** manufacturer advises avoid—no information available
- **Side-effects** very rarely nausea, vomiting, diarrhoea, abdominal pain, taste disturbance, headache, rash, and urticaria
- **Dose**
  - **ADULT** over 18 years, 300 mg twice daily for up to 10 days

**Dornase alfa**

Dornase alfa is a genetically engineered version of a naturally occurring human enzyme which cleaves extra-cellular deoxyribonucleic acid (DNA). It is used in cystic fibrosis and is administered by inhalation using a jet nebuliser (section 3.1.5).

**DORNASE ALFA**

- **Phosphorylated glycosylated recombinant human deoxyribonuclease 1 (rhDNase)**
- **Indications** management of cystic fibrosis patients with a forced vital capacity (FVC) of greater than 40% of predicted to improve pulmonary function
- **Pregnancy** no evidence of teratogenicity; manufacturer advises use only if potential benefit outweighs risk
- **Breast-feeding** amount probably too small to be harmful—manufacturer advises caution
- **Side-effects** rarely dyspepsia, chest pain, dysphonia, dyspnoea, pharyngitis, laryngitis, pyrexia, conjunctivitis, rhinitis, rash, urticaria
- **Dose**
  - **ADULT** and **CHILD** over 5 years, by inhalation of nebulised solution (by jet nebuliser), 2500 units (2.5 mg) once daily (patients over 21 years may benefit from twice daily dosage)

**Pulmozyme®** (Roche) [87]

- **Nebuliser solution**, dornase alfa 1000 units (1 mg)/mL. Net price 2.5-mL (2500 units) vial = £16.55
  - **Note** For use undiluted with jet nebulisers only; ultrasonic nebulisers are unsuitable

**Hypertonic sodium chloride**

Nebulised hypertonic sodium chloride solution (3–7%) is used to mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis). Nebulised hypertonic sodium chloride solution (3%) is used for mild to moderate acute viral bronchiolitis in infants. Temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment with hypertonic sodium chloride to reduce the risk of these adverse effects.

**MucoClear® 3%** (Pari)

- **Nebuliser solution**, sodium chloride 3%, net price 20 x 4 mL = £12.98; 60 x 4 mL = £27.00
  - **Dose** by inhalation of nebulised solution, 4 mL 2–4 times daily

**MucoClear® 6%** (Pari)

- **Nebuliser solution**, sodium chloride 6%, net price 20 x 4 mL = £12.98; 60 x 4 mL = £27.00
  - **Dose** by inhalation of nebulised solution, 4 mL twice daily

**Nebusal® 7%** (Forest)

- **Nebuliser solution**, sodium chloride 7%, net price 60 x 4 mL = £27.00
  - **Dose** by inhalation of nebulised solution, 4 mL up to twice daily

**Ivacafort**

Ivacafort is licensed for the treatment of cystic fibrosis in patients who have a G551D mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene; it should be prescribed by a physician experienced in the treatment of cystic fibrosis. If the patient’s genotype is unknown, a validated genotyping method should be performed to confirm the presence of the G551D mutation in at least one allele of the CFTR gene before starting treatment.

**IVACAFTOR**

- **Indications** treatment of cystic fibrosis in patients who have a G551D mutation in the CFTR gene
- **Cautions** test liver function before treatment, every 3 months during the first year of treatment, then annually thereafter; **interactions**: Appendix 1 (ivacafort)
- **Contra-indications** organ transplantation (no information available); avoid grapefruit and Seville oranges
- **Hepatic impairment** max. 150 mg once daily in moderate impairment; in severe impairment, manufacturer recommends use only if potential benefit outweighs risk—starting dose 150 mg on alternate days; dosing interval adjusted according to clinical response and tolerability
- **Renal impairment** caution in severe impairment
- **Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available
- **Breast-feeding** manufacturer advises use only if potential benefit outweighs risk—no information available
**Side-effects**  abdominal pain, diarrhoea, oropharyngeal pain, pharyngeal oedema, headache, dizziness, upper respiratory-tract infection, rhinitis, nasopharyngitis, nasal congestion, ear discomfort, tinnitus, rash; less commonly vestibular disorder, gynaecomastia.

**Dose**
- **ADULT** and **CHILD** over 6 years, 150 mg every 12 hours.

**Note**  Reduce dose to 150 mg twice a week with concomitant use of iraconazole, posaconazole, voriconazole, telithromycin, and clarithromycin; reduce dose to 150 mg once daily with concomitant use of fluconazole and erythromycin.

**Kalydeco** (Vertex) Tablets, 1/c, ivacaftor 150 mg, net price 56-tab pack = £4000.00. Label: 25, counselling, administration.

**Counselling**  Tablets should be taken with fat-containing food.

**Mannitol**
Mannitol, administered by inhalation, improves mucus clearance and is licensed for the treatment of cystic fibrosis as an add-on therapy to standard care. Patients must be assessed for bronchial hyperresponsiveness to inhaled mannitol before starting the therapeutic dose regimen; an initiation dose assessment must be carried out under medical supervision—for details of the initiation dose regimen, consult product literature.

The **Scottish Medicines Consortium**, p. 4 has advised (November 2013) that mannitol (Bronchitol®) is accepted for restricted use within NHS Scotland for the treatment of cystic fibrosis in adults aged 18 years and over as an add-on therapy to best standard of care. Mannitol is restricted to patients who are not currently using dornase alfa due to lack of response, intolerance, or ineligibility and have rapidly declining lung function and in whom other osmotic agents are considered unsuitable.

**NICE guidance**
Mannitol dry powder for inhalation for treating cystic fibrosis (November 2012)
Mannitol dry powder for inhalation is recommended as an option for treating cystic fibrosis in adults:
- who cannot use dornase alfa (rhDNase) because of ineligibility, intolerance or inadequate response to dornase alfa (rhDNase), and
- whose lung function is rapidly declining (forced expiratory volume in 1 second decline greater than 2% annually), and
- for whom other osmotic agents are not considered appropriate.

www.nice.org.uk/TA266

---

**3.8 Aromatic inhalations**

**MANNITOL**

**Indications**  see notes above.

**Cautions**  see notes above; also asthma, haemoptysis.

**Contra-indications**  bronchial hyperresponsiveness to inhaled mannitol, non-CF bronchiectasis, impaired lung function (forced expiratory volume in 1 second < 30% of predicted).

**Pregnancy**  manufacturer advises avoid.

**Breast-feeding**  manufacturer advises avoid.

**Side-effects**  vomiting, cough, wheezing, haemoptysis, throat irritation, pharyngolaryngeal pain, headache; less commonly nausea, eructation, flatulence, gastro-oesophageal reflux disease, glossodynia, stomatitis, bronchospasm, dysphonia, dysphagia, hyperventilation, pharyngitis, transient insomnia, dizziness, malaise, pyrexia, influenza-like illness, arthralgia, oral candidiasis, ear pain, rhinorrhoea, acne, pruritus, rash.

**Dose**
- By inhalation of powder, ADULT over 18 years, initiation dose (see notes above), then 400 mg twice daily.

**Counselling**  The dose should be administered 5–15 minutes after a bronchodilator and before physiotherapy; the second daily dose should be taken 2–3 hours before bedtime.

**Bronchitol** (Pharmaxis) Inhalation powder, hard capsule (for use with disposable inhaler device), mannitol 40 mg, net price 280-cap pack with 2 disposable inhaler devices = £231.66; initiation dose pack, 10-cap pack with disposable inhaler device = £8.27. Counselling, administration.

**BNF 68**

**3.9 Cough preparations**

**3.9.1 Cough suppressants**

Cough may be a symptom of an underlying disorder, such as asthma (section 3.1.1), gastro-oesophageal reflux disease (section 1.1), or rhinitis (section 12.2.1),...
which should be addressed before prescribing cough suppressants. Cough may be a side-effect of another drug, such as an ACE inhibitor (section 2.5.5.1), or it can be associated with smoking or environmental pollutants. Cough can also have a significant habit component. When there is no identifiable cause, cough suppressants may be useful, for example if sleep is disturbed. They may cause sputum retention and this may be harmful in patients with chronic bronchitis and bronchiectasis.

**Coughing** may be effective but it is constipating and can cause dependence; *dextromethorphan* and *pholcodine* have fewer side-effects.

**Sedating antihistamines** are used as the cough suppressant component of many compound cough preparations on sale to the public; all tend to cause drowsiness which may reflect their main mode of action.

**Children**

The use of over-the-counter cough suppressants containing codeine should be avoided in children under 18 years. Cough suppressants containing similar opioid analgesics such as dextromethorphan and pholcodine are not generally recommended in children and should be avoided in children under 6 years.

**MHRA/CHM advice (March 2008 and February 2009) Over-the-counter cough and cold medicines for children**

Children under 6 years should not be given over-the-counter cough and cold medicines containing the following ingredients:

- brompheniramine, chlorpheniramine, diphenhydramine, doxylamine, promethazine, or triprolidine (antihistamines);
- dextromethorphan or pholcodine (cough suppressants);
- guaifenesin or ipacacuinha (expectorants);
- phenylephrine, pseudoephedrine, ephedrine, oxymetazoline, or xylometazoline (decongestants).

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to 5 days or less. Children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

**MHRA/CHM advice (October 2010) Over-the-counter codeine-containing liquid medicines for children**

Children under 18 years should not use codeine-containing over-the-counter liquid medicines for cough suppression.

**CODINE PHOSPHATE**

**Indications** dry or painful cough; diarrhoea (section 1.4.2); pain (section 4.7.2)

**Cautions** see notes above and section 4.7.2

**Contra-indications** section 4.7.2

**Hepatic impairment** section 4.7.2

**Renal impairment** section 4.7.2

**Pregnancy** section 4.7.2

**Breast-feeding** section 4.7.2

**Side-effects** section 4.7.2

**Dose**

- See under preparations below

**Codeine Linctus, BP**

**Linctus** (= oral solution), codeine phosphate 15 mg/5 mL, net price 100 mL = 78p (diabetic, 78p)

**Brands Include** Galcodine®

**Dose**

- **ADULT** over 18 years 5–10 mL 3–4 times daily

**Note** BP directs that when Diabetic Codeine Linctus is prescribed, Codeine Linctus formulated with a vehicle appropriate for administration to diabetics, whether or not labelled ‘Diabetic Codeine Linctus’, shall be dispensed or supplied

**Other preparations**

Tablets, syrup, and injection section 4.7.2

**PHOLCODINE**

**Indications** dry cough

**Cautions** asthma; chronic, persistent, or productive cough, interactions: Appendix 1 (pholcodine)

**Contra-indications** chronic bronchitis, chronic obstructive pulmonary disease, bronchiectasis, patients at risk of respiratory failure

**Hepatic impairment** avoid

**Renal impairment** use with caution; avoid in severe impairment

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Side-effects** nausea, vomiting, constipation, sputum retention, drowsiness, dizziness, excitation, confusion, rash

**Dose**

- See under preparations below

**Pholcodine Linctus, BP**

**Linctus** (= oral solution), pholcodine 5 mg/5 mL in a suitable flavoured vehicle, containing citric acid monohydrate 1%. Net price 100 mL = 52p

**Brands Include** Flavoxol® (sugar-free), Galenphol® (sugar-free)

**Dose** 5–10 mL 3–4 times daily; **CHILD** (but not generally recommended, see notes above) 6–12 years 2.5–5 mL

**Pholcodine Linctus, Strong, BP**

**Linctus** (= oral solution), pholcodine 10 mg/5 mL in a suitable flavoured vehicle, containing citric acid monohydrate 2%. Net price 100 mL = 44p

**Brands Include** Galenphol®

**Dose**

- **ADULT** and **CHILD** over 12 years, 5 mL 3–4 times daily

**Galenphol®** (Thornton & Ross)

**Paediatric linctus** (= oral solution), orange, sugar-free, pholcodine 2 mg/5 mL. Net price 100 mL = £0.19

**Dose**

- **CHILD** (but not generally recommended, see notes above) 6–12 years 10 mL 3 times daily

**Palliative care**

Diamorphine and methadone have been used to control distressing cough in terminal lung cancer although morphine is now preferred (see Prescribing in Palliative Care p. 22). In other circumstances they are contra-indicated because they induce sputum retention and ventilatory failure as well as causing opioid dependence. Methadone linctus should be avoided because it has a long duration of action and tends to accumulate.
METHADONE HYDROCHLORIDE

Indications  cough in terminal disease
Cautions  section 4.7.2
Contra-indications  section 4.7.2
Hepatic impairment  section 4.7.2
Renal impairment  section 4.7.2
Pregnancy  section 4.7.2
Breast-feeding  section 4.7.2
Side-effects  section 4.7.2; longer-acting than morphine therefore effects may be cumulative

Dose  
- See below

Methadone Linctus  (BP)  
Linctus (= oral solution), methadone hydrochloride 2 mg/5 mL in a suitable vehicle with a tolu flavour.
Label: 2
Dose  2.5–5 mL every 4–6 hours, reduced to twice daily on prolonged use

MORPHINE HYDROCHLORIDE

Indications  cough in terminal disease (see also Prescribing in Palliative Care p. 22)
Cautions  section 4.7.2
Contra-indications  section 4.7.2
Hepatic impairment  section 4.7.2
Renal impairment  section 4.7.2
Pregnancy  section 4.7.2
Breast-feeding  section 4.7.2
Side-effects  section 4.7.2

3.9.2 Demulcent and expectorant cough preparations

Demulcent cough preparations contain soothing substances such as syrup or glycerol and some patients believe that such preparations relieve a dry irritating cough. Preparations such as simple linctus have the advantage of being harmless and inexpensive; paediatric simple linctus is particularly useful in children.

Expectorants are claimed to promote expulsion of bronchial secretions, but there is no evidence that any drug can specifically facilitate expectoration.

Compound preparations are on sale to the public for the treatment of cough and colds but should not be used in children under 6 years; the rationale for some is dubious. Care should be taken to give the correct dose and to not use more than one preparation at a time, see MHRA/CHM advice, p. 218.

Simple Linctus, Paediatric, BP  
Linctus (= oral solution), citric acid monohydrate 0.625% in a suitable vehicle with an anise flavour, net price 200 mL = 96p
Dose  Child 1 month–12 years 5–10 mL 3–4 times daily
A sugar-free version is also available

3.10 Systemic nasal decongestants

Nasal decongestants for administration by mouth may not be as effective as preparations for local application (section 12.2.2) but they do not give rise to rebound nasal congestion on withdrawal. Pseudoephedrine is available over the counter; it has few sympathomimetic effects.

Systemic decongestants should be used with caution in diabetes, hypertension, hyperthyroidism, susceptibility to angle-closure glaucoma, prostatic hypertrophy, ischaemic heart disease, and should be avoided in patients taking monoamine oxidase inhibitors; interactions: Appendix 1 (sympathomimetics).

PSEUDOEPHEDRINE HYDROCHLORIDE

Indications  see notes above
Cautions  see notes above
Hepatic impairment  manufacturer advises use with caution in severe impairment
Renal impairment  use with caution in mild to moderate impairment; manufacturer advises avoid in severe impairment
Pregnancy  defective closure of the abdominal wall (gastroschisis) reported very rarely in newborns after first trimester exposure
Breast-feeding  may suppress lactation; avoid if lactation not well established or if milk production insufficient

Side-effects  nausea, vomiting, hypertension, tachycardia, headache, anxiety, restlessness, insomnia; rarely hallucinations, rash; very rarely angle-closure glaucoma; urinary retention also reported

Dose  
- Initially 5 mg every 4 hours

Preparations  
Section 4.7.2

Simple Lincuts, Paediatric, BP

3.9.2 Demulcent and expectorant cough preparations

Simple Linctus, Paediatric, BP  
Linctus (= oral solution), citric acid monohydrate 2.5% in a suitable vehicle with an anise flavour, net price 200 mL = 96p
Dose  Adult and Child over 12 years 5 mL 3–4 times daily
A sugar-free version is also available

3.10 Systemic nasal decongestants

Nasal decongestants for administration by mouth may not be as effective as preparations for local application (section 12.2.2) but they do not give rise to rebound nasal congestion on withdrawal. Pseudoephedrine is available over the counter; it has few sympathomimetic effects.

Systemic decongestants should be used with caution in diabetes, hypertension, hyperthyroidism, susceptibility to angle-closure glaucoma, prostatic hypertrophy, ischaemic heart disease, and should be avoided in patients taking monoamine oxidase inhibitors; interactions: Appendix 1 (sympathomimetics).

PSEUDOEPHEDRINE HYDROCHLORIDE

Indications  see notes above
Cautions  see notes above

Dose  
- Initially 5 mg every 4 hours

Preparations  
Section 4.7.2

Simple Linctus, Paediatric, BP

Linctus (= oral solution), citric acid monohydrate 2.5% in a suitable vehicle with an anise flavour, net price 200 mL = 96p
Dose  Child 1 month–12 years 5–10 mL 3–4 times daily
A sugar-free version is also available

3.10 Systemic nasal decongestants

Nasal decongestants for administration by mouth may not be as effective as preparations for local application (section 12.2.2) but they do not give rise to rebound nasal congestion on withdrawal. Pseudoephedrine is available over the counter; it has few sympathomimetic effects.

Systemic decongestants should be used with caution in diabetes, hypertension, hyperthyroidism, susceptibility to angle-closure glaucoma, prostatic hypertrophy, ischaemic heart disease, and should be avoided in patients taking monoamine oxidase inhibitors; interactions: Appendix 1 (sympathomimetics).
3.11 Antifibrotics

Pirfenidone is licensed for the treatment of mild to moderate idiopathic pulmonary fibrosis; treatment should be initiated and supervised by an appropriate specialist. The exact mechanism of action of pirfenidone is not yet understood, but it is believed to slow down the progression of idiopathic pulmonary fibrosis by exerting both antifibrotic and anti-inflammatory properties.

The Scottish Medicines Consortium, p. 4 has advised (August 2013) that pirfenidone is accepted for restricted use within NHS Scotland for the treatment of mild to moderate idiopathic pulmonary fibrosis. Pirfenidone is restricted for use in patients with a predicted forced vital capacity less than or equal to 80%, and only whilst pirfenidone is available at the price agreed in the patient access scheme.

NICE guidance

Pirfenidone for treating idiopathic pulmonary fibrosis (April 2013)

Pirfenidone is recommended as an option for treating idiopathic pulmonary fibrosis only if:

- the patient has a forced vital capacity (FVC) between 50% and 80% predicted, and
- the manufacturer provides pirfenidone with the discount agreed in the patient access scheme.

Treatment should be discontinued if there is evidence of disease progression, defined as a decline in predicted FVC of 10% or more within any 12 month period.

Patients currently receiving pirfenidone that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA282

PIRFENIDONE

Indications  see notes above

Cautions  test liver function before treatment, then at monthly intervals for the next 6 months, and then every 3 months thereafter; review if abnormal liver function tests—dose reduction, treatment interruption or discontinuation may be required (consult product literature); avoid exposure to direct sunlight and concomitant use of drugs known to cause photosensitivity—if photosensitivity reaction or rash occurs, dose adjustment or treatment interruption may be required (consult product literature); concomitant use with ciprofloxacin—reduce dose of pirfenidone to 2 capsules three times daily with high-dose ciprofloxacin (750 mg twice daily); monitor for weight loss; treatment interruption—see note below; interactions: Appendix 1 (pirfenidone)

Driving  Dizziness or malaise may affect performance of skilled tasks (e.g. driving)

Contra-indications  cigarette smoking

Hepatic impairment  caution in mild to moderate impairment, particularly if concomitant use of CYP1A2 inhibitors; avoid in severe impairment

Renal impairment  avoid if eGFR less than 30 mL/minute/1.73m²

Pregnancy  manufacturer advises avoid—no information available

Breast-feeding  manufacturer advises avoid—no information available

Side-effects  dyspepsia, nausea, diarrhea, gastrointestinal reflux disease, vomiting, abdominal discomfort, gastritis, constipation, flatulence, gastrointestinal side-effects may require dose reduction or treatment interruption—consult product literature, raised hepatic enzymes, anorexia, weight loss, non-cardiac chest pain, hot flush, insomnia, dizziness, headache, somnolence, malaise, dysgeusia, upper respiratory tract infection, urinary tract infection, myalgia, arthralgia, photosensitivity reaction, rash, pruritus, erythema, dry skin; rarely raised bilirubin in combination with raised hepatic transaminases

Dose

- ADULT over 18 years, initially 1 capsule three times daily for 7 days, then 2 capsules three times daily for 7 days, then 3 capsules three times daily (see also Cautions, above)

Note  If treatment is interrupted for 14 consecutive days or more, the initial 2 week titration regimen should be repeated; if treatment is interrupted for less than 14 consecutive days, the dose can be resumed at the previous daily dose without titration

Esbriet® (InterMune)  

Capsule, blue/gold, pirfenidone 267 mg, net price 63-cap pack = £501.92, 252-cap pack = £2007.70, 270-cap pack = £2151.10. Label: 21, 25, Counseling, driving, see above

4.11.2 Antimuscarinic drugs used in parkinsonism

4.11.3 Drugs used in essential tremor, chorea, tics, and related disorders

4.11.4 Drugs used in substance dependence

4.11.5 Alcohol dependence

4.11.6 Nicotine dependence

4.11.7 Opioid dependence

4.11.8 Drugs for dementia

Most anxiolytics (‘sedatives’) will induce sleep when given at night and most hypnotics will sedate when given during the day. Prescribing of these drugs is widespread but dependence (both physical and psychological) and tolerance occur. This may lead to difficulty in withdrawing the drug after the patient has been taking it regularly for more than a few weeks (see Dependence and Withdrawal, below). Hypnotics and anxiolytics should therefore be reserved for short courses to alleviate acute conditions after causal factors have been established.

Benzodiazepines are the most commonly used anxiolytics and hypnotics; they act at benzodiazepine receptors which are associated with gamma-aminobutyric acid (GABA) receptors. Older drugs such as meprobamate and barbiturates are not recommended—they have more side-effects and interactions than benzodiazepines and are much more dangerous in overdosage.

Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects. Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

Driving Hypnotics and anxiolytics may impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day. See also Drugs and Driving under General Guidance, p. 3.
Dependence and withdrawal

Withdrawal of a benzodiazepine should be gradual because abrupt withdrawal may produce confusion, toxic psychosis, convulsions, or a condition resembling delirium tremens. Abrupt withdrawal of a barbiturate is even more likely to have serious effects.

The benzodiazepine withdrawal syndrome may develop at any time up to 3 weeks after stopping a long-acting benzodiazepine, but may occur within a day in the case of a short-acting one. It is characterised by insomnia, anxiety, loss of appetite and of body-weight, tremor, perspiration, tinnitus, and perceptual disturbances. Some symptoms may be similar to the original complaint and encourage further prescribing; some symptoms may continue for weeks or months after stopping benzodiazepines.

Benzodiazepine withdrawal should be flexible and carried out at a reduction rate that is tolerable for the patient. The rate should depend on the initial dose of benzodiazepine, duration of use, and the patient’s clinical response. Short-term users of benzodiazepines (2–4 weeks only) can usually taper off within 2–4 weeks. However, long-term users should be withdrawn over a much longer period of several months or more.

A suggested protocol for withdrawal for prescribed long-term benzodiazepine patients is as follows:

1. Transfer patient stepwise, one dose at a time over about a week, to an equivalent daily dose of diazepam1 preferably taken at night
2. Reduce diazepam dose, usually by 1–2 mg every 2–4 weeks (in patients taking high doses of benzodiazepines, initially it may be appropriate to reduce the dose by up to one-tenth every 1–2 weeks). If uncomfortable withdrawal symptoms occur, maintain this dose until symptoms lessen
3. Reduce diazepam dose further, if necessary in smaller steps; steps of 500 micrograms may be appropriate towards the end of withdrawal. Then stop completely.
4. For long-term patients, the period needed for complete withdrawal may vary from several months to a year or more.

Withdrawal symptoms for long-term users usually resolve within 6–18 months of the last dose. Some patients will recover more quickly, others may take much longer. The addition of beta-blockers, antidepressants and antipsychotics should be avoided where possible. Counselling can be of considerable help both during and after the taper.

Important: benzodiazepine indications

1. Benzodiazepines are indicated for the short-term relief (two to four weeks only) of anxiety that is severe, disabling, or causing the patient unacceptable distress, occurring alone or in association with insomnia or short-term psychosomatic, organic, or psychotic illness.
2. The use of benzodiazepines to treat short-term ’mild’ anxiety is inappropriate.
3. Benzodiazepines should be used to treat insomnia only when it is severe, disabling, or causing the patient extreme distress.

Before a hypnotic is prescribed the cause of the insomnia should be established and, where possible, underlying factors should be treated. However, it should be noted that some patients have unrealistic sleep expectations, and others understate their alcohol consumption which is often the cause of the insomnia. Short-acting hypnotics are preferable in patients with sleep onset insomnia, when sedation the following day is undesirable, or when prescribing for elderly patients (but see below). Long-acting hypnotics are indicated in patients with poor sleep maintenance (e.g. early morning waking) that causes daytime effects, when an anxiety effect is needed during the day, or when sedation the following day is acceptable; see also Important: Benzodiazepine Indications, above.

Transient insomnia may occur in those who normally sleep well and may be due to extraneous factors such as noise, shift work, and jet lag. If a hypnotic is indicated one that is rapidly eliminated should be chosen, and only one or two doses should be given.

Short-term insomnia is usually related to an emotional problem or serious medical illness. It may last for a few weeks and may recur; a hypnotic can be useful but should not be given for more than three weeks (preferably only one week). Intermittent use is desirable with omission of some doses. A short-acting drug is usually appropriate.

Chronic insomnia is rarely benefited by hypnotics and is sometimes due to mild dependence caused by injudicious prescribing of hypnotics. Psychiatric disorders such as anxiety, depression, and abuse of drugs and alcohol are common causes. Sleep disturbance is very common in depressive illness and early wakening is often a useful pointer. The underlying psychiatric complaint should be treated, adapting the drug regimen to alleviate insomnia. For example, clomipramine or mirtazapine prescribed for depression will also help to promote sleep if taken at night. Other causes of insomnia include daytime cat-napping and physical causes such as pain, pruritus, and dyspnoea.

Hypnotics should not be prescribed indiscriminately and routine prescribing is undesirable. They should be reserved for short courses in the acutely distressed. Tolerance to their effects develops within 3 to 14 days of continuous use and long-term efficacy cannot be assured. A major drawback of long-term use is that withdrawal can cause rebound insomnia and a withdrawal syndrome (section 4.1).

Where prolonged administration is unavoidable hypnotics should be discontinued as soon as feasible and the

1. Approximate equivalent doses, diazepam 5 mg = alprazolam 250 micrograms = chlorazepate 10 mg = clonazepam 250 micrograms = flurazepam 7.5–15 mg = lorazepam 0.5–1 mg = lorazepam 500 micrograms = temazepam 0.5–1 mg = nitrazepam 5 mg = oxazepam 10 mg = temazepam 10 mg
BNF 68

4.1.1 Hypnotics 223

patient warned that sleep may be disturbed for a few days before normal rhythm is re-established; broken sleep with vivid dreams may persist for several weeks.

**Children** The prescribing of hypnotics to children, except for occasional use such as for night terrors and somnambulism (sleep-walking), is not justified.

**Elderly** Benzodiazepines and the Z–drugs should be avoided in the elderly, because the elderly are at greater risk of becoming ataxic and confused, leading to falls and injury.

**Dental procedures** Some anxious patients may benefit from the use of hypnotics such as temazepam or diazepam. Temazepam is preferred when it is important to minimise any residual effect the following day.

---

**Benzodiazepines**

Benzodiazepines used as hypnotics include nitrazepam and flurazepam which have a prolonged action and may give rise to residual effects on the following day; repeated doses tend to be cumulative.

Loprazolam, lormetazepam, and temazepam act for a shorter time and they have little or no hangover effect. Withdrawal phenomena are more common with the short-acting benzodiazepines.

If insomnia is associated with daytime anxiety then the use of a long-acting benzodiazepine anxiolytic such as diazepam given as a single dose at night may effectively treat both symptoms.

For general guidelines on benzodiazepine prescribing see section 4.1.2 and for benzodiazepine withdrawal see section 4.1.

**Hepatic impairment** Benzodiazepines can precipitate coma if used in hepatic impairment. If treatment is necessary, benzodiazepines with shorter half lives are safer, such as temazepam or oxazepam. Start with smaller initial doses or reduce dose; avoid in severe impairment.

**Renal impairment** Patients with renal impairment have increased cerebral sensitivity to benzodiazepines; start with small doses in severe impairment.

**Pregnancy** There is a risk of neonatal withdrawal symptoms when benzodiazepines are used during pregnancy. Avoid regular use and use only if there is a clear indication such as seizure control. High doses administered during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.

**Breast-feeding** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

---

**Nitrazepam**

**Indications** Insomnia (short-term use; see p. 222)

**Cautions** Respiratory disease; muscle weakness and myasthenia gravis; history of drug or alcohol abuse; hypoalbuminaemia; marked personality disorder; reduce dose in elderly and debilitated; avoid prolonged use (and abrupt withdrawal thereafter); acute porphyria (section 9.8.2); interactions: Appendix 1 (anxiolytics and hypnotics)

Driving Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Contra-indications** Respiratory depression; marked neuromuscular respiratory weakness including unstable myasthenia gravis; acute pulmonary insufficiency; sleep apnoea syndrome; not for use alone to treat depression (or anxiety associated with depression) or chronic psychosis

**Hepatic impairment** See notes above

**Renal impairment** See notes above

**Pregnancy** See notes above

**Breast-feeding** See notes above

**Side-effects** Drowsiness and lightheadedness the next day; confusion and ataxia (especially in the elderly); amnesia may occur; dependence; see also under Diazepam (section 4.1.2); **overdosage:** See Emergency Treatment of Poisoning, p. 39

**Dose**

- 5–10 mg at bedtime; **Elderly** (or debilitated) 2.5–5 mg

**Nitrazepam (Non-proprietary)**

**Tablets,** nitrazepam 5 mg, net price 28 = £1.83.

Label: 19

**Brands include** Mogadon®

**Oral suspension,** nitrazepam 2.5 mg/5 mL. Net price 150 mL = £10.60. Label: 19

---

**Flurazepam**

**Indications** Insomnia (short-term use; see p. 222)

**Cautions** See under Nitrazepam

**Contra-indications** See under Nitrazepam

**Hepatic impairment** See notes above

**Renal impairment** See notes above

**Pregnancy** See notes above

**Breast-feeding** See notes above

**Side-effects** See under Nitrazepam

**Dose**

- 15–30 mg at bedtime; **Elderly** (or debilitated) 15 mg; **Child** not recommended

**Dalmane® (Meda)**

**Capsules,** flurazepam (as hydrochloride), 15 mg (grey/yellow), net price 30-cap pack = £6.73; 30 mg (black/grey), 30-cap pack = £8.63. Label: 19

---

**Loprazolam**

**Indications** Insomnia (short-term use; see p. 222)

**Cautions** See under Nitrazepam

**Contra-indications** See under Nitrazepam

**Hepatic impairment** See notes above

**Renal impairment** See notes above

**Pregnancy** See notes above

**Breast-feeding** See notes above

**Side-effects** See under Nitrazepam

**Dose**

- 1 mg at bedtime; **Elderly** (or debilitated) 0.5 or 1 mg; **Child** not recommended

**Loprazolam (Non-proprietary)**

**Tablets,** loprazolam 1 mg (as mesilate). Net price 28-tab pack = £18.00. Label: 19

---

**Lormetazepam**

**Indications** Insomnia (short-term use; see p. 222)

**Cautions** See under Nitrazepam

**Contra-indications** See under Nitrazepam
4.1.1 Hypnotics

Hepatic impairment see notes above
Renal impairment see notes above
Pregnancy see notes above
Breast-feeding see notes above
Side-effects see under Nitrazepam; shorter acting

Dose
- 0.5–1.5 mg at bedtime; **ELDERLY** (or debilitated) 500 micrograms; CHILD not recommended

Lormetazepam (Non-proprietary) [2] Tablets, lormetazepam 500 micrograms, net price 30-tab pack = £36.63; 1 mg, 30-tab pack = £30.60. Label: 19

**TEMAZEPAM**

Indications insomnia (short-term use; see p. 222); see also section 15.1.4.1 for peri-operative use
Cautions see under Nitrazepam
Contra-indications see under Nitrazepam
Hepatic impairment see notes above
Renal impairment see notes above
Breast-feeding see notes above
Side-effects see under Nitrazepam; shorter acting

Dose
- 10–20 mg at bedtime, exceptional circumstances 30–40 mg; **ELDERLY** (or debilitated) 10 mg at bedtime, exceptional circumstances 20 mg; **CHILD** not recommended

Temazepam (Non-proprietary) [3] Tablets, temazepam 10 mg, net price 28-tab pack = £20.55; 20 mg, 28-tab pack = £19.64. Label: 19
Dental prescribing on NHS Temazepam Tablets may be prescribed
Oral solution, temazepam 10 mg/5 mL, net price 300 mL = £55.93. Label: 19
Note Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription
Dental prescribing on NHS Temazepam Oral Solution may be prescribed

**ZALEPLAN**

Indications insomnia (short-term use—up to 4 weeks)
Cautions depression, muscle weakness and myasthenia gravis, history of drug or alcohol abuse; elderly; avoid prolonged use (and abrupt withdrawal thereafter); interactions: Appendix 1 (anxiolytics and hypnotics)

Contra-indications obstructive sleep apnoea, acute or severe respiratory depression, marked neuromuscular respiratory weakness including unstable myasthenia gravis, psychotic illness

Hepatic impairment can precipitate coma; reduce dose to 5 mg (avoid if severe impairment)

Renal impairment use with caution

Pregnancy avoid regular use (risk of neonatal withdrawal symptoms); high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression

Breast-feeding small amounts present in milk—avoid

Side-effects diarrhoea, nausea, vomiting, dizziness, headache, drowsiness, hallucination, agitation, asthenia, amnesia; dependence, memory disturbances, nightmares, depression, confusion, perceptual disturbances or diplopia, tremor, ataxia, falls, skin reactions, changes in libido; paradoxical effects (see p. 221); muscular weakness, and sleep-walking also reported

Dose
- **ADULT** over 18 years, 10 mg at bedtime or after going to bed if difficulty falling asleep; **ELDERLY** 5 mg
Note Patients should be advised not to take a second dose during a single night

**ZOLPIDEM TARTRATE**

Indications insomnia (short-term use—to up to 4 weeks)
Cautions depression, muscle weakness and myasthenia gravis, history of drug or alcohol abuse; elderly; avoid prolonged use (and abrupt withdrawal thereafter); interactions: Appendix 1 (anxiolytics and hypnotics)

Contra-indications obstructive sleep apnoea, acute or severe respiratory depression, marked neuromuscular respiratory weakness including unstable myasthenia gravis, psychotic illness

Hepatic impairment can precipitate coma; reduce dose to 5 mg (avoid if severe impairment)

Renal impairment use with caution

Pregnancy avoid regular use (risk of neonatal withdrawal symptoms); high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression

Breast-feeding small amounts present in milk—avoid

Side-effects diarrhoea, nausea, vomiting, dizziness, headache, drowsiness, hallucination, agitation, asthenia, amnesia; dependence, memory disturbances, nightmares, depression, confusion, perceptual disturbances or diplopia, tremor, ataxia, falls, skin reactions, changes in libido; paradoxical effects (see p. 221); muscular weakness, and sleep-walking also reported

Dose
- **ADULT** over 18 years, 10 mg at bedtime; **ELDERLY** (or debilitated) 5 mg at bedtime

Zolpidem (Non-proprietary) [2] Tablets, zolpidem tartrate 5 mg, net price 28-tab pack = £1.58; 10 mg, 28-tab pack = £1.45. Label: 19

Zaleplon, zolpidem, and zopiclone

Zaleplon, zolpidem, and zopiclone are non-benzodiazepine hypnotics (sometimes referred to as Z-drugs), but they act at the benzodiazepine receptor. They are very short acting. Zaleplon, zolpidem have a short duration of action; zaleplon is reported in a small number of patients. Zolpidem and zopiclone are non-benzodiazepine hypnotics (sometimes referred to as Z-drugs), but they act at the benzodiazepine receptor. They are very short acting.

Zaleplon, zolpidem, and zopiclone are recommended for the short-term management of severe insomnia that interferes with normal daily life, and should be prescribed for short periods of time only.

www.nice.org.uk/TA77

**ZALEPLAN**

Indications insomnia (short-term use—to up to 2 weeks)
Cautions respiratory insufficiency (avoid if severe); muscle weakness and myasthenia gravis, history of drug or alcohol abuse; depression (risk of suicidal ideation); avoid prolonged use (risk of tolerance and withdrawal symptoms); interactions: Appendix 1 (anxiolytics and hypnotics)

Contra-indications sleep apnoea syndrome, marked neuromuscular respiratory weakness including unstable myasthenia gravis

Hepatic impairment can precipitate coma; reduce dose to 5 mg (avoid if severe impairment)

Renal impairment avoid in severe impairment

Pregnancy use only if necessary and restrict to occasional short-term use; risk of withdrawal symptoms in neonate if used in late pregnancy

Breast-feeding present in milk but amount probably too small to be harmful

Side-effects amnesia, paraesthesia, drowsiness; less commonly nausea, anorexia, asthenia, incoordination, confusion, impaired concentration, depression, depersonalisation, dizziness, hallucinations, disturbances of smell, hearing, speech, and vision; photosensitivity; paradoxical effects (see p. 221) and sleep-walking also reported

Dose
- **ADULT** over 18 years, 10 mg at bedtime or after going to bed if difficulty falling asleep; **ELDERLY** 5 mg
Note Patients should be advised not to take a second dose during a single night

**ZOLPIDEM TARTRATE**

Indications insomnia (short-term use—to up to 4 weeks)
Cautions depression, muscle weakness and myasthenia gravis, history of drug or alcohol abuse; elderly; avoid prolonged use (and abrupt withdrawal thereafter); interactions: Appendix 1 (anxiolytics and hypnotics)

Contra-indications obstructive sleep apnoea, acute or severe respiratory depression, marked neuromuscular respiratory weakness including unstable myasthenia gravis, psychotic illness

Hepatic impairment can precipitate coma; reduce dose to 5 mg (avoid if severe impairment)

Renal impairment use with caution

Pregnancy avoid regular use (risk of neonatal withdrawal symptoms); high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression

Breast-feeding small amounts present in milk—avoid

Side-effects diarrhoea, nausea, vomiting, dizziness, headache, drowsiness, hallucination, agitation, asthenia, amnesia; dependence, memory disturbances, nightmares, depression, confusion, perceptual disturbances or diplopia, tremor, ataxia, falls, skin reactions, changes in libido; paradoxical effects (see p. 221); muscular weakness, and sleep-walking also reported

Dose
- **ADULT** over 18 years, 10 mg at bedtime; **ELDERLY** (or debilitated) 5 mg at bedtime

Zolpidem (Non-proprietary) [2] Tablets, zolpidem tartrate 5 mg, net price 28-tab pack = £1.58; 10 mg, 28-tab pack = £1.45. Label: 19
Zopiclone® (Sanofi-Aventis) (9.1)

**Indications**  insomnia (short-term use—up to 4 weeks)

**Cautions**  elderly; muscle weakness and myasthenia gravis, history of drug abuse, psychiatric illness; avoid prolonged use (risk of tolerance and withdrawal symptoms); **interactions**: Appendix 1 (anxiolytics and hypnotics)

**Driving**  Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Contra-indications**  marked neuromuscular respiratory weakness including unstable myasthenia gravis, respiratory failure, severe sleep apnoea syndrome

**Hepatic impairment**  can precipitate coma; reduce dose (avoid if severe impairment)

**Renal impairment**  start with small doses in severe impairment; increased cerebral sensitivity

**Pregnancy**  avoid regular use (risk of tolerance and withdrawal symptoms); high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression

**Breast-feeding**  present in milk—avoid

**Side-effects**  taste disturbance; less common nausea, vomiting; dizziness, drowsiness, dry mouth, headache; rarely amnesia, confusion, depression, hallucinations, nightmares; very rarely light headedness, incoordination; paradoxical effects (see p. 221) and sleep-walking also reported

**Dose**

- **ADULT** over 18 years, 7.5 mg at bedtime; **ELDERLY** initially 3.75 mg at bedtime increased if necessary

**Zopiclone (Non-proprietary)**

| Tablets | zopiclone 3.75 mg, net price 28-tab pack = £1.20; 7.5 mg, 28-tab pack = £1.19. Label: 19 |

**Zimovane® (Sanofi-Aventis)**

| Tablets | f/c, zopiclone 3.75 mg (Zimovane® LS), net price 28-tab pack = £2.24; 7.5 mg (scored), 28-tab pack = £3.26. Label: 19 |

Chloral and derivatives

Chloral hydrate and derivatives were formerly popular hypnotics for children (but the use of hypnotics in children is not usually justified). There is no convincing evidence that they are particularly useful in the elderly and their role as hypnotics is now very limited.

### CHLORAL HYDRATE

**Indications**  insomnia (short-term use)

**Cautions**  reduce dose in elderly and debilitated; avoid prolonged use (and abrupt withdrawal thereafter); avoid contact with skin and mucous membranes; **interactions**: Appendix 1 (anxiolytics and hypnotics)

**Driving**  Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Contra-indications**  severe cardiac disease; gastritis; acute porphyria (section 9.8.2)

**Hepatic impairment**  can precipitate coma; reduce dose in mild to moderate impairment; avoid in severe impairment

**Renal impairment**  avoid in severe impairment

**Pregnancy**  avoid

**Breast-feeding**  risk of sedation in infant—avoid

**Side-effects**  gastric irritation (nausea and vomiting reported), abdominal distention, flatulence, headache, tolerance, dependence, excitement, delirium (especially on abrupt withdrawal), ketonuria, and rash

**Dose**  see under preparations below

**Chloral Mixture, BP 2000**

- **(Chloral Oral Solution)**
  - **Mixture**: chloral hydrate 500 mg/5 mL in a suitable vehicle. Label: 19, 27
  - **Dose** 5–20 mL; **CHILD** 1–12 years 30–50 mg/kg (max. 1 g), taken well diluted with water at bedtime
  - Available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104

**Chloral Elixir, Paediatric, BP 2000**

- **(Chloral Oral Solution, Paediatric)**
  - **Elixir**: chloral hydrate 200 mg/5 mL (4%) in a suitable vehicle with a blackcurrant flavour. Label: 1, 27
  - **Dose**  CHILD 1–2 years 30–50 mg/kg, taken well diluted with water at bedtime
  - Available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104

**Cloral betaine Welldorm® (Marlborough)**

- **Tablets**: blue-purple, f/c, cloral betaine 707 mg (equiv. chloral hydrate 414 mg), net price 30-tab pack = £12.10. Label: 19, 27
- **Dose**  ADULT and CHILD over 12 years, 1–2 tablets with water or milk at bedtime, max. 5 tablets (chloral hydrate 2 g) daily
- **Elixir**: red, chloral hydrate 143.3 mg/5 mL, net price 150-mL pack = £8.70. Label: 19, 27
- **Dose**  CHILD 1–45 mL (chloral hydrate 0.4–1.3 g) with water or milk, at bedtime, max. 70 mL (chloral hydrate 2 g) daily;
- **CHILD** 2–12 years, 1–1.75 mL/kg (chloral hydrate 30–50 mg/kg), max. 35 mL (chloral hydrate 1 g) daily

Clomethiazole

Clomethiazole may be a useful hypnotic for elderly patients because of its freedom from hangover but, as with all hypnotics, routine administration is undesirable and dependence occurs. It is also licensed for use in acute alcohol withdrawal, but see section 4.10.1.
**Renal impairment** start with small doses in severe impairment; increased cerebral sensitivity

**Pregnancy** avoid if possible—especially during first and third trimesters

**Breast-feeding** use only if benefit outweighs risk—present in breast milk but effects unknown

**Side-effects** nasal congestion and irritation (increased nasopharyngeal and bronchial secretions), conjunctival irritation, headache; rarely gastro-intestinal disturbances, paradoxical excitement, confusion, dependence, rash, urticaria, bullous eruption, anaphylaxis, alterations in liver enzymes

**Dose**
- See preparations below

**Clomethiazole** (Non-proprietary)  
**Capsules**, clomethiazole base 192 mg in an oily basis, net price 60-cap pack = £15.00. Label: 19
**Dose** Severe insomnia in the elderly (short-term use), 1–2 capsules at bedtime

Restlessness and agitation in the elderly, 1 capsule 3 times daily

Alcohol withdrawal (but see section 4.10.1), initially 2–4 capsules, if necessary repeated after some hours; day 1 (first 24 hours), 9–12 capsules in 3–4 divided doses; day 2, 6–8 capsules in 3–4 divided doses; day 3, 4–6 capsules in 3–4 divided doses; then gradually reduced over days 4–6; total treatment for not more than 9 days; **CHILD** not recommended

**Oral solution**, clomethiazole (as edisilate) 157.5 mg/5 mL, net price 300-mL = £22.00. Label: 19
**Excipients** include alcohol 0.13%

**Dose** Severe insomnia in the elderly (short-term use), 5–10 mL at bedtime

Restlessness and agitation in the elderly, 5 mL 3 times daily

Alcohol withdrawal (but see section 4.10.1), initially 10–20 mL, if necessary repeated after some hours; day 1 (first 24 hours), 45–60 mL in 3–4 divided doses; day 2, 30–40 mL in 3–4 divided doses; day 3, 20–30 mL in 3–4 divided doses; then gradually reduced over days 4–6; total treatment for not more than 9 days; **CHILD** not recommended

**Antihistamines**

Some antihistamines (section 3.4.1) such as promethazine are on sale for the public to occasional insomnia; their prolonged duration of action can often cause drowsiness the following day. The sedative effect of antihistamines may diminish after a few days of continued treatment; antihistamines are associated with headache, psychomotor impairment and antimuscarinic effects.

Promethazine is also popular for use in children, but the use of hypnotics in children is not usually justified.

**PROMETHAZINE HYDROCHLORIDE**

**Indications** sedation (short-term use); allergy and urticaria (section 3.4.1); nausea and vomiting (section 4.6)

**Cautions** see Promethazine Hydrochloride, section 3.4.1

**Contra-indications** see notes in section 3.4.1

**Hepatic impairment** see notes in section 3.4.1

**Renal impairment** see Promethazine Hydrochloride, section 3.4.1

**Pregnancy** see notes in section 3.4.1

**Breast-feeding** see notes in section 3.4.1

**Side-effects** see Promethazine Hydrochloride, section 3.4.1

**Dose**
- **By mouth**, 25–50 mg; **CHILD** 2–5 years 15–20 mg, 5–10 years 20–25 mg
- **By deep intramuscular injection**, 25–50 mg; **CHILD** 5–10 years 6.25–12.5 mg

**Preparations**
- **Section 3.4.1**

**Alcohol**

Alcohol is a poor hypnotic because the diuretic action interferes with sleep during the latter part of the night. Alcohol also disturbs sleep patterns, and so can worsen sleep disorders; **interactions**: Appendix 1 (alcohol).

**Sodium oxybate**

Sodium oxybate is a central nervous system depressant that is licensed for the treatment of narcolepsy with cataplexy.

**SODIUM OXYBATE**

**Indications** narcolepsy with cataplexy (under specialist supervision)

**Cautions** history of drug abuse or depression; epilepsy; body mass index of 40 kg/m² or greater (higher risk of sleep apnoea); elderly; respiratory disorders; heart failure and hypertension (high sodium content); risk of discontinuation effects including rebound cataplexy and withdrawal symptoms; **interactions**: Appendix 1 (sodium oxybate)

**Hepatic impairment** halve initial dose

**Renal impairment** caution—contains 3.96 mmol Na+ /mL

**Pregnancy** avoid

**Breast-feeding** no information available

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain, taste disturbance, anorexia; hypertension, palpitation, peripheral oedema; dyspnoea; sleep disorders, confusion, disinorientation, paraesthesia, hypoesthesia, impaired attention, depression, drowsiness, anxiety, dizziness, headache, tremor, asthenia, fatigue; urinary incontinence, nocturnal enuresis; arthralgia, back pain, muscle cramps; blurred vision; nasal congestion, vertigo; sweating, rash; *less commonly* faecal incontinence, myoclonus, psychosis, paranoia, hallucination, agitation, and amnesia; respiratory depression, dependence, seizures, suicidal ideation, sleep apnoea, and urticaria also reported

**Dose**
- **ADULT** over 18 years, initially 2.25 g on retiring and repeated 2.5–4 hours later, increased according to response in steps of 1.5 g daily in 2 divided doses at intervals of 1–2 weeks; max. 9 g daily in two divided doses

**Note** Dose titration should be repeated if restarting after interval of more than 14 days

**Counselling** Dilute each dose with 60 mL water; prepare both doses before retiring. Observe the same time interval (2–3 hours) each night between the last meal and the first dose

**Xyrem®** (UCB Pharma)  
**Oral solution**, sugar-free, sodium oxybate 500 mg/mL, net price 180 mL (with graduated syringe) = £360.00. Label: 13, 19, counselling, administration

**Electrolytes** Na⁺ 3.96 mmol/mL
Melatonin
Melatonin is a pineal hormone; it is licensed for the short-term treatment of insomnia in adults over 55 years. For information on the use of melatonin in children and adolescents see BNF for Children.

**Indications** insomina (short-term use)

**Cautions** autoimmune disease (manufacturer advises avoid—no information available); Interactions: Appendix 1 (melatonin)

**Hepatic impairment** clearance reduced—avoid

**Renal impairment** no information available—use with caution

**Pregnancy** no information available—avoid

**Breast-feeding** present in milk—avoid

**Side-effects** less commonly abdominal pain, dyspepsia, dry mouth, mouth ulceration, nausea, weight gain, hypertension, chest pain, malaise, dizziness, restlessness, nervousness, irritability, anxiety, headache, abnormal dreams, proteinuria, glycosuria, pruritus, rash, dry skin; rarely thirst, flatulence, halitosis, salivation, vomiting, gastritis, hypertriglyceridaemia, angina, palpitation, syncope, hot flushes, aggression, impaired memory, restless legs syndrome, paraesthesia, mood changes, priapism, increased libido, prostatitis, polycystic ovary disease, haematuria, leucopenia, thrombocytopenia, electrolyte disturbances, muscle spasm, arthritis, lacrimation, visual disturbances, nail disorder; also reported galactorrhoea, mouth and tongue oedema

**Dose**
- ADULT over 55 years, 2 mg once daily 1–2 hours before bedtime for up to 13 weeks; CHILD 1 month–18 years see BNF for Children

**Circadin** Tablets, m/r, melatonin 2 mg, net price 30-tab pack = £15.39. Label: 2, 21, 25

### 4.1.2 Anxiolytics

Benzodiazepine anxiolytics can be effective in alleviating anxiety states. Although these drugs are sometimes prescribed for stress-related symptoms, unhappiness, or minor physical disease, their use in such conditions is inappropriate. Benzodiazepine anxiolytics should not be used as sole treatment for chronic anxiety, and they are not appropriate for treating depression or chronic psychosis. In bereavement, psychological adjustment may be inhibited by benzodiazepines. In children, anxiolytic treatment should be used only to relieve acute anxiety (and related insomnia) caused by fear (e.g. before surgery).

Anxiolytic benzodiazepine treatment should be limited to the lowest possible dose for the shortest possible time (see p. 222). Dependence is particularly likely in patients with a history of alcohol or drug abuse and in patients with marked personality disorders.

Some antidepressants (section 4.3) are licensed for use in anxiety and related disorders; see section 4.3 for a comment on their role in chronic anxiety. Some antipsychotics, in low doses, are also sometimes used in severe anxiety for their sedative action, but long-term use should be avoided because of the risk of adverse effects (section 4.2.1). The use of antihistamines (e.g. hydroxyzine) for their sedative effect in anxiety is not appropriate.

**Beta-blockers** (section 2.4) do not affect psychological symptoms of anxiety, such as worry, tension, and fear, but they do reduce autonomic symptoms, such as palpitation and tremor; they do not reduce non-autonomic symptoms, such as muscle tension. Beta-blockers are therefore indicated for patients with predominantly somatic symptoms; this, in turn, may prevent the onset of worry and fear.

**Benzodiazepines**

Benzodiazepines are indicated for the short-term relief of severe anxiety; long-term use should be avoided (see p. 222). Diazepam, alprazolam, chlordiazepoxide, and clobazam have a sustained action. Shorter-acting compounds such as lorazepam and oxazepam may be preferred in patients with hepatic impairment but they carry a greater risk of withdrawal symptoms. In panic disorders (with or without agoraphobia) resistant to antidepressant therapy (section 4.3), a benzodiazepine (lorazepam 3–5 mg daily or clonazepam 1–2 mg daily (section 4.8.1) [both unlicensed]) may be used, alternatively, a benzodiazepine may be used as short-term adjunctive therapy at the start of antidepressant treatment to prevent the initial worsening of symptoms. Diazepam or lorazepam are very occasionally administered intravenously for the control of panic attacks. This route is the most rapid but the procedure is not without risk (section 4.8.2) and should be used only when alternative measures have failed. The intramuscular route has no advantage over the oral route.

For guidelines on benzodiazepine withdrawal, see p. 222.

**Hepatic impairment** Benzodiazepines can precipitate coma if used in hepatic impairment. If treatment is necessary, benzodiazepines with shorter half lives are safer, such as temazepam or oxazepam. Start with smaller initial doses or reduce dose; avoid in severe impairment.

**Renal impairment** Patients with renal impairment have increased cerebral sensitivity to benzodiazepines; start with small doses in severe impairment.

**Pregnancy** There is a risk of neonatal withdrawal symptoms when benzodiazepines are used during pregnancy. Avoid regular use and use only if there is a clear indication such as seizure control. High doses administered during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.

**Breast-feeding** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

### DIAZEPAM

**Indications** short-term use in anxiety or insomnia (see p. 222); life-threatening acute drug-induced dystonic reactions (see also section 4.9.2); adjunct in acute alcohol withdrawal; status epilepticus (section 4.8.2); febrile convulsions (section 4.8.3); muscle spasm (section 10.2.2); peri-operative use (section 15.1.4.1)

**Cautions** respiratory disease; muscle weakness and myasthenia gravis; organic brain changes; history of
Central nervous system

Drug or alcohol dependence; personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence; reduce dose in elderly and debilitated; avoid prolonged use (and abrupt withdrawal thereafter); special precautions for intravenous injection (section 4.8.2); when given parenterally, close observation required until full recovery from sedation. Interactions: Appendix 1 (anxiolytics and hypnotics)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications Respiratory depression; marked neuromuscular respiratory weakness including unstable myasthenia gravis; acute pulmonary insufficiency; sleep apnoea syndrome; not for chronic psychosis; phobic or obsession states; hyperkinesis; should not be used alone in depression or in anxiety with depression; avoid injections containing benzyl alcohol in neonates (see under preparations below)

Hepatic impairment see notes above Renal impairment see notes above Pregnancy see notes above Breast-feeding see notes above Side-effects Drowsiness and lightheadedness the next day; confusion and ataxia (especially in the elderly); amnesia; dependence; paradoxical increase in aggression (see also section 4.1); muscle weakness; occasionally: headache, vertigo, dizziness, slurred speech, hypotension, salivation changes, gastrointestinal disturbances, visual disturbances, dysarthria, tremor, changes in libido, gynaecomastia, incontinence, urinary retention; rarely: apnoea, respiratory depression, blood disorders, jaundice, skin reactions; on intravenous injection, pain, thrombophlebitis; overdose: see Emergency Treatment of Poisoning, p. 39

Dose

By mouth, anxiety, 2 mg 3 times daily increased if necessary to 15–30 mg daily in divided doses; elderly (or debilitated) half adult dose

Insomnia associated with anxiety, 5–15 mg at bedtime

By intramuscular injection or slow intravenous injection (into a large vein, at a rate of not more than 5 mg/minute), for severe acute anxiety, control of acute panic attacks, and acute alcohol withdrawal, 10 mg, repeated if necessary after not less than 4 hours

Note: Only use intramuscular route when oral and intravenous routes not possible

By slow intravenous injection (into a large vein, at a rate of not more than 5 mg/minute), for acute drug-induced dystonic reactions, 5–10 mg repeated as necessary after at least 10 minutes; child 1 month–12 years, 100 micrograms/kg repeated as necessary after at least 10 minutes

By rectum as rectal solution, acute anxiety and agitation, 500 micrograms/kg repeated after 12 hours as required; elderly 250 micrograms/kg; child not recommended

Note: Emulsion formulation preferred for intravenous injection; special precautions for intravenous injection, see section 4.8.2

Diazepam (Non-proprietary) [D4.1]

Tablets, diazepam 2 mg, net price 28-tab pack = 80p; 5 mg, 28-tab pack = 83p; 10 mg, 28-tab pack = 82p. Label: 2 or 19

Brands include Bintumap®, Tensium®,

Dental prescribing on NHS Diazepam Tablets may be prescribed

Oral solution, diazepam 2 mg/5 mL, net price 100-mL pack = £19.09. Label: 2 or 19

Brands include Dialpar®

Dental prescribing on NHS Diazepam Oral Solution 2 mg/5 mL may be prescribed

Note: Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription

Strong oral solution, diazepam 5 mg/5 mL, net price 100-mL pack = £55.00. Label: 2 or 19

Brands include Dialpar®

Injection (solution), diazepam 5 mg/mL, net price 2-mL amp = 45p

Excipients may include benzyl alcohol (avoid in neonates, see Excipients. p. 2), ethanol, propylene glycol

Note: Do not dilute (except for intravenous infusion, see Appendix 4)

Injection (emulsion), diazepam 5 mg/mL, net price 2-mL amp = 91p

Brands include Diazemuls®

Note: For intravenous injection or infusion, see Appendix 4

Rectal tubes (= rectal solution), diazepam 2 mg/mL, net price 1.25-mL (2.5-mg) tube = £1.13, 2.5-mL (5-mg) tube = £1.09, 4-mg/mL, 2.5-mL (10-mg) tube = £1.37. Label: 2 or 19

Brands include Diazepam Desitin®, Diazepam Rectubes®, Stenolid®

ALPRAZOLAM

Indications short-term use in anxiety (see p. 222)

Cautions see under Diazepam

Contra-indications see under Diazepam

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see under Diazepam

Dose

250–500 micrograms 3 times daily (elderly or debilitated 250 micrograms 2–3 times daily), increased if necessary to a total of 3 mg daily; child not recommended

Alprazolam (Non-proprietary) [D4.1]

Tablets, alprazolam 250 micrograms, net price 60-tab pack = £2.97; 500 micrograms, 60-tab pack = £5.69. Label: 2

Brands include Xanox®

CHLORDIAZEPoxide HYDROCHLORIDE

Indications short-term use in anxiety (see p. 222); adjunct in acute alcohol withdrawal (section 4.10.1)

Cautions see under Diazepam

Contra-indications see under Diazepam

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see under Diazepam

Dose

Anxiety, 10 mg 3 times daily increased if necessary to 60–100 mg daily in divided doses; elderly (or debilitated) half adult dose; child not recommended

Treatment of alcohol withdrawal in moderate dependence, 10–30 mg 4 times daily (according to local protocol), gradually reduced over 5–7 days

- Treatment of alcohol withdrawal in severe dependence, 10–50 mg 4 times daily (with 10–40 mg as required, if necessary, for the first 2 days; max. total daily dose 250 mg) (according to local protocol), gradually reduced over 7–10 days

Chlordiazepoxide (Non-proprietary) (C01A)
Capsules, chlordiazepoxide hydrochloride 5 mg, net price 100-cap pack = £6.21; 10 mg, 100-cap pack = £8.97. Label: 2
Brands include Librium®

Chlordiazepoxide Hydrochloride (Non-proprietary) (C01A)
Tablets, chlordiazepoxide hydrochloride 5 mg, net price 100 = £20.30; 10 mg, 100 = £25.20. Label: 2

**LORAZEPAM**

Indications
- short-term use in anxiety or insomnia (see p. 222); status epilepticus (section 4.8.2); peri-operative (section 15.1.4.1)

Cautions
- see under Diazepam; short acting; when given parenterally, facilities for managing respiratory depression with mechanical ventilation must be available

Contra-indications
- see under Diazepam

Hepatic impairment
- see notes above

Renal impairment
- see notes above

Pregnancy
- see notes above

Breast-feeding
- see notes above

Side-effects
- see under Diazepam

Dose
- By mouth, anxiety, 1–4 mg daily in divided doses; ELDERLY (or debilitated) half adult dose
- Insomnia associated with anxiety, 1–2 mg at bedtime;
- CHILD not recommended
- By intramuscular or slow intravenous injection (into a large vein), acute panic attacks, 25–30 micrograms/kg (usual range 1.5–2.5 mg), repeated every 6 hours if necessary; CHILD not recommended

Note
- Only use intramuscular route when oral and intravenous routes not possible

Lorazepam (Non-proprietary) (C01A)
Tablets, lorazepam 1 mg, net price 28-tab pack = £2.45; 2.5 mg, 28-tab pack = £3.68. Label: 2 or 19
Injection, lorazepam 4 mg/mL, net price 1-mL amp = 55p
Excipients include benzyl alcohol, propylene glycol (see Excipients, p. 2)
Brands include Ativan®

Note
- For intramuscular injection it should be diluted with an equal volume of water for injections or physiological saline (but only use when oral and intravenous routes not possible)

**OXAZEPAM**

Indications
- anxiety (short-term use; see p. 222)

Cautions
- see under Diazepam; short acting

Contra-indications
- see under Diazepam

Hepatic impairment
- see notes above

Renal impairment
- see notes above

Pregnancy
- see notes above

Breast-feeding
- see notes above

Side-effects
- see under Diazepam

Dose
- Anxiety, 15–30 mg (elderly or debilitated 10–20 mg) 3–4 times daily; CHILD not recommended

- Insomnia associated with anxiety, 15–25 mg (max. 50 mg) at bedtime;

Oxazepam (Non-proprietary) (C01A)
Tablets, oxazepam 10 mg, net price 28-tab pack = £1.54; 15 mg, 28-tab pack = £1.55. Label: 2

**BUSPIRONE HYDROCHLORIDE**

Indications
- anxiety (short-term use)

Cautions
- does not alleviate benzodiazepine withdrawal (see notes above); interactions: Appendix 1 (anxiolytics and hypnotics)

Driving
- May affect performance of skilled tasks (e.g. driving), effects of alcohol may be enhanced

Contra-indications
- epilepsy; acute porphyria (section 9.8.2)

Hepatic impairment
- reduce dose in mild to moderate disease; avoid in severe disease

Renal impairment
- reduce dose; avoid if eGFR less than 20 mL/minute/1.73 m²

Pregnancy
- avoid

Breast-feeding
- avoid

Side-effects
- nausea; dizziness, headache, nervousness, excitement; rarely dry mouth, tachycardia, palpitation, chest pain, drowsiness, confusion, seizures, fatigue, and sweating

Dose
- ADULT over 18 years, 5 mg 2–3 times daily, increased as necessary every 2–3 days; usual range 15–30 mg daily in divided doses; max. 45 mg daily

Buspirone Hydrochloride (Non-proprietary) (C01A)
Tablets, buspirone hydrochloride 5 mg, net price 30-tab pack = £7.27; 10 mg, 30-tab pack = £9.56. Counselling, driving

**Meprobamate**

Meprobamate is less effective than the benzodiazepines, more hazardous in overdose, and can also induce dependence. It is not recommended.

Meprobamate

The European Medicines Agency has recommended (January 2012) the suspension of all marketing authorisations for meprobamate because the risks, particularly of serious CNS side-effects, outweigh the benefits.

Meprobamate
4.1.3 Barbiturates

The intermediate-acting barbiturates have a place only in the treatment of severe intractable insomnia in patients already taking barbiturates; they should be avoided in the elderly. Intermediate-acting barbiturate preparations containing amobarbital sodium, butobarbital, and secobarbital sodium are available on a named-preparations basis.

The long-acting barbiturate phenobarbital is still sometimes of value in epilepsy (section 4.8.1) but its use as a sedative is unjustified.

The very short-acting barbiturate thiopental is used in anaesthesia (section 15.1.1).

4.2 Drugs used in psychoses and related disorders

4.2.1 Antipsychotic drugs

Advice of Royal College of Psychiatrists on doses of antipsychotic drugs above BNF upper limit. Unless otherwise stated, doses in the BNF are licensed doses—any higher dose is therefore unlicensed (for an explanation of the significance of this, see p. 2).

1. Consider alternative approaches including adjuvant therapy and newer or second-generation antipsychotic drugs such as clozapine.
2. Bear in mind risk factors, including obesity; particular caution is indicated in older patients, especially those over 70 (see p. 231).
3. Consider potential for drug interactions—see interactions: Appendix 1 (antipsychotics).

4. Carry out ECG to exclude untoward abnormalities such as prolonged QT interval; repeat ECG periodically and reduce dose if prolonged QT interval or other adverse cardiac abnormality develops.
5. Increase dose slowly and not more often than once weekly.
6. Carry out regular pulse, blood pressure, and temperature checks; ensure that patient maintains adequate fluid intake.
7. Consider high-dose therapy to be for limited period and review regularly; abandon if no improvement after 3 months (return to standard dosage).

Important When prescribing an antipsychotic for administration on an emergency basis, the intramuscular dose should be lower than the corresponding oral dose (owing to absence of first-pass effect), particularly if the patient is very active (increased blood flow to muscle considerably increases the rate of absorption). The prescription should specify the dose for each route and should not imply that the same dose can be given by mouth or by intramuscular injection. The dose of antipsychotic for emergency use should be reviewed at least daily.

4.2.1.1 First-generation antipsychotic drugs

Antipsychotic drugs are also known as ‘neuroleptics’ and (misleadingly) as ‘major tranquillisers’. In the short term they are used to calm disturbed patients whatever the underlying psychopathology, which may be schizophrenia, brain damage, mania, toxic delirium, or agitated depression. Antipsychotic drugs are used to alleviate severe anxiety but this too should be a short-term measure.

Schizophrenia The aim of treatment is to alleviate the suffering of the patient (and carer) and to improve social and cognitive functioning. Many patients require life-long treatment with antipsychotic medication. Antipsychotic drugs relieve positive psychotic symptoms such as thought disorder, hallucinations, and delusions, and prevent relapse; they are usually less effective on negative symptoms such as apathy and social withdrawal. In many patients, negative symptoms persist between episodes of treated positive symptoms, but earlier treatment of psychotic illness may protect against the development of negative symptoms over time. Patients with acute schizophrenia generally respond better than those with chronic symptoms. Long-term treatment of a patient with a definitive diagnosis of schizophrenia is usually required after the first episode of illness in order to prevent relapses. Doses that are effective in acute episodes should generally be continued as prophylaxis.

First-generation antipsychotic drugs The first-generation antipsychotic drugs act predominantly by blocking dopamine D 2 receptors in the brain. First-generation antipsychotic drugs are not selective for any of the four dopamine pathways in the brain and so can cause a range of side-effects, particularly extrapyramidal symptoms and elevated prolactin. The phenothiazine derivatives can be divided into 3 main groups:

Group 1: chlorpromazine, levomepromazine, and promazine, generally characterised by pronounced sedative effects and moderate antimuscarinic and extrapyramidal side-effects.
Group 2: perazine and pipotiazine, generally characterised by moderate sedative effects, but fewer extrapyramidal side-effects than groups 1 or 3.

Group 3: fluphenazine, perphenazine, prochlorperazine, and trifluoperazine, generally characterised by fewer sedative and antimuscarinic effects, but more pronounced extrapyramidal side-effects than groups 1 and 2.

Butyrophenones (benperidol and haloperidol) resemble the group 3 phenothiazines in their clinical properties. Thioxanthenes (flupentixol and zuclopenthixol) have moderate sedative, antimuscarinic effects, and extrapyramidal effects. Diphenylbutylypiperidines (pimozide) and the substituted benzamides (sulpiride) have reduced sedative, antimuscarinic, and extrapyramidal effects.

Second-generation antipsychotic drugs The second-generation antipsychotic drugs (sometimes referred to as typical antipsychotic drugs) act on a range of receptors in comparison to first-generation antipsychotic drugs and have more distinct clinical profiles, particularly with regard to side-effects.

Amisulpride is a selective dopamine receptor antagonist with high affinity for mesolimbic D_1 and D_2 receptors; clozapine is a dopamine D_1, dopamine D_2, 5-HT_2A, alpha-adrenoceptor, and muscarinic-receptor antagonist; olanzapine is a dopamine D_1, D_2, D_6, 5-HT_2, histamine-1, and muscarinic-receptor antagonist; paliperidone is a metabolite of risperidone; quetiapine is a dopamine D_1, dopamine D_2, 5-HT_2, alpha-adrenoceptor, and histamine-1 receptor antagonist; and risperidone is a dopamine D_1, 5-HT_2A, alpha-adrenoceptor, and histamine-1 receptor antagonist.

Aripiprazole is a dopamine D_2 partial agonist with weak 5-HT_2A partial agonism and 5-HT_2A receptor antagonism. Aripiprazole can cause nausea and, unlike other antipsychotic drugs, lowers prolactin.

Cautions Antipsychotic drugs should be used with caution in patients with cardiovascular disease; an ECG may be required (see individual drug monographs), particularly if physical examination identifies cardiovascular risk factors, if there is a personal history of cardiovascular disease, or if the patient is being admitted as an inpatient. Antipsychotic drugs should also be used with caution in Parkinson’s disease (may be exacerbated by antipsychotics), epilepsy (and conditions predisposing to seizures), depression, myasthenia gravis, prostatic hypertrophy, or a susceptibility to angle-closure glaucoma. Caution is also required in severe respiratory disease and in patients with a history of jaundice or who have blood dyscrasias (perform blood counts if unexplained infection or fever develops). As photosensitivity may occur with higher dosages, patients should avoid direct sunlight. Patients with schizophrenia should have physical health monitoring (including cardiovascular disease risk assessment) at least once per year. Interactions: Appendix 1 (antipsychotics).

Contra-indications Antipsychotic drugs may be contra-indicated in comatose states, CNS depression, and phaeochromocytoma.

Prescribing for the elderly The balance of risks and benefit should be considered before prescribing antipsychotic drugs for elderly patients. In elderly patients with dementia, antipsychotic drugs are associated with a small increased risk of mortality and an increased risk of stroke or overt ischaemic attack. Furthermore, elderly patients are particularly susceptible to postural hypotension and to hyper- and hypothermia in hot or cold weather.

It is recommended that:
- Antipsychotic drugs should not be used in elderly patients to treat mild to moderate psychotic symptoms.
- Initial doses of antipsychotic drugs in elderly patients should be reduced (to half the adult dose or less), taking into account factors such as the patient’s weight, co-morbidity, and concomitant medication.
- Treatment should be reviewed regularly.

Driving Drowsiness may affect performance of skilled tasks (e.g. driving or operating machinery), especially at start of treatment; effects of alcohol are enhanced.

Withdrawal There is a high risk of relapse if medication is stopped after 1–2 years. Withdrawal of antipsychotic drugs after long-term therapy should always be gradual and closely monitored to avoid the risk of acute withdrawal syndromes or rapid relapse. Patients should be monitored for 2 years after withdrawal of antipsychotic medication for signs and symptoms of relapse.

Hepatic impairment All antipsychotic drugs can precipitate coma if used in hepatic impairment; phenothiazines are hepatotoxic. See also under individual drugs.

Renal impairment Start with small doses of antipsychotic drugs in severe renal impairment because of increased cerebral sensitivity. See also under individual drugs.

Pregnancy Extrapyramidal effects and withdrawal syndrome have been reported occasionally in the neonate when antipsychotic drugs are taken during the third trimester of pregnancy. Following maternal use of antipsychotic drugs in the third trimester, neonates should be monitored for symptoms including agitation, hypotonia, hypotonia, tremor, drowsiness, feeding problems, and respiratory distress. See also under individual drugs.

Breast-feeding There is limited information available on the short- and long-term effects of antipsychotic drugs on the breast-fed infant. Animal studies indicate possible adverse effects of antipsychotic medicines on the developing nervous system. Chronic treatment with antipsychotic drugs whilst breast-feeding should be avoided unless absolutely necessary. Phenothiazine derivatives are sometimes used in breast-feeding women for short-term treatment of nausea and vomiting. See also under individual drugs.

Side-effects Side-effects caused by antipsychotic drugs are common and contribute significantly to non-adherence to therapy. Extrapyramidal symptoms occur most frequently with the piperazine phenothiazines (fluphenazine, perphenazine, prochlorperazine, and trifluoperazine), the butyrophenones (benperidol and haloperidol), and the first-generation depot preparations. They are easy to recognise but cannot be predicted accurately because...
they depend on the dose, the type of drug, and on individual susceptibility.

Extrapyramidal symptoms consist of:

- **Parkinsonian symptoms** (including tremor), which may occur more commonly in adults or the elderly and may appear gradually;
- **Dystonia** (abnormal face and body movements) and **dyskinesia**, which occur more commonly in children or young adults and appear after only a few doses;
- **Akathisia** (restlessness), which characteristically occurs after large initial doses and may resemble an exacerbation of the condition being treated;
- **Tardive dyskinesia** (rhythmic, involuntary movements of tongue, face, and jaw), which usually develops on long-term therapy or with high dosage, but it may develop on short-term treatment with low doses—short-lived tardive dyskinesia may occur after withdrawal of the drug.

**Parkinsonian symptoms** remit if the drug is withdrawn and may be suppressed by the administration of antimuscarinic drugs (section 4.9.2). However, routine administration of such drugs is not justified because not all patients are affected and they may unmask or worsen tardive dyskinesia.

**Tardive dyskinesia** is the most serious manifestation of extrapyramidal symptoms; it is of particular concern because it may be irreversible on withdrawing therapy and treatment is usually ineffective. However, some manufacturers suggest that drug withdrawal at the earliest signs of tardive dyskinesia (fine vermicular movements of the tongue) may halt its full development. Tardive dyskinesia occurs fairly frequently, especially in the elderly, and treatment must be carefully and regularly reviewed.

Most antipsychotic drugs, both first- and second-generation, increase prolactin concentration to some extent because dopamine inhibits prolactin release. Aripiprazole reduces prolactin because it is a dopamine-receptor partial agonist. Risperidone, amisulpride, and first-generation antipsychotic drugs are most likely to cause symptomatic hyperprolactinaemia. The clinical symptoms of hyperprolactinaemia include sexual dysfunction, reduced bone mineral density, menstrual disturbances, breast enlargement, and galactorrhoea.

Sexual dysfunction is one of the main causes of non-adherence to antipsychotic medication; physical illness, psychiatric illness, and substance misuse are contributing factors. Antipsychotic-induced sexual dysfunction is caused by more than one mechanism. Reduced dopamine transmission and hyperprolactinaemia decrease libido; antimuscarinic effects can cause disorders of arousal; and alpha-1-adrenoceptor antagonists may occlude the connection between the sympathetic and parasympathetic nervous systems. However, the clinical effects of antipsychotic drugs are dose dependent and the presence of sexual dysfunction has been found not to be dose limiting. Sexual dysfunction may improve on dose reduction or switching medication should be considered.

Antipsychotic drugs are used to treat a wide range of conditions, the most common of which are schizophrenia, bipolar disorder, and mania. They are also used in the treatment of other conditions, including pain, nausea, vomiting, and agitation.

**Antipsychotic drugs** can cause a variety of side-effects, including extrapyramidal symptoms, tardive dyskinesia, and sexual dysfunction. These side-effects can be managed with medication, therapy, and lifestyle changes. Antipsychotic drugs can also cause other side-effects, including weight gain,EPS, and parkinsonian symptoms.

**EPS** is a term used to describe extrapyramidal side-effects, which are common with antipsychotic drugs. These side-effects can include akathisia, akinesia, and bradykinesia. EPS can be managed with medication or lifestyle changes.

**Tardive dyskinesia** is a condition that is associated with long-term antipsychotic drug use. It is characterized by involuntary movements of the face, tongue, and jaw. Tardive dyskinesia is a serious side-effect and can be irreversible.

**Sexual dysfunction** is a common side-effect of antipsychotic drugs. It can include loss of libido, erectile dysfunction, and decreased sex drive. These side-effects can be managed with medication or therapy.

**Hypotension** and **hyperprolactinaemia** are other side-effects that can occur with antipsychotic drugs. Hypotension can be managed with fluids and medication, while hyperprolactinaemia can be managed with medication.

**Overdosage** can occur with antipsychotic drugs and can be life-threatening. Symptoms of overdose include increased agitation, seizures, and coma. Treatment for overdose includes supportive care and administration of activated charcoal.

**Emergency Treatment of Poisoning** is available to provide additional information on antipsychotic overdose and management.

**Choice** of antipsychotic drug should be made on a case-by-case basis, taking into account the individual patient's needs and the risks and benefits of each drug.

**Second-generation antipsychotic drugs** are generally preferred over **first-generation antipsychotic drugs** for the treatment of schizophrenia. Second-generation antipsychotic drugs are associated with **lower risk of EPS** and **less risk of extrapyramidal side-effects**. However, they may be associated with **higher risk of sedation and weight gain**.

**Third-generation antipsychotic drugs** are an newer class of antipsychotic drugs that are associated with **lower risk of EPS** and **less risk of extrapyramidal side-effects**. However, they may be associated with **higher risk of sedation and weight gain**.

**Summary**

Antipsychotic drugs are used to treat a wide range of conditions, the most common of which are schizophrenia, bipolar disorder, and mania. They are also used in the treatment of other conditions, including pain, nausea, vomiting, and agitation. Antipsychotic drugs can cause a variety of side-effects, including extrapyramidal symptoms, tardive dyskinesia, and sexual dysfunction. These side-effects can be managed with medication, therapy, and lifestyle changes. Antipsychotic drugs can also cause other side-effects, including weight gain, EPS, and parkinsonian symptoms. Overdosage can occur with antipsychotic drugs and can be life-threatening. Symptoms of overdose include increased agitation, seizures, and coma. Treatment for overdose includes supportive care and administration of activated charcoal. Choice of antipsychotic drug should be made on a case-by-case basis, taking into account the individual patient's needs and the risks and benefits of each drug.
because amisulpride selectively blocks mesolimbic dopamine receptors, and extrapyramidal symptoms are caused by blockade of the striatal dopamine pathway.

Aripiprazole has negligible effect on the QT interval. Other antipsychotic drugs with a reduced tendency to prolong QT interval include amisulpride, clozapine, flupentixol, fluphenazine, olanzapine, perphenazine, prochlorperazine, risperidone, and sulpiride.

Schizophrenia is associated with insulin resistance and diabetes; the risk of diabetes is increased in patients with schizophrenia who take antipsychotic drugs. First-generation antipsychotic drugs are less likely to cause diabetes than second-generation antipsychotic drugs, and of the first-generation antipsychotic drugs, fluphenazine and haloperidol are lowest risk. Amisulpride and aripiprazole have the lowest risk of diabetes of the second-generation antipsychotic drugs. Aminopropylrole, aripiprazole, haloperidol, sulpiride, and trifluoperazine are least likely to cause weight gain.

The antipsychotic drugs with the lowest risk of sexual dysfunction are aripiprazole and quetiapine. Olanzapine may be considered if sexual dysfunction is judged to be secondary to hyperprolactinaemia. Hyperprolactinaemia is usually not clinically significant with aripiprazole, clozapine, olanzapine, and quetiapine treatment. When changing from other antipsychotic drugs, a reduction in prolactin concentration may increase fertility.

Patients should receive an antipsychotic drug for 4–6 weeks before it is deemed ineffective. Prescribing more than one antipsychotic drug at a time should be avoided except in exceptional circumstances (e.g. clozapine augmentation or when changing medication during titration) because of the increased risk of adverse effects such as extrapyramidal symptoms, QT-interval prolongation, and sudden cardiac death.

Clozapine is licensed for the treatment of schizophrenia in patients unresponsive to, or intolerant of, other antipsychotic drugs. Clozapine should be introduced if schizophrenia is not controlled despite the sequential use of two or more antipsychotic drugs (one of which should be a second-generation antipsychotic drug), each for at least 6–8 weeks. If symptoms do not respond adequately to an optimised dose of clozapine, plasma-clozapine concentration should be checked before adding a second antipsychotic drug to augment clozapine; allow 8–10 weeks’ treatment to assess response. Patients must be registered with a clozapine patient monitoring service (see under Clozapine).

**Monitoring**

Full blood count, urea and electrolytes, and liver function test monitoring is required at the start of therapy with antipsychotic drugs, and then annually thereafter. Amisulpride and sulpiride do not require liver function test monitoring. Clozapine requires differential white blood cell monitoring weekly for 18 weeks, then fortnightly for up to one year, and then monthly as part of the clozapine patient monitoring service.

Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly. Patients taking clozapine or olanzapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly. Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking clozapine or olanzapine should have fasting blood glucose tested at baseline, after one months’ treatment, then every 4–6 months.

Before initiating antipsychotic drugs, an ECG may be required, particularly if physical examination identifies cardiovascular risk factors, if there is a personal history of cardiovascular disease, or if the patient is being admitted as an inpatient. ECG monitoring is advised for haloperidol and mandatory for pimozide (see under individual drugs and Side-effects above).

Blood pressure monitoring is advised before starting therapy and frequently during dose titration of antipsychotic drugs. Amisulpride, aripiprazole, trifluoperazine, and sulpiride do not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for these drugs.

It is advisable to monitor prolactin concentration at the start of therapy, at 6 months, and then yearly. Patients taking antipsychotic drugs not normally associated with symptomatic hyperprolactinaemia (see Choice above) should be considered for prolactin monitoring if they show symptoms of hyperprolactinaemia (such as breast enlargement and galactorrhoea).

Patients with schizophrenia should have physical health monitoring (including cardiovascular disease risk assessment) at least once per year.

**Other uses**

Nausea and vomiting (section 4.6), chorea, motor tics (section 4.9.3), and intractable hiccup (see under Chlorpromazine Hydrochloride and under Haloperidol). Benperidol is used in deviant antisocial sexual behaviour but its value is not established; see also section 6.4.2 for the role of cyproterone acetate.

Psychomotor agitation should be investigated for an underlying cause; it can be managed with low doses of chlorpromazine or haloperidol used for short periods. Antipsychotic drugs can be used with caution for the short-term treatment of severe agitation and restlessness in the elderly (but see p. 231).

### Equivalent doses of oral antipsychotics

These equivalences are intended only as an approximate guide; individual dosage instructions should also be checked; patients should be carefully monitored after any change in medication.

**Important** These equivalences must not be extrapolated beyond the maximum dose for the drug. Higher doses require careful titration in specialist units and the equivalences shown here may not be appropriate.

### Dosage

After an initial period of stabilisation, in most patients, the total daily oral dose can be given as a single dose. For the advice of The Royal College of Psychiatrists on doses above the BNF upper limit, see p. 230.
First-generation antipsychotic drugs

**BENPERIDOL**

**Indications** control of deviant antisocial sexual behaviour (but see notes above)

**Cautions** see notes above; also manufacturer advises regular blood counts and liver function tests during long-term treatment; risk factors for stroke

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**
- 0.25–1.5 mg daily in divided doses, adjusted according to response; **ELDERLY** (or debilitated) initially half adult dose; **CHILD** not recommended

**Anquil**® (Archimedes) **(Ped)**

Tablets, scored, benperidol 250 micrograms, net price 112-tab pack = £117.31. Label: 2

Note: The proprietary name *Anquil*® has been used for benperidol tablets

**CHLORPROMAZINE HYDROCHLORIDE**

**Warning** Owing to the risk of contact sensitisation, pharmacists, nurses, and other health workers should avoid direct contact with chlorpromazine; tablets should not be crushed and solutions should be handled with care

**Indications** see under Dose; animetic in palliative care (section 4.6)

**Cautions** see notes above; also diabetes; patients should remain supine, with blood pressure monitoring for 30 minutes after intramuscular injection; dose adjustment may be necessary if smoking started or stopped during treatment

**Contra-indications** see notes above; hypothyroidism

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also hyperglycaemia

**Dose**
- By mouth, schizophrenia and other psychoses, mania, short-term adjunctive management of severe anxiety, psychomotor agitation, excitement, and violent or dangerously impulsive behaviour, initially 25 mg 3 times daily (or 75 mg at night), adjusted according to response, to usual maintenance dose of 75–300 mg daily (but up to 1 g daily may be required in psychoses); **ELDERLY** (or debilitated) third to half adult dose; **CHILD** under 18 years see **BNF for Children**

Intrathecally by deep intramuscular injection, (for relief of acute symptoms but see also Cautions and Side-effects), 25–50 mg every 6–8 hours; **CHILD** under 18 years see **BNF for Children**

By deep intramuscular injection, for relief of acute symptoms but see also Cautions and Side-effects, 25–50 mg every 6–8 hours; **CHILD** under 18 years see **BNF for Children**

By rectum in suppositories as chlorpromazine base 100 mg every 6–8 hours [unlicensed]

**Note** For equivalent therapeutic effect 100 mg chlorpromazine base given rectally as a suppository = 20–25 mg chlorpromazine hydrochloride by intramuscular injection = 40–50 mg of chlorpromazine base or hydrochloride by mouth

**Chlorpromazine** (Non-proprietary) **(Pom)**

Tablets, chlorpromazine hydrochloride 25 mg, net price 28-tab pack = £2.04; 50 mg, 28-tab pack = £2.15; 100 mg, 28-tab pack = £2.17. Label: 2, 11

**Brands include Chloractil**

**Oral solution**, chlorpromazine hydrochloride 25 mg/5 mL, net price 150 mL = £2.35; 100 mg/5 mL, 150 mL = £5.50. Label: 2, 11

**Injection**, chlorpromazine hydrochloride 25 mg/mL, net price 1-mL amp = 60p, 2-mL amp = 63p

**Suppositories**, chlorpromazine 25 mg and 100 mg. Label: 2, 11

Available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104

**Largactil**® (Sanofi-Aventis) **(Pom)**

**Injection**, chlorpromazine hydrochloride 25 mg/mL, net price 2-mL amp = 75p

**FLUPENTIXOL** (Flupenthixol) **(Pom)**

**Indications** schizophrenia and other psychoses, particularly with apathy and withdrawal but not mania or psychomotor hyperactivity; depression (section 4.3.4)

**Cautions** see notes above; diabetes; avoid in acute porphyria (section 9.8.2)

**Contra-indications** see notes above; also excitable and overactive patients

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; less sedating but extrapyramidal symptoms frequent; hyperglycaemia

**Dose**
- Psychosis, initially 3–9 mg twice daily adjusted according to the response; max. 18 mg daily; **ELDERLY** (or debilitated) initially quarter to half adult dose; **CHILD** not recommended

**Depixol**® (Lundbeck) **(Pom)**

Tablets, yellow, s/c, flupentixol 3 mg (as dihydrochloride), net price 100 = £13.92. Label: 2

**Fluanxol**® (Lundbeck) **(Pom)**

Section 4.3.4 (depression)

**Depot preparation**

Section 4.2.2

**HALOPERIDOL**

**Indications** see under Dose; motor tics (section 4.9.3)

**Cautions** see notes above; also subarachnoid haemorrhage; metabolic disturbances such as hypokalaemia, hypercalcaemia, or hypomagnesaemia; thyrotoxicosis; arteriosclerosis; dose adjustment may be necessary if smoking started or stopped during treatment; baseline ECG required before treatment—assess need for further ECGs during treatment on an individual basis

**Contra-indications** see notes above; QT-interval prolongation (avoid concomitant administration of drugs that prolong QT interval); bradycardia; lesions of the basal ganglia; Parkinson’s disease

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** avoid unless benefits outweigh risks; see also notes above
Breast-feeding see notes above

Side-effects see notes above, but less sedating and fewer antimuscarinic or hypotensive symptoms; pigmentation and photosensitivity reactions rare; depression; weight loss; less commonly dyspnoea, oedema; rarely bronchospasm, hypoglycaemia, and inappropriate antidiuretic hormone secretion, hypertension, sweating, Stevens-Johnson syndrome, and toxic epidermal necrolysis also reported

Dose

- Schizophrenia, psychoses, mania and hypomania, organic brain damage (depending on symptoms),
  ADULT over 18 years, by mouth, initially 2–20 mg daily as a single dose or in divided doses, maintenance 1–3 mg three times daily adjusted according to response (max. 20 mg daily in divided doses), ELDERLY (or debilitated) initially half adult dose; CHILD under 18 years see BNF for Children

- By intramuscular injection, ADULT over 18 years, initially 2–5 mg, repeated according to response and tolerability to max. 12 mg daily; ELDERLY (or debilitated) initially half adult dose

Note BNF doses differ from those in product literature

- Agitation and restlessness in the elderly, by mouth, initially 0.75–1.5 mg 2–3 times daily adjusted according to response if necessary

- Management of mental or behavioural problems such as aggression, hyperactivity and self-mutilation in the mentally retarded and in patients with organic brain damage (depending on symptoms), Gilles de la Tourette syndrome, severe tics, intractable hiccups, as an adjunct to short-term management of moderate to severe psychomotor agitation, excitement, and violent or dangerously impulsive behaviour, by mouth, ADULT over 18 years, initially 1.5–3 mg 2–3 times daily (3–5 mg 2–3 times daily in severely affected or resistant patients), maintenance 0.5–1 mg three times daily (increased to 2–3 mg three times daily if necessary; once symptoms controlled, gradually reduce dose to the lowest effective maintenance dose; ELDERLY (or debilitated) initially half adult dose; CHILD under 18 years see BNF for Children

- Nausea and vomiting, see Prescribing in Palliative Care, p. 22

By intramuscular injection, 1–2 mg

Haloperidol (Non-proprietary)

Tablets, haloperidol 500 micrograms, net price 28-tab pack = 91p; 1.5 mg, 28-tab pack = £2.19; 5 mg, 28-tab pack = £3.02; 10 mg, 28-tab pack = £7.84; 20 mg, 28-tab pack = £17.79. Label: 2

Oral liquid, haloperidol 5 mg/5 mL, net price 100-mL pack = £6.14; 10 mg/5 mL, 100-mL pack = £7.10. Label: 2

Injection, haloperidol 5 mg/mL, net price 1-mL amp = £36p

Important When prescribing, dispensing, or administering, check that this injection is the correct preparation—this preparation is usually used in hospital for the rapid control of an acute episode and should not be confused with depot preparations which are usually used in the community or clinics for maintenance treatment

Doxine® (Rosemont)

Oral liquid, sugar-free, haloperidol 5 mg/5 mL, net price 100-mL pack = £6.30. Label: 2

Haldol® (Janssen)

Oral liquid, sugar-free, haloperidol 10 mg/5 mL, net price 100-mL pack (with pipette) = £4.45. Label: 2

Serenece® (TEVA UK)

Capsules, green, haloperidol 500 micrograms, net price 30-cap pack = £1.18. Label: 2

Depot preparation

Section 4.2.2

LEVOMEPRAMINE

(Methotrimeprazine)

Indications see under Dose

Cautions see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; occasionally raised erythrocyte sedimentation rate occurs; hyperglycaemia also reported

Dose

- Schizophrenia, by mouth initially 25–50 mg daily in divided doses increased as necessary; bedpatients initially 100–200 mg daily usually in 3 divided doses, increased if necessary to 1 g daily; ELDERLY, see Cautions

- Pain in palliative care, see p. 23

- Restlessness and confusion in palliative care, see p. 23; CHILD 1–18 years see BNF for Children

- Nausea and vomiting in palliative care, by mouth, see p. 22, or by subcutaneous infusion, see p. 23; CHILD 1 month–18 years see BNF for Children

Nozinan® (Sanofi-Aventis)

Tablets, scored, levomepromazine maleate 25 mg, net price 84-tab pack = £20.26. Label: 2

Injection, levomepromazine hydrochloride 25 mg/mL, net price 1-mL amp = £2.01

PERICYZANE

(Pericazine)

Indications see under Dose

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; more sedating, hypertension common when treatment initiated; respiratory depression

Dose

- Schizophrenia and other psychoses, initially 75 mg daily in divided doses increased at weekly intervals by steps of 25 mg according to response; usually max. 300 mg daily (elderly initially 15–30 mg daily); CHILD and INFANT over 1 year (schizophrenia or behavioural disorders only), initially, 500 micrograms daily for 10-kg child, increased by 1 mg for each additional 5 kg body-weight to max. total daily dose of 10 mg; dose may be gradually increased according to response but maintenance should not exceed twice initial dose
Pimozide

**Indications** see under Dose

**Cautions** see notes above

**ECG monitoring**

Following reports of sudden unexplained death, an ECG is recommended before treatment. It is also recommended that patients taking pimozide should have an annual ECG if the QT interval is prolonged, treatment should be reviewed and either withdrawn or dose reduced under close supervision and that pimozide should not be given with other antipsychotic drugs (including depot preparations), tricyclic antidepressants or other drugs which prolong the QT interval, such as certain antiarrhythmics, anti-arrhythmic drugs and certain antihistamines and should not be given with drugs which cause electrolyte disturbances (especially diuretics)

**Contra-indications**

see notes above; history or family history of congenital QT prolongation; history of arrhythmias

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; less sedating; serious arrhythmias reported; glycosuria and, rarely, hypotonia reported

**Dose**

Schizophrenia, **ADULT** and **CHILD** over 12 years, initially 2 mg daily, increased according to response in steps of 2–4 mg at intervals of not less than 1 week; usual dose range 2–20 mg daily; **ELDERLY** half usual starting dose

Monosymptomatic hypochondriacal psychosis, paranoid psychosis, **ADULT** and **CHILD** over 12 years, initially 4 mg daily, increased according to response in steps of 2–4 mg at intervals of not less than 1 week; max. 16 mg daily; **ELDERLY** half usual starting dose

**Preparations**

Section 4.6

Promazine hydrochloride

**Indications** see under Dose

**Cautions** see notes above; also cerebral arteriosclerosis

**Contra-indications**

see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also haemolytic anaemia

**Dose**

Short-term adjunctive management of psychomotor agitation, 100–200 mg 4 times daily; **CHILD** not recommended

Agitation and restlessness in the elderly, 25–50 mg 4 times daily

**Preparations**

Tablets, promazine hydrochloride 25 mg, net price 100 = £37.53; 50 mg, 100 = £72.67. Label: 2

Oral solution, promazine hydrochloride 25 mg/5 mL, net price 150 mL = £11.50; 50 mg/5 mL, 150 mL = £13.50. Label: 2
**SULPIRIDE**

**Indications** schizophrenia

**Cautions** see notes above; also excited, agitated, or aggressive patients (even low doses may aggravate symptoms)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also hepatitis

**Dose**

- **ADULT** and **CHILD** over 14 years, 200–400 mg twice daily; max. 800 mg daily in predominantly negative symptoms; and 2.4 g daily in mainly positive symptoms; **ELDERLY**, lower initial dose, increased gradually according to response

**Sulpiride** (Non-proprietary) *(PH)*

- **Tablets**, sulpiride 200 mg, net price 30-tab pack = £5.28, 50-tab pack = £8.46; 400 mg, 30-tab pack = £18.80. Label: 2

**Dolmatil** *(Sanofi-Aventis)* *(PH)*

- **Tablets**, both scored, sulpiride 200 mg, net price 100-tab pack = £6.00; 400 mg (f/c), 100-tab pack = £19.00. Label: 2

**Sulpor** *(Rosemont)* *(PH)*

- **Oral solution**, sugar-free, lemon- and aniseed-flavoured, sulpiride 200 mg/5 mL, net price 150 mL = £25.38. Label: 2

**TRIFLUOPERAZINE**

**Indications** see under Dose; antiemetic (section 4.6)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; extrapyramidal symptoms more frequent, especially at doses exceeding 6 mg daily; anorexia; muscle weakness

**Dose**

- Schizophrenia and other psychoses, short-term management of acute psychosis, mania, or exacerbations of chronic psychosis

  - **ADULT** and **CHILD** over 12 years, initially 5 mg twice daily, increased by 5 mg daily after 1 week, then at intervals of 3 days, according to the response; **ELDERLY** reduce initial dose by at least half

- Schizophrenia or other psychoses, short-term adjunctive management of psychomotor agitation, excitement, and violent or dangerously impulsive behaviour

  - **ADULT** and **CHILD** over 12 years, initially 5 mg twice daily, increased by 5 mg daily after 1 week, then at intervals of 3 days, according to the response; **ELDERLY** reduce initial dose by at least half

  - Short-term adjunctive management of severe anxiety

    - **ADULT** and **CHILD** over 12 years, 2–4 mg daily in divided doses, increased if necessary to 6 mg daily; **CHILD** 3–5 years up to 1 mg daily, 6–12 years up to 4 mg daily; **ELDERLY** reduce initial dose by at least half

**Trifluoperazine** (Non-proprietary) *(PH)*

- **Tablets**, trifluoperazine (as hydrochloride) 1 mg, net price 112-tab pack = £5.41; 5 mg, 112-tab pack = £77.00. Label: 2

- **Oral solution**, trifluoperazine (as hydrochloride) 1 mg/5 mL, net price 200-mL = £3.28; 5 mg/5 mL, 150-mL = £25.50. Label: 2

**Stelazine** *(AMCo)* *(PH)*

- **Tablets**, both blue, f/c, trifluoperazine (as hydrochloride) 1 mg, net price 112 = £4.11; 5 mg, 112 = £5.87. Label: 2

**ZUCLOPENTHIXOL**

**Indications** schizophrenia and other psychoses

**Cautions** see notes above; avoid in acute porphyria (section 9.8.2)

**Contra-indications** see notes above; apathetic or withdrawn states

**Hepatic impairment** see notes above; halve dose and consider serum-level monitoring

**Renal impairment** see notes above; halve dose in renal failure

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; urinary frequency or incontinence; weight loss (less common than weight gain)

**Dose**

- **By mouth**, initially 20–30 mg daily in divided doses, increasing to a max. of 150 mg daily if necessary; usual maintenance dose 20–50 mg daily; max. single dose 40 mg; **ELDERLY** (or debilitated) initially quarter to half adult dose; **CHILD** not recommended

**Clopixol** *(Lundbeck)* *(PH)*

- **Tablets**, f/c, zuclopenthixol (as dihydrochloride) 2 mg (red), net price 100 = £3.14; 10 mg (light red-brown), 100 = £8.06; 25 mg (red-brown), 100 = £16.13. Label: 2

  **Depot preparation** Section 4.2.2

**ZUCLOPENTHIXOL ACETATE**

**Indications** short-term management of acute psychosis, mania, or exacerbations of chronic psychosis

**Cautions** see notes above; avoid in acute porphyria (section 9.8.2)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**

- **By deep intramuscular injection** into the gluteal muscle or lateral thigh, 50–150 mg (**ELDERLY** 50–100 mg), repeated if necessary after 2–3 days (1 additional dose may be needed 1–2 days after the first injection); max. cumulative dose 400 mg in 2 weeks and max. 4 injections; max. duration of treatment 2 weeks—if maintenance treatment necessary change to an oral antipsychotic 2–3 days after last injection, or to a longer acting antipsychotic depot injection given concomitantly with last injection of zuclopenthixol acetate; **CHILD** not recommended

**Clopixol Acuphase** *(Lundbeck)* *(PH)*

- **Injection** (oily), zuclopenthixol acetate 50 mg/mL, net price 1-mL amp = £4.84

  Important When prescribing, dispensing, or administering, check that this is the correct preparation—this preparation is usually used in hospital for an acute episode and should not be confused with depot preparations which are usually used in the community or clinics for maintenance treatment

  **Depot preparation** Section 4.2.2
4.2.1 Antipsychotic drugs

Second-generation antipsychotic drugs

**AMISULPRIDE**

**Indications** schizophrenia

**Cautions** see notes above

**Contra-indications** see notes above; also prolactin-dependent tumours; pre-pubertal children

**Renal impairment** halve dose if eGFR 30–60 mL/minute/1.73 m²; use one-third dose if eGFR 10–30 mL/minute/1.73 m²; no information available if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy** avoid breast-feeding

**Side-effects** see notes above; also anxiety; less commonly bradycardia

**Use**

- Acute psychotic episode, 400–800 mg daily in 2 divided doses, adjusted according to response; max. 1.2 g daily; **CHILD** under 18 years not recommended
- Predominantly negative symptoms, 50–300 mg daily; **CHILD** under 18 years not recommended

**Amisulpride** (Non-proprietary) [®]

**Tablets**, amisulpride 50 mg, net price 60-tab pack = £3.84; 100 mg, 60-tab pack = £5.91; 200 mg, 60-tab pack = £9.89; 400 mg, 60-tab pack = £40.64. Label: 2

**Solution**, 100 mg/mL, net price 60 mL (caramel flavour) = £33.76. Label: 2

**ARIPIPRAZOLE**

**Indications** see under Dose

**Cautions** see notes above; cerebrovascular disease; elderly (reduce initial dose)

**Contra-indications** see notes above

**Hepatic impairment** use with caution in severe impairment

**Pregnancy** see, p. 231; also use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid—present in milk

**Side-effects** see notes above; hypersalivation, anxiety, drowsiness, malaise; less commonly depression, dry mouth, also reported anorexia, ophthalmoplegia, spasm, laryngospasm, respiratory disorders (including infection), hepatitis, pancreatitis, bradycardia, pathological gambling, suicidal ideation, hyponatraemia, urinary disorders, myalgia, rhabdomyolysis, oedema, sweating, alopecia

**Dose**

- Schizophrenia, by mouth, **ADULT** over 18 years, 10–15 mg once daily, usual maintenance 15 mg once daily; max. 30 mg once daily; for dose adjustments due to concomitant use of interacting drugs, consult product literature; **CHILD** under 18 years see BNF for Children
- Treatment and recurrence prevention of mania, by mouth, **ADULT** over 18 years, 15 mg once daily, increased if necessary; max. 30 mg once daily; for dose adjustments due to concomitant use of interacting drugs, consult product literature: **CHILD** under 18 years see BNF for Children

- Control of agitation and disturbed behaviour in schizophrenia, by intramuscular injection, **ADULT** over 18 years, initially 5.25–15 mg (usual dose 9.75 mg) as a single dose followed by 5.25–15 mg after 2 hours if necessary; max. 3 injections daily; max. daily combined oral and parenteral dose 30 mg; for dose adjustments due to concomitant use of interacting drugs, consult product literature

**Ability®** (Otsuka) [®]

**Tablets**, aripiprazole 5 mg (blue), net price 28-tab pack = £96.04; 10 mg (pink), 28-tab pack = £96.04; 15 mg (yellow), 28-tab pack = £96.04; 30 mg (pink), 28-tab pack = £192.08. Label: 2

**Orodispersible tablets**, aripiprazole 10 mg (pink), net price 28-tab pack = £96.04; 15 mg (yellow), 28-tab pack = £96.04. Label: 2, counselling, administration

**Excipients** include aspartame (section 9.4.1)

**Counselling** Tablets should be placed on the tongue and allowed to dissolve, or be dispersed in water and swallowed

**Oral solution**, aripiprazole 1 mg/mL, net price 150 mL with measuring cup = £102.90. Label: 2

**Injection**, aripiprazole 7.5 mg/mL, net price 1.3-mL (9.75 mg vial) = £3.43

**Important** When prescribing, dispensing, or administering, check that this injection is the correct preparation—this preparation is usually used in hospital for the rapid control of an acute episode and should not be confused with depot preparations which are usually used in the community or clinics for maintenance treatment

**Depot preparation** section 4.2.2

**CLOZAPINE**

**Indications** schizophrenia (including psychosis in Parkinson’s disease) in patients unresponsive to, or intolerant of, conventional antipsychotic drugs

**Cautions** see notes above; adult over 60 years; monitor leucocyte and differential blood counts (see Agranulocytosis, below); prostatic hypertrophy, susceptibility to angle-closure glaucoma; taper off other antipsychotics before starting; close medical supervision during initiation (risk of collapse because of hypotension and convulsions); dose adjustment may be necessary if smoking started or stopped during treatment

**Withdrawal** On planned withdrawal reduce dose over 1–2 weeks to avoid risk of rebound psychosis. If abrupt withdrawal necessary observe patient carefully

**Agranulocytosis** Neutropenia and potentially fatal agranulocytosis reported. Leucocyte and differential blood counts must be normal before starting; monitor counts every week for 1 week then at least every 2 weeks and if clozapine continued and blood count stable after 1 year at least every 4 weeks (and 4 weeks after discontinuation), if leucocyte count below 3000/mmol or if absolute neutrophil count below 1500/mm³ discontinue permanently and refer to haematologist. Patients who have a low white blood cell count because of benign ethnic neutropenia may be started on clozapine with the agreement of a haematologist. Avoid drugs which depress leucopoiesis; patients should report immediately symptoms of infection, especially influenza-like illness

**Myocarditis and cardiomyopathy** Fatal myocarditis (most commonly in first 2 months) and cardiomyopathy reported

- Perform physical examination and take full medical history before starting
4.2.1 Antipsychotic drugs

Schizophrenia, combination therapy for mania, prevention recurrence in bipolar disorder, by mouth, ADULT over 18 years, 10 mg daily adjusted to usual

Gastro-intestinal obstruction
Reactions resembling gastro-intestinal obstruction reported. Clozapine should be used cautiously with drugs which cause constipation (e.g. antimuscarinic drugs) or in history of colonic disease or bowel surgery. Monitor for constipation and prescribe laxative if required

Contra-indications
Severe cardiac disorders (e.g. myocarditis; see Cautions); history of neutropenia or agranulocytosis (see Cautions); bone-marrow disorders; paralytic ileus (see Cautions); alcoholic and toxic psychoses; history of circulatory collapse; drug intoxication; coma or severe CNS depression; uncontrolled epilepsy

Hepatic impairment
Monitor hepatic function regularly; avoid in symptomatic or progressive liver disease or hepatic failure

Renal impairment
Avoid in severe impairment

Pregnancy
See, p. 231; also use with caution

Breast-feeding
Avoid

Side-effects
See notes above; also constipation (see Cautions), hypersalivation, anorexia, speech disorders, malaise, urinary incontinence; less commonly agranulocytosis (important: see Cautions); rarely dysphagia, hepatitis, pancreatitis, circulatory collapse, myocarditis (important: see Cautions), pericarditis, pulmonary aspiration, pneumonia; very rarely parotid gland enlargement, intestinal obstruction (see Cautions), cardiomyopathy (important: see Cautions), myocardial infarction, respiratory depression, obsessive compulsive disorder, interstitial nephritis, hypertiglyceridaemia, hypercholesterolaemia; also reported hepatic disorders and failure, renal failure, muscle disorders

Dose
- Schizophrenia, ADULT over 18 years, 12.5 mg once or twice (ADULT over 60 years, 12.5 mg once) on first day then 25–50 mg (ADULT over 60 years, 25–37.5 mg) on second day then increased gradually (if well tolerated) in steps of 25–50 mg daily (ADULT over 60 years, max. increment 25 mg daily) over 14–21 days up to 300 mg daily in divided doses (larger dose at night, up to 200 mg daily may be taken as a single dose at bedtime); if necessary may be further increased in steps of 50–100 mg once (preferably) or twice weekly; usual dose 200–450 mg daily (max. 900 mg daily); CHILD 12–18 years see BNF for Children

Note
Restoring after interval of more than 2 days, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing

- Psychosis in Parkinson’s disease, ADULT over 16 years, 12.5 mg at bedtime then increased according to response in steps of 12.5 mg up to twice weekly; usual dose range 25–37.5 mg at bedtime, usual max. 50 mg daily; exceptionally, dose may be increased further in steps of 12.5 mg weekly to max. 100 mg daily in 1–2 divided doses

Clozaril® (Novartis) Tablets, yellow, clozapine 25 mg (scored), net price 28-tab pack = £3.78, 84-tab pack (hospital only) = £11.33, 100-tab pack (hospital only) = £13.48; 100 mg, 28-tab pack = £15.09, 84-tab pack (hospital only) = £45.28, 100-tab pack (hospital only) = £53.90; Label: 2, 10, patient information leaflet

Note
Patient, prescriber, and supplying pharmacist must be registered with the Clozaril Patient Monitoring Service—takes several days to do this

Denzapine® (Genus) Tablets, yellow, scored, clozapine 25 mg, net price 84-tab pack = £16.64, 100-tab pack = £19.80; 50 mg, 50-tab pack = £19.80; 100 mg, 84-tab pack = £26.53, 100-tab pack = £79.20; 200 mg, 50-tab pack = £79.20. Label: 2, 10, patient information leaflet

Suspension, clozapine 50 mg/mL, net price 100 mL = £39.60. Label: 2, 10, patient information leaflet, counselling, administration

Counselling
Shake well for 90 seconds when dispensing or if visibly settled and stand for 24 hours before use; otherwise shake well for 10 seconds before use

Note
May be diluted with water

Note
Patient, prescriber, and supplying pharmacist must be registered with the Denzapine Patient Monitoring Service—takes several days to do this

Zaponex® (TEVA UK) Tablets, yellow, scored, clozapine 25 mg, net price 84-tab pack = £8.28; 100 mg, 84-tab pack = £33.88. Label: 2, 10, patient information leaflet

Note
Patient, prescriber, and supplying pharmacist must be registered with the Zaponex Treatment Access System—takes several days to do this

OLANZAPINE

Indications
See under Dose

Cautions
See notes above; also paralytic ileus, diabetes mellitus (risk of exacerbation or ketoacidosis), low leucocyte or neutrophil count, bone-marrow depression, hypercoagulopathic disorders, myeloproliferative disease; dose adjustment may be necessary if smoking started or stopped during treatment

CNS and respiratory depression
Blood pressure, pulse and respiratory rate should be monitored for at least 4 hours after intramuscular injection, particularly in those also receiving a benzodiazepine or another antipsychotic (leave at least one hour between administration of olanzapine intramuscular injection and parenteral benzodiazepines)

Contra-indications
For injection, acute myocardial infarction, unstable angina, severe hypotension or tachycardia, sick sinus syndrome, recent heart surgery

Hepatic impairment
Consider initial dose of 5 mg daily

Renal impairment
Consider initial dose of 5 mg daily

Pregnancy
See, p. 231; also use only if potential benefit outweighs risk; neonatal lethargy, tremor, and hypotonia reported when used in third trimester

Breast-feeding
Avoid—present in milk

Side-effects
See notes above; also increased appetite, hypertiglyceridaemia, hypercholesterolaemia, bradycardia, arthralgia, oedema, malaise; less commonly epistaxis, amenorrhea, alopecia; rarely hepatitis, pancreatitis, rhabdomyolysis; with injection, sinus pause, hypotension

Dose
- Schizophrenia, combination therapy for mania, preventing recurrence in bipolar disorder, by mouth, ADULT over 18 years, 10 mg daily adjusted to usual
range of 5–20 mg daily; doses greater than 10 mg daily only after reassessment; max. 20 mg daily; CHILD 12–18 years see BNF for Children

- Monotherapy for mania, by mouth, ADULT over 18 years, 15 mg daily adjusted to usual range of 5–20 mg daily; doses greater than 15 mg only after reassessment; max. 20 mg daily; CHILD 12–18 years see BNF for Children

- Control of agitation and disturbed behaviour in schizophrenia or mania, by intramuscular injection, ADULT over 18 years, initially 5–10 mg (usual dose 10 mg) as a single dose followed by 5–10 mg after 2 hours if necessary; ELDERLY initially 2.5–5 mg as a single dose followed by 2.5–5 mg after 2 hours if necessary; max. 3 injections daily for 3 days; max. daily combined oral and parenteral dose 20 mg

**Important** When prescribing, dispensing, or administering, check that this injection is the correct preparation—this preparation is usually used in the hospital for the rapid control of an acute episode and should not be confused with depot preparations which are usually used in the community or clinics for maintenance treatment

**Note** When one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase

### Olanzapine (Non-proprietary) [Pm]

#### Tablets

- olanzapine 2.5 mg, net price 28-tab pack = 96p; 5 mg, 28-tab pack = £1.20; 7.5 mg, 56-tab pack = £2.70; 10 mg, 28-tab pack = £1.51; 15 mg, 28-tab pack = £2.08; 20 mg, 28-tab pack = £2.09. Label: 2

**Brands include** Zalansta®

#### Orodispersible tablets

- olanzapine 5 mg, net price 28-tab pack = £2.73; 10 mg, 28-tab pack = £3.43; 15 mg, 28-tab pack = £4.04; 20 mg, 28-tab pack = £5.66. Label: 2, counselling, administration

**Counselling** Olanzapine orodispersible tablet may be placed on the tongue and allowed to dissolve, or dispersed in water, orange juice, apple juice, milk, or coffee

### Zyprexa® (Lilly) [Pm]

#### Tablets, f/c, olanzapine 2.5 mg, net price 28-tab pack = £1.85; 5 mg, 28-tab pack = £4.70; 7.5 mg, 56-tab pack = £13.10; 10 mg, 28-tab pack = £87.40; 15 mg (blue), 28-tab pack = £119.18; 20 mg (pink), 28-tab pack = £158.90. Label: 2

**Orodispersible tablet (Velotab®),** yellow, olanzapine 5 mg, net price 28-tab pack = £48.07; 10 mg, 28-tab pack = £87.40; 15 mg, 28-tab pack = £131.10; 20 mg, 28-tab pack = £174.79. Label: 2, counselling, administration

**Excipients** include aspartame (section 9.4.1)

**Counselling** Velotab® may be placed on the tongue and allowed to dissolve, or dispersed in water, orange juice, apple juice, milk, or coffee

### Quetiapine

**Indications** schizophrenia; mania, either alone or with mood stabilizers; depression in bipolar disorder; adjunctive treatment in major depressive disorder

**Cautions** see notes above; also cerebrovascular disease; patients at risk of aspiration pneumonia; treatment of depression in patients under 25 years (increased risk of suicide); elderly, see Prescribing for the Elderly, p. 231

**Hepatic impairment** caution in severe impairment—no information available

**Renal impairment** initially 3 mg once daily if eGFR 50–80 mL/minute/1.73 m² (max. 6 mg once daily); initially 1.5 mg once daily if eGFR 10–50 mL/minute/1.73 m² (max. 3 mg once daily); avoid if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy** see, p. 231; also use only if potential benefit outweighs risk—toxicity in animal studies; if discontinuation during pregnancy is necessary, withdraw gradually

**Breast-feeding** avoid—present in milk

**Side-effects** see notes above; also hypertension, respiratory disorders (including infection), epistaxis, appetite changes, sleep disorders, anxiety, depression, malaise, urinary disorders, arthralgia, myalgia, toothache, oedema; less commonly hypoaesthesia, paraesthesia, taste disturbances, elevated plasma-triglyceride and -cholesterol concentrations, visual disorders, tinnitus, alopecia; rarely intestinal obstruction, pancreatitis, pulmonary embolism, inappropriate antidiuretic hormone secretion, rhabdomyolysis, intra-operative floppy iris syndrome

### Dose

- ADULT over 18 years, 6 mg once daily in the morning, adjusted if necessary in increments of 3 mg over at least 5 days; usual range 3–12 mg daily

**Counselling** Always take with breakfast or always take on an empty stomach

### Invega® (Janssen) [Pm]

#### Tablets, m/r, paliperidone 3 mg (white), net price 28-tab pack = £97.28; 6 mg (beige), 28-tab pack = £97.28; 9 mg (pink), 28-tab pack = £145.92. Label: 2, 25, counselling, administration

### Depot preparation

**Section 4.2.2**

### PALIPERIDONE

**Note** Paliperidone is a metabolite of risperidone

**Indications** schizophrenia; psychotic or manic symptoms of schizoaffective disorder

**Cautions** see notes above; predisposition to gastrointestinal obstruction; elderly patients with dementia and risk factors for stroke; prolactin-dependent tumours; cataract surgery (risk of intraoperative floppy iris syndrome)

**Hepatic impairment** caution in severe impairment—no information available

**Renal impairment** initially 3 mg once daily if eGFR 50–80 mL/minute/1.73 m² (max. 6 mg once daily); initially 1.5 mg once daily if eGFR 10–50 mL/minute/1.73 m² (max. 3 mg once daily); avoid if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy** see, p. 231; also use only if potential benefit outweighs risk—toxicity in animal studies; if discontinuation during pregnancy is necessary, withdraw gradually

**Breast-feeding** avoid—present in milk

**Side-effects** see notes above; also hypertension, respiratory disorders (including infection), epistaxis, appetite changes, sleep disorders, anxiety, depression, malaise, urinary disorders, arthralgia, myalgia, toothache, oedema; less commonly hypoaesthesia, paraesthesia, taste disturbances, elevated plasma-triglyceride and -cholesterol concentrations, visual disorders, tinnitus, alopecia; rarely intestinal obstruction, pancreatitis, pulmonary embolism, inappropriate antidiuretic hormone secretion, rhabdomyolysis, intra-operative floppy iris syndrome

### Dose

- ADULT over 18 years, 6 mg once daily in the morning, adjusted if necessary in increments of 3 mg over at least 5 days; usual range 3–12 mg daily

**Counselling** Always take with breakfast or always take on an empty stomach

### Invega® (Janssen) [Pm]

#### Tablets, m/r, paliperidone 3 mg (white), net price 28-tab pack = £97.28; 6 mg (beige), 28-tab pack = £97.28; 9 mg (pink), 28-tab pack = £145.92. Label: 2, 25, counselling, administration

### Depot preparation

**Section 4.2.2**

### Quetiapine

**Indications** schizophrenia; mania, either alone or with mood stabilizers; depression in bipolar disorder; adjunctive treatment in major depressive disorder

**Cautions** see notes above; also cerebrovascular disease; patients at risk of aspiration pneumonia; treatment of depression in patients under 25 years (increased risk of suicide); elderly, see Prescribing for the Elderly, p. 231

**Hepatic impairment** for immediate-release tablets, initially 25 mg daily, increased daily in steps of 25–50 mg; for modified-release tablets, initially 50 mg daily, increased daily in steps of 50 mg

**Pregnancy** see, p. 231; also use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid

**Side-effects** see notes above; also dyspnoea, elevated plasma-triglyceride and -cholesterol concentrations, peripheral oedema, increased appetite, sleep disorders, irritability, dysarthria, asthenia; less commonly rhinitis, restless legs syndrome, hyponatraemia, hypothyroidism; rarely pancreatitis, hepatitis; very rarely inappropriate secretion of antidiuretic hormone, rhabdomyolysis, angioedema, Stevens-Johnson syndrome; also reported suicidal behaviour (particularly on initiation), toxic epidermal necrolysis
Dose

- **Schizophrenia**, ADULT over 18 years, 25 mg twice daily on day 1, 50 mg twice daily on day 2, 100 mg twice daily on day 3, 150 mg twice daily on day 4, then adjusted according to response, usual range 300–450 mg daily in 2 divided doses; max. 750 mg daily; CHILD 12–18 years see BNF for Children
- **Treatment of mania in bipolar disorder**, ADULT over 18 years, 50 mg twice daily on day 1, 100 mg twice daily on day 2, 150 mg twice daily on day 3, 200 mg twice daily on day 4, then adjusted according to response in steps of up to 200 mg daily to max. 800 mg daily; usual range 400–800 mg daily in 2 divided doses; CHILD 12–18 years see BNF for Children
- **Treatment of depression in bipolar disorder**, ADULT over 18 years, 50 mg twice daily on day 1, 100 mg twice daily on day 2, 150 mg twice daily on day 3, 200 mg twice daily on day 4, then adjusted according to response in steps of up to 200 mg daily to max. 800 mg daily; usual range 400–800 mg daily in 2 divided doses; CHILD 12–18 years see BNF for Children
- **Prevention of mania and depression in bipolar disorder**, ADULT over 18 years, 10 mg once daily (at bedtime) on day 1, 20 mg once daily on day 2, 30 mg once daily on day 3, 40 mg once daily on day 4; adjust according to response, usual dose 300 mg once daily, max. 600 mg daily
- **Prevention of mania and depression in bipolar disorder**, ADULT over 18 years, initially 50 mg once daily (at bedtime) on day 1, 100 mg once daily on day 2, then adjusted according to response, usual range 300–800 mg in 2 divided doses

**Note**

- The dose of dose titration may need to be slower and the dose daily lower in elderly patients; see Prescribing for the Elderly. p. 231

**Quetiapine** (Non-proprietary) (\[^\]^)

- **Tablets**, quetiapine (as fumarate) 25 mg, net price 60-tab pack = £1.44; 100 mg, 60-tab pack = £2.43; 150 mg, 60-tab pack = £2.78; 200 mg 60-tab pack = £3.26; 300 mg, 60-tab pack = £4.34. Label: 2

**Seroquel** (AstraZeneca) (\[^\]^)

- **Tablets**, f/c, quetiapine (as fumarate) 25 mg (peach), net price 60-tab pack = £40.50; 100 mg (yellow), 60-tab pack = £113.10; 150 mg (pale yellow), 60-tab pack = £113.10; 200 mg (white), 60-tab pack = £113.10; 300 mg (white), 60-tab pack = £170.00. Label: 2

**Modified release**

**Quetiapine m/r preparations** (\[^\]^)

- **Tablets**, m/r, quetiapine (as fumarate) 50 mg, net price 60-tab pack = £57.66; 150 mg 60-tab pack = £113.10; 200 mg, 60-tab pack = £113.10; 300 mg, 60-tab pack = £170.00; 400 mg, 60-tab pack = £226.20. Label: 2, 23, 25

**Brands include** Seroquel\(^{\text{XL}}\), Tenprolide\(^{\text{XL}}\)

**Dose**

- Schizophrenia, ADULT over 18 years, 2 mg in 1–2 divided doses on first day then 4 mg in 1–2 divided doses on second day (slower titration appropriate in some patients); usual dose range 4–6 mg daily; doses above 10 mg daily only if benefit considered to outweigh risk (max. 16 mg daily); ELDERLY initially 500 micrograms twice daily increased in steps of 500 micrograms twice daily to 1–2 mg twice daily; CHILD 12–18 years see BNF for Children
- **Mania, initially 2 mg once daily, increased if necessary in steps of 1 mg daily; usual dose range 1–4 mg daily; ELDERLY initially 500 micrograms twice daily increased in steps of 500 micrograms twice daily to 1–2 mg twice daily; CHILD 12–18 years see BNF for Children
- **Persistent aggression in Alzheimer’s dementia, initially 250 micrograms twice daily, increased according to response in steps of 250 micrograms twice daily on alternate days; usual dose 500 micrograms twice daily (up to 1 mg twice daily has been required)**
- **Persistent aggression in conduct disorder, CHILD 5–18 years see BNF for Children**

Risperidone (Non-proprietary) (\[^\]^)

- **Tablets**, risperidone 500 micrograms, net price 20-tab pack = £1.05; 1 mg, 20-tab pack = 90p, 60-tab pack = £1.66; 2 mg, 60-tab pack = £1.66; 3 mg, 60-tab pack = £1.99; 4 mg, 60-tab pack = £2.20; 6 mg, 28-tab pack = £5.36. Label: 2

**Indications**

- acute and chronic psychoses, mania; short-term treatment (up to 6 weeks) of persistent aggression in patients with moderate to severe Alzheimer’s dementia unresponsive to non-pharmacological interventions and when there is a risk of harm to self or others; short-term treatment (up to 6 weeks) of persistent aggression in conduct disorder (under specialist supervision)

Cautions

- see notes above; dementia with Lewy bodies; prolactin-dependent tumours, dehydration; cataract surgery (risk of intra-operative flopppy iris syndrome); avoid in acute porphyria (section 9.8.2)

**Hepatic impairment** initial and subsequent oral doses should be halved

**Renal impairment** initial and subsequent oral doses should be halved

**Pregnancy** see Pregnancy notes, p. 231; also use only if potential benefit outweighs risk

**Breast-feeding** use only if potential benefit outweighs risk—small amount present in milk

**Side-effects** see notes above; also hypertension, respiratory disorders (including infection), epistaxis, appetite changes, sleep disorders, anxiety, depression, malaise, urinary disorders, arthralgia, myalgia, toothache, oedema; less commonly: hypoesthesia, paraesthesia, taste disturbances, elevated plasma-triglyceride and -cholesterol concentrations, visual disorders, tinnitus, alopecia; rarely: intestinal obstruction, pancreatitis, pulmonary embolism, inappropriate antidiuretic hormone secretion, rhabdomyolysis, intra-operative floppy iris syndrome

**Risperidone** (Non-proprietary) (\[^\]^)

- **Tablets**, risperidone 500 micrograms, net price 20-tab pack = £1.05; 1 mg, 20-tab pack = 90p, 60-tab pack = £1.66; 2 mg, 60-tab pack = £1.66; 3 mg, 60-tab pack = £1.99; 4 mg, 60-tab pack = £2.20; 6 mg, 28-tab pack = £5.36. Label: 2
### 4.2.2 Antipsychotic depot injections

Long-acting depot injections are used for maintenance therapy especially when compliance with oral treatment is unreliable. However, depot injections of conventional antipsychotics may give rise to a higher incidence of extrapyramidal reactions than oral preparations; extrapyramidal reactions occur less frequently with second-generation antipsychotic depot preparations, such as risperidone and olanzapine embonate.

**Administration**  
Depot antipsychotics are administered by deep intramuscular injection at intervals of 1 to 4 weeks. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged. In general not more than 2–3 mL of oily injection should be administered at any one site; correct injection technique (including the use of z-track technique) and rotation of injection sites are essential. If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

**Equivalent doses of depot antipsychotics**

These equivalences are intended only as an approximate guide; individual dosage instructions should also be checked; patients should be carefully monitored after any change in medication.

<table>
<thead>
<tr>
<th>Antipsychotic drug</th>
<th>Dose (mg)</th>
<th>Interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fluphenazine decanoate</td>
<td>40</td>
<td>2 weeks</td>
</tr>
<tr>
<td>Haloperidol (as decanoate)</td>
<td>100</td>
<td>4 weeks</td>
</tr>
<tr>
<td>Pipotiazine palmilate</td>
<td>50</td>
<td>4 weeks</td>
</tr>
<tr>
<td>Zuclopenthixol decanoate</td>
<td>200</td>
<td>2 weeks</td>
</tr>
</tbody>
</table>

**Important** These equivalences must not be extrapolated beyond the maximum dose for the drug.

### Choice

There is no clear-cut division in the use of the conventional antipsychotics, but zuclopenthixol may be suitable for the treatment of agitated or aggressive patients whereas fluphenazine can cause over-excitement in such patients. Zuclopenthixol decanoate may be more effective in preventing relapses than other conventional antipsychotic depot preparations. The incidence of extrapyramidal reactions is similar for the conventional antipsychotics.

### Cautions

See section 4.2.1. Treatment requires careful monitoring for optimum effect. When transferring from oral to depot therapy, the dose by mouth should be reduced gradually.

### Contra-indications

See section 4.2.1. Do not use in children.

### Side-effects

See section 4.2.1. Pain may occur at injection site and occasionally erythema, swelling, and nodules. For side-effects of specific antipsychotics see under the relevant drug.

### ARIPIPRAZOLE

**Indications**  
maintenance in schizophrenia in patients stabilised with oral aripiprazole

**Cautions**  
see section 4.2.1; cerebrovascular disease; elderly

**Contra-indications**  
see section 4.2.1

**Hepatic impairment**  
oral treatment preferred in severe impairment; see Aripiprazole (section 4.2.1)

**Pregnancy**  
see Aripiprazole (section 4.2.1)

**Breast-feeding**  
see Aripiprazole (section 4.2.1)

**Side-effects**  
see Aripiprazole (section 4.2.1) and notes above

**Dose**

- By intramuscular injection into the gluteal muscle, 400 mg repeated at monthly intervals (minimum 26 days between injections); for dose adjustment due to side-effects or concomitant use of interacting drugs,

---

**Depot preparation**

Section 4.2.2

**Orodispersible tablets**, risperidone 500 micrograms, net price 28-tab pack = £23.40; 1 mg, 28-tab pack = £20.67; 2 mg, 28-tab pack = £37.81; 3 mg, 28-tab pack = £33.47; 4 mg, 28-tab pack = £37.44. Label: 2, counselling, administration

**Counselling**  
Tablets should be placed on the tongue, allowed to dissolve and swallowed

**Note**  
Liquid may be diluted with any non-alcoholic drink, except tea

**Risperdal**® (Janssen) (Pot)

**Tablets**, 1/c, scored, risperidone 500 micrograms (brown-red), net price 28-tab pack = £5.08; 1 mg (white), 28-tab pack = £8.36; 60-tab pack = £17.58; 2 mg (orange), 60-tab pack = £34.62; 3 mg (yellow), 60-tab pack = £50.91; 4 mg (green), 60-tab pack = £67.20; 6 mg (yellow), 28-tab pack = £67.88. Label: 2, counselling, use of dose syringe

**Note**  
Tablets should be placed on the tongue, allowed to dissolve and swallowed

**Liquid**, risperidone 1 mg/mL, net price 100-mL pack = £38.13. Label: 2, counselling, administration

**Important**  
These equivalences must not be extrapolated beyond the maximum dose for the drug.
consult product literature; CHILD under 18 years not recommended

Note Treatment with 10–20 mg of oral aripiprazole should be continued for 14 consecutive days after the first injection; for missed depot doses see product literature

Ability Maintena® (Otsuka) (Fu)
Injection, powder for reconstitution, aripiprazole 400-mg vial (with solvent), net price = £220.41

Important When prescribing, dispensing or administering, check that this is the correct preparation—this preparation is used for maintenance treatment and should not be used for the rapid control of an acute episode

FLUPENTIXOL DECANOATE
(Flupentixol Decanoate)

Indications maintenance in schizophrenia and other psychoses

Cautions see Flupentixol (section 4.2.1) and notes above; an alternative antipsychotic may be necessary if symptoms such as aggression or agitation appear

Contra-indications see Flupentixol (section 4.2.1) and notes above

Hepatic impairment see section 4.2.1
Renal impairment see section 4.2.1
Pregnancy see section 4.2.1
Breast-feeding see section 4.2.1

Side-effects see Flupentixol (section 4.2.1) and notes above, but may have a mood elevating effect

Dose
By deep intramuscular injection into the upper outer buttock or lateral thigh, test dose 20 mg; then after at least 7 days 20–40 mg repeated at intervals of 2–4 weeks, adjusted according to response; max. 400 mg weekly; usual maintenance dose 50 mg every 4 weeks to 300 mg every 2 weeks; ELDERLY initially quarter to half adult dose; CHILD not recommended

Depixol® (Lundbeck) (Fu)
Injection (oily), flupentixol decanoate 20 mg/mL, net price 1-mL amp = £1.52; 2-mL amp = £2.54

Depixol Conc.® (Lundbeck) (Fu)
Injection (oily), flupentixol decanoate 100 mg/mL, net price 1-mL amp = £6.25

Depixol Low Volume® (Lundbeck) (Fu)
Injection (oily), flupentixol decanoate 200 mg/mL, net price 1-mL amp = £19.52

FLUPHENAZINE DECANOATE

Indications maintenance in schizophrenia and other psychoses

Cautions see section 4.2.1 and notes above; dose adjustment may be necessary if smoking started or stopped during treatment; QT-interval prolongation (avoid concomitant drugs that prolong QT interval)

Contra-indications see section 4.2.1 and notes above; also marked cerebral atherosclerosis

Hepatic impairment see section 4.2.1; avoid in hepatic failure

Renal impairment see section 4.2.1; manufacturer advises caution; avoid in renal failure

Pregnancy see section 4.2.1

Breast-feeding see section 4.2.1

Side-effects see section 4.2.1 and notes above; less sedating and fewer antimuscarinic or hypotensive symptoms, but extrapyramidal symptoms, particularly dystonic reactions and akathisia, more frequent; systemic lupus erythematosus, inappropriate antidiuretic hormone secretion, and oedema also reported; extrapyramidal symptoms usually appear a few hours after injection and continue for about 2 days but may be delayed

Dose
By deep intramuscular injection into the gluteal muscle, test dose 12.5 mg (6.25 mg in elderly), then after 4–7 days 12.5–100 mg repeated at intervals of 14–35 days, adjusted according to response; CHILD not recommended

Fluphenazine decanoate (Non-proprietary) (Fu)
Injection (oily), fluphenazine decanoate 25 mg/mL, net price 1-mL amp = £2.26; 100 mg/mL, 0.5-mL amp = £4.50, 1-mL amp = £8.75
Excipients include sesame oil

Modcate® (Sanofi-Aventis) (Fu)
Injection (oily), fluphenazine decanoate 25 mg/mL, net price 1-mL amp = £1.30, 1-mL amp = £2.26, 2-mL amp = £4.44
Excipients include sesame oil

Modicate Concentrate® (Sanofi-Aventis) (Fu)
Injection (oily), fluphenazine decanoate 100 mg/mL, net price 0.5-mL amp = £4.47, 1-mL amp = £8.75
Excipients include sesame oil

HALOPERIDOL

Indications maintenance in schizophrenia and other psychoses

Cautions see Haloperidol (section 4.2.1) and notes above

Contra-indications see Haloperidol (section 4.2.1) and notes above

Hepatic impairment see section 4.2.1
Renal impairment see section 4.2.1
Pregnancy avoid unless benefits outweigh risks; see also section 4.2.1
Breast-feeding see section 4.2.1

Side-effects see Haloperidol (section 4.2.1) and notes above

Dose
By deep intramuscular injection into the gluteal muscle, initially 50 mg every 4 weeks, if necessary increasing by 50-mg increments to 300 mg every 4 weeks; higher doses may be needed in some patients; ELDERLY, initially 12.5–25 mg every 4 weeks; CHILD not recommended

Note If 2-weekly administration preferred, doses should be halved

Haldol Decanoate® (Janssen) (Fu)
Injection (oily), haloperidol (as decanoate) 50 mg/mL, net price 1-mL amp = £3.81; 100 mg/mL, 1-mL amp = £5.05
Excipients include sesame oil and benzyl alcohol (see Excipients)

Important When prescribing, dispensing or administering, check that this is the correct preparation—this preparation is used for maintenance treatment and should not be used for the rapid control of an acute episode

OLANZAPINE EMBONATE
(Olanzapine Pamoate)

Indications maintenance in schizophrenia in patients tolerant to olanzapine by mouth

Cautions see under Olanzapine (section 4.2.1) and notes above; observe patient for at least 3 hours after injection
4.2.2 Antipsychotic depot injections

PALIPERIDONE

**Indications** maintenance in schizophrenia in patients previously responsive to paliperidone or risperidone

**Cautions** see Paliperidone (section 4.2.1) and notes above

**Hepatic impairment** see Paliperidone (section 4.2.1)

**Renal impairment**
- initial dose 100 mg on day 1 and then 75 mg on day 8 if eGFR 50–100 mL/minute/1.73 m²; recommended maintenance dose 50 mg (range 25–100 mg) monthly if eGFR 50–80 mL/minute/1.73 m²; avoid if eGFR less than 50 mL/minute/1.73 m²
- recommended maintenance dose 50 mg every 4 weeks; dose adjusted at intervals of at least 4 weeks in steps of 12.5 mg to max. 50 mg every 4 weeks; CHILD under 18 years not recommended

**Pregnancy** see Paliperidone (section 4.2.1)

**Breast-feeding** avoid unless essential

**Side-effects** see Paliperidone (section 4.2.1) and notes above

**Dose**
- By deep intramuscular injection into the deltoid muscle, 150 mg on day 1, then 100 mg on day 8, then adjusted at monthly intervals according to response; recommended maintenance dose 75 mg (range 25–150 mg) monthly

**Note** Following the second dose, monthly maintenance doses can be administered into either the deltoid or gluteal muscle; for missed doses see product literature; 25 mg prefilled syringe not available in the UK

**Excipients**
- Pipotiazine Palmitate (Pipothiazine Palmitate)

RISPERIDONE

**Indications** schizophrenia and other psychoses in patients tolerant to risperidone by mouth

**Cautions** see Risperidone (section 4.2.1) and notes above

**Hepatic impairment** if an oral dose of at least 2 mg daily tolerated, 25 mg as a depot injection can be given every 2 weeks

**Renal impairment** see Risperidone (section 4.2.1)

**Pregnancy** see Risperidone (section 4.2.1)

**Breast-feeding** see Risperidone (section 4.2.1)

**Side-effects** see Risperidone (section 4.2.1) and notes above

**Dose**
- By deep intramuscular injection into the deltoid or gluteal muscle, patients taking oral risperidone up to 4 mg daily, initially 25 mg every 2 weeks; patients taking oral risperidone over 4 mg daily, initially 37.5 mg every 2 weeks; dose adjusted at intervals of at least 4 weeks in steps of 12.5 mg to max. 50 mg every 4 weeks; CHILD under 18 years not recommended

**Note** During initiation risperidone by mouth may need to be continued for 4–6 weeks; risperidone by mouth may also be used during dose adjustment of depot injection

**Risperdal Consta® (Janssen)**

**Indications** maintenance in schizophrenia and paranoid psychoses

**Cautions** see section 4.2.1 and notes above; QT-interval prolongation (avoid concomitant use of drugs that prolong QT interval); avoid in acute porphyria

**Contra-indications** see section 4.2.1 and notes above

**Hepatic impairment** see section 4.2.1

**Renal impairment** see section 4.2.1

**Pregnancy** see section 4.2.1

**Breast-feeding** avoid unless essential

**Side-effects** see section 4.2.1 and notes above

**Dose**
- By deep intramuscular injection into the deltoid or gluteal muscle, test dose 25 mg, then a further 25–50 mg after 4–7 days, then adjusted according to response at intervals of 4 weeks; usual maintenance range 50–100 mg (max. 200 mg) every 4 weeks; CHILD initially 5–10 mg

**Excipients** include sesame oil

ZUCLOPENTHIXOL DECANOATE

**Indications** maintenance in schizophrenia and paranoid psychoses

**Cautions** see section 4.2.1 and notes above; QT-interval prolongation (avoid concomitant use of drugs that prolong QT interval); avoid in acute porphyria (section 9.8.2)

**Contra-indications** see section 4.2.1

**Hepatic impairment** see section 4.2.1

**Renal impairment** see section 4.2.1

**Pregnancy** see section 4.2.1

**Breast-feeding** avoid unless essential

**Side-effects** see section 4.2.1 and notes above

**Dose**
- By deep intramuscular injection into the deltoid or gluteal muscle, patients taking oral risperidone up to 4 mg daily, initially 25 mg every 2 weeks; patients taking oral risperidone over 4 mg daily, initially 37.5 mg every 2 weeks; dose adjusted at intervals of at least 4 weeks in steps of 12.5 mg to max. 50 mg every 4 weeks; CHILD under 18 years not recommended

**Note** During initiation risperidone by mouth may need to be continued for 4–6 weeks; risperidone by mouth may also be used during dose adjustment of depot injection

**Risperdal Consta® (Janssen)**

**Indications** maintenance in schizophrenia and paranoid psychoses

**Cautions** see section 4.2.1 and notes above; QT-interval prolongation (avoid concomitant use of drugs that prolong QT interval); avoid in acute porphyria

**Contra-indications** see section 4.2.1 and notes above

**Hepatic impairment** see section 4.2.1

**Renal impairment** see section 4.2.1

**Pregnancy** see section 4.2.1

**Breast-feeding** avoid unless essential

**Side-effects** see section 4.2.1 and notes above

**Dose**
- By deep intramuscular injection into the deltoid or gluteal muscle, test dose 25 mg, then a further 25–50 mg after 4–7 days, then adjusted according to response at intervals of 4 weeks; usual maintenance range 50–100 mg (max. 200 mg) every 4 weeks; CHILD initially 5–10 mg

**Excipients** include sesame oil
Antimanic drugs are used to control acute attacks and to prevent recurrence of episodes of mania or hypomania. Long-term treatment of bipolar disorder should continue for at least two years from the last manic episode and up to five years if the patient has risk factors for relapse.

An antidepressant drug (section 4.3) may also be required for the treatment of co-existing depression, but should be avoided in patients with rapid-cycling bipolar disorder, a recent history of hypomania, or with rapid mood fluctuations.

**Benzodiazepines**

Use of benzodiazepines (such as lorazepam) (section 4.1) may be helpful in the initial stages of treatment for behavioural disturbance or agitation; they should not be used for long periods because of the risk of dependence.

**Antipsychotic drugs**

Antipsychotic drugs (normally olanzapine, quetiapine, or risperidone) (section 4.2.1) are useful in acute episodes of mania and hypomania; if the response to antipsychotic drugs is inadequate, lithium or valproate may be added. An antipsychotic drug may be used concomitantly with lithium or valproate in the initial treatment of severe acute mania.

Olanzapine can be used for the long-term management of bipolar disorder in patients whose manic episode responded to olanzapine therapy. It can be given either as monotherapy, or in combination with lithium or valproate if the patient has frequent relapses or continuing functional impairment.

Asenapine, a second-generation antipsychotic, is licensed for the treatment of moderate to severe manic episodes associated with bipolar disorder.

When discontinuing antipsychotics, the dose should be reduced gradually over at least 4 weeks if the patient is continuing with other antimanic drugs; if the patient is not continuing with other antimanic drugs or if there is a history of manic relapse, a withdrawal period of up to 3 months should be considered.

High doses of haloperidol or flupentixol may be hazardous when used with lithium; irreversible toxic encephalopathy has been reported.

**ASENAPINE**

**Indications** treatment of moderate to severe manic episodes associated with bipolar disorder

**Cautions** see section 4.2.1; also dementia with Lewy Bodies

**Hepatic impairment** use with caution in moderate impairment; avoid in severe impairment

**Renal impairment** use with caution if eGFR less than 15 mL/minute/1.73 m²—no information available

**Pregnancy** use only if potential benefit outweighs risk—toxicity in animal studies; see also section 4.2.1

**Breast-feeding** avoid—no information available

**Side-effects** see section 4.2.1; also hypersalivation, taste disturbance, tongue swelling, glossodynia, anxiety, speech disturbance, dysphagia, transient oral hypoaesthesia and paraesthesia, rhombomylolysis

**Dose**

- Monotherapy, **ADULT** over 18 years initially 10 mg twice daily, reduced to 5 mg twice daily according to response
- Combination therapy, **ADULT** over 18 years initially 5 mg twice daily, increased if necessary to 10 mg twice daily according to response

**Sycrest** (Lundbeck) ▼

Tablets (sublingual), asenapine (as maleate) 5 mg, net price 60-tab pack = £102.60; 10 mg, 60-tab pack = £102.60. Label: 2, 26, counselling, administration

**Carbamazepine**

Carbamazepine (section 4.8.1) may be used under specialist supervision for the prophylaxis of bipolar disorder (manic-depressive disorder) in patients unresponsive to a combination of other prophylactic drugs; it is used in patients with rapid-cycling manic-depressive illness (4 or more affective episodes per year). The dose of carbamazepine should not normally be increased if an acute episode of mania occurs.

When stopping treatment with carbamazepine, reduce the dose gradually over a period of at least 4 weeks.

**Valproate**

Valproic acid (as the semisodium salt) and sodium valproate (section 4.8.1) are used for the treatment of manic episodes associated with bipolar disorder.

Valproate (valproic acid and sodium valproate) is also used for the prophylaxis of bipolar disorder; however, it should not normally be prescribed for women of child-bearing potential. In patients with frequent relapse or continuing functional impairment, consider switching therapy to lithium or olanzapine, or adding lithium or olanzapine to valproate. If a patient taking valproate experiences an acute episode of mania that is not ameliorated by increasing the valproate dose, consider concomitant therapy with olanzapine, quetiapine, or risperidone.

If treatment with valproate is stopped, reduce the dose gradually over at least 4 weeks.
Central nervous system

Need for continued therapy should be assessed regularly as starting ACE inhibitors, NSAIDs, or diuretics. The deterioration or if the patient has other risk factors, such function should be monitored at baseline and every 6 months. Long-term treatment should therefore be under- 

Long-term use of lithium has been associated with thy- 

Lithium toxicity is made worse by sod- 

Interactions Lithium toxicity is made worse by sodium depletion, therefore concurrent use of diuretics (particularly thiazides) is hazardous and should be avoided. For other interactions with lithium, see Appendix 1 (lithium).

Withdrawal While there is no clear evidence of withdrawal or rebound psychosis, abrupt discontinua- 

Lithium treatment packs A lithium treatment pack should be given to patients on initiation of treatment with lithium. The pack consists of a patient information booklet, lithium alert card, and a record book for tracking serum-lithium concentration. Packs may be purchased from 3M. Tel: 0845 610 1112

Lithium carbonate

Indications treatment and prophylaxis of mania, bipolar disorder, and recurrent depression (see also notes above); aggressive or self-harming behaviour

Cautions see notes above; assess cardiac, renal, and thyroid function before initiating, and thereafter every
BNF 68

4.2.3 Drugs used for mania and hypomania

6 months on stabilised regimens; cardiac disease; QT-interval prolongation (caution with concomitant use of drugs that prolong the QT interval); review dose as necessary in diarrhoea, vomiting, and intercurrent infection (especially if sweating profusely); may lower seizure threshold (caution with epilepsy; concurrent ECT, concomitant use of drugs and any therapy that may lower seizure threshold); psoriasis (risk of exacerbation); elderly (reduce dose); diuretic treatment (risk of toxicity); myasthenia gravis; surgery (section 15.1); avoid abrupt withdrawal (see notes above); interactions: Appendix 1 (lithium)

Counselling Patients should be advised to report signs and symptoms of lithium toxicity (see above), hypothyroidism, renal dysfunction (including polyuria and polydipsia), and benign intracranial hypertension (persistent headache and visual disturbance); maintain adequate fluid intake and avoid dietary changes which reduce or increase sodium intake; may impair performance of skilled tasks (e.g. driving, operating machinery); lithium treatment packs are available (see above)

Contra-indications dehydration, low sodium diets, Addison’s disease, untreated hypothyroidism, personal or family history of Brugada syndrome, cardiac insufficiency or rhythm disorder

Renal impairment caution in mild to moderate impairment—monitor serum-lithium concentration closely and adjust dose accordingly; avoid in severe impairment

Pregnancy avoid if possible, particularly in the first trimester (risk of teratogenicity, including cardiac abnormalities); dose requirements increased during the second and third trimesters (but on delivery return abruptly to normal); close monitoring of serum-lithium concentration advised (risk of toxicity in neonate); manufacturer advises effective contraception during treatment for women of child bearing potential

Breast-feeding present in milk and risk of toxicity in infant—avoid

Side-effects gastro-intestinal disturbances, gastritis, weight changes, anorexia, oedema, benign intracranial hypertension, Raynaud’s phenomena, ECG changes (including arrhythmia, bradycardia, sinus node dysfunction, QT interval prolongation, AV block), cardiomyopathy, hypersalivation, dry mouth, cognitive impairment, hallucinations, extrapyramidal side-effects, fine tremor, speech disorder, vertigo, memory loss, encephalopathy, dysgeusia, malaise, myasthenia gravis, peripheral neuropathy, kidney changes, renal impairment, polydipsia, nephrotic syndrome, nephrogenic diabetes insipidus; electrolyte imbalance, sexual dysfunction; thyroid changes (including hyperthyroidism, hypothyroidism, euthyroid goitre); hyperparathyroidism, parathyroid adenoma, leucocytosis, arthralgia, myalgia, nystagmus, alopecia, psoriasis exacerbation, acneiform eruptions and other skin disorders; signs of intoxication require withdrawal of treatment and include increasing gastrointestinal disturbances (vomiting, diarrhoea), visual disturbances, polyuria, muscle weakness, fine tremor increasing to coarse tremor, CNS disturbances (confusion and drowsiness increasing to lack of coordination, restlessness, stupor); abnormal reflexes, myoclonus, incontinence, hypnerotemia; with severe overdose (serum-lithium concentration above 2 mmol/litre) seizures, cardiac arrhythmias (including sino-atrial block, bradycardia and first-degree heart block), blood pressure changes, circulatory failure, renal failure, coma and sudden death reported; see also Emergency Treatment of Poisoning, p. 40

Dose • See under preparations below, adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter; doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Note Preparations vary widely in bioavailability; changing the preparation requires the same precautions as initiation of treatment

Camcolit® (Norgine)® Camcolit 250® tablets, f/c, scored, lithium carbonate 250 mg (Li+ 0.8 mmol), net price 100-tab pack = £3.22. Label: 10, lithium card, counselling, driving, fluid and salt intake, toxicity symptoms, see above

Camcolit 400® tablets, m/r, f/c, scored, lithium carbonate 400 mg (Li+ 1.08 mmol), net price 100-tab pack = £3.40. Label: 10, lithium card, 25, counselling, driving, fluid and salt intake, toxicity symptoms, see above

Dose (see Dose above for advice on bioavailability and serum monitoring)

Treatment, ADULT over 18 years, initially 1–1.5 g daily; ELDERLY reduce initial dose; prophylaxis, ADULT over 18 years, initially 300–400 mg daily; CHILD under 18 years see BNF for Children

Note Camcolit 400® also available as Lithionate® (TEYA UK)

Liskonum® (GSK)® Tablets, m/r, f/c, scored, lithium carbonate 450 mg (Li+ 12.2 mmol), net price 60-tab pack = £2.88. Label: 10, lithium card, 25, counselling, driving, fluid and salt intake, toxicity symptoms, see above

Dose (see Dose above for advice on bioavailability and serum monitoring)

Treatment, ADULT over 18 years, initially 450–675 mg twice daily; ELDERLY initially 225 mg twice daily; prophylaxis, ADULT over 18 years, initially 450 mg twice daily; CHILD under 18 years see BNF for Children

Priadel® (Sanofi-Aventis)® Tablets, m/r, both scored, lithium carbonate 200 mg (Li+ 5.4 mmol), net price 100-tab pack = £2.30; 400 mg (Li+ 10.8 mmol), 100-tab pack = £3.35. Label: 10, lithium card, 25, counselling, driving, fluid and salt intake, toxicity symptoms, see above

Dose (see Dose above for advice on bioavailability and serum monitoring)

Treatment and prophylaxis, ADULT over 18 years, initially 0.4–1.2 g daily as a single dose or in 2 divided doses, ELDERLY or patients less than 50 kg, initially 200–400 mg daily; CHILD not recommended

Liquid, see under Lithium Citrate below

**LITHIUM CITRATE**

Indications see Lithium Carbonate

Cautions see Lithium Carbonate

Counselling Patients should be advised to report signs and symptoms of lithium toxicity (see above), hypothyroidism, renal dysfunction (including polyuria and polydipsia), and benign intracranial hypertension (persistent headache and visual disturbance); maintain adequate fluid intake and avoid dietary changes which reduce or increase sodium intake; may impair performance of skilled tasks (e.g. driving, operating machinery); lithium treatment cards are available (see above)

Contra-indications see Lithium Carbonate

Renal impairment see Lithium Carbonate

Pregnancy see Lithium Carbonate
Central nervous system

4.3 Antidepressant drugs

Breast-feeding see Lithium Carbonate

Side-effects see Lithium Carbonate

Dose

- See under preparations below, adjusted to achieve serum-lithium concentration of 0.4–1 mmol/litre as described under Lithium Carbonate

Note Preparations vary widely in bioavailability, changing the preparation requires the same precautions as initiation of treatment

4.3.1 Tricyclic and related antidepressant drugs

Tricyclic antidepressants (section 4.3.1), the selective serotonin re-uptake inhibitors (SSRIs) (section 4.3.3), and the monoamine oxidase inhibitors (MAOIs) (section 4.3.2). A number of antidepressant drugs cannot be accommodated easily into this classification; these are included in section 4.3.4.

There is little to choose between the different classes of antidepressant drugs in terms of efficacy, so choice should be based on the individual patient’s requirements, including the presence of concomitant disease, existing therapy, suicide risk, and previous response to antidepressant therapy. Since there may be an interval of 2 weeks before the antidepressant action takes place, electroconvulsive treatment may be required in severe depression when delay is hazardous or intolerable. During the first few weeks of treatment, there is an increased potential for agitation, anxiety, and suicidal ideation (see p. 249).

SSRIs are better tolerated and are safer in overdose than other classes of antidepressants and should be considered first-line for treating depression. In patients with unstable angina or who have had a recent myocardial infarction, sertraline has been shown to be safe.

Tricyclic antidepressants have similar efficacy to SSRIs but are more likely to be discontinued because of side-effects; toxicity in overdose is also a problem. See section 4.3.1 for more details.

MAOIs have dangerous interactions with some foods and drugs, and should be reserved for use by specialists.

Although anxiety is often present in depressive illness (and may be the presenting symptom), the use of an antipsychotic or an anxiolytic may mask the true diagnosis. Anxiolytics (section 4.1.2) or antipsychotic drugs (section 4.2.1) should therefore be used with caution in depression but they are useful adjuncts in agitation. Augmenting antidepressants with antipsychotics under specialist supervision may also be necessary in patients who have depression with psychotic symptoms.

See section 4.2.3 for notes on the management of bipolar disorder.

St John’s wort (Hypericum perforatum) is a popular herbal remedy on sale to the public for treating mild depression. It should not be prescribed or recommended for depression because St John’s wort can induce drug metabolising enzymes and a number of important interactions with conventional drugs, including conventional antidepressants, have been identified (see Appendix 1, St John’s wort). Furthermore, the amount of active ingredient varies between different preparations of St John’s wort and switching from one to another can change the degree of enzyme induction. If a patient stops taking St John’s wort, the concentration of interacting drugs may increase, leading to toxicity.

Hyponatraemia and antidepressant therapy

Hyponatraemia (usually in the elderly and possibly due to inappropriate secretion of antidiuretic hormone) has been associated with all types of antidepressants; however, it has been reported more frequently with SSRIs than with other antidepressants. Hyponatraemia should be considered in all patients who develop drowsiness, confusion, or convulsions while taking an antidepressant.

St John’s wort (Hypericum perforatum) is a popular herbal remedy on sale to the public for treating mild depression. It should not be prescribed or recommended for depression because St John’s wort can induce drug metabolising enzymes and a number of important interactions with conventional drugs, including conventional antidepressants, have been identified (see Appendix 1, St John’s wort). Furthermore, the amount of active ingredient varies between different preparations of St John’s wort and switching from one to another can change the degree of enzyme induction. If a patient stops taking St John’s wort, the concentration of interacting drugs may increase, leading to toxicity.

Hyponatraemia and antidepressant therapy

Hyponatraemia (usually in the elderly and possibly due to inappropriate secretion of antidiuretic hormone) has been associated with all types of antidepressants; however, it has been reported more frequently with SSRIs than with other antidepressants. Hyponatraemia should be considered in all patients who develop drowsiness, confusion, or convulsions while taking an antidepressant.
Suicidal behaviour and antidepressant therapy

The use of antidepressants has been linked with suicidal thoughts and behaviour; children, young adults, and patients with a history of suicidal behaviour are particularly at risk. Where necessary patients should be monitored for suicidal behaviour, self-harm, or hostility, particularly at the beginning of treatment or if the dose is changed.

Management

Patients should be reviewed every 1–2 weeks at the start of antidepressant treatment. Treatment should be continued for at least 4 weeks (6 weeks in the elderly) before considering whether to switch antidepressant due to lack of efficacy. In cases of partial response, continue for a further 2–4 weeks (elderly patients may take longer to respond).

Following remission, antidepressant treatment should be continued at the same dose for at least 6 months (about 12 months in the elderly), or for at least 12 months in patients receiving treatment for generalised anxiety disorder (as the likelihood of relapse is high). Patients with a history of recurrent depression should receive maintenance treatment for at least 2 years.

Failure to respond

Failure to respond to initial treatment with an SSRI may require an increase in the dose, or switching to a different SSRI or mirtazapine. Other second-line choices include lofepramine, moclobemide, and reboxetine. Other tricyclic antidepressants and venlafaxine should be considered for more severe forms of depression; irreversible MAOIs should only be prescribed by specialists. Failure to respond to a second antidepressant may require the addition of another antidepressant of a different class, or use of an augmenting agent (such as lithium (section 4.2.3), aripiprazole [unlicensed], olanzapine [unlicensed], quetiapine, or risperidone [unlicensed] (section 4.2.1)), but such adjunctive treatment should be initiated only by doctors with special experience of these combinations. Electroconvulsive therapy may be initiated in severe refractory depression.

Withdrawal

Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. Drugs with a shorter half-life, such as paroxetine (p. 257) and venlafaxine (p. 260), are associated with a higher risk of withdrawal symptoms. The risk of withdrawal symptoms is also increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). See also section 4.3.1, section 4.3.2, and section 4.3.3.

Anxiety disorders and obsessive-compulsive disorder

Management of acute anxiety generally involves the use of a benzodiazepine or buspironne (section 4.1.2). For chronic anxiety (of longer than 4 weeks’ duration) it may be appropriate to use an antidepressant. Combined therapy with a benzodiazepine may be required until the antidepressant takes effect. Patients with generalised anxiety disorder, a form of chronic anxiety, should be offered psychological treatment before initiating an antidepressant. If drug treatment is needed, an SSRI such as escitalopram, paroxetine, or sertraline [unlicensed], can be used. Duloxetine and venlafaxine (serotonin and noradrenaline reuptake inhibitors) are also recommended for the treatment of generalised anxiety disorder; if the patient cannot tolerate SSRIs or serotonin and noradrenaline reuptake inhibitors (or if treatment has failed to control symptoms), pregabalin can be considered.

Panic disorder, obsessive-compulsive disorder, post-traumatic stress disorder, and phobic states such as social anxiety disorder are treated with SSRIs. Clomipramine or imipramine can be used second-line in panic disorder [unlicensed]; clomipramine can also be used second-line for obsessive-compulsive disorder. Moclobemide is licensed for the treatment of social anxiety disorder.

Tricyclic and related antidepressant drugs

This section covers tricyclic antidepressants and also 1-, 2-, and 4-ring structured drugs with broadly similar properties.

Some tricyclic antidepressants are used in the management of panic and other anxiety disorders (section 4.3). For reference to the role of some tricyclic antidepressants in some forms of neuralgia, see section 4.7.3, and in nocturnal enuresis in children, see section 7.4.2.

Cautions

Tricyclic and related antidepressant drugs should be used with caution in patients with cardiovascular disease (see also Contra-indications, below); because of the risk of arrhythmias, patients with concomitant conditions such as hyperthyroidism and phaeochromocytoma should be treated with care. Care is also needed in patients with epilepsy and diabetes.

Tricyclic antidepressant drugs have antimuscarinic activity, and therefore caution is needed in patients with prostatic hypertrophy, chronic constipation, increased intra-ocular pressure, urinary retention, or those with a susceptibility to angle-closure glaucoma. Tricyclic and related antidepressant drugs should be used with caution in patients with a significant risk of suicide, or a history of psychosis or bipolar disorder, because antidepressant therapy may aggravate these conditions; treatment should be stopped if the patient enters a manic phase.

Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

Overdosage

Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose. In particular, overdose with doxepin and amitriptyline is associated with a relatively high rate of fatality. Lofepramine is associated with the lowest risk of fatality in overdose, in comparison with other tricyclic antidepressant drugs. For advice on overdose see Emergency Treatment of Poisoning, p. 38.

Withdrawal

Withdrawal symptoms include influenza-like symptoms (chills, myalgia, sweating, headache, nausea), insomnia, vivid dreams, and may occasionally include movement disorders and mania. If possible tricyclic and related antidepressants should be withdrawn slowly (see also section 4.3).
4.3.1 Tricyclic and related antidepressant drugs

**Interactions** A tricyclic or related antidepressant (or an SSRI or related antidepressant) should not be started until 2 weeks after stopping an MAOI (3 weeks if starting clomipramine or imipramine). Conversely, an MAOI should not be started until at least 7–14 days after a tricyclic or related antidepressant (3 weeks in the case of clomipramine or imipramine) has been stopped. For guidance relating to the reversible monoamine oxidase inhibitor, moclobemide, see p. 254. For other tricyclic antidepressant interactions, see Appendix 1 (antidepressants, tricyclic and antidepressants, tricyclic (related)).

**Driving** Drowsiness may affect the performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

**Contra-indications** Tricyclic and related antidepressants are contra-indicated in the immediate recovery period after myocardial infarction, in arrhythmias (particularly heart block), and in the manic phase of bipolar disorder. Avoid treatment with tricyclic antidepressants in acute porphyria (section 9.8.2).

**Hepatic impairment** Tricyclic antidepressants are preferable to MAOIs in hepatic impairment but sedative effects are increased. They should be avoided in severe liver disease.

**Breast-feeding** The amount of tricyclic antidepressants (including related drugs such as mianserin and trazodone) secreted into breast milk is too small to be harmful (but see Doxepin, p. 251).

**Side-effects** Arrhythmias and heart block occasionally follow the use of tricyclic antidepressants, particularly amitriptyline, and may be a factor in the sudden death of patients with cardiac disease; other cardiovascular side-effects include postural hypotension, tachycardia, and ECG changes. The tricyclic-related antidepressant drugs may be associated with a lower risk of cardiotoxicity in overdosage.

Central nervous system side-effects are common, particularly in the elderly, and include anxiety, dizziness, agitation, confusion, sleep disturbances, irritability, and paroxysmal night dysremia. Drowsiness is associated with some of the tricyclic antidepressants (see under Choice, below). Convulsions, hallucinations, delusions, mania, and hypomania may occur (see also under Cautions, above), and, rarely, extrapyramidal symptoms including tremor and dysarthria.

Antimuscarinic side-effects include dry mouth, blurred vision (very rarely precipitation of angle-closure glaucoma), constipation (rarely leading to paralytic ileus, particularly in the elderly), and urinary retention. Tricyclic-related antidepressant drugs have a lower incidence of antimuscarinic side-effects than older tricyclics.

Endocrine effects include breast enlargement, galactorrhoea, and gynaecomastia. Sexual dysfunction may occur. Changes in blood sugar, increased appetite, and weight gain can accompany treatment with tricyclic antidepressant drugs, but anorexia and weight loss are also seen. Hepatic and haematological reactions may occur and have been particularly associated with mianserin. Another side-effect to which the elderly are particularly susceptible is hypotension (see Hyponatraemia and Antidepressant Therapy, p. 248). Other class side-effects include nausea, vomiting, taste disturbance, tinnitus, rash, urticaria, pruritus, photosensitivity, alopecia, and sweating.

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

Neurolepptic malignant syndrome (section 4.2.1) may, very rarely, occur in the course of antidepressant drug treatment. Suicidal behaviour has been linked with antidepressants (see p. 249).

**Dosage** About 10 to 20% of patients fail to respond to tricyclic and related antidepressant drugs and inadequate dosage may account for some of these failures. It is important to use doses that are sufficiently high for effective treatment but not so high as to cause toxic effects. Low doses should be used for initial treatment in the elderly (see under Side-effects, below).

In most patients the long half-life of tricyclic antidepressant drugs allows once-daily administration, usually at night; the use of modified-release preparations is therefore unnecessary.

**Choice** Tricyclic and related antidepressants block the re-uptake of both serotonin and noradrenaline, although to different extents. For example, clomipramine is more selective for serotonergic transmission, and imipramine is more selective for noradrenergic transmission. Tricyclic and related antidepressant drugs can be roughly divided into those with additional sedative properties and those that are less sedating. Agitated and anxious patients tend to respond best to the sedative compounds, whereas withdrawn and apathetic patients will often obtain most benefit from the less sedating ones. Those with sedative properties include amitriptyline, clomipramine, dosulepin, doxepin, mianserin, trazodone, and trimipramine. Those with less sedative properties include imipramine, lofepramine, and norluptfirepine. Tricyclic and related antidepressants also have varying degrees of antimuscarinic side-effects and cardiotoxicity in overdosage, which may be important in individual patients. Lofepramine has a lower incidence of side-effects and is less dangerous in overdosage but is infrequently associated with hepatic toxicity. Imipramine is also well established, but has more marked antimuscarinic side-effects than other tricyclic and related antidepressants. Amitriptyline and dosulepin are effective but they are particularly dangerous in overdosage (see Overdosage, above) and are not recommended for the treatment of depression; dosulepin should be initiated by a specialist.

**Children and adolescents** Studies have shown that tricyclic antidepressants are not effective for treating depression in children; see also Depressive Illness in Children and Adolescents, p. 255.

### Tricyclic antidepressants

#### AMITRIPTYLINE HYDROCHLORIDE

**Indications** depressive illness (but not recommended, see notes above); neuropathic pain [unlicensed] (section 4.7.3); migraine prophylaxis [unlicensed] (section 4.7.4.2)

**Cautions** see notes above

**Contra-indications** see notes above
**Hepatic impairment** see notes above

**Pregnancy** use only if potential benefit outweighs risk

**Breast-feeding** see notes above

**Side-effects** see notes above; also abdominal pain, stomatitis, palpitation, oedema, hypertension, restlessness, fatigue, mydriasis, and increased intraocular pressure; high rate of fatality in overdose—see notes above

**Dose**

- Depression (but not recommended, see notes above), ADULT and CHILD over 16 years, initially 75 mg (ELDERLY and ADOLESCENTS 30–75 mg) daily in divided doses or as a single dose at bedtime increased gradually as necessary to 150–200 mg
- Neuropathic pain [unlicensed indication], initially 10 mg daily at night, gradually increased if necessary to 75 mg daily; higher doses under specialist supervision
- Migraine prophylaxis [unlicensed indication], initially 10 mg at night, increased if necessary to maintenance of 50–75 mg at night; max. 150 mg at night

**Amisulpride** (Non-proprietary) 

Tablets, coated, amisulpride hydrochloride 10 mg, net price 28-tab pack = £33.13. Label: 2

**Oral solution**, amisulpride hydrochloride 25 mg/5 mL, net price 150 mL = £17.22; 50 mg/5 mL, 150 mL = £18.21. Label: 2

**Compound preparations**

**Triptafen® (AMCo)**

Tablets, pink, s/c, amisulpride hydrochloride 25 mg, perhexiline 2 mg, net price 100-tab pack = £33.13. Label: 2

**Dose** depression with anxiety, ADULT over 18 years, 1 tablet 3 times daily; an additional tablet may be taken at bedtime when required

**CLOMIPRAMINE HYDROCHLORIDE**

**Indications** depressive illness, phobic and obsessional states; adjunctive treatment of cataplexy associated with narcolepsy

**Cautions** see notes above

**Contra-indications** see notes above

**Pregnancy** neonatal withdrawal symptoms reported if used during third trimester

**Breast-feeding** see notes above

**Side-effects** see notes above; also abdominal pain, diarrhoea, hypertension, flushing, restlessness, fatigue, aggression, impaired memory, muscle weakness, muscle hypertonia, myoclonus, mydriasis, and yawning; very rarely allergic alveolitis

**Dose**

- Depressive illness, ADULT over 18 years, initially 10 mg daily, increased gradually as necessary to 30–150 mg daily in divided doses or as a single dose at bedtime; max. 250 mg daily; ELDERLY initially 10 mg daily increased carefully over approx. 10 days to 30–75 mg daily
- Phobic and obsessional states, ADULT over 18 years, initially 25 mg daily (ELDERLY 10 mg daily) increased over 2 weeks to 100–150 mg daily; max. 250 mg daily
- Adjunctive treatment of cataplexy associated with narcolepsy, ADULT over 18 years, initially 10 mg daily, gradually increased until satisfactory response (range 10–75 mg daily)

**Clomipramine** (Non-proprietary) 

**Capsules**, clomipramine hydrochloride 10 mg, net price 28-cap pack = £1.25; 25 mg, 28-cap pack = £1.55; 50 mg, 28-cap pack = £1.86. Label: 2

**Modified release**

**Anafranil SR® (Novartis)**

**Tablets**, m/r, grey-red, t/c, clomipramine hydrochloride 75 mg, net price 28-tab pack = £8.83. Label: 2, 25

**Dose** see above; to be taken once daily

**DOXEPIN HYDROCHLORIDE** (Dothiepin hydrochloride)

**Indications** depressive illness, particularly where sedation is required (initiated by a specialist)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Pregnancy** use only if potential benefit outweighs risk

**Breast-feeding** see notes above

**Side-effects** see notes above; also increased intraocular pressure; high rate of fatality in overdose—see notes above

**Dose**

- Initially 75 mg (ELDERLY 50–75 mg) daily in divided doses or as a single dose at bedtime, increased gradually as necessary to 150 mg daily (ELDERLY 75 mg may be sufficient); up to 225 mg daily in some circumstances (e.g. hospital use); CHILD not recommended

**Note** A maximum prescription equivalent to 2 weeks’ supply of 75 mg daily should be considered in patients with increased risk factors for suicide at initiation of treatment, during any dose adjustment, and until improvement occurs

**Dosulepin** (Non-proprietary) 

**Capsules**, doxepin hydrochloride 25 mg, net price 28-cap pack = £1.41. Label: 2

**Tablets**, doxepin hydrochloride 75 mg, net price 28-tab pack = £1.45. Label: 2

**Prothiaden®** (Teofarma) 

**Capsules**, red/red-brown, doxepin hydrochloride 25 mg, net price 28-cap pack = £1.70. Label: 2

**Tablets**, red, s/c, doxepin hydrochloride 75 mg, net price 28-tab pack = £2.97. Label: 2

**DOXEPIN**

**Indications** depressive illness, particularly where sedation is required; pruritus in eczema (section 13.3)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** use with caution

**Pregnancy** use with caution—limited information available

**Breast-feeding** see notes above; accumulation of metabolite may cause sedation and respiratory depression in neonate

**Side-effects** see notes above; also abdominal pain, stomatitis, diarrhoea, flushing, and oedema

**Dose**

- ADULT and CHILD over 12 years, initially 75 mg daily in divided doses or as a single dose at bedtime, adjusted according to response; usual maintenance 25–300 mg daily (doses above 100 mg given in 3 divided doses); ELDERLY start with lower doses and adjust according to response
**4.3.1 Tricyclic and related antidepressant drugs**

**Sinepin** (Marlborough) Capsules, doxepin (as hydrochloride) 25 mg (blue/red), net price 28-cap pack = £3.77; 50 mg (blue), 28-cap pack = £5.71. Label: 2

**Impiramine Hydrochloride**

**Indications** depressive illness; nocturnal enuresis in children (section 7.4.2)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** use with caution above severe impairment

**Renal impairment** use with caution above severe impairment

**Pregnancy** colic, tachycardia, dyspnoea, irritability, muscle spasms, respiratory depression, and withdrawal symptoms reported in neonates when used in the third trimester

**Breast-feeding** see notes above

**Side-effects** see notes above; also palpitation, flushing, restlessness, headache, fatigue; very rarely abdominal pain, stomatitis, hypertension, oedema, cardiac decompensation, allergic alveolitis, aggression, myoclonus, peripheral vasospasm, and mydriasis

**Dose**

- Depression, initially up to 75 mg daily in divided doses increased gradually to 150–200 mg (up to 300 mg in hospital patients); up to 150 mg may be given as a single dose at bedtime; **ELDERLY** initially 10 mg daily, increased gradually to 30–50 mg daily; **CHILD** not recommended for depression

- Nocturnal enuresis, **CHILD** 6–8 years 25 mg, 8–11 years 25–50 mg, over 11 years 50–75 mg at bedtime; initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course

**Lofepramine** (Non-proprietary)

**Oral solution**, imipramine hydrochloride 25 mg/5 mL, net price 150-mL = £31.25. Label: 2

**Lofepramine** (Non-proprietary)

**Tablets**, lofepramine 70 mg (as hydrochloride), net price 56-tab pack = £5.28. Label: 2

**Brands include** Feprapax®

**Oral suspension**, lofepramine 70 mg/5 mL (as hydrochloride), net price 150 mL = £22.22. Label: 2

**Brands include** Lomont® (sugar-free)

**Surmontil** (Sanofi-Aventis) Tablets, trimipramine (as maleate) 10 mg, net price 28-tab pack = £1.57; 25 mg, 28-tab pack = £2.98. Label: 2

**Tramiprazine** (King) Tablets, nortriptyline (as hydrochloride) 10 mg, net price 100-tab pack = £12.06; 25 mg (orange, scored), 100-tab pack = £24.02. Label: 2

**Nortriptyline**

**Indications** depressive illness; neuropathic pain [unlicensed] (section 4.7.3)

**Cautions** see notes above; manufacturer advises plasma-nortriptyline concentration monitoring if dose above 100 mg daily, but evidence of practical value uncertain

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Pregnancy** use only if potential benefit outweighs risk

**Breast-feeding** see notes above

**Side-effects** see notes above; also abdominal pain, stomatitis, diarrhoea, hypertension, oedema, flushing, restlessness, fatigue, and mydriasis

**Dose**

- Depression, low dose initially increased as necessary to 75–100 mg daily in divided doses or as a single dose (max. 150 mg daily); **ADOLESCENT** and **ELDERLY** 30–50 mg daily in divided doses; **CHILD** not recommended for depression

- Neuropathic pain [unlicensed], initially 10 mg daily at night, gradually increased if necessary to 75 mg daily; higher doses under specialist supervision

**Allegron** (King) Tablets, trimipramine (as hydrochloride) 10 mg, net price 100-tab pack = £12.06; 25 mg (orange, scored), 100-tab pack = £24.02. Label: 2

**Tramiprazine**

**Indications** depressive illness, particularly where sedation required

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Pregnancy** use only if potential benefit outweighs risk

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**

- Initially 50–75 mg daily in divided doses or as a single dose at bedtime, increased as necessary to 150–300 mg daily; **ELDERLY** initially 10–25 mg 3 times daily, maintenance half adult dose may be sufficient; **CHILD** not recommended

**Surmontil** (Sanofi-Aventis) Tablets, trimipramine (as maleate) 10 mg, net price 28-tab pack = £3.77, 84-tab pack = £11.30; 25 mg, 28-tab pack = £4.98, 84-tab pack = £14.91. Label: 2

**Tricyclic-related antidepressants**

**Mianserin Hydrochloride**

**Indications** depressive illness, particularly where sedation is required

**Cautions** see notes above

**Blood counts** A full blood count is recommended every 4 weeks during the first 3 months of treatment; clinical monitoring should continue subsequently and treatment should be stopped and a full blood count obtained if fever, sore throat, stomatitis, or other signs of infection develop

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** caution in renal impairment
Anxiety, 75 mg daily, increasing if necessary to

Side-effects see notes above; also jaundice, oedema, blood dyscrasias, arthritis, and arthralgia.

Dose
* ADULT over 18 years, initially 30–40 mg (elderly 30 mg) daily in divided doses or as a single dose at bedtime, increased gradually as necessary; usual dose range 30–90 mg

Mianserin (Non-proprietary) 
Tablets, mianserin hydrochloride 10 mg, net price 28-tab pack = £7.81; 30 mg, 28-tab pack = £18.34. Label: 2, 25

### TRAZODONE HYDROCHLORIDE

**Indications** depressive illness, particularly where sedation is required; anxiety

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** use with caution in severe impairment

**Pregnancy** avoid during first trimester—limited information available; monitor infant for signs of withdrawal if used until delivery

**Breast-feeding** see notes above

**Side-effects** see notes above; also dyspepsia, hyper-salivation, hypertension, palpitation, dyspnœa, priapism (discontinue immediately), myalgia, arthralgia

**Dose**
- Depression, initially 150 mg (elderly 100 mg) daily in divided doses after food or as a single dose at bedtime; may be increased to 300 mg daily; hospital patients up to max. 600 mg daily in divided doses; CHILD not recommended
- Anxiety, 75 mg daily, increasing if necessary to 300 mg daily; CHILD not recommended

**Trazadone (Non-proprietary)** 
Capsules, trazadone hydrochloride 50 mg, net price 84-cap pack = £21.34; 100 mg, 56-cap pack = £22.95. Label: 2, 21

Tablets, trazadone hydrochloride 150 mg, net price 28-tab pack = £15.88. Label: 2, 21

**Molipaxin** (Sanofi-Aventis) 
Capsules, trazadone hydrochloride 50 mg (violet/ green), net price 84-cap pack = £23.92; 100 mg (vio-let/fawn), 56-cap pack = £28.14. Label: 2, 21

Tablets, pink, f/c, trazadone hydrochloride 150 mg, net price 28-tab pack = £16.08. Label: 2, 21

### 4.3.2 Monoamine-oxidase inhibitors (MAOIs)

Monoamine-oxidase inhibitors are used much less frequently than tricyclic and related antidepressants, or SSRIs and related antidepressants because of the dangers of dietary and drug interactions and the fact that it is easier to prescribe MAOIs when tricyclic antidepressants have been unsuccessful than vice versa.

Tranylcypromine has a greater stimulant action than phenelzine or isocarboxazid and is more likely to cause a hypertensive crisis. Isocarboxazid and phenelzine are more likely to cause hepatotoxicity than tranylcypromine.

Phobic patients and depressed patients with atypical, hypochondriacal, or hysterical features are said to respond best to MAOIs. However, MAOIs should be tried in any patients who are refractory to treatment with other antidepressants as there is occasionally a dramatic response. Response to treatment may be delayed for 3 weeks or more and may take an additional 1 or 2 weeks to become maximal.

**Withdrawal** MAOIs are associated with withdrawal symptoms on cessation of therapy. Symptoms include agitation, irritability, ataxia, movement disorders, insomnia, drowsiness, vivid dreams, cognitive impairment, and slowed speech. Withdrawal symptoms occasionally experienced when discontinuing MAOIs include hallucinations and paranoid delusions. If possible MAOIs should be withdrawn slowly (see also section 4.3).

**Hepatic impairment** MAOIs may cause idiosyncratic hepatotoxicity if used in patients with hepatic impairment. See also individual monographs.

**Pregnancy** There is an increased risk of neonatal malformations when phenelzine, isocarboxazid, or tranylcypromine is used during pregnancy. The safety of moclobemide in pregnancy has not been established. Manufacturers advise avoid use unless there are compelling reasons.

**Interactions** MAOIs inhibit monoamine oxidase, thereby causing an accumulation of amine neurotransmitters. The metabolism of some amine drugs such as indirect-acting sympathomimetics (present in many cough and decongestant preparations, section 3.10) is also inhibited and their pressor action may be potentiated; the pressor effect of tyramine (in some foods, such as mature cheese, pickled herring, broad bean pods, and Bovril®, Oxo®, Marmite® or any similar meat or yeast extract or fermented soya bean extract) may also be dangerously potentiated. These interactions may cause a dangerous rise in blood pressure. An early warning symptom may be a throbbing headache. Patients should be advised to eat only fresh foods and avoid food that is suspected of being stale or ‘going off’. This is especially important with meat, fish, poultry or offal; game should be avoided. The danger of interaction persists for up to 2 weeks after treatment with MAOIs is discontinued. Patients should also avoid alcoholic drinks or de-alcoholised (low alcohol) drinks.

Other antidepressants should not be started for 2 weeks after treatment with MAOIs has been stopped (3 weeks if starting clomipramine or imipramine). Some psychiatrists use selected tricyclics in conjunction with MAOIs but this is hazardous, indeed potentially lethal, except in experienced hands and there is no evidence that the combination is more effective than when either constituent is used alone. The combination of tranylcypromine with clomipramine is particularly dangerous.

Conversely, an MAOI should not be started until at least 7–14 days after a tricyclic or related antidepressant (3 weeks in the case of clomipramine or imipramine) has been stopped.
In addition, an MAOI should not be started for at least 2 weeks after a previous MAOI has been stopped (then started at a reduced dose).

For other interactions with MAOIs including those with opioid analgesics (notably pethidine), see Appendix 1 (MAOIs). For guidance on interactions relating to the reversible monoamine oxidase inhibitor, moclobemide, see below; for guidance on interactions relating to SSRIs, see p. 255.

PHENELZINE

**Indications** depressive illness

**Cautions** diabetes mellitus, cardiovascular disease, epilepsy, blood disorders, concurrent electroconvulsive therapy; elderly (great caution); monitor blood pressure (risk of postural hypotension and hypertensive responses—discontinue if palpitations or frequent headaches); if possible avoid abrupt withdrawal; severe hypertensive reactions to certain drugs and foods—see notes above; avoid in agitated patients; acute porphyria (section 9.8.2); surgery (section 15.1); **interactions:** see notes above and Appendix 1 (MAOIs)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** cerebrovascular disease, phaeochromocytoma; not indicated in manic phase

**Hepatic impairment** avoid in hepatic impairment or if abnormal liver function tests; see also notes above

**Pregnancy** see notes above

**Breast-feeding** avoid—no information available

**Side-effects** commonly postural hypotension (especially in elderly) and dizziness; less common side-effects include drowsiness, insomnia, headache, weakness and fatigue, dry mouth, constipation and other gastro-intestinal disturbances, oedema, myoclonic movement, hyperreflexia, elevated liver enzymes; agitation and tremors, nervousness, euphoria, arrhythmias, blurred vision, myasthenia, difficulty in micturition, sweating, convulsions, rashes, purpura, leucopenia, sexual disturbances, and weight gain with inappropriate appetite may also occur; psychotic episodes with hypomanic behaviour, confusion, and hallucinations may be induced in susceptible persons; suicidal behaviour (see p. 249); jaundice has been reported and, on rare occasions, fatal progressive hepatocellular necrosis; parasthesia, peripheral neuritis, peripheral neuropathy may be due to pyridoxine deficiency; hyponatraemia (see Hyponatraemia and Antidepressant Therapy, p. 248)

**Dose**
- 15 mg 3 times daily, increased if necessary to 4 times daily after 2 weeks (hospital patients, max. 30 mg 3 times daily), then reduced gradually to lowest possible maintenance dose (15 mg on alternate days may be adequate); **Child** not recommended

**Nardil® (Archimedes)**

- **Tablets**, orange, f/c, phenelzine (as sulfate) 15 mg, net price 100-tab pack = £22.50. Label: 3, 10, patient information leaflet

**Isocarboxazid**

**Indications** depressive illness

**Cautions** see under Phenelzine

**Contra-indications** see under Phenelzine

**Hepatic impairment** avoid in hepatic impairment; see also notes above

**Renal impairment** use with caution

**Pregnancy** see notes above

**Breast-feeding** avoid

**Side-effects** see under Phenelzine

**Dose**
- Initially 30 mg daily in single or divided doses until improvement occurs (increased after 4 weeks if necessary to max. 60 mg daily for 4–6 weeks under close supervision), then reduced to usual maintenance dose 10–20 mg daily (but up to 40 mg daily may be required); **Elderly** 5–10 mg daily; **Child** not recommended

**Isocarboxazid** (Non-proprietary)

- **Tablets**, pink, scored, isocarboxazid 10 mg, net price 56-tab pack = £110.33. Label: 3, 10, patient information leaflet

TRANYLCYPROMINE

**Indications** depressive illness

**Cautions** see under Phenelzine

**Contra-indications** see under Phenelzine; hypertrophy; congestive heart failure; history of hepatic disease (see below)

**Hepatic impairment** avoid if history of hepatic disease or if abnormal liver function tests, see also notes above

**Pregnancy** see notes above

**Breast-feeding** present in milk in animal studies

**Side-effects** see under Phenelzine; also insomnia; **less commonly** speech disturbances, hyponatraemia, lupus erythematosus-like syndrome; very rarely angle-closure glaucoma; hypertensive crises with throbbing headache requiring discontinuation of treatment more frequent than with other MAOIs; liver damage less frequent than with phenelzine; blood dyscrasias also reported

**Dose**
- Initially 10 mg twice daily not later than 3 p.m., increasing the second daily dose to 20 mg after 1 week if necessary; doses above 30 mg daily under close supervision only; usual maintenance dose 10 mg daily; **Child** not recommended

**Tranylcypromine** (Non-proprietary)

- **Tablets**, tranylcypromine (as sulfate) 10 mg, net price 28-tab pack = £192.71. Label: 3, 10, patient information leaflet

Reversible MAOIs

Moclobemide is indicated for major depression and social anxiety disorder; it is reported to act by reversible inhibition of monooamine oxidase type A (it is therefore termed a RIMA). It should be reserved as a second-line treatment.

**Interactions** Moclobemide is claimed to cause less potentiation of the pressor effect of tyramine than the traditional (irreversible) MAOIs, but patients should avoid consuming large amounts of tyramine-rich food (such as mature cheese, yeast extracts and fermented soya bean products).

The risk of drug interactions is also claimed to be less but patients still need to avoid sympathomimetics such
as ephedrine and pseudoephedrine. In addition, moclobemide should not be given with another antidepressant. Owing to its short duration of action no treatment-free period is required after it has been stopped but it should not be started until at least a week after a tricyclic or related antidepressant or an SSRI or related antidepressant has been stopped (at least 5 weeks in the case of fluoxetine), or for at least a week after an MAOI has been stopped. For other interactions, see Appendix 1 (moclobemide).

## MOCLOBEMIDE

### Indications

Depressive illness; social anxiety disorder

### Cautions

Avoid in agitated or excited patients (or give with sedative for up to 2–3 weeks), thyrotoxicosis, may provoke manic episodes in bipolar disorders; interactions: see notes above and Appendix 1 (moclobemide)

### Contra-indications

Acute confusional states, pheochromocytoma

### Hepatic impairment

Reduce dose in severe disease

### Pregnancy

See notes above, p. 253

### Breast-feeding

Amount too small to be harmful, but patient information leaflet advises avoid

### Side-effects

Sleep disturbances, dizziness, gastrointestinal disorders, headache, restlessness, agitation; paraesthesia, dry mouth, visual disturbances, oedema, skin reactions, confusional states reported; rarely raised liver enzymes, galactorrhoea; hyponatraemia (see Hyponatraemia and Antidepressant Therapy, p. 248)

### Dose

- Depression, initially 300 mg daily usually in divided doses after food, adjusted according to response; usual range 150–600 mg daily; child not recommended
- Social anxiety disorder, initially 300 mg daily increased on fourth day to 600 mg daily in 2 divided doses, continued for 8–12 weeks to assess efficacy; child not recommended

#### Moclobemide (Non-proprietary)

- Tablets, moclobemide 150 mg, net price 30-tab pack = £18.16; 300 mg, 30-tab pack = £13.99. Label: 10, patient information leaflet, 21

#### Manerix® (Meda)

- Tablets, yellow, f/c, scored, moclobemide 150 mg, net price 30-tab pack = £9.33; 300 mg, 30-tab pack = £13.99. Label: 10, patient information leaflet, 21

### Depressive illness in children and adolescents

The balance of risks and benefits for the treatment of depressive illness in individuals under 18 years is considered unfavourable for the SSRIs citalopram, escitalopram, paroxetine, and sertraline, and for mirtazapine and venlafaxine. Clinical trials have failed to show efficacy and have shown an increase in harmful outcomes. However, it is recognised that specialists may sometimes decide to use these drugs in response to individual clinical need; children and adolescents should be monitored carefully for suicidal behaviour, self-harm or hostility, particularly at the beginning of treatment.

Only fluoxetine has been shown in clinical trials to be effective for treating depressive illness in children and adolescents. However, it is possible that, in common with the other SSRIs, it is associated with a small risk of self-harm and suicidal thoughts. Overall, the balance of risks and benefits for fluoxetine in the treatment of depressive illness in individuals under 18 years is considered favourable, but children and adolescents must be carefully monitored as above.

### Cautions

SSRIs should be used with caution in patients with epilepsy (avoid if poorly controlled, discontinue if convulsions develop), cardiac disease, diabetes mellitus, susceptibility to angle-closure glaucoma, a history of mania or bleeding disorders (especially gastro-intestinal bleeding), and if used with other drugs that increase the risk of bleeding. They should also be used with caution in those receiving concurrent electroconvulsive therapy (prolonged seizures reported with fluoxetine). SSRIs may also impair performance of skilled tasks (e.g. driving, operating machinery). Interactions: see below and Appendix 1 (antidepressants, SSRI).

### Withdrawal

The risk of withdrawal reactions is higher with paroxetine (see also Withdrawal, section 4.3). Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, electric shock sensation in the head, neck, and spine, tinnitus, sleep disturbances, fatigue, influenza-like symptoms, and sweating are the most common features of abrupt withdrawal of an SSRI or marked reduction of the dose; palpitation and visual disturbances can occur less commonly. The dose should be tapered over at least a few weeks to avoid these effects. For some patients, it may be necessary to withdraw treatment over a longer period; consider obtaining specialist advice if symptoms persist.

### Interactions

An SSRI or related antidepressant should not be started until 2 weeks after stopping an MAOI. Conversely, an MAOI should not be started until at least a week after an SSRI or related antidepressant has been stopped (2 weeks in the case of sertraline, at least 5 weeks in the case of fluoxetine). For guidance relating to the reversible monoamine oxidase inhibitor, moclobemide, see above. For other SSRI antidepressant interactions, see Appendix 1 (antidepressants, SSRI).

### Contra-indications

SSRIs should not be used if the patient enters a manic phase.

### Pregnancy

Manufacturers advise that SSRIs should not be used during pregnancy unless the potential benefit outweighs the risk. There is a small increased risk of congenital heart defects when SSRIs are taken...
CITALOPRAM

Indications  depressive illness, panic disorder

Cautions  see notes above; susceptibility to QT-interval prolongation

Contra-indications  see notes above; QT-interval prolongation (avoid concomitant administration of drugs that prolong QT interval)

Hepatic impairment  use doses at lower end of range; for tablets up to max. 20 mg; for oral solution up to max. 16 mg

Renal impairment  no information available for eGFR less than 20 mL/minute/1.73 m²

Pregnancy  see notes above

Breast-feeding  present in milk—use with caution

Side-effects  see notes above; also hepatic, palpitation, tachycardia, oedema, bradycardia, postural hypotension, haemorrhage, QT-interval prolongation, coughing, yawning, confusion, impaired concentration, aggression, malaise, amnesia, migraine, paraesthesia, abnormal dreams, euphoria, mydriasis, taste disturbance, increased salivation, rhinitis, tinnitus, polyuria, micturition disorders, hypokalaemia, pruritus; paradoxical increased anxiety during initial treatment of panic disorder (reduce dose)

Dose

- By mouth as tablets, depressive illness, 20 mg once daily increased if necessary in steps of 20 mg daily at intervals of 3–4 weeks; max. 40 mg daily (ELDERLY over 65 years, max. 20 mg daily)
- By mouth as oral drops, depressive illness, 16 mg daily as a single dose increased if necessary in steps of 16 mg daily at intervals of 3–4 weeks; max. 32 mg daily (ELDERLY over 65 years, max. 16 mg daily)

CHILD under 18 years see BNF for Children and Depressive Illness in Children and Adolescents, p. 255

Panic disorder, ADULT over 18 years, initially 8 mg daily as a single dose increased gradually if necessary in steps of 8 mg, usual dose 16–24 mg daily; max. 32 mg daily (ELDERLY over 65 years, max. 16 mg daily)

Citalopram (Non-proprietary) (RN)

Tablets, capsules, inhaler (formaldehyde solution) 20 mg, net price 28-tab pack = £8.86; 20 mg, 28-tab pack = £9.86; 40 mg, 28-tab pack = £9.86. Counselling, driving

Note  4 drops (8 mg) is equivalent in therapeutic effect to 10-mg tablet

Cipramil® (Lundbeck) (RN)

Tablets, I/V, oral drops (formaldehyde solution) 20 mg (scored), net price 28-tab pack = £8.85. Counselling, driving

Note  4 drops (8 mg) is equivalent in therapeutic effect to 10-mg tablet

Mix with water, orange juice, or apple juice before taking

ESCITALOPRAM

Note  Escitalopram is the active enantiomer of citalopram

Indications  see under Dose

Cautions  see notes above; susceptibility to QT-interval prolongation

Contra-indications  see notes above; QT-interval prolongation (avoid concomitant administration of drugs that prolong QT interval)

Hepatic impairment  initial dose 5 mg daily for 2 weeks, thereafter increased to max. 10 mg daily according to response; particular caution in severe impairment

Renal impairment  caution if eGFR less than 30 mL/minute/1.73 m²

Pregnancy  see notes above

Breast-feeding  present in milk; avoid

Side-effects  see notes above; also sinusitis, yawning; fatigue, restlessness, abnormal dreams, paraesthesia; pyrexia; less commonly taste disturbance, bruxism, syncope, tachycardia, oedema, confusion, menstrual disturbances, epistaxis, mydriasis, tinnitus, pruritus, and alopecia; rarely bradycardia, aggression, and depersonalisation; hepatitis, postural hypotension, QT interval prolongation, and thrombocytopenia also reported; paradoxical increased anxiety during initial treatment of panic disorder (reduce dose)

Dose

- ADULT over 18 years, depressive illness, generalised anxiety disorder, and obsessive-compulsive disorder, 10 mg once daily increased if necessary to max. 20 mg daily; ELDERLY over 65 years, initially half adult dose; max. 10 mg daily; CHILD not recommended (see
Depressive Illness in Children and Adolescents, p. 255

- **ADULT** over 18 years, panic disorder, initially 5 mg once daily increased to 10 mg daily after 7 days; max. 20 mg daily; **ELDERLY** over 65 years, initially half adult dose; max. 10 mg daily
- **ADULT** over 18 years, social anxiety disorder, initially 10 mg once daily adjusted after 2–4 weeks; usual dose 5–20 mg daily; **ELDERLY** over 65 years, not recommended

Cipralex® (Lundbeck)®

**Tablets**, f/c, escitalopram (as oxalate) 5 mg, net price 28-tab pack = £8.97; 10 mg (scored), 28-tab pack = £14.91; 20 mg (scored), 28-tab pack = £25.20. Counselling, driving

**Oral drops**, sugar-free, escitalopram (as oxalate) 20 mg/mL (1 mg drop), net price 15 mL = £20.16. Counselling, driving, administration

Note: Can be mixed with water, orange juice, or apple juice before taking

**FLUOXETINE**

**Indications** see under Dose

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** reduce dose or increase dose interval

**Pregnancy** see notes above

**Breast-feeding** present in milk—avoid

**Side-effects** see notes above; also diarrhoea, dyspepsia, nausea, vomiting, flatulence, abdominal discomfort, chest pain, weight loss, cold hands or feet; rarely, muscle cramps, tremor, paraesthesia, taste disturbance, tachycardia, malaise, constipation, jaundice, hepatitis, toxic epidermal necrolysis, priapism, haemorrhage, pulmonary inflammation and fibrosis, hepatitis, toxic epidermal necrolysis, priapism, and neuroleptic malignant syndrome-like event also reported

**Dose**

- Major depression, 20 mg daily increased after 3–4 weeks if necessary, and at appropriate intervals thereafter; max. 60 mg daily (ELDERLY usual max. 40 mg daily but 60 mg can be used); **CHILD** 8–18 years, 10 mg daily increased after 1–2 weeks if necessary, max. 20 mg daily (but see also Depressive Illness in Children and Adolescents, p. 255)
- Bulimia nervosa, **ADULT** over 18 years, 60 mg daily as a single or divided dose (ELDERLY usual max. 40 mg daily but 60 mg can be used)
- Obsessive-compulsive disorder, **ADULT** over 18 years, 20 mg daily; increased gradually if necessary to max. 60 mg daily (ELDERLY usual max. 40 mg daily but 60 mg can be used); review treatment if inadequate response after 10 weeks
- **Note** Daily dose may be administered as a single or divided dose

**Long duration of action** Consider the long half-life of fluoxetine when adjusting dosage (or in overdosage)

**Fluoxetine** (Non-proprietary)®

**Capsules**, fluoxetine (as hydrochloride) 20 mg, net price 30-cap pack = £9.99; 60 mg, 30-cap pack = £29.97. Counselling, driving

**Brands include** *Oxactin®*

**Liquid**, fluoxetine (as hydrochloride) 20 mg/5 mL, net price 70 mL = £4.43. Counselling, driving

**Brands include** *Prozac®*

**Prozac®** (Lilly)®

**Capsules**, fluoxetine (as hydrochloride) 20 mg (green/yellow), net price 30-cap pack = £1.50. Counselling, driving

**Liquid**, fluoxetine (as hydrochloride) 20 mg/5 mL, net price 70 mL = £11.12. Counselling, driving

**FLUVOXAMINE MALEATE**

**Indications** depressive illness, obsessive-compulsive disorder

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** start with low dose

**Renal impairment** start with low dose

**Pregnancy** see notes above

**Breast-feeding** present above; also palpitation, tachycardia, malaise, less commonly postural hypotension, confusion, ataxia; rarely abnormal liver function, usually symptomatic (discontinue treatment); also reported paraesthesia, taste disturbance, neuroleptic malignant syndrome-like event

**Dose**

- Depression, **ADULT** over 18 years, initially 50–100 mg daily in the evening, increased gradually if necessary to max. 300 mg daily (over 150 mg in divided doses); usual maintenance dose 100 mg daily
- Obsessive-compulsive disorder, initially 50 mg in the evening increased gradually if necessary after some weeks to max. 300 mg daily (over 150 mg in divided doses); usual maintenance dose 100–300 mg daily; **CHILD** over 8 years initially 25 mg daily increased if necessary in steps of 25 mg every 4–7 days to max. 200 mg daily (over 50 mg in 2 divided doses)
- **Note** If no improvement in obsessive-compulsive disorder within 10 weeks, treatment should be reconsidered

**Fluvosome® (Non-proprietary)®**

**Tablets**, fluvoxamine maleate 50 mg, net price 60-tab pack = £16.69. 100 mg, 30-tab pack = £16.69. Counselling, driving

**Favorin®** (Abbott Healthcare)®

**Tablets**, f/c, scored, fluvoxamine maleate 50 mg, net price 60-tab pack = £17.10; 100 mg, 30-tab pack = £17.10. Counselling, driving

**PAROXETINE**

**Indications** major depression, obsessive-compulsive disorder, panic disorder, social anxiety disorder, post-traumatic stress disorder, generalised anxiety disorder

**Cautions** see notes above; also achlorhydria or high gastric pH (reduced absorption of oral suspension)

**Contra-indications** see notes above

**Hepatic impairment** reduce dose

**Renal impairment** reduce dose if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** increased risk of congenital malformations, especially if used in the first trimester; see also notes above

**Breast-feeding** present in milk but amount too small to be harmful

**Side-effects** see notes above; also yawning; abnormal dreams; raised cholesterol; less commonly arrhythmias, confusion, urinary incontinence; rarely panic attacks and paradoxical increased anxiety during initial
treatment of panic disorder (reduce dose), deper-sonalisation, and neuroleptic malignant syndrome-like event; rarely restless legs syndrome; very rarely peripheral oedema, acute glaucoma, hepatic disorders (e.g. hepatitis, and priapism; also reported) tinnitus, extrapyramidal reactions (including orocutaneous dys-tonias) and withdrawal reactions (see notes above)

Dose  
- Major depression, social anxiety disorder, post-traumatic stress disorder, generalised anxiety disorder, ADULT over 18 years, recommended dose 20 mg each morning (no evidence of greater efficacy at higher doses); max. 50 mg daily (ELDERLY 40 mg daily); CHILD under 18 years not recommended (see Depressive Illness in Children and Adolescents, p. 255)
- Obsessive-compulsive disorder, ADULT over 18 years, initially 20 mg each morning, increased gradually in steps of 10 mg to recommended dose of 40 mg daily (no evidence of greater efficacy at higher doses); max. 60 mg daily (ELDERLY 40 mg daily)
- Panic disorder, ADULT over 18 years, initially 10 mg each morning, increased gradually in steps of 10 mg to recommended dose of 40 mg daily (no evidence of greater efficacy at higher doses); max. 60 mg daily (ELDERLY 40 mg daily)
- Sertraline (Non-proprietary) Tablets, sertraline (as hydrochloride) 20 mg, net price 30-tab pack = £1.18; 30 mg, 30-tab pack = £2.11. Label: 21, counselling, driving

Paroxetine (Non-proprietary) Tablets, paroxetine (as hydrochloride) 20 mg, net price 30-tab pack = £1.58; 30 mg, 30-tab pack = £2.11. Label: 21, counselling, driving

Seroxat® (GSK) Tablets, f/c, scored, paroxetine (as hydrochloride) 10 mg, net price 28-tab pack = £11.84; 20 mg, 30-tab pack = £12.69; 30 mg (blue), 30-tab pack = £22.28. Label: 21, counselling, driving

Oral suspension, orange, sugar-free, paroxetine (as hydrochloride) 10 mg/5 mL, net price 150-mL pack = £9.12. Label: 5, 21, counselling, driving

200 mg daily; CHILD 6–12 years initially 25 mg daily, increased to 50 mg daily after 1 week, further increased if necessary in steps of 50 mg at intervals of at least 1 week; max. 200 mg daily
- Panic disorder, post-traumatic stress disorder, or social anxiety disorder, ADULT over 18 years, initially 25 mg daily, increased after 1 week to 50 mg daily; if response is partial and if drug tolerated, dose increased in steps of 50 mg at intervals of at least 1 week to max. 200 mg daily

Sertraline (Non-proprietary) Tablets, sertraline (as hydrochloride) 50 mg, net price 28-tab pack = £2.09; 100 mg, 28-tab pack = £2.98. Counselling, driving

Lustral® (Pfizer) Tablets, f/c, sertraline (as hydrochloride) 50 mg (scored), net price 28-tab pack = £17.82; 100 mg, 28-tab pack = £29.16. Counselling, driving

4.3.4 Other antidepressant drugs

Agomelatine is a melatonin receptor agonist and a selective serotonin-receptor antagonist; it does not affect the uptake of serotonin, noradrenaline, or dopamine.

Duloxetine inhibits the re-uptake of both serotonin and noradrenaline and is licensed to treat major depressive disorder.

The thioxanthene fluoxetine (Fluonex®) has antidepressant properties when given by mouth in low doses. Fluoxetine is also used for the treatment of psychoses (section 4.2.1 and section 4.2.2)

Mirtazapine, a presynaptic alpha-1 adrenoceptor antagonist, increases central noradrenergic and serotonergic neurotransmission. It has few antimuscarinic effects, but causes sedation during initial treatment.

Reboxetine, a selective inhibitor of noradrenaline re-uptake, has been introduced for the treatment of depressive illness.

Venlafaxine is a serotonin and noradrenaline re-uptake inhibitor; it lacks the sedative and antimuscarinic effects of the tricyclic antidepressants. Treatment with venla-faxine is associated with a higher risk of withdrawal effects compared with other antidepressants.

AGOMELATINE

Indications major depression

Cautions bipolar disorder, mania or hypomania; concomitant use of drugs associated with hepatic injury; excessive alcohol consumption; obesity; diabetes; non-alcoholic fatty liver disease; dose adjustment may be necessary if smoking started or stopped during treatment; interactions: Appendix 1 (agomela

tine)

Hepatotoxicity Hepatic injury, including hepatitis and hepatic failure reported rarely; test liver function before treatment and after 3, 6, 12 and 24 weeks of treatment, and then as appropriate (restart monitoring schedule if dose increased); discontinue if serum transaminases exceed 3 times the upper limit of reference range or symptoms of liver disorder (counselling, see below)

Counselling Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as dark urine, light coloured stools, fatigue, abdominal pain, or pruritus develop
Contra-indications  dementia; patients over 75 years of age; see also Hepatotoxicity above

Hepatic impairment  avoid

Renal impairment  caution in moderate to severe impairment

Pregnancy  manufacturer advises avoid

Breast-feeding  avoid—present in milk in animal studies

Side-effects  nausea, vomiting, diarrhoea, constipation, abdominal pain, increased serum transaminases (see Hepatotoxicity above), headache, dizziness, drowsiness, agitation, sleep disturbances, fatigue, anxiety, back pain, sweating; less commonly paraesthesia, restless legs syndrome, blurred vision, tinnitus, eczema; rarely hepatitis, hepatic failure (see Hepatotoxicity above), weight changes, rash; suicidal behaviour (see Suicidal Behaviour and Antidepressant Therapy, p. 249) and priapism also reported

Dose  • ADULT over 18 years, 25 mg at bedtime, increased if necessary after 2 weeks to 50 mg at bedtime

Valdoxan® (Servier)  Tablets, orange-yellow, f/c, agomelatine 25 mg, net price 28-tab pack = £30.00

DULOXETINE

Indications  major depressive disorder; generalised anxiety disorder; diabetic neuropathy (section 6.1.5); stress urinary incontinence (section 7.4.2)

Cautions  section 7.4.2

Contra-indications  section 7.4.2

Hepatic impairment  section 7.4.2

Renal impairment  section 7.4.2

Pregnancy  toxicity in animal studies—use only if potential benefit outweighs risk; risk of neonatal withdrawal symptoms if used near term

Breast-feeding  section 7.4.2

Side-effects  section 7.4.2

Dose  • Major depression, ADULT over 18 years, 60 mg once daily

• Generalised anxiety disorder, ADULT over 18 years, initially 30 mg daily, increased if necessary to 60 mg once daily; max. 120 mg daily

• Diabetic neuropathy, ADULT over 18 years, 60 mg once daily, max. 120 mg daily in divided doses

Note  In diabetic neuropathy, discontinue if inadequate response after 2 months; review treatment at least every 3 months

Cymbalta® (Lilly)  Tablets, orange-yellow, f/c, duloxetine (as hydrochloride) 30 mg (white/blue), net price 28-tab pack = £22.40; 60 mg (green/blue), 28-cap pack = £27.72. Label: 2

Note  The Scottish Medicines Consortium has advised (September 2006) that duloxetine (Cymbalta®) should be restricted for use by specialists when other treatments for diabetic peripheral neuropathic pain are unsuitable or inadequate

Yentreve® (Lilly)  Section 7.4.2 (stress urinary incontinence)

4.3.4 Other antidepressant drugs

PROLONGATION (avoid concomitant administration of drugs that prolong QT interval); diabetes; senile confusional states, parkinsonism; elderly; acute porphyria (section 9.8.2); see also section 4.2.1; interactions: Appendix 1 (antipsychotics)

Contra-indications  excitable and overactive patients; impaired consciousness; circulatory collapse; coma

Hepatic impairment  can precipitate coma; consider serum-flupentixol concentration monitoring

Renal impairment  increased renal sensitivity in severe impairment; manufacturer advises caution in renal failure

Pregnancy  avoid unless potential benefit outweighs risk

Breast-feeding  present in milk—avoid

Side-effects  section 4.2.1; also hypersalivation, dyspnœa, asthenia, hyperglycaemia, myalgia; torsade de points and sudden death also reported

Dose  • ADULT over 18 years, initially 1 mg (ELDERLY 500 micrograms) in the morning, increased after 1 week to 2 mg (ELDERLY 1 mg) if necessary; max. 3 mg (ELDERLY 1.5 mg) daily, doses above 2 mg (ELDERLY 1 mg) in divided doses, last dose before 4 pm; discontinue if no response after 1 week at max. dosage

Counselling  Although drowsiness may occur, can also have an alerting effect so should not be taken in the evening

Fluanxol® (Lundbeck)  Tablets, yellow, s/c, flupentixol (as dihydrochloride) 500 micrograms, net price 60-tab pack = £2.88; 1 mg, 60-tab pack = £4.86. Label: 2, counselling, administration

Dexiprol® (Lundbeck)  Section 4.2.1 (psychoses)

MIRTAZAPINE

Indications  major depression

Cautions  elderly, cardiac disorders, hypotension, history of urinary retention, susceptibility to angle-closure glaucoma, diabetes mellitus, psychoses (may aggravate psychotic symptoms), history of seizures or bipolar depression; interactions: Appendix 1 (mirtazapine)

Blood disorders  Patients should be advised to report any fever, sore throat, stomatitis or other signs of infection during treatment. Blood count should be performed and the drug stopped immediately if blood dyscrasia suspected

Withdrawal  Nausea, vomiting, dizziness, agitation, anxiety, and headache are most common features of withdrawal if treatment stopped abruptly or if dose reduced markedly; dose should be reduced over several weeks

Hepatic impairment  use with caution; discontinue if jaundice occurs

Renal impairment  clearance reduced by 30% if eGFR less than 40 mL/minute/1.73 m²; clearance reduced by 50% if eGFR less than 10 mL/minute/1.73 m²

Pregnancy  use with caution—limited experience; monitor neonate for withdrawal effects

Breast-feeding  present in milk; use only if potential benefit outweighs risk

Side-effects  increased appetite, weight gain, dry mouth, postural hypotension, oedema, drowsiness, fatigue, tremor, dizziness, abnormal dreams, confusion, anxiety, insomnia, arthralgia, myalgia less commonly syncope, mania, hallucinations, movement disorders; rarely pancreatitis, aggression, myoclonus; also reported hypersalivation, dysarthria, convulsions,
suicidal behaviour (see Suicidal Behaviour and Antidepressant Therapy, p. 249), blood disorders (see Cautions), hyponatraemia (see Hyponatraemia and Antidepressant Therapy, p. 248), inappropriate secretion of antidiuretic hormone, angle-closure glaucoma, Stevens-Johnson syndrome, toxic epidermal necrolysis

**Dose**
- Initially 15–30 mg daily at bedtime increased within 2–4 weeks according to response; max. 45 mg daily as a single dose at bedtime or in 2 divided doses; **CHILD** under 18 years not recommended (see Depressive Illness in Children and Adolescents, p. 255)

**Mirtazapine** (Non-proprietary) (Phar)

**Tablets**, mirtazapine 15 mg, net price 28-tab pack = £1.84; 30 mg, 28-tab pack = £1.49; 45 mg, 28-tab pack = £2.05. Label: 2, 25

**Orodispersible tablets**, mirtazapine 15 mg, net price 30-tab pack = £1.49. 30 mg, 30-tab pack = £1.59; 45 mg, 30-tab pack = £2.01. Label: 2, counselling, administration

**Oral solution**, mirtazapine 15 mg/mL, net price 66 mL = £47.25. Label: 2

**Zispin SolTab** (MSD) (Phar)

**Orodispersible tablets**, mirtazapine 15 mg, net price 6-tab pack = £3.84, 30-tab pack = £15.06; 30 mg, 30-tab pack = £15.06; 45 mg, 30-tab pack = £15.06. Label: 2, counselling, administration

Excipients include aspartame (section 9.4.1) (Non-proprietary), mirtazapine 15 mg/mL, net price 66 mL = £47.25. Label: 2, counselling, administration

**Depression, generalised anxiety disorder, see under preparations below**

**Side-effects**
- Constipation, nausea, anorexia, weight changes, vomiting; hypertension, palpitation, vasodilatation, changes in serum cholesterol; chills, yawning; dizziness, dry mouth, insomnia, nervousness, drowsiness, asthenia, headache, abnormal dreams, anxiety, confusion, hypotonia, sensory disturbances, tremor; difficulty with micturition, sexual dysfunction, menstrual disturbances; visual disturbances, mydriasis (very rarely angle-closure glaucoma); sweating, less commonly bruxism, diarrhoea, taste disturbance, postural hypotension, arrhythmias, agitation, apathy, incoordination, hallucinations, myoclonus, angioedema, urinary retention, bleeding disorders (including ecchymosis and gastro-intestinal haemorrhage), tinnitus, alopecia, photosensitivity, and rash; rarely mania, hypomania, seizures, extrapyramidal symptoms including akathisia, urinary incontinence; also reported hepatitis, pancreatitis, hypotension, QT-interval prolongation, aggression, neuroleptic malignant syndrome, delirium, vertigo, syndrome of inappropriate anti-diuretic hormone secretion (see Hyponatraemia and Antidepressant Therapy, p. 248), hyperprolactinaemia, blood dyscrasias, rhabdomyolysis, pruritus, urticaria, Stevens-Johnson syndrome; suicidal behaviour (see p. 249)

**Dose**
- Depression, **ADULT** over 18 years, initially 75 mg daily in 2 divided doses increased if necessary at intervals of at least 2 weeks; max. 375 mg daily; **CHILD** under 18 years not recommended (see Depressive Illness in Children and Adolescents, p. 255)

**Note** Faster dose titration may be necessary in some patients

**Generalised anxiety disorder and social anxiety disorder, see under preparations below**

**Venlafaxine** (Non-proprietary) (Phar)

**Tablets**, venlafaxine (as hydrochloride) 37.5 mg, net price 56-tab pack = £2.14; 75 mg, 56-tab pack = £2.52. Label: 3, counselling, driving
Venlafaxine m/r preparations

Capsules, m/r, venlafaxine (as hydrochloride)
75 mg; 150 mg. Label: 3, 21, 25, counselling, driving

Brands include: Alventa XL®, Bonilux XL®, Depeflex® XL, Foreven XL®; Folidrit XL®, Raneflex XL®, Tifoxin XL®, Venax XL®, Venair XL®, Wenef® XL

Dose depression, ADULT over 18 years, 75 mg once daily; increased if necessary at intervals of at least 2 weeks; max. 375 mg once daily. CHILD under 18 years not recommended (see Depressive Illness in Children and Adolescents, p. 255)

Note Faster dose titration may be necessary in some patients
Generalised anxiety disorder, ADULT over 18 years, 75 mg once daily, increased if necessary at intervals of at least 2 weeks, max. 225 mg once daily
Social anxiety disorder, ADULT over 18 years, recommended dose 75 mg once daily (no evidence of greater efficacy at higher doses); dose may be increased at intervals of at least 2 weeks; max. 225 mg once daily
Tablets, m/r, venlafaxine (as hydrochloride)
37.5 mg; 75 mg; 150 mg; 225 mg. Label: 3, 21, 25, counselling, driving
Brands include Venalic® XL

Dose depression, ADULT over 18 years, 75 mg once daily, increased if necessary at intervals of at least 2 weeks; max. 375 mg once daily. CHILD under 18 years not recommended (see Depressive Illness in Children and Adolescents, p. 255)

Note Faster dose titration may be necessary in some patients

Efexor® XL (Pfizer)

Capsules, m/r, venlafaxine (as hydrochloride) 75 mg (peach), net price 28-cap pack = £22.08; 150 mg (orange), 28-cap pack = £36.81. Label: 3, 21, 25, counselling, driving

Dose depression, ADULT over 18 years, 75 mg once daily, increased if necessary at intervals of at least 2 weeks; max. 375 mg once daily. CHILD under 18 years not recommended (see Depressive Illness in Children and Adolescents, p. 255)

Note Faster dose titration may be necessary in some patients
Generalised anxiety disorder, ADULT over 18 years, 75 mg once daily, increased if necessary at intervals of at least 2 weeks, max. 225 mg once daily
Social anxiety disorder, ADULT over 18 years, recommended dose 75 mg once daily (no evidence of greater efficacy at higher doses); dose may be increased at intervals of at least 2 weeks; max. 225 mg once daily

Central nervous system stimulants include the amphetamines (dexamfetamine and lisdexamfetamine) and related drugs (e.g. methylphenidate). They have very few indications and in particular, should not be used to treat depression, obesity, senility, debility, or for relief of fatigue.

CNS stimulants should be prescribed for children with severe and persistent symptoms of attention deficit hyperactivity disorder (ADHD), when the diagnosis has been confirmed by a specialist; children with moderate symptoms of ADHD can be treated with CNS stimulants when psychological interventions have been unsuccessful or are unavailable. Prescribing of CNS stimulants may be continued by general practitioners, under a shared-care arrangement. Treatment of ADHD often needs to be continued into adolescence, and may need to be continued into adulthood.

Drug treatment of ADHD should be part of a comprehensive treatment programme. The choice of medication should take into consideration co-morbid conditions (such as tic disorders, Tourette syndrome, and epilepsy), the adverse effect profile, potential for drug misuse, tolerance and dependance; and preferences of the patient and caregivers. Methylphenidate and atomoxetine are used for the management of ADHD; dexamfetamine and lisdexamfetamine are an alternative in children who do not respond to these drugs. Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

The need to continue drug treatment for ADHD should be reviewed at least annually. This may involve suspending treatment.

Atomoxetine is used for the treatment of excessive sleepiness associated with narcolepsy with or without cataplexy; dependence with long-term use cannot be excluded and it should therefore be used with caution. Dexamfetamine and methylphenidate [unlicensed indication] are also used to treat narcolepsy.

4.4 CNS stimulants and drugs used for attention deficit hyperactivity disorder

BNF 68

4.4 CNS stimulants and drugs used for ADHD

Shared care arrangement. Treatment of ADHD often needs to be continued into adolescence, and may need to be continued into adulthood.

Drug treatment of ADHD should be part of a comprehensive treatment programme. The choice of medication should take into consideration co-morbid conditions (such as tic disorders, Tourette syndrome, and epilepsy), the adverse effect profile, potential for drug misuse, tolerance and dependance; and preferences of the patient and caregivers. Methylphenidate and atomoxetine are used for the management of ADHD; dexamfetamine and lisdexamfetamine are an alternative in children who do not respond to these drugs. Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

The need to continue drug treatment for ADHD should be reviewed at least annually. This may involve suspending treatment.

Atomoxetine is used for the treatment of excessive sleepiness associated with narcolepsy with or without cataplexy; dependence with long-term use cannot be excluded and it should therefore be used with caution. Dexamfetamine and methylphenidate [unlicensed indication] are also used to treat narcolepsy.

Central nervous system stimulants include the amphetamines (dexamfetamine and lisdexamfetamine) and related drugs (e.g. methylphenidate). They have very few indications and in particular, should not be used to treat depression, obesity, senility, debility, or for relief of fatigue.

CNS stimulants should be prescribed for children with severe and persistent symptoms of attention deficit hyperactivity disorder (ADHD), when the diagnosis has been confirmed by a specialist; children with moderate symptoms of ADHD can be treated with CNS stimulants when psychological interventions have been unsuccessful or are unavailable. Prescribing of CNS stimulants may be continued by general practitioners, under a
function, mydriasis, dermatitis, rash, sweating; less commonly QT-interval prolongation, syncope, suicidal ideation (see Suicidal Ideation, above), aggression, hostility, emotional lability, tics, psychosis, hypoesthesia, cold extremities, menstrual disturbances, muscle spams, pruritus; rarely seizures, Raynaud’s phenomenon; very rarely hepatic disorders (see Hepatic Disorders, above), angle-closure glaucoma.

**Dose**
- **ADULT** over 18 years, body-weight over 70 kg, initially 40 mg daily for 7 days, increased according to response; usual maintenance 80–100 mg daily, but may be increased to max. 120 mg [unlicensed] under the direction of a specialist; **CHILD** 6–18 years, body-weight over 70 kg, initially 40 mg daily for 7 days, increased according to response; usual maintenance 80 mg daily, but may be increased to max. 120 mg [unlicensed] under the direction of a specialist.

**Note**
- Total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening.

**Note**
- Atomoxetine doses in BNF may differ from those in product literature.

**Strattera®** *(Lilly)*
- **Capsules**, atomoxetine (as hydrochloride) 10 mg (white), net price 7-cap pack = £15.62, 28-caps pack = £62.46; 18 mg (gold/white), 7-caps pack = £15.62, 28-caps pack = £62.46, 25 mg (blue/white), 7-caps pack = £15.62, 28-caps pack = £62.46, 40 mg (blue), 7-caps pack = £15.62, 28-caps pack = £62.46, 60 mg (blue/gold), 28-caps pack = £82.46, 80 mg (brown/white), 28-caps pack = £83.28, 100 mg (brown), 28-cap pack = £83.28. Label: 3

**Dexamfetamine Sulfate** *(Dexamphetamine sulfate)*

**Indications**
- Narcolepsy; refractory attention deficit hyperactivity disorder (under specialist supervision).

**Cautions**
- see notes above; also anorexia; mild hypertension (contra-indicated if moderate or severe); psychosis or bipolar disorder; monitor for aggressive behaviour or hostility during initial treatment; history of epilepsy (discontinue if seizures occur); tics and Tourette syndrome (use with caution)—discontinue if tics occur; monitor growth in children (see also below); susceptibility to angle-closure glaucoma; avoid abrupt withdrawal; data on safety and efficacy of long-term use not complete; acute porphyria (section 9.8.2); *interactions*: Appendix 1 (sympathomimetics).

**Special cautions in children**
- Monitor height and weight as growth restriction may occur during prolonged therapy (drug-free periods may allow catch-up in growth but withdraw slowly to avoid inducing depression or renewed hyperactivity).

**Driving**
- May affect performance of skilled tasks (e.g. driving); effects of alcohol unpredictable.

**Contra-indications**
- Cardiovascular disease including moderate to severe hypertension, structural cardiac abnormalities, advanced arteriosclerosis, hypereexcitability or agitated states, hyperthyroidism, history of drug or alcohol abuse.

**Renal impairment**
- use with caution.

**Pregnancy**
- avoid (retrospective evidence of uncertain significance suggesting possible embryotoxicity).

**Breast-feeding**
- significant amount in milk—avoid.

**Side-effects**
- nausea, diarrhoea, dry mouth, abdominal cramps, anorexia (increased appetite also reported), weight loss, taste disturbance, ischaemic colitis, palpitations, tachycardia, chest pain, hypertension, hypotension, cardiomyopathy, myocardial infarction, cardiovascular collapse, cerebral vasculitis, stroke, headache, restless legs, depression, hyperflexia, hyperactivity, impaired concentration, ataxia, anxiety, aggression, dizziness, confusion, sleep disturbances, dysphoria, euphoria, irritability, nervousness, malaise, obsessive-compulsive behaviour, paraesthesia, psychosis, panic attack, tremor, seizures (see also Cautions), neuroleptic malignant syndrome, anhedonia, growth restriction in children (see also under Cautions and notes above), pyrexia, renal impairment, sexual dysfunction, acidosis, rhabdomyolysis, mydriasis, visual disturbances, alopecia, rash, sweating, urticaria; central stimulants have provoked choreothetoid movements and dyskinesia, tics and Tourette syndrome in predisposed individuals (see also Cautions); very rarely angle-closure glaucoma; overdosage: see Emergency Treatment of Poisoning. p. 40

**Dose**
- Narcolepsy, initially 10 mg (ELDERLY 5 mg) daily in divided doses increased at weekly intervals by 10 mg (ELDERLY 5 mg) daily to a max. of 60 mg daily.
- Refractory attention deficit hyperactivity disorder, **ADULT** over 18 years [unlicensed use], initially 5 mg twice daily, increased at weekly intervals according to response; max. 60 mg daily; **CHILD** 6–18 years, initially 2.5 mg 2–3 times daily, increased if necessary at weekly intervals by 5 mg daily, usual max. 1 mg/kg (up to 20 mg) daily (40 mg daily has been required in some children).

**Note**
- Maintenance dose given in 2–4 divided doses.

**Dexamfetamine** *(Non-proprietary)*
- **Tablets**, scored, dexamfetamine sulfate 5 mg, net price 28-tab pack = £18.90. Counselling, driving

**Lisdexamfetamine Mesilate** *(Lisdexamfetamine dimesylate)*
- **Note** Lisdexamfetamine is a prodrug of dexamfetamine.

**Indications**
- attention deficit hyperactivity disorder refractory to methylphenidate (under specialist supervision).

**Cautions**
- see notes above; also anorexia; history of cardiovascular disease or abnormalities; psychosis or bipolar disorder; monitor for aggressive behaviour or hostility during initial treatment; history of drug or alcohol abuse; may lower seizure threshold (discontinue if seizures occur); tics and Tourette syndrome (use with caution)—discontinue if tics occur; monitor growth in children (see also below); susceptibility to angle-closure glaucoma; avoid abrupt withdrawal; acute porphyria (section 9.8.2); *interactions*: Appendix 1 (sympathomimetics).

**Special cautions in children**
- Monitor height and weight as growth restriction may occur during prolonged therapy (drug-free periods may allow catch-up in growth but withdraw slowly to avoid inducing depression or renewed hyperactivity).

**Contra-indications**
- Symptomatic cardiovascular disease including moderate to severe hypertension and...
advanced arteriosclerosis, hyperexcitability or agitated states, hyperthyroidism

Renal impairment use with caution

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises avoid—present in human milk

Side-effects nausea, decreased appetite, vomiting, diarrhoea, dry mouth, abdominal cramps, dysphagia, sleep disturbances, tics, aggression, headache, dizziness, drowsiness, mydriasis, labile mood, weight loss, pyrexia, malaise, growth restriction in children (see also under Cautions and notes above); less commonly anorexia, tachycardia, palpitation, hypertension, logorrhoea, anxiety, paraesthesia, restlessness, depression, dysphoria, dermatomelania, mania, hallucination, sweating, tremor, visual disturbances, sexual dysfunction, rash; very rarely angle-closure glaucoma; also reported cardiomopathy, euphoria, seizures (see also Cautions), central stimulants have provoked choreoathetoid movements and dyskinesia, and Tourette syndrome in predisposed individuals (see also Cautions); overdosage: see Emergency Treatment of Poisoning, p. 40

Dose

- **ADULT** over 18 years [unlicensed use] and **CHILD** 6–18 years, initially 30 mg once daily in the morning, increased if necessary at weekly intervals by 20 mg; max. 70 mg daily (discontinue if response insufficient after 1 month)

Elvanse® (Shire) ▼ [C2]

Capsule, lisdexamfetamine mesilate 30 mg (white/pink), net price 28-cap pack = £58.24; 50 mg (white/blue), 28-cap pack = £68.60; 70 mg (blue/pink), 28-cap pack = £83.16. Label: 3, 25, counseling, administration

Counselling Swallow whole or dissolve contents of capsule in a glass of water

**METHYLPHENIDATE HYDROCHLORIDE**

**Indications** attention deficit hyperactivity disorder (under specialist supervision); narcolepsy [unlicensed indication]

**Cautions** see notes above; also monitor for psychiatric disorders; anxiety or agitation; tics or a family history of Tourette syndrome; drug or alcohol dependence; epilepsy (discontinue if increased seizure frequency); susceptibility to angle-closure glaucoma; avoid abrupt withdrawal; **interactions**: Appendix 1 (sympathomimetics)

**Contra-indications** severe depression, suicidal ideation; anorexia nervosa; psychosis; uncontrolled bipolar disorder; hyperthyroidism; cardiovascular disease (including heart failure, cardiomyopathy, severe hypertension, and arrhythmias), structural cardiac abnormalities; pheochromocytoma; vasculitis; cerebrovascular disorders

**Pregnancy** limited experience—avoid unless potential benefit outweighs risk

**Breast-feeding** limited information available—avoid

**Side-effects** abdominal pain, nausea, vomiting, diarrhoea, dyspepsia, dry mouth, anorexia, reduced weight gain; tachycardia, palpitation, arrhythmias, changes in blood pressure; cough, nasopharyngitis; tics (very rarely Tourette syndrome), insomnia, nervousness, asthenia, depression, irritability, aggression, headache, drowsiness, dizziness, movement disorders; fever; arthralgia; rash, pruritus, alopecia; growth restriction; less commonly constipation, dysphagia, abnormal dreams, confusion, suicidal ideation, urinary frequency, haematuria, muscle cramps, epis-taxis; rarely angina, sweating, and visual disturbances; very rarely hepatic dysfunction, myocardial infarction, cerebral arteritis, psychosis, seizures, neuroleptic malignant syndrome, tolerance and dependence, blood disorders including leucopenia and thrombocytopenia, angle-closure glaucoma, exfoliative dermatitis, and erythema multiforme; supraventricular tachycardia, Bradycardia, and convulsions also reported

**Dose**

- **Attention deficit hyperactivity disorder, ADULT** over 18 years [unlicensed use], 5 mg 2–3 times daily increased if necessary at weekly intervals according to response, max. 100 mg daily in 2–3 divided doses; **CHILD** 6–18 years, initially 5 mg 1–2 times daily, increased if necessary at weekly intervals by 5–10 mg daily; usual max. 60 mg daily in 2–3 divided doses but may be increased to 2.1 mg/kg daily in 2–3 divided doses (max. 90 mg daily) under the direction of a specialist; discontinue if no response after 1 month; **CHILD** 4–6 years see **BNF for Children**

**Evening dose** If effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose)

**Note** Treatment may be started using a modified-release preparation

- **Narcolepsy** [unlicensed indication], 10–60 mg (usually 20–30 mg) daily in divided doses before meals

**Methylphenidate Hydrochloride (Non-proprietary) [C2]**

Tablets, methylphenidate hydrochloride 5 mg, net price 30-tab pack = £3.03; 10 mg, 30-tab pack = £5.49; 20 mg, 30-tab pack = £10.92

**Brands include Medikinet®**

Ritalin® (Novartis) [C2]

Tablets, scored, methylphenidate hydrochloride 10 mg, net price 30-tab pack = £5.57

**Modified release**

**Note** Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of methylphenidate, prescribers should specify the brand to be dispensed.

**Concerta® XL** (Janssen) [C2]

Tablets, m/t, methylphenidate hydrochloride 18 mg (yellow), net price 30-tab pack = £31.19; 27 mg (grey), 30-tab pack = £36.81; 36 mg (white), 30-tab pack = £42.45. Label: 25

**Note** Concerta® XL tablets consist of an immediate-release component (22% of the dose) and a modified-release component (78% of the dose)

**Counselling** Tablet membrane may pass through gastrointestinal tract unchanged

**Cautions** dose form not appropriate for use in dysphagia or if gastro-intestinal lumen restricted

**Dose** attention deficit hyperactivity disorder, **ADULT** over 18 years [initiation unlicensed], initially 18 mg once daily in the morning, adjusted at weekly intervals according to response, max. 108 mg daily; **CHILD** 6–18 years, initially 18 mg once daily (in the morning), increased if necessary at weekly intervals by 18 mg according to response, usual max. 54 mg once daily, but may be increased to 2.1 mg/kg daily (max. 108 mg daily) [unlicensed] under the direction of a specialist; discontinue if no response after 1 month

**Note** Total daily dose of 15 mg of standard-release formulation is equivalent to Concerta® XL 18 mg once daily
Central nervous system

Side-effects

dry mouth, appetite changes, gastrointestinal disturbances (including nausea and diarrhea)

Breast-feeding

avoid—present in milk in small quantities

Pregnancy

avoid—use with caution

Renal impairment

moderate to severe uncontrolled hypertension, heart failure, hypertension, heart valve damage, arrhythmia, peripheral oedema, hypercholesterolaemia, rhinitis, dysphonia, epistaxis, dyskinesia, amnesia, emotional lability, abnormal dreams, suicide ideation, tremor, decreased libido, agitation, aggression, hyperglycaemia, thirst, urinary frequency, menstrual disturbances, eosinophilia, leukocytopenia, myasthenia, muscle cramps, hypotonia, myalgia, arthritis, dry eye, sinusitis, acne, sweating, rash, and pruritus; rarely hallucinations, mania, psychosis; multi-organ hypersensitivity reaction, Stevens-Johnson syndrome, and toxic epidermal necrolysis also reported

Dose

• Narcolepsy ADULT over 18 years, initially 200 mg daily, either in 2 divided doses morning and at noon or as a single dose in the morning, dose adjusted according to response to 200–400 mg daily in 2 divided doses or as a single dose; ELDERLY initiate at 100 mg daily

Provigrat® (TEVA UK) Tablets, modafinil 100 mg, net price 30-tab pack = £52.60; 200 mg (scored), 30-tab pack = £105.21

Obesity is associated with many health problems including cardiovascular disease, diabetes mellitus, gallstones and osteoarthritis. Factors that aggravate obesity may include depression, other psychosocial problems, and some drugs.

The main treatment of the obese individual is a suitable diet, carefully explained to the individual, with appropriate support and encouragement; the individual should also be advised to increase physical activity. Smoking cessation (while maintaining body weight) may be worthwhile before attempting supervised weight loss since cigarette smoking may be more harmful than obesity. Attendance at weight loss groups helps some individuals.

Obesity should be managed in an appropriate setting by staff who have been trained in the management of obesity; the individual should receive advice on diet and lifestyle modification and be monitored for changes in weight as well as in blood pressure, blood lipids and other associated conditions.

An anti-obesity drug should be considered only for those with a body mass index (BMI) individual’s body-weight divided by the square of the individual’s height of 30 kg/m² or greater in whom at least 3 months of managed care involving supervised diet, exercise and behaviour modification fails to achieve a realistic reduction in weight. In the presence of risk factors (such as diabetes, coronary heart disease, hypertension, and

Equasym XL® (Shire) (C2)

Capsules, m/r, methylphenidate hydrochloride 10 mg (white/green), net price 30-cap pack = £25.00; 20 mg (white/blue), 30-cap pack = £30.00; 30 mg (white/brown), 30-cap pack = £35.00. Label: 25

Note Equasym XL® capsules consist of an immediate-release component (30% of the dose) and a modified-release component (70% of the dose)

Dose attention deficit hyperactivity disorder, ADULT over 18 years [unlicensed use], initially 10 mg once daily in the morning before breakfast, increased gradually at weekly intervals if necessary, max 100 mg daily. CHILD 6–18 years, initially 10 mg once daily in the morning before breakfast, increased gradually at weekly intervals if necessary, usual max 60 mg daily but may be increased to 2.1 mg/kg daily (max. 90 mg daily) [unlicensed] under the direction of a specialist; discontinue if no response after 1 month

Note Contents of capsule can be sprinkled on a tablespoon of apple sauce (then swallowed immediately without chewing)

Medikinet XL® (Finn) (C2)

Capsules, m/r, methylphenidate hydrochloride 5 mg (white), net price 30-cap pack = £24.04; 10 mg (lilac/white), 30-cap pack = £24.04; 20 mg (lilac), 30-cap pack = £28.86; 30 mg (purple/light grey), 30-cap pack = £33.66; 40 mg (purple/grey), 30-cap pack = £57.72. Label: 25

Note Medikinet XL® capsules consist of an immediate-release component (50% of the dose) and a modified-release component (50% of the dose)

Dose attention deficit hyperactivity disorder, ADULT over 18 years [unlicensed use], initially 10 mg once daily in the morning with breakfast, adjusted at weekly intervals according to response, max 100 mg daily. CHILD 6–18 years, initially 10 mg once daily in the morning with breakfast, adjusted at weekly intervals according to response, usual max. 60 mg daily but may be increased to 2.1 mg/kg daily (max. 90 mg daily) [unlicensed] under the direction of a specialist; discontinue if no response after 1 month

Note Contents of capsule can be sprinkled on a tablespoon of apple sauce or yoghurt (then swallowed immediately without chewing)

MODAFINIL

Indications excessive sleepiness associated with narcolepsy with or without cataplexy

Cautions monitor blood pressure and heart rate in hypertensive patients (but see Contra-indications); ECG required before initiation; history of psychosis, depression, mania, alcohol or drug abuse; discontinue treatment if psychiatric symptoms develop; possibility of dependence; discontinue treatment if rash develops; interactions: Appendix 1 (modafinil)

Contra-indications moderate to severe uncontrolled hypertension, arrhythmia; history of left ventricular hypertrophy, cor pulmonale, or of clinically significant signs of CNS stimulant-induced mitral valve prolapse (including ischaemic ECG changes, chest pain and arrhythmias)

Hepatic impairment halve dose in severe impairment

Renal impairment use with caution—limited information available

Pregnancy avoid

Breast-feeding avoid—present in milk in animal studies

Side-effects dry mouth, appetite changes, gastrointestinal disturbances (including nausea, diarrhoea, constipation, and dyspepsia), abdominal pain; tachycardia, vasodilatation, chest pain, palpitation; headache (uncommonly migraine), anxiety, sleep disturbances, dizziness, drowsiness, depression, confusion, paraesthesia, asthma; visual disturbances; less commonly flatulence, reflux, vomiting, mouth ulcers, glossitis, dysphagia, taste disturbance, weight changes, hypertension, hypotension, bradycardia, arrhythmia, peripheral oedema, hypercholesterolaemia, rhinitis, dysphonia, epistaxis, dyskinesia, amnesia, emotional lability, abnormal dreams, suicidal ideation, tremor, decreased libido, agitation, aggression, hyperglycaemia, thirst, urinary frequency, menstrual disturbances, eosinophilia, leucocytopenia, myasthenia, muscle cramps, hypotonia, myalgia, arthritis, dry eye, sinusitis, acne, sweating, rash, and pruritus; rarely hallucinations, mania, psychosis; multi-organ hypersensitivity reaction, Stevens-Johnson syndrome, and toxic epidermal necrolysis also reported

4.5 Drugs used in the treatment of obesity

4.5.1 Anti-obesity drugs acting on the gastro-intestinal tract

4.5.2 Centrally acting appetite suppressants

4.5 Drugs used in the treatment of obesity

BNF 68

264
obstructive sleep apnoea), it may be appropriate to prescribe a drug to individuals with a BMI of 27 kg/m² or greater, provided that such use is permitted by the drug’s marketing authorisation. Drugs should never be used as the sole element of treatment. The individual should be monitored on a regular basis; drug treatment should be discontinued if the individual regains weight at any time whilst receiving drug treatment.

Combination therapy involving more than one anti-obesity drug is contra-indicated by the manufacturers; there is no evidence-base to support such treatment.

Thyroid hormones have no place in the treatment of obesity except in biochemically proven hypothyroid patients. The use of diuretics, chlorionic gonadotrophin, or amfeftamines is not appropriate for weight reduction.

**4.5.1 Anti-obesity drugs acting on the gastro-intestinal tract**

**Orlistat** is a lipase inhibitor, reduces the absorption of dietary fat. It is used in conjunction with a mildly hypocaloric diet in individuals with a body mass index (BMI) of 30 kg/m² or more or in individuals with a BMI of 28 kg/m² in the presence of other risk factors such as type 2 diabetes, hypertension, or hypercholesterolaemia.

Orlistat should be used in conjunction with other lifestyle measures to manage obesity (section 4.5); treatment should only be continued beyond 12 months after discussing potential benefits and risks with the patient. On stopping orlistat, there may be a gradual reversal of weight loss.

Some of the weight loss in those taking orlistat probably results from individuals reducing their fat intake to avoid severe gastro-intestinal effects including steatorrhea. Vitamin supplementation (especially of vitamin D) may be considered if there is concern about deficiency of fatsoluble vitamins.

Methylcellulose is claimed to reduce food intake by producing a feeling of satiety, but there is little evidence to support its use in the management of obesity.

**Oralistat**

**Indications** adjunct in obesity (see notes above)

**Cautions** may impair absorption of fat-soluble vitamins; chronic kidney disease or volume depletion; interaction: Appendix 1 (orlistat)

**Multivitamins** If a multivitamin supplement is required, it should be taken at least 2 hours after orlistat dose or at bedtime

**Contra-indications** chronic malabsorption syndrome; cholestasis

**Pregnancy** use with caution

**Breast-feeding** avoid—no information available

**Side-effects** oily leakage from rectum, flatulence, faecal urgency, liquid or oily stools, faecal incontinence, abdominal distension and pain (gastro-intestinal effects minimised by reduced fat intake), tooth and gingival disorders, respiratory infections, malaise, anxiety, headache, menstrual disturbances, urinary tract infection, hypoglycaemia; also reported: rectal bleeding, diverticulitis, cholelithiasis, hepatitis, hypothyroidism, oxalate nephropathy, bullous eruptions

**Dose**

- ADULT over 18 years, 120 mg taken immediately before, during, or up to 1 hour after each main meal (max. 120 mg 3 times daily); continue treatment beyond 12 weeks only if weight loss since start of treatment exceeds 5% (target for initial weight loss may be lower in patients with type 2 diabetes); CHILD over 12 years see BNF for Children

**Note** If a meal is missed or contains no fat, the dose of orlistat should be omitted

**Xenical** (Roche) 24 orlistat 120 mg, net price 84-
cap pack £31.63

**4.5.2 Centrally acting appetite suppressants**

Phentermine and diethylpropion are central stimulants; they are not recommended for the treatment of obesity. Phentermine has been associated with a risk of pulmonary hypertension.

Sibutramine, dexfenfluramine, and fenfluramine have been withdrawn because the benefit of treatment does not outweigh the risk of serious adverse effects.

**4.6 Drugs used in nausea and vertigo**

Antiemetics should be prescribed only when the cause of vomiting is known because otherwise they may delay diagnosis, particularly in children. Antiemetics are unnecessary and sometimes harmful when the cause can be treated, such as in diabetic ketoacidosis, or in digoxin or antiepileptic overdose.

If antiemetic drug treatment is indicated, the drug is chosen according to the aetiology of vomiting.

**Antihistamines** are effective against nausea and vomiting resulting from many underlying conditions. There is no evidence that any one antihistamine is superior to another but their duration of action and incidence of adverse effects (drowsiness and antimuscarinic effects) differ.

The phenothiazines are dopamine antagonists and act centrally by blocking the chemoreceptor trigger zone. They are of considerable value for the prophylaxis and treatment of nausea and vomiting associated with diffuse neoplastic disease, radiation sickness, and the emesis caused by drugs such as opioids, general anaesthetics, and cytotoxics. Prochlorperazine, perphenazine, and trifluoperazine are less sedating than chlorpromazine; severe dystonic reactions sometimes occur with phenothiazines, especially in children. Some phenothiazines are available as rectal suppositories, which can be useful in patients with persistent vomiting or with severe nausea; prochlorperazine can also be administered as a buccal tablet which is placed between the upper lip and the gum.

Droperidol is a butyrophenone, structurally related to haloperidol, which blocks dopamine receptors in the chemoreceptor trigger zone.
Other antipsychotic drugs including haloperidol and levomepromazine are used for the relief of nausea and vomiting in terminal illness, see Palliative Care. (p. 22).

Metoclopramide is an effective antiemetic and its activity closely resembles that of the phenothiazines. Metoclopramide also acts directly on the gastro-intestinal tract and it may be superior to the phenothiazines for emesis associated with gastroduodenal, hepatic, and biliary disease. As with the phenothiazines, metoclopramide can induce acute dystonic reactions involving facial and skeletal muscle spasms and oculogyric crises. These dystonic effects are more common in the young (especially girls and young women) and the very old; they usually occur shortly after starting treatment with metoclopramide and subside within 24 hours of stopping it. Injection of an antiparkinsonian drug such as procyclidine (section 4.9.2) will abort dystonic attacks, see also MHRA advice below.

**MHRA/CHM advice**

**Metoclopramide: risk of neurological adverse effects—restricted dose and duration of use (August 2013)**

The benefits and risks of metoclopramide have been reviewed by the European Medicines Agency’s Committee on Medicinal Products for Human Use, which concluded that the risk of neurological effects such as extrapyramidal disorders and tardive dyskinesia outweigh the benefits in long-term or high-dose treatment. To help minimise the risk of potentially serious neurological adverse effects, the following restrictions to indications, dose, and duration of use have been made:

- In adults over 18 years, metoclopramide should only be used for prevention of postoperative nausea and vomiting, radiotherapy-induced nausea and vomiting, delayed (but not acute) chemotherapy-induced nausea and vomiting, and symptomatic treatment of nausea and vomiting, including that associated with acute migraine (where it may also be used to improve absorption of oral analgesics);
- Metoclopramide should only be prescribed for short-term use (up to 5 days);
- Usual dose is 10 mg, repeated up to 3 times daily; max. daily dose is 500 micrograms/kg;
- Intravenous doses should be administered as a slow bolus over at least 3 minutes;
- Oral liquid formulations should be given via an appropriately designed, graduated oral syringe to ensure dose accuracy.

**Note** This advice does not apply to unlicensed uses of domperidone (e.g. palliative care, p. 20).

**Domperidone** acts at the chemoreceptor trigger zone; it is licensed only for the relief of nausea and vomiting. It has the advantage over metoclopramide and the phenothiazines of being less likely to cause central effects such as sedation and dystonic reactions because it does not readily cross the blood-brain barrier. In Parkinson’s disease, it can be used to treat nausea caused by dopaminergic drugs (section 4.9.1). See also MHRA advice below.

**MHRA/CHM advice**

**Domperidone: risk of cardiac side-effects—restricted indication, new contra-indications, reduced dose and duration of use**

The benefits and risks of domperidone have been reviewed. As domperidone is associated with a small increased risk of serious cardiac side-effects, the following restrictions to indication, dose and duration of treatment have been made, and new contra-indications added:

- Domperidone should only be used for the relief of the symptoms of nausea and vomiting;
- Domperidone should be used at the lowest effective dose for the shortest possible duration (max. treatment duration should not normally exceed 1 week);
- Domperidone is contra-indicated for use in conditions where cardiac conduction is, or could be impaired, or where there is underlying cardiac disease, when administered concomitantly with drugs that prolong the QT interval or potent CYP3A4 inhibitors, and in severe hepatic impairment;
- The recommended dose in adults and adolescents over 12 years and over 35 kg is 10 mg up to 3 times daily;
- The recommended dose in children under 35 kg is 250 micrograms/kg up to 3 times daily;
- Oral liquid formulations should be given via an appropriately designed, graduated oral syringe to ensure dose accuracy.

**Note** This advice does not apply to unlicensed uses of domperidone (e.g. palliative care, p. 20).

Granisetron, ondansetron, and palonosetron are specific 5HT3-receptor antagonists which block 5HT3 receptors in the gastro-intestinal tract and in the CNS. Granisetron and ondansetron are of value in the management of nausea and vomiting in patients receiving cytotoxics and in postoperative nausea and vomiting. Palonosetron is licensed for prevention of nausea and vomiting associated with moderately or highly emetogenic cytotoxic chemotherapy.

**Dexamethasone** (section 6.3.2) has antiemetic effects and it is used in vomiting associated with cancer chemotherapy. It can be used alone or with metoclopramide, prochlorperazine, lorazepam, or a 5HT3-receptor antagonist (section 8.1).

**Aprepitant** and **fosaprepitant** are neurokinin 1-receptor antagonists licensed for the prevention of acute and delayed nausea and vomiting associated with cisplatin-based cytotoxic chemotherapy; they are given with dexamethasone and a 5HT3-receptor antagonist.

Nabilone is a synthetic cannabinoid with antiemetic properties. It may be used for nausea and vomiting caused by cytotoxic chemotherapy that is unresponsive to conventional antiemetics. Side-effects such as drowsiness and dizziness occur frequently with standard doses.

**Vomiting during pregnancy** Nausea in the first trimester of pregnancy is generally mild and does not require drug therapy. On rare occasions if vomiting is severe, short-term treatment with an antihistamine, such as promethazine, may be required. **Prochlorperazine** or **metoclopramide** may be considered as second-line treatments, see also MHRA advice above. If symptoms do not settle in 24 to 48 hours then specialist opinion should be sought. Hyperemesis gravidarum is a more serious condition, which requires intravenous fluid and electrolyte replacement and sometimes nutritional
support. Supplementation with thiamine must be considered in order to reduce the risk of Wernicke’s encephalopathy.

Postoperative nausea and vomiting The incidence of postoperative nausea and vomiting depends on many factors including the anaesthetic used, and the type and duration of surgery. Other risk factors include female sex, non-smokers, a history of postoperative nausea and vomiting or motion sickness, and intraoperative and postoperative use of opioids. Therapy to prevent postoperative nausea and vomiting should be based on the assessed risk of postoperative nausea and vomiting in each patient. Drugs used include 5HT3-receptor antagonists, droperidol, dexamethasone (section 6.3.2), some phenothiazines (e.g. prochlorperazine), and antihistamines (e.g. cyclizine). A combination of two or more antiemetic drugs that have different mechanisms of action is often indicated in those at high risk of postoperative nausea and vomiting or where postoperative vomiting presents a particular danger (e.g. in some types of surgery). When a prophylactic antiemetic drug has failed, postoperative nausea and vomiting should be treated with one or more drugs from a different class.

Motion sickness Antiemetics should be given to prevent motion sickness rather than after nausea or vomiting develop. The most effective drug for the prevention of motion sickness is hydroxyzine hydrobromide. For children over 10 years old, a transdermal hydroxyzine patch provides prolonged activity but it needs to be applied several hours before travelling. The sedating antihistamines are slightly less effective against motion sickness, but are generally better tolerated than hydroxyzine. If a sedative effect is desired promethazine is useful, but generally a slightly less sedating antihistamine such as cyclizine or cinnarizine is preferred. Domperidone, metoclopramide, 5HT3-receptor antagonists, and the phenothiazines (except the antihistamine phenothiazine promethazine) are ineffective in motion sickness.

Other vestibular disorders Management of vestibular diseases is aimed at treating the underlying cause as well as treating symptoms of the balance disturbance and associated nausea and vomiting. Vertigo and nausea associated with Menière’s disease and middle-ear surgery can be difficult to treat.

Beta-histidine is an analogue of histamine and is claimed to reduce endolymphatic pressure by improving the microcirculation. Beta-histidine is licensed for vertigo, tinnitus, and hearing loss associated with Menière’s disease.

A diuretic alone or combined with salt restriction may provide some benefit in vertigo associated with Menière’s disease; antihistamines (such as cinnarizine), and phenothiazines (such as prochlorperazine) are also used. Where possible, prochlorperazine should be reserved for the treatment of acute symptoms.

For advice to avoid the inappropriate prescribing of drugs (notably phenothiazines) for dizziness in the elderly, see Prescribing for the Elderly. (p. 25).

Cytotoxic chemotherapy For the management of nausea and vomiting induced by cytotoxic chemotherapy, see section 8.1.

Palliative care For the management of nausea and vomiting in palliative care, see Palliative Care (Nausea and Vomiting), (p. 22) and Syringe Drivers (Nausea and Vomiting), (p. 23).

Migraine For the management of nausea and vomiting associated with migraine, see section 4.7.4.1, (p. 295)

Antihistamines

### CINNARIZINE

**Indications** vestibular disorders, such as vertigo, tinnitus, nausea, and vomiting in Ménière’s disease; motion sickness

**Cautions** section 3.4.1; also Parkinson’s disease

**Contra-indications** section 3.4.1

**Hepatic impairment** section 3.4.1

**Renal impairment** use with caution—no information available

**Pregnancy** section 3.4.1

**Breast-feeding** section 3.4.1

**Side-effects** section 3.4.1; also rarely weight gain, sweating, lichen planus, and lupus-like skin reactions

**Dose**

- Vestibular disorders, 30 mg 3 times daily; **CHILD** 5–12 years 15 mg 3 times daily
- Motion sickness, 30 mg 2 hours before travel then 15 mg every 8 hours during journey if necessary; **CHILD** 5–12 years, 15 mg 2 hours before travel then 7.5 mg every 8 hours during journey if necessary

Cinnarizine (Non-proprietary)

- **Tablets**, cinnarizine 15 mg, net price 84-tab pack = £3.45. Label: 2

Stugeron® (Janssen)

- **Tablets**, scored, cinnarizine 15 mg, net price 15-tab pack = £1.77, 100-tab pack = £4.18. Label: 2

**With dimenhydrinate**

Arlevert® (Hennig Arzneimittel)

- **Tablets**, cinnarizine 20 mg, dimenhydrinate 40 mg, net price 100-tab pack = £24.00. Label: 2, 21

**Dose** vertigo, **ADULT** over 18 years, 1 tablet 3 times daily

### CYCLIZINE

**Indications** nausea, vomiting, vertigo, motion sickness, labyrinthine disorders

**Cautions** section 3.4.1; severe heart failure; may counteract haemodynamic benefits of opioids; **interactions**: Appendix 1 (antihistamines)

**Contra-indications** section 3.4.1

**Hepatic impairment** section 3.4.1

**Pregnancy** section 3.4.1

**Breast-feeding** no information available

**Side-effects** section 3.4.1; also hypertension, paraesthesia, and twitching

**Dose**

- **By mouth**, cyclizine hydrochloride 50 mg up to 3 times daily; **CHILD** 6–12 years 25 mg up to 3 times daily

**Note** For motion sickness, take 1–2 hours before departure

- **By intramuscular or intravenous injection**, cyclizine lactate 50 mg 3 times daily
Central nervous system

4.6 Drugs used in nausea and vertigo

**Cyclizine (Non-proprietary)**
- **Tablets.** cyclizine hydrochloride 50 mg, net price 100-tab pack = £10.72. Label: 2
- **Valoid® (AMCo) [FR] Injection.** cyclizine lactate 50 mg/mL, net price 1-mL amp = 65p

**PROMETHAZINE HYDROCHLORIDE**
- **Indications** nausea, vomiting, vertigo, labyrinthine disorders, motion sickness; allergy and urticaria (section 3.4.1); sedation (section 4.1.1)
- **Cautions** see Promethazine Hydrochloride, section 3.4.1
- **Contra-indications** see notes in section 3.4.1
- **Hepatic impairment** see notes in section 3.4.1
- **Renal impairment** see Promethazine Hydrochloride, section 3.4.1
- **Pregnancy** see notes in section 3.4.1
- **Breast-feeding** see notes in section 3.4.1
- **Side-effects** see Chlorpromazine Hydrochloride, section 4.2.1

**Dose**
- **By mouth.**
  - ADULT 1–2 hours before travel
  - CHILD 25–50 mg every 3–4 hours until vomiting stops; CHILD 5–10 years, 12.5 mg at bedtime on night before travel; CHILD 10 years+, 25 mg at bedtime on night before travel or 25 mg 1–2 hours before travel; CHILD 5–10 years, 12.5 mg at bedtime on night before travel or 12.5 mg 1–2 hours before travel

**Phenothiazines and related drugs**

**CHLORPROMAZINE HYDROCHLORIDE**
- **Indications** nausea and vomiting of terminal illness (where other drugs have failed or are not available); other indications (section 4.2.1)
- **Cautions** see Chlorpromazine Hydrochloride, section 4.2.1
- **Contra-indications** see notes in section 4.2.1
- **Hepatic impairment** see notes in section 4.2.1
- **Renal impairment** see notes in section 4.2.1
- **Pregnancy** see notes in section 4.2.1
- **Breast-feeding** see notes in section 4.2.1
- **Side-effects** see Chlorpromazine Hydrochloride, section 4.2.1

**Dose**
- By mouth, 10–25 mg every 4–6 hours; CHILD 500 micrograms/kg every 4–6 hours (1–5 years max. 40 mg daily, 6–12 years max. 75 mg daily)
- By deep intramuscular injection initially 25 mg then 25–50 mg every 3–4 hours until vomiting stops; CHILD 500 micrograms/kg every 6–8 hours (1–5 years max. 40 mg daily, 6–12 years max. 75 mg daily)
- By rectum in suppositories, chlorpromazine 100 mg every 6–8 hours [unlicensed]

**DROPERIDOL**
- **Indications** prevention and treatment of postoperative nausea and vomiting
- **Cautions** section 4.2.1; also chronic obstructive pulmonary disease or respiratory failure; electrolyte disturbances; history of alcohol abuse; continuous pulse oximetry required if risk of ventricular arrhythmia—continue for 30 minutes following administration; interactions: Appendix 1 (droperidol)
- **Contra-indications** section 4.2.1: QT-interval prolongation (avoid concomitant administration of drugs that prolong QT interval); hypokalaemia; hypomagnesaemia; bradycardia
- **Hepatic impairment** in postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required; for nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia, reduce dose
- **Renal impairment** in postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required; for nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia, reduce dose
- **Pregnancy** section 4.2.1
- **Breast-feeding** limited information available—avoid repeated administration
- **Side-effects** section 4.2.1; also anxiety, cardiac arrest, hallucinations, and inappropriate antidiuretic hormone secretion
- **Dose**
  - Prevention and treatment of postoperative nausea and vomiting. ADULT over 18 years, by intravenous injection, 0.625–1.25 mg (ELDERLY 625 micrograms) 30 minutes before end of surgery, repeated every 6 hours
as required; CHILD over 2 years (second-line use only) 20–50 micrograms/kg (max. 1.25 mg)

- Prevention of nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia (PCA), ADULT over 18 years, by intravenous injection, 15–50 micrograms of droperidol for every 1 mg of morphine in PCA (max. 5 mg droperidol daily); ELDERLY reduce dose

Xomolix® (ProStrakan) (TM)
Injection, droperidol 2.5 mg/mL, net price 1–1 mL amp = £3.94

### PERPHENAZINE

**Indications** severe nausea, vomiting (see notes above); other indications (section 4.2.1)

**Cautions** see notes in section 4.2.1

**Contra-indications** see Perphenazine, section 4.2.1

**Hepatic impairment** see notes in section 4.2.1

**Renal impairment** see notes in section 4.2.1

**Pregnancy** see notes in section 4.2.1

**Breast-feeding** see notes in section 4.2.1

**Side-effects** see Perphenazine, section 4.2.1

**Dose**
- 4 mg 3 times daily, adjusted according to response; max. 24 mg daily (chemotherapy-induced); ELDERLY quarter to half adult dose; CHILD under 14 years not recommended

**Preparations**

Section 4.2.1

### PROChlorPERAZINE

**Indications** severe nausea, vomiting, vertigo, labyrinthine disorders (see notes above); other indications section 4.2.1

**Cautions** see Prochlorperazine, section 4.2.1; elderly (see notes above)

**Contra-indications** see Prochlorperazine, section 4.2.1

**Hepatic impairment** see notes in section 4.2.1

**Renal impairment** see notes in section 4.2.1

**Pregnancy** see notes in section 4.2.1

**Breast-feeding** see notes in section 4.2.1

**Side-effects** see Prochlorperazine, section 4.2.1

**Dose**
- Note: Doses are expressed as prochlorperazine maleate or prochlorperazine mesilate; 1 mg prochlorperazine maleate = 1 mg prochlorperazine mesilate

- **By mouth**, nausea and vomiting, acute attack, 20 mg initially then 10 mg after 2 hours; prevention 5–10 mg 2–3 times daily; CHILD (over 10 kg only) 250 micrograms/kg 2–3 times daily

- Labyrinthine disorders, 5 mg 3 times daily, gradually increased if necessary to 30 mg daily in divided doses, then reduced after several weeks to 5–10 mg daily; CHILD not recommended

- **By deep intramuscular injection**, nausea and vomiting, 12.5 mg when required followed if necessary after 6 hours by an oral dose, as above; CHILD and ADOLESCENT under 18 years see BNF for Children

Prochlorperazine (Non-proprietary) (TM)

**Tablets**, prochlorperazine maleate 5 mg, net price 28-tab pack = 95p, 84-tab pack = £1.37. Label: 2

**Injection**, prochlorperazine mesilate 12.5 mg/mL, net price 1-mL amp = 52p

**Stemetil®** (Sanofi-Aventis) (TM)

**Tablets**, prochlorperazine maleate 5 mg (off-white), net price 28-tab pack = £1.98, 84-tab pack = £5.94. Label: 2

**Syrup**, straw-coloured, prochlorperazine mesilate 5 mg/5 mL, net price 100-mL pack = £3.34. Label: 2

**Injection**, prochlorperazine mesilate 12.5 mg/mL, net price 1-mL amp = 52p

**Buccal preparation**

Buccastem® (Alliance) (TM)

**Tablets** (buccal), pale yellow, prochlorperazine maleate 3 mg, net price 5 × 10-tab pack = £6.49. Label: 2, counselling, administration, see under Dose below

**Dose** ADULT and CHILD over 12 years, 1–2 tablets twice daily; tablets are placed high between upper lip and gum and left to dissolve

### TRIFluOPERAZINE

**Indications** severe nausea and vomiting (see notes above); other indications (section 4.2.1)

**Cautions** see notes in section 4.2.1

**Contra-indications** see notes in section 4.2.1

**Hepatic impairment** see notes in section 4.2.1

**Renal impairment** see notes in section 4.2.1

**Pregnancy** see notes in section 4.2.1

**Breast-feeding** see notes in section 4.2.1

**Side-effects** see Trifluoperazine, section 4.2.1

**Dose**
- 2–4 mg daily in divided doses; max. 6 mg daily; CHILD 3–5 years up to 1 mg daily, 6–12 years up to 4 mg daily

**Preparations**

Section 4.2.1

### Domperidone and metoclopramide

### DOMPERIDONE

**Indications** relief of nausea and vomiting

**Cautions** children: patients over 60 years—increased risk of ventricular arrhythmia; interactions: Appendix 1 (domperidone)

**Counselling** Patients should be told how to recognise signs of arrhythmia and advised to seek medical attention if symptoms such as palpitation or syncope develop

**Contra-indications** prolactinoma; if increased gastrointestinal motility harmful; conditions where cardiac conduction is, or could be, impaired; concomitant use of drugs that prolong the QT interval, or of potent CYP3A4 inhibitors; cardiac disease

**Hepatic impairment** avoid in moderate or severe impairment

**Renal impairment** reduce frequency

**Pregnancy** use only if potential benefit outweighs risk

**Breast-feeding** amount too small to be harmful

**Side-effects** dry mouth; less commonly diarrhoea, drowsiness, malaise, headache, anxiety, decreased libido, galactorrhea, breast pain, rash, pruritus; also reported QT-interval prolongation, ventricular arrhythmias, sudden cardiac death, agitation, nervousness, convulsions, extrapyramidal disorders, gynaecomastia, amenorrhoea, urinary retention, oculogyric crisis

Stemetil® (Sanofi-Aventis) (TM)

**Tablets**, prochlorperazine maleate 5 mg (off-white), net price 28-tab pack = £1.98, 84-tab pack = £5.94. Label: 2

**Syrup**, straw-coloured, prochlorperazine mesilate 5 mg/5 mL, net price 100-mL pack = £3.34. Label: 2

**Injection**, prochlorperazine mesilate 12.5 mg/mL, net price 1-mL amp = 52p
Dose
- By mouth, ADULT and CHILD over 12 years and body-weight over 35 kg, 10 mg up to 3 times daily; max. 30 mg daily; CHILD body-weight up to 35 kg, 250 micrograms/kg up to 3 times daily; max. 750 micrograms/kg daily

Note: See also MHRA advice above

Domperidone (Non-proprietary)

Tablets, 10 mg (as maleate), net price 30-tab pack = £1.59; 100-tab pack = £4.63. Label: 22, counselling, arrhythmias

Suspension, domperidone 5 mg/5 mL, net price 200-mL pack = £12.53. Label: 22, counselling, arrhythmias

Motilium® (Zentiva)

Tablets, f/c, domperidone 10 mg (as maleate), net price 30-tab pack = £2.71; 100-tab pack = £9.04. Label: 22, counselling, arrhythmias

5HT3-receptor antagonists

Metoclopramide (Non-proprietary)

Tablets, metoclopramide hydrochloride 10 mg, net price 28-tab pack = 87p

Oral solution, metoclopramide hydrochloride 5 mg/5 mL, net price 150-mL pack = £17.08. Counselling, use of pipette

Injection, metoclopramide hydrochloride 5 mg/mL, net price 2-mL amp = 30p

Maxolon® (AMCo)

Tablets, scored, metoclopramide hydrochloride 10 mg, net price 84-tab pack = £5.24

Injection, metoclopramide hydrochloride 5 mg/mL, net price 2-mL amp = 27p

Compound preparations (for migraine)

Section 4.7.1

GRANISETRON

Indications see under Dose

Cautions susceptibility to QT-interval prolongation (including concomitant use of drugs that prolong QT interval, and electrolyte disturbances); subacute intestinal obstruction

Hepatic impairment manufacturer advises use with caution

Pregnancy manufacturer advises avoid

Breast-feeding avoid—no information available

Side-effects constipation, diarrhoea, headache, insomnia; less commonly QT-interval prolongation, extrapyramidal reactions, rash; also application-site reactions with transdermal patch

Dose
- Nausea and vomiting induced by cytotoxic chemotherapy or radiotherapy, by mouth, 1–2 mg within 1 hour before start of treatment, then 2 mg daily in 1–2 divided doses for up to 1 week following treatment; when intravenous infusion also used, max. combined total 9 mg in 24 hours; CHILD under 18 years see BNF for Children

By intravenous injection (each 1 mg granisetron diluted to 5 mL and given over not less than 30 seconds) or by intravenous infusion (over 5 minutes), prevention, 10–40 micrograms/kg (max. 3 mg) 5 minutes before start of chemotherapy or radiotherapy; treatment, dose as for prevention (further maintenance doses must not be given less than 10 minutes apart); max. 9 mg in 24 hours; CHILD under 18 years see BNF for Children

Note: See also MHRA advice above
Granisetron (Non-proprietary) ®

**Tablets**, granisetron (as hydrochloride) 1 mg, net price 10-tab pack = £50.38

**Injection**, granisetron (as hydrochloride) 1 mg/mL, for dilution before use, net price 1-mL amp = £1.60, 3-mL amp = £2.40

**Kytril®** (Roche) ®

**Tablets**, 1/16c, granisetron (as hydrochloride) 1 mg, net price 10-tab pack = £52.39; 2 mg, 5-tab pack = £52.39

**Sancuso®** (ProStrakan) ®

**Patches**, self-adhesive, granisetron 3.1 mg/24 hours, net price 1 patch = £56.00. Counselling, administration

**Note** Patients should be advised not to expose the site of the patch to sunlight during use and for 10 days after removal

---

**ONDANSETRON**

**Indications** see under Dose

**Cautions** susceptibility to QT-interval prolongation (including concomitant use of drugs that prolong QT interval, and electrolyte disturbances); subacute intestinal obstruction; adenotonsillar surgery; interactions: Appendix 1 (5HT3-receptor Antagonists)

**Contra-indications** congenital long QT syndrome

**Hepatic impairment** max. 8 mg daily in moderate or severe impairment

**Pregnancy** no information available; avoid unless potential benefit outweighs risk

**Breast-feeding** present in milk in animal studies—avoid

**Side-effects** constipation; headache; flushing; injection site-reactions; less commonly hiccups, hypotension, bradycardia, chest pain, arrhythmias, movement disorders, seizures; or intravenous administration, rarely dizziness, transient visual disturbances (very rarely transient blindness); suppositories may cause rectal irritation

**Dose**

- Moderately emetogenic chemotherapy or radiotherapy, **ADULT** 18–65 years, **by mouth**, 8 mg 1–2 hours before treatment or **by rectum**, 16 mg 1–2 hours before treatment or **by intramuscular injection** or slow intravenous injection, 8 mg immediately before treatment; **ELDERLY** over 65 years, **by mouth**, 8 mg 1–2 hours before treatment or **by rectum**, 16 mg 1–2 hours before treatment or **by intramuscular injection** or intravenous infusion (over at least 15 minutes), 8 mg immediately before treatment

- then **by mouth**, 8 mg every 12 hours for up to 5 days or **by rectum**, 16 mg daily for up to 5 days; **CHILD** under 18 years see **BNF for Children**

**Ondasetron** (Non-proprietary) ®

**Tablets**, ondasetron (as hydrochloride) 4 mg, net price 30-tab pack = £5.37; 8 mg, 10-tab pack = £10.89

**Brands include** Ondemet®

**Oral solution**, ondasetron (as hydrochloride) 4 mg/5 mL, net price 50-mL pack = £5.65

**Brands include** Demorem®

**Orodispersible film**, ondasetron 4 mg, net price 10-film pack = £28.50; 8 mg, 10-film pack = £5.70.

Counselling, administration

**Counselling** Films should be placed on the tongue, allowed to disperse and swallowed

**Brands include** Setofilm®

**Injection**, ondasetron (as hydrochloride) 2 mg/mL, net price 2-mL amp = £1.00, 4-mL amp = £1.39

**Brands include** Ondemet®

**Zofran®** (GSK) ®

**Tablets**, yellow, 1/6c, ondasetron (as hydrochloride) 4 mg, net price 50-tab pack = £107.91; 8 mg, 10-tab pack = £216.94

**Oral lypophilisates** (Zofran Mel®), ondasetron 4 mg, net price 10-tab pack = £35.97; 8 mg, 10-tab pack = £71.94. Counselling, administration

**Excipients** include aspartame (section 9.4.1)

Counselling Tablets should be placed on the tongue, allowed to disperse and swallowed

**Oral solution**, sugar-free, strawberry-flavoured, ondasetron (as hydrochloride) 4 mg/5 mL, net price 50-mL pack = £35.97

**Injection**, ondasetron (as hydrochloride) 2 mg/mL, net price 2-mL amp = £5.99; 4-mL amp = £11.99

**Suppositories**, ondasetron 16 mg, net price 1 = £14.39
### 4.6 Drugs used in nausea and vertigo

#### PALONOSETRON

**Indications** see under Dose

**Cautions** history of constipation; intestinal obstruction; susceptibility to QT-interval prolongation (including concomitant use of drugs that prolong QT interval, and electrolyte disturbances)

**Driving** Dizziness or drowsiness may affect performance of skilled tasks (e.g. driving)

**Pregnancy** avoid unless potential benefit outweighs possible effects

**Breast-feeding** avoid unless essential

**Side-effects** diarhoea, constipation, headache, dizziness; less commonly dyspepsia, abdominal pain, dry mouth, flatulence, changes in blood pressure, tachycardia, bradycardia, arrhythmia, myocardial ischaemia, atioventricular block, extrasytleses, hiccups, dyspnoea, asthenia, insomnia, anxiety, euphoria, peripheral neuropathy, anorexia, motion sickness, influenza-like symptoms, urinary retention, glycosuria, hyperglycaemia, electrolyte disturbance, myalgia, arthralgia, eye irritation, eye swelling, amylodopa, sinititis, rash

**Dose**

- Moderately emetogenic chemotherapy, **ADULT** over 18 years, by mouth, 500 micrograms 1 hour before treatment or by intravenous injection (over 30 seconds), 250 micrograms as a single dose 30 minutes before treatment
- Severely emetogenic chemotherapy, **ADULT** over 18 years, by intravenous injection (over 30 seconds), 250 micrograms as a single dose 30 minutes before treatment

**Aloxi®** (Sinclair IS) 

Capsules, palonosetron (as hydrochloride) 500 micrograms, net price 1-cap pack = £55.89

Injection, palonosetron (as hydrochloride) 50 micrograms/mL, net price 5-mL amp = £55.89

#### Neurokinin-receptor antagonists

#### APREPITANT

**Indications** adjunct to dexamethasone and a 5HT3-receptor antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy

**Cautions** interactions: Appendix 1 (aprepitant)

**Contra-indications** acute porphyria (section 9.8.2)

**Hepatic impairment** see Aprepitant

**Pregnancy** see Aprepitant

**Breast-feeding** see Aprepitant

**Side-effects** see Aprepitant

**Dose**

- By intravenous infusion, over 20–30 minutes, **ADULT** over 18 years, 150 mg 30 minutes before chemotherapy on day 1 of cycle only; consult product literature for dose of concomitant corticosteroid and 5HT3-receptor antagonist

- Fosaprepitant is a prodrug of aprepitant

- **Emend** (MSD) 

Capsules, aprepitant 80 mg (white), net price 2-cap pack = £31.61; 125 mg (white/pink), 5-cap pack = £79.03; 3-day pack of one 125-mg capsule and two 80-mg capsules = £47.42

#### FOSAPREPIANT

**Note** Fosaprepitant is a produg of aprepitant

**Indications** adjunct to dexamethasone and a 5HT3-receptor antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy

**Cautions** interactions: Appendix 1 (aprepitant)

**Contra-indications** acute porphyria (section 9.8.2)

**Hepatic impairment** see Aprepitant

**Pregnancy** see Aprepitant

**Breast-feeding** see Aprepitant

**Side-effects** see Aprepitant

**Dose**

- By intravenous injection, over 30 seconds, **ADULT** over 18 years, 150 mg 30 minutes before chemotherapy, unresponsive to conventional antiemetics (under close observation, preferably in hospital setting)

**Aprepitant** 

**Indications** nausea and vomiting caused by cytotoxic chemotherapy, unresponsive to conventional antiemetics (under close observation, preferably in hospital setting)

**Cautions** history of psychiatric disorder; elderly; hypertension; heart disease; adverse effects on mental state can persist for 48–72 hours after stopping

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Hepatic impairment** avoid in severe impairment

**Pregnancy** avoid unless essential

**Breast-feeding** avoid—no information available

**Side-effects** drowsiness, vertigo, euphoria, dry mouth, ataxia, visual disturbance, concentration difficulties, sleep disturbance, dysphoria, hypotension, headache and nausea; also confusion, disorientation, hallucinations, psychosis, depression, decreased coordination, tremors, tachycardia, decreased appetite, and abdominal pain

**Behavioural effects** Patients should be made aware of possible changes of mood and other adverse behavioural effects

#### CANNABINOIDS

#### NABILONE

**Indications** nausea and vomiting caused by cytotoxic chemotherapy, unresponsive to conventional antiemetics (under close observation, preferably in hospital setting)

**Cautions** history of psychiatric disorder; elderly; hypertension; heart disease; adverse effects on mental state can persist for 48–72 hours after stopping

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Hepatic impairment** avoid in severe impairment

**Pregnancy** avoid unless essential

**Breast-feeding** avoid—no information available

**Side-effects** drowsiness, vertigo, euphoria, dry mouth, ataxia, visual disturbance, concentration difficulties, sleep disturbance, dysphoria, hypotension, headache and nausea; also confusion, disorientation, hallucinations, psychosis, depression, decreased coordination, tremors, tachycardia, decreased appetite, and abdominal pain

**Behavioural effects** Patients should be made aware of possible changes of mood and other adverse behavioural effects
Dose
- Initially 1 mg twice daily, increased if necessary to 2 mg twice daily, throughout each cycle of cytotoxic therapy and, if necessary, for 48 hours after the last dose of each cycle; max. 6 mg daily given in 3 divided doses. The first dose should be taken the night before initiation of cytotoxic treatment and the second dose 1–3 hours before the first dose of cytotoxic drug; ADOLESCENT and CHILD under 18 years consult local treatment protocol [unlicensed use].

Nabilone (Meda)
- Capsules, blue/white, nabilone 1 mg, net price 20-cap pack = £125.84. Label: 2, counselling, behavioural effects

Hyoscine

HYOSCINE HYDROBROMIDE
(Scopolamine Hydrobromide)

Indications motion sickness; hypersalivation associated with clozapine therapy; premedication (section 15.1.3); excessive respiratory secretions (see Prescribing in Palliative Care, p. 21)

Cautions section 1.2; also epilepsy

Contra-indications section 1.2

Hepatic impairment section 15.1.3

Renal impairment section 15.1.3

Pregnancy section 15.1.3

Breast-feeding section 15.1.3

Side-effects gastro-intestinal disturbances; headache, rashes and pruritus reported

Dose
- Motion sickness, by mouth, ADULT and CHILD over 10 years, 150–300 micrograms up to 30 minutes before start of journey repeated every 6 hours if required; max. 900 micrograms daily; CHILD 3–4 years 75 micrograms up to 30 minutes before start of journey repeated after 6 hours if required, max. 150 micrograms daily; 4–10 years 75–150 micrograms up to 30 minutes before start of journey repeated every 6 hours if required; max. 450 micrograms daily
- Hypersalivation associated with clozapine therapy [unlicensed indication], by mouth, 300 micrograms up to 3 times daily; max. 900 micrograms daily; CHILD under 18 years see BNF for Children

Joy Rides® (Forest)
- Tablets, chewable, raspberry-flavoured, hyoscine hydrobromide 150 micrograms, net price 12-tab pack = £1.55. Label: 2, 24

Kwells® (Bayer Consumer Care)
- Tablets, chewable, scored, hyoscine hydrobromide 150 micrograms (Kwells® Kids) (white), net price 12-tab pack = £1.67; 300 micrograms (pink), 12-tab pack = £1.67. Label: 2

Scopoderm TTS® (Novartis Consumer Health)
- Patch, self-adhesive, pink, releasing hyoscine approx. 1 mg/72 hours when in contact with skin, net price 5 = £8.64. Label: 19, counselling, see below

Dose motion sickness prevention, apply 1 patch to hairless area of skin behind ear 5–6 hours before journey; replace if necessary after 72 hours, siting replacement patch behind other ear; CHILD under 10 years not recommended

Counselling Explain accompanying instructions to patient and in particular emphasise advice to wash hands after handling and to wash application site after removing, and to use one patch at a time

Parenteral preparations
Section 15.1.3

Other drugs for Ménière’s disease
Betahistine has been promoted as a specific treatment for Ménière’s disease.

BETAHISTINE DIHYDROCHLORIDE

Indications vertigo, tinnitus and hearing loss associated with Ménière’s disease

Cautions asthma, history of peptic ulcer; interactions: Appendix 1 (betahistine)

Contra-indications phaeochromocytoma

Pregnancy avoid unless clearly necessary—no information available

Breast-feeding use only if potential benefit outweighs risk—no information available

Side-effects gastro-intestinal disturbances; headache, rashes and pruritus reported

Dose
- Initially 16 mg 3 times daily, preferably with food; maintenance 24–48 mg daily; CHILD not recommended

Betahistine Dihydrochloride (Non-proprietary) Tablets, betahistine dihydrochloride 8 mg, net price 84-tab pack = £1.76, 120-tab pack = £2.51; 16 mg, 84-tab pack = £2.05. Label: 21

Serc® (Abbott Healthcare) Tablets, betahistine dihydrochloride 8 mg (Serc®-8), net price 120-tab pack = £9.04; 16 mg (Serc®-16) (scored), 84-tab pack = £12.65. Label: 21

4.7 Analgesics

4.7.1 Non-opioid analgesics and compound analgesic preparations

4.7.2 Opioid analgesics

4.7.3 Neuropathic pain

4.7.4 Antimigraine drugs

The non-opioid drugs (section 4.7.1), paracetamol and aspirin (and other NSAIDs), are particularly suitable for pain in musculoskeletal conditions, whereas the opioid analgesics (section 4.7.2) are more suitable for moderate to severe pain, particularly of visceral origin.

Pain in palliative care For advice on pain relief in palliative care, see p. 20.

Pain in sickle-cell disease The pain of mild sickle-cell crises is managed with paracetamol, a NSAID (section 10.1.1), codeine, or dihydrocodeine. Severe crises may require the use of morphine or diamorphine; concomitant use of a NSAID may potentiate analgesia and allow lower doses of the opioid to be used. Pethidine should be avoided if possible because accumulation of a neurotoxic metabolite can precipitate seizures; the relatively short half-life of pethidine necessitates frequent injections.
Dental and orofacial pain  Analgesics should be used judiciously in dental care as a temporary measure until the cause of the pain has been dealt with.

Dental pain of inflammatory origin, such as that associated with pulpitis, apical infection, localised osteitis or pericoronitis is usually best managed by treating the infection, providing drainage, restorative procedures, and other local measures. Analgesics provide temporary relief of pain (usually for about 1 to 7 days) until the causative factors have been brought under control. In the case of pulpitis, intra-osseous infection or abscess, reliance on analgesics alone is usually inappropriate.

Similarly the pain and discomfort associated with acute problems of the oral mucosa (e.g. acute herpetic gingivostomatitis, erythema multiforme) may be relieved by benzylamine mouthwash or spray (p. 773) until the cause of the mucosal disorder has been dealt with. However, where a patient is febrile, the antipyretic action of paracetamol (p. 276) or ibuprofen (p. 708) is often helpful.

The choice of an analgesic for dental purposes should be based on its suitability for the patient. Most dental pain is relieved effectively by non-steroidal anti-inflammatory drugs (NSAIDs). NSAIDs that are used for dental pain include ibuprofen, diclofenac, and aspirin; for further details see section 4.7.1 and section 10.1.1.

Paracetamol has analgesic and antipyretic effects but no anti-inflammatory effect.

Opioid analgesics (section 4.7.2) such as dihydrocodeine act on the central nervous system and are traditionally used for moderate to severe pain. However, opioid analgesics are relatively ineffective in dental pain and their side-effects can be unpleasant. Paracetamol, ibuprofen, or aspirin are adequate for most cases of dental pain and an opioid is rarely required.

Combining a non-opioid with an opioid analgesic can provide greater relief of pain than either analgesic given alone. However, this applies only when an adequate dose of each analgesic is used. Most combination analgesic preparations have not been shown to provide greater relief of pain than an adequate dose of the non-opioid component given alone. Moreover, combination preparations have the disadvantage of an increased number of side-effects.

Any analgesic given before a dental procedure should have a low risk of increasing postoperative bleeding. In the case of pain after the dental procedure, taking an analgesic before the effect of the local anaesthetic has worn off can improve control. Postoperative analgesia with ibuprofen or aspirin is usually continued for about 24 to 72 hours.

Temporomandibular dysfunction can be related to anxiety in some patients who may clench or grind their teeth (bruxism) during the day or night. The muscle spasm (which appears to be the main source of pain) may be treated empirically with an overlay appliance which provides a free sliding occlusion and may also interfere with grinding. In addition, diazepam (section 4.1.2), which has muscle relaxant as well as anxiolytic properties, may be helpful but it should only be prescribed on a short-term basis during the acute phase. Analgesics such as aspirin (section 4.7.1) or ibuprofen (section 10.1.1) may also be required.

For the management of neuropathic pain, persistent idiopathic facial pain, and trigeminal neuralgia, see section 4.7.3.

Dysmenorrhoea  Use of an oral contraceptive prevents the pain of dysmenorrhoea which is generally associated with ovulatory cycles. If treatment is necessary paracetamol or a NSAID (section 10.1.1) will generally provide adequate relief of pain. The vomiting and severe pain associated with dysmenorrhoea in women with endometriosis may call for an antiemetic (in addition to an analgesic). Antispasmodics (such as alverine citrate, section 1.2) have been advocated for dysmenorrhoea but the antispasmodic action does not generally provide significant relief.

4.7.1 Non-opioid analgesics and compound analgesic preparations

Aspirin is indicated for headache, transient musculoskeletal pain, dysmenorrhoea, and pyrexia. In inflammatory conditions, most physicians prefer anti-inflammatory treatment with another NSAID which may be better tolerated and more convenient for the patient. Aspirin is used increasingly for its antiplatelet properties (section 2.9). Aspirin tablets or dispersible aspirin tablets are adequate for most purposes as they act rapidly.

Gastric irritation may be a problem; it is minimised by taking the dose after food. Enteric-coated preparations are available, but have a slow onset of action and are therefore unsuitable for single-dose analgesic use (though their prolonged action may be useful for night pain).

Aspirin interacts significantly with a number of other drugs and its interaction with warfarin is a special hazard, see interactions: Appendix 1 (aspirin).

Paracetamol is similar in efficacy to aspirin, but has no demonstrable anti-inflammatory activity; it is less irritant to the stomach and for that reason is now generally preferred to aspirin, particularly in the elderly. Overdose with paracetamol is particularly dangerous as it may cause hepatic damage which is sometimes not apparent for 4 to 6 days (see Emergency Treatment of Poisoning, p. 35).

Nefopam may have a place in the relief of persistent pain unresponsive to other non-opioid analgesics. It causes little or no respiratory depression, but sympathomimetic and antimuscarinic side-effects may be troublesome.

Non-steroidal anti-inflammatory analgesics (NSAIDs, section 10.1.1) are particularly useful for the treatment of patients with chronic disease accompanied by pain and inflammation. Some of them are also used in the short-term treatment of mild to moderate pain including transient musculoskeletal pain but paracetamol is now often preferred, particularly in the elderly (see also p. 25). They are also suitable for the relief of pain in dysmenorrhoea and to treat pain caused by secondary bone tumours, many of which produce lysis of bone and release prostaglandins (see Prescribing in Palliative Care, p. 20). Selective inhibitors of cyclooxygenase-2 may be used in preference to non-selective NSAIDs for patients at high risk of developing serious gastro-intestinal side-effects. Several NSAIDs are also used for postoperative analgesia (section 15.1.4.2).

A non-opioid analgesic administered by intrathecal infusion (ziconotide (Prialt®), available from Eisai) is
licenced for the treatment of chronic severe pain; zic- 
notide can be used by a hospital specialist as an adjunct to opioid analgesics.

**Dental and orofacial pain** Most dental pain is relieved effectively by NSAIDs (section 10.1.1). Aspirin (below) is effective against mild to moderate dental pain; dispersible tablets provide a rapidly absorbed form of aspirin suitable for most purposes.

The analgesic effect of paracetamol in mild to moderate dental pain is probably less than that of aspirin, but it does not affect bleeding time or interact significantly with warfarin. Moreover, it is less irritant to the stom- 
ach. Paracetamol is a suitable analgesic for children; sugar-free versions can be requested by specifying ‘sugar-free’ on the prescription.

For further information on the management of dental and orofacial pain, see p. 274.

**Compound analgesic preparations**

Compound analgesic preparations that contain a simple analgesic (such as aspirin or paracetamol) with an opioid component reduce the scope for effective titra- 
tion of the individual components in the management of pain of varying intensity.

Compound analgesic preparations containing paracetamol or aspirin with a low dose of an opioid analgesic (e.g. 8 mg of codeine phosphate per compound tablet) are commonly used, but the advantages have not been substantiated. The low dose of the opioid may be enough to cause opioid side-effects (in particular, con- 
stipation) and can complicate the treatment of over- 
dosage (see p. 38) yet may not provide significant additional relief of pain.

A full dose of the opioid component (e.g. 60 mg codeine phosphate) in compound analgesic preparations effect- 
vively augments the analgesic activity but is associated with the full range of opioid side-effects (including nausea, vomiting, severe constipation, drowsiness, respira-
tory depression, and risk of dependence on long-term administration). For details of the side-effects of opioid analgesics, see p. 279 (important: the elderly are particu-
larly susceptible to opioid side-effects and should receive lower doses).

In general, when assessing pain, it is necessary to weigh up carefully whether there is a need for a non-opioid and an opioid analgesic to be taken simultaneously.

For information on the use of combination analgesic preparations in dental and orofacial pain, see p. 274.

**Caffeine**

Caffeine is a weak stimulant that is often included, in 
small doses, in analgesic preparations. It is claimed that the addition of caffeine may enhance the analgesic effect, but the alerting effect, mild habit-forming effect and possible provocation of headache may not always be desirable. Moreover, in excessive dosage or on with-
drawal caffeine may itself induce headache.

Co-proxamol tablets (dextropropoxyphene in combina-
tion with paracetamol) are no longer licenced because of safety concerns, particularly toxicity in overdose. Co-
proxamol tablets [unlicensed] may still be prescribed for patients who find it difficult to change, because alter-
natives are not effective or suitable.

---

**ASPIRIN**

(Acetyl salicylic Acid)

**Indications** mild to moderate pain, pyrexia; anti-
platelet (section 2.9)

**Cautions** asthma, allergic disease, dehydration; pre-
ferably avoid during fever or viral infection in children (risk of Reye’s syndrome, see below); elderly, G6PD- 
deficiency (section 9.1.5); concomitant use of drugs that increase risk of bleeding; anemia; thyrtoxino-
cosis; interactions: Appendix 1 (aspirin)

**Contra-indications** children under 16 years (Reye’s syndrome, see below); previous or active peptic ulceration, haemophilia; severe cardiac failure; not for treatment of gout

**Hypersensitivity** Aspirin and other NSAIDs are contra-
indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, urticaria, angioedema or rhinitis have been precipitated by aspirin or any other NSAID

**Reye’s syndrome** Owing to an association with Reye’s syndrome, aspirin-containing preparations should not be given to children under 16 years, unless specifically indicated, e.g. for Kawasaki disease

**Hepatic impairment** avoid in severe impairment— 
increased risk of gastro-intestinal bleeding

**Renal impairment** use with caution; avoid in severe impairment; sodium and water retention; deteriora-
tion in renal function; increased risk of gastro-intestinal 
bleeding

**Pregnancy** high doses may be related to intrauterine growth restriction and teratogenic effects; impaired platelet function with risk of haemorrhage, and delayed onset and increased duration of labour with increased blood loss, can occur if used during deliv-
ery; avoid analgesic doses if possible in last few weeks (low doses probably not harmful); with high doses, 
closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of newborn; kern-
icterus in jaundiced neonates

**Breast-feeding** avoid—possible risk of Reye’s syndrome; regular use of high doses could impair platelet function and produce hypoprothrombinaemia in infant if neonatal vitamin K stores low

**Side-effects** generally mild and infrequent but high incidence of gastro-intestinal irritation with slight asymptomatic blood loss, blood disorders have occurred (including increased bleeding time), confusion, tinnitus, bronchospasm and skin reactions in hypersensitive patients. Prolonged administration, see section 10.1.1. **Overdose**: see Emergency Treatment of Poisoning, p. 35

**Dose**

- **By mouth**, 300–900 mg every 4–6 hours when necessary; max. 4 g daily; CHILD under 16 years not recommended (see Reye’s Syndrome, above)
- **By rectum**, 450–900 mg every 4 hours (max. 3.6 g daily); CHILD under 16 years not recommended (see Reye’s Syndrome, above)

**Aspirin** (Non-proprietary)

**Tablets** 1, aspirin 300 mg, net price 32-tab pack = £3.35. Label: 21, 32

**Tablets** 1, e/c, aspirin 300 mg, net price 100-tab pack = £11.90; 75 mg, see section 2.9. Label: 5, 25, 32

---

1. Can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.
Central nervous system

4 Central nervous system

1. Can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

Dispersible tablets, aspirin 300 mg, net price 100-tab pack = £3.19; 75 mg, see section 2.9. Label: 13, 21, 32

Note BP directs that when no strength is stated the 300-mg strength should be dispensed, and that when soluble aspirin tablets are prescribed, dispersive aspirin tablets shall be dispensed.

Dental prescribing on NHS

Aspirin Dispersible Tablets 300 mg may be prescribed.

Tablets, (Non-proprietary), aspirin 150 mg, net price 100-tab pack = £16.05; 300 mg, 12 = £13.89. Label: 32

Brands include Resparin ®

Cautions

Indications mild to moderate pain, pyrexia (pyrexia = Dispersible tablets)

Nu-Seals ® Aspirin (Alliance)

Tablets, e/c, aspirin 300 mg, net price 100-tab pack = £4.15; 75 mg, see section 2.9. Label: 5, 25, 32

Tablets (and caplets) aspartame (section 9.4.1)

Important

Dose

ADULT

and CHILD over 16 years, 1–2 tablets in water every 4–6 hours when necessary; max. 8 tablets daily

Note When co-codaprin tablets or dispersible tablets are prescribed and no strength is stated, tablets or dispersible tablets, respectively, containing codeine phosphate 8 mg and aspirin 400 mg should be dispensed

With metoclopramide

For prescribing information on metoclopramide, see section 4.6

MigraMax ® (Zentiva) (Non-proprietary)

Oral powder, lemon flavour, aspirin (as lysine acetylsalicylate) 900 mg, metoclopramide hydrochloride 10 mg/sachet. net price 6-sachet pack = £6.61. Label: 13, 21, 32

Excipients include aspartame (section 9.4.1)

Dose acute migraine, ADULT over 18 years, 1 sachet in water at onset of attack, repeated after 2 hours if necessary (max. 3 sachets in 24 hours); CHILD under 18 years, not recommended

Importantly, Metoclopramide can cause severe extrapyramidal effects, particularly in children and young adults (for further details, see p. 266).

Note Treatment should not exceed 3 months due to risk of tardive dyskinesia, but see also MHRA advice on Metoclopramide, section 4.6

PARACETAMOL (Acetaminophen)

Indications mild to moderate pain, pyrexia (pyrexia = Dispersible tablets)

Cautions alcohol dependence; hepatocellular insufficiency, chronic alcoholism, chronic malnutrition, or dehydration, max. daily infusion dose 3 g in patients greater than 50 kg body-weight with risk factors for hepatotoxicity; before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours; interactions: Appendix 1 (paracetamol)

Hepatic impairment dose-related toxicity—avoid large doses; see also Cautions

Renal impairment increase infusion dose interval to every 6 hours if eGFR less than 30 mL/minute/1.73 m²; note also sodium content of effervescent tablets (see under relevant preparation entry)

Pregnancy not known to be harmful

Breast-feeding amount too small to be harmful

Side-effects side-effects rare, malaise, skin reactions including Stevens-Johnson syndrome, toxic epidermal necrolysis, acute generalised exanthematous pustulosis; blood disorders including thrombocytopenia, leucopenia, neutropenia reported; hypotension, flushing, and tachycardia reported on infusion; important: liver damage (and less frequently renal damage) following overdosage, see Emergency Treatment of Poisoning, p. 35

Dose

By mouth, 0.5–1 g every 4–6 hours to a max. of 4 g daily; CHILD 2–3 months 60 mg for post-immunisation pyrexia, repeated once after 4–6 hours if necessary; otherwise under 3 months see BNF for Children; 3–6 months 60 mg, 6 months–2 years 120 mg, 2–4 years 180 mg, 4–6 years 240 mg, 6–8 years 240–250 mg, 8–10 years 360–375 mg, 10–12 years 480–500 mg, 12–16 years 480–750 mg; these doses may be repeated every 4–6 hours when necessary (max. of 4 doses in 24 hours); postoperative pain in children see BNF for Children

By intravenous infusion over 15 minutes, ADULT and CHILD over 50 kg, 1 g every 4–6 hours, max. 4 g daily; ADULT and CHILD 10–50 kg, 15 mg/kg every 4–6 hours, max. 60 mg/kg daily; CHILD less than 10 kg see BNF for Children

By rectum, 0.5–1 g every 4–6 hours to a max. of 4 g daily; CHILD under 3 months see BNF for Children, 3 months–1 year 60–125 mg, 1–5 years 125–250 mg, 5–12 years 250–500 mg, 12–18 years 500 mg; these doses may be repeated every 4–6 hours as necessary (max. 4 doses in 24 hours); postoperative pain in children see BNF for Children

Note For full Joint Committee on Vaccination and Immunisation recommendation on post-immunisation pyrexia, see section 14.1

Paracetamol (Non-proprietary)

Tablets (and caplets) (Non-proprietary), paracetamol 500 mg, net price 32-tab pack = 84p, 100-tab pack = £2.63. Label: 29, 30

Dental prescribing on NHS Paracetamol Tablets may be prescribed

Capsules (Non-proprietary), paracetamol 500 mg, net price 32-cap pack = £1.15, 100-cap pack = £3.59. Label: 29, 30

Sustainable tablets (= Dispersible tablets) (Non-proprietary), paracetamol 500 mg, net price 24-tab pack = £2.00, 100-tab pack = £8.33. Label: 13, 29, 30

Dental prescribing on NHS Paracetamol Tablets Soluble Tablets 500 mg may be prescribed

Oral suspension 120 mg/5 mL, paracetamol 120 mg/5 mL, net price 100 mL = 70p, 500 mL = £3.04. Label: 30

Note BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed Paracetamol Oral Suspension 120 mg/5 mL should be dispensed; sugar-free versions can be ordered by specifying ‘sugar-free’ on the prescription
Oral suspension 250 mg/5 mL paracetamol 250 mg/5 mL, net price 100 mL = £1.19, 200 mL = £1.65. Label: 30

Dental prescribing on NHS Paracetamol Oral Suspension may be prescribed

Oral suspension 500 mg/5 mL (Paracetamol), paracetamol 500 mg/5 mL sugar-free, net price 150 mL = £20.00. Label: 30

Suppositories, paracetamol 60 mg, net price 10 = £11.95; 120 mg, 10 = £10.78; 250 mg, 10 = £13.80; 400 mg, 10 = £36.57; 1 g, 12 = £60.00. Label: 30

Note Other strengths available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104

Intravenous infusion (Paracetamol), paracetamol 10 mg/mL, net price 100-mL vial = £1.20

Panadol OA® (GSK) Tablets, 1/7c, paracetamol 1 g, net price 100-tab pack = £3.45. Label: 30

Dose ADULT and CHILD over 12 years, 1 tablet up to 4 times daily, not more often than every 4 hours

Perfalgan® (Bristol-Myers Squibb) Tablets, paracetamol 1000 mg/mL, net price 50-mL vial = £1.13, 100-mL vial = £1.25

With codeine phosphate 8 mg

When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and no strength is stated, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate 8 mg and paracetamol 500 mg should be dispensed.

See notes on p. 275

For prescribing information on codeine, see p. 281

Co-codamol 8/500 (Non-proprietary) Tablets, co-codamol 8/500 (codeine phosphate 8 mg, paracetamol 500 mg), net price 30-tab pack = £1.02, 32-tab pack = 50p, 100-tab pack = £3.40. Label: 2, 29, 30

Dose ADULT over 18 years; 1–2 tablets every 4–6 hours when necessary; max. 8 tablets daily; CHILD under 18 years see BNF for Children

Effervescent or dispersible tablets, co-codamol 8/500 (codeine phosphate 8 mg, paracetamol 500 mg), net price 32-tab pack = £2.26, 100-tab pack = £7.06. Label: 13, 29, 30

Brands include Paracodine®

Note The Drug Tariff allows tablets of co-codamol labelled ‘dispersible’ to be dispensed against an order for ‘effervescent’ and vice versa

Dose ADULT over 18 years; 1–2 tablets in water every 4–6 hours when necessary, max. 8 tablets daily; CHILD under 18 years see BNF for Children

Capsules, co-codamol 8/500 (codeine phosphate 8 mg, paracetamol 500 mg), net price 100-cap pack = £8.25. Label: 2, 29, 30

Brands include Paracodine®

Dose ADULT over 18 years; 1–2 capsules every 4–6 hours when necessary; max. 8 capsules daily; CHILD under 18 years see BNF for Children

With codeine phosphate 15 mg

When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and no strength is stated, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate 8 mg and paracetamol 500 mg should be dispensed (see preparations above).

See warnings and notes on p. 275 (important: special care in elderly—reduce dose)

For prescribing information on codeine, see p. 281

Codipar® (AMCo) Tablets, co-codamol 15/500 (codeine phosphate 15 mg, paracetamol 500 mg), net price 100-tab pack = £8.25. Label: 2, 29, 30

Dose ADULT over 18 years; 1–2 tablets every 4–6 hours when necessary; max. 8 tablets daily; CHILD under 18 years see BNF for Children

Capsules, co-codamol 15/500 (codeine phosphate 15 mg, paracetamol 500 mg), net price 100-cap pack = £7.25. Label: 2, 29, 30

Dose ADULT over 18 years; 1–2 capsules every 4–6 hours when necessary; max. 8 capsules daily; CHILD under 18 years see BNF for Children

Effervescent tablets, co-codamol 15/500 (codeine phosphate 15 mg, paracetamol 500 mg), net price 100-tab pack = £8.25. Label: 2, 29, 30

Electrolytes Na+ 16.5 mmol/tablet

Dose ADULT over 18 years; 2 tablets every 4–6 hours when necessary; max. 8 tablets daily; CHILD not recommended

Kapake® (Galen) Tablets, co-codamol 15/500 (codeine phosphate 15 mg, paracetamol 500 mg), net price 100-tab pack = £7.01. Label: 2, 29, 30

Dose ADULT over 18 years; 2 tablets every 4–6 hours when necessary; max. 8 tablets daily; CHILD under 18 years see BNF for Children

With codeine phosphate 30 mg

When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and no strength is stated, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate 8 mg and paracetamol 500 mg should be dispensed (see preparations above).

See warnings and notes on p. 275 (important: special care in elderly—reduce dose)

For prescribing information on codeine, see p. 281

Co-codamol 30/500 (Non-proprietary) Tablets, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 100-tab pack = £4.40. Label: 2, 29, 30

Dose ADULT over 18 years; 1–2 tablets every 4–6 hours when necessary, max. 8 tablets daily; CHILD under 18 years see BNF for Children

Capsules, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 100-cap pack = £4.02. Label: 2, 29, 30

Brands include Medocodene®, Zapain®

Dose ADULT over 18 years; severe pain, 1–2 capsules every 4–6 hours when necessary; max. 8 capsules daily; CHILD under 18 years see BNF for Children

Effervescent tablets, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 100-tab pack = £6.19. Label: 2, 13, 29, 30

Brands include Medocodene® Effervescent (contains Na+ 13.6 mmol/tablet)

Dose ADULT over 18 years; severe pain, 1–2 tablets in water every 4–6 hours when necessary; max. 8 tablets daily; CHILD under 18 years see BNF for Children

Kapake® (Galen) Tablets, scored, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 30-tab pack = £2.26 (hosp. only), 100-tab pack = £6.04. Label: 2, 29, 30

Dose ADULT over 18 years; severe pain, 1–2 tablets every 4–6 hours when necessary; max. 8 tablets daily; CHILD under 18 years see BNF for Children

1. Can be sold to the public in certain circumstances, for exemptions see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition)
4.7.1 Non-opioid analgesics and compound analgesic preparations

**BNF 68**

Solpadol® (Sanofi-Aventis)  
**Capsules** (= tablets), co-codanol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 100-tab pack = £6.74. Label: 2, 29, 30  
**Dose** ADULT over 18 years, severe pain, 2 tablets every 4–6 hours when necessary, max. 8 tablets daily; CHILD under 18 years see BNF for Children  
**Capsules** grey/purple, co-codanol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 100-cap pack = £6.74. Label: 2, 29, 30  
**Dose** ADULT over 18 years, severe pain, 2 capsules every 4–6 hours when necessary, max. 8 capsules daily; CHILD under 18 years see BNF for Children  
**Effervescent tablets**, co-codanol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 32-tab pack = £2.59, 100-tab pack = £8.90. Label: 2, 13, 29, 30  
**Phosphate** 14.2 mmol/tablet  
**Excipients** include sulphites  
**Dose** ADULT over 18 years, severe pain, 2 tablets in water every 4–6 hours when necessary; max. 8 tablets daily; CHILD under 18 years see BNF for Children  
**Effervescent tablets**, co-codanol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 100-tab pack = £9.06. Label: 2, 13, 29, 30  
**Phosphate** 16.9 mmol/tablet  
**Excipients** include aspartame 15 mg/tablet  
**Dose** ADULT over 18 years, severe pain, 2 tablets in water every 4–6 hours when necessary; max. 8 tablets daily; CHILD under 18 years see BNF for Children

**With dihydrocodeine tartrate 10 mg**  
**When co-dydramol tablets are prescribed and no strength is stated**, tablets containing dihydrocodeine tartrate 10 mg and paracetamol 500 mg should be dispensed.  
**See notes on p. 275**  
**For prescribing information on dihydrocodeine, see p. 282**

Co-dydramol (Non-proprietary)  
**Tablets**, scored, co-dydramol 10/500 (dihydrocodeine tartrate 10 mg, paracetamol 500 mg), net price 30-tab pack = £0.98. Label: 29, 30  
**Dose** ADULT over 18 years, 1–2 tablets every 4–6 hours when necessary; max. 8 tablets daily; CHILD under 18 years see BNF for Children

**With dihydrocodeine tartrate 20 mg**  
**When co-dydramol tablets are prescribed and no strength is stated**, tablets containing dihydrocodeine tartrate 20 mg and paracetamol 500 mg should be dispensed (see preparation above).  
**See warnings and notes on p. 275** (important: special care in elderly—reduce dose)

**For prescribing information on dihydrocodeine, see p. 282**

Remedeine Forte® (Crescent)  
**Tablets**, paracetamol 500 mg, dihydrocodeine tartrate 30 mg, net price 56-tab pack = £6.57. Label: 2, 29, 30  
**Dose** ADULT over 18 years, severe pain, 1–2 tablets every 4–6 hours when necessary; max. 8 tablets daily; CHILD under 18 years see BNF for Children

**With isometheptene mucate**  
**Isometheptene mucate** (in combination with paracetamol) is licensed for the treatment of acute attacks of migraine; other more effective treatments are available.

Midrid® (Manx)  
**Capsules**, red, isometheptene mucate 65 mg, paracetamol 325 mg, net price 30-cap pack = £5.50. Label: 30, counselling, dosage  
**Dose** migraine, 2 capsules at onset of attack, followed by 1 capsule every hour if necessary; max. 5 capsules in 12 hours; CHILD not recommended

**With tramadol**  
**For prescribing information on tramadol, see section 4.7.2**

Tramacet® (Grünenthal)  
**Tablets**, 1/3, yellow, tramadol hydrochloride 37.5 mg, paracetamol 325 mg, net price 60-tab pack = £9.68. Label: 2, 25, 29, 30  
**Dose** 2 tablets not more often than every 6 hours; max. 8 tablets daily. CHILD under 12 years not recommended  
**Effervescent tablets**, pink, tramadol hydrochloride 37.5 mg, paracetamol 325 mg, net price 60-tab pack = £9.68. Label: 2, 13, 29, 30  
**Excipients** 7.8 mmol/tablet  
**Dose** 2 tablets not more often than every 6 hours; max. 8 tablets daily. CHILD under 12 years not recommended

**With antihistamines**  
**For prescribing information on codeine, see Codeine Phosphate, section 4.7.2.**

**For prescribing information on buclizine hydrochloride, see Antihistamines, section 3.4.1.**

Migraleve® (McNeil)  
**Tablets**, 1/3, pink tablets, buclizine hydrochloride 6.25 mg, paracetamol 500 mg, codeine phosphate 8 mg, yellow tablets, paracetamol 500 mg, codeine phosphate 8 mg, net price 48-tab Migraleve® (2 pink + 16 yellow) = £3.64; 48 pink (Migraleve Pink) = £3.97; 48 yellow (Migraleve Yellow) = £4.70. Label: 2, (Migraleve Pink), 17, 30  
**Dose** acute migraine, ADULT and CHILD over 15 years, 2 pink tablets at onset of attack, followed by 2 yellow tablets every 4 hours if necessary; max. 2 pink and 6 yellow tablets in 24 hours; CHILD 12–14 years, half adult dose

Paramax® (Zentiva)  
**Tablets**, scored, paracetamol 500 mg, metoclopramide hydrochloride 5 mg, net price 42-tab pack = £9.64. Label: 17, 30  
**Dose** acute migraine, ADULT over 18 years, 2 tablets at the onset of attack then repeat every 4 hours when necessary to max. 6 tablets in 24 hours

**Sachets**, effervescent powder, sugar-free, paracetamol 500 mg, metoclopramide hydrochloride 5 mg, net price 42-sachet pack = £12.52. Label: 13, 17, 30  
**Dose** acute migraine, ADULT over 18 years, 2 sachets dissolved in a quarter tumblerful of water at onset of attack then repeat every 4 hours when necessary to max. 6 sachets in 24 hours

**Important** Metoclopramide can cause severe extrapyramidal effects, particularly in young adults (for further details, see p. 266)

**Note** Treatment should not exceed 3 months due to risk of tardive dyskinesia, but see also MHRA advice on Metoclopramide, section 4.6
Opioid analgesics are usually used to relieve moderate to severe pain particularly of visceral origin. Repeated administration may cause dependence and tolerance, but this is no deterrent in the control of pain in terminal illness, for guidelines see Prescribing in Palliative Care, p. 20. Regular use of a potent opioid may be appropriate for certain cases of chronic non-malignant pain; treatment should be supervised by a specialist and the patient should be assessed at regular intervals.

Cautions Opioids should be used with caution in patients with impaired respiratory function (avoid in chronic obstructive pulmonary disease) and asthma (avoid during an acute attack). Hypotension, urethral stenosis, shock, myocardial infarction, tachycardia, headache; confusion and hallucinations also reported; may colour urine (pink).

Dose By mouth, initially 60 mg (ELDERLY 30 mg) 3 times daily, adjusted according to response; usual range 50–90 mg 3 times daily; CHILD not recommended.

4.7.2 Opioid analgesics

Opioid analgesics are used to relieve moderate to severe pain in terminal illness, for guidelines see Prescribing in Palliative Care, p. 20. Regular use of a potent opioid may be appropriate for certain cases of chronic non-malignant pain; treatment should be supervised by a specialist and the patient should be assessed at regular intervals.

Cautions Opioids should be used with caution in patients with impaired respiratory function (avoid in chronic obstructive pulmonary disease) and asthma (avoid during an acute attack). Hypotension, urethral stenosis, shock, myocardial infarction, tachycardia, headache; confusion and hallucinations also reported; may colour urine (pink).

Dose By mouth, initially 60 mg (ELDERLY 30 mg) 3 times daily, adjusted according to response; usual range 50–90 mg 3 times daily; CHILD not recommended.

4.7.2 Opioid analgesics

Opioid analgesics are usually used to relieve moderate to severe pain particularly of visceral origin. Repeated administration may cause dependence and tolerance, but this is no deterrent in the control of pain in terminal illness, for guidelines see Prescribing in Palliative Care, p. 20. Regular use of a potent opioid may be appropriate for certain cases of chronic non-malignant pain; treatment should be supervised by a specialist and the patient should be assessed at regular intervals.

Cautions Opioids should be used with caution in patients with impaired respiratory function (avoid in chronic obstructive pulmonary disease) and asthma (avoid during an acute attack). Hypotension, urethral stenosis, shock, myocardial infarction, tachycardia, headache; confusion and hallucinations also reported; may colour urine (pink).

Dose By mouth, initially 60 mg (ELDERLY 30 mg) 3 times daily, adjusted according to response; usual range 50–90 mg 3 times daily; CHILD not recommended.

It has abuse potential and may itself cause dependence. It has a much longer duration of action than morphine and sublingually is an effective analgesic for 6 to 8 hours. Unlike most opioid analgesics, the effects of buprenorphine are only partially reversed by naloxone.

Dipipanone used alone is less sedating than morphine but the only preparation available contains an antiemetic and is therefore not suitable for regular regimens in palliative care.

Diamorphine (heroin) is a powerful opioid analgesic. It may cause less nausea and hypotension than morphine. In palliative care the greater solubility of diamorphine allows effective doses to be injected in smaller volumes and this is important in the emaciated patient.

Alfentanil, fentanyl and remifentanil are used by injection for intra-operative analgesia (section 15.1.4.3); fentanyl is available in a transdermal drug delivery system as a self-adhesive patch which is changed every 72 hours.

Methadone is less sedating than morphine and acts for longer periods. In prolonged use, methadone should not be administered more often than twice daily to avoid the risk of accumulation and opioid overdosage. Methadone may be used instead of morphine in the occasional patient who experiences excitation (or exacerbation of pain) with morphine.

Oxycodeone has an efficacy and side-effect profile similar to that of morphine. It is used primarily for control of pain in palliative care.

Fapaveretum is rarely used; morphine is easier to prescribe and less prone to error with regard to the strength and dose.

Pentazocine has both agonist and antagonist properties and precipitates withdrawal symptoms, including pain in patients dependent on other opioids. By injection it is more potent than dihydrocodeine or codeine, but hallucinations and thought disturbances may occur. It is not recommended and, in particular, should be avoided after myocardial infarction as it may increase pulmonary and aortic blood pressure as well as cardiac work.

Pethidine produces prompt but short-lasting analgesia; it is less constipating than morphine, but even in high doses is a less potent analgesic. It is not suitable for severe continuing pain. It is used for analgesia in labour; however, other opioids, such as morphine or diamorphine, are often preferred for obstetric pain.

Tapentadol produces analgesia by two mechanisms. It is an opioid-receptor agonist and it also inhibits noradrenaline reuptake. Nausea, vomiting, and constipation are less likely to occur with tapentadol than with other strong opioid analgesics.

Tramadol produces analgesia by two mechanisms: an opioid effect and an enhancement of serotonergic and adrenergic pathways. It has fewer of the typical opioid side-effects (notably, less respiratory depression, less constipation and less addiction potential); psychiatric reactions have been reported.

Weak opioids Codeine can be used for the relief of mild to moderate pain where other painkillers such as paracetamol or ibuprofen have proved ineffective, but see Variation in Metabolism, p. 281.

Dihydrocodeine has an analgesic efficacy similar to that of codeine. Higher doses may provide some additional pain relief but this may be at the cost of more nausea and vomiting.

Meptazinol is claimed to have a low incidence of respiratory depression. It has a reported length of action of 2 to 7 hours with onset within 15 minutes.

Dose The dose of opioids in the BNF may need to be adjusted individually according to the degree of analgesia and side-effects; patients’ response to opioids varies widely.

Postoperative analgesia A combination of opioid and non-opioid analgesics (section 4.7.1 and section 15.1.4.2) is used to treat postoperative pain. The use of intra-operative opioids affects the prescribing of postoperative analgesics. A postoperative opioid analgesic should be given with care since it may potentiate any residual respiratory depression (for the treatment of opioid-induced respiratory depression, see section 15.1.7).

Morphine is used most widely. Tramadol is not as effective in severe pain as other opioid analgesics.

Buprenorphine may antagonise the analgesic effect of previously administered opioids and is generally not recommended. Pethidine is generally not recommended for postoperative pain because it is metabolised to norpethidine which may accumulate, particularly in renal impairment; norpethidine stimulates the central nervous system and may cause convulsions.

Opioids are also given epidurally [unlicensed route] in the postoperative period but are associated with side-effects such as pruritus, urinary retention, nausea and vomiting; respiratory depression can be delayed, particularly with morphine.

For details of patient-controlled analgesia (PCA) to relieve postoperative pain, consult hospital protocols.

Dental and orofacial pain Opioid analgesics are relatively ineffective in dental pain. Like other opioids, dihydrocodeine often causes nausea and vomiting which limits its value in dental pain; if taken for more than a few doses it is also liable to cause constipation. Dihydrocodeine is not very effective in postoperative dental pain.

For the management of dental and orofacial pain, see p. 274.

Pain management and opioid dependence Although caution is necessary, patients who are dependent on opioids or have a history of drug dependence may be treated with opioid analgesics when there is a clinical need. Treatment with opioid analgesics in this patient group should normally be carried out with the advice of specialists. However, doctors do not require a special licence to prescribe opioid analgesics to patients with opioid dependence for relief of pain due to organic disease or injury.

**BUPRENORPHINE**

**Indications** see under Dose and under Patches; opioid dependence (section 4.10.3)

**Cautions** see notes above; also impaired consciousness; effects only partially reversed by naloxone; monitor liver function

**Fever or external heat** Monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat (may also increase absorption)

**Contra-indications** see notes above
**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above and section 4.10.3

**Breast-feeding** present in low levels in breast milk—monitor neonate for drowsiness, adequate weight gain, and developmental milestones

**Side-effects** see notes above; can induce mild withdrawal symptoms in patients dependent on opioids; also diarrhoea, abdominal pain, anorexia, dyspepsia; vasodilatation; dyspnoea; paraesthesia, asthenia, fatigue, agitation, anxiety; less commonly flatulence, taste disturbance, angina, hypertension, syncope, hypoxia, wheezing, cough, restlessness, depersonalisation, dysarthria, impaired memory, hypoaesthesia, tremor, influenza-like symptoms, pyrexia, rhinitis, rigors, muscle cramp, myalgia, tinnitus, dry eye, and dry skin; rarely paralytic ileus, dysphagia, impaired concentration, and psychosis; very rarely retching, hyperventilation, hiccups, and muscle fasciculation; hepatic necrosis and hepatitis also reported

**Dose**

- Moderate to severe pain, by sublingual administration, 200–400 micrograms every 6–8 hours; **CHILD** over 6 years, 16–25 kg, 100 micrograms every 6–8 hours; 25–37.5 kg, 100–200 micrograms every 6–8 hours; 37.5–50 kg, 200–300 micrograms every 6–8 hours
- By intramuscular or slow intravenous injection, 300–600 micrograms every 6–8 hours; **CHILD** over 6 months 3–6 micrograms/kg every 6–8 hours (max. 9 micrograms/kg)
- Premedication, by sublingual administration, 400 micrograms
- By intramuscular injection, 300 micrograms
- Intra-operative analgesia, by slow intravenous injection, 300–450 micrograms

**Temgesic** (Reckitt Benckiser) (G3)

**Tablets** (sublingual), buprenorphine (as hydrochloride), 200 micrograms, net price 50-tab pack = £5.04; 400 micrograms, 50-tab pack = £10.07. Label: 2, 26

**Injection**, buprenorphine (as hydrochloride) 300 micrograms/mL, net price 1-mL amp = 49p

**Patches**

**BuTrans®** (Napp) (G3)

**Patches**, self-adhesive, beige, buprenorphine, ‘5’ patch (releasing 5 micrograms/hour for 7 days), net price 4 = £17.60; ‘10’ patch (releasing 10 micrograms/hour for 7 days), 4 = £31.55; ‘20’ patch (releasing 20 micrograms/hour for 7 days), 4 = £57.46. Label: 2

**Dose** moderate, non-malignant pain unresponsive to non-opioid analgesics, **ADULT** over 18 years, initially one ‘5 micrograms/hour’ patch, apply to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 72 hours and siting replacement patch on a different area (avoid same area for at least 7 days). Patients who have not previously received strong opioid analgesic, initially, one ‘35 micrograms/hour’ patch replaced after no longer than 72 hours; patients who have received strong opioid analgesic, initial dose based on previous 24-hour opioid requirement, consult product literature

**Dose adjustment** When starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Max. 2 patches can be used at any one time. For breakthrough pain, consider 200–400 micrograms buprenorphine sublingually

**Important:** it may take approx. 25 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed

**Long duration of action** In view of the long duration of action, patients who have severe side-effects should be monitored for up to 25 hours after removing patch, other opioids should not be administered within 24 hours of patch removal

**Trans Tec®** (Napp) (G3)

**Patches**, self-adhesive, skin-coloured, buprenorphine, ‘35’ patch (releasing 35 micrograms/hour for 72 hours), net price 4 = £9.58; ‘52.5’ patch (releasing 52.5 micrograms/hour for 72 hours), 4 = £14.23; ‘70’ patch (releasing 70 micrograms/hour for 72 hours), 4 = £18.96. Label: 2

**Dose** moderate to severe chronic cancer pain and severe pain unresponsive to non-opioid analgesics, **ADULT** over 18 years, apply to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 72 hours and siting replacement patch on a different area (avoid same area for at least 7 days). Patients who have not previously received strong opioid analgesic, initially, one ‘35 micrograms/hour’ patch replaced after no longer than 72 hours; patients who have received strong opioid analgesic, initial dose based on previous 24-hour opioid requirement, consult product literature

**Dose adjustment** When starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Max. 2 patches can be used at any one time. For breakthrough pain, consider 200–400 micrograms buprenorphine sublingually

**Important:** it may take approx. 30 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed

**Long duration of action** In view of the long duration of action, patients who have severe side-effects should be monitored for up to 30 hours after removing patch, other opioids should not be administered within 24 hours of patch removal

**CODEINE PHOSPHATE**

**Indications** mild to moderate pain; diarrhoea (section 1.4.2); cough suppression (section 3.9.1)

**Cautions** see notes above; also cardiac arrhythmias; acute abdomen; gallstones

**Variation in metabolism** The capacity to metabolise codeine to morphine can vary considerably between individuals; there is a marked increase in morphine toxicity
4.7.2 Opioid analgesics

in patients who are ultra-rapid codeine metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.

Contra-indications see notes above; also in children under 18 years who undergo the removal of tonsils or adenoids for the treatment of sleep apnoea; known ultra-rapid codeine metabolisers (see Variation in Metabolism above)

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding

Avoid—although amount usually too small to be harmful, mothers vary considerably in their capacity to metabolize codeine—risk of morphine overdose in infant

Side-effects see notes above; also abdominal pain, anorexia, seizures, malaise, hyperthermia, antiduretic effect, and muscle fasculation; pancreatitis also reported

Dose

By mouth, ADULT over 18 years, 30–60 mg every 4 hours when necessary, to a max. of 240 mg daily; CHILD under 18 years see BNF for Children

By intramuscular injection, ADULT over 18 years, 30–60 mg every 4 hours when necessary; CHILD under 18 years see BNF for Children

Codeine Phosphate (Non-proprietary)

Tablets, codeine phosphate 15 mg, net price 28-tab pack = £1.17; 30 mg, 28-tab pack = £1.33; 60 mg, 28-tab pack = £3.04. Label: 2

Syrup, codeine phosphate 25 mg/5 mL, net price 100 mL = 98p. Label: 2

Injection, codeine phosphate 60 mg/mL, net price 1-mL amp = £2.37

Linctus

Section 3.9.1

With paracetamol

Section 4.7.1

DIHYDROCODEINE TARTRATE

(Dihydrocodeine Hydrochloride)

Indications see under Dose

Cautions see notes above; also severe diarrhoea; toxic psychosis, CNS depression; severe cor pulmonale

Contra-indications see notes above; also delayed gastric emptying; phaeochromocytoma

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding

therapeutic doses unlikely to affect

Breast-feeding Avoid—although amount usually too small to be harmful, mothers vary considerably in their capacity to metabolize codeine—risk of morphine overdose in infant

Side-effects see notes above; also abdominal pain, anorexia, seizures, malaise, hyperthermia, antiduretic effect, and muscle fasculation; pancreatitis also reported

Dose

By mouth, ADULT over 18 years, 30–60 mg every 4 hours when necessary, to a max. of 240 mg daily; CHILD under 18 years see BNF for Children

By intramuscular injection, ADULT over 18 years, 30–60 mg every 4 hours when necessary; CHILD under 18 years see BNF for Children

Dose

By mouth, ADULT over 18 years, 30–60 mg every 4 hours when necessary; CHILD under 18 years see BNF for Children

By intramuscular injection, ADULT over 18 years, 30–60 mg every 4 hours when necessary; CHILD under 18 years see BNF for Children

Codeine Phosphate (Non-proprietary)

Tablets, codeine phosphate 15 mg, net price 28-tab pack = £1.17; 30 mg, 28-tab pack = £1.33; 60 mg, 28-tab pack = £3.04. Label: 2

Syrup, codeine phosphate 25 mg/5 mL, net price 100 mL = 98p. Label: 2

Injection, codeine phosphate 60 mg/mL, net price 1-mL amp = £2.37

Linctus

Section 3.9.1

With paracetamol

Section 4.7.1

DIHYDROCODEINE TARTRATE

Indications moderate to severe pain

Cautions see notes above; also pancreatitis; severe cor pulmonale

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding

use only if potential benefit outweighs risk

Side-effects see notes above; also paralytic ileus, abdominal pain, diarrhoea, seizures, and paraesthesia

Dose

By mouth, 30 mg every 4–6 hours when necessary (see also notes above); CHILD over 4 years 0.5–1 mg/kg every 4–6 hours

By deep subcutaneous or intramuscular injection, up to 50 mg repeated every 4–6 hours if necessary; CHILD over 4 years 0.5–1 mg/kg every 4–6 hours

Dihydrocodeine (Non-proprietary)

Tablets, dihydrocodeine tartrate 30 mg, net price 28-tab pack = £1.15. Label: 2

Dental prescribing on NHS Dihydrocodeine Tablets 30 mg may be prescribed

Oral solution, dihydrocodeine tartrate 10 mg/5 mL, net price 150 mL = £6.20. Label: 2

Injection, dihydrocodeine tartrate 50 mg/mL, net price 1-mL amp = £7.89

DF118 Forte® (Martindale) Tablets, dihydrocodeine tartrate 40 mg, net price 100-tab pack = £11.51. Label: 2

Dose ADULT and CHILD over 12 years, severe pain, 40–80 mg 3 times daily; max. 240 mg daily

Modified release

DHC Continus® (Napp) Tablets, m/r, dihydrocodeine tartrate 60 mg, net price 56-tab pack = £8.20; 90 mg, 56-tab pack = £8.66; 120 mg, 56-tab pack = £10.95. Label: 2, 25

Dose ADULT and CHILD over 12 years, severe pain, 60–120 mg every 12 hours

Note Dihydrocodeine is an ingredient of some compound analgesic preparations, section 4.7.1

With paracetamol

section 4.7.1
DIPIPANONE HYDROCHLORIDE

**Indications**
- moderate to severe pain

**Cautions**
- see notes above; also diabetes mellitus; phaeochromocytoma

**Contra-indications**
- see notes above

**Hepatic impairment**
- see notes above

**Renal impairment**
- see notes above

**Pregnancy**
- see notes above

**Breast-feeding**
- see notes above; also psychosis, restlessness, raised intracranial pressure

**Dose**
- See preparation below

**Dipipanone and cyclizine (Non-proprietary)**
- Tablets, dipipanone hydrochloride 10 mg, cyclizine hydrochloride 30 mg, net price 50-tab pack = £129.74

**Abstral**
- Tablets, dipipanone hydrochloride 30 mg, cyclizine hydrochloride 30 mg, net price 50-tab pack = £129.74

**Dose**
- *acute pain, 1 tablet gradually increased to 3 tablets every 6 hours; CHILD not recommended*

**Caution**
- Not recommended in palliative care, see Nausea and Vomiting, p. 22

**FENTANYL**

**Indications**
- severe chronic pain, breakthrough pain; parental indications (section 15.1.4.3)

**Cautions**
- see notes above; also diabetes mellitus (with Actiq® lozenges); impaired consciousness; cerebral tumour; mucositis—absorption from oral preparations may be increased, caution during dose titration; see also Transdermal Fentanyl, p. 284

**Contra-indications**
- see notes above

**Hepatic impairment**
- see notes above

**Renal impairment**
- see notes above

**Pregnancy**
- see notes above

**Breast-feeding**
- monitor infant for opioid-induced side-effects

**Side-effects**
- see notes above; also abdominal pain, dyspepsia, diarrhoea, gastro-oesophageal reflux disease, stomatitis, anorexia, hypertension, vasodilation, dyspnoea, aesthesia, myoclonus, anxiety, tremor, appetite changes, rhinitis, pharyngitis, paraesthesia, application-site reactions; less commonly: ileus, flatulence, hyperventilation, impaired concentration, impaired coordination, amnesia, sleep disorder, malaise, seizures, depressed level of consciousness, loss of consciousness, dysgeusia, parosmia, pyrexia, thirst, blood disorders (including thrombocytopenia), arthralgia, chills; rarely: hiccups; very rarely: arthralgia, apnoea, haemoptysis, ataxia, delusions, bladder pain

**Dose**
- *Chronic intractable pain, by transdermal route, apply to dry, non-irritated, non-hairy skin on torso or upper arm, removing after 72 hours and sitting replacement patch on a different area (avoid using the same area for several days). ADULT over 16 years not currently treated with a strong opioid analgesic (but see Transdermal Fentanyl, p. 284), initial dose, one ‘12’ or 25 micrograms/hour’ patch replaced after 72 hours; ADULT and CHILD over 2 years currently treated with a strong opioid analgesic, initial dose based on previous 24-hour opioid requirement (consult product literature)*

**Dose adjustment**
- When starting, evaluation of the analgesic effect should not be made before the system has been worn for 24 hours (to allow for the gradual increase in plasma-fentanyl concentration)—previous analgesic therapy should be phased out gradually from time of first patch application, if necessary dose should be adjusted at 48–72-hour intervals in steps of 12–25 micrograms/hour. More than one patch may be used at a time (but applied at the same time to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (important: it takes 17 hours or more for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually).

**Long duration of action**
- In view of the long duration of action, patients who have had severe side-effects should be monitored for up to 24 hours after patch removal

- *Breakthrough pain, see under preparations below Important Fentanyl preparations for the treatment of breakthrough pain are not interchangeable; if patients are switched from another fentanyl-containing preparation, a new dose titration is required*

**Conversion**
- (from long-term oral morphine to transdermal fentanyl) see Prescribing in Palliative Care, p. 21

**Abstral**
- Tablets (sublingual), fentanyl (as citrate) 100 micrograms, net price 10-tab pack = £49.99, 30-tab pack = £149.70; 200 micrograms, 10-tab pack = £49.99, 30-tab pack = £149.70; 300 micrograms, 10-tab pack = £49.99, 30-tab pack = £149.70; 400 micrograms, 10-tab pack = £49.99, 30-tab pack = £149.70; 600 micrograms, 30-tab pack = £149.70; 800 micrograms, 30-tab pack = £149.70. Label: 2, 26, counselling, administration

**Dose**
- *breakthrough pain in patients receiving opioid therapy for chronic cancer pain, ADULT over 18 years, initially 100 micrograms repeated if necessary after 15–30 minutes, adjust dose according to response—consult product literature, no more than 2 dose units 15–30 minutes apart, for each pain episode, max. 800 micrograms per episode of breakthrough pain, leave at least 2 hours between treatment of episodes of breakthrough pain*

**Note**
- If more than 4 episodes of breakthrough pain each day, adjust background analgesia

**Counselling**
- Patients should be advised not to eat or drink until the tablet is completely dissolved. In patients with a dry mouth, the buccal mucosa may be moistened with water before administration of tablet

**The Scottish Medicines Consortium**
- The Scottish Medicines Consortium (p. 4) has advised (January 2009) that Abstral® sublingual tablets should be restricted for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable

**Effentora®**
- Tablets (buccal), fentanyl, sugar-free (as citrate) 100 micrograms, net price 4-tab pack = £19.96, 28-tab pack = £139.72; 200 micrograms, 4-tab pack = £19.96, 28-tab pack = £139.72; 400 micrograms, 4-tab pack = £19.96, 28-tab pack = £139.72; 800 micrograms, 4-tab pack = £19.96. Label: 2, counselling, administration

**Electrolytes Na+ 0.35 mmol/100 microgram tablet. Na+ 0.70 mmol/tablet (all other strengths)**

**Dose**
- *breakthrough pain in patients receiving opioid therapy for chronic cancer pain, ADULT over 18 years, initially 100 micrograms repeated if necessary after 30 minutes after first dose (no more in 2 dose units for each pain episode); adjust dose according to response—consult product literature, max. 800 micrograms per episode of breakthrough pain, leave at least 4 hours between treatment of episodes of breakthrough pain during titration*

**Counselling**
- Place tablet between cheek and gum and leave to dissolve, if more than 1 tablet required, place second tablet on the other side of the mouth, tablet may alternatively be placed under the tongue (sublingually). Patients should be advised not to eat or drink until the tablet is completely dissolved, after 30 minutes, if any remnants remain, they may be swallowed with a glass of water. Patients with a dry mouth should be advised to drink water to moisten the buccal mucosa before administration of the tablets; if appropriate effervescence does not occur, a switch of therapy may be advised
4.7.2 Opioid analgesics

The Scottish Medicines Consortium (p. 4) has advised that Effentor® buccal tablets should be restricted for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

Recivil® (Grünenthal) (D2)

Tablets (sublingual), fentanyl (as citrate) 133 micrograms, net price 30-tab pack = £127.20; 267 micrograms, 30-tab pack = £127.20; 400 micrograms, 30-tab pack = £127.20; 533 micrograms, 30-tab pack = £127.20; 800 micrograms, 30-tab pack = £127.20. Label: 2, counselling, administration.

Excipients include propylene glycol (see Excipients, p. 4) has advised that PecFent® nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

Lozenges

Actiq® (TEVA UK) (D2)

Lozenge (buccal), with oromucosal applicator, fentanyl (as citrate) 200 micrograms, net price 3 = £210.41; 400 micrograms, 3 = £210.05, 30 = £210.41; 600 micrograms, 3 = £210.05, 30 = £210.41; 800 micrograms, 3 = £210.05, 30 = £210.41; 1.2 mg, 3 = £210.05, 30 = £210.41. Label: 2, counselling, administration.

Excipients include propylene glycol (see Excipients).

Dose breakthrough pain in patients receiving opioid therapy for chronic cancer pain, ADULT over 18 years, initially 133 micrograms repeated if necessary after 15–30 minutes, adjust dose according to response—consult product literature, no more than 2 dose units, 15–30 minutes apart, for each pain episode, max. four doses per day.

Note If more than 4 episodes of breakthrough pain each day, adjust background analgesia.

Counselling Patients should be advised not to eat or drink until the tablet is completely dissolved, after 30 minutes, if any remnants remain, they may be swallowed. In patients with a dry mouth, the buccal mucosa may be moistened with water before administration of tablet.

Lozenges

Actiq® (TEVA UK) (D2)

Lozenge (buccal), with oromucosal applicator, fentanyl (as citrate) 200 micrograms, net price 3 = £210.41; 400 micrograms, 3 = £210.05, 30 = £210.41; 600 micrograms, 3 = £210.05, 30 = £210.41; 800 micrograms, 3 = £210.05, 30 = £210.41; 1.2 mg, 3 = £210.05, 30 = £210.41. Label: 2, counselling, administration.

Excipients include propylene glycol (see Excipients).

Dose breakthrough pain in patients receiving opioid therapy for chronic cancer pain, ADULT over 18 years, initially 200 micrograms (over 15 minutes) repeated if necessary 15 minutes after first dose (no more than 2 dose units for each pain episode), if adequate pain relief not achieved with 1 dose unit for consecutive breakthrough pain episodes, increase the strength of the dose unit until adequate pain relief achieved with 4 lozenges or less daily.

Note If more than 4 episodes of breakthrough pain each day, adjust background analgesia.

Counselling Patients should be advised to place the lozenge in the mouth against the cheek and move it around the mouth using the applicator; each lozenge should be sucked over a 15 minute period. In patients with a dry mouth, water may be used to moisten the buccal mucosa. Patients with diabetes should be advised each lozenge contains approximately 2 g glucose.

Films

Breakyl® (Meda) (D2)

Film (buccal), fentanyl (as citrate) 200 micrograms, net price 10 = £49.90; 400 micrograms, 10 = £49.90; 800 micrograms, 28 = £119.72. Label: 2, counselling, administration.

Excipients include propylene glycol (see Excipients, p. 2).

Dose breakthrough pain in patients receiving opioid therapy for chronic cancer pain, ADULT over 18 years, initially 200 micrograms; adjust dose according to response—consult product literature, max. 1.2 mg per episode of breakthrough pain; leave at least 4 hours between treatment of episodes of breakthrough pain.

Note If more than 4 episodes of breakthrough pain each day occur on more than 4 consecutive days, adjust background analgesia.

Counselling Moisten mouth, place film on inner lining of cheek (pink side to cheek), hold for at least 5 seconds until it sticks, and leave to dissolve (15–30 minutes); if more than 1 film required do not overlap, but use another area of the mouth. Avoid liquids for 5 minutes after application; avoid food until the film has dissolved.

Nasal spray

Instanyl® (Takeda) (D2)

Nasal spray, fentanyl (as citrate) 50 micrograms/metered spray, net price single-dose pack = £5.95, 10-dose pack = £59.50, 20-dose pack = £119.00; 100 micrograms/metered spray, single-dose pack = £5.95, 10-dose pack = £59.50, 20-dose pack = £119.00; 200 micrograms/metered spray, single-dose pack = £5.95, 10-dose pack = £59.50, 20-dose pack = £119.00. Label: 2, counselling, administration.

Dose breakthrough pain in patients receiving opioid therapy for chronic cancer pain, ADULT over 18 years, initially 50 micrograms into one nostril, repeated once if necessary after 10 minutes; adjust dose according to response, max. 2 sprays for each pain episode and minimum 4 hours between treatment of each pain episode.

Note If more than 4 breakthrough pain episodes daily, adjust background analgesia.

Counselling Patient should sit or stand during administration. Avoid concomitant use of other nasal preparations.

The Scottish Medicines Consortium (p. 4) has advised that Instanyl® nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

Patches

Transdermal fentanyl

Fever or external heat Monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat, for example a hot bath or sauna (may also increase absorption).

Respiratory depression Risk of fatal respiratory depression, particularly in patients not previously treated with a strong opioid analgesic; manufacturer recommends use only in opioid tolerant patients.

Counselling Patients and carers should be informed about safe use, including correct administration and disposal, strict adherence to dosage instructions, and the symptoms and signs of opioid overdosage. Patches should be removed immediately in case of breathing difficulties, marked drowsiness, confusion, dizziness, or impaired speech, and patients and carers should seek prompt medical attention.
Prescriptions Prescriptions for fentanyl patches can be written to show the strength in terms of the release rate and it is acceptable to write ‘Fentanyl 25 patches’ to prescribe patches that release fentanyl 25 micrograms per hour. The dosage should be expressed in terms of the interval between applying a patch and replacing it with a new one, e.g. ‘one patch to be applied every 72 hours’. The total quantity of patches to be supplied should be written in words and figures.

Fentanyl (Non-proprietary) (06) Patches, self-adhesive, fentanyl, ‘12’ patch (releasing approx. 12 micrograms/hour for 72 hours), net price 5 = £12.59; ‘25’ patch (releasing approx. 25 micrograms/hour for 72 hours), 5 = £17.99; ‘37.5’ patch (releasing approx. 37.5 micrograms/hour for 72 hours; Mezolar® brand only), 5 = £15.45; ‘50’ patch (releasing approx. 50 micrograms/hour for 72 hours), 5 = £33.66; ‘75’ patch (releasing approx. 75 micrograms/hour for 72 hours), 5 = £46.99; ‘100’ patch (releasing approx. 100 micrograms/hour for 72 hours), 5 = £57.86. Label: 2, counselling, administration.

Brands include Fenclone®, Fentanil®, Matrixen®, Mezolar®, Opiodur®, Osmanil®, Telifyl®, Victanyl®

Durogesic DTans® (Janssen) (06) Patches, self-adhesive, transparent, fentanyl, ‘12’ patch (releasing approx. 12 micrograms/hour for 72 hours), net price 5 = £12.59; ‘25’ patch (releasing approx. 25 micrograms/hour for 72 hours), 5 = £17.99; ‘50’ patch (releasing approx. 50 micrograms/hour for 72 hours), 5 = £33.66; ‘75’ patch (releasing approx. 75 micrograms/hour for 72 hours), 5 = £46.99; ‘100’ patch (releasing approx. 100 micrograms/hour for 72 hours), 5 = £57.86. Label: 2, counselling, administration.

HYDROMORPHONE HYDROCHLORIDE Indications severe pain in cancer
Cautions see notes above; also pancreatitis; toxic psychosis
Contra-indications see notes above; also acute abdomen
Hepatic impairment see notes above
Renal impairment see notes above
Pregnancy see notes above
Breast-feeding avoid—no information available
Side-effects see notes above; also abdominal pain, anorexia, anxiety; less commonly diarrhoea, paralytic ileus, peripheral oedema, dysgeusia, seizures, paraesthesia, dyskinesia, myoclonus, agitation, tremor
Dose ● See under preparations below

Palladone® SR (Napp) (02) Capsules, m/r, hydromorphone hydrochloride 2 mg (yellow/clear), net price 56-cap pack = £20.96; 4 mg (pale blue/clear), 56-cap pack = £28.75; 8 mg (pink/clear), 56-cap pack = £56.08; 16 mg (brown/clear), 56-cap pack = £106.53; 24 mg (dark blue/clear), 56-cap pack = £159.82. Label: 2, counselling, see below
Dose 4 mg every 12 hours, increased if necessary according to severity of pain; CHILD under 12 years not recommended
Counselling Swallow whole or open capsule and sprinkle contents on soft food

MEPTAZINOL Indications moderate to severe pain, including post-operative and obstetric pain and renal colic; peri-operative analgesia, section 15.1.4.3
Cautions see notes above; effects only partially reversed by naloxone
Contra-indications see notes above; also myocardial infarction; phaeochromocytoma
Hepatic impairment see notes above
Renal impairment see notes above
Pregnancy see notes above
Breast-feeding use only if potential benefit outweighs risk
Side-effects see notes above; can induce withdrawal symptoms in patients dependent on opioids; also diarrhoea, abdominal pain, dyspepsia, and hypothermia
Dose ● By mouth, 200 mg every 3–6 hours as required; CHILD not recommended
● By intramuscular injection, 75–100 mg every 2–4 hours if necessary; obstetric analgesia, 100–150 mg according to patient’s weight (2 mg/kg); CHILD not recommended
● By slow intravenous injection, 50–100 mg every 2–4 hours if necessary; CHILD not recommended

Meptil® (Almirall) (RH) Tablets, orange, F/c, meptazinol 200 mg, net price 112-tab pack = £22.11. Label: 2
Injection, meptazinol 100 mg (as hydrochloride)/mL, net price 1-mL amp = £1.92

METHADONE HYDROCHLORIDE Indications severe pain, see notes above; cough in terminal disease (section 3.9.1); adjunct in treatment of opioid dependence (section 4.10.3)
Cautions see notes above; also history of cardiac conduction abnormalities, family history of sudden death (ECG monitoring recommended; see also QT-Interval Prolongation, below)
QT-interval prolongation Patients with the following risk factors for QT-interval prolongation should be carefully monitored while taking methadone: heart or liver disease, electrolyte abnormalities, or concomitant treatment with drugs that can prolong QT interval; patients requiring more than 100 mg daily should also be monitored
Contra-indications see notes above; also phaeochromocytoma
Hepatic impairment see notes above
Renal impairment see notes above
Pregnancy see notes above
Breast-feeding

Withdrawal symptoms in infant; breast-feeding permissible during maintenance but dose should be as low as possible and infant monitored to avoid sedation.

Side-effects

See notes above; also QT-interval prolongation, torsade de pointes, hypothermia, restlessness, raised intracranial pressure, dysmenorrhea, dry eyes, and hyperprolactinaemia.

Dose

- By mouth or by subcutaneous or intramuscular injection, 5–10 mg every 6–8 hours, adjusted according to response; on prolonged use not to be given more frequently than every 12 hours; CHILD not recommended.

Methadone (Non-proprietary) (B2)

Tablets, methadone hydrochloride 5 mg, net price £0.22. Label: 2.

Brands include Phyperone®, Synastone®.

Linctus

Section 3.9.1

Oral solution and oral concentrate

Section 4.10.3

MORPHINE SALTS

Indications

See notes above and under Dose; acute diarrhoea (section 1.4.2); cough in terminal care (section 3.9.1)

Cautions

See notes above; also pancreatitis, cardiac arrhythmias, severe cor pulmonale

Contra-indications

See notes above; also delayed gastric emptying, acute abdomen; heart failure secondary to chronic lung disease; phenochromocytoma

Hepatic impairment

See notes above

Renal impairment

See notes above

Pregnancy

See notes above

Breast-feeding

Therapeutic doses unlikely to affect infant

Side-effects

See notes above; also paralytic ileus, abdominal pain, anorexia, dyspepsia, exacerbation of pancreatitis, taste disturbance; hypertension, hypothermia, syncope; bronchospasm, inhibition of cough reflex; restlessness, seizures, paresis, asthenia, malaise, disorientation, excitation, agitation, delirium, raised intracranial pressure; amenorrhoea; myoclonus, muscle fasciculation, rhabdomyolysis, and nystagmus

Dose

The patient should be closely monitored for pain relief as well as for side-effects especially respiratory depression. See also notes above.

- Acute pain, by subcutaneous injection (not suitable for oedematous patients) or by intramuscular injection, initially 10 mg (ELDERLY) or 5 mg every 4 hours (or more frequently during titration), adjusted according to response; CHILD 1–6 months initially 100–200 micrograms/kg every 6 hours, adjusted according to response; CHILD 6 months–2 years initially 100–200 micrograms/kg every 4 hours, adjusted according to response; CHILD 2–12 years initially 200 micrograms/kg every 4 hours, adjusted according to response; CHILD 12–18 years initially 2.5–10 mg every 4 hours, adjusted according to response.

By slow intravenous injection, initially 5 mg (reduce dose in ELDERLY or frail) every 4 hours (or more frequently during titration), adjusted according to response; NEONATE initially 50 micrograms/kg every 6 hours, adjusted according to response; CHILD 1–6 months initially 100 micrograms/kg every 6 hours, adjusted according to response; CHILD 6 months–12 years initially 100 micrograms/kg every 4 hours, adjusted according to response.

- Premedication, by subcutaneous or intramuscular injection, up to 10 mg 60–90 minutes before operation; CHILD, by intramuscular injection, 150 micrograms/kg

- Patient controlled analgesia (PCA), consult hospital protocols

- Myocardial infarction, by slow intravenous injection (1–2 mg/minute), 5–10 mg followed by a further 5–10 mg if necessary; ELDERLY or frail patients, reduce dose by half

- Acute pulmonary oedema, by slow intravenous injection (2 mg/minute) 5–10 mg; ELDERLY or frail patients, reduce dose by half

- Chronic pain, by mouth or by subcutaneous injection (not suitable for oedematous patients) or by intramuscular injection, initially 5–10 mg every 4 hours, adjusted according to response; see also Prescribing in Palliative Care, p. 20

By rectum, initially 15–30 mg every 4 hours, adjusted according to response.

Note

The doses stated above refer equally to morphine hydrochloride and sulfate.

Oral solutions

Note

For advice on transfer from oral solutions of morphine to modified-release preparations of morphine, see Prescribing in Palliative Care, p. 20.

Morphine Oral Solutions

Oral solutions of morphine can be prescribed by writing the formula:

Morphine hydrochloride 5 mg

Chloroform water to 5 mL

Note

The proportion of morphine hydrochloride may be altered when specified by the prescriber; if above 13 mg per 5 mL the solution becomes B2. For sample prescription see Controlled Drugs and Drug Dependence, p. 8. It is usual to adjust the strength so that the dose volume is 5 or 10 mL.

Oramorph® (Boehringer Ingelheim)

Oramorph oral solution B2, morphine sulfate 10 mg/5 mL, net price 100-mL pack = £1.89; 300-mL pack = £5.45; 500-mL pack = £8.50. Label: 2.

Oramorph® concentrated oral solution B2, sugar-free, morphine sulfate 100 mg/5 mL, net price 30-mL pack = £4.98; 120-mL pack = £19.50 (both with calibrated dropper). Label: 2.

Tablets

Sevredol® (Napp) B2

Tablets, f/c, scored, morphine sulfate 10 mg (blue), net price 56-tab pack = £0.31; 20 mg (pink), 56-tab pack = £10.61; 50 mg (pale green), 56-tab pack = £28.02. Label: 2.
BNF 68

4.7.2 Opioid analgesics 287

** Modified-release 12-hourly oral preparations

Filnarine® SR (TEVA UK) (G2)

Tablets, m/r, f/c, morphine sulfate 10 mg (pink), net price 60-tab pack = £3.30; 30 mg (blue), 60-tab pack = £7.89; 60 mg (pink), 60-tab pack = £15.59; 100 mg (white), 60-tab pack = £24.57; 200 mg (white), 60-tab pack = £48.74. Label: 2, 25

**Dose**
every 12 hours, dose adjusted according to daily morphine requirements; for further advice on determining dose, see Prescribing in Palliative Care, p. 20; dosage requirements should be reviewed if the brand is altered

**Note**
Prescriptions must also specify ‘tablets’ (i.e. Filnarine SR tablets)

Morphgesic® SR (AMCo) (G2)

Tablets, m/r, f/c, morphine sulfate 10 mg (buff), net price 60-tab pack = £3.85; 30 mg (violet), 60-tab pack = £9.24; 60 mg (orange), 60-tab pack = £18.04; 100 mg (grey), 60-tab pack = £28.54. Label: 2, 25

**Dose**
every 12 hours, dose adjusted according to daily morphine requirements; for further advice on determining dose, see Prescribing in Palliative Care, p. 20; dosage requirements should be reviewed if the brand is altered

**Note**
Prescriptions must also specify ‘tablets’ (i.e. Morphgesic SR tablets)

**MST Continus® (Napp)** (G2)

Tablets, m/r, f/c, morphine sulfate 5 mg (white), net price 60-tab pack = £3.29; 10 mg (brown), 60-tab pack = £5.18; 15 mg (green), 60-tab pack = £9.10; 30 mg (purple), 60-tab pack = £12.47; 60 mg (orange), 60-tab pack = £24.32; 100 mg (grey), 60-tab pack = £38.50; 200 mg (green), 60-tab pack = £81.34. Label: 2, 25

**Suspension** (= sachet of granules to mix with water), m/r, pink, morphine sulfate 20 mg/sachet, net price 30-sachet pack = £24.58; 30 mg/sachet, 30-sachet pack = £25.54; 60 mg/sachet, 30-sachet pack = £51.09; 100 mg (red), 28-cap pack = £36.43; 200 mg (red), 28-cap pack = £46.15. Label: 2, counselling, see below

**Dose**
every 24 hours, dose adjusted according to daily morphine requirements; for further advice on determining dose, see Prescribing in Palliative Care, p. 20; dosage requirements should be reviewed if the brand is altered

**Counselling**
Swallow whole or open capsule and sprinkle contents on soft food

**Note**
Prescriptions must also specify ‘capsules’ (i.e. ‘MST Continus’ capsules)

**Suppositories**

Morphine (Non-proprietary) (G2)

**Suppositories**, morphine sulfate 10 mg, net price 12 = £11.21; 15 mg, 12 = £15.88; 20 mg, 12 = £33.22; 30 mg, 12 = £17.76. Label: 2

**Note**
Both the strength of the suppositories and the morphine salt contained in them must be specified by the prescriber

**Injections**

Morphine Sulfate (Non-proprietary) (G2)

**Injection**, morphine sulfate 10, 15, 20, and 30 mg/mL, net price 1- and 2-mL amp (all) = 72p–£4.48

**Intravenous infusion**, morphine sulfate 1 mg/mL, net price 50-mL vial = £5.25; 2 mg/mL, 50-mL vial = £5.89

Minjet® Morphine Sulphate (UCB Pharma) (G2)

**Injection**, morphine sulfate 1 mg/mL, net price 10-mL disposable syringe = £15.00

**Injection with antiemetic**

For prescribing information on cyclizine, see section 4.6.

**Caution**
In myocardial infarction cyclizine may aggravate severe heart failure and counteract the haemodynamic benefits of opioids, section 4.6. Not recommended in palliative care, see Nausea and Vomiting, p. 22

**Cyclimorph®** (AMCo) (G2)

**Cyclimorph-10** injection, morphine tartrate 10 mg, cyclizine tartrate 50 mg/mL, net price 1-mL amp = £1.75

**Dose**
ADULT and CHILD over 12 years, moderate to severe pain (short-term use only) by subcutaneous, intramuscular, or intravenous injection, 1 mL, repeated not more than every 4 hours; max. 3 doses in any 24-hour period

**Cyclimorph-15** injection, morphine tartrate 15 mg, cyclizine tartrate 50 mg/mL, net price 1-mL amp = £1.82

**Dose**
ADULT and CHILD over 12 years, moderate to severe pain (short-term use only) by subcutaneous, intramuscular, or intravenous injection, 1 mL, repeated not more than every 4 hours; max. 3 doses in any 24-hour period

**OXYCODONE HYDROCHLORIDE**

**Indications**
moderate to severe pain in patients with cancer; postoperative pain; severe pain

**Caution**
sees notes above; also toxic psychosis; pancreatitis

**Contra-indications**
sees notes above; also acute abdomen; delayed gastric emptying; chronic constipation; congenital anomalies

**Hepatic impairment**
initially 2.5 mg every 6 hours in patients not currently treated with an opioid with mild impairment; avoid in moderate to severe impairment; see also notes above

**Renal impairment**
initially 2.5 mg every 6 hours in patients not currently treated with an opioid with mild impairment

Note
Prescriptions must also specify ‘capsules’ (i.e. ‘MRL capsules’)

**Modified-release 24-hourly oral preparations**

MXL® (Napp) (G2)

Tablets, m/r, morphine sulfate 30 mg (light blue), net price 28-cap pack = £10.91; 60 mg (brown), 28-cap pack = £14.95; 90 mg (pink), 28-cap pack = £22.04; 120 mg (green), 28-cap pack = £29.15; 150 mg (blue), 28-cap pack = £36.43; 200 mg (red-

brown), 28-cap pack = £46.15. Label: 2, counselling, see below

**Dose**
every 24 hours, dose adjusted according to daily morphine requirements; for further advice on determining dose, see Prescribing in Palliative Care, p. 20; dosage requirements should be reviewed if the brand is altered

**Counselling**
Swallow whole or open capsule and sprinkle contents on soft food

**Note**
Prescriptions must also specify ‘capsules’ (i.e. ‘MXL capsules’)

**Cyclimorph-15** injection, morphine tartrate 15 mg, cyclizine tartrate 50 mg/mL, net price 1-mL amp = £1.82

**Dose**
ADULT and CHILD over 12 years, moderate to severe pain (short-term use only) by subcutaneous, intramuscular, or intravenous injection, 1 mL, repeated not more than every 4 hours; max. 3 doses in any 24-hour period

**Cyclimorph-10** injection, morphine tartrate 10 mg, cyclizine tartrate 50 mg/mL, net price 1-mL amp = £1.75

**Dose**
ADULT and CHILD over 12 years, moderate to severe pain (short-term use only) by subcutaneous, intramuscular, or intravenous injection, 1 mL, repeated not more than every 4 hours; max. 3 doses in any 24-hour period
4.7.2 Opioid analgesics

Central nervous system

Pregnancy see notes above
Breast-feeding present in milk—avoid

Side-effects see notes above; also diarrhoea, abdominal pain, anorexia, dyspepsia; bronchospasm, dyspnoea, impaired cough reflex; asthenia, anxiety, chills; less commonly paralytic ileus, cholestasis, gastritis, flatulence, dysphagia, taste disturbance, belching, hiccup, vasodilatation, supraventricular tachycardia, syncope, amnesia, hypoaesthesia, restlessness, seizures, hypotonia, paraesthesia, disorientation, malaise, agitation, speech disorder, tremor, pyrexia, amnorrhea, thirst, dehydration, muscle fasciculation, and dry skin

Dose
- By mouth, initially 5 mg every 4–6 hours, increased if necessary according to severity of pain, usual max. 400 mg daily, but some patients may require higher doses; CHILD under 18 years see BNF for Children
- By slow intravenous injection, 1–10 mg every 4 hours when necessary; CHILD under 18 years not recommended
- By intravenous infusion, initially 2 mg/hour, adjusted according to response; CHILD under 18 years not recommended
- By subcutaneous injection, initially 5 mg every 4 hours when necessary; CHILD under 18 years not recommended
- By subcutaneous infusion, initially 7.5 mg/24 hours adjusted according to response; CHILD under 18 years not recommended
- Patient controlled analgesia (PCA), consult hospital protocols

Note 2 mg oral oxycodone is approximately equivalent to 1 mg parenteral oxycodone

Oxycodone (Non-proprietary) (62)

Capsules, oxycodone hydrochloride 5 mg, net price 56 = £11.43; 10 mg, 56 = £22.86; 20 mg, 56 = £45.71. Label: 2

Oral solution, oxycodone hydrochloride 5 mg/5 mL, net price 250-mL pack = £9.71. Label: 2

Concentrated oral solution, oxycodone hydrochloride 10 mg/mL, net price 120-mL pack = £46.63. Label: 2

Injection, oxycodone hydrochloride 10 mg/mL, net price 1-mL amp = £1.60, 2-mL amp = £3.20

OxyNorm® (Napp) (62)

Capsules, oxycodone hydrochloride 5 mg (orange/beige), net price 56-cap pack = £11.43; 10 mg (white/beige), 56-cap pack = £22.86; 20 mg (pink/beige), 56-cap pack = £45.71. Label: 2

Liquid (= oral solution), sugar-free, oxycodone hydrochloride 5 mg/5 mL, net price 250 mL = £9.71. Label: 2

Concentrate (= concentrated oral solution), sugar-free, oxycodone hydrochloride 10 mg/mL, net price 120 mL = £46.63. Label: 2

Injection, oxycodone hydrochloride 10 mg/mL, net price 1-mL amp = £1.60, 2-mL amp = £3.20; 50 mg/mL, 1-mL amp = £14.02

Note The Scottish Medicines Consortium (p. 4) has advised (October 2004 and November 2010) that OxyNorm® injection is restricted for use within NHS Scotland for patients with cancer who have difficulty in tolerating morphine or diamorphine

Modified release

Dolocodon® PR (Zentiva) (62)

Tablets, f/c, m/r, oxycodone hydrochloride 5 mg (white), net price 28-tab pack = £12.50; 10 mg (pink), 56-tab pack = £24.99; 20 mg (white), 56-tab pack = £49.98; 40 mg (pink), 56-tab pack = £99.98. Label: 2, 25

Dose initially 10 mg every 12 hours, increased if necessary according to severity of pain, usual max. 200 mg every 12 hours, but some patients may require higher doses; CHILD 18 years see BNF for Children

Longtec® (Qdem) (62)

Tablets, f/c, oxycodone hydrochloride 5 mg (blue), net price 28-tab pack = £10.00; 10 mg (white), 56-tab pack = £19.99; 20 mg (pink), 56-tab pack = £39.98; 40 mg (yellow), 56-tab pack = £79.98; 80 mg (green), 56-tab pack = £159.98. Label: 2, 25

Dose initially 10 mg every 12 hours, increased if necessary according to severity of pain, usual max. 200 mg every 12 hours, but some patients may require higher doses; CHILD 8–18 years see BNF for Children

OxyContin® (Napp) (62)

Tablets, f/c, m/r, oxycodone hydrochloride 5 mg (blue), net price 28-tab pack = £12.52; 10 mg (white), 56-tab pack = £25.04; 15 mg (grey), 56-tab pack = £38.12; 20 mg (pink), 56-tab pack = £50.08; 30 mg (brown), 56-tab pack = £76.23; 40 mg (yellow), 56-tab pack = £100.19; 60 mg (red), 56-tab pack = £152.49; 80 mg (green), 56-tab pack = £200.39; 120 mg (purple), 56-tab pack = £305.02. Label: 2, 25

Dose initially 10 mg every 12 hours, increased if necessary according to severity of pain, usual max. 200 mg every 12 hours, but some patients may require higher doses; CHILD under 18 years see BNF for Children

With naloxone

Targinact® (Napp) (62)

Tablets 5 mg/2.5 mg, f/c, m/r, oxycodone hydrochloride 5 mg, naloxone hydrochloride 2.5 mg (blue), net price 28-tab pack = £21.16. Label: 2, 25

Tablets 10 mg/5 mg, f/c, m/r, oxycodone hydrochloride 10 mg, naloxone hydrochloride 5 mg (white), net price 56-tab pack = £42.32. Label: 2, 25

Tablets 20 mg/10 mg, f/c, m/r, oxycodone hydrochloride 20 mg, naloxone hydrochloride 10 mg (pink), net price 56-tab pack = £84.62. Label: 2, 25

Tablets 40 mg/20 mg, f/c, m/r, oxycodone hydrochloride 40 mg, naloxone hydrochloride 20 mg (yellow), net price 56-tab pack = £169.28. Label: 2, 25

Dose severe pain responsive only to opioid analgesics, ADULT over 18 years not currently treated with opioid analgesics, initially 10 mg/5 mg every 12 hours, increased according to response, patients already receiving opioid analgesics can start with a higher dose of Targinact®, max. Targinact® 40 mg/20 mg every 12 hours

Note Supplemental modified-release oxycodone (without naloxone) can be prescribed for patients who need higher doses—consult product literature

PAPAVERETUM

Important Do not confuse with papaverine (section 7.4.5)
A mixture of 253 parts of morphine hydrochloride, 23 parts of papaverine hydrochloride and 20 parts of codeine hydrochloride

Indications postoperative analgesia; severe chronic pain

Cautions see notes above; supraventricular tachycardia

price 1-mL amp = £1.60, 2-mL amp = £3.20; 50 mg/mL, 1-mL amp = £14.02

Note The Scottish Medicines Consortium (p. 4) has advised (October 2004 and November 2010) that OxyNorm® injection is restricted for use within NHS Scotland for patients with cancer who have difficulty in tolerating morphine or diamorphine

BNF 68

288

Central nervous system

to moderate impairment; avoid if eGFR less than 10 mL/minute/1.73m²; see also notes above
**Contra-indications** see notes above; heart failure secondary to chronic lung disease; phaeochromocytoma

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** therapeutic doses unlikely to affect infant

**Side-effects** see notes above; also abdominal pain,

**Breast-feeding** see notes above; also abdominal pain,

**Pregnancy** see notes above; also abdominal pain,

**Hepatic impairment** see notes above

**Contra-indications** see notes above; patients dependent on opioids (can precipitate withdrawal); heart failure secondary to chronic lung disease; acute porphyria (section 9.8.2)

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above; also diarrhea, constipation, nausea, vomiting, abdominal pain, fever, hypothermia; convulsions reported in overdose

**Side-effects** see notes above; also restlessness, tremor, and hypothermia; convulsions reported in overdose

**Dose**

- By subcutaneous, intramuscular, or intravenous injection, 7.7–15.4 mg repeated every 4 hours if necessary (ELDERLY initially 7.7 mg; CHILD up to 1 month 115 micrograms/kg, 1–12 months 154 micrograms/kg, 1–5 years 1.93–3.85 mg, 6–12 years, 3.85–7.7 mg

**Intravenous dose** In general the intravenous dose should be 25–50% of the corresponding subcutaneous or intramuscular dose

**Papaveretum (Non-proprietary)**

**Injection**, papaveretum 15.4 mg/mL (providing the equivalent of 10 mg of anhydrous morphine/mL), net price 1-mL amp = £4.90

**Note** The name Omnopon® was formerly used for papaveretum preparations

**With hyoscine** For prescribing information on hyoscine, see section 4.6.

**Papaveretum and Hyoscine Injection (Non-proprietary)**

**Injection**, papaveretum 15.4 mg (providing the equivalent of 10 mg of anhydrous morphine), hyoscine hydrobromide 400 micrograms/mL, net price 1-mL amp = £3.57

**Dose** premedication, by subcutaneous or intramuscular injection, 0.5–1 mL

---

**PENTAZOCINE**

**Indications** moderate to severe pain, but see notes above

**Cautions** see notes above; also pancreatitis, arterial or pulmonary hypertension, cardiac arrhythmias, myocardial infarction, phaeochromocytoma; effects only partially reversed by naloxone

**Contra-indications** see notes above; patients dependent on opioids (can precipitate withdrawal); heart failure secondary to chronic lung disease; acute porphyria (section 9.8.2)

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also abdominal pain, hypertension, syncope, seizures, paraesthesia, tremor, raised intracranial pressure, disorientation, hypothermia, chills, blood disorders, myalgia, and toxic epidermal necrolysis

**Dose**

- By mouth, pentazocine hydrochloride 50 mg every 3–4 hours preferably after food (range 25–100 mg); max. 600 mg daily; CHILD 6–12 years 25 mg

- By subcutaneous, intramuscular, or intravenous injection, moderate pain, pentazocine 30 mg, severe pain 45–60 mg every 3–4 hours when necessary; max. 360 mg daily; CHILD over 1 year, by subcutaneous or intramuscular injection, up to 1 mg/kg, by intravenous injection up to 500 micrograms/kg

**Pentazocine (Non-proprietary)**

**Capsules**, pentazocine hydrochloride 50 mg, net price 28-cap pack = £28.50. Label: 2, 21

**Tablets**, pentazocine hydrochloride 25 mg, net price 28-tab pack = £18.97. Label: 2, 21

**Injection**, pentazocine 30 mg (as lactate)/mL, net price 1-mL amp = £1.67; 2-mL amp = £3.21

---

**PETHIDINE HYDROCHLORIDE**

(Meperidine)

**Indications** moderate to severe pain, obstetric analgesia; peri-operative analgesia

**Cautions** see notes above; not suitable for severe continuing pain; accumulation of metabolites may result in neurotoxicity; cardiac arrhythmias, severe cor pulmonale

**Contra-indications** see notes above; phaeochromocytoma

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** present in milk but not known to be harmful

**Side-effects** see notes above; also restlessness, tremor, and hypothermia; convulsions reported in overdose

**Dose**

- Acute pain, by mouth, 50–150 mg every 4 hours; CHILD under 18 years not recommended

- By subcutaneous or intramuscular injection, 25–100 mg (ELDERLY or debilitated, initially 25 mg), repeated after 4 hours; CHILD under 18 years not recommended

- By slow intravenous injection, 25–50 mg (ELDERLY or debilitated, initially 25 mg), repeated after 4 hours; CHILD under 18 years not recommended

- Obstetric analgesia, by subcutaneous or intramuscular injection, 50–100 mg, repeated 1–3 hours later if necessary; max. 400 mg in 24 hours; CHILD 12–18 years see BNF for Children

- Premedication, by intramuscular injection, 25–100 mg 1 hour before operation (ELDERLY or debilitated, 25 mg); CHILD under 18 years not recommended

- Postoperative pain, by subcutaneous or intramuscular injection, 25–100 mg (ELDERLY or debilitated, initially 25 mg), every 2–3 hours if necessary; CHILD under 18 years not recommended

**Note** In the postoperative period, the patient should be closely monitored for pain relief as well as for side-effects especially respiratory depression

**Pethidine (Non-proprietary)**

**Tablets**, pethidine hydrochloride 50 mg, net price 50 = £48.39. Label: 2

**Injection**, pethidine hydrochloride 50 mg/mL, net price 1-mL amp = 47p, 2-mL amp = 45p; 10 mg/mL, 5-mL amp = £3.17, 10-mL amp = £2.18

**With promethazine** For prescribing information on promethazine hydrochloride, see section 3.4.1.
Pamergan P100® (Martindale) ▶
Injection, pethidine hydrochloride 50 mg, promethazine hydrochloride 25 mg/mL, net price 2-mL amp = £1.44
Dose by intramuscular injection, premedication, 2 mL 60–90 minutes before operation, CHILD 8–12 years 0.75 mL, 13–16 years 1 mL
Obstetric analgesia, 1–2 mL every 4 hours if necessary
Severe pain, 1–2 mL every 4–6 hours if necessary
Note Although usually given intramuscularly, may be given intravenously after dilution to at least 10 mL with water for injections

TAPENTADOL
Indications moderate to severe acute pain which can be managed only with opioid analgesics
Cautions see notes above
Contra-indications see notes above
Hepatic impairment see notes above; for immediate-release tablets, initial max. daily dose 150 mg; for modified-release tablets, initial max. daily dose 50 mg
Renal impairment manufacturer advises no dose adjustment needed in mild or moderate impairment, but avoid in severe impairment; see also notes above
Pregnancy see notes above
Breast-feeding avoid—no information available
Side-effects see notes above; also decreased appetite, diarrhoea, dyspepsia, abdominal discomfort, weight loss, anxiety, tremor, ataxia, dysarthria, hypoaesthesia, paraesthesia, seizures, malaise, muscle spasms
Dose...
ADULT over 18 years, by mouth, initially 50 mg every 4–6 hours (max. 700 mg in the first 24 hours), adjusted according to response; max. 600 mg daily
Note During the first 24 hours of treatment, an additional dose of 50 mg may be taken 1 hour after the initial dose if pain control not achieved

Palexia® (Gruenenthal) ▶
Tablets, f/c, tapentadol (as hydrochloride) 50 mg (white), net price 28-tab pack = £12.46, 56-tab pack = £24.91; 75 mg (yellow), 28-tab pack = £18.68, 56-tab pack = £37.37. Label: 2
Oral solution, tapentadol (as hydrochloride) 20 mg/mL, net price 100-mL pack = £17.80; 200-mL pack = £35.60. Label: 2
Excipients include propylene glycol (see Excipients, p. 2)

Modiﬁed release
Palexia® SR (Gruenenthal) ▶
Tablets, f/c, m/r, tapentadol (as hydrochloride) 50 mg (white), net price 28-tab pack = £12.46, 56-tab pack = £24.91; 100 mg (yellow), 56-tab pack = £49.62, 150 mg (pink), 56-tab pack = £74.73; 200 mg (orange), 56-tab pack = £99.64; 250 mg (red), 56-tab pack = £124.55. Label: 2, 25
Dose severe chronic pain, initially 50 mg every 12 hours, adjusted according to response; max. 500 mg daily

The Scottish Medicines Consortium p. 4 has advised (May 2011) that tapentadol (Palexia® SR) is accepted for restricted use within NHS Scotland for the management of severe chronic pain in adult patients, which can be adequately managed only with opioid analgesics, when morphine sulphate modified-release has failed to provide adequate pain control or is not tolerated

TRAMADOL HYDROCHLORIDE
Indications moderate to severe pain
Cautions see notes above; impaired consciousness; excessive bronchial secretions; not suitable as a substitute in opioid-dependent patients
General anaesthesia Not recommended for analgesia during potentially light planes of general anaesthesia (possibly increased intra-operative recall reported)
Contra-indications see notes above; uncontrolled epilepsy
Hepatic impairment see notes above
Renal impairment see notes above
Pregnancy embryotoxic in animal studies—manufacturers advise avoid; see also notes above
Breast-feeding amount probably too small to be harmful, but manufacturer advises avoid
Side-effects see notes above; also diarrhoea, retching, fatigue, paraesthesia; less commonly gastritis, and flatulence; rarely anorexia, syncope, hypertension, bronchospasm, dyspnoea, wheezing, seizures, and muscle weakness; blood disorders also reported
Dose...
ADULT and CHILD over 12 years, by mouth, 50–100 mg not more often than every 4 hours; total of more than 400 mg daily not usually required
ADULT and CHILD over 12 years, by intramuscular injection or by intravenous injection (over 2–3 minutes) or by intravenous infusion, 50–100 mg every 4–6 hours
Postoperative pain, 100 mg initially then 50 mg every 10–20 minutes if necessary during first hour to total max. 250 mg (including initial dose) in first hour, then 50–100 mg every 4–6 hours; max. 600 mg daily

Tramadol Hydrochloride (Non-proprietary) ▶
Capsules, tramadol hydrochloride 50 mg, net price 30-cap pack = 99p, 100-cap pack = £3.30. Label: 2
Brands include Zamadol®
Oral drops, tramadol hydrochloride 100 mg/mL (2.5 mg/drop), net price 10 mL = £3.50. Label: 2, 13
Orodispensible tablets, tramadol hydrochloride 50 mg, net price 60-tab pack = £7.12. Label: 2, counselling, administration
Counselling Tramadol hydrochloride orodispensible tablets should be sucked and then swallowed. May also be dispersed in water
Brands include Zamadol®
Injection, tramadol hydrochloride 50 mg/mL, net price 2-mL amp = 91p
Brands include Zamadol®

Zydol® (Gruenenthal) ▶
Capsules, yellow, tramadol hydrochloride 50 mg, net price 30-cap pack = £2.29, 100-cap pack = £7.63. Label: 2
Brands include Zeridame®, Zamadol®, Mabron®, Marol®

Modiﬁed-release 12-hourly preparations
Tramadol m/r preparations (Non-proprietary) ▶
Tablets, m/r, tramadol hydrochloride 100 mg, net price 60 = £17.21; 150 mg, 60 = £27.39; 200 mg, 60 = £36.52. Label: 2, 25
Brands include Mabron®, Marol®, Zeridame® SR

4.7.2 Opioid analgesics

290  BNF 68

Central nervous system

4
Neuropathic pain, which occurs as a result of damage to neural tissue, includes phantom limb pain, compression neuropathies, peripheral neuropathies (e.g. due to diabetes (section 6.1.5), chronic excessive alcohol intake, HIV infection, chemotherapy, idiopathic neuropathy), trauma, central pain (e.g. pain following stroke, spinal cord injury, and syringomyelia), and postherpetic neuralgia (peripheral nerve damage following acute herpes zoster infection (shingles)). The pain may occur in an area of sensory deficit and is sometimes accompanied by pain that is evoked by a non-noxious stimulus (allodynia).

Trigeminal neuralgia is also caused by dysfunction of neural tissue, but its management (see below) is distinct from other forms of neuropathic pain.

Neuropathic pain is generally managed with a tricyclic antidepressant or with certain antiepileptic drugs. Ami-triptiline (p. 250) [unlicensed indication] and pregabalin (p. 304) are effective treatments for neuropathic pain. Amitriptyline and pregabalin can be used in combination if the patient has an inadequate response to either drug at the maximum tolerated dose.

Neuropathic pain may respond to opioid analgesics. There is evidence of efficacy for tramadol (p. 290), morphine (p. 286), and oxycodone (p. 287); however, treatment with morphine or oxycodone should be initiated only under specialist supervision. Tramadol can be prescribed when other treatments have been unsuccessful, while the patient is waiting for assessment by a specialist.

Patients with localised pain who are unable to take oral medicines may benefit from topical local anaesthetic preparations, such as lidocaine medicated plasters (section 15.2), while awaiting specialist review.

Capsaicin (p. 738) is licensed for neuropathic pain (but the intense burning sensation during initial treatment may limit use). Capsaicin 0.075% cream is licensed for the symptomatic relief of postherpetic neuralgia. A self-adhesive patch containing capsaicin 8% is licensed for the treatment of peripheral neuropathic pain in non-diabetic patients. It should be used under specialist supervision.

A corticosteroid may help to relieve pressure in compression neuropathy and thereby reduce pain. Neuromodulation by spinal cord stimulation may be of benefit in some patients. Many patients with chronic neuropathic pain require multidisciplinary management, including physiotherapy and psychological support.

The management of trigeminal neuralgia and chronic facial pain are outlined below; for the management of neuropathic pain in palliative care, see p. 20; for the management of diabetic neuropathy, see section 6.1.5.

Trigeminal neuralgia
Surgery may be the treatment of choice in many patients; a neurosurgical assessment will identify those who stand to benefit. Carbamazepine (p. 300) taken during the acute stages of trigeminal neuralgia, reduces the frequency and severity of attacks. It is very effective for the severe pain associated with trigeminal neuralgia and (less commonly) glossopharyngeal neuralgia. Blood counts and electrolytes should be monitored when high doses are given. Small doses should be used initially to reduce the incidence of side-effects e.g. dizziness. Some cases respond to phenytoin (p. 309); the drug may be given by intravenous infusion (possibly as fosphenytoin) in a crisis (specialist use only).

Chronic facial pain
Chronic oral and facial pain including persistent idiopathic facial pain (also termed ‘atypical facial pain’) and temporomandibular dysfunction (previously termed temporomandibular joint pain dysfunction syndrome) may call for prolonged use of analgesics or for other drugs. Tricyclic antidepressants (section 4.3.1) may be useful for facial pain [unlicensed indication], but are not on the Dental Practitioners’ List. Disorders of this type require specialist referral and psychological support to accompany drug treatment. Patients on long-term therapy need to be monitored both for progress and for side-effects.

4.7.4 Antimigraine drugs

4.7.4.1 Treatment of acute migraine

Treatment of a migraine attack should be guided by response to previous treatment and the severity of the attacks. A simple analgesic such as aspirin, paracetamol (preferably in a soluble or dispersible form) or a NSAID is often effective; concomitant antiemetic treatment may be required. If treatment with an analgesic is inadequate, an attack may be treated with a specific antimigraine compound such as a 5HT1-receptor agonist ('triptan'). Ergot alkaloids are rarely required; oral preparations are associated with many side-effects and should be avoided in cerebrovascular or cardiovascular disease. Excessive use of acute treatments for migraine (opioid and non-opioid analgesics, 5HT1 receptor agonists, and ergotamine) is associated with medication-overuse headache (analgesic-induced headache); therefore, increasing consumption of these medicines needs careful management.

Analgesics

Most migraine headaches respond to analgesics such as aspirin (p. 275) or paracetamol (p. 276) but because peristalsis is often reduced during migraine attacks the medication may not be sufficiently well absorbed to be effective; dispersible or effervescent preparations are therefore preferred. Compound preparations containing analgesics and antiemetics are available (section 4.7.1).

The NSAID tolfenamic acid is licensed specifically for the treatment of an acute attack of migraine; diclofenac potassium, flurbiprofen, and ibuprofen (section 10.1.1) are also licensed for use in migraine.

TOLFENAMIC ACID

Indications treatment of acute migraine
Cautions see NSAIDs, section 10.1.1
Contra-indications see NSAIDs, section 10.1.1
Hepatic impairment section 10.1.1
Renal impairment section 10.1.1
Pregnancy section 10.1.1
Breast-feeding amount too small to be harmful
Side-effects see NSAIDs, section 10.1.1; also dysuria (most commonly in men), confusion, malaise, hallucination, paraesthesia, tremor, euphoria, fatigue, and visual disturbances reported

Dose

- ADULT over 18 years, 200 mg at onset repeated once after 1–2 hours if necessary
- Clotam Rapid (Galén) (Tab)
  Tablets, tolfenamic acid 200 mg, net price 10-tab pack = £12.75. Label: 21

5HT1-receptor agonists

A 5HT1-receptor agonist is of considerable value in the treatment of an acute migraine attack. The 5HT1-receptor agonists (‘triptans’) act on the 5HT (serotonin) 1B/1D receptors and they are sometimes referred to as 5HT1B/1D-receptor agonists. A 5HT1-receptor agonist may be used during the established headache phase of an attack and is the preferred treatment in those who fail to respond to conventional analgesics. The 5HT1-receptor agonists available for treating migraine are almotriptan, eletriptan, frovatriptan, naratriptan, rizatriptan, sumatriptan, and zolmitriptan. If a patient does not respond to one 5HT1-receptor agonist, an alternative 5HT1-receptor agonist should be tried. For patients who have prolonged attacks that frequently recur despite treatment with a 5HT1-receptor agonist, combination therapy with a NSAID such as naproxen can be considered. Sumatriptan or zolmitriptan are also used to treat cluster headache (section 4.7.4.3).

Cautions 5HT1-receptor agonists should be used with caution in the elderly [unlicensed], and in conditions which predispose to coronary artery disease (pre-existing cardiac disease, see Contra-indications below); interactions: Appendix 1 (5HT1 agonists).

Contra-indications 5HT1-receptor agonists are contra-indicated in ischaemic heart disease, previous myocardial infarction, coronary vasospasm (including Prinzmetal’s angina), and uncontrolled or severe hypertension. 5HT1-receptor agonists are not indicated for the treatment of hemiplegic, basilar, or ophthalmoplegic migraine.

Pregnancy There is limited experience of using 5HT1-receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.

Side-effects Side-effects of the 5HT1-receptor agonists include sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body (including throat and chest—discontinue if intense, may be due to coronary vasoconstriction or to anaphylaxis), flushing, dizziness, feeling of weakness; fatigue; nausea and vomiting also reported.

ALMOTRIPTAN

Indications treatment of acute migraine
Cautions see under 5HT1-receptor agonists above; sensitivity to sulfonamides; interactions: Appendix 1 (5HT1 agonists).

Contra-indications see under 5HT1-receptor agonists above; previous cerebrovascular accident or transient ischaemic attack; peripheral vascular disease

Hepatic impairment caution in mild to moderate impairment; avoid in severe impairment

Renal impairment max. 12.5 mg in 24 hours if eGFR less than 30 mL/minute/1.73 m²

Pregnancy see notes above

Breast-feeding present in milk in animal studies— withholding breast-feeding for 24 hours

Side-effects see under 5HT1-receptor agonists above; also transient increase in blood pressure, drowsiness; less commonly diarrhea, dyspepsia, dry mouth, chest pain, palpitation, paraesthesia, headache, myalgia, bone pain, tumits; very rarely myocardial infarction, and tachycardia; seizures also reported

Dose

- 12.5 mg as soon as possible after onset repeated after 2 hours if migraine recurs (patient not responding should not take second dose for same attack); max. 25 mg in 24 hours; CHILD and ADOLESCENT under 18 years not recommended
**ELIPTRAN**

**Indications** treatment of acute migraine

**Cautions** see under 5HT₁-receptor agonists above;
interactions: Appendix 1 (5HT₁ agonists)

**Contra-indications** see under 5HT₁-receptor agonists above; previous cerebrovascular accident or transient ischaemic attack; arrhythmias; heart failure; peripheral vascular disease

**Hepatic impairment** avoid in severe impairment

**Renal impairment** reduce initial dose to 20 mg; max. 40 mg in 24 hours; avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** see notes above

**Breast-feeding** present in milk—avoid breast-feeding for 24 hours

**Side-effects** see under 5HT₁-receptor agonists above; also abdominal pain, dry mouth, dyspepsia; tachycardia, palpitation; drowsiness, headache; pharyngitis, rhinitis, chills; myasthenia, myalgia; sweating; less commonly diarrhoea, glossitis, thirst, anorexia, taste disturbance; dyspnoea, yawning, oedema, agitation, confusion, euphoria, depression, insomnia, depersonalisation, tremor, dysrhythmia, stupor, movement disorders, hypotonia, urinary frequency, arthralgia, photophobia, visual disturbances, tinnitus, rash, and pruritus; rarely constipation, oesophagitis, bradycardia, asthma, syncope, lymphadenopathy, and menorrhagia; ischaemic colitis and hypertension also reported

**Dose**

- **ADULT**
  - over 18 years, 40 mg repeated after 2 hours if migraine recurs (patient not responding to initial dose should not take second dose for same attack); increase to 80 mg for subsequent attacks if 40-mg dose inadequate; max. 80 mg in 24 hours

- **RELAX**
  - Tablets, 1/2 c, orange, eletriptan (as hydrobromide) 20 mg, net price 6-tab pack = £22.50; 40 mg, 6-tab pack = £22.50. Label: 3

**FROVARIPTAN**

**Indications** treatment of acute migraine

**Cautions** see under 5HT₁-receptor agonists above;
interactions: Appendix 1 (5HT₁ agonists)

**Contra-indications** see under 5HT₁-receptor agonists above; previous cerebrovascular accident or transient ischaemic attack; peripheral vascular disease

**Hepatic impairment** avoid in severe impairment

**Pregnancy** see notes above

**Breast-feeding** present in milk in animal studies— withhold breast-feeding for 24 hours

**Side-effects** see under 5HT₁-receptor agonists above; also dry mouth, dyspepsia, abdominal pain, parasthesia, drowsiness, headache, visual disturbances, sweating; less commonly diarrhoea, dysphagia, flatulence, tachycardia, palpitation, hypertension, rhinitis, pharyngitis, sinusitis, laryngitis, tremor, anxiety, asthenia, insomnia, confusion, nervousness, impaired concentration, agitation, depression, depersonalisation, taste disturbances, micturition disorders, thirst, dehydration, arthralgia, muscle stiffness, tinnitus, vertigo, pruritus; rarely constipation, gastro-oesophageal reflux, irritable bowel syndrome, hiccup, peptic ulcer, stomatitis, bradycardia, hyperventilation, amnesia, abnormal dreams, hypotension, hypertension, breast tenderness, hypocalcaemia, hypoglycaemia, bilirubinemia, epistaxis, urticaria, pyrexia, and purpura

**Dose**

- 2.5 mg as soon as possible after onset repeated after 2 hours if migraine recurs (patient not responding should not take second dose for same attack); max. 5 mg in 24 hours; CHILD and ADOLESCENT under 18 years not recommended

**NARATRIPAN**

**Indications** treatment of acute migraine

**Cautions** see under 5HT₁-receptor agonists above; sensitivity to sulfonamides;
interactions: Appendix 1 (5HT₁ agonists)

**Contra-indications** see under 5HT₁-receptor agonists above; moderate hypertension; previous cerebrovascular accident or transient ischaemic attack; peripheral vascular disease

**Hepatic impairment** max. 2.5 mg in 24 hours in moderate impairment; avoid if severe

**Renal impairment** max. 2.5 mg in 24 hours; avoid if eGFR less than 15 mL/minute/1.73 m²

**Pregnancy** see notes above

**Breast-feeding** withhold breast-feeding for 24 hours

**Side-effects** see under 5HT₁-receptor agonists above; also less commonly bradycardia, tachycardia, palpitation, and visual disturbance; rarely ischaemic colitis, rash, and pruritus

**Dose**

- 2.5 mg, repeated after at least 4 hours if migraine recurs (patient not responding should not take second dose for same attack); max. 5 mg in 24 hours; CHILD and ADOLESCENT under 18 years not recommended

**Rizatriptan**

**Indications** treatment of acute migraine

**Cautions** see under 5HT₁-receptor agonists above;
interactions: Appendix 1 (5HT₁ agonists)

**Contra-indications** see under 5HT₁-receptor agonists above; previous cerebrovascular accident or transient ischaemic attack; peripheral vascular disease

**Hepatic impairment** reduce dose to 5 mg in mild to moderate impairment; avoid in severe impairment

**Renal impairment** reduce dose to 5 mg in mild to moderate impairment; avoid in severe impairment

**Pregnancy** see notes above

**Breast-feeding** present in milk in animal studies— withhold breast-feeding for 24 hours
Side-effects

see under 5HT1-receptor agonists above; also dry mouth, diarrhoea, drowsiness, palpitation, tachycardia, pharyngeal discomfort, dyspnoea, headache, paraesthesia, decreased alertness, tremor, sweating; less commonly dyspepsia, thirst, hypertension, arthralgia, insomnia, ataxia, nervousness, vertigo, confusion, taste disturbances, myalgia, muscle weakness, blurred vision, urticaria, pruritus; rarely syncope, bradyarrhythmia; also reported seizures, toxic epidermal necrolysis

Dose

• 10 mg as soon as possible after onset repeated after 2 hours if migraine recurs (patient not responding should not take second dose for same attack); max. 20 mg in 24 hours; CHILD under 18 years see notes above

Rizatriptan (Non-proprietary) 

Tablets, rizatriptan (as benzoate) 5 mg, net price 6-tab pack = £26.74; 10 mg, 3-tab pack = £5.79. Label: 3

Orodispersible tablets, rizatriptan (as benzoate) 10 mg, net price 3-tab pack = £8.12. Label: 3, counselling, administration

Counselling rizatriptan orodispersible tablets should be placed on the tongue, allowed to disperse and swallowed Excipients may include aspartame (section 9.4.1)

Maxalt® (MSD) 

Tablets, pink, rizatriptan (as benzoate) 5 mg, net price 6-tab pack = £26.74; 10 mg, 3-tab pack = £13.37, 6-tab pack = £26.74. Label: 3

Oral lyophilisates (Maxalt® Melt Wafers), rizatriptan (as benzoate) 10 mg, net price 3-wafer pack = £13.37, 6-wafer pack = £26.74. Label: 3, counselling, administration

Counselling Maxalt® Melt wafers should be placed on the tongue and allowed to dissolve Excipients include aspartame equivalent to phenylalanine 2.1 mg (section 9.4.1)

SUMATRIPTAN

Indications treatment of acute migraine; cluster headache

Cautions see under 5HT1-receptor agonists above; history of seizures; sensitivity to sulfonamides; interactions: Appendix 1 (5HT1 agonists)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving)

Contra-indications see under 5HT1-receptor agonists above; previous cerebrovascular accident or transient ischaemic attack, peripheral vascular disease; moderate and severe hypertension

Hepatic impairment reduce oral dose to 25–50 mg; avoid in severe impairment

Renal impairment use with caution

Pregnancy see notes above

Breast-feeding present in milk but amount probably too small to be harmful; withhold breast-feeding for 12 hours

Side-effects see under 5HT1-receptor agonists above; also dysphoria, drowsiness, transient increase in blood pressure, myalgia; also reported diarrhoea, ischaemic colitis, hyperglycaemia, bradycardia or tachycardia, palpitation, arthralgias, myocardial infarction, Raynaud’s syndrome, anxiety, seizures, tremor, dystonia, myasthenia, arthralgia, visual disturbances, and sweating; epistaxis with nasal spray

Dose

• By mouth, migraine, 50 mg (some patients may require 100 mg); dose may be repeated after at least 2 hours if migraine recurs; max. 300 mg in 24 hours; CHILD under 18 years see BNF for Children

• By subcutaneous injection cluster headache or migraine, using auto-injector, 6 mg; dose may be repeated once after at least 1 hour if headache recurs; max. 12 mg in 24 hours; CHILD 10–18 years see BNF for Children

Important Not for intravenous injection which may cause coronary vasospasm and angina

Intranasally, cluster headache [unlicensed] or migraine, 10–20 mg into one nostril; dose may be repeated once after at least 2 hours if headache recurs; max. 40 mg in 24 hours; CHILD 12–18 years see BNF for Children

Note Patient not responding to initial dose should not take second dose for same attack

Sumatriptan (Non-proprietary) 

Tablets, sumatriptan (as succinate) 50 mg, net price 6-tab pack = £1.41; 100 mg, 6-tab pack = £1.78. Label: 3, 10, patient information leaflet

Imigran® (GSK) 

Tablets, sumatriptan (as succinate) 50 mg, net price 6-tab pack = £26.54; 100 mg, 6-tab pack = £42.90. Label: 3, 10, patient information leaflet

Injection, sumatriptan (as succinate) 12 mg/mL (= 6 mg/0.5-mL syringe), net price, treatment pack (2 x 0.5-mL prefilled syringes and auto-injector) = £42.47; refill pack 2 x 0.5-mL prefilled cartridges = £40.41. Label: 3, 10, patient information leaflet

Nasal spray, sumatriptan 10 mg/0.1-mL actuation, net price 2 unit-dose spray device = £11.80; 20 mg/0.1-mL actuation, 2 unit-dose spray device = £11.80, 6 unit-dose spray device = £35.39. Label: 3, 10, patient information leaflet

Imigran® Radis (GSK) 

Tablets, 17 c, sumatriptan (as succinate) 50 mg (pink), net price 6-tab pack = £23.90; 100 mg (white), 6-tab pack = £42.90. Label: 3, 10, patient information leaflet

ZOLMİTRİPTAN

Indications treatment of acute migraine; cluster headache (nasal route only) [unlicensed use]

Cautions see under 5HT1-receptor agonists above; should not be taken within 24 hours of any other 5HT1-receptor agonist; interactions: Appendix 1 (5HT1 agonists)

Contra-indications see under 5HT1-receptor agonists above; Wolff-Parkinson-White syndrome or arrhythmias associated with accessory cardiac conduction pathways; previous cerebrovascular accident or transient ischaemic attack

Hepatic impairment max. 5 mg in 24 hours in moderate or severe impairment

Pregnancy see notes above

Breast-feeding use with caution—present in milk in animal studies

Side-effects see under 5HT1-receptor agonists above; also abdominal pain, dry mouth, palpitation, dysphagia, drowsiness, paraesthesia, headache, myalgia, muscle weakness; less commonly tachycardia, transient increase in blood pressure, polyuria; rarely urticaria; very rarely gastro-intestinal and splenic infarction, ischaemic colitis, angina, myocardial infarction; with nasal spray, taste disturbance, and epistaxis
Dose
- By mouth, migraine, ADULT over 18 years, 2.5 mg repeated after not less than 2 hours if migraine recurs (increase to 5 mg for subsequent attacks in patients not achieving satisfactory relief with 2.5 mg dose); max. 10 mg in 24 hours; CHILD 12–18 years see BNF for Children
- Intranasally, cluster headache [unlicensed] or migraine, ADULT over 18 years, 5 mg (1 spray) into one nostril as soon as possible after onset, repeated after not less than 2 hours if headache recurs; max. 10 mg in 24 hours; CHILD 12–18 years see BNF for Children

Note: Max. 5 mg in 24 hours with concomitant cimetidine, fluoxetine, modafinil, or quinolone antibiotics

Zolmitriptan (Non-proprietary) DM
Tablets, zolmitriptan 2.5 mg, net price 6-tab pack = £1.21
Orodispersible tablets, zolmitriptan 2.5 mg, net price 6-tab pack = £1.33; 5 mg, 6-tab pack = £10.58. Counselling, administration
Counselling Zolmitriptan orodispersible tablets should be placed on the tongue, allowed to disperse and swallowed
Zomig® (AstraZeneca) PM
Tablets, f/c, yellow, zolmitriptan 2.5 mg, net price 6-tab pack = £23.94
Orodispersible tablets (Zomig Rapimelt®), zolmitriptan 2.5 mg, net price 6-tab pack = £23.99; 5 mg, 6-tab pack = £23.94. Counselling, administration
Counselling Zomig Rapimelt® should be placed on the tongue, allowed to disperse and swallowed
Excipients include aspartame equivalent to phenylalanine 2.81 mg/tablet (section 9.4.1)
Nasal spray, zolmitriptan 5 mg/0.1-mL unit-dose spray device, net price 6 unit-dose sprays = £36.50

Ergot alkaloids
The value of ergotamine for migraine is limited by difficulties in absorption and by its side-effects, particularly nausea, vomiting, abdominal pain, and muscular cramps; it is best avoided. The recommended doses of ergotamine preparations should not be exceeded and treatment should not be repeated at intervals of less than 4 days. To avoid habituation the frequency of administration of ergotamine should be limited to no more than twice a month. It should never be prescribed prophylactically but in the management of cluster headache a low dose (e.g. ergotamine 1 mg at night for 6 nights in 7) is occasionally given for 1 to 2 weeks [unlicensed indication].

Ergotamine Tartrate

Indications treatment of acute migraine and migraine variants unresponsive to analgesics
Cautions risk of peripheral vasospasm (see below); elderly; dependence (see Ergot Alkaloids above); cardiac disease; anaemia; interactions: Appendix 1 (ergot alkaloids)
Peripheral vasospasm Warn patient to stop treatment immediately if numbness or tingling of extremities develops and to contact doctor
Contra-indications peripheral vascular disease, coronary heart disease, obliterator vascular disease and Raynaud’s syndrome, temporal arteritis, sepsis, severe or inadequately controlled hypertension, hyperthyroidism, acute porphyria (section 9.8.2)
Hepatic impairment avoid in severe impairment—risk of toxicity increased

Renal impairment avoid; risk of renal vasoconstriction
Pregnancy avoid; oxytocic effect on the uterus
Breast-feeding avoid; ergotism may occur in infant; repeated doses may inhibit lactation

Side-effects abdominal pain, nausea, vomiting; dizziness; less commonly diarrhoea, pain and weakness in extremities, cyanosis, peripheral vasoconstriction, paraesthesia, and hypoesthesia; rarely intestinal ischaemia, arrhythmias, increased blood pressure, bradycardia, tachycardia, dyspnoea, ergotism (including absence of pulse and numbness in extremities), myalgia, rash, and urticaria; very rarely myocardial ischaemia, myocardial infarction, heart-valve fibrosis, and gangrene; constipation, dry mouth, cerebral ischaemia, thrombosis, drowsiness, sleep disturbances, tremor, seizures, extrapyramidal effects, anxiety, depression, confusion, hallucinations, renal artery spasm, urinary retention, blood disorders, blurred vision, and arthralgia also reported

4.7.4.2 Prophylaxis of migraine

Where migraine attacks are frequent, possible provoking factors such as stress, irregular life-style (e.g. lack of sleep), or chemical triggers (e.g. alcohol and nitrates) should be sought; combined oral contraceptives may also provoke migraine, see section 7.3.1 for advice.
Preventive treatment for migraine should be considered for patients who:
- suffer at least two attacks a month;
- suffer an increasing frequency of headaches;
- suffer significant disability despite suitable treatment for migraine attacks;
- cannot take suitable treatment for migraine attacks.
Prophylaxis is also necessary in some rare migraine subtypes and those at risk of migraineous infarction. The beta-blockers propranolol, atenolol, metoprolol, nadolol, and timolol (section 2.4) are all effective. Propranolol is the most commonly used.
Tricyclic antidepressants (section 4.3.1) [unlicensed indication], topiramate (section 4.8.1), sodium valproate (section 4.8.1) [unlicensed indication], valproic acid (section 4.2.3) [unlicensed indication], and gabapentin (section 4.8.1) [unlicensed indication] are also effective for preventing migraine.

Pizotifen is an antihistamine and a serotonin-receptor antagonist, structurally related to the tricyclic antidepressants. It is of limited value and may cause weight gain.

Botulinum toxin type A, (p. 332) is licensed for the prophylaxis of headaches in adults with chronic migraine.

**NICE guidance**

Botulinum toxin type A for the prevention of headaches in adults with chronic migraine (June 2012)

Botulinum toxin type A is recommended as an option for the prophylaxis of headaches in adults with chronic migraine, (defined as headaches on at least 15 days per month, of which at least 8 days are with migraine), that has not responded to at least three prior pharmacological prophylaxis therapies and whose condition is appropriately managed for medication overuse. www.nice.org.uk/TA260

**PIZOTIFEN**

**Indications** prevention of vascular headache including classical migraine, common migraine, and cluster headache

**Cautions** urinary retention; susceptibility to angle-closure glaucoma; history of epilepsy; avoid abrupt withdrawal; interactions: Appendix 1 (pizotifen)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Hepatic impairment** use with caution

**Renal impairment** use with caution

**Pregnancy** avoid unless potential benefit outweighs risk

**Breast-feeding** avoid

**Side-effects** constipation, dry mouth, nausea, vomiting; postural hypotension; depression, sleep disorder, dizziness, headache, drowsiness; erectile dysfunction; less commonly Raynaud’s syndrome, paraesthesia, hallucination, rash, and pruritis; rarely AV block, gynaecomastia, and alopecia

**Dose**

- **ADULT** over 18 years, 50 micrograms twice daily, increased after 2 weeks to 75 micrograms twice daily if necessary

Clonidine (Non-proprietary) Tablets, clonidine hydrochloride 25 micrograms, net price 112-tab pack = £9.53

Dixarit® (Boehringer Ingelheim) Tablets, blue, s/c, clonidine hydrochloride 25 micrograms, net price 112-tab pack = £6.99

**Catapres®** (Boehringer Ingelheim) Section 2.5.2 (hypertension)

**4.7.4.3 Cluster headache and the trigeminal autonomic cephalalgias**

Cluster headache rarely responds to standard analgesics. Sumatriptan (p. 294) given by subcutaneous injection is the drug of choice for the treatment of cluster headache. If an injection is unsuitable, sumatriptan nasal spray or zolmitriptan nasal spray [both unlicensed use] may be used. Alternatively, 100% oxygen at a rate of 10–15 litres/minute for 10–20 minutes is useful in aborting an attack.

Prophylaxis of cluster headache is considered if the attacks are frequent, last over 3 weeks, or if they cannot be treated effectively. Verapamil (p. 137) or lithium [both unlicensed use] are used for prophylaxis.

Prednisolone (section 6.3.2) can be used for short-term prophylaxis of episodic cluster headache [unlicensed use] either as monotherapy, or in combination with verapamil during verapamil titration. The dose of prednisolone for monotherapy or adjunctive therapy is 60–100 mg once daily for 2–5 days followed by a dose reduction of 10 mg every 2–3 days until prednisolone is discontinued.
The dosage frequency is often determined by the plasma-drug half-life, and should be kept as low as possible to encourage adherence with the prescribed regimen. Most antiepileptics, when used in the usual dosage, can be given twice daily. Lamotrigine, perampanel, and phenytoin, which have long plasma-drug half-lives, can be given once daily at bedtime. However, with large doses, some antiepileptics may need to be given more frequently to avoid adverse effects associated with high peak plasma-drug concentration. Young children metabolise some antiepileptics more rapidly than adults and therefore may require more significant adverse effects.

When choosing an antiepileptic drug, the presenting epilepsy syndrome should first be considered. If the syndrome is not clear, the seizure type should determine the choice of treatment. Concomitant medication, co-morbidity, age, and sex should also be taken into account. For women of child-bearing age, see Pregnancy, p. 299 and Breast-feeding, p. 299.

The object of treatment is to prevent the occurrence of seizures by maintaining an effective dose of one or more antiepileptic drugs. Careful adjustment of doses is necessary, starting with low doses and increasing gradually until seizures are controlled or there are significant adverse effects.

Management  When monotherapy with a first-line antiepileptic drug has failed, monotherapy with a second drug should be tried; the diagnosis should be checked before starting an alternative drug if the first drug showed lack of efficacy. The change from one antiepileptic drug to another should be cautious, slowly withdrawing the first drug only when the new regimen has been established. Combination therapy with two or more antiepileptic drugs may be necessary, but the concurrent use of antiepileptic drugs increases the risk of adverse effects and drug interactions (see below). If combination therapy does not bring about worthwhile benefits, revert to the regimen (monotherapy or combination therapy) that provided the best balance between tolerability and efficacy. A single antiepileptic drug should be prescribed wherever possible.

MHRA/CHM advice  Antiepileptic drugs: new advice on switching between different manufacturers’ products for a particular drug (November 2013)  The CHM has reviewed spontaneous adverse reactions received by the MHRA and publications that reported potential harm arising from switching of antiepileptic drugs in patients previously stabilised on a branded product to a generic. The CHM concluded that reports of loss of seizure control and/or worsening of side-effects around the time of switching between products could be explained as chance associations, but that a causal role of switching could not be ruled out in all cases. The following guidance has been issued to help minimise risk:

- Different antiepileptic drugs vary considerably in their characteristics, which influences the risk of whether switching between different manufacturers’ products of a particular drug may cause adverse effects or loss of seizure control;
- Antiepileptic drugs have been divided into three risk-based categories to help healthcare professionals decide whether it is necessary to maintain continuity of supply of a specific manufacturer’s product. These categories are listed below;
- If it is felt desirable for a patient to be maintained on a specific manufacturer’s product this should be prescribed either by specifying a brand name, or by using the generic drug name and name of the manufacturer (otherwise known as the Marketing Authorisation Holder);
- This advice relates only to antiepileptic drug use for treatment of epilepsy; it does not apply to their use in other indications (e.g. mood stabilisation, neuropathic pain);
- Please report on a Yellow Card any suspected adverse reactions to antiepileptic drugs (see Yellow Card Scheme, p. 12);
- Dispensing pharmacists should ensure the continuity of supply of a particular product when the prescription specifies it. If the prescribed product is unavailable, it may be necessary to dispense a product from a different manufacturer to maintain continuity of treatment of that antiepileptic drug. Such cases should be discussed and agreed with both the prescriber and patient (or carer);
- Usual dispensing practice can be followed when a specific product is not stated.

Category 1  Phenytoin, carbamazepine, phenobarbital, primidone. For these drugs, doctors are advised to ensure that their patient is maintained on a specific manufacturer’s product

Category 2  Valproate, lamotrigine, perampanel, retigabine, rufinamide, clobazam, clonazepam, ocarbazepine, eslicarbazepine, zonisamide, topiramate. For these drugs, doctors are advised to ensure that their patient is maintained on a specific manufacturer’s product

Category 3  Levetiracetam, lacosamide, tiagabine, gabapentin, pregabalin, ethosuximide, vigabatrin. For these drugs, it is usually unnecessary to ensure that patients are maintained on a specific manufacturer’s product unless there are specific concerns such as patient anxiety, and risk of confusion or dosing errors.

Ergotamine, used on an intermittent basis is an alternative for patients with short bouts, but it should not be used for prolonged periods.

The other trigeminal autonomic cephalalgias, paroxysmal hemicrania (sensitive to indometacin), and short-lasting unilateral neuralgiform headache attacks with conjunctival injection and tearing, are seen rarely and are best managed by a specialist.
Interactions  Interactions between antiepileptics are complex and may increase toxicity without a corresponding increase in antiepileptic effect. Interactions are usually caused by hepatic enzyme induction or inhibition; displacement from protein binding sites is not usually a problem. These interactions are highly variable and unpredictable.

For interactions of antiepileptic drugs, see Appendix 1; for advice on hormonal contraception and enzyme-inducing drugs, see section 7.3.1 and section 7.3.2.

Significant interactions that occur between antiepileptics and that may affect dosing requirements are as follows:

Note  Check under each drug for possible interactions when two or more antiepileptic drugs are used

Carbamazepine  
- *often lowers* plasma concentration of clobazam, clonazepam, lamotrigine, perampanel, phenytoin (but may also raise plasma-phenytoin concentration), tiagabine, topiramate, valproate, zonisamide, and an active metabolite of oxcarbazepine  
- *sometimes lowers* plasma concentration of eslicarbazepine, ethosuximide, primidone (but tendency for corresponding increase in phenobarbital level), retigabine, and rufinamide  
- *sometimes raises* plasma concentration of phenobarbital and primidone-derived phenobarbital

Eslicarbazepine  
- *often raises* plasma concentration of phenytoin

Ethosuximide  
- *sometimes raises* plasma concentration of phenytoin

Lamotrigine  
- *sometimes raises* plasma concentration of an active metabolite of carbamazepine (but evidence is conflicting)

Oxcarbazepine  
- *often lowers* plasma concentration of perampanel  
- *sometimes lowers* plasma concentration of carbamazepine (but may raise plasma concentration of an active metabolite of oxcarbazepine)  
- *sometimes raises* plasma concentration of phenytoin  
- *often raises* plasma concentration of phenobarbital and primidone-derived phenobarbital

Phenobarbital or primidone  
- *often lowers* plasma concentration of clonazepam, lamotrigine, phenytoin (but may also raise plasma-phenytoin concentration), tiagabine, valproate, zonisamide, and an active metabolite of oxcarbazepine  
- *sometimes lowers* plasma concentration of ethosuximide, rufinamide, and topiramate

Phenytoin  
- *often lowers* plasma concentration of clonazepam, carbamazepine, eslicarbazepine, lamotrigine, perampanel, tiagabine, topiramate, valproate, zonisamide, and an active metabolite of oxcarbazepine  
- *often raises* plasma concentration of phenobarbital and primidone-derived phenobarbital  
- *sometimes lowers* plasma concentration of ethosuximide, primidone (by increasing conversion to phenobarbital), retigabine, and rufinamide

Rufinamide  
- *sometimes lowers* plasma concentration of carbamazepine  
- *sometimes raises* plasma concentration of phenytoin

Topiramate  
- *often lowers* plasma concentration of perampanel  
- *sometimes raises* plasma concentration of phenytoin

Valproate  
- *sometimes lowers* plasma concentration of an active metabolite of oxcarbazepine  
- *often raises* plasma concentration of lamotrigine, phenobarbital, primidone-derived phenobarbital, phenytoin (but may also lower), and an active metabolite of carbamazepine  
- *sometimes raises* plasma concentration of ethosuximide and rufinamide

Vigabatrin  
- *often lowers* plasma concentration of phenytoin

Withdrawal  Antiepileptic drugs should be withdrawn under specialist supervision. Avoid abrupt withdrawal, particularly of barbiturates and benzodiazepines, because this can precipitate severe rebound seizures. Reduction in dosage should be gradual and, in the case of barbiturates, withdrawal of the drug may take months.

The decision to withdraw antiepileptic drugs from a seizure-free patient, and its timing, is often difficult and depends on individual circumstances. Even in patients who have been seizure-free for several years, there is a significant risk of seizure recurrence on drug withdrawal.

In patients receiving several antiepileptic drugs, only one drug should be withdrawn at a time.

Antiepileptic hypersensitivity syndrome  Anti-epileptic hypersensitivity syndrome is a rare but potentially fatal syndrome associated with some antiepileptic drugs (carbamazepine, lacosamide, lamotrigine, oxcarbazepine, phenobarbital, phenytoin, primidone, and rufinamide); rarely cross-sensitivity occurs between some of these antiepileptic drugs. Some other antiepileptics (eslicarbazepine, stiripentol, and zonisamide) have a theoretical risk. The symptoms usually start between 1 and 8 weeks of exposure; fever, rash, and lymphadenopathy are most commonly seen. Other systemic signs include liver dysfunction, haematological, renal, and pulmonary abnormalities, vasculitis, and multi-organ failure. If signs or symptoms of hypersensitivity syndrome occur, the drug should be withdrawn immediately, the patient must not be re-exposed, and expert advice should be sought.

Driving  Patients with epilepsy may drive a motor vehicle (but not a large goods or passenger carrying vehicle) provided that they have been seizure-free for one year or, if subject to attacks only while asleep, have established a 3-year period of asleep attacks without awake attacks. Those affected by drowsiness should not drive or operate machinery.

Guidance issued by the Drivers Medical Unit of the Driver and Vehicle Licensing Agency (DVLA) recommends that patients should be advised not to drive during medication changes or withdrawal of antiepileptic drugs, and for 6 months afterwards (see also Drugs and Driving under General Guidance, p. 3).
Patients who have had a first or single epileptic seizure must not drive for 6 months (5 years in the case of large goods or passenger carrying vehicles) after the event; driving may then be resumed, provided the patient has been assessed by a specialist as fit to drive because no abnormality was detected on investigation.

**Pregnancy**  Women of child-bearing potential should discuss with a specialist the impact of both epilepsy, and its treatment, on the outcome of pregnancy. There is an increased risk of teratogenicity associated with the use of antiepileptic drugs (especially if used during the first trimester and particularly if the patient takes two or more antiepileptic drugs). Valproate is associated with the highest risk of major and minor congenital malformations (in particular neural tube defects), and long-term neurodevelopmental effects. Valproate should not be used during pregnancy or in women of child-bearing potential unless there is no safer alternative and only after a careful discussion of the risks. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses or as modified-release tablets to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy. There is also an increased risk of teratogenicity with phenytoin, primidone, phenobarbital, lamotrigine, and carbamazepine. Topiramate carries an increased risk of cleft palate if taken in the first trimester of pregnancy. There is not enough evidence to establish the risk of teratogenicity with other antiepileptic drugs.

Prescribers should also consider carefully the choice of antiepileptic therapy in pre-pubescent girls who may later become pregnant.

Women of child-bearing potential who take antiepileptic drugs should be given contraceptive advice. Some antiepileptic drugs can reduce the efficacy of hormonal contraceptives, and the efficacy of some antiepileptics may be affected by hormonal contraceptives (see section 7.3.1 and interactions of antiepileptics, Appendix 1).

Women who want to become pregnant should be referred to a specialist for advice in advance of conception. For some women, the severity of seizure or the seizure type may not pose a serious threat, and drug withdrawal may be considered; therapy may be resumed after the first trimester. If treatment with antiepileptic drugs must continue throughout pregnancy, then monotherapy is preferable at the lowest effective dose.

Once an unplanned pregnancy is discovered it is usually too late for changes to be made to the treatment regimen; the risk of harm to the mother and fetus from convulsive seizures outweighs the risk of continued therapy. The likelihood of a woman who is taking antiepileptic drugs having a baby with no malformations is at least 90%, and it is important that women do not stop taking essential treatment because of concern over harm to the fetus.

To reduce the risk of neural tube defects, folate supplementation (section 9.1.2) is advised before conception and throughout the first trimester.

The concentration of antiepileptic drugs in the plasma can change during pregnancy. Doses of phenytoin (see p. 309), carbamazepine, and lamotrigine should be adjusted on the basis of plasma-drug concentration monitoring; the dose of other antiepileptic drugs should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis. Plasma-drug concentration monitoring during pregnancy is also useful to check compliance. Additionally, in patients taking topiramate or levetiracetam, it is recommended that fetal growth should be monitored.

Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol, see section 4.8.2.

Routine injection of vitamin K (section 9.6.6) at birth minimises the risk of neonatal haemorrhage associated with antiepileptics.

Withdrawal effects in the newborn may occur with some antiepileptic drugs, in particular benzodiazepines and phenobarbital.

### Epilepsy and Pregnancy Register
All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).

#### Breast-feeding
Women taking antiepileptic monotherapy should generally be encouraged to breast-feed; if a woman is on combination therapy or if there are other risk factors, such as premature birth, specialist advice should be sought.

All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones. Infants should also be monitored for adverse effects associated with the antiepileptic drug particularly with newer antiepileptics, if the antiepileptic is readily transferred into breast-milk causing high infant serum-drug concentrations (e.g. ethosuximide, lamotrigine, primidone, and zonisamide), or if slower metabolism in the infant causes drugs to accumulate (e.g. phenobarbital and lamotrigine). Serum-drug concentration monitoring should be undertaken in breast-fed infants if suspected adverse reactions develop; if toxicity develops it may be necessary to introduce formula feeds to limit the infant’s drug exposure, or to wean the infant off breast-milk altogether.

Primidone, phenobarbital, and the benzodiazepines are associated with an established risk of drowsiness in breast-fed babies and caution is required.

Withdrawal effects may occur in infants if a mother suddenly stops breast-feeding, particularly if she is taking phenobarbital, primidone, or lamotrigine.

### Focal seizures with or without secondary generalisation
Carbamazepine and lamotrigine are first-line options for treating newly diagnosed focal seizures; oxcarbazepine, sodium valproate and levetiracetam may be used if carbamazepine or lamotrigine are unsuitable or not tolerated. If monotherapy is unsuccessful with two of these first-line antiepileptic drugs, adjunctive treatment may be considered. Options for adjunctive treatment include carbamazepine, clobazam, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, sodium valproate, or topiramate. If adjunctive treatment is ineffective or not tolerated, a tertiary epilepsy specialist should
be consulted who may consider eslicarbazepine, lacosamide, phenobarbital, phenytoin, pregabalin, tiagabine, vigabatrin and zonisamide.

Generalised seizures

Tonic-clonic seizures  Sodium valproate is the first-line treatment for newly diagnosed generalised tonic-clonic seizures. Lamotrigine is the alternative choice if sodium valproate is not suitable, but may exacerbate myoclonic seizures. Carbamazepine and oxcarbazepine may also be considered in newly diagnosed and established tonic-clonic seizures, but may exacerbate myoclonic and absence seizures. Clobazam, lamotrigine, levetiracetam, sodium valproate or topiramate may be used as adjunctive treatment if monotherapy is ineffective or not tolerated.

Absence seizures  Ethosuximide or sodium valproate are the drugs of choice in absence seizures and syndromes; lamotrigine is a suitable alternative when ethosuximide and sodium valproate are unsuitable, ineffective or not tolerated. Sodium valproate should be used as the first choice if there is a high risk of generalised tonic-clonic seizures. A combination of any two of these drugs may be used if monotherapy is ineffective. Clobazam, clonazepam, levetiracetam, topiramate or zonisamide may be considered by a tertiary epilepsy specialist if adjunctive treatment fails. carbamazepine, gabapentin, oxcarbazepine, phenytoin, pregabalin, tiagabine and vigabatrin are not recommended in absence seizures or syndromes.

Myoclonic seizures  Myoclonic seizures (myoclonic jerks) occur in a variety of syndromes, and response to treatment varies considerably. Sodium valproate is the drug of choice in newly diagnosed myoclonic seizures; topiramate and levetiracetam are alternative options if sodium valproate is unsuitable but consideration should be given to the less favourable side-effect profile of topiramate. A combination of two of these drugs may be used if monotherapy is ineffective or not tolerated. If adjunctive treatment fails, a tertiary epilepsy specialist should be consulted and may consider clobazam, clonazepam, zonisamide or piracetam. For reference to the adjunctive use of piracetam, see section 4.9.3. Carbamazepine, gabapentin, oxcarbazepine, phenytoin, pregabalin, tiagabine and vigabatrin are not recommended for the treatment of myoclonic seizures. Sodium valproate and levetiracetam are effective in treating the generalised tonic-clonic seizures that co-exist with myoclonic seizures in idiopathic generalised epilepsy.

Atonic and tonic seizures  Atonic and tonic seizures are usually seen in childhood, in specific epilepsy syndromes, or associated with cerebral damage or mental retardation. They may respond poorly to the traditional drugs. Sodium valproate is the drug of choice; lamotrigine can be added as adjunctive treatment. If adjunctive treatment is ineffective or not tolerated, a tertiary epilepsy specialist should be consulted, and may consider rufinamide or topiramate. Carbamazepine, gabapentin, oxcarbazepine, pregabalin, tiagabine or vigabatrin are not recommended in atonic and tonic seizures.

Epilepsy syndromes

Some drugs are licensed for use in particular epilepsy syndromes, such as lamotrigine and rufinamide in Lennox-Gastaut syndrome. The epilepsy syndromes are specific types of epilepsy that are characterised according to a number of features including seizure type, age of onset, and EEG characteristics.

For more information on epilepsy syndromes in children, see BNF for Children, section 4.8.1. Prescribing information for stiripentol (Diozero®) in severe myoclonic epilepsy of infancy (Dravet syndrome) can also be found in BNF for Children.

Carbamazepine and related antiepileptics

Carbamazepine is a drug of choice for simple and complex focal seizures and is a first-line treatment option for generalised tonic-clonic seizures. It can be used as adjunctive treatment for focal seizures when monotherapy has been ineffective. It is essential to initiate carbamazepine therapy at a low dose and build this up slowly with increments of 100–200 mg every two weeks. Some side-effects (such as headache, ataxia, drowsiness, nausea, vomiting, blurring of vision, dizziness, unsteadiness, and allergic skin reactions) are dose-related, and may be dose-limiting. These side-effects are more common at the start of treatment and in the elderly. Patients should be offered a modified-release preparation to reduce the risk of side-effects; altering the timing of medication may also be beneficial. Carbamazepine may exacerbate tonic, atomic, myoclonic and absence seizures and is therefore not recommended if these seizures are present.

Oxcarbazepine is licensed as monotherapy or adjunctive therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures. It can also be considered for the treatment of primary generalised tonic-clonic seizures [unlicensed]. Oxcarbazepine is not recommended in tonic, atomic, absence or myoclonic seizures due to the risk of seizure exacerbation.

Eslicarbazepine is licensed for adjunctive treatment in adults with focal seizures with or without secondary generalisation. The Scottish Medicines Consortium (p. 4) has advised (October 2010) that eslicarbazepine (Zebinix®) is accepted for restricted use within NHS Scotland as adjunctive therapy in adults with focal seizures with or without secondary generalisation. It is restricted for use in refractory epilepsy.
Control of the epilepsies

Dose
- Epilepsy, by mouth, initially 100–200 mg 1–2 times daily, increased slowly (see notes above) to usual dose of 0.8–1.2 g daily in divided doses; in some cases 1.6–2 g daily in divided doses may be needed; ELDERLY reduce initial dose; CHILD daily in divided doses, up to 1 year 100–200 mg, 1–5 years 200–400 mg, 5–10 years 400–600 mg, 10–15 years 0.6–1 g
- By rectum, for short-term use (max. 7 days) when oral therapy temporarily not possible; 125-mg suppository approx. equivalent to 100-mg tablet, but final adjustment should always depend on clinical response (plasma concentration monitoring recommended); max. 1 g daily in 4 divided doses
- Trigeminal neuralgia, by mouth, initially 100 mg 1–2 times daily (but some patients may require higher initial dose), increased gradually according to response; usual dose 200 mg 3–4 times daily, up to 1.6 g daily in some patients
- Prophylaxis of bipolar disorder unresponsive to lithium (see also section 4.2.3), by mouth, initially 400 mg daily in divided doses increased until symptoms controlled; usual range 400–600 mg daily, max. 1.6 g daily
- Treatment of alcohol withdrawal [unlicensed indication], by mouth, initially 800 mg daily in divided doses, reduced gradually over 5 days to 200 mg daily; usual treatment duration 7–10 days
- Diabetic neuropathy [unlicensed indication], by mouth, initially 100 mg 1–2 times daily, increased gradually according to response; usual dose 200 mg 3–4 times daily, up to 1.6 g daily in some patients

Note Plasma concentration for optimum response 4–12 mg/litre (20–50 micromol/litre)

Carbamazepine (Non-proprietary)

Tablets, carbamazepine 100 mg, net price 28 = £6.27; 200 mg, 28 = £5.01; 400 mg, 28 = £2.51.
Label: 3, 8, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Note Patients being treated for epilepsy should be maintained on a specific manufacturer’s branded or generic oral carbamazepine product. See also MHRA/CHM advice, p. 297

Dental prescribing on NHS Carbamazepine Tablets may be prescribed

Tegretol® (Novartis)

Tablets, scored, carbamazepine 100 mg, net price 84-tab pack = £2.07, 200 mg, 84-tab pack = £3.83; 400 mg, 56-tab pack = £5.02. Label: 3, 8, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Note Patients being treated for epilepsy should be maintained on a specific manufacturer’s branded or generic oral carbamazepine product. See also MHRA/CHM advice, p. 297

Liquid, sugar-free, carbamazepine 100 mg/5 mL. Net price 300-mL pack = £8.12. Label: 3, 8, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Suppositories, carbamazepine 125 mg, net price 5 = £8.03; 250 mg, 5 = £10.71. Label: 3, 8, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Note Patients being treated for epilepsy should be maintained on a specific manufacturer’s branded or generic oral carbamazepine product. See also MHRA/CHM advice, p. 297
Central nervous system

4.8.1 Control of the epilepsies

Modified release

Carbagen® SR (Generics) Tablets, m/r, fi/c, scored, carbamazepine 200 mg, net price 56-tab pack = £4.16; 400 mg, 56-tab pack = £8.20. Label: 3, 8, 25, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Dose epilepsy, ADULT and CHILD over 5 years, as above; trigeminal neuralgia, as above; bipolar disorder, as above; total daily dose given in 2 divided doses

Note Patients being treated for epilepsy should be maintained on a specific manufacturer’s branded or generic oral carbamazepine product. See also MHRA/CHM advice, p. 297

Tegretol® Prolonged Release (Novartis) Tablets, m/r, scored, carbamazepine 200 mg (beige-orange), net price 56-tab pack = £5.20; 400 mg (brown-orange), 56-tab pack = £10.24. Label: 3, 8, 25, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Dose epilepsy, ADULT and CHILD over 5 years, as above; trigeminal neuralgia, as above; bipolar disorder, as above; total daily dose given in 2 divided doses

Note Patients being treated for epilepsy should be maintained on a specific manufacturer’s branded or generic oral carbamazepine product. See also MHRA/CHM advice, p. 297

ESLICARB AZEPINE ACETATE

Indications see notes above

Cautions avoid abrupt withdrawal; hyponatraemia (monitor plasma-sodium concentration in patients at risk and discontinue treatment if hyponatraemia occurs); PR-interval prolongation (avoid concomitant administration of drugs that prolong PR interval); elderly, test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele); interactions: see p. 298 and Appendix 1 (eslicarbazepine)

Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history (see also MHRA/CHM advice, p. 297)

Contra-indications second- or third-degree AV block

Hepatic impairment avoid in severe impairment—no information available

Renal impairment reduce initial dose to 400 mg every other day for 2 weeks then 400 mg once daily if eGFR 30–60 mL/minute/1.73 m², adjusted according to response; avoid if eGFR less than 30 mL/minute/1.73 m²

Pregnancy see Pregnancy, p. 299

Breast-feeding see Breast-feeding, p. 299

Side-effects gastro-intestinal disturbances; dizziness, drowsiness, headache, impaired coordination, tremor, visual disturbances, fatigue, rash; less commonly dry mouth, dehydration, gingival hyperplasia, stomatitis; palpititation, Bradycardia, hypertension, hypotension, chest pain, epistaxis, appetite changes, weight changes, agitation, hyperactivity, confusion, mood changes, psychosis, impaired memory, insomnia, dysesthesia, dystonia, paroxysm, movement disorders, convulsions, peripheral neuropathy, nystagmus, dysartria, taste disturbance, urinary tract infection, liver disorders, hypothyroidism, anaemia, hyponatraemia (see Cautions), electrolyte imbalance, tinnitus, alopecia, sweating, nail disorder, myalgia, nocturia, menstruation changes, malaise, chills, peripheral oedema; very rarely pancreatitis, thrombocytopenia, and leucopenia; PR-interval prolongation also reported; suicidal ideation

Dose

ADULT over 18 years, initially 400 mg once daily, increased after 1–2 weeks to 800 mg once daily; max. 1.2 g

Zebinia® Tablets, scored, eslicarbazepine acetate 800 mg, net price 30-tab pack = £136.00. Label: 8, counselling, driving (see notes above)

Note Patients may need to be maintained on a specific manufacturer’s branded or generic eslicarbazepine product, see MHRA/CHM advice, p. 297

OXCARBAZEPINE

Indications see notes above

Cautions hypersensitivity to carbamazepine (see also Antiepileptic Hypersensitivity Syndrome p. 298); avoid abrupt withdrawal; hyponatraemia (monitor plasma-sodium concentration in patients at risk), heart failure (monitor body-weight), cardiac conduction disorders; test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele); avoid in acute porphyria (section 9.8.2); interactions: see p. 298 and Appendix 1 (oxcarbazepine)

Blood, hepatic, or skin disorders Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as lassithea, confusion, muscular twitching, fever, rash, blistering, mouth ulcers, bruising, or bleeding develop

Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history (see also MHRA/CHM advice, p. 297)

Hepatic impairment caution in severe impairment—no information available

Renal impairment halve initial dose if eGFR less than 30 mL/minute/1.73 m²; increase according to response at intervals of at least 1 week

Pregnancy see Pregnancy, p. 299

Breast-feeding see Breast-feeding, p. 299

Side-effects nausea, vomiting, constipation, diarrhoea, abdominal pain, dizziness, headache, drowsiness, agitation, amnesia, asthenia, ataxia, confusion, impaired concentration, depression, tremor, hypotension, anaemia, acne, alopecia, rash, nystagmus, visual disorders including diplopia; less commonly leucopenia, urticaria; very rarely arrhythmias, atrioventricular block, thrombocytopenia, hepatitis, pancreatitis, multi-organ hypersensitivity disorders (see also Anti-epileptic Hypersensitivity Syndrome p. 298), systemic lupus erythematosus, Stevens-Johnson syndrome, toxic epidermal necrolysis; also reported hypertension, suicidal ideation, hypothyroidism, bone marrow depression, aplastic anaemia, neutropenia, pancytopenia, osteoporotic bone disorders

Dose

Initially 300 mg twice daily increased according to response in steps of up to 600 mg daily at weekly intervals; usual dose range 0.6–2.4 g daily in divided daily doses.
4.1 Control of the epilepsies

Dose

- **ADULT** and **CHILD** over 6 years, initially 500 mg daily in 2 divided doses, increased by 250 mg every 5–7 days to usual dose of 1–1.5 g daily in 2 divided doses; occasionally up to 2 g daily may be needed; **CHILD** 1 month–6 years, initially 10 mg/kg (max. 250 mg) daily in 2 divided doses, increased every 5–7 days to usual dose of 20–40 mg/kg (max. 1 g) daily in 2 divided doses; total daily dose may be given in 3 divided doses

**Ethosuximide** (Non-proprietary)  
Capsules, ethosuximide 250 mg, net price 56-cap pack = £48.20. Label: 8, counselling, blood disorders (see above), driving (see notes above)

**Emeside** (Chemidex)  
**Syrup**, black currant, ethosuximide 250 mg/5 mL, net price 200-mL pack = £42.22. Label: 8, counselling, blood disorders (see above), driving (see notes above)

**Zarontin** (Pfizer)  
Syrup, yellow, ethosuximide 250 mg/5 mL, net price 200-mL pack = £42.22. Label: 8, counselling, blood disorders (see above), driving (see notes above)

**Gabapentin and pregabalin**

Gabapentin and pregabalin are used for the treatment of focal seizures with or without secondary generalisation. They are not recommended if tonic, atonic, absence or myoclonic seizures are present. Both are also licensed for the treatment of neuropathic pain (p. 291). Pregabalin is licensed for the treatment of generalised anxiety disorder (p. 249). Gabapentin is an effective treatment for migraine prophylaxis [unlicensed] (p. 295).

The Scottish Medicines Consortium (p. 4) has advised (July 2007) that pregabalin (*Lyrica*) is not recommended for the treatment of central neuropathic pain. The Scottish Medicines Consortium (p. 4) has advised (April 2009) that pregabalin (*Lyrica*) is accepted for restricted use within NHS Scotland for the treatment of peripheral neuropathic pain in adults who have not achieved adequate pain relief with, or have not tolerated, first- or second-line treatments; discontinue treatment if sufficient benefit is not achieved within 8 weeks of reaching the maximum tolerated dose.

**ETHOSUXIMIDE**

**Indications** see notes above

**Cautions** avoid abrupt withdrawal; avoid in acute porphyria (section 9.8.2); **interactions**: see p. 298 and Appendix 1 (ethosuximide)

**Blood disorders** Patients or their carers should be told how to recognise signs of blood disorders, and advised to seek immediate medical attention if symptoms such as fever, mouth ulcers, bruising, or bleeding develop

**Hepatic impairment** use with caution

**Renal impairment** use with caution

**Pregnancy** see Pregnancy, p. 299

**Breast-feeding** see Breast-feeding, p. 299

**Side-effects** gastro-intestinal disturbances (including nausea, vomiting, diarrhoea, abdominal pain, anorexia, weight loss); *less frequently* headache, fatigue, drowsiness, dizziness, hiccup, ataxia, euphoria, irritability, aggression, impaired concentration; rarely tongue swelling, sleep disturbances, depression, psychosis, photophobia, dyskinesia, increased libido, vaginal bleeding, myopia, gingival hypertrophy, rash; also reported hyperactivity, increase in seizure frequency, blood disorders (including leucopenia, agranulocytosis, pancytopenia, and aplastic anaemia—blood counts required if features of infection), systemic lupus erythematosus, Stevens-Johnson syndrome; suicidal ideation

** Gabapentin and pregabalin are used for the treatment of focal seizures with or without secondary generalisation. They are not recommended if tonic, atonic, absence or myoclonic seizures are present. Both are also licensed for the treatment of neuropathic pain (p. 291). Pregabalin is licensed for the treatment of generalised anxiety disorder (p. 249). Gabapentin is an effective treatment for migraine prophylaxis [unlicensed] (p. 295).**

The Scottish Medicines Consortium (p. 4) has advised (July 2007) that pregabalin (*Lyrica*) is not recommended for the treatment of central neuropathic pain.

The Scottish Medicines Consortium (p. 4) has advised (April 2009) that pregabalin (*Lyrica*) is accepted for restricted use within NHS Scotland for the treatment of peripheral neuropathic pain in adults who have not achieved adequate pain relief with, or have not tolerated, first- or second-line treatments; discontinue treatment if sufficient benefit is not achieved within 8 weeks of reaching the maximum tolerated dose.

**GABAPENTIN**

**Indications** monotherapy and adjunctive treatment of focal seizures with or without secondary generalisation; peripheral neuropathic pain (section 4.7.3); migraine prophylaxis [unlicensed] (section 4.7.4.2)

**Cautions** avoid abrupt withdrawal; elderly; diabetes mellitus; mixed seizures (including absences); false positive readings with some urinary protein tests; history of psychotic illness; high doses of oral solution in adolescents and adults with low body-weight—see preparations below; **interactions**: Appendix 1 (gabapentin)

**Renal impairment** reduce dose to 0.6–1.8 g daily in 3 divided doses if eGFR 50–80 mL/minute/1.73 m²; reduce dose to 300–900 mg daily in 3 divided doses if eGFR 30–50 mL/minute/1.73 m²; reduce dose to 300 mg on alternate days (up to max. 600 mg daily) in 3 divided doses if eGFR 15–30 mL/minute/1.73 m²; reduce dose to 300 mg on alternate days (up to max. 600 mg daily) in 3 divided doses if eGFR 10–15 mL/minute/1.73 m²; reduce dose to 300 mg on alternate days (up to max. 600 mg daily) in 3 divided doses if eGFR ≤ 10 mL/minute/1.73 m²; reduce dose to 300 mg on alternate days (up to max. 600 mg daily) in 3 divided doses if eGFR ≤ 5 mL/minute/1.73 m²;
4 Central nervous system

Neurontin (Non-proprietary) E731

**Epilepsy,** 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times daily on day 3 or initially 300 mg 3 times daily on day 1; then increased according to response in steps of 300 mg (in 3 divided doses) every 2–3 days; usual dose 0.9–3.6 g daily in 3 divided doses (max. 4.8 g daily in 3 divided doses); **CHILD** 6–12 years (adjunctive therapy only) initially 10 mg/kg (max. 300 mg) once daily on day 1, then 10 mg/kg (max. 300 mg) twice daily on day 2, then 10 mg/kg (max. 300 mg) 3 times daily on day 3; usual dose 25–35 mg/kg daily in 3 divided doses; max. 70 mg/kg daily in 3 divided doses; **CHILD** 2–6 years see BNF for Children

**Neuropathic pain.** **ADULT** over 18 years, initially 100 mg daily in 2–3 divided doses, increased if necessary up to 300 mg daily in 2–3 divided doses every 2–3 days up to max. 3.6 g daily

**Migraine prophylaxis [unlicensed],** initially 300 mg daily, increased according to response up to 2.4 g daily in divided doses

**Gabapentin (Non-proprietary).** (PM)

**Capsules,** gabapentin 100 mg, net price 100-cap pack = £4.29; 300 mg, 100-cap pack = £6.64; 400 mg, 100-cap pack = £4.94. Label: 3, 5, 8, counselling, driving (see notes above)

**Tablets,** gabapentin 600 mg, net price 100-tab pack = £10.07; 800 mg, 100-tab pack = £13.45. Label: 3, 5, 8, counselling, driving (see notes above)

**Oral solution,** gabapentin 50 mg/mL, net price 150-mL pack = £57.50. Label: 3, 5, 8, counselling, driving (see notes above)

**Excipients** include propylene glycol (see Excipients, p. 2)

**Important** The levels of propylene glycol, acesulfame K and saccharin sodium may exceed the recommended WHO daily intake limits if high doses of gabapentin oral solution (Rosemont brand) are given to adolescents or adults with low body-weight (39–50 kg)—consult product literature

**Electrolytes** Na⁺ 0.031 mmol/mL, K⁺ 0.097 mmol/mL

**Neurontin® (Pfizer).** (PM)

**Capsules,** gabapentin 100 mg (white), net price 100-cap pack = £18.29; 300 mg (yellow), 100-cap pack = £42.40; 400 mg (orange), 100-cap pack = £49.06. Label: 3, 5, 8, counselling, driving (see notes above)

**PREGABALIN**

**Indications** peripheral and central neuropathic pain (section 4.7.3); adjunctive therapy for focal seizures with or without secondary generalisation; generalised anxiety disorder (section 4.3)

**Cautions** avoid abrupt withdrawal (taper over at least 1 week); severe congestive heart failure; conditions that may precipitate encephalopathy: **Interactions:** Appendix 1 (pregabalin)

**Renal impairment** initially 75 mg daily and max. 300 mg daily if eGFR 30–60 mL/minute/1.73 m²; initially 25–50 mg daily and max. 150 mg daily in 1–2 divided doses if eGFR 15–30 mL/minute/1.73 m²; initially 25 mg once daily and max. 75 mg once daily if eGFR less than 15 mL/minute/1.73 m²

**Pregnancy** see Pregnancy, p. 299

**Breast-feeding** see Breast-feeding, p. 299

**Side-effects** dry mouth, constipation, vomiting, flatulence, oedema, dizziness, drowsiness, irritability, impaired attention, disturbances in muscle control and movement, speech disorder, impaired memory, paraesthesia, euphoria, confusion, malaise, appetite changes, insomnia, weight gain, sexual dysfunction, visual disturbances (including blurred vision, diplopia, visual field defects); less commonly abdominal distension, hypersalivation, gastro-oesophageal reflux disease, thirst, taste disturbance, flushing, hypotension, hypertension, tachycardia, syncope, first-degree AV block, dysphoria, nasal dryness, stupor, depersonalisation, depression, abnormal dreams, hallucinations, agitation, cognitive impairment, panic attacks, chills, hypoglycaemia, thrombocytopenia, urinary incontinence, dysuria, myalgia, arthralgia, dry eye, lacrimation, hyperacusis, nasopharyngitis, sweating, rash; rarely ascites, dysphagia, pancreatitis, weight loss, cold extremities, arrhythmia, bradycardia, cough, epistaxis, rhinitis, parosmia, hyperglycaemia, renal failure, oliguria, menstrual disturbances, breast pain, breast discharge, breast hypertrophy, neutropenia, hypokalaemia, leucopenia, rhabdomyolysis, urticaria; also reported diarrhoea, nausea, congestive heart failure, QT-interval prolongation, aggression, headache, convulsions, encephalopathy, urinary retention, keratitis, Stevens-Johnson syndrome, pruritus, suicidal ideation

**Dose**

**Neuropathic pain.** **ADULT** over 18 years, initially 25 mg daily in 2–3 divided doses, increased if necessary after 3–7 days to max. 300 mg daily in 2–3 divided doses, increased further if necessary after 7 days to max. 600 mg daily in 2–3 divided doses

**Epilepsy.** **ADULT** over 18 years, initially 150 mg daily in 2–3 divided doses, increased if necessary at 7–day intervals in steps of 150 mg daily; max. 600 mg daily in 2–3 divided doses

**Generalised anxiety disorder.** **ADULT** over 18 years, initially 150 mg daily in 2–3 divided doses, increased if necessary at 7-day intervals in steps of 150 mg daily; max. 600 mg daily in 2–3 divided doses

**Note** Pregabalin doses in BNF may differ from those in product literature

Tablets, 15 mL pack = £57.50. Label: 3, 5, 8, counselling, driving (see notes above)
**LACOSAMIDE**

**Indications**  
see notes above

**Cautions**  
risk of PR-interval prolongation (including conduction problems, severe cardiac disease, and concomitant use of drugs that prolong PR interval), elderly;  
**Contra-indications**  
2nd- or 3rd-degree AV block

**Hepatic impairment**  
titrated with caution in mild to moderate impairment—no information available

**Renal impairment**  
loading dose regimen can be considered in mild to moderate impairment—titrate above 200 mg with caution; titrate with caution in severe impairment, max: 250 mg daily; consult product literature for loading dose if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy**  
see Pregnancy, p. 299

**Breast-feeding**  
manufacturer advises avoid—present in milk in animal studies; see also Breast-feeding, p. 299

**Side-effects**  
nausea, vomiting, constipation, flatulence, dizziness, headache, impaired coordination, cognitive disorder, drowsiness, tremor, depression, fatigue, abnormally pale, blurred vision, nystagmus, pruritus; rarely multi-organ hypersensitivity reaction (see Antiepileptic Hypersensitivity Syndrome p. 298); also reported dyspepsia, dry mouth, AV block, bradycardia, PR-interval prolongation, atrial fibrillation, atrial flutter, aggression, agitation, psychosis, euphoria, confusion, hypoesthesia, dysarthria, irritability, agranulocytosis, muscle spasm, tinnitus, rash; suicidal ideation

**Dose**

- **By mouth** or **by intravenous infusion** over 15–60 minutes (for up to 5 days), **ADULT** and **CHILD** over 16 years, initially 50 mg twice daily, increased weekly by 50 mg twice daily according to response and tolerability; initial maintenance dose 100 mg twice daily; max: 200 mg twice daily

- **Alternative loading dose regimen** (can be used under medical supervision when it is necessary to rapidly attain therapeutic plasma concentrations), by mouth or by intravenous infusion over 15–60 minutes (for up to 5 days), **ADULT** and **CHILD** over 16 years, initially 100 mg twice daily, followed 12 hours later by a maintenance dose of 100 mg twice daily; thereafter increased weekly by 50 mg twice daily according to response and tolerability; max 200 mg twice daily

**Vimpat®** (UCB Pharma)  
**Tables, f/c, lacosamide 50 mg (pink), net price 14-tab pack = £10.81; 100 mg (yellow), 14-tab pack = £21.62; 56-tab pack = £88.50; 150 mg (pink), 14-tab pack = £32.44, 56-tab pack £129.74; 200 mg (blue), 56-tab pack = £144.16. Label: 8, counselling, driving (see notes above)

**Exipients** aspartame (section 9.4.1), propylene glycol, (see Excipients)

**Electrolytes** Na⁺ 0.62 mmol/mL

**Intravenous infusion** lacosamide 10 mg/mL, net price 200-mL vial = £29.70

**Electrolytes** Na⁺ 2.6 mmol/vial

**LAMOTRIGINE**

**Indications**  
monotherapy and adjunctive treatment of focal seizures and generalised seizures including tonic-clonic seizures; seizures associated with Lennox-Gastaut syndrome; monotherapy of typical absence seizures in children; prevention of depressive episodes associated with bipolar disorder

**Cautions**  
closely monitor and consider withdrawal if rash, fever, or other signs of hypersensitivity syndrome occur; abrupt withdrawal (taper off over 2 weeks or longer) is dangerous

**Blood disorders** Patients and their carers should be alert for symptoms and signs suggestive of bone-marrow failure, such as anaemia, bruising, or infection. Aplastic anaemia,
bone-marrow depression, and pancytopenia have been associated rarely with lamotrigine

Switching between formulations can be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history (see also MHRA/CHM advice, p. 297)

Hepatic impairment: halve dose in moderate impairment; quarter dose in severe impairment

Renal impairment: caution in renal failure; metabolite may accumulate; consider reducing maintenance dose in significant impairment

Pregnancy: see Pregnancy, p. 299

Breast-feeding: see Breast-feeding, p. 299

Side-effects: nausea, vomiting, diarrhoea, dry mouth, see Breast-feeding, p. 299

Breast-feeding: Pregnancy

caution in renal failure; metabolite may accumulate; consider reducing maintenance dose in significant impairment

Pregnancy: see Pregnancy, p. 299

Breast-feeding: see Breast-feeding, p. 299

Skin reactions: Serious skin reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis have developed (especially in children); most rashes occur in the first 8 weeks. Rash is sometimes associated with hypersensitivity syndrome (see Side-effects, above) and is more common in patients with history of allergy or rash from other antiepileptic drugs. Consider withdrawal if rash or signs of hypersensitivity syndrome develop. Factors associated with increased risk of serious skin reactions include concomitant use of valproate, initial lamotrigine dosing higher than recommended, and more rapid dose escalation than recommended.

Counselling: Warn patients to see their doctor immediately if rash or signs of hypersensitivity syndrome develop (see Antiepileptic Hypersensitivity Syndrome, p. 298)

Dose

Important: Do not confuse the different combinations or indications; see also notes above

Note: Dose titration should be repeated if restarting after an interval of more than 5 days

- Monotherapy of seizures, ADULT and CHILD over 12 years, initially 25 mg once daily for 14 days, increased to 50 mg once daily for further 14 days, then increased by max. 100 mg every 7–14 days; usual maintenance 100–200 mg daily in 1–2 divided doses (up to 500 mg daily has been required)

- Monotherapy of typical absence seizures, CHILD 2–12 years see BNF for Children

- Adjunctive therapy of seizures with valproate, ADULT and CHILD over 12 years, initially 25 mg on alternate days for 14 days then 25 mg once daily for further 14 days, thereafter increased by max. 50 mg every 7–14 days; usual maintenance, 100–200 mg daily in 1–2 divided doses; CHILD 2–12 years initially 150 micrograms/kg once daily for 14 days (those weighing under 13 kg may receive 2 mg on alternate days for first 14 days) then 300 micrograms/kg once daily for further 14 days, thereafter increased by max. 300 micrograms/kg every 7–14 days; usual maintenance 1–5 mg/kg daily in 1–2 divided doses; max. 200 mg daily

- Adjunctive therapy of seizures (with enzyme inducing drugs) without valproate, ADULT and CHILD over 12 years, initially 50 mg once daily for 14 days then 50 mg twice daily for further 14 days, thereafter increased by max. 100 mg every 7–14 days; usual maintenance 200–400 mg daily in 2 divided doses (up to 700 mg daily has been required); CHILD 2–12 years initially 600 micrograms/kg daily in 2 divided doses for 14 days then 1.2 mg/kg daily in 2 divided doses for further 14 days, thereafter increased by max. 1.2 mg/kg every 7–14 days; usual maintenance 5–15 mg/kg daily in 1–2 divided doses; max. 400 mg daily

- Adjunctive therapy of seizures (without enzyme inducing drugs) without valproate, ADULT and CHILD over 12 years, initially 25 mg once daily for 14 days, increased to 50 mg once daily for further 14 days, then increased by max. 100 mg every 7–14 days; usual maintenance 100–200 mg daily in 1–2 divided doses; CHILD 2–12 years initially 100 micrograms/kg daily in 1–2 divided doses for 14 days then 600 micrograms/kg daily in 1–2 divided doses for further 14 days, thereafter increased by max. 600 micrograms/kg every 7–14 days; usual maintenance 1–10 mg/kg daily in 1–2 divided doses; max. 200 mg daily

- Monotherapy or adjunctive therapy of bipolar disorder (without enzyme inducing drugs) without valproate, ADULT over 18 years, initially 25 mg once daily for 14 days, then 50 mg daily in 1–2 divided doses for further 14 days, then 100 mg daily in 1–2 divided doses for further 7 days; usual maintenance 200 mg daily in 1–2 divided doses; max. 400 mg daily

- Adjunctive therapy of bipolar disorder with valproate, ADULT over 18 years, initially 25 mg on alternate days for 14 days, then 25 mg once daily for further 14 days, then 50 mg daily in 1–2 divided doses for further 7 days; usual maintenance 100 mg daily in 1–2 divided doses; max. 200 mg daily

- Adjunctive therapy of bipolar disorder (with enzyme inducing drugs) without valproate, ADULT over 18 years, initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then 100 mg twice daily for further 7 days, then 150 mg twice daily for further 7 days; usual maintenance 200 mg twice daily

Note: Patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimens—consult product literature

Lamotrigine (Non-proprietary)

Tablets, lamotrigine 25 mg, net price 56-tab pack = £1.38; 50 mg, 56-tab pack = £1.66; 100 mg, 56-tab pack = £2.17; 200 mg, 30-tab pack = £2.53, 56-tab pack = £3.39. Label: 8, counselling, driving (see notes above), skin reactions (see above)

Dispersible tablets, lamotrigine 5 mg, net price 28-tab pack = £1.64; 25 mg, 56-tab pack = £2.58; 100 mg, 56-tab pack = £4.32. Label: 8, 13, counselling, driving (see notes above), skin reactions (see above)

Note: Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic lamotrigine product, see MHRA/CHM advice, p. 297

Lamictal® (GSK) (Proprietary)

Tablets, yellow, lamotrigine 25 mg, net price 56-tab pack = £19.61; 50 mg, 56-tab pack = £33.35; 100 mg, 56-tab pack = £57.53; 200 mg, 56-tab pack = £97.79. Label: 8, counselling, driving (see notes above), skin reactions (see above)

Dispersible tablets, chewable, lamotrigine 2 mg, net price 30-tab pack = £10.45; 5 mg, 28-tab pack = £7.82; 25 mg, 56-tab pack = £19.61; 100 mg, 56-tab
Levetiracetam

Levetiracetam is licensed for monotherapy and adjunctive treatment of focal seizures with or without secondary generalisation, and for adjunctive therapy of myoclonic seizures in patients with juvenile myoclonic epilepsy and primary generalised tonic-clonic seizures. Levetiracetam may also be prescribed alone or in combination for the treatment of myoclonic seizures, and under specialist supervision for absence seizures [both unlicensed].

**INDICATIONS**

- **Monotherapy of focal seizures, by mouth or by intravenous infusion, ADULT and CHILD over 16 years,** initially 250 mg once daily increased after 1–2 weeks to 250 mg twice daily; thereafter, increased according to response in steps of 250 mg twice daily every 2 weeks; max. 1.5 g twice daily
- **Adjunctive therapy of focal seizures, by mouth, ADULT and CHILD over 12 years,** body-weight over 50 kg, initially 250 mg twice daily, increased by 500 mg twice daily every 2–4 weeks; max. 1.5 g twice daily; CHILD over 4 years, body-weight under 50 kg, initially 10 mg/kg once daily, increased by max. 10 mg/kg twice daily every 2 weeks; max. 30 mg/kg twice daily
- **Adjunctive therapy of myoclonic seizures and tonic-clonic seizures, by mouth or by intravenous infusion, ADULT and CHILD over 12 years,** body-weight over 50 kg, initially 250 mg twice daily, increased by 500 mg twice daily every 2–4 weeks; max. 1.5 g twice daily; CHILD 12–18 years, body-weight under 50 kg, initially 10 mg/kg once daily, increased by max. 10 mg/kg twice daily every 2 weeks; max. 30 mg/kg twice daily
- **If switching between oral therapy and intravenous therapy (because oral route temporarily unavailable), by intravenous infusion, same as established oral dose**

**CAUTIONS**

- **Avoid abrupt withdrawal**
- **See notes above**
- **Renal impairment** halve dose in severe hepatic impairment if eGFR less than 60 mL/min/1.73 m²
- **Renal impairment** max. 2 g daily if eGFR 50–80 mL/min/1.73 m²
- **Renal impairment** max. 1.5 g daily if eGFR 30–50 mL/min/1.73 m²
- **Renal impairment** max. 1 g daily if eGFR less than 30 mL/min/1.73 m²
- **Hepatic impairment** increase at intervals of at least 2 weeks, up to max. 8 mg daily in mild or moderate impairment; avoid in severe impairment
- **Renal impairment** avoid in moderate or severe impairment
- **Pregnancy** see Pregnancy, p. 299; manufacturer advises avoid

**PERAMPELAN**

Perampanel is licensed for adjunctive treatment of focal seizures with or without secondary generalised seizures.

**INDICATIONS**

- **Adjunctive treatment of focal seizures, by mouth, ADULT and CHILD over 12 years,** body-weight over 50 kg, initially 250 mg twice daily, increased by 500 mg twice daily every 2–4 weeks; max. 1.5 g twice daily; CHILD over 4 years, body-weight under 50 kg, initially 10 mg/kg once daily, increased by max. 10 mg/kg twice daily every 2 weeks; max. 30 mg/kg twice daily

**Cautions**

- **Avoid abrupt withdrawal**
- **See notes above**
- **Interactions:** Appendix 1 (perampanel)

**Switching between formulations** Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history (see also MHRA/CHM advice, p. 297)

**Hepatic impairment** increase at intervals of at least 2 weeks, up to max. 8 mg daily in mild or moderate impairment; avoid in severe impairment

**Renal impairment** avoid in moderate or severe impairment

**Pregnancy** see Pregnancy, p. 299; manufacturer advises avoid
Breast-feeding  avoid—present in milk in animal studies
Side-effects  nausea, changes in appetite, weight increase, aggression, dizziness, drowsiness, dysarthria, gait disturbance, irritability, anxiety, confusion, suicidal ideation and behaviour, malaise, ataxia, back pain, vertigo, blurred vision, diplopia
Dose  
* ADULT and CHILD over 12 years, initially 2 mg once daily before bedtime, increased according to response and tolerability in 2-mg steps at intervals of at least 2 weeks; usual maintenance 4–8 mg once daily; max. 12 mg once daily
  
  Note  Titrate at intervals of at least 1 week with concomitant carbamazepine, oxcarbazepine, or phenytoin (see also Appendix 1)

Phenobarbital and primidone

Phenobarbital is effective for tonic-clonic and focal seizures but may be sedative in adults and cause behavioural disturbances and hyperkinesia in children. It may be tried for atypical absence, atonic, and tonic seizures. Rebound seizures may be a problem on withdrawal. Plasma-phenobarbital concentration for optimum response is 15–40 mg/litre (60–180 micromol/litre); however, monitoring the plasma-drug concentration is less useful than with other drugs because tolerance occurs.

Primidone is largely converted to phenobarbital and this is probably responsible for its antiepileptic action. A low initial dose of primidone is essential.

### PHENOBARBITAL (Phenobarbitone)

**Indications**  all forms of epilepsy except typical absence seizures; status epilepticus (section 4.8.2)

**Cautions**  see notes above; elderly; debilitated; children; respiratory depression (avoid if severe); avoid abrupt withdrawal (dependence with prolonged use); history of drug or alcohol abuse; consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium; avoid in acute porphyria (section 9.8.2); interactions: see p. 298 and Appendix 1 (phenobarbital)

**Switching between formulations**  Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer’s product (see also MHRA/CHM advice, p. 297)

**Hepatic impairment**  may precipitate coma; avoid in severe impairment

**Renal impairment**  use with caution

**Pregnancy**  see Pregnancy, p. 299

**Breast-feeding**  see Breast-feeding, p. 299

**Side-effects**  hepatitis; cholestasis; hypotension; respiratory depression; behavioural disturbances, nystagmus, irritability, drowsiness, lethargy, depression, ataxia, paradoxical excitement, hallucinations, impaired memory and cognition, hyperactivity particularly in the elderly and in children; osteomalacia (see Caution); megaloblastic anaemia (may be treated with folic acid), agranulocytosis, thrombocytopenia; allergic skin reactions; very rarely Stevens-Johnson syndrome and toxic epidermal necrolysis; suicidal ideation; Antiepileptic Hypersensitivity Syndrome (see p. 298); overdosage: see Emergency Treatment of Poisoning, p. 34

**Dose**  
* By mouth, 60–180 mg at night; CHILD 5–8 mg/kg daily

Phenobarbital (Non-proprietary)

**Tablets**, phenobarbital 15 mg, net price 28-tab pack = £22.65; 30 mg, 28-tab pack = 84p; 60 mg, 28-tab pack = £7.04. Label: 2, 8, counselling, driving (see notes above)

**Elixir**, phenobarbital 15 mg/5 mL in a suitable flavoured vehicle, containing alcohol 38%, net price 100 mL = £4.67. Label: 2, 8, counselling, driving (see notes above)

**Note**  Patients should be maintained on a specific manufacturer’s branded or generic phenobarbital product. See also MHRA/CHM advice, p. 297

**Note**  Some hospitals supply alcohol-free formulations of varying phenobarbital strengths

### PRIMIDONE

**Indications**  all forms of epilepsy except typical absence seizures; essential tremor (section 4.9.3)

**Cautions**  see under Phenobarbital; interactions: see p. 298 and Appendix 1 (phenobarbital)

**Switching between formulations**  Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer’s product (see also MHRA/CHM advice, p. 297)

**Hepatic impairment**  reduce dose; may precipitate coma

**Renal impairment**  see Phenobarbital

**Pregnancy**  see Pregnancy, p. 299

**Breast-feeding**  see Breast-feeding, p. 299

**Side-effects**  see Phenobarbital; also nausea, visual disturbances; less commonly vomiting, headache, dizziness; rarely psychosis, lupus erythematosus, arthralgia; also reported Dupuytren’s contracture

**Dose**  
* Epilepsy, ADULT and CHILD over 9 years, initially 125 mg daily at bedtime, increased by 125 mg every 3 days to 500 mg daily in 2 divided doses, then increased according to response by 250 mg every 3 days to usual maintenance 0.75–1.5 g daily in 2 divided doses; CHILD under 9 years, initially 125 mg daily at bedtime, increased by 125 mg every 3 days according to response; usual maintenance, CHILD under 2 years, 250–500 mg daily in 2 divided doses; 2–5 years, 500–750 mg daily in 2 divided doses; 5–9 years 0.75–1 g daily in 2 divided doses
* Essential tremor, initially 50 mg daily, increased gradually over 2–5 weeks according to response; max. 750 mg daily

**Note**  Monitor plasma concentrations of derived phenobarbital; optimum range as for phenobarbital
Phenytoin
Phenytoin is licensed for tonic-clonic and focal seizures but may exacerbate absence or myoclonic seizures and should be avoided if these seizures are present. It has a narrow therapeutic index and the relationship between dose and plasma-drug concentration is non-linear; small dosage increases in some patients may produce large increases in plasma concentration with acute toxic side-effects. Similarly, a few missed doses or a small change in drug absorption may result in a marked change in plasma-drug concentration. Monitoring of plasma-drug concentration improves dosage adjustment.

Preparations containing phenytoin sodium are not bioequivalent to those containing phenytoin base (such as Epanutin Infatabs® and Epanutin® suspension); 100 mg of phenytoin sodium is approximately equivalent in therapeutic effect to 92 mg phenytoin base. The dose is the same for all phenytoin products when initiating therapy, however if switching between these products the difference in phenytoin content may be clinically significant. Care is needed when making changes between formulations and plasma-phenytoin concentration monitoring is recommended (see also MHRA/CHM advice, p. 297).

The usual total plasma-phenytoin concentration for optimum response is 10–20 μg/litre (or 40–80 micromol/litre). In pregnancy, the elderly, and certain disease states where protein binding may be reduced, careful interpretation of total plasma-phenytoin concentration is necessary; it may be more appropriate to measure free plasma-phenytoin concentration.

Symptoms of phenytoin toxicity include nystagmus, diplopia, slurred speech, ataxia, confusion, and hyperglycaemia. Phenytoin may cause coarsening of the facial appearance, acne, hirsutism, and gingival hyperplasia and so may be particularly undesirable in adolescent patients. When only parenteral administration is possible, fosphenytoin (section 4.8.2), a pro-drug of phenytoin, may be convenient to give. Unlike phenytoin (which should only be given intravenously), fosphenytoin may also be given by intramuscular injection.

PHENYTOIN
Indications tonic-clonic seizures; focal seizures; prevention and treatment of seizures during or following neurosurgery or severe head injury; status epilepticus (section 4.8.2); trigeminal neuralgia if carbamazepine inappropriate (see also section 4.7.3)

Cautions cross-sensitivity reported with carbamazepine (see also Antiepileptic Hypersensitivity Syndrome p. 298); avoid abrupt withdrawal; HLA-B*1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome); manufacturer recommends blood counts (but evidence of practical value uncertain); consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium; enteral feeding (interrupt feeding for 2 hours before and after dose; more frequent monitoring may be necessary); avoid in acute porphyria (section 9.8.2); Interactions see p. 298 and Appendix 1 (phenytoin) Blood or skin disorders. Patients or their carers should be told how to recognise signs of blood or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative) Switching between formulations. Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer’s product (see also MHRA/CHM advice, p. 297)

Hepatic impairment reduce dose to avoid toxicity

Pregnancy changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction; see also Pregnancy, p. 299

Breast-feeding see Breast-feeding, p. 299

Side-effects nausea, vomiting, constipation, drowsiness, insomnia, transient nervousness, tremor, paraesthesia, dizziness, headache, anorexia; gingival hypertrophy and tenderness (maintain good oral hygiene); rash (discontinue; if mild re-introduce cautiously but discontinue immediately if recurrence), acne, hirsutism, coarsening of facial appearance; rarely hepatotoxicity (discontinue immediately and do not readmit), peripheral neuropathy, dyskinesia, lymphadenopathy, osteomalacia (see Cautions); blood disorders (including megaloblastic anaemia, leucopenia, thrombocytopenia, and aplastic anaemia), polyarteritis nodosa, lupus erythematosus, Stevens-Johnson syndrome, and toxic epidermal necrolysis; also reported polyarthropathy, pneumonitis, interstitial nephritis, hypersensitivity syndrome (see Antiepileptic Hypersensitivity Syndrome p. 298); suicidal ideation

Dose
- By mouth, initially 3–4 mg/kg daily or 150–300 mg daily (as a single dose or in 2 divided doses) increased gradually as necessary (with plasma-phenytoin concentration monitoring); usual dose 200–500 mg daily (exceptionally, higher doses may be used); CHILD initially 5 mg/kg daily in 2 divided doses, usual dose range 4–8 mg/kg daily (max. 300 mg daily)

Counselling Take preferably with or after food

Phenytoin (Non-proprietary) (TM) Tablets, coated, phenytoin sodium 100 mg, net price 28-tab pack = £30.00. Label: 8, counselling, administration, blood or skin disorder symptoms (see above), driving (see notes above)

Capsules, phenytoin sodium 25 mg, net price 28-cap pack =£15.74; 50 mg, 28-cap pack =£15.98; 100 mg, 84-cap pack =£54.00; 300 mg, 28-cap pack = £57.38. Label: 8, counselling, administration, blood or skin disorder symptoms (see above), driving (see notes above)

Note Patients being treated for epilepsy should be maintained on a specific manufacturer’s branded or generic phenytoin product. See also MHRA/CHM advice, p. 297

Epanutin® (Pfizer) (TM) Chewable tablets (Infatabs®), yellow, scored, phenytoin 50 mg, net price 200-tab pack = £13.18. Label: 8, 24, counselling, blood or skin disorder symptoms (see above), driving (see notes above)
Central nervous system

Trobalt
Scottish Medicines Consortium

The Cautions
avoid abrupt withdrawal; risk of urinary see notes above

or have not been tolerated.

appropriate drug combinations have proved inadequate

generalisation; it should only be prescribed when other
drug-resistant focal seizures with or without secondary
generalisation. It is restricted for use in refrac-
tory epilepsy.

NICE guidance
Retigabine for the adjunctive treatment of partial onset seizures in epilepsy (July 2011)
Retigabine is recommended as an option for the adjunctive treatment of partial onset seizures with or without secondary generalisation in adults aged 18 years and older with epilepsy, only when previous treatment with carbamazepine, clobazam, gabapen-
tin, lamotrigine, levetiracetam, oxcarbazepine, sodium valproate, and topiramate has not provided an adequate response, or has not been tolerated.

www.nice.org.uk/TA232

The Scottish Medicines Consortium (p. 4) has advised (June 2011) that retigabine (Trovant®) is accepted for restricted use within NHS Scotland as adjunctive ther-
apy in adults with focal seizures with or without sec-
ondary generalisation. It is restricted for use in refrac-
tory epilepsy.

RETIGABINE

Indications see notes above

Cautions avoid abrupt withdrawal; risk of urinary retention; known QT-interval prolongation (see below); monitor for discoloration of ocular tissue and visual impairment (see Ophthalmological Monitoring below); monitor for blue-grey discoloration of nails, lips and skin—continue treatment only if potential benefit outweighs risk; interactions: see p. 298 and Appendix 1 (retigabine)

QT-interval prolongation Patients with known QT-interval prolongation, or with the following risk factors for QT-interval prolongation, should be carefully monitored while taking retigabine: cardiac failure, ventricular hypertrophy, electrolyte abnormalities, or concomitant treatment with drugs that can prolong QT interval

Ophthalmological monitoring A comprehensive ophthalmological examination (including visual acuity test, slit-lamp examination, and dilated fundoscopy) should be performed at initiation of treatment and at least every 6 months thereafter during treatment. Changes in vision or retinal pigment should lead to re-assessment of the benefits and risks of continuing treatment—discontinue unless no other treatment options are available. Monitoring should be increased if treatment is continued.

Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history (see also MHRA/CHM advice, p. 297)

Hepatic impairment reduce dose by 50% in moderate to severe impairment; increase by 50 mg every week according to response up to max. 600 mg daily (450 mg in ELDERLY)

Renal impairment reduce dose by 50% if eGFR less than 50 mL/minute/1.73 m²; increase by 50 mg every week according to response up to max. 600 mg daily (450 mg in ELDERLY)

Pregnancy see Pregnancy, p. 299

Breast-feeding see Breast-feeding, p. 299

Side-effects increased appetite, weight gain, nausea, constipation, dyspepsia, dry mouth, peripheral oedema, malaise, drowsiness, dizziness, vertigo, amnesia, paresthesia, tremor, impaired coordination, impaired speech and attention, myoclonus, confusion, psychosis, anxiety, dysuria, haematuria, diplopia, blurred vision, discoloration of ocular tissue, visual impairment, discoloration of nails, lips and skin; less commonly dysphagia, hypokinesia, urinary retention, nephrothiasis, rash, sweating; suicidal ideation

Dose
• ADULT over 18 years, initially up to 300 mg daily in 3 divided doses, increased according to response by up to 150 mg every week up to maintenance dose of 0.6–1.2 g daily; ELDERLY over 65 years, initially 150 mg daily in 3 divided doses, increased according to response by up to 150 mg every week; max. 900 mg daily

Trovant® (GSK) ▼ (p.141)
Tablets, f/c, retigabine 50 mg (purple), net price 21-
tab pack = £4.87, 84-tab pack = £19.46; 100 mg (green), 21-tab pack = £9.73, 84-tab pack = £38.93; 200 mg (yellow), 84-tab pack = £77.86; 300 mg (green), 84-tab pack = £116.78; 400 mg (purple), 84-
tab pack = £127.68; starter pack of 21 x 50-mg tablets and 42 x 100-mg tablets = £24.33. Label: 8, 14, 25, counselling, driving (see notes above)

Note Patients may need to be maintained on a specific manufacturer’s branded or generic retigabine product. see MHRA/CHM advice, p. 297

Rufinamide
Rufinamide is licensed for the adjunctive treatment of seizures in Lennox-Gastaut syndrome. It may be considered by a tertiary specialist for the treatment of refractory tonic or atomic seizures [unlicensed].

The Scottish Medicines Consortium (p. 4) has advised (October 2008) that rufinamide (Inovelon®) is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of seizures associated with Lennox-Gastaut syndrome in patients 4 years and above. It is restricted for use when alternative traditional antiepileptic drugs are unsatisfactory.

RUFINAMIDE

Indications see notes above

Cautions closely monitor and consider withdrawal if rash, fever, or other signs of hypersensitivity syndrome develop (see also Antiepileptic Hyper-
sensitivity Syndrome p. 298); avoid abrupt with-
drawal; interactions: see p. 298 and Appendix 1 (rufinamide)

Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as
seizure frequency and treatment history (see also MHRA/CHM advice, p. 297)

### Hepatic impairment

caution and careful dose titration in mild to moderate impairment; avoid in severe impairment

### Pregnancy

see Pregnancy, p. 299

### Breast-feeding

see Breast-feeding, p. 299

#### Side-effects

nausea, vomiting, constipation, diarrhoea, dyspepsia, abdominal pain, weight loss, anorexia; rhinitis, epistaxis; dizziness, headache, drowsiness, insomnia, anxiety, fatigue, increase in seizure frequency, impaired coordination, hyperactivity, tremor, gait disturbances; influenza-like symptoms; oligomenorrhea; back pain; nystagmus, diplopia, blurred vision; rash and acne; hypersensitivity syndrome (see Antiepileptic Hypersensitivity Syndrome p. 298) also reported

#### Dose

- **ADULT** and **CHILD** over 4 years body-weight over 30 kg, initially 200 mg twice daily increased according to response in steps of 200 mg twice daily at intervals of not less than 2 days; body-weight 30–50 kg max. 900 mg twice daily; body-weight 50–70 kg max. 1.2 g twice daily; body-weight over 70 kg max. 1.6 g twice daily. **CHILD** over 4 years body-weight less than 30 kg, initially 100 mg twice daily increased according to response in steps of 100 mg twice daily at intervals of not less than 2 days; max. 500 mg twice daily (max. 300 mg twice daily if adjunctive therapy with valproate)

**Inovelon**

- **Tablets**, pink, f/c, scored, rufinamide 100 mg, net price 10-tab pack = £5.15; 200 mg, 60-tab pack = £61.77; 400 mg, 60-tab pack = £102.96. Label: 8, 21, counselling, driving (see notes above), hypersensitivity syndrome (see notes above)

**Oral suspension**, white, sugar-free, rufinamide 40 mg/mL, net price 460-ml pack = £94.71. Label: 8, 21, counselling, driving, (see notes above), hypersensitivity syndrome (see notes above)

**Excipients** include propylene glycol (see Excipients)

**Note** Patients may need to be maintained on a specific manufacturer’s branded or generic rufinamide product, see MHRA/CHM advice, p. 297

### Tiagabine

Tiagabine is used as adjunctive treatment for focal seizures with or without secondary generalisation that are not satisfactorily controlled by other antiepileptics. It should be avoided in absence, myoclonic, tonic and atomic seizures due to risk of seizure exacerbation.

#### Tiagabine

**Indications** see notes above

**Cautions** avoid abrupt withdrawal; risk of metabolic acidosis; risk of nephrolithiasis—ensure adequate hydration (especially in strenuous activity or warm environment); avoid in acute porphyria (section 9.8.2); interactions: see p. 298 and Appendix 1 (tiagabine)

**Topiramate**

Topiramate can be given alone or as adjunctive treatment in generalised tonic-clonic seizures or focal seizures with or without secondary generalisation. It can be used as adjunctive treatment for seizures associated with Lennox-Gastaut syndrome and for absence, tonic and atomic seizures under specialist supervision [unlicensed]. It can also be considered as an option in myoclonic seizures [unlicensed]. Topiramate is also licensed for prophylaxis of migraine (section 4.7.4.2).

### Topiramate

**Indications** see notes above

**Cautions** avoid abrupt withdrawal; risk of metabolic acidosis; risk of nephrolithiasis—ensure adequate hydration (especially in strenuous activity or warm environment); avoid in acute porphyria (section 9.8.2); interactions: see p. 298 and Appendix 1 (topiramate)

**Topiramate** has been associated with acute myopia with secondary angle-closure glaucoma, typically occurring within 1 month of starting treatment. Choroidal effusions resulting in anterior displacement of the lens and iris have also been reported. If raised intra-ocular pressure occurs:

- seek specialist ophthalmological advice;
- use appropriate measures to reduce intra-ocular pressure;
- stop topiramate as rapidly as feasible

**Switching between formulations** Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history (see also MHRA/CHM advice, p. 297)

**Hepatic impairment** use with caution in moderate to severe impairment—clearance may be reduced

**Renal impairment** use with caution; half usual starting and maintenance dose if eGFR less than 70 mL/minute/1.73 m²—reduced clearance and longer time to steady-state plasma concentration

**Pregnancy** see Pregnancy, p. 299

**Breast-feeding** manufacturer advises avoid—present in milk; see also Breast-feeding, p. 299

**Side-effects** nausea, diarrhoea, vomiting, constipation, dyspepsia, abdominal pain, dry mouth, taste disturbance, gastritis, appetite changes, dyspnoea, impaired attention, cognitive impairment, movement disorders, seizures, tremor, malaise, impaired coordination, speech disorder, drowsiness, dizziness, sleep disturbance, anxiety, confusion, paraesthesia,
aggression, mood changes, depression, agitation, irritability, nephrolithiasis, urinary disorders, anaemia, arthralgia, muscle spasm, myalgia, muscular weakness, visual disturbances, nystagmus, tinnitus, epis-taxis, alopecia, rash, pruritus; less commonly pancreatitis, flatulence, abdominal distension, gingival bleeding, salivation, halitosis, thirst, glossodynia, bradycardia, palpitation, hypotension, postural hypotension, flushing, altered sense of smell, peripheral neuropathy, suicidal ideation, psychosis, panic attack, influenza-like symptoms, sexual dysfunction, urinary calculus, haematuria, blood disorders (including leucopenia, neutropenia, and thrombocytopenia), hypokalaemia, metabolic acidosis, dry eye, photophobia, blepharospasm, increased lacrimation, mydriasis, hearing loss, reduced sweating, skin dis-coloration; rarely hepatitis, hepatic failure, Raynaud’s syndrome, periportial oedema, unilateral blindness, Stevens-Johnson syndrome, abnormal skin odour, calcinosis; very rarely angle-closure glaucoma; also reported encephalopathy, hyperammonaemia, macu-lopathy, toxic epidermal necrolysis

Dose

- Monotherapy in epilepsy, initially 25 mg at night for 1 week then increased in steps of 25–50 mg taken in 2 divided doses at intervals of 1–2 weeks; usual dose 100–200 mg daily in 2 divided doses, adjusted according to response; max. 500 mg daily (doses of 1 g daily have been used in refractory epilepsy); CHILD 6–18 years, initially 0.5–1 mg/kg (max. 25 mg) at night for 1 week then increased in steps of 0.5–1 mg/kg (max. 50 mg) taken in 2 divided doses at intervals of 1–2 weeks; initial target dose 100 mg daily in 2 divided doses; max. 15 mg/kg (max. 500 mg) daily

- Adjunctive therapy in epilepsy, initially 25–50 mg at night for 1 week then increased in steps of 25–50 mg taken in 2 divided doses at intervals of 1–2 weeks; usual dose 200–400 mg daily in 2 divided doses; max. 400 mg daily; CHILD 2–18 years, initially 1–3 mg/kg (max. 25 mg) at night for 1 week then increased in steps of 1–3 mg/kg (max. 50 mg) taken in 2 divided doses at intervals of 1–2 weeks; usual dose 5–9 mg/kg daily in 2 divided doses; max. 15 mg/kg (max. 400 mg) daily

- Migraine prophylaxis, ADULT over 18 years, initially 25 mg at night for 1 week then increased in steps of 25 mg at weekly intervals; usual dose 50–100 mg daily in 2 divided doses; max. 200 mg daily; CHILD 16–18 years see BNF for Children

Topiramate (Non-proprietary)

Tablets, topiramate 25 mg, net price 60-tab pack = £3.24; 50 mg, 60-tab pack = £2.94; 100 mg, 60-tab pack = £2.95; 200 mg, 60-tab pack = £16.35. Label: 3, 8, counselling, driving (see notes above)

Capsules (Sprinkle®), topiramate 15 mg, net price 60-cap pack = £14.79; 25 mg, 60-cap pack = £22.18; 50 mg, 60-cap pack = £36.45. Label: 3, 8, counselling, administration, driving (see notes above)

Note Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic topiramate product, see MHRA/CHM advice. p. 297

Valproate

Sodium valproate is effective in controlling tonic-clonic seizures, particularly in primary generalised epilepsy. It is a drug of choice in primary generalised tonic-clonic seizures, focal seizures, generalised absences and myoclonic seizures, and can be tried in atypical absence seizures. It is recommended as a first-line option in atomic and tonic seizures. Sodium valproate has widespread metabolic effects and monitoring of liver function tests and full blood count is essential (see Cautions below). Plasma-valproate concentrations are not a useful index of efficacy, therefore routine monitoring is unhelpful.

Valproic acid (as semi-sodium valproate) (section 4.2.3) is licensed for acute mania associated with bipolar disorder.

Valproate is associated with teratogenic risks—this should be fully considered and discussed before prescribing for women of child-bearing age (see Pregnancy, p. 299)

SODIUM VALPROATE

Indications all forms of epilepsy; migraine prophylaxis [unlicensed] (section 4.7.4.2); mania (section 4.2.3)

Cautions monitor liver function before therapy and during first 6 months especially in patients most at risk (see also below); measure full blood count and ensure no undue potential for bleeding before starting and before surgery; systemic lupus erythematosus; false-positive urine tests for ketones; avoid abrupt withdrawal; consider vitamin D supplementation in patients that are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium; interactions: see p. 298 and Appendix 1 (valproate)

Liver toxicity Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities).

Blood or hepatic disorders Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop

Pancreatitis Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea, or vomiting develop. Discontinue if pancreatitis is diagnosed

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular
Epilepsy.

**Dose**

- **Epilepsy**, by **mouth**, initially 600 mg daily in 1–2 divided doses, increased gradually (in steps of 150–300 mg) every 3 days; usual maintenance dose 1–2 g daily (20–30 mg/kg daily), max. 2.5 g daily; **CHILD** 1 month–12 years, initially 10–15 mg/kg (max. 600 mg) daily in 1–2 divided doses; usual maintenance dose 25–30 mg/kg daily in 2 divided doses

Initiation of valproate treatment by **intravenous administration**, **ADULT** and **CHILD** over 12 years, initially 10 mg/kg (usually 400–800 mg) by **intravenous injection** (over 3–5 minutes) followed by **intravenous infusion or intravenous injection** (over 3–5 minutes) in 2–4 divided doses or by **continuous intravenous infusion** up to max. 2.5 g daily; usual range 1–2 g daily (20–30 mg/kg daily); **CHILD** 1 month–12 years, 10 mg/kg by **intravenous injection** (over 3–5 minutes) followed by **intravenous infusion or intravenous injection** (over 3–5 minutes) in 2–4 divided doses or by **continuous intravenous infusion** up to usual range 20–40 mg/kg daily (doses above 40 mg/kg daily monitor clinical chemistry and haematological parameters)

Continuation of valproate treatment by **intravenous injection** (over 3–5 minutes) or **intravenous infusion** in 2–4 divided doses, or by **continuous intravenous infusion**, same as established oral daily dose

- **Migraine prophylaxis** [unlicensed], by **mouth**, initially 200 mg twice daily, increased if necessary to 1.2–1.5 g daily in divided doses

- **Mania**, see under **Epilepsia**

**Side-effects**

- nausea, gastric irritation, diarrhoea;

- disappearance of family history of severe hepatic dysfunction; acute porphyria (section 9.8.2)

- **Hepatic impairment** avoid if possible—hepatotoxicity and hepatic failure may occasionally occur (usually in first 6 months); avoid in active liver disease; see also under **Cautions**

- **Renal impairment** reduce dose

- **Pregnancy** see Pregnancy, p. 299; neonatal bleeding (related to hypofibrinaemia) and neonatal hepatotoxicity also reported

- **Breast-feeding** see Breast-feeding, p. 299

**Contra-indications**

- family history of severe hepatic dysfunction

**Note**

- Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic oral sodium valproate product, see MHRA/CHM advice, p. 297

- Note: Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic oral sodium valproate product, see MHRA/CHM advice, p. 297

**Oral**

- **Sodium Valproate** (Non-proprietary)

  - **Tablets** (crushable), scored, sodium valproate 100 mg, net price 100-tab pack = £0.60. Label: 8, 21, counselling, pancreatitis, blood, or hepatic disorder symptoms (see above), driving (see notes above)

  - **Tablets**, e/c, sodium valproate 200 mg, net price 100-tab pack = £4.00; 500 mg, 100-tab pack = £7.64. Label: 5, 8, 25, counselling, pancreatitis, blood, or hepatic disorder symptoms (see above), driving (see notes above)

  - **Oral solution**, sodium valproate 200 mg/5 mL, net price 300 mL = £9.33. Label: 8, 21, counselling, pancreatitis, blood, or hepatic disorder symptoms (see above), driving (see notes above)

  - **Note**: Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic oral sodium valproate product, see MHRA/CHM advice, p. 297

**Epilepsia**

- **Sodium Valproate** (Non-proprietary)

  - **Tablets** (crushable), scored, sodium valproate 100 mg, net price 100-tab pack = £0.60. Label: 8, 21, counselling, pancreatitis, blood, or hepatic disorder symptoms (see above), driving (see notes above)

  - **Tablets**, e/c, sodium valproate 200 mg, net price 100-tab pack = £4.00; 500 mg, 100-tab pack = £7.64. Label: 5, 8, 25, counselling, pancreatitis, blood, or hepatic disorder symptoms (see above), driving (see notes above)

  - **Oral solution**, sodium valproate 200 mg/5 mL, net price 300 mL = £9.33. Label: 8, 21, counselling, pancreatitis, blood, or hepatic disorder symptoms (see above), driving (see notes above)

  - **Note**: Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic oral sodium valproate product, see MHRA/CHM advice, p. 297

**Modified release**

- **Epilepsia**

  - **Sodium Valproate** (Non-proprietary)

    - **Tablets**, m/r, iliac, sodium valproate 200 mg (as sodium valproate and valproic acid), net price 100-tab pack = £11.65; 300 mg, 100-tab pack = £17.47; 500 mg, 100-tab pack = £29.10. Label: 8, 21, counselling, pancreatitis, blood, or hepatic disorder symptoms (see above), driving (see notes above)

    - **Note**: Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic oral sodium valproate product, see MHRA/CHM advice, p. 297

**Epilepsia**

- **Sodium Valproate** (Non-proprietary)

  - **Granules**, m/r, sodium valproate 50 mg (as sodium valproate and valproic acid), net price 30-sachet pack = £0.00; 100 mg, 30-sachet pack = £0.00; 250 mg, 30-sachet pack = £0.00; 500 mg, 30-sachet pack = £0.00; 750 mg, 30-sachet pack = £0.00; 1 g, 30-sachet pack = £0.00. Label: 8, 21, 25, counselling, administration, pancreatitis, blood, or...
hepatic disorder symptoms (see above), driving (see notes above)

**Dose**  
epilepsy, **ADULT** and **CHILD**, as above to the nearest whole 50-mg sachet; total daily dose given in 1–2 divided doses

**Counselling**  
Granules may be mixed with soft food or drink that is cold or at room temperature, and swallowed immediately without chewing

**Note**  
Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic oral sodium valproate product, see MHRA/CHM advice, p. 297

**Episenta®** (Deshion)  
**Capsules**, enclosing m/r granules, sodium valproate 150 mg, net price 100-cap pack = £7.00; 300 mg, 100-cap pack = £13.00. Label: 8, 21, 25, counselling, administration, pancreatitis, blood, or hepatic disorder symptoms (see above), driving (see notes above)

**Dose**  
epilepsy, **ADULT** and **CHILD**, as above, total daily dose given in 1–2 divided doses

**Mania, ADULT** over 18 years, initially 750 mg daily, adjusted according to response, usual dose 1–2 daily; doses greater than 45 mg/kg daily require careful monitoring; total daily dose given in 1–2 divided doses

**Counselling**  
Contents of capsule may be mixed with cold soft food or drink and swallowed immediately without chewing

**Granules**, m/r, sodium valproate 500 mg, net price 100-sachet pack = £21.00; 1 g, 100-sachet pack = £41.00. Label: 8, 21, 25, counselling, administration, pancreatitis, blood, or hepatic disorder symptoms (see above), driving (see notes above)

**Dose**  
epilepsy, **ADULT** and **CHILD**, as above, total daily dose given in 1–2 divided doses

**Mania, ADULT** over 18 years, initially 750 mg daily, adjusted according to response, usual dose 1–2 daily; doses greater than 45 mg/kg daily require careful monitoring; total daily dose given in 1–2 divided doses

**Counselling**  
Granules may be mixed with cold soft food or drink and swallowed immediately without chewing

**Note**  
Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic oral sodium valproate product, see MHRA/CHM advice, p. 297

**Epival®** (Chanelle Medical)  
**Tablets**, m/r, scored, sodium valproate 300 mg, net price 100-tab pack = £12.13; 1 g, 100-tab pack = £20.21. Label: 8, 21, 25, counselling, administration, pancreatitis, blood, or hepatic disorder symptoms (see above), driving (see notes above)

**Dose**  
epilepsy, **ADULT** and **CHILD**, as above, total daily dose given in 1–2 divided doses

**Mania, ADULT** over 18 years, initially 750 mg daily, adjusted according to response, usual dose 1–2 daily; doses greater than 45 mg/kg daily require careful monitoring; total daily dose given in 1–2 divided doses

**Counselling**  
Tablets may be halved but not crushed or chewed

**Note**  
Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic oral sodium valproate product, as described in Appendix 1 (vigabatrin)
BNF 68

hepatitis, optic neuritis, optic atrophy; also reported movement disorders in infantile spasms

**Dose**

- With current antiepileptic therapy, by mouth initially 1 g daily in single or 2 divided doses then increased according to response in steps of 500 mg at weekly intervals; usual range 2–5 g daily (max. 3 g daily);
- **NEONATE** initially 15–20 mg/kg twice daily, increased over 2–3 weeks to usual maintenance dose 30–40 mg/kg twice daily; max. 75 mg/kg twice daily;
- **CHILD** 1 month–12 years, initially 15–20 mg/kg (max. 250 mg) twice daily increased over 2–3 weeks to usual maintenance dose 30–40 mg/kg twice daily (1 month–2 years, max. 75 mg/kg twice daily; 2–12 years, max. 1.5 g twice daily); **CHILD** 12–18 years, initially 250 mg twice daily increased over 2–3 weeks to usual maintenance dose 1–1.5 g twice daily

- **By rectum**, [unlicensed route] **CHILD** 1 month–18 years, dose as for oral therapy, see above

**Note** Dissolve contents of sachet in small amount of water and administer rectally [unlicensed]

- Infantile spasms (West’s syndrome), **monotherapy**, **NEONATE** and **CHILD**, initially 15–25 mg/kg twice daily, adjusted according to response over 7 days to usual maintenance dose 40–50 mg/kg twice daily; max. 75 mg/kg twice daily

**Note** Neonate and child vigabatrin doses in BNF may differ from those in product literature

**Sabbril** (Sanofi-Aventis)®

**Tablets**, 1/3, scored, vigabatrin 500 mg, net price 100-tab pack = £37.01. Label: 3, 8, counselling, driving (see notes above)

**Note** Tablets may be crushed and dispersed in liquid [unlicensed use]

**Granules**, sugar-free, vigabatrin 500 mg/sachet. Net price 50-sachet pack = £20.50. Label: 3, 8, 13, counselling, driving (see notes above)

**Note** The contents of a sachet should be dissolved in water or a soft drink immediately before swallowing; may also be dissolved in a small amount of water and administered rectally [unlicensed use]

**Zonisamide**

Zonisamide can be used alone for the treatment of focal seizures with or without secondary generalisation in adults with newly diagnosed epilepsy, and as adjunctive treatment for refractory focal seizures with or without secondary generalisation in adults and children aged 6 years and above. It can also be used under the supervision of a specialist for refractory absence and myoclonic seizures [unlicensed indications].

The Scottish Medicines Consortium (p. 4) has advised (February 2014) that zonisamide (Zonegran®) is accepted for restricted use within NHS Scotland as adjunctive treatment of focal seizures, with or without secondary generalisation, in adolescents and children aged 6 years and above. It is restricted to use on advice from specialists in paediatric neurology or epilepsy.

### 4.8.1 Control of the epilepsies 315

**Indications** for use in children; metabolic acidosis—monitor serum bicarbonate concentration in children and those with other risk factors (consider dose reduction or discontinuation if metabolic acidosis develops); avoid abrupt withdrawal (consult product literature for recommended withdrawal regimens in children); low body-weight or poor appetite—monitor weight throughout treatment (fatal cases of weight loss reported in children); **interactions**: see p. 298 and Appendix 1 (zonisamide)

**Switching between formulations** Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history (see also MHRA/CHM advice, p. 297)

**Contra-indications** hypersensitivity to sulfonamides; concomitant use of drugs that increase risk of hyperthermia or metabolic acidosis in children

**Hepatic impairment** initially increase dose at 2-week intervals if mild or moderate impairment; avoid in severe impairment

**Renal impairment** initially increase dose at 2-week intervals; discontinue if renal function deteriorates

**Pregnancy** manufacturer advises women of childbearing potential should use adequate contraception during treatment and for 4 weeks after last dose; see also Pregnancy, p. 299

**Breast-feeding** manufacturer advises avoid for 4 weeks after last dose; see also Breast-feeding, p. 299

**Side-effects** nausea, diarrhoea, abdominal pain, constipation, dyspepsia, anorexia, weight loss, peripheral oedema, drowsiness, dizziness, confusion, agitation, irritability, depression, psychosis, ataxia, speech disorder, impaired memory and attention, fatigue, nystagmus, paraesthesia, tremor, pyrexia, insomnia, diplopia, ecchymosis, alopecia, pruritus, rash (consider withdrawal); less common vomiting, cholelithiasis, cholecystitis, aggression, suicidal ideation, seizures, pneumonia, urinary tract infection, urinary calculus, hypokalaemia; very rarely hepatitis, pancreatitis, aspiration, dyspnkea, hallucinations, amenia, coma, myasthenic syndrome, neuroleptic malignant syndrome, heat stroke, hydogrephosis, renal failure, metabolic acidosis, renal tubular acidosis, blood disorders, rhabdomyolysis, impaired sweating, Stevens-Johnson syndrome, and toxic epidermal necrolysis

**Dose**

- **Monotherapy**, **ADULT** over 18 years, initially 100 mg once daily for 2 weeks, increased by 100 mg at 2-week intervals to usual maintenance 300 mg once daily; max. 500 mg daily

- **Adjunctive therapy**, **ADULT** over 18 years, initially 50 mg daily in 2 divided doses, increased after 7 days to 100 mg daily in 2 divided doses; then increased by 100 mg every 7 days; usual maintenance 300–500 mg daily in 1–2 divided doses; **CHILD** 6–18 years, initially 1 mg/kg once daily for 7 days, then increased by 1 mg/kg every 7 days; usual maintenance, body-weight 20–55 kg, 6–8 mg/kg once daily (max. 500 mg once daily), body-weight 55 kg, 300–500 mg once daily

**Note** In adjunctive therapy, increase dose at 2-week intervals in patients who are not receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inductors of cytochrome P450 enzyme CYP3A4

Counselling. Children and their carers should be made aware of how to prevent and recognise overheating and dehydration
4.8.1 Control of the epilepsies

**Zonegran® (Eisai)**

*Capsules*, zoisamide 25 mg (white), net price 14-cap pack = £8.82; 50 mg (white/grey), 56-cap pack = £47.04; 100 mg (white/red), 56-cap pack = £62.72.

*Note* Patients may need to be maintained on a specific manufacturer’s branded or generic zoisamide product, see MHRA/CHM advice, p. 297

### CLONAZEPAM

**Indications**

All forms of epilepsy; myoclonus

**Cautions**

See notes above; elderly and debilitated patients, respiratory disease, airways obstruction, spinal or cerebellar ataxia, brain damage, history of alcohol or drug abuse, depression or suicidal ideation; avoid sudden withdrawal (risk of withdrawal symptoms and rebound seizures); myasthenia gravis (avoid if unstable); acute porphyria (section 9.8.2); interactions: Appendix 1 (anxiolytics and hypnotics)

**Driving**

Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Switching between formulations**

Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history (see also MHRA/CHM advice, p. 297)

**Contra-indications**

Respiratory depression; acute pulmonary insufficiency; sleep apnoea syndrome; marked neuromuscular respiratory weakness including unstable myasthenia gravis; coma; current alcohol or drug abuse

**Hepatic impairment**

See Benzodiazepines, section 4.1.2

**Renal impairment**

See Benzodiazepines, section 4.1.2

**Pregnancy**

See Pregnancy, section 4.1.2

**Breast-feeding**

See Benzodiazepines, section 4.1.2

**Side-effects**

Drowsiness, fatigue, dizziness, muscle hypotonia, co-ordination disturbances; also poor concentration, restlessness, confusion, amnesia, dependence; salivary or bronchial hypersecretion in infants and small children; nystagmus; rarely gastrointestinal symptoms, respiratory depression, headache, paradoxical effects including aggression and anxiety, sexual dysfunction, urinary incontinence, urticaria, pruritus, reversible hair loss, skin pigmentation changes; dysarthria, and visual disturbances on long-term treatment; blood disorders reported; suicidal ideation; very rarely increase in seizure frequency; overdosage: see Emergency Treatment of Poisoning, p. 39

**Dose**

1 mg (elderly 500 micrograms) initially at night for 4 nights, increased according to response over 2–4 weeks to usual maintenance dose of 4–8 mg usually at night (may be given in 3–4 divided doses if necessary). Child up to 1 year, initially 250 micrograms increased as above to usual maintenance dose of 0.5–1 mg, 1–5 years, initially 250 micrograms increased as above to 1–3 mg, 5–12 years, initially 500 micrograms increased as above to 3–6 mg

*Note* Clonazepam doses in BNF may differ from those in product literature

**Clonazepam (Non-proprietary)**

*Tablets*, clonazepam 10 mg. Net price 30-tab pack = £2.66. Label: 2 or 19, 8, counselling, driving (see notes above)

**Brands include**

*Frisium®*

*Oral suspension*, clonazepam 5 mg/5 mL, net price 150 mL = £115.61; 10 mg/5 mL, net price 150 mL = £120.25. Label: 2, 19, 8, counselling, driving (see notes above)

**Brands include**

*Tapclob®*

*Note* Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic clonazepam product, see MHRA/CHM advice, p. 297
4.8.2 Drugs used in status epilepticus

Convulsive status epilepticus Immediate measures to manage status epilepticus include positioning the patient to avoid injury, supporting respiration including the provision of oxygen, maintaining blood pressure, and the correction of any hypoglycaemia. Parenteral thiamine should be considered if alcohol abuse is suspected; pyridoxine (section 9.6.2) should be given if the status epilepticus is caused by pyridoxine deficiency.

Seizures lasting longer than 5 minutes should be treated urgently with intravenous lorazepam (repeated once after 10 minutes if seizures recur or fail to respond). Intravenous diazepam is effective but it carries a high risk of thrombophlebitis (reduced by using an emulsion formulation). Absorption of diazepam from intramuscular injection or from suppositories is too slow for treatment of status epilepticus. Patients should be monitored for respiratory depression and hypotension.

Where facilities for resuscitation are not immediately available, diazepam can be administered as a rectal solution or midazolam oromucosal solution can be given into the buccal cavity.

Phenytoin sodium can be given by slow intravenous injection, followed by the maintenance dosage if appropriate; monitor ECG and blood pressure and reduce rate of administration if bradycardia or hypotension occurs. Intramuscular phenytoin should not be used (absorption is too slow and erratic).

Alternatively, fosphenytoin (a pro-drug of phenytoin), can be given more rapidly and when given intravenously causes fewer injection-site reactions than phenytoin. Intravenous administration requires ECG monitoring. Although it can also be given intramuscularly, absorption is too slow by this route for treatment of status epilepticus. Doses of fosphenytoin should be expressed in terms of phenytoin sodium.

For advice on the management of epileptic seizures in dental practice, see p. 28.

Non-convulsive status epilepticus The urgency to treat non-convulsive status epilepticus depends on the severity of the patient’s condition. If there is incomplete loss of awareness, usual oral antiepileptic therapy should be continued or restarted. Patients who fail to respond to oral antiepileptic therapy or have complete lack of awareness can be treated in the same way as for convulsive status epilepticus, although anaesthesia is rarely needed.

DIAZEPAM

Indications status epilepticus; febrile convulsions (section 4.8.3); convulsions due to poisoning (see p. 34); other indications (section 4.1.2, section 10.2.2, and section 15.1.4.1)

Cautions see Diazepam, section 4.1.2; when given intravenously facilities for reversing respiratory depression with mechanical ventilation must be immediately available (but see also notes above)

Contra-indications see Diazepam, section 4.1.2

Hepatic impairment see Benzodiazepines, section 4.1.2

Renal impairment see Benzodiazepines, section 4.1.2

Pregnancy see Benzodiazepines, section 4.1.2, and Pregnancy, p. 299

Breast-feeding see Benzodiazepines, section 4.1.2

Side-effects see Diazepam, section 4.1.2; hypotension and apnoea

Dose

• Status epilepticus (but see notes above), febrile convulsions, and convulsions due to poisoning, by intravenous injection, 10 mg at a rate of 1 mL (5 mg) per minute, repeated once after 10 minutes if necessary; CHILD under 12 years, 300–400 micrograms/kg (max. 10 mg) [unlicensed dose], repeated once after 10 minutes if necessary.

By rectum as rectal solution, ADULT and CHILD over 12 years, 10–20 mg, repeated once after 10–15 minutes if necessary; ELDERLY 10 mg; NEONATE [unlicensed] 1.25–2.5 mg; CHILD 1 month–1 year [unlicensed] 5 mg; 1–2 years 5 mg; 2–12 years 5–10 mg

Diazepam (Non-proprietary) (DD4.1)

Injection (solution), diazepam 5 mg/mL. See Appendix 4. Net price 2-mL amp = 45p

Excipients may include benzyl alcohol (avoid in neonates, see Excipients, p. 2); ethanol, propylene glycol

Injection (emulsion), diazepam 5 mg/mL (0.5%). See Appendix 4. Net price 2-mL amp = 91p

Brands include Dexamethas®

Rectal tubes (= rectal solution), diazepam 2 mg/mL, net price 1.25-mL (2.5-mg) tube = £1.13, 2.5-mL (5-mg) tube = £1.09, 4 mg/mL, 2.5-mL (10-mg) tube = £1.37

Brands include Diazepam Desitin®, Diazepam Rectubes®, Stesolid®

FOSPHENYTOIN SODIUM

Note Fosphenytoin is a pro-drug of phenytoin

Indications status epilepticus; seizures associated with neurosurgery or head injury; when phenytoin by mouth not possible
### Cautions
see Phenytoin Sodium; resuscitation facilities must be available; interactions: see p. 298 and Appendix 1 (phenytoin)

### Contra-indications
see Phenytoin Sodium

### Hepatic impairment
consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus)

### Renal impairment
consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus)

### Pregnancy
see Phenytoin, section 4.8.1, and Pregnancy, p. 299

### Breast-feeding
see Breast-feeding, p. 299

### Side-effects
see Phenytoin Sodium; also dry mouth, see Breast-feeding, p. 299

### Breast-feeding
see Breast-feeding, p. 299

### Pregnancy
see Phenytoin, section 4.8.1, and Pregnancy, p. 299

### Renal impairment
consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus)

### Cautions
see Phenytoin Sodium; also dry mouth, taste disturbance, vasodilatation, an asthma, dysarthria, euphoria, incoordination, chills, visual disturbances, tinnitus, pruritus, ecchymosis; less commonly hypoaesthesia, increased or decreased reflexes, stupor, muscle weakness, muscle spasm, pain, hypoacusis, also reported extrapyramidal disorder, twitching, confusion, hyperglycaemia

important Intravenous infusion of fosphenytoin has been associated with severe cardiovascular reactions including asystole, ventricular fibrillation, and cardiac arrest. Hypotension, bradycardia, and heart block have also been reported. The following are recommended:

- monitor heart rate, blood pressure, and respiratory function for duration of infusion;
- observe patient for at least 30 minutes after infusion;
- if hypotension occurs, reduce infusion rate or discontinue;
- reduce dose or infusion rate in elderly, and in renal or hepatic impairment.

### Dose

**Note**
Prescriptions for fosphenytoin sodium should state the dose in terms of phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg ≡ phenytoin sodium 1 mg

- Status epilepticus, by intravenous infusion (at a rate of 100–150 mg PE/kg/minute), initially 20 mg PE/kg then by intravenous infusion (at a rate of 50–100 mg PE/kg/minute), 4–5 mg PE/kg daily in 1–2 divided doses, dose adjusted according to response and trough plasma-phenytoin concentration

  **CHILD** 5 years and over, by intravenous infusion (at a rate of 2–3 mg/kg/minute), initially 20 mg PE/kg then by intravenous infusion (at a rate of 1–2 mg/kg/minute), 4–5 mg PE/kg daily in 1–4 divided doses, dose adjusted according to response and trough plasma-phenytoin concentration

- Prophylaxis or treatment of seizures associated with neurosurgery or head injury, by intramuscular injection or by intravenous infusion (at a rate of 50–100 mg PE/kg/minute), initially 10–15 mg PE/kg then by intramuscular injection or by intravenous infusion (at a rate of 50–100 mg PE/kg/minute), 4–5 mg PE/kg daily (in 1–2 divided doses), dose adjusted according to response and trough plasma-phenytoin concentration

  **CHILD** 5 years and over, by intravenous infusion (at a rate of 1–2 mg/kg/minute), initially 10–15 mg PE/kg then 4–5 mg PE/kg daily in 1–4 divided doses, dose adjusted according to response and trough plasma-phenytoin concentration

- Temporary substitution for oral phenytoin, by intramuscular injection or by intravenous infusion (at a rate of 50–100 mg PE/kg/minute), same dose and dosing frequency as oral phenytoin therapy; **CHILD** 5 years and over, by intravenous infusion (at a rate of 1–2 mg PE/kg/minute, max. 100 mg PE/minute), same dose and dosing frequency as oral phenytoin therapy

**Note**
ELDERLY consider 10–25% reduction in dose or infusion rate

**Note**
Fosphenytoin sodium doses in BNF may differ from those in product literature

### Pro-Epanutin® (Pfizer) (PE)
Injection, fosphenytoin sodium 75 mg/mL (equivalent to phenytoin sodium 50 mg/mL), net price 10 mL vial = £40.00

### Electrolytes
phosphate 3.7 micromol/mg fosphenytoin sodium (phosphate 5.6 micromol/mg phenytoin sodium)

### LORAZEPAM

**Indications**
status epilepticus; febrile convulsions (section 4.8.3); convulsions due to poisoning (see p. 34); other indications (section 4.1.2 and section 15.1.4.1)

**Cautions**
see Diazepam, section 4.1.2; when given intravenously facilities for reversing respiratory depression with mechanical ventilation must be immediately available (but see also notes above)

**Contra-indications**
see Diazepam, section 4.1.2

### Hepatic impairment
see Benzodiazepines, section 4.1.2

### Renal impairment
see Benzodiazepines, section 4.1.2

### Pregnancy
see Benzodiazepines, section 4.1.2, and Pregnancy, p. 299

### Breast-feeding
see Benzodiazepines, section 4.1.2

### Side-effects
see Diazepam, section 4.1.2

### Dose

- By slow intravenous injection (into large vein), 4 mg repeated once after 10 minutes if necessary; **CHILD** under 12 years 100 micrograms/kg (max. 4 mg) repeated once after 10 minutes if necessary

### Preparations
Section 4.1.2

### MIDAZOLAM

**Indications**
status epilepticus; febrile convulsions [unlicensed] (section 4.8.3); other indications (section 15.1.4.1)

**Cautions**
see Midazolam, section 15.1.4.1

**Contra-indications**
see Midazolam, section 15.1.4.1

### Hepatic impairment
use with caution in mild to moderate impairment; avoid in severe impairment

### Renal impairment
use with caution in chronic renal failure

**Pregnancy**
see Midazolam, section 15.1.4.1, and Pregnancy, p. 299

### Breast-feeding
amount probably too small to be harmful after single doses

**Side-effects**
see Midazolam, section 15.1.4.1; also depression of consciousness

**Dose**

- By buccal administration, **ADULT** over 18 years [unlicensed], 10 mg repeated once after 10 minutes if necessary; **CHILD** up to 3 months [unlicensed], 300 micrograms/kg (max. 2.5 mg), 3 months+ 1 year 2.5 mg, 1–5 years 5 mg, 5–10 years 7.5 mg, 10–18 years 10 mg; these doses may be repeated once after 10 minutes if necessary

**Note**
Midazolam injection solution may be given by buccal administration [unlicensed indication]
4.8.3 Febrile convulsions

Brief febrile convulsions need no specific treatment; antipyretic medication (e.g., paracetamol, section 4.7.1) is commonly used to reduce fever and prevent further convulsions but evidence to support this practice is lacking. Prolonged febrile convulsions (those lasting 5 minutes or longer), or recurrent febrile convulsions without recovery must be treated actively (as for convulsive status epilepticus, section 4.8.2).

Long-term anticonvulsant prophylaxis for febrile convulsions is rarely indicated.

4.9 Drugs used in parkinsonism and related disorders

4.9.1 Dopaminergic drugs used in Parkinson’s disease

4.9.2 Antimuscarinic drugs used in parkinsonism

4.9.3 Drugs used in essential tremor, chorea, tics, and related disorders

Parkinson’s disease

In idiopathic Parkinson’s disease, the progressive degeneration of pigmented neurones in the substantia nigra leads to a deficiency of the neurotransmitter dopamine. The resulting neurochemical imbalance in the basal ganglia causes the characteristic signs and symptoms of the illness. Drug therapy does not prevent disease progression, but it improves most patients’ quality of life.

Patients with suspected Parkinson’s disease should be referred to a specialist to confirm the diagnosis; the diagnosis should be reviewed every 6–12 months. Features resembling those of Parkinson’s disease can occur in diseases such as progressive supranuclear palsy and multiple system atrophy, but they do not correspond to Parkinson’s disease.
normally show a sustained response to the drugs used in the treatment of idiopathic Parkinson’s disease.

When initiating treatment, patients should be advised about its limitations and possible side-effects. About 5–10% of patients with Parkinson’s disease respond poorly to treatment.

Treatment is usually not started until symptoms cause significant disruption of daily activities. **Levodopa** (p. 324), non-ergot-derived dopamine-receptor agonists (below), or monoamine-oxidase-B inhibitors (p. 327) can be prescribed for initial treatment in early Parkinson’s disease. Therapy with two or more antiparkinsonian drugs may be necessary as the disease progresses. Most patients eventually require levodopa and subsequently develop motor complications.

**Elderly** Antiparkinsonian drugs can cause confusion in the elderly. It is particularly important to initiate treatment with low doses and to increase the dose gradually.

### Dopaminergic drugs used in Parkinson’s disease

#### Dopamine-receptor agonists

The dopamine-receptor agonists have a direct action on dopamine receptors. Initial treatment of Parkinson’s disease is often with the dopamine-receptor agonists pramipexole, ropinirole, and rotigotine. The ergot-derived dopamine-receptor agonists bromocriptine, cabergoline, and pergolide are rarely used because of the risk of fibrotic reactions (see notes below).

When used alone, dopamine-receptor agonists cause fewer motor complications in long-term treatment compared with levodopa treatment but the overall motor performance improves slightly less. The dopamine-receptor agonists are associated with more psychiatric side-effects than levodopa.

Dopamine-receptor agonists are also used with levodopa in more advanced disease. If a dopamine-receptor agonist is added to levodopa therapy, the dose of levodopa needs to be reduced (see individual monographs).

### Impulse control disorders

Treatment with dopamine-receptor agonists and levodopa is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist or levodopa should be withdrawn or the dose reduced until the symptoms resolve.

**Apopomorphine** is a potent dopamine-receptor agonist that is sometimes helpful in advanced disease for patients experiencing unpredictable ‘off’ periods with levodopa treatment. Apomorphine should be initiated in a specialist clinic. After an overnight withdrawal of oral antiparkinsonian medication to induce an ‘off’ episode, the threshold dose of apomorphine is determined. Oral antiparkinsonian medication is then restarted. The patient must be taught to self-administer apomorphine by subcutaneous injection into the lower abdomen or outer thigh at the first sign of an ‘off’ episode. Once treatment has been established it may be possible to gradually reduce other antiparkinsonian medications. Treatment with apomorphine should remain under specialist supervision.

#### Fibrotic reactions

Ergot-derived dopamine-receptor agonists, bromocriptine, cabergoline, and pergolide, have been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions.

Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson’s disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking cabergoline or pergolide should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

#### Driving

**Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with co-careldopa, co-beneldopa, and dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring. Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions** Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

#### Apomorphine hydrochloride

**Indications** refractory motor fluctuations in Parkinson’s disease (‘off’ episodes) inadequately controlled by co-beneldopa or co-careldopa or other dopaminergics (for capable and motivated patients under specialist supervision).

**Cautions** see notes above; pulmonary disease, cardiovascular disease, history of postural hypotension (special care on initiation); susceptibility to
QT-interval prolongation; neuropsychiatric conditions; monitor hepatic, haemopoietic, renal, and cardiovascular function; with concomitant levodopa test initially and every 6 months for haemolytic anaemia and thrombocytopenia (development calls for specialist haematological care with dose reduction and possible discontinuation); interactions: Appendix 1

**Contra-indications** respiratory depression, dementia, hypersensitivity to opioids, psychosis; avoid if ‘on’ response to levodopa marred by severe dyskinesia or dystonia

**Hepatic impairment** avoid

**Renal impairment** use with caution

**Pregnancy** avoid unless clearly necessary

**Breast-feeding** no information available; may suppress lactation

**Side-effects** see notes above; also nausea, vomiting (see notes above); yawning; drowsiness (including sudden onset of sleep), confusion, hallucinations; less commonly postural hypotension, dyspnoea, dyskinesia during ‘on’ periods (may require discontinuation), haemolytic anaemia and thrombocytopenia with levodopa (see Cautions), and rash; rarely eosinophilia; peripheral oedema, compulsive behaviour (see notes above), and dizziness also reported

**Dose**

- By subcutaneous injection, ADULT over 18 years, to determine threshold dose (see also notes above), initially 1 mg at the first sign of ‘off’ episode; if inadequate or no response after 30 minutes, then a further 2 mg should be given; thereafter increase dose at minimum 40-minute intervals until satisfactory response obtained; usual range 3–30 mg daily in divided doses; subcutaneous infusion may be preferable in those requiring division of injections into more than 10 doses daily; max. single dose 10 mg

- By continuous subcutaneous infusion, ADULT over 18 years, (those requiring division into more than 10 injections daily) initially 1 mg/hour increased according to response (not more often than every 4 hours) in max. steps of 500 micrograms/hour, to usual rate of 1–4 mg/hour (15–60 micrograms/kg/hour); change infusion site every 12 hours and give during waking hours only (tolerance may occur unless there is a 4-hour treatment-free period at night—24-hour infusions not recommended unless severe night-time symptoms); intermittent bolus doses may be needed

**Note** Total daily dose by either route (or combined routes) max. 100 mg

Apomorphine (Non-proprietary) **Injection**, apomorphine hydrochloride 10 mg/mL, net price 2-mL amp = £6.07, 5-mL amp = £11.70. Label: 10, counselling, driving, see notes above

APO-go® (Genus) **Injection**, apomorphine hydrochloride 10 mg/mL, net price 2-mL amp = £7.59, 5-mL amp = £14.62. Label: 10, counselling, driving, see notes above

**Excipients** include sulphates

**Injection (APO-go® Pen)**, apomorphine hydrochloride 10 mg/mL, net price 3-mL pen injector = £24.78. Label: 10, counselling, driving, see notes above

**Excipients** include sulphates

**Injection (APO-go® PFS)**, apomorphine hydrochloride 5 mg/mL, net price 10-mL prefilled syringe = £14.62. Label: 10, counselling, driving, see notes above

**Excipients** include sulphates

**BROMOCRIP TINE**

**Indications** Parkinson’s disease; endocrine disorders (section 6.7.1)

**Cautions** see Bromocriptine in section 6.7.1 and notes above

**Contra-indications** see Bromocriptine, section 6.7.1

**Hepatic impairment** see Bromocriptine, section 6.7.1

**Pregnancy** see Bromocriptine, section 6.7.1

**Breast-feeding** see Bromocriptine, section 6.7.1

**Side-effects** see notes above and Bromocriptine, section 6.7.1

**Dose**

- First week 1–1.25 mg at night, second week 2–2.5 mg at night, third week 2.5 mg twice daily, fourth week 2.5 mg 3 times daily then increasing by 2.5 mg every 3–14 days according to response to a usual range of 10–30 mg daily

**Preparations** Section 6.7.1

**CABERGOLINE**

**Indications** alone or as adjunct to co-beneldopa or cocareldopa in Parkinson’s disease where dopamine-receptor agonists other than ergot derivative not appropriate; endocrine disorders (section 6.7.1)

**Cautions** see Cabergoline in section 6.7.1 and notes above

**Contra-indications** see Cabergoline, section 6.7.1

**Hepatic impairment** see Cabergoline, section 6.7.1

**Pregnancy** see Cabergoline, section 6.7.1

**Breast-feeding** see Cabergoline, section 6.7.1

**Side-effects** see notes above and Cabergoline, section 6.7.1

**Dose**

- Initially 1 mg daily, increased by increments of 0.5–1 mg at 7 or 14 day intervals; max. 3 mg daily

**Note** Concurrent dose of levodopa may be decreased gradually while dose of cabergoline is increased

**Cabergoline** (Non-proprietary) **Tablets**, scored, cabergoline 1 mg, net price 20-tab pack = £60.02; 2 mg, 20-tab pack = £71.76. Label: 10, 21, counselling, driving, see notes above

**Note** Dispense in original container (contains desiccant)

**Cabaser®** (Pharmacia) **Tablets**, scored, cabergoline 1 mg, net price 20-tab pack = £83.00; 2 mg, 20-tab pack = £83.00. Label: 10, 21, counselling, driving, see notes above

**Note** Dispense in original container (contains desiccant)

**PERGOLIDE**

**Indications** alone or as adjunct to co-beneldopa or cocareldopa in Parkinson’s disease where dopamine-receptor agonists other than ergot derivative not appropriate

**Cautions** see notes above; arrhythmias or underlying cardiac disease; history of confusion, psychosis, or hallucinations, dyskinesia (may exacerbate); acute porphyria (section 9.8.2); interactions: Appendix 1 (pergolide)

**Contra-indications** history of fibrotic disorders; cardiac valvulopathy (exclude before treatment, see Fibrotic Reactions, p. 320)

**Pregnancy** use only if potential benefit outweighs risk
Breast-feeding may suppress lactation

Side-effects see notes above; also nausea, vomiting, dyspepsia, abdominal pain; dyspnoea, rhinitis; hallucinations, dyskinesia, drowsiness (including sudden onset of sleep, see p. 320); diplopia; also reported constipation, diarrhoea, hiccup, tachycardia, atrial premature contractions, palpitation; hypotension, syncope, Raynaud’s phenomenon, compulsive behaviour (see notes above), insomnia, confusion, dizziness, fever, erythromelalgia, and rash

Dose

- Monotherapy, 50 micrograms at night on day 1, then 50 micrograms twice daily on days 2–4, then increased by 100–250 micrograms daily every 3–4 days to 1 mg daily in 3 divided doses at day 28; after day 30, further increases every 3–4 days of up to 250 micrograms daily; usual maintenance dose 2.1–2.5 mg daily; max. 3 mg daily

- Adjunctive therapy with levodopa, 50 micrograms daily for 2 days, increased gradually by 100–150 micrograms every 3 days over next 12 days, usually given in 3 divided doses; further increases of 250 micrograms every 3 days; max. 3 mg daily

Note: During pergolide titration levodopa dose may be reduced cautiously

**Pergolide** (Non-proprietary) Tablets, pergolide (as mesilate) 50 micrograms, net price 100-tab pack = £31.82; 250 micrograms, 100-tab pack = £35.45; 1 mg, 100-tab pack = £125.53. Label: 10, counselling, driving, see notes above

## PRAMIPEXOLE

**Indications** Parkinson’s disease, used alone or as an adjunct to co-beneldopa or co-careldopa; moderate to severe restless legs syndrome

**Cautions** see notes above; psychotic disorders; ophthalmological testing recommended (risk of visual disorders); severe cardiovascular disease; risk of postural hypotension (especially on initiation)—monitor blood pressure; **interactions**: Appendix 1 (pramipexole)

**Renal impairment**

- for immediate-release tablets in Parkinson’s disease, initially 88 micrograms twice daily (max. 1.57 mg daily in 2 divided doses) if eGFR 20–50 mL/min/1.73 m²; initially 88 micrograms once daily (max. 1.1 mg once daily) if eGFR less than 20 mL/min/1.73 m²; if renal function declines during treatment, reduce dose by the same percentage as the decline in eGFR

- for immediate-release tablets in restless legs syndrome, reduce dose if eGFR less than 20 mL/min/1.73 m²

- for modified-release tablets, initially 260 micrograms on alternate days if eGFR 30–50 mL/min/1.73 m², increased to 260 micrograms once daily after 1 week, further increased if necessary by 260 micrograms daily at weekly intervals to max. 1.57 mg daily; avoid if eGFR less than 30 mL/min/1.73 m²

**Pregnancy** use only if potential benefit outweighs risk—no information available

**Breast-feeding** may suppress lactation; avoid—present in milk in animal studies

**Side-effects** see notes above; also nausea, constipation, vomiting, weight changes, decreased appetite, hypotension (including postural hypotension), peripheral oedema, dizziness, dyskinesia, hyperkinesia, drowsiness (including sudden onset of sleep, see p. 320), headache, sleep disturbances, confusion, hallucinations, restlessness, visual disturbances; less commonly hiccup, cardiac failure, syncope, pneumonia, dyspnoea, binge eating, compulsive behaviour (see notes above), amnesia, delusion, paranoia, pruritus, rash; also reported paradoxical worsening of restless legs syndrome

**Dose** Important Doses and strengths are stated in terms of pramipexole (base); equivalent strengths in terms of pramipexole dihydrochloride monohydrate (salt) are as follows:

- 88 micrograms base = 125 micrograms salt;
- 180 micrograms base = 250 micrograms salt;
- 350 micrograms base = 500 micrograms salt;
- 700 micrograms base = 1 mg salt

- Parkinson’s disease, **ADULT** over 18 years, initially 88 micrograms 3 times daily, dose doubled every 5–7 days if tolerated to 350 micrograms 3 times daily, further increased if necessary by 180 micrograms 3 times daily at weekly intervals; max. 3.3 mg daily in 3 divided doses

**Note** During dose titration and maintenance, levodopa dose may be reduced

- Restless legs syndrome, **ADULT** over 18 years, initially 88 micrograms once daily 2–3 hours before bedtime, dose doubled every 4–7 days if necessary; max. 540 micrograms daily

**Note** Repeat dose titration if restarting treatment after an interval of more than a few days

**Pramipexole** (Non-proprietary) Tablets, pramipexole 88 micrograms, net price 30-tab pack = £4.45; 180 micrograms, 30-tab pack = £2.63, 100-tab pack = £8.76; 350 micrograms 30-tab pack = £20.34, 100-tab pack = £32.95, 700 micrograms, 30-tab pack = £4.22, 100-tab pack = £14.06. Label: 10, counselling, driving, see notes above

**Mirapexin®** (Boehringer Ingelheim) Tablets, pramipexole 88 micrograms, net price 30-tab pack = £11.24; 180 micrograms (scored), 30-tab pack = £22.49, 100-tab pack = £74.95; 350 micrograms (scored), 30-tab pack = £44.97, 100-tab pack = £149.90; 700 micrograms (scored), 30-tab pack = £89.94, 100-tab pack = £299.82. Label: 10, counselling, driving, see notes above

**Mirapexin® Prolonged Release** (Boehringer Ingelheim) Tablets, m/r, pramipexole 260 micrograms, net price 30-tab pack = £30.08; 520 micrograms, 30-tab pack = £60.17; 1.05 mg, 30-tab pack = £129.96; 1.57 mg, 30-tab pack = £202.36; 2.1 mg, 30-tab pack = £259.91; 2.62 mg, 30-tab pack = £337.27; 3.15 mg, 30-tab pack = £414.87; 5.25 mg, 30-tab pack = £540.54. Label: 10, 25, counselling, driving, see notes above

**Important** Doses and strengths are stated in terms of pramipexole (base); equivalent strengths in terms of pramipexole dihydrochloride monohydrate (salt) are as follows:

- 250 micrograms base = 375 micrograms salt;
- 520 micrograms base = 750 micrograms salt;
- 1.05 mg base = 1.5 mg salt;
- 1.57 mg base = 2.25 mg salt;
- 2.1 mg base = 3 mg salt;
- 2.62 mg base = 3.75 mg salt;
- 3.15 mg base = 4.5 mg salt

**Dose** Parkinson’s disease (with or without co-beneldopa or co-careldopa), **ADULT** over 18 years, initially
Adartrel
Ropinirole
Restless legs syndrome, Parkinson’s disease, initially 750 micrograms daily in
Dose see notes above; also nausea, vomiting, may suppress lactation—avoid
Pregnancy avoid unless potential benefit outweighs
Hepatic impairment
Cautions
Indications
BNF 68 4.9.1 Dopaminergic drugs used in Parkinson’s disease 323
worsening of restless legs syndrome psychosis, compulsive behaviour (see notes above);
Central nervous system interactions:
Appendix 1 (ropinirole)
Hepatic impairment avoid—no information available
Renal impairment avoid if eGFR less than 30 mL/minute/1.73 m²
Pregnancy avoid unless potential benefit outweighs risk—-toxicity in animal studies
Breast-feeding may suppress lactation—avoid
Side-effects see notes above; also nausea, vomiting, abdominal pain, dyspepsia, gastro-oesophageal reflux disease, constipation; hypotension; syncope; peripheral oedema; drowsiness (including sudden onset of sleep, see p. 320), dizziness, nervousness, fatigue, dyskinesia, hallucinations, confusion; less commonly psychosis, compulsive behaviour (see notes above); very rarely hepatic disorders; also reported paradoxical worsening of restless legs syndrome
Dose
PARKINSON’S DISEASE
Indications Parkinson’s disease, either used alone or as adjunct to co-beneldopa or co-careldopa; moderate to severe restless legs syndrome
Cautions see notes above; severe cardiovascular disease (risk of hypotension—monitor blood pressure), major psychotic disorders; elderly; avoid abrupt withdrawal; dose adjustment may be necessary if smoking started or stopped during treatment; interactions: Appendix 1 (ropinirole)
Hepatic impairment avoid—no information available
Renal impairment avoid if eGFR less than 30 mL/minute/1.73 m²
Pregnancy avoid unless potential benefit outweighs risk—toxicity in animal studies
Breast-feeding may suppress lactation—avoid
Side-effects see notes above; also nausea, vomiting, abdominal pain, dyspepsia, gastro-oesophageal reflux disease, constipation; hypotension; syncope; peripheral oedema; drowsiness (including sudden onset of sleep, see p. 320), dizziness, nervousness, fatigue, dyskinesia, hallucinations, confusion; less commonly psychosis, compulsive behaviour (see notes above); very rarely hepatic disorders; also reported paradoxical worsening of restless legs syndrome
Dose
Parkinson’s disease, initially 750 micrograms daily in
3 divided doses, increased by increments of 750 micrograms daily at weekly intervals to 2 mg daily in 3 divided doses; further increased by increments of 1.5–3 mg daily at weekly intervals according to response; usual range 9–16 mg daily in 3 divided doses (but higher doses may be required if used with levodopa); max. 24 mg daily in 3 divided doses
Note When administered as adjunct to levodopa, concurrent dose of levodopa may be reduced by approx. 20%; ropinirole doses in the BNF may differ from those in product literature
Restless legs syndrome, ADULT over 18 years initially 250 micrograms at night for 2 days, increased if tolerated to 500 micrograms at night for 5 days and then to 1 mg at night for 7 days; further increased at weekly intervals in steps of 500 micrograms daily according to response; usual dose 2 mg at night; max. 4 mg daily
Note Repeat dose titration if restarting after interval of more than a few days
Ropinirole (Non-proprietary) Tablets, ropinirole (as hydrochloride) 250 micrograms, net price 12-tab pack = £1.38; 500 micrograms, 28-tab pack = £2.43; 1 mg, 84-tab pack = £3.89; 2 mg, 84-tab pack = £6.94; 5 mg, 84-tab pack = £17.39. Label: 10, 21, counselling, driving, see notes above
Adartrel® (GSK) Tablets, 1/c, ropinirole (as hydrochloride) 250 micrograms (white), net price 12-tab pack = £3.94; 500 micrograms (yellow), 28-tab pack = £15.75, 84-tab pack = £47.26, 2 mg (pink), 28-tab pack = £31.51, 84-tab pack = £94.53. Label: 10, 21, counselling, driving, see notes above
Note The Scottish Medicines Consortium, p. 4 has advised (June 2006) that Adartrel® should be restricted for use in patients with a baseline score of 24 points or more on the International Restless Legs Scale
Requip® (GSK) Tablets, f/c, ropinirole (as hydrochloride) 1 mg (green), net price 84-tab pack = £47.26; 2 mg (pink), 84-tab pack = £94.53; 5 mg (blue), 84-tab pack = £163.27; 28-day starter pack of 42 × 250-microgram (white) tablets, 42 × 500-microgram (yellow) tablets, and 21 × 1-mg (green) tablets = £40.10; 28-day follow-on pack of 42 × 500-microgram (yellow) tablets, 42 × 1-mg (green) tablets, and 63 × 2-mg (pink) tablets = £74.40. Label: 10, 21, counselling, driving, see notes above
Modified release Ropinirole m/r preparations (Non-proprietary) Tablets, m/r, ropinirole 2 mg; 4 mg; 8 mg. Label: 10, 25, counselling, driving, see notes above
Brands include Raline XL®, Regines XL®, Spinico XL®
Dose initial treatment of Parkinson’s disease, 2 mg once daily for 1 week, then 4 mg once daily, increased according to response by 2 mg at intervals of at least 1 week up to 8 mg once daily, if still no response, increase by 2–4 mg at intervals of at least 2 weeks as necessary; max. 24 mg once daily
Parkinson’s disease in patients transferring from ropinirole immediate-release tablets, initially ropinirole modified release once daily substituted for total daily dose equivalent of ropinirole immediate-release tablets, if control not maintained after switching, titrate dose as above
Note Consider slower titration in patients over 75 years
Note When administered as adjunct to levodopa, concurrent dose of levodopa may gradually be reduced by approx. 30%
Note If treatment interrupted for 1 day or more, consider re-initiation with immediate-release tablets
Requip® XL (GSK) Tablets, m/r, f/c, ropinirole (as hydrochloride) 2 mg (pink), net price 28-tab pack = £12.54; 4 mg (brown), 28-tab pack = £23.09; 8 mg (red), 28-tab pack = £42.11. Label: 10, 25, counselling, driving, see notes above
Dose initial treatment of Parkinson’s disease, 2 mg once daily for 1 week, then 4 mg once daily, increased according to response by 2 mg at intervals of at least 1 week up to 8 mg once daily, if still no response, increase by 2–4 mg at intervals of at least 2 weeks as necessary; max. 24 mg once daily
Parkinson’s disease in patients transferring from ropinirole immediate-release tablets, initially Requip® XL once daily substituted for total daily dose equivalent of ropinirole immediate-release tablets, if control not maintained after switching, titrate dose as above
Note Consider slower titration in patients over 75 years
Note When administered as adjunct to levodopa, concurrent dose of levodopa may gradually be reduced by approx. 30%
Note If treatment interrupted for 1 day or more, consider re-initiation with immediate-release tablets
Rogitoline
Indications Parkinson’s disease, either used alone or as adjunct to co-beneldopa or co-careldopa; moderate to severe restless legs syndrome
Cautions see notes above; ophthalmic testing recommended; avoid exposure of patch to heat; withdraw gradually; interactions: Appendix 1 (rogitoline)
Hepatic impairment caution in severe impairment—no information available
Pregnancy avoid—no information available
Breast-feeding may suppress lactation; avoid—present in milk in animal studies
Side-effects see notes above; also constipation, dry mouth, dyspepsia, nausea, vomiting, weight changes, hypertension, postural hypotension, palpitation, peripheral oedema, hiccup, malaise, dizziness, droverniness (including sudden onset of sleep, see p. 320), sleep disturbances, dyskinesia, abnormal thinking and behaviour (including hallucinations, paranoia, psychosis, aggression, confusion), headache, syncope, sweating, rash, pruritus, application site reactions; less commonly abdominal pain, atrial fibrillation, hypotension, impulse control disorders (see notes above), erectile dysfunction, visual disturbances; rarely tachycardia, seizures, irritability, obsessive compulsive disorder

Dose
- Monotherapy in Parkinson’s disease, initially apply ‘2 mg/24 hours’ patch, increased in steps of 2 mg/24 hours at weekly intervals if required; max. 8 mg/24 hours
- Adjunctive therapy with levodopa in Parkinson’s disease, initially apply ‘4 mg/24 hours’ patch, increased in steps of 2 mg/24 hours at weekly intervals if required; max. 16 mg/24 hours
- Restless legs syndrome, initially apply ‘1 mg/24 hours’ patch, increased in steps of 1 mg/24 hours at weekly intervals if required; max. 3 mg/24 hours

Note Apply patch to dry, non-irritated skin on torso, thigh, or upper arm, removing after 24 hours and siting replacement patch on a different area (avoid using the same or upper arm, removing after 24 hours and siting lower doses of levodopa. The extracerebral dopamine, thereby limiting side-effects such as nausea, vomiting, and cardiovascular effects; additionally, effective brain-dopamine concentrations are achieved with lower doses of levodopa. The extracerebral dopa-carboxylase inhibitors used with levodopa are benserazide (in co-beneldopa) and carbidopa (in co-careldopa).

Levodopa, in combination with a dopa-decarboxylase inhibitor, is useful in the elderly or frail, in patients with other significant illnesses, and in those with more severe symptoms. It is effective and well tolerated in the majority of patients. Levodopa therapy should be initiated at a low dose and increased in small steps; the final dose should be as low as possible. Intervals between doses should be chosen to suit the needs of the individual patient.

Nausea and vomiting with co-beneldopa or co-careldopa are rarely dose-limiting and domperidone (section 4.6) can be useful in controlling these effects.

Levodopa treatment is associated with potentially troublesome motor complications including response fluctuations and dyskinesias. Response fluctuations are particularly problematic in young patients treated with levodopa.

Cautions Levodopa should be used with caution in severe pulmonary or cardiovascular disease (including history of myocardial infarction with residual arrhythmia), psychiatric illness (avoid if severe and discontinue if deterioration), endocrine disorders (including hyperthyroidism, Cushing’s syndrome, diabetes mellitus, osteomalacia, and phaeochromocytoma), and in those with a history of convulsions or peptic ulcer. Levodopa should be used with caution in patients susceptible to angle-closure glaucoma, and in hepatic or renal impairment. Patients should be advised to avoid abrupt withdrawal (risk of neuroleptic malignant syndrome and rhabdomyolysis), and to be aware of the potential for excessive drowsiness and sudden onset of sleep (see Driving, p. 320); interactions: Appendix I (levodopa).

Pregnancy Levodopa should be used with caution in pregnancy—toxicity has occurred in animal studies.

Breast-feeding Levodopa may suppress lactation. It is present in milk—avoid.

Side-effects Side-effects of levodopa include nausea, vomiting, taste disturbances, dry mouth, anorexia, arrhythmias, palpitations, postural hypotension, syncope, drowsiness (see Driving, p. 320), fatigue, dementia, psychosis, confusion, euphoria, abnormal dreams, insomnia, depression (very rarely with suicidal ideation), anxiety, dizziness, dystonia, dyskinesia, and chorea.

Less commonly weight changes, constipation, diarrhoea, hypersalivation, dysphagia, flatulence, hypertension, chest pain, oedema, hoarseness, ataxia, hand tremor, malaise, weakness, muscle cramps, and reddish discoloration of the urine and other body fluids may occur. Rare side-effects include abdominal pain, gastro-intestinal bleeding, duodenal ulcer, dyspepsia, phlebitis, dyspnœa, agitation, paraesthesia, bruxism, trismus, hic cusps, neuroleptic malignant syndrome (associated with abrupt withdrawal), convulsions, reduced mental acuity, disorientation, headache, urinary retention, urinary incontinence, priapism, activation of malignant

Levodopa
Levodopa, the amino-acid precursor of dopamine, acts by replenishing depleted striatal dopamine. It is given with an extracerebral dopa-decarboxylase inhibitor, which reduces the peripheral conversion of levodopa to dopamine, thereby limiting side-effects such as nausea, vomiting, and cardiovascular effects; additionally, effective brain-dopamine concentrations are achieved with lower doses of levodopa. The extracerebral dopa-decarboxylase inhibitors used with levodopa are benserazide (in co-beneldopa) and carbidopa (in co-careldopa).
melanoma, leucopenia, haemyoletic and non-haemyoletic anaemia, thrombocytopenia, agranulocytosis, blurred vision, blepharospasm, diplopia, activation of Horner's syndrome, pupil dilatation, oculogyric crisis, flushing, alopecia, exanthena, Henoch-Schönlein purpura, and sweating; very rarely angle-closure glaucoma may occur; compulsive behaviour (see Impulse Control Disorders, p. 320) and false positive tests for urinary ketones have also been reported.

### CO-BENELDOPA

A mixture of benserazide hydrochloride and levodopa in mass proportions corresponding to 1 part of benserazide and 4 parts of levodopa

**Indications** Parkinson's disease, see notes above

**Cautions** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**

- Expressed as levodopa, initially 50 mg 3–4 times daily (100 mg 3 times daily in advanced disease), increased by 100 mg daily once or twice weekly according to response; usual maintenance dose 400–800 mg daily in divided doses; **ELDERLY** initially 50 mg once or twice daily, increased by 50 mg daily every 3–4 days according to response.

**Note**

- When transferring patients from another levodopa/dopa-decarboxylase inhibitor preparation, the previous preparation should be discontinued 12 hours before (although interval can be shorter).

- When administered as an adjunct to other antiparkinsonian drugs, once therapeutic effect apparent, the other drugs may be reduced or withdrawn.

**Note** When switching from modified-release levodopa to dispersible co-beneldopa, reduce dose by approx. 30%.

#### Co-beneldopa (Non-proprietary)

**Capsules**, co-beneldopa 12.5/50 (benserazide 12.5 mg (as hydrochloride), levodopa 50 mg), net price 100-cap pack = £4.96. Label: 10, 14, 21, counselling, driving, see notes above

**Capsules**, co-beneldopa 25/100 (benserazide 25 mg (as hydrochloride), levodopa 100 mg), net price 100-cap pack = £6.91. Label: 10, 14, 21, counselling, driving, see notes above

**Capsules**, co-beneldopa 50/200 (benserazide 50 mg (as hydrochloride), levodopa 200 mg), net price 100-cap pack = £11.78. Label: 10, 14, 21, counselling, driving, see notes above

#### Madopar® CR (Roche)

**Capsules**, m/r, dark green/light blue, co-beneldopa 25/100 (benserazide 25 mg (as hydrochloride), levodopa 100 mg), net price 100-cap pack = £12.77. Label: 5, 10, 14, 25, counselling, driving, see notes above

**Dose**

- Patients not taking levodopa/dopa-decarboxylase inhibitor therapy, initially 1 capsule 3 times daily (max. initial dose 6 capsules daily).

- Patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations, initially 1 capsule substituted for every 100 mg of levodopa and given at same dosage frequency, increased every 2–3 days according to response; average increase of 50% needed over previous levodopa dose and titration may take up to 4 weeks.

**Counselling** The dispersible tablets can be dispersed in water or orange squash (not orange juice) or swallowed whole.

### Modified release

#### Madopar® CR

**Capsules**, m/r, dark green/light blue, co-beneldopa 25/100 (benserazide 25 mg (as hydrochloride), levodopa 100 mg), net price 100-cap pack = £12.77. Label: 5, 10, 14, 25, counselling, driving, see notes above

**Dose**

- Initially levodopa 125 mg (with carbidopa 62.5 mg), blue/grey, co-beneldopa 12.5/50 (benserazide 12.5 mg (as hydrochloride), levodopa 50 mg), net price 100-cap pack = £4.96. Label: 10, 14, 21, counselling, driving, see notes above

- Alternatively, initially levodopa 50–100 mg (with carbidopa 12.5 or 25 mg) 3–4 times daily, increased by 50–100 mg daily or on alternate days according to response, up to 800 mg (with carbidopa 200 mg) daily in divided doses.

**Counselling** The dispersible tablets can be dispersed in water or orange squash (not orange juice) or swallowed whole.

### CO-CARELDOPA

A mixture of carbidopa and levodopa; the proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively

**Indications** Parkinson’s disease, see notes above

**Cautions** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**

- Expressed as levodopa, initially 100 mg (with carbidopa 25 mg) 3 times daily, increased by 50–100 mg (with carbidopa 12.5 or 25 mg) daily or on alternate days according to response, up to 800 mg (with carbidopa 60 or 100 mg) daily in divided doses.

- Alternatively, initially levodopa 50–100 mg (with carbidopa 12.5 or 12.5 mg) 3–4 times daily, increased by 50–100 mg daily or on alternate days according to response, up to 800 mg (with carbidopa 60 or 100 mg) daily in divided doses.

- Alternatively, initially levodopa 125 mg (with carbidopa 12.5 mg, as ½ tablet of co-careldopa 25/250) 1–2 times daily, increased by 125 mg (with carbidopa 12.5 mg) daily or on alternate days according to response.

**Note**

- When co-careldopa is used, the total daily dose of carbidopa should be at least 70 mg. A lower dose may not achieve full inhibition of extracerebral dopa-decarboxylase, with a resultant increase in side-effects.

- When transferring patients from another levodopa/dopa-decarboxylase inhibitor preparation, the previous preparation should be discontinued at least 12 hours before.
4.9.1 Dopaminergic drugs used in Parkinson’s disease

**Central nervous system**

**Caramet**

- **Sinemet**
  - **Co-careldopa** (Non-proprietary) *(OTC)*
    - Tablets, co-careldopa 10/100 (carbidopa 10 mg (anhydrous), levodopa 100 mg), net price 100-tab pack = £8.07. Label: 10, 14, counselling, driving, see notes above
    - Tablets, co-careldopa 25/100 (carbidopa 25 mg (anhydrous), levodopa 100 mg), net price 100-tab pack = £26.13. Label: 10, 14, counselling, driving, see notes above
    - Tablets, co-careldopa 25/250 (carbidopa 25 mg (anhydrous), levodopa 250 mg), net price 100-tab pack = £34.38. Label: 10, 14, counselling, driving, see notes above

**Sinemet** *(MSD)* *(OTC)*

- **Sinemet**
  - **Co-careldopa** 25/100 provides an adequate dose of carbidopa when low doses of levodopa are needed
  - **Sinemet** CR
    - **Sinemet** CR 12.5 mg/50 mg tablets, yellow, scored, co-careldopa 12.5/50 (carbidopa 12.5 mg (anhydrous), levodopa 50 mg), net price 90-tab pack = £6.28. Label: 10, 14, counselling, driving, see notes above
  - **Sinemet** CR 10 mg/100 mg tablets, blue, scored, co-careldopa 10/100 (carbidopa 10 mg (anhydrous), levodopa 100 mg), net price 100-tab pack = £7.30. Label: 10, 14, counselling, driving, see notes above

**Note**

- **Co-careldopa** 25/100 provides an adequate dose of carbidopa when low doses of levodopa are needed

**Dose**

- **Severe Parkinson’s disease inadequately controlled by other preparations, consult product literature**

**With entacapone**

**Duodopa** *(AbbVie)* *(OTC)*

- **Intestinal gel**, co-careldopa 5/20 (carbidopa 5 mg as monohydrate, levodopa 20 mg/mL, net price 100 mL cassette (for use with Duodopa® portable pump) = £77.00. Label: 10, 14, counselling, driving, see notes above

**Dose** severe Parkinson’s disease inadequately controlled by other preparations, consult product literature

**Modified release**

**Caramet** CR *(TEVA UK)* *(OTC)*

- Tablets, m/r, orange-brown, co-careldopa 25/100 (carbidopa 25 mg (as monohydrate), levodopa 100 mg), net price 60-tab pack = £11.47; co-careldopa 50/200 (carbidopa 50 mg (as monohydrate), levodopa 200 mg), 60-tab pack = £11.47. Label: 10, 14, 25, counselling, driving, see notes above

**Dose**

- Patients not receiving levodopa/dopa-decarboxylase inhibitor preparations, expressed as levodopa, initially 100–200 mg twice daily (at least 6 hours between doses); dose adjusted according to response at intervals of at least 2 days

- Patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations, discontinue previous preparation at least 12 hours before first dose of Caramet CR; substitute Caramet CR to provide a similar amount of levodopa daily and extend dosing interval by 30–50%; dose then adjusted according to response at intervals of at least 2 days

**Half Sinemet** CR *(MSD)* *(OTC)*

- Tablets, m/r, pink, co-careldopa 25/100 (carbidopa 25 mg (anhydrous), levodopa 100 mg), net price 60-tab pack = £11.60. Label: 10, 14, 25, counselling, driving, see notes above

**Dose** for fine adjustment of Sinemet CR dose (see below)

**Sinemet** CR *(MSD)* *(OTC)*

- Tablets, m/r, peach, scored, co-careldopa 50/200 (carbidopa 50 mg (anhydrous), levodopa 200 mg), net price 60-tab pack = £11.60. Label: 10, 14, 25, counselling, driving, see notes above

**Dose**

- Patients not receiving levodopa/dopa-decarboxylase inhibitor therapy, initially, 1 Sinemet CR tablet twice daily; both dose and interval then adjusted according to response at intervals of not less than 3 days

- Patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations, 1 Sinemet CR tablet twice daily; both dose and interval then adjusted according to response at intervals of not less than 3 days

**Stalevo** *(Orion)* *(OTC)*

- **Tablets**, f/c, brown, levodopa 50 mg, carbidopa 12.5 mg, entacapone 200 mg, net price 30-tab pack = £20.79, 100-tab pack = £69.31. Label: 10, 14 (urine reddish-brown), 25, counselling, driving, see notes above

**Dose**

- **Only 1 tablet to be taken for each dose; max. 10 tablets daily**

- **Tablets**, f/c, brown, levodopa 75 mg, carbidopa 18.75 mg, entacapone 200 mg, net price 30-tab pack = £20.79, 100-tab pack = £69.31. Label: 10, 14 (urine reddish-brown), 25, counselling, driving, see notes above

**Dose**

- **Only 1 tablet to be taken for each dose; max. 10 tablets daily**

- **Tablets**, f/c, brown, levodopa 125 mg, carbidopa 31.25 mg, entacapone 200 mg, net price 30-tab pack = £20.79, 100-tab pack = £69.31. Label: 10, 14 (urine reddish-brown), 25, counselling, driving, see notes above

**Dose**

- **Only 1 tablet to be taken for each dose; max. 10 tablets daily**

- **Tablets**, f/c, brown, levodopa 150 mg, carbidopa 37.5 mg, entacapone 200 mg, net price 30-tab pack = £20.79, 100-tab pack = £69.31. Label: 10, 14 (urine reddish-brown), 25, counselling, driving, see notes above

**Dose**

- **Only 1 tablet to be taken for each dose; max. 8 tablets daily**

**Stalevo** *(MSD)* *(OTC)*

- Tablets, f/c, brown, levodopa 175 mg, carbidopa 43.75 mg, entacapone 200 mg, net price 30-tab pack = £20.79, 100-tab pack = £69.31. Label: 10, 14 (urine reddish-brown), 25, counselling, driving, see notes above

**Dose**

- **Only 1 tablet to be taken for each dose; max. 8 tablets daily**
Monoamine-oxidase-B inhibitors

Rasagiline, a monoamine-oxidase-B inhibitor, is licensed for the management of Parkinson’s disease used alone or as an adjunct to levodopa for ‘end-of-dose’ fluctuations.

Selegiline is a monoamine-oxidase-B inhibitor used in conjunction with levodopa to reduce ‘end-of-dose’ deterioration in advanced Parkinson’s disease. Early treatment with selegiline alone can delay the need for levodopa therapy. When combined with levodopa, selegiline should be avoided or used with great caution in postural hypotension.

Rasagiline

Indications Parkinson’s disease, used alone or as an adjunct to benecar-dopa or co-careldopa

Cautions avoid abrupt withdrawal; interactions: Appendix 1 (rasagiline)

Hepatic impairment use with caution in mild impairment; avoid in moderate to severe impairment

Pregnancy use with caution

Breast-feeding use with caution—may suppress lactation

Side-effects dry mouth, dyspepsia, constipation, flatulence; angina; headache, depression, anorexia, weight loss, abnormal dreams, vertigo, hallucinations; influenza-like symptoms; urinary urgency; leucopenia; arthralgia; conjunctivitis; rhinitis; rash, skin carcinoma; less commonly loss of sexuality; blurred vision; skin reactions; also reported hypersexual dysfunction; avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (selegiline)

Hepatic impairment use with caution in severe impairment

Renal impairment use with caution in severe impairment

Pregnancy avoid—no information available

Breast-feeding avoid—no information available

Side-effects nausea, constipation, diarrhoea, dry mouth, stomatitis, mouth ulcers, bradycardia, hypertension, hypotension, depression, dizziness, psychosis, impaired balance, tremor, fatigue, movement disorders, sleeping disorders, headache, confusion, arthralgia, myalgia, muscle cramps, myopathy, nasal congestion, hair loss, sweating; less commonly loss of appetite, angina, arrhythmias, palpitation, postural hypotension, supraventricular tachycardia, ankle oedema, dyspnoea, agitation, anxiety, micturition difficulties, leucocytopenia, thrombocytopenia, blurred vision; skin reactions; also reported hypersexual dysfunction

Dose
• Initially 5 mg in the morning; increasing after 2–4 weeks if tolerated to 10 mg in the morning

Note 1.25-mg oral lyophilisate is equivalent to 10-mg tablet

Selegiline Hydrochloride (Non-proprietary) Tablets, selegiline hydrochloride 5 mg, net price 60-tab pack = £22.16; 10 mg, 30-tab pack = £22.16

Eldepryl® (Orion) Tablets, scored, selegiline hydrochloride 5 mg, net price 100-tab pack = £16.52; 10 mg, 100-tab pack = £32.23

Oral lyophilisate

Zelapar® (TEVA UK) Oral lyophilisates (= freeze-dried tablets), yellow, selegiline hydrochloride 1.25 mg, net price 30-tab pack = £43.16. Counselling, administration Excipients include aspartame (section 9.4.1) Dose 1.25 mg daily before breakfast Counselling Tablets should be placed on the tongue and allowed to dissolve. Advise patient not to drink, rinse, or wash mouth out for 5 minutes after taking the tablet Note Patients receiving 10 mg conventional selegiline hydrochloride tablets can be switched to Zelapar® 1.25 mg

Catechol-O-methyltransferase inhibitors

Entacapone and tolcapone prevent the peripheral breakdown of levodopa, by inhibiting catechol-O-methyltransferase, allowing more levodopa to reach the brain. They are licensed for use as an adjunct to co-beneldopa or co-careldopa for patients with Parkinson’s disease who experience ‘end-of-dose’ deterioration and cannot be stabilised on these combinations. Due to the risk of hepatotoxicity, tolcapone should be prescribed under specialist supervision only, when other catechol-O-methyltransferase inhibitors combined with co-beneldopa or co-careldopa are ineffective.

Entacapone

Indications adjunct to co-beneldopa or co-careldopa in Parkinson’s disease with ‘end-of-dose’ motor fluctuations

Cautions ischaemic heart disease; avoid abrupt withdrawal; concurrent levodopa dose may need to be...
4 Central nervous system

328

4.9.1 Dopaminergic drugs used in Parkinson’s disease

Breast-feeding  avoid—present in milk in animal studies

Side-effects diarrhoea, constipation, dyspepsia, abdominal pain, nausea, vomiting, anorexia, xerostomia, hepatotoxicity (see above); chest pain; confusion, dysautonomia, dizziness, headache, dizziness, sleep disturbances, excessive dreaming, hallucinations; syncope; urine discoloration; sweating; neuroleptic malignant syndrome and rhabdomyolysis reported on dose reduction or withdrawal

Dose
- 100 mg 3 times daily, leave 6 hours between each dose; max. 200 mg 3 times daily in exceptional circumstances; first daily dose should be taken at the same time as levodopa with dopa-decarboxylase inhibitor

Note  Continue beyond 3 weeks only if substantial improvement

Tasmar® (Meda)
Tablets, f/c, yellow, tolcapone 100 mg, net price 100-tab pack = £95.20. Label: 14, 25

AMANTADINE HYDROCHLORIDE

Indications Parkinson’s disease; antiviral (section 5.3.4)

Cautions congestive heart disease (may exacerbate oedema), confused or hallucinatory states, elderly; avoid abrupt withdrawal in Parkinson’s disease; interactions: Appendix 1 (amantadine)

Driving  May affect performance of skilled tasks (e.g. driving)

Contra-indications  epilepsy; history of gastric ulceration

Hepatic impairment caution

Renal impairment  reduce dose; avoid if eGFR less than 15 mL/minute/1.73 m²

Pregnancy  avoid; toxicity in animal studies

Breast-feeding  avoid; present in milk

Amanadine

Amanadine is a weak dopamine agonist with modest antiparkinsonian effects. Tolerance to its effects may develop and confusion and hallucinations may occasionally occur.

TOLCAPONE

Indications adjunct to co-beneldopa or co-careldopa in Parkinson’s disease with ‘end-of-dose’ motor fluctuations if another inhibitor of peripheral catechol-O-methyltransferase inappropriate (under specialist supervision)

Cautions avoid abrupt withdrawal; most patients receiving more than 600 mg levodopa daily require reduction of levodopa dose by about 30%; interactions: Appendix 1 (tolcapone)

Hepatoxicity Potentially life-threatening hepatotoxicity including fulminant hepatitis reported rarely, usually in women and during the first 6 months, but late-onset liver injury also reported, test liver function before treatment, and monitor every 2 weeks for first year, every 4 weeks for next 6 months and then every 8 weeks thereafter (restart monitoring schedule if dose increased); discontinue if abnormal liver function tests or symptoms of liver disorder (counselling, see below); do not re-introduce tolcapone once discontinued

Counselling  Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop

Contra-indications severe dyskinesia, phaeochromocytoma, previous history of neuroleptic malignant syndrome, rhabdomyolysis, or hyperthermia

Hepatic impairment avoid; see also under Cautions

Renal impairment caution if eGFR less than 30 mL/minute/1.73 m²

Pregnancy  toxicity in animal studies—use only if potential benefit outweighs risk

Breast-feeding  avoid; present in milk

Side-effects diarrhoea, constipation, dyspepsia, abdominal pain, nausea, vomiting, anorexia, xerostomia, hepatotoxicity (see above); chest pain; confusion, dystonia, dyskinesia, drowsiness, headache, tinnitus, dizziness, sleep disturbances, excessive dreaming, hallucinations; syncope; urine discoloration; sweating; neuroleptic malignant syndrome and rhabdomyolysis reported on dose reduction or withdrawal

Dose
- 100 mg 3 times daily, leave 6 hours between each dose; max. 200 mg 3 times daily in exceptional circumstances; first daily dose should be taken at the same time as levodopa with dopa-decarboxylase inhibitor

Note  Continue beyond 3 weeks only if substantial improvement

Tasmar® (Meda)
Tablets, f/c, yellow, tolcapone 100 mg, net price 100-tab pack = £95.20. Label: 14, 25

Amanadine

TOLCAPONE

Indications adjunct to co-beneldopa or co-careldopa in Parkinson’s disease with ‘end-of-dose’ motor fluctuations if another inhibitor of peripheral catechol-O-methyltransferase inappropriate (under specialist supervision)

Cautions avoid abrupt withdrawal; most patients receiving more than 600 mg levodopa daily require reduction of levodopa dose by about 30%; interactions: Appendix 1 (tolcapone)

Hepatoxicity Potentially life-threatening hepatotoxicity including fulminant hepatitis reported rarely, usually in women and during the first 6 months, but late-onset liver injury also reported, test liver function before treatment, and monitor every 2 weeks for first year, every 4 weeks for next 6 months and then every 8 weeks thereafter (restart monitoring schedule if dose increased); discontinue if abnormal liver function tests or symptoms of liver disorder (counselling, see below); do not re-introduce tolcapone once discontinued

Counselling  Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop

Contra-indications severe dyskinesia, phaeochromocytoma, previous history of neuroleptic malignant syndrome, rhabdomyolysis, or hyperthermia

Hepatic impairment avoid; see also under Cautions

Renal impairment caution if eGFR less than 30 mL/minute/1.73 m²

Pregnancy  toxicity in animal studies—use only if potential benefit outweighs risk

Breast-feeding  avoid; present in milk

Side-effects diarrhoea, constipation, dyspepsia, abdominal pain, nausea, vomiting, anorexia, xerostomia, hepatotoxicity (see above); chest pain; confusion, dystonia, dyskinesia, drowsiness, headache, tinnitus, dizziness, sleep disturbances, excessive dreaming, hallucinations; syncope; urine discoloration; sweating; neuroleptic malignant syndrome and rhabdomyolysis reported on dose reduction or withdrawal

Dose
- 100 mg 3 times daily, leave 6 hours between each dose; max. 200 mg 3 times daily in exceptional circumstances; first daily dose should be taken at the same time as levodopa with dopa-decarboxylase inhibitor

Note  Continue beyond 3 weeks only if substantial improvement

Tasmar® (Meda)
Tablets, f/c, yellow, tolcapone 100 mg, net price 100-tab pack = £95.20. Label: 14, 25

Amanadine

Amanadine is a weak dopamine agonist with modest antiparkinsonian effects. Tolerance to its effects may develop and confusion and hallucinations may occasionally occur.

TOLCAPONE

Indications adjunct to co-beneldopa or co-careldopa in Parkinson’s disease with ‘end-of-dose’ motor fluctuations if another inhibitor of peripheral catechol-O-methyltransferase inappropriate (under specialist supervision)

Cautions avoid abrupt withdrawal; most patients receiving more than 600 mg levodopa daily require reduction of levodopa dose by about 30%; interactions: Appendix 1 (tolcapone)

Hepatoxicity Potentially life-threatening hepatotoxicity including fulminant hepatitis reported rarely, usually in women and during the first 6 months, but late-onset liver injury also reported, test liver function before treatment, and monitor every 2 weeks for first year, every 4 weeks for next 6 months and then every 8 weeks thereafter (restart monitoring schedule if dose increased); discontinue if abnormal liver function tests or symptoms of liver disorder (counselling, see below); do not re-introduce tolcapone once discontinued

Counselling  Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop

Contra-indications severe dyskinesia, phaeochromocytoma, previous history of neuroleptic malignant syndrome, rhabdomyolysis, or hyperthermia

Hepatic impairment avoid; see also under Cautions

Renal impairment caution if eGFR less than 30 mL/minute/1.73 m²

Pregnancy  toxicity in animal studies—use only if potential benefit outweighs risk

Breast-feeding  avoid; present in milk

Side-effects diarrhoea, constipation, dyspepsia, abdominal pain, nausea, vomiting, anorexia, xerostomia, hepatotoxicity (see above); chest pain; confusion, dystonia, dyskinesia, drowsiness, headache, tinnitus, dizziness, sleep disturbances, excessive dreaming, hallucinations; syncope; urine discoloration; sweating; neuroleptic malignant syndrome and rhabdomyolysis reported on dose reduction or withdrawal

Dose
- 100 mg 3 times daily, leave 6 hours between each dose; max. 200 mg 3 times daily in exceptional circumstances; first daily dose should be taken at the same time as levodopa with dopa-decarboxylase inhibitor

Note  Continue beyond 3 weeks only if substantial improvement

Breast-feeding  avoid; present in milk
4.9.2 Antimuscarinic drugs used in parkinsonism

Antimuscarinic drugs exert their antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency. Antimuscarinic drugs can be useful in drug-induced parkinsonism, but they are generally not used in idiopathic Parkinson’s disease because they are less effective than dopaminergic drugs and they are associated with cognitive impairment.

The antimuscarinic drugs orphenadrine, procyclidine, and trihexyphenidyl reduce the symptoms of parkinsonism induced by antipsychotic drugs, but there is no justification for giving them routinely in the absence of parkinsonian side-effects. Tardive dyskinesia is not improved by antimuscarinic drugs and may be made worse.

In idiopathic Parkinson’s disease, antimuscarinic drugs reduce tremor and rigidity but they have little effect on bradykinesia. They may be useful in reducing sialorrhoea.

There are no important differences between the antimuscarinic drugs, but some patients tolerate one better than another.

Procyclidine can be given parenterally and is effective emergency treatment for acute drug-induced dystonic reactions.

If treatment with an antimuscarinic is ineffective, intravenous diazepam (p. 227) can be given for life-threatening acute drug-induced dystonic reactions.

**Cautions** Antimuscarinics should be used with caution in cardiovascular disease, hypertension, psychotic disorders, prostatic hypertrophy, pyrexia, in those susceptible to angle-closure glaucoma, and in the elderly. Antimuscarinics should not be withdrawn abruptly in patients taking long-term treatment. Antimuscarinics are liable to abuse. **Interactions:** Appendix 1 (Antimuscarinics)

**Driving** Antimuscarinics can affect performance of skilled tasks (e.g. driving)

**Contra-indications** Antimuscarinics should be avoided in gastro-intestinal obstruction and myasthenia gravis.

**Hepatic and renal impairment** Orphenadrine, procyclidine, and trihexyphenidyl should be used with caution in patients with hepatic or renal impairment.

**Side-effects** Side-effects of antimuscarinics include constipation, dry mouth, nausea, vomiting, tachycardia, dizziness, confusion, euphoria, hallucinations, impaired memory, anxiety, restlessness, urinary retention, blurred vision, and rash. Angle-closure glaucoma occurs very rarely.

---

**ORPHENADRINE HYDROCHLORIDE**

**Indications** parkinsonism; drug-induced extrapyramidal symptoms (but not tardive dyskinesia, see notes above)

**Cautions** see notes above

**Contra-indications** see notes above; also acute porphyria (section 9.8.2)

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** caution

**Breast-feeding** caution

**Side-effects** see notes above; less commonly seizures, drowsiness, insomnia, and impaired coordination

**Dose**
- Initially 150 mg daily in divided doses, increased gradually in steps of 50 mg every 2–3 days according to response; usual dose range 150–300 mg daily in divided doses; max. 400 mg daily; **ELDERLY** preferably lower end of range

**Orphenadrine Hydrochloride** (Non-proprietary) Tablets, orphenadrine hydrochloride 50 mg, net price 100-tab pack = £80.00. Counselling, driving, see notes above

**Oral solution**, orphenadrine hydrochloride 50 mg/5 mL, net price 200 mL = £9.47. Counselling, driving, see notes above

**Biophen®** (Alliance) **Liquid**, sugar-free, orphenadrine hydrochloride 25 mg/5 mL, net price 200 mL = £8.48. Counselling, driving, see notes above

**Disipal®** (Astellas) Tablets, yellow, s/c, orphenadrine hydrochloride 50 mg, net price 250-tab pack = £8.59. Counselling, driving, see notes above

**Excipients** include tartrazine

---

**PROCYCLIDINE HYDROCHLORIDE**

**Indications** parkinsonism; drug-induced extrapyramidal symptoms (but not tardive dyskinesia, see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** use only if potential benefit outweighs risk

**Breast-feeding** no information available

**Side-effects** see notes above; also gingivitis

**Dose**
- By mouth, 2.5 mg 3 times daily, increased gradually in steps of 2.5–5 mg daily every 2–3 days if necessary; usual max. 30 mg daily in 2–4 divided doses (60 mg daily in exceptional circumstances); **ELDERLY** preferably lower end of range

- By intramuscular or intravenous injection, acute dystonia, 5–10 mg (occasionally more than 10 mg), usually effective in 5–10 minutes but may need 30 minutes for relief; **ELDERLY** preferably lower end of range

**Procyclidine** (Non-proprietary) Tablets, procyclidine hydrochloride 5 mg, net price 28-tab pack = £1.63. Counselling, driving, see notes above
4.9.3 Drugs used in essential tremor, chorea, tics, and related disorders

**Trihexyphenidyl Hydrochloride**

*Benhexol hydrochloride*

**Indications**
- parkinsonism; drug-induced extrapyramidal symptoms (but not tardive dyskinesia, see notes above)

**Cautions**
- see notes above

**Contra-indications**
- see notes above

**Hepatic impairment**
- see notes above

**Renal impairment**
- see notes above

**Pregnancy**
- use only if benefit outweighs risks

**Breast-feeding**
- avoid

**Side-effects**
- see notes above

**Dose**
- 1 mg daily, increased by 2 mg every 3–5 days according to response; usual maintenance dose 5–15 mg daily in 3–4 divided doses (max. 20 mg daily); ELDERLY preferably lower end of range; CHILD under 18 years see *BNF for Children*

**Note**
- Not recommended for use in Parkinson’s disease because of toxicity in the elderly and the risk of aggravating dementia. However, if using in combination with co-careldopa or co-beneldopa the usual maintenance dose is 2–6 mg daily in divided doses

**Trihexyphenidyl**

*Non-proprietary*

**Tablets**
- trihexyphenidyl hydrochloride 2 mg, net price 84-tab pack = £6.31; 5 mg, 84-tab pack = £17.15. Counselling, with or after food, driving, see notes above

**Syrup**
- trihexyphenidyl hydrochloride 5 mg/5 mL, net price 200 mL = £20.00. Counselling, driving, see notes above

**Excipients**
- may include propylene glycol (see Excipients, p. 2)

**Arpicon® (Rosemont)**

*Syrup*, sugar-free, procyclidine hydrochloride
- 2.5 mg/5 mL, net price 150 mL = £4.22; 5 mg/5 mL, 150 mL pack = £7.54. Counselling, driving, see notes above

**Kemadrin® (Aspen)**

*Tablets*, scored, procyclidine hydrochloride 5 mg, net price 100-tab pack = £4.72. Counselling, driving, see notes above

**Kemadrin® (Auden McKenzie)**

*Injection*, procyclidine hydrochloride 5 mg/mL, net price 2-mL amp = £1.49

**Tetrabenazine**

*mainly used to control movement disorders in Huntington’s chorea and related disorders.*

**Cautions**
- avoid abrupt withdrawal; increased risk of bleeding (gastric ulcer, history of haemorrhagic stroke, concomitant drugs that increase bleeding), underlying disorders of haemostasis, major surgery

**Contra-indications**
- cerebral haemorrhage; Huntington’s chorea

**Hepatic impairment**
- adjust dose if both hepatic and renal impairment (see under Renal impairment, below)

**Renal impairment**
- use two-thirds of normal dose if eGFR 20–30 mL/minute/1.73 m²; avoid if eGFR less than 20 mL/minute/1.73 m²

**Haloperidol**

(p. 234) can also improve motor tics and symptoms of Tourette syndrome and related choras.

**Other treatments for Tourette syndrome include**
- pimozide (p. 236) [unlicensed indication] (important: ECG monitoring required), clonidine (p. 296) [unlicensed indication], and sulpiride (p. 237) [unlicensed indication].

**Trihexyphenidyl** (above) in high dosage can also improve some movement disorders; it is sometimes necessary to build the dose up over many weeks, to 20 to 30 mg daily or higher.

**Chlorpromazine** (p. 234) and haloperidol (p. 234) are used to relieve intractable hiccup.

**Propranolol** or another beta-adrenoceptor blocking drug (section 2.4) may be useful in treating essential tremor or tremors associated with anxiety or thyrtoxicosis.

**Primidone** (p. 308) in some cases provides relief from benign essential tremor; the dose is increased slowly to reduce side-effects.

**Piracetam** (below) is used as an adjunctive treatment for myoclonus of cortical origin. After an acute episode, attempts should be made every 6 months to decrease or discontinue treatment.

**Riluzole** (p. 331) is used to extend life in patients with motor neuron disease who have amyotrophic lateral sclerosis.

**NICE guidance**

**Riluzole for motor neurone disease (January 2001)**

Riluzole is recommended for treating the amyotrophic lateral sclerosis (ALS) form of motor neurone disease (MND). Treatment should be initiated by a specialist in MND but it can then be supervised under a shared-care arrangement involving the general practitioner.

www.nice.org.uk/TA20

**Tafamidis** (p. 331) is used for the treatment of transthyretin familial amyloid polyneuropathy (TTR-FAP) in patients with stage 1 symptomatic polyneuropathy to delay peripheral neurological impairment. It acts by inhibiting amyloid formation, and should be prescribed in addition to standard treatment, but before liver transplantation; it should be discontinued in patients who undergo liver transplantation. Treatment should be initiated and supervised by a specialist in TTR-FAP.

**Piracetam**

**Indications**
- adjunctive treatment of cortical myoclonus

**Cautions**
- avoid abrupt withdrawal; increased risk of bleeding (gastric ulcer, history of haemorrhagic stroke, concomitant drugs that increase bleeding), underlying disorders of haemostasis, major surgery

**Contra-indications**
- cerebral haemorrhage; Huntington’s chorea

**Hepatic impairment**
- adjust dose if both hepatic and renal impairment (see under Renal impairment, below)

**Renal impairment**
- use two-thirds of normal dose if eGFR 20–30 mL/minute/1.73 m²; avoid if eGFR less than 20 mL/minute/1.73 m²

**Olanzapine** (p. 239) [unlicensed indication], risperidone (p. 241) [unlicensed indication], and quetiapine (p. 240) [unlicensed indication], can also be used to suppress chorea in Huntington’s disease.

Haloperidol can also improve motor tics and symptoms of Tourette syndrome and related choras. Other treatments for Tourette syndrome include pimozide (important: ECG monitoring required), clonidine (unlicensed indication), and sulpiride [unlicensed indication].
Pregnancy avoid
Breast-feeding avoid
Side-effects weight gain, nervousness, hyperkinesia; less commonly drowsiness, depression, asthenia; also reported abdominal pain, nausea, vomiting, diarrhoea, headache, anxiety, confusion, hallucination, vertigo, ataxia, insomnia, haemorrhagic disorder, dermatitis, pruritus, urticaria
Dose
• Initially 7.2 g daily in 2–3 divided doses, increased according to response by 4.8 g every 3–4 days to max. 24 g daily (subsequently, attempts should be made to reduce dose of concurrent therapy); CHILD under 16 years not recommended
Oral solution Follow the oral solution with a glass of water (or soft drink) to reduce bitter taste.
Nootropil® (UCB Pharma) Tablets, 1/2, scored, piracetam 800 mg, net price 90-tab pack = £11.75, 1.2 g, 60-tab pack = £10.97. Label: 3
Oral solution, piracetam, 333.3 mg/mL, net price 300-mL pack = £16.31. Label: 3

RILUZOLE
Indications to extend life in patients with amyotrophic lateral sclerosis, initiated by specialists experienced in the management of motor neurone disease
Cautions history of abnormal hepatic function (consult product literature for details)
Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever occur; white blood cell counts should be determined in febrile illness; neutropenia requires discontinuation of riluzole
Interstitial lung disease Perform chest radiography if symptoms such as dry cough or dyspnoea develop; discontinue if interstitial lung disease is diagnosed
Driving Dizziness or vertigo may affect performance of skilled tasks (e.g. driving)
Contra-indications depression, parkinsonism, phaeochromocytoma, prolactin-dependent tumours
Hepatic impairment use half initial dose and slower dose titration in mild to moderate impairment; use with caution in severe impairment
Renal impairment use with caution
Breast-feeding avoid unless essential—toxicity in animal studies
Side-effects dysphagia, nausea, vomiting, diarrhoea, constipation, hypotension, depression, anxiety, insomnia, confusion, drowsiness, parkinsonism; less commonly altered consciousness level, extrapyramidal disorders, hyperthermia; rarely neuroleptic malignant syndrome; very rarely rhabdomyolysis; also reported
Driving May affect performance of skilled tasks (e.g. driving)
Dose
• Movement disorders due to Huntington’s chorea, hemiballismus, senile chorea, and related neurological conditions, initially 25 mg 3 times daily, increased by 25 mg every 3–4 days as tolerated to max. 200 mg daily
Note Lower initial doses may be necessary in elderly patients
• Moderate to severe tardive dyskinesia, initially 12.5 mg daily, gradually increased according to response
Tetradamine (Non-proprietary) Tablets, tetrabenazine 25 mg, net price 112-tab pack = £100.00. Label: 2
Brands include Temonid®, Xenazine®

TAFAMIDIS
Indications see notes above
Hepatic impairment caution in severe impairment—no information available
Pregnancy avoid (toxicity in animal studies); exclude pregnancy before treatment and ensure effective contraception during and for one month after stopping treatment
Breast-feeding avoid—present in milk in animal studies
Side-effects diarrhoea, abdominal pain, urinary tract infection, vaginal infection
Dose 
• ADULT over 18 years, 20 mg once daily

TETRABENAZINE
Indications see Dose
Cautions avoid abrupt withdrawal; susceptibility to QT-interval prolongation (including concomitant use of drugs that prolong QT interval); interactions: Appendix 1 (tetrabenazine)
Driving May affect performance of skilled tasks (e.g. driving)
Contra-indications depression, parkinsonism, phaeochromocytoma, prolactin-dependent tumours
Hepatic impairment use half initial dose and slower dose titration in mild to moderate impairment; use with caution in severe impairment
Renal impairment use with caution
Breast-feeding avoid unless essential—toxicity in animal studies
Side-effects dysphagia, nausea, vomiting, diarrhoea, constipation, hypotension, depression, anxiety, insomnia, confusion, drowsiness, parkinsonism; less commonly altered consciousness level, extrapyramidal disorders, hyperthermia; rarely neuroleptic malignant syndrome; very rarely rhabdomyolysis; also reported
Driving May affect performance of skilled tasks (e.g. driving)
Dose
• Movement disorders due to Huntington’s chorea, hemiballismus, senile chorea, and related neurological conditions, initially 25 mg 3 times daily, increased by 25 mg every 3–4 days as tolerated to max. 200 mg daily
Note Lower initial doses may be necessary in elderly patients
• Moderate to severe tardive dyskinesia, initially 12.5 mg daily, gradually increased according to response
Tetradamine (Non-proprietary) Tablets, tetrabenazine 25 mg, net price 112-tab pack = £100.00. Label: 2
Brands include Temonid®, Xenazine®

Torsion dystonias and other involuntary movements
Botulinum toxin type A should be used under specialist supervision.
Botox® and Dysport® are licensed for the treatment of focal spasticity (including arm symptoms in conjunction with physiotherapy, dynamic equinus foot deformity caused by spasticity in ambulant paediatric cerebral palsy patients over 2 years, and hand and wrist disability associated with stroke), blepharospasm, hemifacial spasm, and spasmodic torticollis. Botox® is also licensed for severe hyperhidrosis of the axillae, and for the prophylaxis of headaches in adults with chronic

Appendix 1 (tetrabenazine)
migraine (section 4.7.4.2). The Scottish Medicines Consortium (p. 4) has advised (March 2011 and March 2013) that Botox® is not recommended for use within NHS Scotland for prophylaxis of headaches in adults with chronic migraine.

Azzalure®, Bocouture®, Botox®, and Vistabel® are licensed for the temporary improvement of moderate to severe wrinkles between the eyebrows in adults under 65 years. The Scottish Medicines Consortium (p. 4) has advised that Azzalure® and Vistabel® (December 2010), and that Bocouture® (February 2011) are not recommended for use within NHS Scotland.

Xeomin® is licensed for the treatment of blepharospasm, spasmodic torticollis, and post-stroke spasticity of the upper limb.

Treatment with botulinum toxin type A can be considered after an acquired non-progressive brain injury if rapid-onset spasticity causes postural or functional difficulties.

### BOTULINUM TOXIN TYPE A

#### Indications

See notes above; preparations are not interchangeable and should be used under specialist supervision.

#### Cautions

History of dysphagia or aspiration; chronic respiratory disorder; neuromuscular or neurological disorders (can lead to increased sensitivity and exaggerated muscle weakness including dysphagia and respiratory compromise); excessive weakness, inflammation or atrophy in target muscle; off-label use (fatal adverse events reported)

#### Contra-indications

Generalised disorders of muscle activity (e.g. myasthenia gravis); injection at injection site

#### Pregnancy

Avoid unless essential—toxicity in animal studies; avoid in women of child-bearing age unless using effective contraception

#### Breast-feeding

Low risk of systemic absorption but avoid unless essential

#### Side-effects

Increased electrophysiologic jitter in some distant muscles; misplaced injections may paralyse nearby muscle groups and excessive doses may paralyse distant muscles; influenza-like symptoms; rarely arrhythmias, myocardial infarction, seizures, and antibody formation (substantial deterioration in response); very rarely exaggerated muscle weakness, dysphagia, dysphonia, respiratory disorders, aspiration (see Counselling below)

Specific side-effects in focal upper-limb spasticity:
- drowsiness, malaise, abnormal gait, paraesthesia, urinary incontinence, myalgia, pain in extremities

Specific side-effects for temporary improvement of moderate to severe wrinkles between the eyebrows:
- facial oedema, headache, ptosis; less commonly nausea, dry mouth, dizziness, anxiety, paraesthesia, muscle cramps, visual disturbances, tinnitus, blepharitis, photosensitivity reactions, and dry skin

Specific side-effects in spasmodic torticollis:
- dysphagia and pooling of saliva (occurs most frequently after injection into sternomastoid muscle), nausea, dry mouth, rhinitis, drowsiness, headache, dizziness, malaise, numbness, stiffness, hypertonia, back pain, weakness, less commonly diarrhea, vomiting, colitis, dysphagia, voice alteration, tremor, skeletal pain, myalgia, diplopia, eye pain, ptosis, and sweating

Specific side-effects in axillary hyperhidrosis:
- parasthesia, pain in extremities, non-axillary sweating, hot flushes, abnormal skin odour, pruritus, subcutaneous nodule, alopecia, less commonly myalgia and joint pain

#### Specific side-effects in focal upper-limb spasticity associated with stroke

Dysphagia, hypertonia, purpura, less commonly nausea, dry mouth, cough, haemoptoma, peripheral oedema, depression, insomnia, vertigo, amnesia, malaise, paraesthesia, dysaesthesia, headache, pain in extremities, arthralgia, and burstitis

#### Dose

- Consult product literature (important: specific to each individual preparation and not interchangeable)

#### Counselling

Patients should be warned of the signs and symptoms of toxin spread, such as muscle weakness and breathing difficulties; they should be advised to seek immediate medical attention if swallowing, speech or breathing difficulties occur

Azzalure® (Galderma) **Injection**

Bocouture® (Merz) **Injection**

Botox® (Allergan) **Injection**

Xeomin® (Merz) **Injection**

Vistabel® (Allergan) **Injection**

#### Contra-indications

- Pregnancy
- Breast-feeding
- Side-effects
- Dose
Breast-feeding  low risk of systemic absorption but avoid unless essential

Side-effects  increased electrophysiologic jitter in some distant muscles; dry mouth, taste disturbances, dyspepsia, dysphagia, worsening torticollis, neck pain, myasthenia, dysphonia, headache, influenza-like symptoms, visual disturbances; also reported vomiting, constipation, respiratory disorders, aspiration pneumonia, exaggerated muscle weakness (see Counselling below), malaise, ptiosis

Dose
- By intramuscular injection, ADULT over 18 years, initially 5000–10 000 units divided between 2–4 most affected muscles; adjust dose and frequency according to response; important: not interchangeable with other botulinum toxin preparations

Counselling  Patients should be warned of the signs and symptoms of toxin spread, such as muscle weakness and breathing difficulties; they should be advised to seek immediate medical attention if swallowing, speech or breathing difficulties occur

**NeuroBloc® (Eisai)®**
Injection, botulinum toxin type B 5000 units/mL, net price 0.5-mL vial = £111.20; 1-mL vial = £148.27; 2-mL vial = £197.69. Counselling, side-effects, see under Dose above

**Note**  May be diluted with sodium chloride 0.9%

### 4.10 Drugs used in substance dependence

#### 4.10.1 Alcohol dependence

Excessive drinking of alcoholic beverages over a prolonged period of time can result in an alcohol withdrawal syndrome on abrupt cessation of, or marked reduction in, drinking. The presence and severity of alcohol dependence can be assessed by The Severity of Alcohol Dependence Questionnaire (SADQ); other assessment questionnaires are also available.

**Acute alcohol withdrawal**  People with moderate dependence can generally be treated in a community setting unless they are under 18 years of age, or are at high-risk of severe reactions or treatment failure. People with severe dependence should undergo withdrawal in an inpatient setting; withdrawal in severely dependent patients without medical support may lead to seizures, delirium tremens, and death. Long-acting benzodiazepines, usually *chloralhydrate* (p. 228), are used to attenuate alcohol withdrawal symptoms. In primary care, fixed-dose reducing regimens are usually used, whilst a symptom-triggered flexible regimen is used in hospital or other settings where continued assessment and monitoring is carried out for 24–48 hours, usually followed by a fixed 5-day reducing dose schedule (sometimes it may be necessary to continue treatment for up to 10 days). Patients with decompensated liver disease should be treated under specialist supervision.

**Carbamazepine** [unlicensed indication] (p. 300) is sometimes used as an alternative treatment in acute alcohol withdrawal when benzodiazepines are contra-indicated or not tolerated. **Clomethiazole** (p. 225) is licensed for use in acute alcohol withdrawal, but benzodiazepines are preferred. It should only be used in an inpatient setting and should not be prescribed if the patient is liable to continue drinking alcohol.

Patients with marked agitation or hallucinations and those at risk of delirium tremens (characterised by delirium, hallucinations, course tremor, and disorientation) may be prescribed antipsychotic drugs, such as haloperidol (p. 234) or olanzapine (p. 239) [unlicensed indication], as adjunctive therapy to benzodiazepines; antipsychotics should not be used alone because they do not treat alcohol withdrawal and may lower the seizure threshold. Delirium tremens is a medical emergency that requires specialist inpatient care.

If a patient taking a benzodiazepine as part of a withdrawal regimen develops alcohol withdrawal seizures, a fast-acting benzodiazepine (such as intravenous lorazepam [unlicensed indication] (p. 318) or rectal diazepam (p. 317)) should be prescribed; thereafter an increase in the dose of oral benzodiazepine should be considered to prevent further seizures from occurring.

**Alcohol dependence**  *Acamprosate* and naltrexone are effective treatments for relapse prevention in patients with alcohol dependence; *disulfiram* is an alternative (see below). Disulfiram should only be used in patients in whom acamprosate and naltrexone are not suitable, or if the patient prefers disulfiram. **Nalmefene** is licensed for the reduction of alcohol consumption in patients with alcohol dependence who have a high drinking risk level, without physical withdrawal symptoms, and who do not require immediate detoxification. Patients with alcohol dependence are at risk of developing Wernicke’s encephalopathy; patients at high-risk are those who are malnourished, at risk of malnourishment, or have decompensated liver disease. Parenteral thiamine (as *Pabrinex®,* section 9.6.2) should be prescribed for treatment of suspected or confirmed Wernicke’s encephalopathy, and for prophylaxis in alcohol-dependent patients attending hospital for acute treatment (including treatment unrelated to alcohol dependence); parenteral prophylaxis may also be considered for high-risk patients being treated in primary care. High-dose oral thiamine (p. 688) should be prescribed following parenteral treatment until cognitive function is maximised. In primary care, prophylactic high-dose oral thiamine should be prescribed during acute withdrawal of alcohol, before planned withdrawal, and for patients not undergoing withdrawal but who are at high-risk of developing Wernicke’s encephalopathy.

Patients with chronic alcohol-related pancreatitis who have symptoms of steatorrhoea or who have poor nutritional status due to exocrine pancreatic insufficiency should be prescribed *pancreatic enzyme supplements* (section 1.9.4); supplements are not indicated when pain is the only symptom.

**Corticosteroids** (section 6.3.2) are used in patients with severe acute alcohol-related hepatitis.
Acamprosate

Acamprosate, in combination with counselling, may be helpful for maintaining abstinence in alcohol-dependent patients. It is useful for patients who are concerned that strong cravings will result in relapse. It should be initiated as soon as possible after abstinence has been achieved and continued for 1 year; treatment should be maintained if the patient has a temporary relapse but stopped if the patient returns to regular or excessive drinking that persists 4–6 weeks after starting treatment. Acamprosate is not effective in all patients, so efficacy should be regularly assessed.

ACAMPROSATE CALCIUM

Indications  see notes above

Cautions  continued alcohol abuse (risk of treatment failure)

Hepatic impairment  avoid if severe

Renal impairment  avoid if serum-creatinine greater than 120 micromol/litre

Pregnancy  avoid

Breast-feeding  avoid

Side-effects  diarrhoea, nausea, vomiting, abdominal pain; fluctuation in libido; pruritus, maculopapular rash; rarely bullous skin reactions

Dose

• ADULT 18–65 years, body-weight 60 kg and over, 666 mg 3 times daily; body-weight less than 60 kg, 666 mg at breakfast, 333 mg at midday, and 333 mg at night

• CHILD 16–18 years (under specialist supervision) [unlicensed], body-weight 60 kg and over, 666 mg 3 times daily; body-weight less than 60 kg, 666 mg at breakfast, 333 mg at midday, and 333 mg at night

Campral EC® (Merck Serono) Flip

Tablet, e/c, acamprosate calcium 333 mg, net price 168-tab pack = £28.80. Label: 21, 25

Electrolytes  Ca2+ 0.8 mmol/tablet

Disulfiram

Disulfiram is used as an adjunct in the treatment of alcohol dependence (under specialist supervision). It gives rise to an extremely unpleasant systemic reaction after the ingestion of even a small amount of alcohol because it causes accumulation of acetaldehyde in the body; it is only effective if taken daily. Symptoms can occur within 10 minutes of ingesting alcohol and include flushing of the face, throbbing headache, palpitation, tachycardia, nausea, vomiting, and, with large doses of alcohol, arrhythmias, hypotension, and collapse; these reactions can last several hours. Small amounts of alcohol such as those included in many oral medicines may be sufficient to precipitate a reaction—even toiletries and mouthwashes that contain alcohol should be avoided. Alcohol should be avoided for at least 1 week after stopping treatment.

Before initiating disulfiram, prescribers should evaluate the patient’s suitability for treatment, because some patient factors, for example memory impairment or social circumstances, make compliance to treatment or abstinence from alcohol difficult.

During treatment with disulfiram, patients should be monitored at least every 2 weeks for the first 2 months, then each month for the following 4 months, and at least every 6 months thereafter.

DISULFIRAM

Indications  see notes above

Cautions  ensure that alcohol not consumed for at least 24 hours before initiating treatment; see also notes above; alcohol challenge not recommended on routine basis (if considered essential—specialist units only with resuscitation facilities); respiratory disease, diabetes mellitus, epilepsy; avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (disulfiram)

Contra-indications  cardiac failure, coronary artery disease, history of cerebrovascular accident, hypertension, psychosis, severe personality disorder, suicide risk

Hepatic impairment  use with caution

Renal impairment  use with caution

Pregnancy  high concentrations of acetaldehyde which occur in presence of alcohol may be teratogenic; avoid in first trimester

Breast-feeding  avoid—no information available

Side-effects  initially drowsiness and fatigue; nausea, vomiting, halitosis, reduced libido; rarely psychotic reactions (depression, paranoia, schizophrenia, mania), allergic dermatitis, peripheral neuritis, hepatic cell damage

Dose

• 200 mg daily increased if necessary; usual max. 500 mg daily; CHILD not recommended

Note  Disulfiram doses in BNF may differ from those in product literature

Antabuse® (Actavis) Flip

Tablets, scored, disulfiram 200 mg. Net price 50-tab pack = £31.00. Label: 2, counselling, alcohol reaction

Nalmefene

Nalmefene is licensed for the reduction of alcohol consumption in patients with alcohol dependence who have a high drinking risk level without physical withdrawal symptoms, and who do not require immediate detoxification. It should only be prescribed in conjunction with continuous psychosocial support focused on treatment adherence and reducing alcohol consumption. Nalmefene is not recommended for patients aiming to achieve immediate abstinence.

Before initiating treatment, prescribers should evaluate the patient’s clinical status, alcohol dependence, and level of alcohol consumption. Nalmefene should only be prescribed for patients who continue to have a high drinking risk level two weeks after the initial assessment. During treatment, patients should be monitored regularly and the need for continued treatment assessed. Caution is advised if treatment is continued for more than 1 year.

NALMEFENE

Indications  see notes above

Cautions  notes above; also avoid concomitant use of opioids—discontinue treatment 1 week before anticipated use of opioids; if emergency analgesia is required during treatment, an increased dose of opioid analgesic may be necessary (monitor for
BNF 68

4.10.2 Nicotine dependence

Smoking cessation interventions are a cost-effective way of reducing ill health and prolonging life. Smokers should be advised to stop and offered help with follow-up when appropriate. If possible, smokers should have access to smoking cessation services for behavioural support.

Therapy to aid smoking cessation is chosen according to the smoker’s likely adherence, availability of counselling and support, previous experience of smoking-cessation aids, contra-indications and adverse effects of the preparations, and the smoker’s preferences. Nicotine replacement therapy, bupropion, and varenicline are effective aids to smoking cessation. The use of nicotine replacement therapy in an individual who is already accustomed to nicotine introduces few new risks and it is widely accepted that there are no circumstances in which it is safer to smoke than to use nicotine replacement therapy.

Some patients benefit from having more than one type of nicotine replacement therapy prescribed, such as a combination of transdermal and oral preparations. The combination of nicotine replacement therapy with varenicline or bupropion is not recommended.

Concomitant medication Cigarette smoking increases the metabolism of some medicines by stimulating the hepatic enzyme CYP1A2. When smoking is discontinued, the dose of these drugs, in particular theophylline (p. 191), cinacalcet (p. 682), ropinirole (p. 323), and some antipsychotics (including clozapine (p. 238), olanzapine (p. 239), chlorpromazine (p. 234), and haloperidol (p. 234)), may need to be reduced. Regular monitoring for adverse effects is advised.

Bupropion

Bupropion has been used as an antidepressant. Its mode of action in smoking cessation is not clear and may involve an effect on noradrenaline and dopamine neurotransmission.

BUPROPION HYDROCHLORIDE

(Amfebutamone hydrochloride)

Indications see notes above

Cautions elderly; predisposition to seizures (prescribe only if benefit clearly outweighs risk) including concomitant use of drugs that lower seizure threshold, alcohol abuse, history of head trauma, and diabetes; measure blood pressure before and during treatment; interactions: Appendix 1 (bupropion)

Driving May impair performance of skilled tasks (e.g. driving)

Contra-Indications acute alcohol or benzodiazepine withdrawal; severe hepatic cirrhosis; CNS tumour; history of seizures, eating disorders, or bipolar disorder

Hepatic impairment reduce dose to 150 mg daily; avoid in severe hepatic cirrhosis

Renal impairment reduce dose to 150 mg daily

Pregnancy avoid—no information available

Breast-feeding present in milk—avoid

Side-effects dry mouth, gastro-intestinal disturbances, taste disturbance; agitation, anxiety, dizziness, depression, headache, impaired concentration, insomnia (reduced by avoiding dose at bedtime), tremor; fever, pruritus, rash, sweating; less commonly chest pain, flushing, hypertension, tachycardia, anorexia, asthenia, confusion, tinnitus, and visual disturbances; rarely hepatitis, jaundice, palpitation, postural hypotension, vasodilatation, abnormal dreams, ataxia, dystonia, depersonalisation, hallucinations, hostility, incoordination, irritability, impaired memory, paraesthesia, seizures, twitching, blood-glucose changes, urinary frequency, urinary retention, exacerbation of psoriasis, and Stevens-Johnson syndrome; very rarely aggression, delusions, paranoid ideation, and restlessness; also reported suicidal ideation

Dose

• ADULT over 18 years, start 1–2 weeks before target stop date, initially 150 mg daily for 6 days then 150 mg twice daily (max. single dose 150 mg, max. daily dose 300 mg; minimum 8 hours between doses); period of treatment 7–9 weeks; discontinue if abstinence not achieved at 7 weeks; consider max. 150 mg daily in patients with risk factors for seizures; ELDERLY max. 150 mg daily
Nicotine replacement therapy

Nicotine replacement therapy can be used in place of cigarettes after abrupt cessation of smoking, or alternatively to reduce the amount of cigarettes used in advance of making a quit attempt. Nicotine replacement therapy can also be used to minimise passive smoking, and to treat cravings and reduce compensatory smoking after enforced abstinence in smoke-free environments. Smokers who find it difficult to achieve abstinence should consult a healthcare professional for advice.

Choice

Nicotine patches are a prolonged-release formulation and are applied for 16 hours (with the patch removed overnight) or for 24 hours. If patients experience strong cravings for cigarettes on waking, a 24-hour patch may be more suitable. Immediate-release nicotine preparations (gum, lozenges, sublingual tablets, inhalator, nasal spray, and oral spray) are used whenever the urge to smoke occurs or to prevent cravings.

The choice of nicotine replacement preparation depends largely on patient preference, and should take into account what preparations, if any, have been tried before. Patients with a high level of nicotine dependence, or who have failed with nicotine replacement therapy previously, may benefit from using a combination of an immediate-release preparation and patches to achieve abstinence.

All preparations are licensed for adults and children over 12 years (with the exception of Nicotinell® lozenges which are licensed for children under 16 years only when recommended by a doctor).

Cautions

Most warnings for nicotine replacement therapy also apply to continued cigarette smoking, but the risk of continued smoking outweighs any risks of using nicotine preparations. Nicotine replacement therapy should be used with caution in haemodynamically unstable patients hospitalised with severe arrhythmias, myocardial infarction, or cerebrovascular accident, and in patients with phaeochromocytoma or uncontrolled hyperthyroidism. Care is also needed in patients with diabetes mellitus—blood-glucose concentration should be monitored closely when initiating treatment.

Specific cautions for individual preparations are usually related to the local effect of nicotine. Oral preparations should be used with caution in patients with oesophagitis, gastritis, or peptic ulcers because swallowed nicotine can aggravate these conditions. The gum may also stick to and damage dentures. Acidic beverages, such as coffee or fruit juice, may decrease the absorption of nicotine through the buccal mucosa and should be avoided for 15 minutes before the use of oral nicotine replacement therapy. Care should be taken with the inhalation cartridges in patients with obstructive lung disease, chronic throat disease, or bronchospastic disease. The nasal spray can cause worsening of bronchial asthma. Patches should not be placed on broken skin and should be used with caution in patients with skin disorders.

Hepatic impairment

Nicotine replacement therapy should be used with caution in moderate to severe hepatic impairment.

Renal impairment

Nicotine replacement therapy should be used with caution in severe renal impairment.

Pregnancy

The use of nicotine replacement therapy in pregnancy is preferable to the continuation of smoking, but should be used only if smoking cessation without nicotine replacement fails. Intermittent therapy is preferable to patches but avoid liquorice-flavoured nicotine products. Patches are useful, however, if the patient is experiencing pregnancy-related nausea and vomiting. If patches are used, they should be removed before bed.

Breast-feeding

Nicotine is present in milk; however, the amount to which the infant is exposed is small and less hazardous than second-hand smoke. Intermittent therapy is preferred.

Side-effects

Some systemic effects occur on initiation of therapy, particularly if the patient is using high-strength preparations; however, the patient may confuse side-effects of the nicotine-replacement preparation with nicotine withdrawal symptoms. Common symptoms of nicotine withdrawal include malaise, headache, dizziness, sleep disturbance, coughing, influenza-like symptoms, depression, irritability, increased appetite, weight gain, restlessness, anxiety, drowsiness, aphthous ulcers, decreased heart rate, and impaired concentration.

Mild local reactions at the beginning of treatment are common because of the irritant effect of nicotine. Oral preparations and inhalation cartridges can cause irritation of the throat, gum, lozenges, and oral spray can cause increased salivation, and patches can cause minor skin irritation. The nasal spray commonly causes coughing, nasal irritation, epistaxis, sneezing, and watery eyes, the oral spray can cause watery eyes and blurred vision.

Gastro-intestinal disturbances are common and may be caused by swallowed nicotine. Nausea, vomiting, dyspepsia, and hiccup occur most frequently. Ulcerative stomatitis has also been reported. Dry mouth is a common side-effect of lozenges, patches, oral spray, and sublingual tablets. Lozenges cause diarrhoea, constipation, dysphagia, oesophagitis, gastritis, mouth ulcers, bloating, flatulence, and less commonly, taste disturbance, thirst, gingival bleeding, and haltosis. The oral spray may also cause abdominal pain, flatulence, and taste disturbance.

Palpitations may occur with nicotine replacement therapy and rarely patches and oral spray can cause arrhythmia. Patches, lozenges, and oral spray can cause chest pain. The inhalator can very rarely cause reversible atrial fibrillation.

Paraesthesia is a common side-effect of oral spray. Abnormal dreams can occur with patches; removal of the patch before bed may help. Lozenges and oral spray may cause rash and hot flushes. Sweating and myalgia can occur with patches and oral spray; the patches can also cause arthralgia.

Nicotine medicated chewing gum

Individuals who smoke fewer than 20 cigarettes each day should use 1 piece of 2-mg strength gum when the urge to smoke occurs or to prevent cravings; individuals who smoke more than 20 cigarettes each day or who require more than 15 pieces of 2-mg strength gum each day should use the 4-mg strength. Patients should not exceed 15 pieces of 4-mg strength gum daily. If attempting smoking cessation, treatment should continue for 3 months before reducing the dose.
BNF 68

4.10.2 Nicotine dependence

---

**Administration** Chew the gum until the taste becomes strong, then rest it between the cheek and gum; when the taste starts to fade, repeat this process. One piece of gum lasts for approximately 30 minutes.

**Nicotine inhalation cartridge** The cartridges can be used when the urge to smoke occurs or to prevent cravings. Patients should not exceed 12 cartridges of the 10 mg strength daily, or 6 cartridges of the 15 mg strength daily.

**Administration** Insert the cartridge into the device and draw in air through the mouthpiece; each session can last for approximately 5 minutes. The amount of nicotine from 1 puff of the cartridge is less than that from a cigarette, therefore it is necessary to inhale more often than when smoking a cigarette. A single 10 mg cartridge lasts for approximately 20 minutes of intense use; a single 15 mg cartridge lasts for approximately 40 minutes of intense use.

**Nicotine lozenge** One lozenge should be used every 1–2 hours when the urge to smoke occurs. Individuals who smoke less than 20 cigarettes each day should usually use the lower-strength lozenges; individuals who smoke more than 20 cigarettes each day and those who fail to stop smoking with the low-strength lozenges should use the higher-strength lozenges. Patients should not exceed 15 lozenges daily. If attempting smoking cessation, treatment should continue for 6–12 weeks before attempting a reduction in dose.

**Administration** Slowly allow each lozenge to dissolve in the mouth; periodically move the lozenge from one side of the mouth to the other. Lozenges last for 10–30 minutes, depending on their size.

**Nicotine sublingual tablets** Individuals who smoke fewer than 20 cigarettes each day should initially use 1 tablet each hour, increased to 2 tablets each hour if necessary; individuals who smoke more than 20 cigarettes each day should use 2 tablets each hour. Patients should not exceed 40 tablets daily. If attempting smoking cessation, treatment should continue for up to 3 months before reducing the dose.

**Administration** Each tablet should be placed under the tongue and allowed to dissolve.

**Nicotine oral spray** Patients can use 1–2 sprays in the mouth when the urge to smoke occurs or to prevent cravings. Individuals should not exceed 2 sprays per episode (up to 4 sprays every hour), and a maximum of 64 sprays daily.

**Administration** The oral spray should be released into the mouth, holding the spray as close to the mouth as possible and avoiding the lips. The patient should not inhale while spraying and avoid swallowing for a few seconds after use.

**Note** If using the oral spray for the first time, or if unit not used for 2 or more days, prime the unit before administration.

**Nicotine nasal spray** Patients can use 1 spray in each nostril when the urge to smoke occurs, up to twice every hour for 16 hours daily (maximum 64 sprays daily). If attempting smoking cessation, treatment should continue for 8 weeks before reducing the dose.

**Administration** Initially 1 spray should be used in both nostrils but when withdrawing from therapy, the dose can be gradually reduced to 1 spray in 1 nostril.

**Nicotine transdermal patches** As a general guide for smoking cessation, individuals who smoke more than 10 cigarettes daily should apply a high-strength patch daily for 6–8 weeks, followed by the medium-strength patch for 2 weeks, and then the low-strength patch for the final 2 weeks; individuals who smoke fewer than 10 cigarettes daily can usually start with the medium-strength patch for 6–8 weeks, followed by the low-strength patch for 2–4 weeks. A slower titration schedule can be used in patients who are not ready to quit but want to reduce cigarette consumption before a quit attempt.

If abstinence is not achieved, or if withdrawal symptoms are experienced, the strength of the patch used should be maintained or increased until the patient is stabilised. Patients using the high-strength patch who experience excessive side-effects, that do not resolve within a few days, should change to a medium-strength patch for the remainder of the initial period and then use the low-strength patch for 2–4 weeks.

**Administration** Patches should be applied on waking to dry, non-hairy skin on the hip, trunk, or upper arm and held in position for 10–20 seconds to ensure adhesion; place next patch on a different area and avoid using the same site for several days.

Counselling, administration, see notes above

Note: Also available as a clear patch

Varenicline

Varenicline is a selective nicotine-receptor partial agonist used as an aid for smoking cessation.

NICE guidance

Varenicline for smoking cessation (July 2007)

Varenicline is recommended, within its licensed indications, as an option for smokers who have expressed a desire to quit smoking; it should normally be prescribed only as part of a programme of behavioural support.

www.nice.org.uk/TA123

VARENICLINE

Indications: see notes above

Cautions: risk of relapse, irritability, depression, and insomnia on discontinuation (consider dose tapering on completion of 12-week course); history of psychiatric illness (may exacerbate underlying illness including depression); predisposition to seizures, including conditions that may lower seizure threshold; history of cardiovascular disease

MHRA/CHM advice

Suicidal behaviour and varenicline

Patients should be advised to discontinue treatment and seek prompt medical advice if they develop agitation, depressed mood, or suicidal thoughts. Patients with a history of psychiatric illness should be monitored closely while taking varenicline

Renal impairment: if eGFR less than 30 mL/minute/1.73 m², initial dose 500 micrograms once daily, increased after 3 days to 1 mg once daily

Pregnancy: avoid— toxicity in animal studies

Breast-feeding: avoid— present in milk in animal studies

Side-effects: gastro-intestinal disturbances, appetite changes, dry mouth, taste disturbance; headache, drowsiness, dizziness, sleep disorders, abnormal dreams; less commonly, thirst, weight gain, aphthous stomatitis, gingival pain, chest pain, hypertension, tachycardia, atrial fibrillation, palpitation, depression, anxiety, hallucinations, panic attack, mood swings, dysarthria, asthenia, seizure, tremor, incoordination, hypotension, restlessness, hypoanaesthesia, impaired temperature regulation, menorrhagia, vaginal discharge, sexual dysfunction, dysuria, arthralgia, muscle spasm, visual disturbances, eye pain, laceration, tinnitus, acne, sweating, rash, pruritus; rarely cerebrovascular accident; also reported myocardial infarction, aggravation, irational behaviour, psychosis, suicidal ideation (see MHRA/CHM advice above), sleep-walking, hyperglycaemia, diabetes mellitus, Stevens-Johnson syndrome

Dose

• ADULT over 18 years, starting usually 1-2 weeks before target stop date (up to max. 5 weeks before target stop date), initially 500 micrograms once daily for 3 days, increased to 500 micrograms twice daily for 4 days, then 1 mg twice daily for 11 weeks (reduce to 500 micrograms twice daily if not tolerated); 12-week course can be repeated in abstinent individuals to reduce risk of relapse

Champix® (Pfizer) Tablets, 1/2 mg, varenicline (as tartrate) 500 micrograms (white), net price 56-tab pack = £54.60; 1 mg (blue) 28-tab pack = £27.30, 56-tab pack = £54.60; starter pack of 11 x 500-microgram tabs with 14 x 1-mg tabs = £27.30. Label: 3
4.10.3 Opioid dependence

The management of opioid dependence requires medical, social, and psychological treatment; access to a multidisciplinary team is recommended. Treatment for opioid dependence should be initiated under the supervision of an appropriately qualified prescriber.

Untreated heroin dependence shows early withdrawal symptoms within 8 hours, with peak symptoms at 36–72 hours; symptoms subside substantially after 5 days. Methadone or buprenorphine withdrawal occurs later, with longer-lasting symptoms.

Opioid substitution therapy

Methadone and buprenorphine are used as substitution therapy in opioid dependence. Substitution medication should be commenced with a short period of stabilisation, followed by either a withdrawal regimen or by maintenance treatment. Maintenance treatment enables patients to achieve stability, reduces drug use and crime, and improves health; it should be regularly reviewed to ensure the patient continues to derive benefit. The prescriber should monitor for signs of toxicity, and the patient should be told to be aware of warning signs of toxicity on initiation and during titration.

A withdrawal regimen after stabilisation with methadone or buprenorphine should be attempted only after careful consideration. Enforced withdrawal is ineffective for sustained abstinence, and it increases the risk of patients relapsing and subsequently overdosing because of loss of tolerance. Complete withdrawal from opioids usually takes up to 4 weeks in an inpatient or residential setting, and up to 12 weeks in a community setting. If abstinence is not achieved, illicit drug use is resumed, or the patient cannot tolerate withdrawal, the withdrawal regimen should be stopped and maintenance therapy should be resumed at the optimal dose. Following successful withdrawal treatment, further support and monitoring to maintain abstinence should be provided for a period of at least 6 months.

In younger patients (under 18 years), the harmful effects of drug misuse are more often related to acute intoxication than to dependence, so substitution therapy is usually inappropriate. Maintenance treatment with opioid substitution therapy is therefore controversial in young people; however, it may be useful for the older adolescent who has a history of opioid use to undergo a period of stabilisation with buprenorphine or methadone before starting a withdrawal regimen.

Missed doses

Patients who miss 3 days or more of their regular prescribed dose of opioid maintenance therapy are at risk of overdose because of loss of tolerance. Consider reducing the dose in these patients.

If the patient misses 5 or more days of treatment, an assessment of illicit drug use is also recommended before restarting substitution therapy; this is particularly important for patients taking buprenorphine, because of the risk of precipitated withdrawal.

NICE guidance

Methadone and buprenorphine for the management of opioid dependence (January 2007)

Oral methadone and buprenorphine are recommended for maintenance therapy in the management of opioid dependence. Patients should be committed to a supportive care programme including a flexible dosing regimen administered under supervision for at least 3 months, until compliance is assured. Selection of methadone or buprenorphine should be made on a case-by-case basis, but methadone should be prescribed if both drugs are equally suitable.

www.nice.org.uk/TA114

Buprenorphine Buprenorphine is an opioid-receptor partial agonist (it has opioid agonist and antagonist properties). Buprenorphine is preferred by some patients because it is less sedating than methadone; for this reason it may be more suitable for employed patients or those undertaking other skilled tasks such as driving. Buprenorphine is safer than methadone when used in conjunction with other sedating drugs, and has fewer drug interactions. Dose reductions may be easier than with methadone because the withdrawal symptoms are milder, and patients generally require fewer adjunctive medications; there is also a lower risk of overdose. Buprenorphine can be given on alternate days in higher doses and it requires a shorter drug-free period than methadone before induction with naltrexone for prevention of relapse (p. 342).

Patients dependent on high doses of opioids may be at increased risk of precipitated withdrawal. Precipitated withdrawal can occur in any patient if buprenorphine is administered when other opioid agonist drugs are in circulation. Precipitated opioid withdrawal, if it occurs, starts within 1–3 hours of the first buprenorphine dose and peaks at around 6 hours. Non-opioid adjunctive therapy, such as lofexidine (p. 341), may be required if symptoms are severe.

To reduce the risk of precipitated withdrawal, the first dose of buprenorphine should be given when the patient is exhibiting signs of withdrawal, or 6–12 hours after the last use of heroin (or other short-acting opioid), or 24–48 hours after the last dose of methadone. It is possible to titrate the dose of buprenorphine within one week—more rapidly than with methadone therapy—but care is still needed to avoid toxicity or precipitated withdrawal; dividing the dose on the first day may be useful.

In patients taking methadone who want to switch to buprenorphine, the dose of methadone should be reduced to a maximum of 30 mg daily before starting buprenorphine treatment. If the dose of methadone is over 10 mg daily, buprenorphine can be started at a dose of 4 mg daily and titrated according to requirements; if the methadone dose is below 10 mg daily, buprenorphine can be started at a dose of 2 mg daily. Buprenorphine should not normally be used in patients with liver dysfunction. Baseline liver function tests and documentation of viral hepatitis status is recommended before commencing therapy, and regular liver function tests should be performed throughout treatment.

A combination preparation containing buprenorphine with naloxone (Suboxone®), below) can be prescribed for patients when there is a risk of dose diversion for par-
Central nervous system

4 Central nervous system

340 4.10.3 Opioid dependence  BNF 68

The dose of methadone should be reduced by 2–4 mg daily to usual dose of 12–24 mg daily (max. 32 mg daily); withdraw gradually.

Buprenorphine (Non-proprietary) (C9)

Tablets (sublingual), buprenorphine (as hydrochloride) 400 micrograms, net price 7-tab pack = £1.60; 2 mg, 7-tab pack = £2.07; 8 mg, 7-tab pack = £4.17. Label: 2, 26

Subutex® (Reckitt Benckiser) (C9)

Tablets (sublingual), buprenorphine (as hydrochloride) 400 micrograms, net price 7-tab pack = £1.60; 2 mg, 7-tab pack = £2.07; 8 mg, 7-tab pack = £4.17. Label: 2, 26

Suboxone® (Reckitt Benckiser) (C9)

Suboxone 2 mg/500 micrograms tablets (sublingual), buprenorphine (as hydrochloride) 2 mg, naloxone (as hydrochloride) 500 micrograms, net price 28-tab pack = £25.40. Label: 2, 26

Suboxone 8 mg/2 mg tablets (sublingual), buprenorphine (as hydrochloride) 8 mg, naloxone (as hydrochloride) 2 mg, net price 28-tab pack = £76.19. Label: 2, 26

Dose expressed as buprenorphine, ADULT and CHILD over 15 years, initially 2-4 mg once daily (an additional dose of 2–4 mg may be administered on day 1 depending on the individual patient’s requirement), increased in steps of 2–8 mg according to response, max. 24 mg daily; total weekly dose may be divided and given on alternate days or 3 times weekly (but max. 24 mg daily)

Note The Scottish Medicines Consortium (p. 4) has advised (February 2007) that Suboxone® should be restricted for use in patients in whom methadone is not suitable

METHADONE HYDROCHLORIDE

Indications adjunct in treatment of opioid dependence; see notes above; analgesia in other situations (section 4.7.2); cough in terminal disease (section 3.9.1)

Cautions see Methadone, section 4.7.2; respiratory depression in neonate)

Increased sleepiness, breathing difficulties, or limpness in breast-fed babies of mothers taking opioid substitutes should be reported urgently to a healthcare professional.

Methadone is initiated at least 8 hours after the last heroin dose, provided that there is objective evidence of withdrawal symptoms. A supplementary dose on the first day may be considered if there is evidence of persistent opioid withdrawal symptoms. Because of the long half-life, plasma concentrations progressively rise during initial treatment even if the patient remains on the same daily dose (it takes 3–10 days for plasma concentrations to reach steady-state in patients on a stable dose); a dose tolerated on the first day of treatment may become a toxic dose on the third day as cumulative toxicity develops. Thus, titration to the optimal dose in methadone maintenance treatment may take several weeks.

Pregnancy

Acute withdrawal of opioids should be avoided in pregnancy because it can cause fetal death. Opioid substitution therapy is recommended during pregnancy because it carries a lower risk to the fetus than continued use of illicit drugs. If a woman who is stabilised on methadone or buprenorphine for treatment of opioid dependence becomes pregnant, therapy should be continued (buprenorphine is not licensed for use in pregnancy). Many pregnant patients choose a withdrawal regimen, but withdrawal during the first trimester should be avoided because it is associated with an increased risk of spontaneous miscarriage. Withdrawal of methadone or buprenorphine should be undertaken gradually during the second trimester; for example, the dose of methadone may be reduced by 2–3 mg every 3–5 days. If illicit drug use occurs, the patient should be re-stabilised at the optimal maintenance dose and consideration should be given to stopping the withdrawal regimen.

Further withdrawal of methadone or buprenorphine in the third trimester is not recommended because maternal withdrawal, even if mild, is associated with fetal distress, stillbirth, and the risk of neonatal mortality. Drug metabolism can be increased in the third trimester; it may be necessary to either increase the dose of methadone or change to twice-daily consumption (or a combination of both strategies) to prevent withdrawal symptoms from developing.

The neonate should be monitored for respiratory depression and signs of withdrawal if the mother is prescribed high doses of opioid substitute.

Signs of neonatal withdrawal from opioids usually develop 24–72 hours after delivery but symptoms may be delayed for up to 14 days, so monitoring may be required for several weeks. Symptoms include a high-pitched cry, rapid breathing, hungry but ineffective sucking, and excessive wakefulness; severe, but rare symptoms include hypertonicity and convulsions.

Breast-feeding

The dose of methadone should be kept as low as possible in breast-feeding mothers and the infant should be monitored for sedation (high doses of methadone carry an increased risk of sedation and respiratory depression in the neonate).

Buprenorphine is excreted in low concentrations in breast milk and has low oral bioavailability; however, neonates should be monitored for drowsiness, adequate weight gain, and developmental milestones.

With naloxone

Suboxone® (Reckitt Benckiser) (C9)

Suboxone 2 mg/500 micrograms tablets (sublingual), buprenorphine (as hydrochloride) 2 mg, naloxone (as hydrochloride) 500 micrograms, net price 28-tab pack = £25.40. Label: 2, 26

Suboxone 8 mg/2 mg tablets (sublingual), buprenorphine (as hydrochloride) 8 mg, naloxone (as hydrochloride) 2 mg, net price 28-tab pack = £76.19. Label: 2, 26

Dose expressed as buprenorphine, ADULT and CHILD over 15 years, initially 2-4 mg once daily (an additional dose of 2–4 mg may be administered on day 1 depending on the individual patient’s requirement), increased in steps of 2–8 mg according to response, max. 24 mg daily; total weekly dose may be divided and given on alternate days or 3 times weekly (but max. 24 mg daily)

Note The Scottish Medicines Consortium (p. 4) has advised (February 2007) that Suboxone® should be restricted for use in patients in whom methadone is not suitable

METHADONE HYDROCHLORIDE

Indications adjunct in treatment of opioid dependence, see notes above; analgesia (section 4.7.2); cough in terminal disease (section 3.9.1)

Cautions see Methadone, section 4.7.2;
Contra-indications see Methadone, section 4.7.2
Hepatic impairment see notes in section 4.7.2
Renal impairment see notes in section 4.7.2
Pregnancy see notes above
Breast-feeding see notes above
Side-effects see Methadone, section 4.7.2, overdose: see Emergency Treatment of Poisoning, p. 38

Important Methadone, even in low doses is a special hazard for children; non-dependent adults are also at risk of toxicity; dependent adults are at risk if tolerance is incorrectly assessed during induction

Incompatibility Syrup preserved with hydroxybenzoate (paraben) esters may be incompatible with methadone hydrochloride.

Dose
- Initially 10–40 mg daily, increased by up to 10 mg daily (max. weekly increase 30 mg) until no signs of withdrawal or intoxication; usual dose range 80–120 mg daily; CHILD not recommended (see also important note above)

Note Methadone hydrochloride doses in the BNF may differ from those in the product literature

Methadone (Non-proprietary) (®)

Oral solution 1 mg/mL, methadone hydrochloride 1 mg/mL, net price 100 mL = £1.27, 500 mL = £6.35, 2.5 L = £32.10. Label: 2

Sugar free oral solution 1 mg/mL, methadone hydrochloride 1 mg/mL, net price 30 mL = £6.2p, 50 mL = £1.04, 100 mL = £2.08, 500 mL = £6.50, 2.5 L = £32.50. Label: 2

Brands include Metharose® (sugar-free), Physeptone® (sugar-free)

Important Methadone oral solution 1 mg/mL is 2½ times the strength of Methadone Linus (section 3.9.1). Many preparations of Methadone oral solution are licensed for opioid drug addiction only but some are also licensed for analgesia in severe pain

Injection, methadone hydrochloride 25 mg/mL, net price 2-mL amp = £1.77, 50 mg/mL, 1-mL amp = £1.77

Brands include Synameth®

Methadose® (Rosemont) (®)

Oral concentrate, methadone hydrochloride 10 mg/mL (blue), net price 150 mL = £12.01, 20 mg/mL (brown), 150 mL = £24.02. Label: 2

Note The final strength of the methadone mixture to be dispensed to the patient must be specified on the prescription

Important Care is required in prescribing and dispensing the correct strength since any confusion could lead to an overdose; this preparation should be dispensed only after dilution as appropriate with Methadose® Diluent (life of diluted solution 3 months) and is for drug dependent persons

Adjunctive therapy and symptomatic treatment

Adjunctive therapy may be required for the management of opioid withdrawal symptoms. Loperamide (p. 59) may be used for the control of diarrhoea; mebeverine (p. 49) for controlling stomach cramps; paracetamol (p. 276) and non-steroidal anti-inflammatory drugs (p. 702) for muscular pains and headaches; metoclopramide (p. 270) or prochlorperazine (p. 269) may be useful for nausea or vomiting. Topical rubefacients (p. 737) can be helpful for relieving muscle pain associated with methadone withdrawal. If a patient is suffering from insomnia, short-acting benzodiazepines (section 4.1) or zopiclone (p. 225) may be prescribed, but because of the potential for abuse, prescriptions should be limited to a short course of a few days only. If anxiety or agitation is severe, specialist advice should be sought.

Lofexidine Lofexidine is an alpha₂-adrenergic agonist. It may alleviate some of the physical symptoms of opioid withdrawal by attenuating the increase in adrenergic neurotransmission that occurs during opioid withdrawal. Lofexidine can be prescribed as an adjuvant to opioid substitution therapy, initiated either at the same time as the opioid substitute or during withdrawal of the opioid substitute. Alternatively, lofexidine may be prescribed instead of an opioid substitute in patients who have mild or uncertain dependence (including young people), and those with a short history of illicit drug use. The patient should take part of the dose at bedtime to offset insomnia associated with opioid withdrawal.

Monitoring of blood pressure and pulse rate is recommended on initiation, for at least 72 hours or until a stable dose is achieved, and on discontinuation; treatment should be discontinued gradually over 2–4 days to reduce the risk of rebound hypertension.

LOFEXIDINE HYDROCHLORIDE

Indications management of symptoms of opioid withdrawal

Cautions severe coronary insufficiency, recent myocardial infarction, cerebrovascular disease, bradycardia, hypotension (monitor pulse rate and blood pressure); history of QT prolongation, concomitant administration of drugs that prolong QT interval; metabolic disturbances; withdrawal gradually over 2–4 days (or longer) to minimise risk of rebound hypotension and associated symptoms; depression; interactions: Appendix 1 (lofexidine)

Renal impairment caution in chronic impairment

Pregnancy use only if benefit outweighs risk—no information available

Breast-feeding use only if benefit outweighs risk—no information available

Side-effects dry mucous membranes; hypotension, bradycardia; dizziness, drowsiness; QT-interval prolongation also reported

Dose
- ADULT and CHILD over 12 years, initially 800 micrograms daily in divided doses, increased as necessary in steps of 400–800 micrograms daily to max. 2.4 mg daily in divided doses; max. single dose 800 micrograms; recommended duration of treatment 7–10 days if no opioid use (but longer may be required)

Note Lofexidine unlicensed for children under 18 years of age

BritLofex® (Genus) (®)

Tablets, peach, f/c, lofexidine hydrochloride 200 micrograms, net price 60-tab pack = £61.79. Label: 2

Opioid-receptor antagonists

Naloxone is an opioid-receptor antagonist used to reverse opioid overdose. Patients dependant on opioids can be given a supply of naloxone to be used in case of accidental overdose; see Emergency Treatment of Poisoning, p. 38.

Naltrexone is an opioid-receptor antagonist that precipitates withdrawal symptoms in opioid-dependent subjects. Because the effects of opioid-receptor agonists
are blocked by naltrexone, it is prescribed as an aid to prevent relapse in formerly opioid-dependent patients.

**NICE guidance**

**Naltrexone for the management of opioid dependence (January 2007)**

Naltrexone is recommended for the prevention of relapse in formerly opioid-dependent patients who are motivated to remain in a supportive care abstinence programme. Naltrexone should be administered under supervision and its effectiveness in preventing opioid misuse reviewed regularly.

www.nice.org.uk/TA115

---

**NALTREXONE HYDROCHLORIDE**

**Indications**  
Adjunct to prevent relapse in formerly opioid-dependent patients (who have remained opioid-free for at least 7–10 days); adjunct to prevent relapse in formerly alcohol-dependent patients (section 4.10.1); treatment should be initiated and supervised by an appropriate specialist

**Contraindications**  
Patients currently dependent on opioids

**Hepatic impairment**  
Avoid in acute hepatitis, hepatic failure or severe impairment

**Renal impairment**  
Avoid in severe impairment

**Pregnancy**  
Use only if benefit outweighs risk

**Breast-feeding**  
Avoid potential toxicity

**Side-effects**  
Nausea, vomiting, abdominal pain, diarrhoea, constipation, reduced appetite, increased thirst, chest pain, anxiety, sleep disorders, headache, increased energy, irritability, mood swings, dizziness, chills, urinary retention, delayed ejaculation, decreased potency, joint and muscle pain, increased lacrimation, rash, increased sweating, rarely hepatic dysfunction, depression, suicidal ideation, tinnitus, speech disorders; very rarely hallucinations, tremor, idiopathic thrombocytopenia, exanthesma

**Dose**

- Relapse prevention in opioid dependence. **ADULT** over 18 years (initiate in specialist clinics only), 25 mg initially then 50 mg daily; total weekly dose (350 mg) may be divided and given on 3 days of the week for improved compliance (e.g. 100 mg on Monday and Wednesday, and 150 mg on Friday)

- Relapse prevention in alcohol dependence. **ADULT** and **CHILD** over 16 years [unlicensed under 18 years], 25 mg [unlicensed dose] on first day, increased to 50 mg daily if tolerated

**Naltrexone** (Non-proprietary)  
Tablets, naltrexone hydrochloride 50 mg, net price £22.34

**Brands include**  
Adepend®, Opizone®

**Naloxone** (Bristol-Myers Squibb)  
Tablets, yellow, f/c, scored, naltrexone hydrochloride 50 mg, net price 28-tab pack = £22.34

---

Acetylcholinesterase inhibiting drugs are used in the treatment of Alzheimer’s disease, specifically for mild to moderate disease. Rivastigmine is also licensed for mild to moderate dementia associated with Parkinson’s disease. The evidence to support the use of these drugs relates to their cognitive enhancement.

Treatment with drugs for dementia should be initiated and supervised only by a specialist experienced in the management of dementia.

Benefit is assessed by repeating the cognitive assessment at around 3 months. Such assessment cannot demonstrate how the disease may have progressed in the absence of treatment but it can give a good guide to response. Up to half the patients given these drugs will show a slower rate of cognitive decline. Drugs for dementia should be discontinued in those thought not to be responding. Many specialists repeat the cognitive assessment 4 to 6 weeks after discontinuation to assess deterioration; if significant deterioration occurs during this short period, consideration should be given to restarting therapy.

Donepezil is a reversible inhibitor of acetylcholinesterase. Galantamine is a reversible inhibitor of acetylcholinesterase and it also has nicotinic receptor agonist properties. Rivastigmine is a reversible non-competitive inhibitor of acetylcholinesterases; it is also licensed for treating mild to moderate dementia in Parkinson’s disease.

Acetylcholinesterase inhibitors can cause unwanted dose-related cholinergic effects and should be started at a low dose and the dose increased according to response and tolerability.

Memantine is a glutamate receptor antagonist; it is licensed for treating moderate to severe Alzheimer’s disease.

**NICE guidance**

**Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer’s disease (March 2011)**

Donepezil, galantamine, and rivastigmine can be used for the treatment of mild to moderate Alzheimer’s disease. Memantine can be used for moderate Alzheimer’s disease in patients who are unable to take acetylcholinesterase inhibitors, and for patients with severe disease; combination treatment with memantine and an acetylcholinesterase inhibitor is not recommended. Treatment should only be prescribed under the following conditions:

- Alzheimer’s disease must be diagnosed and treatment initiated by a specialist; treatment can be continued by general practitioners under a shared-care protocol

- The carers’ views of the condition should be sought before and during treatment

- Treatment should continue only if it is considered to have a worthwhile effect on cognitive, global, functional, or behavioural symptoms.

Healthcare professionals should not rely solely on assessment scales to determine the severity of Alzheimer’s disease when the patient has learning or other disabilities, or other communication difficulties.

www.nice.org.uk/TA217
### DONEPEZIL HYDROCHLORIDE

**Indications**  
Mild to moderate dementia in Alzheimer’s disease

**Cautions**  
Sick sinus syndrome or other supraventricular conduction abnormalities; susceptibility to peptic ulcers; asthma, chronic obstructive pulmonary disease; concomitant antipsychotic treatment—increased risk of neuroleptic malignant syndrome; **interactions**: Appendix 1 (parasympathomimetics)

**Hepatic impairment**  
Caution in mild to moderate impairment, no information available for severe impairment

**Side-effects**  
Nausea, vomiting, anorexia, diarrhoea; caution in mild to moderate hepatic impairment

**Dose**  
- Initially 5 mg once daily at bedtime, increased if necessary after one month to max. 10 mg daily

**Donepezil (Non-proprietary)**

<table>

**Aricet Evess® (Eisai)**

| Tablet form | Donepezil hydrochloride 5 mg (white), net price 28-tab pack = £59.85 | 10 mg (yellow), 28-tab pack = £83.89 |

**GALANTAMINE**

**Indications**  
Mild to moderate dementia in Alzheimer’s disease

**Cautions**  
Cardiac disease (including sick sinus syndrome or other supraventricular conduction abnormalities, unstable angina, congestive heart failure); electrolyte disturbances; susceptibility to peptic ulcers; asthma, chronic obstructive pulmonary disease, pulmonary infection; avoid in urinary retention, gastro-intestinal obstruction, and while recovering from bladder or gastro-intestinal surgery; history of seizures; **interactions**: Appendix 1 (parasympathomimetics)

**Hepatic impairment**  
For immediate-release preparations in moderate impairment, initially 4 mg once daily (preferably in the morning) for at least 7 days, then 4 mg twice daily for at least 4 weeks; max. 8 mg twice daily; avoid in severe impairment

**Side-effects**  
Constipation; hypertension; dyspnoea; headache, dizziness, drowsiness; less commonly vomiting, thrombosis, heart failure, confusion, fatigue, hallucinations, and abnormal gait; very rarely seizures; pancreatitis, psychosis, depression, and suicidal ideation also reported

### MEMANTINE HYDROCHLORIDE

**Indications**  
Moderate to severe dementia in Alzheimer’s disease

**Cautions**  
History of convulsions; **interactions**: Appendix 1 (memantine)

**Hepatic impairment**  
Avoid in severe impairment—no information available

**Renal impairment**  
Reduce dose to 10 mg daily if eGFR 30–49 mL/minute/1.73 m²; if well tolerated after at least 7 days dose can be increased in steps to 20 mg daily; reduce dose to 10 mg daily if eGFR 5–29 mL/minute/1.73 m²; avoid if eGFR less than 5 mL/minute/1.73 m²

**Breast-feeding**  
Avoid—no information available

**Side-effects**  
Constipation; hypertension; dyspnoea; headache, dizziness, drowsiness; less commonly vomiting, thrombosis, heart failure, confusion, fatigue, hallucinations, and abnormal gait; very rarely seizures; pancreatitis, psychosis, depression, and suicidal ideation also reported
Memantine (Non-proprietary) (Non-proprietary)

**Tablets**, memantine 10 mg, net price 28-tab pack = £14.42, 56-tab pack = £69.01; 20 mg, 28-tab pack = £28.85

**Brands include** Marux®, Nembutal®

**Ebixa®** (lundbeck) (Non-proprietary)

**Tablets**, f/c, scored, memantine hydrochloride 10 mg (yellow), net price 28-tab pack = £34.50, 56-tab pack = £69.01, 112-tab pack = £138.01; 20 mg (red), 28-tab pack = £69.01; treatment initiation pack, 7 × 5 mg (white), 7 × 10 mg, 7 × 15 mg (orange), and 7 × 20 mg = £43.13

**Oral solution**, memantine hydrochloride 5 mg/actuation (10 mg/mL), net price 50-mL pump pack = £61.61, 100-mL pump pack = £123.23

**Counselling** Solution should be dosed onto a spoon or into a glass of water

### RIVASTIGMINE

**Indications** see under Dose

**Cautions** gastric or duodenal ulcers (or susceptibility to ulcers); monitor body-weight; sick sinus syndrome, conduction abnormalities; history of asthma or chronic obstructive pulmonary disease; history of seizures; bladder outflow obstruction; risk of fatal overdose with patch administration errors (see Counselling below); **interactions:** Appendix 1 (para-sympathomimetics)

**Hepatic impairment** titrate according to individual tolerability in mild to moderate impairment; use with caution in severe impairment—no information available

**Renal impairment** titrate according to individual tolerability

**Side-effects** nausea, vomiting, diarrhoea, dyspepsia, anorexia, weight loss, increased salivation, abdominal pain, bradycardia, dizziness, headache, drowsiness, malaise, agitation, anxiety, tremor, confusion, insomnia, extrapyramidal symptoms (and worsening of Parkinson’s disease), urinary incontinence, sweating, depression, syncope; rarely gastric and duodenal ulceration, angina, seizures, rash; very rarely gastrointestinal haemorrhage, pancreatitis, tachycardia, hypertension, hallucinations; also reported dehydration, hepatitis, restlessness, aggression, sick sinus syndrome, skin hypersensitivity reactions

**Note** Transdermal administration less likely to cause gastrointestinal disturbance

**Note** Treatment should be interrupted if gastro-intestinal side-effects occur and withheld until their resolution—retitrate dose if necessary

### Dose

**Mild to moderate dementia in Alzheimer’s disease or in Parkinson’s disease, by mouth**, initially 1.5 mg twice daily, increased in steps of 1.5 mg twice daily at intervals of at least 2 weeks according to response and tolerance; usual range 3–6 mg twice daily; max. 6 mg twice daily; if treatment interrupted for more than several days, treatment should be retitrated from 1.5 mg twice daily

**Mild to moderate dementia in Alzheimer’s disease, by transdermal application**, initially apply 4.6 mg/24 hours patch to clean, dry, non-hairy, non-irritated skin on back, upper arm, or chest, removing after 24 hours and siting a replacement patch on a different area (avoid using the same area for 14 days); after at least 4 weeks, and if well tolerated, increase to usual maintenance dose of 9.5 mg/24 hours patch daily; after a further 6 months if well tolerated and cognitive deterioration or functional decline are demonstrated, the dose can be increased to 13.3 mg/24 hours patch daily (caution in patients with body-weight less than 50 kg); if treatment interrupted for more than three days, treatment should be retitrated from 4.6 mg/24 hours patch

**Note** When switching from oral to transdermal therapy, patients taking 3–6 mg by mouth daily should initially switch to 4.6 mg/24 hours patch, then titrate as above. Patients taking 9 mg by mouth daily should switch to 9.5 mg/24 hours patch if oral dose stable and well tolerated; if oral dose not stable or well tolerated, patients should switch to 4.6 mg/24 hours patch, then titrate as above. Patients taking 12 mg by mouth daily should switch to 9.5 mg/24 hours patch. The first patch should be applied on the day following the last oral dose

**Rivastigmine (Non-proprietary)** (Non-proprietary)

**Capsules**, rivastigmine (as hydrogen tartrate) 1.5 mg, net price 28-cap pack = £3.43, 56-cap pack = £11.98; 3 mg, 28-cap pack = £3.40, 56-cap pack = £6.80; 4.5 mg, 28-cap pack = £16.62, 56-cap pack = £15.00; 6 mg, 28-cap pack = £16.62, 56-cap pack = £14.76. Label: 21, 25

**Brands include** Kemptop®

**Exelon®** (Novartis) (Non-proprietary)

**Capsules**, rivastigmine (as hydrogen tartrate) 1.5 mg (yellow), net price 28-cap pack = £33.25, 56-cap pack = £66.51; 3 mg (orange), 28-cap pack = £33.25, 56-cap pack = £66.51; 4.5 mg (red), 28-cap pack = £33.25, 56-cap pack = £66.51; 6 mg (red/orange), 28-cap pack = £33.25, 56-cap pack = £66.51. Label: 21, 25

**Oral solution**, rivastigmine (as hydrogen tartrate) 2 mg/mL, net price 120 mL (with oral syringe) = £99.14. Label: 21

**Patches**, self-adhesive, beige, rivastigmine 4.6 mg/24 hours, net price 30 = £77.97; 9.5 mg/24 hours, 30 = £77.97; 13.3 mg/24 hours, 30 = £77.97. Counselling, administration

**Counselling** Advise patients and carers of patch administration instructions, particularly to remove the previous day’s patch before applying the new patch—consult product literature

**Note** The Scottish Medicines Consortium (p. 4) has advised (October 2007) that Exelon® patches should be restricted for use in patients with moderately severe Alzheimer’s disease under the conditions of the NICE guidance (September 2007) and when a transdermal patch is an appropriate choice of formulation
5 Infections

5.1 Antibacterial drugs

5.1.1 Penicillins

5.1.1.1 Benzylpenicillin and phenoxy-methylpenicillin

5.1.1.2 Penicillinase-resistant penicillins

5.1.1.3 Broad-spectrum penicillins

5.1.1.4 Antipseudomonal penicillins

Notifiable diseases

Doctors must notify the Proper Officer of the local authority (usually the consultant in communicable disease control) when attending a patient suspected of suffering from any of the diseases listed below; a form is available from the Proper Officer.

- Anthrax
- Mumps
- Botulism
- Paratyphoid fever
- Brucellosis
- Plague
- Cholera
- Pneumocystis, acute
- Cholera
- Rabies
- Diphtheria
- Rubella
- Encephalitis, acute
- SARS
- Food poisoning
- Scarlet fever
- Haemolytic uraemic syndrome
- Smallpox
- Haemorrhagic fever (viral)
- Streptococcal disease
- Hepatitis, viral
- (Group A, invasive)
- Legionnaires' disease
- Tetanus
- Leprosy
- Tuberculosis
- Typhus
- Malaria
- Typhoid fever
- Measles
- Whooping cough
- Meningitis
- Yellow fever

Note: It is good practice for doctors to also inform the consultant in communicable disease control of...
instances of other infections (e.g. psittacosis) where there could be a public health risk.

5.1 Antibacterial drugs

5.1.1 Penicillins
5.1.2 Cephalosporins, carbapenems, and other beta-lactams
5.1.3 Tetracyclines
5.1.4 Aminoglycosides
5.1.5 Macrolides
5.1.6 Clindamycin
5.1.7 Some other antibacterials
5.1.8 Sulfonamides and trimethoprim
5.1.9 Antituberculosis drugs
5.1.10 Antileprotic drugs
5.1.11 Metronidazole and tinidazole
5.1.12 Quinolones
5.1.13 Urinary-tract infections

Choice of a suitable drug

Before selecting an antibacterial the clinician must first consider the factors—the patient and the known or likely causative organism. Factors related to the patient which must be considered include history of allergy, renal and hepatic function, susceptibility to infection (i.e. whether immunocompromised), ability to tolerate drugs by mouth, severity of illness, ethnic origin, age, whether taking other medication and, if female, whether pregnant, breast-feeding or taking an oral contraceptive. The known or likely organism and its antibacterial sensitivity, in association with the above factors, will suggest one or more antibacterials, the final choice depending on the microbiological, pharmacological, and toxicological properties.

An example of a rational approach to the selection of an antibacterial is treatment of a urinary-tract infection in a patient complaining of nausea and symptoms of a urinary-tract infection in early pregnancy. The organism is reported as being resistant to ampicillin but sensitive to nitrofurantoin (can cause nausea), gentamicin (can be given only by injection and best avoided in pregnancy), tetracycline (causes dental discoloration) and trimethoprim (folate antagonist therefore theoretical teratogenic risk), and cefalexin. The safest antibiotics in pregnancy are the penicillins and cephalosporins; therefore, cefalexin would be indicated for this patient.

The principles involved in selection of an antibacterial must allow for a number of variables including changing renal and hepatic function, increasing bacterial resistance, and information on side-effects. Duration of therapy, dosage, and route of administration depend on site, type and severity of infection and response.

Antibacterial policies

Local policies often limit the antibacterials that may be used to achieve reasonable economy consistent with adequate cover, and to reduce the development of resistant organisms. A policy may indicate a range of drugs for general use, and permit other drugs only on the advice of the microbiologist or physician responsible for the control of infectious diseases.

Before starting therapy

The following precepts should be considered before starting:

- Viral infections should not be treated with antibacterials. However, antibacterials may be used to treat secondary bacterial infection (e.g. bacterial pneumonia secondary to influenza);
- Samples should be taken for culture and sensitivity testing; ‘blind’ antibacterial prescribing for unexplained pyrexia usually leads to further difficulty in establishing the diagnosis;
- Knowledge of prevalent organisms and their current sensitivity is of great help in choosing an antibacterial before bacteriological confirmation is available. Generally, narrow-spectrum antibacterials are preferred to broad-spectrum antibacterials unless there is a clear clinical indication (e.g. life-threatening sepsis);
- The dose of an antibacterial varies according to a number of factors including age, weight, hepatic function, renal function, and severity of infection. The prescribing of the so-called ‘standard’ dose in serious infections may result in failure of treatment or even death of the patient; therefore it is important to prescribe a dose appropriate to the condition. An inadequate dose may also increase the likelihood of antibacterial resistance. On the other hand, for an antibacterial with a narrow margin between the toxic and therapeutic dose (e.g. an aminoglycoside) it is also important to avoid an excessive dose and the concentration of the drug in the plasma may need to be monitored;
- The route of administration of an antibacterial often depends on the severity of the infection. Life-threatening infections require intravenous therapy. Antibacterials that are well absorbed may be given by mouth even for some serious infections. Parenteral administration is also appropriate when the oral route cannot be used (e.g. because of vomiting) or if absorption is inadequate. Whenever possible, painful intramuscular injections should be avoided in children;
- Duration of therapy depends on the nature of the infection and the response to treatment. Courses should not be unduly prolonged because they encourage resistance, they may lead to side-effects and they are costly. However, in certain infections such as tuberculosis or osteomyelitis it may be necessary to treat for prolonged periods. Conversely a single dose of an antibacterial may cure uncomplicated urinary-tract infections. The prescription for an antibacterial should specify the duration of treatment or the date when treatment is to be reviewed.

Oral bacterial infections

Antibacterial drugs should only be prescribed for the treatment of oral infections on the basis of defined need. They may be used in conjunction with (but not as an alternative to) other appropriate measures, such as providing drainage or extracting a tooth.

The ‘blind’ prescribing of an antibacterial for unexplained pyrexia, cervical lymphadenopathy, or facial swelling can lead to difficulty in establishing the diagnosis. In severe oral infections, a sample should always be taken for bacteriology.

Oral infections which may require antibacterial treatment include acute periapical or periodontal abscesses,
cellulitis, acutely created oral-antral communication (and acute sinusitis), severe pericoronitis, localised osteitis, acute necrotising ulcerative gingivitis, and destructive forms of chronic periodontal disease. Most of these infections are readily resolved by the early establishment of drainage and removal of the cause (typically an infected necrotic pulp). Antibacterials may be required if treatment has to be delayed, in immunocompromised patients, or in those with conditions such as diabetes or Paget’s disease; see also Table 1, section 5.1. Certain rarer infections including bacterial sialadenitis, osteomyelitis, actinomycosis, and infections involving fascial spaces such as Ludwig’s angina, require antibiotics and specialist hospital care.

Antibacterial drugs may also be useful after dental surgery in some cases of spreading infection. Infection may spread to involve local lymph nodes, to fascial spaces (where it can cause airway obstruction), or into the bloodstream (where it can lead to cavernous sinus thrombosis and other serious complications). Extension of an infection can also lead to maxillary sinusitis; osteomyelitis is a complication, which usually arises when host resistance is reduced.

If the oral infection fails to respond to antibacterial treatment within 48 hours the antibacterial should be changed, preferably on the basis of bacteriological investigation. Failure to respond may also suggest an incorrect diagnosis, lack of essential additional measures (such as drainage), poor host resistance, or poor patient compliance.

Combination of a penicillin (or a macrolide) with metronidazole may sometimes be helpful for the treatment of severe oral infections or oral infections that have not responded to initial antibacterial treatment.

See also Penicillins (section 5.1.1), Cephalosporins (section 5.1.2), Tetracyclines (section 5.1.3), Macrolides (section 5.1.5), Clindamycin (section 5.1.6), Metronidazole (section 5.1.11), Fusidic acid (section 13.10.1.2).

**Superinfection** In general, broad-spectrum antibacterial drugs such as the cephalosporins are more likely to be associated with adverse reactions related to the selection of resistant organisms e.g. fungal infections or antibiotic-associated colitis (pseudomembranous colitis); other problems associated with superinfection include vaginitis and pruritus ani.

**Therapy** Suggested treatment is shown in table 1. When the pathogen has been isolated treatment may be changed to a more appropriate antibacterial if necessary. If no bacterium is cultured the antibacterial can be continued or stopped on clinical grounds. Infections for which prophylaxis is useful are listed in table 2.

### Table 1. Summary of antibacterial therapy

If treating a patient suspected of suffering from a notifiable disease, the consultant in communicable disease control should be informed (see p. 345)

**Gastro-intestinal system**

**Gastro-enteritis**

Frequently self-limiting and may not be bacterial.

Antibacterial not usually indicated

**Campylobacter enteritis**

Frequently self-limiting; treat if immunocompromised or if severe infection.

- **Clarithromycin**
  - *Alternative*, ciprofloxacin
    - Strains with decreased sensitivity to ciprofloxacin isolated frequently

**Salmonella (non-typhoid)**

Treat invasive or severe infection. Do not treat less severe infection unless there is a risk of developing invasive infection (e.g. immunocompromised patients, those with haemoglobinopathy, or children under 6 months of age).

- Ciprofloxacin or cefotaxime

**Shigellosis**

Antibacterial not indicated for mild cases.

- Ciprofloxacin or azithromycin
  - *Alternatives if micro-organism sensitive*, amoxicillin or trimethoprim

---

1. Where clarithromycin is suggested azithromycin or erythromycin may be used.
Typhoid fever
Infections from Middle-East, South Asia, and South-East Asia may be multiple-antibacterial-resistant and sensitivity should be tested.

Cefotaxime
Azithromycin may be an alternative in mild or moderate disease caused by multiple-antibacterial-resistant organisms.

Alternative if micro-organism sensitive, ciprofloxacin

Clostridium difficile infection
For first episode of mild to moderate infection, oral metronidazole

Suggested duration of treatment 10–14 days

For second or subsequent episode of infection, for severe infection, for infection not responding to metronidazole, or in patients intolerant of metronidazole, oral vancomycin

For severe infection in patients with multiple co-morbidities who are receiving treatment with other antibacterials, or for second or subsequent episode of infection, fidaxomicin can replace vancomycin

Suggested duration of treatment 10–14 days

For infection not responding to vancomycin or fidaxomicin, for life-threatening infection, or in patients with ileus, oral vancomycin + i/v metronidazole

Suggested duration of treatment 10–14 days

Biliary-tract infection
Ciprofloxacin or gentamicin or a cephalosporin

Peritonitis
A cephalosporin + metronidazole or gentamicin + metronidazole or gentamicin + clindamycin or piperacillin with tazobactam alone

Peritonitis: peritoneal dialysis-associated
Vancomycin + ceftazidime added to dialysis fluid or vancomycin added to dialysis fluid + ciprofloxacin by mouth

Suggested duration of treatment 14 days or longer

Cardiovascular system
Endocarditis: initial ‘blind’ therapy
Native valve endocarditis, amoxicillin
Consider adding low-dose gentamicin
If penicillin-allergic, or if meticillin-resistant Staphylococcus aureus suspected, or if severe sepsis, use vancomycin + low-dose gentamicin
If severe sepsis with risk factors for Gram-negative infection, use vancomycin + meropenem

If prosthetic valve endocarditis, vancomycin + rifampicin + low-dose gentamicin

Native-valve endocarditis caused by staphylococci
Flucloxacillin

Suggested duration of treatment 4 weeks (at least 6 weeks if secondary lung abscess or osteomyelitis also present)

If penicillin-allergic or if meticillin-resistant Staphylococcus aureus, vancomycin + rifampicin

Suggested duration of treatment 4 weeks (at least 6 weeks if secondary lung abscess or osteomyelitis also present)

Prosthetic valve endocarditis caused by staphylococci
Flucloxacillin + rifampicin + low-dose gentamicin

Suggested duration of treatment at least 6 weeks; review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks

If penicillin-allergic or if meticillin-resistant Staphylococcus aureus, vancomycin + rifampicin + low-dose gentamicin

Suggested duration of treatment at least 6 weeks; review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks

1. Where cefotaxime is suggested ceftriaxone may be used
2. Where vancomycin is suggested teicoplanin may be used
3. Where amoxicillin is suggested ampicillin may be used
Endocarditis caused by fully-sensitive streptococci

Benzylpenicillin

*Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis)

*If penicillin-allergic, vancomycin*¹ + low-dose gentamicin

*Suggested duration of treatment* 4–6 weeks (stop gentamicin after 2 weeks)

Endocarditis caused by less-sensitive streptococci

Benzylpenicillin + low-dose gentamicin

*Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks; stop gentamicin at 2 weeks if micro-organisms moderately sensitive to penicillin

*If penicillin-allergic or highly penicillin-resistant, vancomycin*¹ + low-dose gentamicin

*Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks; stop gentamicin at 2 weeks if micro-organisms moderately sensitive to penicillin

Endocarditis caused by enterococci

Amoxicillin² + low-dose gentamicin or benzylpenicillin + low-dose gentamicin

*Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks

*If penicillin-allergic or penicillin-resistant, vancomycin*¹ + low-dose gentamicin

*Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks

*If gentamicin resistant, amoxicillin*²

Add streptomycin (if susceptible) for 2 weeks

*Suggested duration of treatment* at least 6 weeks

Endocarditis caused by *Haemophilus, Actinobacillus, Cardiobacterium, Eikenella, and Kingella* species (‘HACEK’ micro-organisms)

Amoxicillin² + low-dose gentamicin

*Suggested duration of treatment* 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks

*If amoxicillin-resistant, ceftriaxone*³ + low-dose gentamicin

*Suggested duration of treatment* 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks

**Respiratory system**

*Haemophilus influenzae* epiglottitis

Cefotaxime⁴

*If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol*

**Chronic bronchitis: acute exacerbations**

Treat if increase in sputum purulence accompanied by an increase in sputum volume or increase in dyspnoea.

*Amoxicillin*² or a tetracycline

Some pneumococci and *Haemophilus influenzae* strains tetracycline-resistant; approx. 20% *H. influenzae* strains amoxicillin-resistant.

*Suggested duration of treatment* 5 days; longer treatment may be necessary in severely ill patients

*Alternative, clarithromycin*⁵

*Suggested duration of treatment* 5 days; longer treatment may be necessary in severely ill patients

---

1. Where vancomycin is suggested teicoplanin may be used
2. Where amoxicillin is suggested ampicillin may be used
3. Where ceftriaxone is suggested cefotaxime may be used
4. Where cefotaxime is suggested ceftriaxone may be used
5. Where clarithromycin is suggested azithromycin or erythromycin may be used
Pneumonia: low-severity community-acquired

Amoxicillin\(^1\)

- Pneumococci with decreased penicillin sensitivity being isolated, but not yet common in UK.
- If atypical pathogens suspected, add clarithromycin\(^2\).
- If staphylococci suspected (e.g. in influenza or measles), add flucloxacillin.

*Suggested duration of treatment* 7 days (14–21 days for infections caused by staphylococci)

Alternatives, doxycycline or clarithromycin\(^2\)

*Suggested duration of treatment* 7 days (14–21 days for infections caused by staphylococci)

Pneumonia: moderate-severity community-acquired

Amoxicillin\(^1\) + clarithromycin\(^2\) or doxycycline alone

- Pneumococci with decreased penicillin sensitivity being isolated, but not yet common in UK.
- If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin\(^3\).

*Suggested duration of treatment* 7 days (14–21 days for infections caused by staphylococci)

Pneumonia: high-severity community-acquired

Benzylpenicillin + clarithromycin\(^2\) or benzylpenicillin + doxycycline

- If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin\(^3\).

*Suggested duration of treatment* 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci suspected)

If life-threatening infection, or if Gram-negative infection suspected, or if co-morbidities present, or if living in long-term residential or nursing home, co-amoxiclav + clarithromycin\(^2\)

- If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin\(^3\).

*Suggested duration of treatment* 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci or Gram-negative enteric bacilli suspected)

Alternatives if life-threatening infection, or if Gram-negative infection suspected, or if co-morbidities present, or if living in long-term residential or nursing home, cefuroxime + clarithromycin\(^2\) or cefotaxime\(^4\) + clarithromycin\(^2\)

- If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin\(^3\).

*Suggested duration of treatment* 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci or Gram-negative enteric bacilli suspected)

Pneumonia possibly caused by atypical pathogens

Clarithromycin\(^2\)

- If high-severity Legionella infection, add rifampicin for the first few days.

*Suggested duration of treatment* 14 days (usually 7–10 days for Legionella)

Alternative if Legionella infection suspected, a quinolone

- If high-severity Legionella infection, add clarithromycin\(^2\) or rifampicin for the first few days.

*Suggested duration of treatment* usually 7–10 days

Alternative for chlamydial or mycoplasma infections, doxycycline

*Suggested duration of treatment* 14 days

Pneumonia: hospital-acquired

*Early-onset infection* (less than 5 days after admission to hospital), co-amoxiclav or cefuroxime

- If life-threatening infection, or if history of antibacterial treatment in the last 3 months, or if resistant microorganisms suspected, treat as for late-onset hospital-acquired pneumonia.

*Suggested duration of treatment* 7 days

*Late-onset infection* (more than 5 days after admission to hospital), an antipseudomonal penicillin (e.g. piperacillin with tazobactam) or a broad-spectrum cephalosporin (e.g. ceftazidime) or another antipseudomonal beta-lactam or a quinolone (e.g. ciprofloxacin)

- If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin.
  - For severe illness caused by *Pseudomonas aeruginosa*, consider adding an aminoglycoside.

*Suggested duration of treatment* 7 days (longer if *Pseudomonas aeruginosa* confirmed)

---

1. Where amoxicillin is suggested ampicillin may be used
2. Where clarithromycin is suggested azithromycin or erythromycin may be used
3. Where vancomycin is suggested teicoplanin may be used
4. Where cefotaxime is suggested ceftriaxone may be used
Meningitis: initial empirical therapy

- Transfer patient to hospital urgently
- If meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) suspected, benzylpenicillin (see p. 361 for dose) should be given before transfer to hospital, so long as this does not delay the transfer. If a patient with suspected bacterial meningitis without non-blanching rash cannot be transferred to hospital urgently, benzylpenicillin (see p. 361 for dose) should be given before the transfer. Cefotaxime (section 5.1.2) may be an alternative in penicillin allergy; chloramphenicol (section 5.1.7) may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.
- In hospital, consider adjunctive treatment with dexamethasone (particularly if pneumococcal meningitis suspected in adults; section 6.3.2), preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial; avoid dexamethasone in septic shock, meningococcal septicaemia, or if immunocompromised, or in meningitis following surgery.

In hospital, if aetiology unknown

**Adult and child 3 months–50 years**, cefotaxime

Consider adding vancomycin if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci.

**Suggested duration of treatment** at least 10 days

**Adult over 50 years**, cefotaxime + amoxicillin

Consider adding vancomycin if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci.

**Suggested duration of treatment** at least 10 days

Meningitis caused by meningococci

Benzylpenicillin or cefotaxime

**Suggested duration of treatment** 7 days.

To eliminate nasopharyngeal carriage in patients treated with benzylpenicillin or cefotaxime see Table 2, section 5.1

**If history of immediate hypersensitivity reaction to penicillin or to cephalosporins**, chloramphenicol

**Suggested duration of treatment** 7 days.

To eliminate nasopharyngeal carriage see Table 2, section 5.1

Meningitis caused by pneumococci

Cefotaxime

Consider adjunctive treatment with dexamethasone (section 6.3.2), preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial (may reduce penetration of vancomycin into cerebrospinal fluid).

If micro-organism penicillin-sensitive, replace cefotaxime with benzylpenicillin.

If micro-organism highly penicillin- and cephalosporin-resistant, add vancomycin and if necessary rifampicin.

**Suggested duration of antibacterial treatment** 14 days

Meningitis caused by *Haemophilus influenzae*

Cefotaxime

Consider adjunctive treatment with dexamethasone (section 6.3.2), preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.

**Suggested duration of antibacterial treatment** 10 days.

For *H. influenzae* type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts (see Table 2, section 5.1)

**If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, or if micro-organism resistant to cefotaxime**, chloramphenicol

Consider adjunctive treatment with dexamethasone (section 6.3.2), preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.

**Suggested duration of antibacterial treatment** 10 days.

For *H. influenzae* type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts (see Table 2, section 5.1)

1. Where cefotaxime is suggested ceftriaxone may be used
2. Where amoxicillin is suggested ampicillin may be used
Meningitis caused by Listeria
Amoxicillin\(^1\) + gentamicin

Suggested duration of treatment 21 days.
Consider stopping gentamicin after 7 days

If history of immediate hypersensitivity reaction to penicillin, co-trimoxazole
Suggested duration of treatment 21 days

---

### Urinary tract

**Pyelonephritis: acute**
A broad-spectrum cephalosporin or a quinolone

Suggested duration of treatment 10–14 days (longer treatment may be necessary in complicated pyelonephritis)

**Prostatitis: acute**
Ciprofloxacin or ofloxacin

Suggested duration of treatment 28 days
Alternative, trimethoprim

Suggested duration of treatment 28 days

**Urinary-tract infection: ‘lower’**
Trimethoprim or nitrofurantoin

Suggested duration of treatment 7 days, but a short course (e.g., 3 days) is usually adequate for uncomplicated urinary-tract infections in women. See also section 5.1.13
Alternative, amoxicillin\(^1\) or oral cephalosporin

Suggested duration of treatment 7 days, but a short course (e.g., 3 days) is usually adequate for uncomplicated urinary-tract infections in women. See also section 5.1.13

---

### Genital system

**Bacterial vaginosis**
Oral metronidazole

Suggested duration of treatment 5–7 days (or high-dose metronidazole as a single dose)
Alternative, topical metronidazole or topical clindamycin

Suggested duration of treatment 5 days with metronidazole or 7 days with clindamycin

**Uncomplicated genital chlamydial infection, non-gonococcal urethritis, and non-specific genital infection**
Contact tracing recommended.
Azithromycin or doxycycline

Suggested duration of treatment azithromycin as a single dose or doxycycline for 7 days
Alternative, erythromycin

Suggested duration of treatment 14 days

**Gonorrhoea: uncomplicated**
Contact tracing recommended. Consider chlamydia co-infection. Choice of alternative antibacterial regimen depends on locality where infection acquired.
Azithromycin + i/m ceftriaxone

Suggested duration of treatment single-dose of each antibacterial
Alternative when parenteral administration not possible, ceftriaxone + azithromycin

Suggested duration of treatment single-dose of each antibacterial
Alternative if micro-organism sensitive to a quinolone, ciprofloxacin + azithromycin

Suggested duration of treatment single-dose of each antibacterial

Pharyngeal infection, azithromycin + i/m ceftriaxone

Suggested duration of treatment single-dose of each antibacterial

---

1. Where amoxicillin is suggested ampicillin may be used
**Pelvic inflammatory disease**
Contact tracing recommended.

Doxycycline + metronidazole + i/m ceftriaxone or ofloxacin + metronidazole  
Suggested duration of treatment 14 days (use i/m ceftriaxone as a single dose).  
In severely ill patients initial treatment with doxycycline + i/v ceftriaxone + i/v metronidazole, then switch to oral treatment with doxycycline + metronidazole to complete 14 days’ treatment.

**Early syphilis (infection of less than 2 years)**
Contact tracing recommended.

Benzathine benzylpenicillin [unlicensed]  
Suggested duration of treatment single-dose (repeat dose after 7 days for women in the third trimester of pregnancy)  
Alternatives, doxycycline or erythromycin  
Suggested duration of treatment 14 days

**Late latent syphilis (asymptomatic infection of more than 2 years)**
Contact tracing recommended.

Benzathine benzylpenicillin [unlicensed]  
Suggested duration of treatment once weekly for 2 weeks  
Alternative, doxycycline  
Suggested duration of treatment 28 days

**Asymptomatic contacts of patients with infectious syphilis**
Doxycycline  
Suggested duration of treatment 14 days

---

**Blood**

**Septicaemia: community-acquired**
A broad-spectrum antipseudomonal penicillin (e.g. piperacillin with tazobactam, ticarcillin with clavulanic acid) or a broad-spectrum cephalosporin (e.g. cefuroxime)  
If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin.  
If anaerobic infection suspected, add metronidazole to broad-spectrum cephalosporin.  
If other resistant micro-organisms suspected, use a more broad-spectrum beta-lactam antibacterial (e.g. meropenem)

**Septicaemia: hospital-acquired**
A broad-spectrum antipseudomonal beta-lactam antibacterial (e.g. piperacillin with tazobactam, ticarcillin with clavulanic acid, ceftazidime, imipenem with cilastatin, or meropenem)  
If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin.  
If anaerobic infection suspected, add metronidazole to broad-spectrum cephalosporin

**Septicaemia related to vascular catheter**
Vancomycin  
If Gram-negative sepsis suspected, especially in the immunocompromised, add a broad-spectrum antipseudomonal beta-lactam.  
Consider removing vascular catheter, particularly if infection caused by *Staphylococcus aureus*, pseudo-monas, or *Candida* species

**Meningococcal septicaemia**
If meningococcal disease suspected, a single dose of benzylpenicillin (see p. 361 for dose) should be given before urgent transfer to hospital, so long as this does not delay the transfer; cefotaxime (section 5.1.2) may be an alternative in penicillin allergy; chloramphenicol may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.

Benzylpenicillin or cefotaxime  
To eliminate nasopharyngeal carriage in patients treated with benzylpenicillin or cefotaxime see Table 2, section 5.1

*1. Where vancomycin is suggested teicoplanin may be used  
2. Where cefotaxime is suggested ceftriaxone may be used*
Musculoskeletal system

Osteomyelitis
Seek specialist advice if chronic infection or prostheses present.

Flucloxacillin
Consider adding fusidic acid or rifampicin for initial 2 weeks.
*Suggested duration of treatment* 6 weeks for acute infection

*If* penicillin-allergic*, clindamycin
Consider adding fusidic acid or rifampicin for initial 2 weeks.
*Suggested duration of treatment* 6 weeks for acute infection

*If* meticillin-resistant *Staphylococcus aureus* suspected, vancomycin¹
Consider adding fusidic acid or rifampicin for initial 2 weeks.
*Suggested duration of treatment* 6 weeks for acute infection

Septic arthritis
Seek specialist advice if prostheses present.

Flucloxacillin
*Suggested duration of treatment* 4–6 weeks (longer if infection complicated)

*If* penicillin-allergic*, clindamycin
*Suggested duration of treatment* 4–6 weeks (longer if infection complicated)

*If* meticillin-resistant *Staphylococcus aureus* suspected, vancomycin¹
*Suggested duration of treatment* 4–6 weeks (longer if infection complicated)

*If* gonococcal arthritis or Gram-negative infection suspected, *cefotaxime²*
*Suggested duration of treatment* 4–6 weeks (longer if infection complicated; treat gonococcal infection for 2 weeks)

Eye

Purulent conjunctivitis
Chloramphenicol eye-drops
See also section 11.3.1

Ear, nose, and oropharynx

Pericoronitis
Antibacterial required only in presence of systemic features of infection, or of trismus, or persistent swelling despite local treatment.

Metronidazole
*Suggested duration of treatment* 3 days or until symptoms resolve

*Alternative*, amoxicillin
*Suggested duration of treatment* 3 days or until symptoms resolve

Gingivitis: acute necrotising ulcerative
Antibacterial required only if systemic features of infection.

Metronidazole
*Suggested duration of treatment* 3 days or until symptoms resolve

*Alternative*, amoxicillin
*Suggested duration of treatment* 3 days or until symptoms resolve

Periapical or periodontal abscess
Antibacterial required only in severe disease with cellulitis or if systemic features of infection.

Amoxicillin
*Suggested duration of treatment* 5 days

*Alternative*, metronidazole
*Suggested duration of treatment* 5 days

¹ Where vancomycin is suggested teicoplanin may be used
² Where cefotaxime is suggested ceftriaxone may be used
**Periodontitis**
Antibacterial used as an adjunct to debridement in severe disease or disease unresponsive to local treatment alone.

Metronidazole
*Alternative*, doxycycline

**Throat infections**
Most throat infections are caused by viruses and many do not require antibacterial therapy. Consider antibacterial, if history of valvular heart disease, if marked systemic upset, if peritonsillar cellulitis or abscess, or if at increased risk from acute infection (e.g. in immunosuppression, cystic fibrosis); prescribe antibacterial for beta-haemolytic streptococcal pharyngitis.

Phenoxymethylpenicillin
In severe infection, initial parenteral therapy with benzylpenicillin, then oral therapy with phenoxy
methylpenicillin or amoxicillin. Avoid amoxicillin if possibility of glandular fever, see section 5.1.1.3.
*Suggested duration of treatment* 10 days

If *penicillin-allergic*, clarithromycin

*Suggested duration of treatment* 10 days

**Sinusitis**
Antibacterial should usually be used only for persistent symptoms and purulent discharge lasting at least 7 days or if severe symptoms. Also, consider antibacterial for those at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis).

Amoxicillin or doxycycline or clarithromycin
*Suggested duration of treatment* 7 days.

Consider oral co-amoxiclav if no improvement after 48 hours.

In severe infection, initial parenteral therapy with co-amoxiclav or cefuroxime may be required

**Otitis externa**
Consider systemic antibacterial if spreading cellulitis or patient systemically unwell.
For topical preparations see section 12.1.1.

Flucloxacillin
If *penicillin-allergic*, clarithromycin

If *pseudomonas suspected*, ciprofloxacin (or an aminoglycoside)

**Otitis media**
Many infections caused by viruses. Most uncomplicated cases resolve without antibacterial treatment. In children without systemic features, antibacterial treatment may be started after 72 hours if no improvement. Consider earlier treatment if deterioration, if systemically unwell, if at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis present, or in children under 2 years of age with bilateral otitis media.

Amoxicillin
Consider co-amoxiclav if no improvement after 48 hours.

In severe infection, initial parenteral therapy with co-amoxiclav or cefuroxime.
*Suggested duration of treatment* 5 days (longer if severely ill)

If *penicillin-allergic*, clarithromycin
*Suggested duration of treatment* 5 days (longer if severely ill)

1. Where amoxicillin is suggested ampicillin may be used
2. Where clarithromycin is suggested azithromycin or erythromycin may be used
Skin

Impetigo: small areas of skin infected
Seek local microbiology advice before using topical treatment in hospital.
  Topsud fusidic acid
  
  **Suggested duration of treatment** 7 days is usually adequate (max. 10 days)
  
  Alternative if meticillin-resistant Staphylococcus aureus, topical mupirocin
  
  **Suggested duration of treatment** 7 days is usually adequate (max. 10 days)

Impetigo: widespread infection
  Oral flucloxacillin
  
  If streptococci suspected in severe infection, add phenoxympenatecinillin.
  
  **Suggested duration of treatment** 7 days
  
  If penicillin-allergic, oral clarithromycin¹
  
  **Suggested duration of treatment** 7 days

Erysipelas
  Phenoxympenatecinillin or benzylpenicillin
  
  If severe infection, replace phenoxympenatecinillin or benzylpenicillin with high-dose flucloxacillin; if meticillin-resistant *S. aureus* suspected, see section 5.1.1.2.
  
  **Suggested duration of treatment** at least 7 days
  
  If penicillin-allergic, clindamycin or clarithromycin¹
  
  If meticillin-resistant *S. aureus* suspected in severe infection, see section 5.1.1.2.
  
  **Suggested duration of treatment** at least 7 days

Cellulitis
  Flucloxacillin (high-dose)
  
  If streptococcal infection confirmed, replace flucloxacillin with phenoxympenatecinillin or benzylpeni-
  
  If Gram-negative bacteria or anaerobes suspected, use broad-spectrum antibacterials.
  
  If meticillin-resistant *S. aureus* suspected, see section 5.1.1.2
  
  If penicillin-allergic, clindamycin or clarithromycin¹ or vancomycin²
  
  If Gram-negative bacteria suspected, use broad-spectrum antibacterials.
  
  If meticillin-resistant *S. aureus* suspected, see section 5.1.1.2

Animal and human bites
  Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin (with a tetanus-
  containing vaccine if necessary, according to immunisation history and risk of infection), see under Tetanus
  Vaccines, section 14.4. Consider rabies prophylaxis (section 14.4) for bites from animals in endemic countries.
  
  Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent
  viral spread.
  
  Co-amoxiclav
  
  If penicillin-allergic, doxycycline + metronidazole

Mastitis during breast-feeding
  Treat if severe, if systemically unwell, if nipple fissure present, if symptoms do not improve after 12–24 hours of
  effective milk removal, or if culture indicates infection.
  
  Flucloxacillin
  
  Continue breast-feeding or expressing milk during treatment.
  
  **Suggested duration of treatment** 10–14 days
  
  If penicillin-allergic, erythromycin
  
  Continue breast-feeding or expressing milk during treatment.
  
  **Suggested duration of treatment** 10–14 days

Acne
  See section 13.6

---

¹ Where clarithromycin is suggested azithromycin or erythromycin may be used
² Where vancomycin is suggested teicoplanin may be used
Table 2. Summary of antibacterial prophylaxis

Prevention of recurrence of rheumatic fever
Phenoxymethylpenicillin 250 mg twice daily or sulfadiazine 1 g daily (500 mg daily for patients under 30 kg)

Prevention of secondary case of invasive group A streptococcal infection
Phenoxymethylpenicillin 250–500 mg every 6 hours for 10 days; CHILD under 1 year 62.5 mg every 6 hours, 1–5 years 125 mg every 6 hours, 6–12 years 250 mg every 6 hours
Patients who are penicillin allergic, either erythromycin ADULT and CHILD over 8 years, 250–500 mg every 6 hours for 10 days; CHILD under 2 years 125 mg every 6 hours, 2–8 years 250 mg every 6 hours or azithromycin [unlicensed indication] 500 mg once daily for 5 days; CHILD over 6 months, 12 mg/kg (max. 500 mg) once daily

Prevention of secondary case of meningococcal meningitis
Ciprofloxacin 500 mg as a single dose; CHILD [unlicensed] under 5 years 30 mg/kg (max. 125 mg) as a single dose; 5–12 years 250 mg as a single dose or rifampicin 600 mg every 12 hours for 2 days; CHILD under 1 year 5 mg/kg every 12 hours for 2 days; 1–12 years 10 mg/kg every 12 hours for 2 days or i/m ceftriaxone [unlicensed indication] 250 mg as a single dose; CHILD under 12 years 125 mg

Prevention of secondary case of Haemophilus influenzae type b disease
Rifampicin 600 mg once daily for 4 days; CHILD 1–3 months 10 mg/kg once daily for 4 days, over 3 months 20 mg/kg once daily for 4 days (max. 600 mg daily) or (if rifampicin cannot be used) i/v in 1/2 ceftriaxone [unlicensed indication] 1 g once daily for 2 days; CHILD 1 month–12 years 50 mg/kg (max. 1 g) once daily for 2 days by i/v infusion only
Within 4 weeks of illness onset in an index case with confirmed or suspected invasive Haemophilus influenzae type b disease, give antibacterial prophylaxis to all household contacts if there is a vulnerable individual in the household. Also, give antibacterial prophylaxis to the index case if they are in contact with vulnerable household contacts or if they are under 10 years of age. Vulnerable individuals include the immunocompromised, those with asplenia, or children under 10 years of age. If there are 2 or more cases of invasive Haemophilus influenzae type b disease within 120 days in a pre-school or primary school, antibacterial prophylaxis should also be given to all room contacts (including staff).
For immunisation against Haemophilus influenzae type b disease, see section 14.4

Prevention of secondary case of diphtheria in non-immune patient
Erythromycin 3 500 mg every 6 hours for 7 days; CHILD up to 2 years 125 mg every 6 hours, 2–8 years 250 mg every 6 hours
Treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment. For immunisation against diphtheria see section 14.4

Prevention of pertussis
Clarithromycin ADULT and CHILD over 12 years, 500 mg twice daily for 7 days; CHILD body-weight under 8 kg, 7.5 mg/kg twice daily for 7 days; 8–11 kg, 62.5 mg twice daily for 7 days; 12–19 kg, 125 mg twice daily for 7 days; 20–29 kg, 187.5 mg twice daily for 7 days; 30–40 kg, 250 mg twice daily for 7 days
Within 3 weeks of onset of cough in the index case, give antibacterial prophylaxis to all close contacts if amongst them there is at least one unimmunised or partially immunised child under 1 year of age, or if there is at least one individual who has not received a pertussis-containing vaccine more than 1 week and less than 5 years ago (so long as that individual lives or works with children under 4 months of age, is pregnant at over 32 weeks gestation, or is a healthcare worker who works with children under 1 year of age or with pregnant women). For immunisation against pertussis see section 14.4

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease
Phenoxymethylpenicillin ADULT and CHILD over 5 years, 250 mg twice daily; CHILD under 1 year 62.5 mg twice daily, 1–5 years 125 mg twice daily—if cover also needed for H. influenzae in CHILD give amoxicillin instead (1 month–5 years 125 mg twice daily, 5–12 years 250 mg twice daily, 12–18 years 500 mg twice daily)
If penicillin-allergic, erythromycin ADULT and CHILD over 8 years, 500 mg twice daily; CHILD 1 month–2 years 125 mg twice daily, 2–8 years 250 mg twice daily
Note Antibiotic prophylaxis is not fully reliable, for vaccines in asplenia see p. 831. Antibacterial prophylaxis may be discontinued in those over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive
Isoniazid 300 mg daily for 6 months; CHILD 10 mg/kg daily (max. 300 mg daily)
or isoniazid 300 mg daily + rifampicin 600 mg daily (450 mg if less than 50 kg) for 3 months; CHILD isoniazid 10 mg/kg daily (max. 300 mg daily) + rifampicin 15 mg/kg daily (max. 450 mg daily if body-weight less than 50 kg; max. 600 mg daily if body-weight over 50 kg) or (if isoniazid-resistant tuberculosis in patients under 35 years) rifampicin 600 mg daily (450 mg if less than 50 kg) for 6 months; CHILD 15 mg/kg daily (max. 450 mg daily if body-weight less than 50 kg; max. 600 mg daily if body-weight over 50 kg)

1. For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Health Protection Agency laboratory).
2. For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Health Protection Agency laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

3. Where erythromycin is suggested another macrolide (e.g. azithromycin or clarithromycin) may be used
4. Where clarithromycin is suggested azithromycin or erythromycin may be used
5. For details of those who should receive chemoprophylaxis contact the lead clinician for local tuberculosis services (or a consultant in communicable disease control). See also section 5.1.9, for advice on immunocompromised patients and on prevention of tuberculosis
Prevention of infection from animal and human bites
Co-amoxiclav alone (or doxycycline + metronidazole if penicillin-allergic)
Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection), see under Tetanus vaccines, section 14.4. Consider rabies prophylaxis (section 14.4) for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread. Antibacterial prophylaxis recommended for wounds less than 48–72 hours old when the risk of infection is high (e.g. bites from humans or cats, bites to the hand, foot, face, or genital area; bites involving oedema, crush or puncture injury, or other moderate to severe injury, wounds that cannot be debrided adequately; patients with diabetes mellitus, cirrhosis, asplenia, prosthetic joints or valves, or those who are immunocompromised). Give antibacterial prophylaxis for up to 5 days.

Prevention of early-onset neonatal infection
i/v benzylpenicillin (or i/v clindamycin if history of allergy to penicillins)
Give intrapartum prophylaxis to women with group B streptococcal colonisation, bacteruria, or infection in the current pregnancy, or to women who had a previous baby with an invasive group B streptococcal infection. Consider prophylaxis for women in preterm labour if there is prelabour rupture of membranes or if intrapartum rupture of membranes lasting more than 18 hours is suspected.

Prevention of infection in gastro-intestinal procedures
Operations on stomach or oesophagus
Single dose of i/v gentamicin or i/v cefuroxime or i/v co-amoxiclav
Add i/v teicoplanin if high risk of meticillin-resistant Staphylococcus aureus
Open biliary surgery
Single dose of i/v cefuroxime + i/v metronidazole or i/v gentamicin + i/v metronidazole or i/v co-amoxiclav alone
Add i/v teicoplanin if high risk of meticillin-resistant Staphylococcus aureus
Resections of colon and rectum for carcinoma, and resections in inflammatory bowel disease, and appendicectomy
Single dose of i/v gentamicin + i/v metronidazole or i/v cefuroxime + i/v metronidazole or i/v co-amoxiclav alone
Add i/v teicoplanin if high risk of meticillin-resistant Staphylococcus aureus

Endoscopic retrograde cholangiopancreatography
Single dose of i/v gentamicin or oral or i/v ciprofloxacin
Prophylaxis recommended if pancreatic pseudocyst, immunocompromised, history of liver transplantation, or risk of incomplete biliary drainage. For biliary complications following liver transplantation, add i/v amoxicillin or i/v teicoplanin

Percutaneous endoscopic gastrostomy or jejunostomy
Single dose of i/v co-amoxiclav or i/v cefuroxime
Use single dose of i/v teicoplanin if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant Staphylococcus aureus

Prevention of infection in orthopaedic surgery
Joint replacement including hip and knee
Single dose of i/v cefuroxime alone or i/v flucloxacillin + i/v gentamicin
If history of allergy to penicillins or to cephalosporins, or if high risk of meticillin-resistant Staphylococcus aureus, use single dose of i/v teicoplanin + i/v gentamicin
Closed fractures
Single dose of i/v cefuroxime or i/v flucloxacillin
If history of allergy to penicillins or to cephalosporins, or if high risk of meticillin-resistant Staphylococcus aureus, use single dose of i/v teicoplanin
Open fractures
i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole (or i/v clindamycin alone if history of allergy to penicillins or to cephalosporins)
Add i/v teicoplanin if high risk of meticillin-resistant Staphylococcus aureus. Start prophylaxis within 3 hours of injury and continue until soft tissue closure (max. 72 hours). At first debridement also use a single dose of i/v cefuroxime + i/v metronidazole + i/v gentamicin or i/v co-amoxiclav + i/v gentamicin (or i/v clindamycin + i/v gentamicin if history of allergy to penicillins or to cephalosporins). At time of skeletal stabilisation and definitive soft tissue closure use a single dose of i/v gentamicin + i/v teicoplanin
High lower-limb amputation
i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole
Continue antibacterial prophylaxis for at least 2 doses after procedure (max. duration of prophylaxis 5 days). If history of allergy to penicillins or to cephalosporins, or if high risk of meticillin-resistant Staphylococcus aureus, use i/v teicoplanin + i/v gentamicin + i/v metronidazole

Prevention of infection in urological procedures
Transrectal prostate biopsy
Single dose of oral ciprofloxacin + oral metronidazole or i/v gentamicin + i/v metronidazole
Use single dose of i/v gentamicin + i/v metronidazole if high risk of meticillin-resistant Staphylococcus aureus
Transurethral resection of prostate
Single dose of oral ciprofloxacin or i/v gentamicin or i/v cefuroxime
Use single dose of i/v gentamicin if high risk of meticillin-resistant Staphylococcus aureus
Prevention of infection in obstetric and gynaecological surgery

Caesarean section

Single dose of i/v cefuroxime. Substitute i/v clindamycin if history of allergy to penicillins or cephalosporins. Add i/v teicoplanin if high risk of meticillin-resistant *Staphylococcus aureus*.

Hysterectomy

Single dose of i/v cefuroxime + i/v metronidazole or i/v gentamicin + i/v metronidazole or i/v co-amoxiclav alone.

Use single dose of i/v gentamicin + i/v metronidazole or add i/v teicoplanin if high risk of meticillin-resistant *Staphylococcus aureus*.

Termination of pregnancy

Single dose of oral metronidazole. If genital chlamydial infection cannot be ruled out, give doxycycline (section 5.1.3) postoperatively.

Prevention of infection in cardiology procedures

Cardiac pacemaker insertion

Single dose of i/v cefuroxime alone or i/v flucloxacillin + i/v gentamicin or i/v teicoplanin + i/v gentamicin.

Use single dose of i/v teicoplanin + i/v cefuroxime or i/v teicoplanin + i/v gentamicin if high risk of meticillin-resistant *Staphylococcus aureus*.

Prevention of infection in vascular surgery

Reconstructive arterial surgery of abdomen, pelvis or legs

Single dose of i/v cefuroxime alone or i/v flucloxacillin + i/v gentamicin.

Add i/v metronidazole for patients at risk from anaerobic infections including those with diabetes, gangrene, or undergoing amputation. Use single dose of i/v teicoplanin if high risk of meticillin-resistant *Staphylococcus aureus*.

Prevention of endocarditis

NICE guidance

Antimicrobial prophylaxis against infective endocarditis in adults and children undergoing interventional procedures (March 2008)

Antibacterial prophylaxis and chlorhexidine mouthwash are not recommended for the prevention of endocarditis in patients undergoing dental procedures.

Antibacterial prophylaxis is not recommended for the prevention of endocarditis in patients undergoing procedures of the:

- upper and lower respiratory tract (including ear, nose, and throat procedures and bronchoscopy);
- genito-urinary tract (including urological, gynaecological, and obstetric procedures);
- upper and lower gastro-intestinal tract.

Whilst these procedures can cause bacteraemia, there is no clear association with the development of infective endocarditis. Prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven. Any infection in patients at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

If patients at risk of endocarditis are undergoing a gastro-intestinal or genito-urinary tract procedure at a site where infection is suspected, they should receive appropriate antibacterial therapy that includes cover against organisms that cause endocarditis.

Patients at risk of endocarditis should be:

- advised to maintain good oral hygiene;
- told how to recognise signs of infective endocarditis, and advised when to seek expert advice.

Dermatological procedures

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who undergo dermatological procedures do not require antibacterial prophylaxis against endocarditis.

1. Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.
2. Additional intra-operative or postoperative doses of antibacterial may be given for prolonged procedures or if there is major blood loss.
3. Where teicoplanin is suggested vancomycin may be used.
4. Metronidazole may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.
5. Patients at risk of endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis.
6. The British Association of Dermatologists Therapy Guidelines and Audit Subcommittee advise that such dermatological procedures include skin biopsies and excision of moles or of malignant lesions.
Joint prostheses and dental treatment

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibiotic prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibiotics when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibiotics to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

Immunosuppression and indwelling intraperitoneal catheters

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibiotic prophylaxis for dental treatment provided there is no other indication for prophylaxis.

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

5.1.1 Penicillins

5.1.1.1 Benzylpenicillin and phenoxymethylpenicillin

The penicillins are bactericidal and act by interfering with bacterial cell wall synthesis. They diffuse well into body tissues and fluids, but penetration into the cerebrospinal fluid is poor except when the meninges are inflamed. They are excreted in the urine in therapeutic concentrations.

Hypersensitivity reactions. The most important side-effect of the penicillins is hypersensitivity which causes rashes and anaphylaxis and can be fatal. Allergic reactions to penicillins occur in 1–10% of exposed individuals; anaphylactic reactions occur in fewer than 0.05% of treated patients. Patients with a history of atopic allergy (e.g. asthma, eczema, hay fever) are at a higher risk of anaphylactic reactions to penicillins. Individuals with a history of anaphylaxis, urticaria, or rash immediately after penicillin administration are at risk of immediate hypersensitivity to a penicillin; these individuals should not receive a penicillin. Patients who are allergic to one penicillin will be allergic to all because the hypersensitivity is related to the basic penicillin structure. As patients with a history of immediate hypersensitivity to penicillins may also react to the cephalosporins and other beta-lactam antibiotics, they should not receive these antibiotics; aztreonam may be less likely to cause hypersensitivity in penicillin-sensitive patients and can be used with caution. If a penicillin (or another beta-lactam antibiotic) is essential in an individual with immediate hypersensitivity to penicillin then specialist advice should be sought on hypersensitivity testing or using a beta-lactam antibiotic with a different structure to the penicillin that caused the hypersensitivity (see also p. 368).

Individuals with a history of a minor rash (i.e. non-confluent, non-pruritic rash restricted to a small area of the body) or a rash that occurs more than 72 hours after penicillin administration are probably not allergic to penicillin and in these individuals a penicillin should not be withheld unnecessarily for serious infections; the possibility of an allergic reaction should, however, be borne in mind. Other beta-lactam antibiotics (including cephalosporins) can be used in these patients.

Other side-effects. A rare but serious toxic effect of the penicillins is encephalopathy due to cerebral irritation. This may result from excessively high doses or in patients with severe renal failure. The penicillins should not be given by intrathecal injection because they can cause encephalopathy which may be fatal.

Another problem relating to high doses of penicillin, or normal doses given to patients with renal failure, is the accumulation of electrolyte since most injectable penicillins contain either sodium or potassium.

Diarrhoea frequently occurs during oral penicillin therapy. It is most common with broad-spectrum penicillins, which can also cause antibiotic-associated colitis.

Benzylpenicillin sodium (Penicillin G) remains an important and useful antibiotic but is inactivated by bacterial beta-lactamases. It is effective for many streptococcal (including pneumococcal), gonococcal, and meningococcal infections and also for anthrax (section 5.1.12), diphtheria, gas-gangrene, leptospirosis, and treatment of Lyme disease (section 5.1.1.3). Pneumococci, meningococci, and gonococci which have decreased sensitivity to penicillin have been isolated; benzylpenicillin is no longer the drug of first choice for pneumococcal meningitis. Although benzylpenicillin is effective in the treatment of tetanus, metronidazole (section 5.1.11) is preferred. Benzylpenicillin is inactivated by gastric acid and absorption from the gut is low; therefore it is best given by injection.

Benzathine benzylpenicillin (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) is used for the treatment of early syphilis and late latent syphilis; it is given by intramuscular injection.

Phenoxymethylpenicillin (Penicillin V) has a similar antibacterial spectrum to benzylpenicillin, but is less active. It is gastric acid-stable, so is suitable for oral administration. It should not be used for serious infections because absorption can be unpredictable and plasma concentrations variable. It is indicated princi-
Benzylpenicillin sodium

(Penicillin G)

indications

Throat infections, otitis media, endocarditis, meningococcal disease, pneumonia, cellulitis (Table 1, section 5.1); anthrax, intrapartum prophylaxis against group B streptococcal infection; see also notes above

cautions

History of allergy; false-positive urinary glucose (if tested for reducing substances); interactions: Appendix 1 (penicillins)

contra-indications

Penicillin hypersensitivity

renal impairment

Reduce dose—consult product literature; high doses may cause cerebral irritation, convulsions, or coma

Pregnancy

Not known to be harmful

Breast-feeding

Trace amounts in milk, but appropriate to use

side-effects

Hypersensitivity reactions including urticaria, fever, joint pains, rash, angioedema, anaphylaxis, serum sickness-like reaction; rarely CNS toxicity including convulsions (especially with high doses or in severe renal impairment), interstitial nephritis, haemolytic anaemia, leucopenia, thrombocytopenia, and coagulation disorders; also reported diarrhoea (including antibiotic-associated colitis)

Dose

- By intramuscular or by slow intravenous injection or by infusion, 0.6–1.2 g every 6 hours, increased if necessary in more serious infections (single doses over 1.2 g intravenous route only; see also below); CHILD under 18 years see <em>BNF for Children</em>

- Endocarditis (in combination with another anti-bacterial if necessary, see Table 1, section 5.1), by slow intravenous injection or by infusion, 1.2 g every 4 hours, increased if necessary (e.g. in enterococcal endocarditis) to 2.4 g every 4 hours; CHILD 1 month–18 years see <em>BNF for Children</em>

- Anthrax (in combination with other antibacterials, see also section 5.1.12), by slow intravenous injection or by infusion, 2.4 g every 4 hours; CHILD under 18 years see <em>BNF for Children</em>

- Intrapartum prophylaxis against group B streptococcal infection, by slow intravenous injection or by infusion, initially 3 g then 1.5 g every 4 hours until delivery

- Meningitis, meningococcal disease, by slow intravenous injection or by infusion, 2.4 g every 4 hours; NEONATE under 7 days, 50 mg/kg every 12 hours; NEONATE 7–28 days, 50 mg/kg every 8 hours; CHILD 1 month–18 years, 50 mg/kg every 4–6 hours (max. 2.4 g every 4 hours)

Important. If meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) is suspected, a single dose of benzylpenicillin should be given before the transfer. Suitable doses of benzylpenicillin by intravenous injection (or by intramuscular injection) are: ADULT 1.2 g; INFANT under 1 year 300 mg; CHILD 1–9 years 600 mg, 10 years and over as for adult. In penicillin allergy, cefotaxime (section 5.1.2) may be an alternative; chloramphenicol (section 5.1.7) may be used if there is a history of anaphylaxis to penicillins

- By intrathecal injection, not recommended

Note

Benzylpenicillin doses in <em>BNF</em> may differ from those in product literature

Crystaphen® (Genus) (for injection, powder for reconstitution, benzylpenicillin sodium (unbuffered), net price 600-mg vial = £95, 2-vial ‘GP pack’ = £1.65; 1.2-g vial = £1.89

Electrolytes

Na+ 1 68 mmol/600-mg vial; 3 36 mmol/1 2-g vial

Phenoxyethylpenicillin

(Penicillin V)

indications

Oral infections (see notes above), tonsillitis, otitis media, erysipelas, cellulitis; group A streptococcal infection, rheumatic fever and pneumococcal infection prophylaxis (Table 2, section 5.1)

cautions

see under Benzylpenicillin; interactions: Appendix 1 (penicillins)

contra-indications

see under Benzylpenicillin

Pregnancy

Not known to be harmful

Breast-feeding

Trace amounts in milk, but appropriate to use

side-effects

see under Benzylpenicillin

Dose

- 500 mg every 6 hours, increased up to 1 g every 6 hours if necessary; CHILD up to 1 year 62.5 mg every 6 hours, increased up to 12.5 mg/kg every 6 hours if necessary; 1–6 years, 125 mg every 6 hours, increased up to 12.5 mg/kg every 6 hours if necessary; 6–12 years, 250 mg every 6 hours, increased up to 12.5 mg/kg every 6 hours if necessary

Note

Phenoxymethylpenicillin doses in <em>BNF</em> may differ from those in product literature

Phenoxymethylpenicillin (non-proprietary) (for tablets, phenoxymethylpenicillin (as potassium salt) 250 mg, net price 28-tab pack = £1.14. Label: 9, 23

Dental prescribing on NHS

Phenoxymethylpenicillin Tablets may be prescribed

Oral solution, phenoxymethylpenicillin (as potassium salt) for reconstitution with water, net price 125 mg/5 mL, 100 mL = £14.73; 250 mg/5 mL, 100 mL = £14.66. Label: 9, 23

Note

Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription

Dental prescribing on NHS

Phenoxymethylpenicillin Oral Solution may be prescribed

Penicillinase-resistant penicillins

5.1.1.2

Most staphylococci are now resistant to benzylpenicillin because they produce penicillinases. Flucloxacillin, however, is not inactivated by these enzymes and is thus effective in infections caused by penicillin-resistant staphylococci, which is the sole indication for its use. Flucloxacillin is acid-stable and can, therefore, be given by mouth as well as by injection. Flucloxacillin is well absorbed from the gut. For a warning on hepatic disorders see under Flucloxacillin.
Temocillin is active against Gram-negative bacteria and is stable against a wide range of beta-lactamases. It should be reserved for the treatment of infections caused by beta-lactamase-producing strains of Gram-negative bacteria, including those resistant to third-generation cephalosporins. Temocillin is not active against Pseudomonas aeruginosa or Acinetobacter spp.

MRSA Infection from Staphylococcus aureus strains resistant to meticillin [now discontinued] (meticillin-resistant Staph. aureus, MRSA) and to flucloxacillin can be difficult to manage. Treatment is guided by the sensitivity of the infecting strain.

Rifampicin (section 5.1.9) or sodium fusidate (section 5.1.7) should not be used alone because resistance may develop rapidly. A tetracycline alone or a combination of rifampicin and sodium fusidate can be used for skin and soft-tissue infections caused by MRSA; clindamycin alone is an alternative. A glycopeptide (e.g. vancomycin, section 5.1.7) can be used for severe skin and soft-tissue infections associated with MRSA; if a glycopeptide is unsuitable, linezolid (section 5.1.7) can be used on expert advice. As linezolid is not active against Gram-negative organisms, it can be used for mixed skin and soft-tissue infections only when other treatments are not available; linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms. A combination of a glycopeptide and sodium fusidate or a glycopeptide and rifampicin can be considered for skin and soft-tissue infections that have failed to respond to a single antibacterial.

Tigecycline (section 5.1.3) and daptomycin (section 5.1.7) are licensed for the treatment of complicated skin and soft-tissue infections involving MRSA.

A tetracycline or clindamycin can be used for bronchiectasis caused by MRSA. A glycopeptide can be used for pneumonia associated with MRSA; if a glycopeptide is unsuitable, linezolid can be used on expert advice. Linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms. A tetracycline can be used for urinary-tract infections caused by MRSA; trimethoprim or nitrofurantoin are alternatives. A glycopeptide can be used for urinary-tract infections that are severe or resistant to other antibacterials.

A glycopeptide can be used for septicemia associated with MRSA.

For the management of endocarditis, osteomyelitis, or septic arthritis associated with MRSA, see Table 1, section 5.1.

Prophylaxis with vancomycin or teicoplanin (alone or in combination with another antibacterial active against other pathogens) is appropriate for patients undergoing surgery if:

- there is a history of MRSA colonisation or infection without documented eradication;
- there is a risk that the patient’s MRSA carriage has recurred;
- the patient comes from an area with a high prevalence of MRSA.

For eradication of nasal carriage of MRSA, see section 12.2.3.

**FLUCLOXACILLIN**

**Indications** Infections due to beta-lactamase-producing staphylococci including otitis externa; adjacent in pneumonia, impetigo, cellulitis, osteomyelitis and in staphylococcal endocarditis (Table 1, section 5.1)

**Cautions** see under Benzylpenicillin (section 5.1.1); risk of kernicterus in jaundiced neonates when high doses given parenterally; **interactions**: Appendix 1 (penicillins)

**Hepatic disorders**

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:

- flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin;
- flucloxacillin should be used with caution in patients with hepatic impairment;
- careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials.

**Contra-indications** see under Benzylpenicillin (section 5.1.1)

**Hepatic impairment** see Cautions and Hepatic Disorders above

**Renal impairment** reduce dose if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy** not known to be harmful

**Breast-feeding** trace amounts in milk, but appropriate to use

**Side-effects** see under Benzylpenicillin (section 5.1.1); also gastro-intestinal disturbances; very rarely hepatitis and cholestatic jaundice (see also Hepatic disorders above)

**Dose**

- **By mouth**, 250–500 mg every 6 hours, at least 30 minutes before food; **NEONATE** see BNF for Children; **CHILD** 1 month–2 years, 62.5–125 mg every 6 hours, at least 30 minutes before food; 2–10 years, 125–250 mg every 6 hours, at least 30 minutes before food

- **By intramuscular injection**, 250–500 mg every 6 hours; CHILD 1 month–18 years see BNF for Children

- **By slow intravenous injection or by intravenous infusion**, 0.25–2 g every 6 hours; CHILD under 18 years see BNF for Children

Endocarditis (in combination with another antibacterial if necessary, see Table 1, section 5.1), body-weight under 85 kg, 8 g daily in 4 divided doses; body-weight over 85 kg, 12 g daily in 6 divided doses; CHILD 1 month–18 years see BNF for Children

Osteomyelitis (see Table 1, section 5.1), up to 8 g daily in 3–4 divided doses; CHILD under 18 years see BNF for Children

Surgical prophylaxis, by slow intravenous injection or by intravenous infusion, 1–2 g up to 30 minutes before the procedure; up to 4 further doses of 500 mg may be given every 6 hours by mouth, or by intramuscular injection, or by slow intravenous injection or by intravenous infusion for high risk procedures

**Note** Flucloxacillin doses in BNF may differ from those in product literature

**Flucloxacillin** (Non-proprietary)

Capsules, flucloxacillin (as sodium salt) 250 mg, net price 28 = £1.57; 500 mg, 28 = £2.23. Label: 9, 23

Brands include Fluclopten®, Flucloxic®, Latropen®
Ampicillin is active against certain Gram-positive and Gram-negative organisms but is inactivated by penicillinases including those produced by *E. coli*, of *Staph. aureus*, and by common Gram-negative bacilli such as *Klebsiella* spp. Co-amoxiclav makes the combination active against beta-lactamase-producing bacteria that are resistant to amoxicillin. These include resistant strains of *Staph. aureus*, *E. coli*, and *H. influenzae*, as well as many *Bacteroides* and *Klebsiella* spp. Co-amoxiclav should be reserved for infections likely, or known, to be caused by amoxicillin-resistant beta-lactamase-producing strains.

A combination of ampicillin with flucloxacillin (as co-fluampicil) is available to treat infections involving either streptococci or staphylococci (e.g. cellulitis). It should not be used for hospital patients without checking sensitivity.

**AMOXICILLIN**

*Amoxycillin* is as effective as phenoxymethylpenicillin (section 5.1.1.1) but is better absorbed; however, it may encourage emergence of resistant organisms. Like phenoxymethylpenicillin, amoxicillin is ineffective against bacteria that produce beta-lactamasases. Amoxicillin may be used for short-course oral regimens. Co-amoxiclav is active against beta-lactamase-producing bacteria that are resistant to amoxicillin. Co-amoxiclav may be used for severe dental infections with spreading cellulitis or dental infection not responding to first-line antibacterial treatment.
Infections

Breast-feeding  trace amounts in milk, but appropriate to use

Side-effects  see under Ampicillin

Dose  
- By mouth, 500 mg every 8 hours, dose doubled in severe infection; CHILD 1 month–1 year, 125 mg every 8 hours, increased if necessary up to 30 mg/kg every 8 hours; 1–5 years, 250 mg every 8 hours, increased if necessary up to 30 mg/kg every 8 hours; 5–12 years, 500 mg every 8 hours, increased if necessary up to 30 mg/kg (max. 1 g) every 8 hours; 12–18 years, 500 mg every 8 hours, in severe infection 1 g every 8 hours

Lyme disease (see also notes above), ADULT and CHILD over 5 years, 500 mg every 8 hours for 14–21 days (for 28 days in Lyme arthritis) [unlicensed indication].

Child 1 month–5 years see BNF for Children

Anthrax (treatment and post-exposure prophylaxis—see also section 5.1.12), 500 mg every 8 hours; CHILD body-weight under 20 kg, 80 mg/kg daily in 3 divided doses, body-weight over 20 kg, adult dose

- Short-course oral therapy

Dental abscess, ADULT over 18 years, 3 g repeated after 8 hours

Urinary-tract infections, ADULT over 18 years, 3 g repeated after 10–12 hours

- By intramuscular injection, ADULT over 18 years, 500 mg every 8 hours

- By intravenous injection or infusion, 500 mg every 8 hours increased to 1 g every 6 hours in severe infection; CHILD 1 month–18 years, 20–30 mg/kg (max. 500 mg every 8 hours); dose doubled in severe infection (max. 4 g daily)

- Listerial meningitis (in combination with another antibiotic, see Table 1, section 5.1), by intravenous infusion, ADULT over 18 years, 2 g every 4 hours; CHILD under 18 years see BNF for Children

- Endocarditis (in combination with another antibiotic if necessary, see Table 1, section 5.1), by intravenous infusion, ADULT over 18 years, 2 g every 4 hours; CHILD under 18 years see BNF for Children

Note  Amoxicillin doses in BNF may differ from those in product literature

Amoxicillin (Non-proprietary)  

Capsules, amoxicillin (as trihydrate) 250 mg, net price 28 = £1.37; 500 mg, 28 = £1.61. Label: 9

Brands include Amoxicillin®.

Dental prescribing on NHS Amoxicillin Capsules may be prescribed

Oral suspension, amoxicillin (as trihydrate) for reconstitution, with water, 125 mg/5 mL, net price 100 mL = £1.09; 250 mg/5 mL, 100 mL = £1.29. Label: 9

Note  Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription

Brands include Amoform®, Galenomox®, Rimoxillin®

Dental prescribing on NHS Amoxicillin Oral Suspension may be prescribed

Sachets, sugar-free, amoxicillin (as trihydrate) 3 g/sachet, net price 2-sachet pack = £9.81, 14-sachet pack = £31.94. Label: 9, 13

Dental prescribing on NHS Amoxicillin Sachets may be prescribed as Amoxicillin Oral Powder

Injection, powder for reconstitution, amoxicillin (as sodium salt), net price 250-mg vial = 32p; 500-mg vial = 55p; 1-g vial = £1.10

Amoxil® (GSK)  

Capsules, both maroon/gold, amoxicillin (as trihydrate), 250 mg, net price 21-cap pack = £3.38; 500 mg, 21-cap pack = £6.77. Label: 9

Paediatric suspension, amoxicillin 125 mg (as trihydrate)/1.25 mL when reconstituted with water, net price 20 mL (peach-strawberry and lemon-flavoured) = £3.18. Label: 9, counselling, use of pipette

Excipients include sucrose 600 mg/1.25 mL

Sachets, sugar-free, amoxicillin (as trihydrate) 3 g/sachet, net price 2-sachet pack (peach-strawberry and lemon-flavoured) = £2.99. Label: 9, 13

Injection, powder for reconstitution, amoxicillin (as sodium salt), net price 500-mg vial = 55p; 1-g vial = £1.10

Electrolytes Na+ 3.3 mmol/g

AMPICILLIN

Indications  urinary-tract infections, otitis media, sinusitis, bronchitis, low or moderate-severity community-acquired pneumonia (Table 1, section 5.1), invasive salmonellosis; endocarditis treatment (Table 1, section 5.1); listerial meningitis (Table 1, section 5.1)

Cautions  history of allergy; erythematous rashes common in glandular fever (see notes above); increased risk of erythematous rashes in cytomegalovirus infection, and acute or chronic lymphocytic leukaemia (see notes above); interactions: Appendix 1 (penicillins)

Contra-indications penicillin hypersensitivity

Renal impairment  reduce dose if eGFR less than 10 mL/minute/1.73 m²; rashes more common

Pregnancy  not known to be harmful

Breast-feeding  trace amounts in milk, but appropriate to use

Side-effects  nausea, vomiting, diarrhoea; rashes (discontinue treatment); rarely, antibiotic-associated colitis; see also under Benzylpenicillin (section 5.1.1.1)

Dose  
- By mouth, 0.5–1 g every 6 hours; CHILD 1 month–1 year, 125 mg every 6 hours, increased if necessary up to 30 mg/kg every 6 hours; 1–5 years, 250 mg every 6 hours, increased if necessary up to 30 mg/kg every 6 hours; 5–12 years, 500 mg every 6 hours, increased if necessary up to 30 mg/kg (max. 1 g) every 6 hours; 12–18 years, 500 mg every 6 hours, in severe infection 1 g every 6 hours

- By intramuscular injection or intravenous injection or infusion, 500 mg every 4–6 hours; CHILD under 18 years see BNF for Children

- Endocarditis (in combination with another antibiotic if necessary, see Table 1, section 5.1), by intravenous infusion, ADULT over 18 years, 2 g every 4 hours; CHILD under 18 years see BNF for Children

- Listerial meningitis (in combination with another antibiotic, see Table 1, section 5.1), by intravenous infusion, ADULT over 18 years, 2 g every 4 hours; CHILD under 18 years see BNF for Children

Note  Amoxicillin doses in BNF may differ from those in product literature

Ampicillin (Non-proprietary)  

Capsules, amoxicillin 250 mg, net price 28 = £4.75; 500 mg, 28 = £21.37. Label: 9, 23

Brands include Rimoxallin®
Pregnancy not known to be harmful

Risk of crystalluria with high doses

Renal impairment

Hepatic impairment

Pregnancy not known to be harmful

Breast-feeding trace amounts in milk, but appropriate to use

Side-effects see under Ampicillin; hepatitis, cholestatic jaundice (see above); Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis, vasculitis reported; rarely prolongation of bleeding time, dizziness, headache, convulsions (particularly with high doses or in renal impairment); superficial staining of teeth with suspension, phlebitis at injection site

Dose

By mouth, expressed as co-amoxiclav, one 250/125 strength tablet every 8 hours; increased in severe infection to one 500/125 strength tablet every 8 hours;

NEONATE 0.25 mL/kg of 125/31 suspension every 8 hours; CHILD 1 month–1 year, 0.25 mL/kg of 125/31 suspension every 8 hours, dose doubled in severe infection; 1–6 years, 5 mL of 125/31 suspension every 8 hours or 0.25 mL/kg of 125/31 suspension every 8 hours, dose doubled in severe infection; 6–12 years, 5 mL of 250/62 suspension every 8 hours or 0.15 mL/kg of 250/62 suspension every 8 hours, dose doubled in severe infection

Severe dental infections (but not generally first-line, see notes above), expressed as co-amoxiclav, ADULT and CHILD over 12 years, one 250/125 strength tablet every 8 hours for 5 days

By intravenous injection over 3–4 minutes or by intravenous infusion, expressed as co-amoxiclav, 1.2 g every 8 hours; NEONATE 30 mg/kg every 12 hours; CHILD 1–3 months 30 mg/kg every 12 hours; CHILD 3 months–18 years, 30 mg/kg (max. 1.2 g) every 8 hours

Surgical prophylaxis, expressed as co-amoxiclav, 1.2 g up to 30 minutes before the procedure; for high risk procedures up to 2–3 further doses of 1.2 g may be given every 8 hours

Co-amoxiclav (Non-proprietary) tablets, co-amoxiclav 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt), net price 21-tab pack = £2.62. Label: 9

Dental prescribing on NHS co-amoxiclav 250/125 Tablets may be prescribed

Tablets, co-amoxiclav 500/125 (amoxicillin 500 mg as trihydrate, clavulanic acid 125 mg as potassium salt), net price 21-tab pack = £4.13. Label: 9

Oral suspension, co-amoxiclav 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL when reconstituted with water, net price 100 mL = £1.63. Label: 9

Note Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription

Dental prescribing on NHS Co-amoxiclav 125/31 Suspension may be prescribed

Oral suspension, co-amoxiclav 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL when reconstituted with water, net price 100 mL = £1.72. Label: 9

Note Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription

Dental prescribing on NHS Co-amoxiclav 250/62 Suspension may be prescribed

Injection 500/100, powder for reconstitution, co-amoxiclav 500/100 (amoxicillin 500 mg as sodium salt, clavulanic acid 100 mg as potassium salt), net price per vial = £1.21

Injection 1000/200, powder for reconstitution, co-amoxiclav 1000/200 (amoxicillin 1 g as sodium salt, clavulanic acid 200 mg as potassium salt), net price per vial = £2.62

Cholestatic jaundice can occur either temporarily during parenteral therapy; interactions:

- with amoxicillin. Cholestatic jaundice is more common in children. Toxicity was about 6 times greater with co-amoxiclav than epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav than

- during or shortly after the use of co-amoxiclav. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav than

A mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively

Indications infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, ceftriaxone–animal bites, severe dental infection with spreading cellulitis or dental infection not responding to first-line antibacterial

Cautions see under Ampicillin and notes above; maintain adequate hydration with high doses (particularly during parenteral therapy); interactions: Appendix 1 (penicillins)

Cholestatic jaundice Cholestatic jaundice can occur either during or shortly after the use of co-amoxiclav. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav than

- with amoxicillin. Cholestatic jaundice is more common in children. Toxicity was about 6 times greater with co-amoxiclav than

- during or shortly after the use of co-amoxiclav. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav than

**Augmentin**<sup>®</sup> (GSK)<sup>®</sup> Tablets 375 mg, 625 mg, co-amoxiclav 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt), net price 21-tab pack = £4.19. Label: 9

Tables 625 mg, 1250 mg, co-amoxiclav 500/125 (amoxicillin 500 mg as trihydrate, clavulanic acid 125 mg as potassium salt), net price 21-tab pack = £8.00. Label: 9

Suspension ‘125/31 SF’, sugar-free, co-amoxiclav 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL when reconstituted with water, net price 100 mL (raspberry-and orange-flavoured) = £2.95. Label: 9

Excipients include aspartame 12.5 mg/5 mL (section 9.4.1)

Suspension ‘250/62 SF’, sugar-free, co-amoxiclav 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL when reconstituted with water, net price 100 mL (raspberry-and orange-flavoured) = £3.00. Label: 9

Excipients include aspartame 12.5 mg/5 mL (section 9.4.1)

Injection 600 mg, powder for reconstitution, co-amoxiclav 500/100 (amoxicillin 500 mg as sodium salt, clavulanic acid 100 mg as potassium salt), net price per vial = £1.06

**Electrolytes** Na<sup>+</sup> 1.35 mmol/vial

**Injection** 1.2 g, powder for reconstitution, co-amoxiclav 1000/200 (amoxicillin 1 g as sodium salt, clavulanic acid 200 mg as potassium salt), net price per vial = £1.06

**Electrolytes** Na<sup>+</sup> 2.7 mmol, K<sup>+</sup> 1 mmol/1.2-g vial

**Other oral preparations**

**Co-amoxiclav** (Non-proprietary)<sup>®</sup>

**Suspension** ‘400/57’, co-amoxiclav 400/57 (amoxicillin 400 mg as trihydrate, clavulanic acid 57 mg as potassium salt)/5 mL when reconstituted with water, net price 35 mL = £4.13, 70 mL = £5.79. Label: 9

Excipients may include aspartame (section 9.4.1)

Note Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription

**Brands include** Augmentin-Duo<sup>®</sup>

Dose ADULT and CHILD over 40 kg 10 mL twice daily, increased to 10 mL three times daily in severe infection; CHILD 0.2 months–2 years 0.15 mL/kg twice daily, 2–6 years (13–21 kg) 2.5 mL twice daily, 7–12 years (22–40 kg) 5 mL twice daily, doubled in severe infection

**CO-FLUAMPCIL**

A mixture of equal parts by mass of flucloxacillin and ampicillin

**Indications** mixed infections involving beta-lactamase-producing staphylococci

**Cautions** see under Ampicillin and Flucloxacillin; interactions: Appendix 1 (penicillins)

**Contra-indications** see under Ampicillin and Flucloxacillin

**Hepatic impairment** see under Flucloxacillin

**Renal impairment** see under Ampicillin and Flucloxacillin

**Pregnancy** not known to be harmful

**Breast-feeding** trace amounts in milk, but appropriate to use

**Side-effects** see under Ampicillin and Flucloxacillin

**Co-fluampicil (Non-proprietary)<sup>®</sup> Capsules, co-fluampicil 250/250 (flucloxacillin 250 mg as sodium salt, ampicillin 250 mg as trihydrate), net price 28-cap pack = £3.29. Label: 9, 22

Brands include Flu-Amp<sup>®</sup>

**Syrup**, co-fluampicil 125/125 (flucloxacillin 125 mg as magnesium salt, ampicillin 125 mg as trihydrate)/5 mL when reconstituted with water, net price 100 mL = £22.86. Label: 9, 22

Magnapen<sup>®</sup> (Wockhardt)<sup>®</sup>

**Injection** 500 mg, powder for reconstitution, co-fluampicil 250/250 (flucloxacillin 250 mg as sodium salt, ampicillin 250 mg as sodium salt), net price per vial = £1.33

**Electrolytes** Na<sup>+</sup> 1.3 mmol/vial

**5.1.1 Penicillins**

**5.1.1.4 Antipseudomonal penicillins**

**Piperacillin**, a ureidopenicillin, is only available in combination with the beta-lactamase inhibitor tazobactam. **Ticarcillin**, a carboxypenicillin, is only available in combination with the beta-lactamase inhibitor clavulanic acid (section 5.1.1.3). Both preparations have a broad spectrum of activity against a range of Gram-positive and Gram-negative bacteria, and anaerobes. Piperacillin with tazobactam has activity against a wider range of Gram-negative organisms than ticarcillin with clavulanic acid and it is more active against *Pseudomonas aeruginosa*. These antibacterials are not active against MRSA. They are used in the treatment of sepsis, hospital-acquired pneumonia, and complicated infections involving the urinary tract, skin and soft tissues, or intra-abdomen.

For severe pseudomonal infections these antipseudomonal penicillins can be given with an aminoglycoside (e.g. gentamicin section 5.1.4) since they have a synergistic effect.

Owing to the sodium content of many of these antibiotics, high doses may lead to hypernatraemia.

**Piperacillin with Tazobactam**

**Indications** see under Dose

**Cautions** see under Benzylpenicillin (section 5.1.1.1); interactions: Appendix 1 (penicillins)

**Contra-indications** see under Benzylpenicillin (section 5.1.1.1)

**Renal Impairment** max. 4.5 g every 8 hours if eGFR 20–40 mL/minute/1.73 m<sup>2</sup>; max. 4.5 g every 12 hours if eGFR less than 20 mL/minute/1.73 m<sup>2</sup>

**Pregnancy** manufacturers advise use only if potential benefit outweighs risk

**Breast-feeding** trace amounts in milk, but appropriate to use
**Side-effects** see under Benzylpenicillin (section 5.1.1.1); also nausea, vomiting, diarrhoea; less commonly stomatitis, dyspepsia, constipation, jaundice, hypotension, headache, insomnia, injection-site reactions; rarely abdominal pain, hepatitis, eosinophilia; very rarely hypoglycaemia, hypokalaemia, pancytopenia, Stevens-Johnson syndrome, toxic epidermal necrolysis

**Dose**

**Note** Expressed as a combination of piperacillin and tazobactam (both as sodium salts) in a ratio of 8:1

- Hospital-acquired pneumonia, septicaemia, complicated intra-abdominal infections, complicated infections involving the urinary tract or skin and soft tissues, **ADULT** and **CHILD** over 12 years, by intravenous infusion, 4.5 g every 8 hours, increased to 4.5 g every 6 hours in severe infections
- Complicated intra-abdominal infections, by intravenous infusion, **CHILD** 2–12 years, 112.5 mg/kg (max. 4.5 g) every 8 hours
- Infections in neutropenic patients, by intravenous infusion, **ADULT** and **CHILD** over 12 years, 4.5 g every 6 hours; **CHILD** 2–12 years, 90 mg/kg (max. 4.5 g) every 6 hours

**Piperacillin with tazobactam (Non-proprietary) Tazocin**

*Injection 2.25 g* powder for reconstitution, piperacillin 2 g (as sodium salt), tazobactam 250 mg (as sodium salt), net price 2.25-g vial = £12.90

*Injection 4.5 g* powder for reconstitution, piperacillin 4 g (as sodium salt), tazobactam 500 mg (as sodium salt), net price 4.5-g vial = £15.17

**Electrolytes** Na⁺ 11.16 mmol/4.5-g vial

**Pivmecillinam** has significant activity against many Gram-negative bacteria including *Escherichia coli*, *klebsiella*, enterobacter, and *salmonellae*. It is not active against *Pseudomonas aeruginosa* or enterococci. Pivmecillinam is hydrolysed to mecillinam, which is the active drug.

**TICARCILLIN WITH CLAVULANIC ACID**

**Indications** infections due to *Pseudomonas* and *Proteus* spp, see notes above

**Cautions** see under Benzylpenicillin (section 5.1.1.1); interactions: Appendix 1 (penicillins)

*Cholestatic jaundice* For a warning on cholestatic jaundice possibly associated with clavulanic acid, see under Co-amoxiclav, p. 365

**Contra-indications** see under Benzylpenicillin (section 5.1.1.1)

**Hepatic impairment** manufacturer advises caution in severe impairment; also cholestatic jaundice, see under Co-amoxiclav, p. 365

**Renal Impairment** reduce dose to 3.2 g every eight hours if eGFR 30–60 mL/minute/1.73 m²; 1.6 g every eight hours if eGFR 10–30 mL/minute/1.73 m²; 1.2 g every twelve hours if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy** not known to be harmful

**Breast-feeding** trace amounts in milk, but appropriate to use

**Side-effects** see under Benzylpenicillin (section 5.1.1.1); also nausea, vomiting, coagulation disorders, haemorrhagic cystitis (more frequent in children), injection-site reactions, Stevens-Johnson syndrome, toxic epidermal necrolysis, hypokalaemia, eosinophilia

**Dose**

**Note** Expressed as a combination of ticarcillin (as sodium salt) and clavulanic acid (as potassium salt) in a ratio of 15:1

- **By intravenous infusion**, 3.2 g every 6–8 hours increased to every 4 hours in more severe infections; **CHILD** 1 month–18 years, body-weight under 40 kg, 80 mg/kg every 8 hours, increased to every 6 hours in more severe infections; body-weight over 40 kg, adult dose

**Timentin** (GSK) *Injection 3.2 g* powder for reconstitution, ticarcillin 3 g (as sodium salt), clavulanic acid 200 mg (as potassium salt), Net price per vial = £5.33

**Electrolytes** Na⁺ 16 mmol, K⁺ 1 mmol/3.2-g vial

**PIMVECILLINAM HYDROCHLORIDE**

**Indications** see under Dose below

**Cautions** see under Benzylpenicillin (section 5.1.1.1); also liver and renal function tests required in long-term use; avoid in acute porphyria (section 9.8.2)

**Contra-indications** see under Benzylpenicillin (section 5.1.1.1); also carnitine deficiency, oesophageal strictures, gastro-intestinal obstruction, infants under 3 months

**Pregnancy** not known to be harmful, but manufacturer advises avoid

**Breast-feeding** trace amounts in milk, but appropriate to use

**Side-effects** see under Benzylpenicillin (section 5.1.1.1); nausea, vomiting, abdominal pain, headache, dizziness; also reported mouth ulcers, oesophagitis, reduced serum and total body carnitine (especially with long-term or repeated use)

**Dose**

- **Acute uncomplicated cystitis**, **ADULT** and **CHILD** over 40 kg, initially 400 mg then 200 mg every 8 hours for 3 days
- **Chronic or recurrent bacteriuria**, **ADULT** and **CHILD** over 40 kg, 400 mg every 6–8 hours
- **Urinary-tract infections**, **CHILD** under 40 kg, 20–40 mg/kg daily in 3–4 divided doses
- **Salmonellosis**, not recommended therefore no dose stated

**Counselling** Tablets should be swallowed whole with plenty of fluid during meals while sitting or standing

**Selexid** (LEO) *Tablets, f/c, pivmecillinam hydrochloride 200 mg, net price 10-tab pack = £4.50. Label 9, 21, 27, counselling, posture (see Dose above)*
Antibiotics in this section include the cephalosporins, such as cefotaxime, cefazidime, cefuroxime, ceftaxin and cefradine, the monobactam, aztreonam, and the carbapenems, imipenem (a thienamycin derivative), meropenem, and ertapenem.

### 5.1.2 Cephalosporins, carbapenems, and other beta-lactams

#### 5.1.2.1 Cephalosporins

The cephalosporins are broad-spectrum antibiotics which are used for the treatment of septicaemia, pneumonia, meningitis, biliary-tract infections, peritonitis, and urinary-tract infections. The pharmacology of the cephalosporins is similar to that of the penicillins, excretion being principally renal. Cephalosporins penetrate the cerebrospinal fluid poorly unless the meningies are inflamed; cefotaxime is a suitable cephalosporin for infections of the CNS (e.g meningitis).

The principal side-effect of the cephalosporins is hypersensitivity and about 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. Patients with a history of immediate hypersensitivity to penicillins should not receive a cephalosporin. If a cephalosporin is essential in these patients because a suitable alternative antibacterial is not available, then cefixime, cefotaxime, cefazidime, ceftriaxone, or cefuroxime and should be avoided. Antibiotic-associated colitis may occur with the use of broad-spectrum cephalosporins, particularly second- and third-generation cephalosporins.

Cefuroxime is a ‘second generation’ cephalosporin that is less susceptible than the earlier cephalosporins to inactivation by beta-lactamases. It is, therefore, active against certain bacteria which are resistant to the other drugs and has greater activity against Haemophilus influenzae.

Cefotaxime, cefazidime and ceftriaxone are ‘third generation’ cephalosporins with greater activity than the ‘second generation’ cephalosporins against certain Gram-negative bacteria. However, they are less active than cefuroxime against Gram-positive bacteria, most notably Staphylococcus aureus. Their broad antibacterial spectrum may encourage superinfection with resistant bacteria or fungi.

Cefazidime has good activity against pseudomonas. It is also active against other Gram-negative bacteria. Ceftriaxone has a longer half-life and therefore needs to be given only once daily. Indications include serious infections such as septicaemia, pneumonia, and meningitis. The calcium salt of ceftriaxone forms a precipitate in the gall bladder which may rarely cause symptoms but these usually resolve when the antibiotic is stopped.

Ceftaroline fosamil is a ‘fifth generation’ cephalosporin with bactericidal activity similar to cefotaxime; however, ceftaroline fosamil has an extended spectrum of activity against Gram-positive bacteria that includes meticillin-resistant Staphylococcus aureus and multi-drug resistant Streptococcus pneumoniae. Ceftaroline fosamil is licensed for the treatment of community-acquired pneumonia and complicated skin and soft-tissue infections, but there is no experience of its use in pneumonia caused by meticillin-resistant S. aureus. The Scottish Medicines Consortium, p. 4 has advised (Dec 2012) that ceftaroline fosamil (Zinforo®) is accepted for restricted use within NHS Scotland when meticillin-resistant S. aureus is suspected in complicated skin and soft-tissue infection and vancomycin cannot be used.

Orally active cephalosporins The orally active ‘first generation’ cephalosporins, cefalexin, cefradine, and cefadroxil and the ‘second generation’ cephalosporin, cefaclor, have a similar antimicrobial spectrum. They are useful for urinary-tract infections which do not respond to other drugs or which occur in pregnancy, respiratory-tract infections, otitis media, sinusitis, and skin and soft-tissue infections. Cefaclor has good activity against H. influenzae, but it is associated with protracted skin reactions especially in children. Cefadroxil has a long duration of action and can be given twice daily; it has poor activity against H. influenzae. Cefuroxime axetil, an ester of the ‘second generation’ cephalosporin cefuroxime, has the same antibacterial spectrum as the parent compound; it is poorly absorbed.

Cefixime is an orally active ‘third generation’ cephalosporin. It has a longer duration of action than the other cephalosporins that are active by mouth. It is only licensed for acute infections.

For treatment of Lyme disease, see section 5.1.1.3.

### 5.1.2.2 Carbapenems

Orally active carbapenems Oral infections The cephalosporins offer little advantage over the penicillins in dental infections, often being less active against anaerobes. Infections due to oral streptococci (often termed viridans streptococci) which become resistant to penicillin are usually also resistant to cephalosporins. This is of importance in the case of patients who have had rheumatic fever and are on long-term penicillin therapy. Cefalexin and cefradine have been used in the treatment of oral infections.

#### CEFACLOR

**Indications**

Infections due to sensitive Gram-positive and Gram-negative bacteria, but see notes above

**Cautions**

Sensitivity to beta-lactam antibacterials (avoid if history of immediate hypersensitivity reaction, see also notes above and p. 360); false positive urinary glucose (if tested for reducing substances) and false positive Coombs’ test; **interactions:** Appendix 1 (cephalosporins)

**Contra-indications**

cephalosporin hypersensitivity

**Renal impairment**

No dose adjustment required—manufacturer advises caution

**Pregnancy**

Not known to be harmful

**Breast-feeding**

Present in milk in low concentration, but appropriate to use

**Side-effects**

Diarrhoea (rarely antibiotic-associated colitis), nausea and vomiting, abdominal discomfort, headache; allergic reactions including rashes, pruritus, urticaria, serum sickness-like reactions with rashes, fever and arthralgia, and anaphylaxis; Stevens-Johnson syndrome, toxic epidermal necrolysis reported; disturbances in liver enzymes, transient
hepatitis and cholestatic jaundice; other side-effects reported include eosinophilia and blood disorders (including thrombocytopenia, leucopenia, agranulocytosis, aplastic anaemia and haemolytic anaemia); reversible interstitial nephritis, hyperactivity, nervousness; sleep disturbances, hallucinations, confusion, hyperventilation, and dizziness

**Dose**
- 250 mg every 8 hours, doubled for severe infections; max. 4 g daily; CHILD over 1 month, 20 mg/kg daily in 3 divided doses, doubled for severe infections, max. 1 g daily; or 1 month–1 year, 62.5 mg every 8 hours; 1–5 years, 125 mg; over 5 years, 250 mg; doses doubled for severe infections

**Cefaclor (Non-proprietary)**
- **Capsules**, cefaclor (as monohydrate) 250 mg, net price 21-cap pack = £6.80; 500 mg, 50-cap pack = £24.00. Label: 9
- **Brands include** Kefild®
- **Suspension**, cefaclor (as monohydrate) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £5.16; 250 mg/5 mL, 100 mL = £10.32. Label: 9
- **Note**: Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription
- **Brands include** Keftid®

**Distaclox® (Flynn)**
- **Capsules**, cefaclor (as monohydrate) 500 mg (violet/grey), net price 28-cap pack = £7.50. Label: 9
- **Suspension**, both pink, cefaclor (as monohydrate) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £4.13; 250 mg/5 mL, 100 mL = £8.26. Label: 9

**Modified release**

**Distaclox MR® (Flynn)**
- **Tablets**, m/r, both blue, cefaclor (as monohydrate) 375 mg, Net price 14-cap pack = £9.10. Label: 9, 21, 25
- **Dose**: 375 mg every 12 hours with food, dose doubled for pneumonitis
- Lower urinary-tract infections, 375 mg every 12 hours with food

**Cefadroxil**

**Indications** see under Cefaclor; see also notes above

**Cautions** see under Cefaclor; **interactions**: Appendix 1 (cephalosporins)

**Contra-indications** see under Cefaclor

**Renal impairment** 1 g initially, then 500 mg every 12 hours if eGFR 26–50 mL/minute/1.73 m²; 1 g initially, then 500 mg every 24 hours if eGFR 11–26 mL/minute/1.73 m²; 1 g initially, then 500 mg every 36 hours if eGFR less than 11 mL/minute/1.73 m²

**Pregnancy** see under Cefaclor

**Breast-feeding** see under Cefaclor

**Side-effects** see under Cefaclor

**Dose**
- 0.5–1 g twice daily; skin, soft-tissue, and uncomplicated urinary-tract infections, 1 g daily; CHILD 6–18 years, body-weight under 40 kg, 500 mg twice daily; body-weight over 40 kg, adult dose

**Cefadroxil (Non-proprietary)**
- **Capsules**, cefadroxil (as monohydrate) 500 mg, net price 20-cap pack = £20.89. Label: 9

**Cefalexin** (Cephalexin)

**Indications** see under Cefaclor

**Cautions** see under Cefaclor; **interactions**: Appendix 1 (cephalosporins)

**Contra-indications** see under Cefaclor

**Renal impairment** max. 3 g daily if eGFR 40–50 mL/minute/1.73 m²; max. 1.5 g daily if eGFR 10–40 mL/minute/1.73 m²; max. 0.75 g daily if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy** see under Cefaclor

**Breast-feeding** see under Cefaclor

**Side-effects** see under Cefaclor

**Dose**
- 250 mg every 6 hours or 500 mg every 8–12 hours increased to 1–5 g every 6–8 hours for severe infections; CHILD 25 mg/kg daily in divided doses, doubled for severe infections, max. 100 mg/kg daily; or under 1 year 125 mg every 12 hours, 1–5 years 125 mg every 8 hours, 5–12 years 250 mg every 8 hours
- Prophylaxis of recurrent urinary-tract infection, ADULT 125 mg at night

**Cefalexin (Non-proprietary)**
- **Capsules**, cefalexin 250 mg, net price 28-cap pack = £1.67; 500 mg, 21-cap pack = £1.77. Label: 9
- **Dental prescribing on NHS** Cefalexin Capsules may be prescribed
- **Tablets**, cefalexin 250 mg, net price 28-tab pack = £2.02; 500 mg, 21-tab pack = £2.53. Label: 9
- **Dental prescribing on NHS** Cefalexin Tablets may be prescribed

**Oral suspension**, cefalexin for reconstitution with water, 125 mg/5 mL, net price 100 mL = £1.40; 250 mg/5 mL, 100 mL = £1.89. Label: 9
- **Dental prescribing on NHS** Cefalexin Oral Suspension may be prescribed

**Cefpodoxime® (Co-Pharma)**
- **Capsules**, both caramel/grey, cefalexin 250 mg, net price 28-cap pack = £4.02; 500 mg, 28-cap pack = £7.85. Label: 9
- **Tablets**, all pink, f/c, cefalexin 250 mg, net price 28-tab pack = £4.02; 500 mg, 28-tab pack = £7.85. Label: 9
- **Syrup**, all orange, cefalexin for reconstitution with water, 125 mg/5 mL, net price 100 mL = £1.43; 250 mg/5 mL, 100 mL = £2.87; 500 mg/5 mL, 100 mL = £5.57. Label: 9

**Keflex® (Flynn)**
- **Capsules**, cefalexin 250 mg (green/white), net price 28-cap pack = £1.46; 500 mg (pale green/dark green), 21-cap pack = £1.98. Label: 9
- **Tablets**, both peach, cefalexin 250 mg, net price 28-tab pack = £1.60; 500 mg (scored), 21-tab pack = £2.08. Label: 9
- **Suspension**, cefalexin for reconstitution with water, 125 mg/5 mL, net price 100 mL = 84p; 250 mg/5 mL, 100 mL = £1.40. Label: 9

**Cefixime**

**Indications** see under Cefaclor (acute infections only); gonorrhoea [unlicensed indication] (see also Table 1, section 5.1)

**Cautions** see under Cefaclor; **interactions**: Appendix 1 (cephalosporins)
Contra-indications see under Cefaclor
Renal impairment reduce dose if eGFR less than 20 mL/minute/1.73 m² (max. 200 mg once daily)
Pregnancy see under Cefaclor
Breast-feeding manufacturer advises avoid unless essential—no information available
Side-effects see under Cefaclor

Dose

- **ADULT** and **CHILD** over 10 years, 200–400 mg daily in 1–2 divided doses; **CHILD** over 6 months 8 mg/kg daily in 1–2 divided doses or 6 months–1 year 75 mg daily; 1–4 years 100 mg daily; 5–10 years 200 mg daily
- Uncomplicated gonorrhoea [unlicensed indication] (see also Table 1, section 5.1), 400 mg as a single dose

CEFOTAXIME

**Indications** see under Cefaclor; gonorrhoea; surgical prophylaxis; Haemophilus epiglottitis and meningitis (Table 1, section 5.1); see also notes above

**Cautions** see under Cefaclor; interactions: Appendix 1 (cephalosporins)

**Contra-indications** see under Cefaclor

**Renal impairment** if eGFR less than 5 mL/minute/1.73 m², initial dose of 1 g then use half normal dose

**Pregnancy** see under Cefaclor

**Breast-feeding** see under Cefaclor

**Side-effects** see under Cefaclor; rarely arrhythmias following rapid injection reported

**Dose**

- By intramuscular or intravenous injection or by intravenous infusion, 1 g every 12 hours increased in severe infections (e.g. meningitis) to 8 g daily in 4 divided doses; higher doses (up to 12 g daily in 3–4 divided doses) may be required; intramuscular doses over 1 g divided between more than one site; **NEONATE** 50 mg/kg daily in 2–4 divided doses increased to 150–200 mg/kg daily in severe infections; **CHILD** 100–150 mg/kg daily in 2–4 divided doses increased up to 200 mg/kg daily in severe infections
- Uncomplicated gonorrhoea, by intramuscular injection, 500 mg as a single dose

Important: If meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) is suspected, and the patient cannot be given benzylpenicillin (e.g. because of an allergy), a single dose of cefotaxime can be given (if available) before urgent transfer to hospital, so long as this does not delay the transfer. If a patient with suspected bacterial meningitis without non-blanching rash cannot be transferred to hospital urgently and cannot be given benzylpenicillin, a single dose of cefotaxime can be given before transfer. Suitable doses of cefotaxime by intravenous injection (or by intramuscular injection) are **ADULT** and **CHILD** over 12 years 1 g; **CHILD** under 12 years 50 mg/kg; chloramphenicol (section 5.1.7) may be used if there is a history of anaaphylaxis to penicillins or cephalosporins

Cefotaxime (Non-proprietary)

**Injection**, powder for reconstitution, cefotaxime (as sodium salt), net price 500-mg vial = £2.25; 1-g vial = £4.20; 2-g vial = £8.57

CEFTRAROLINE FOSAMIL

**Indications** community-acquired pneumonia; complicated skin and soft-tissue infections; see also notes above

**Cautions** see under Cefaclor; also seizure disorders; interactions: Appendix 1 (cephalosporins)

**Contra-indications** see under Cefaclor

**Renal impairment** 400 mg every 12 hours if eGFR 30–50 mL/minute/1.73 m²; manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid unless essential—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see under Cefaclor

**Dose**

- By intravenous infusion, **ADULT** over 18 years 600 mg every 12 hours for 5–7 days in community-acquired pneumonia or 5–14 days in complicated skin and soft-tissue infections

Zinforo® (AstraZeneca) ((IV)

**Intravenous infusion**, powder for reconstitution, cefaroline fosamil (as acetate), net price 600-mg vial = £37.50

CEFTAZIDIME

**Indications** see under Cefaclor; see also notes above

**Cautions** see under Cefaclor; interactions: Appendix 1 (cephalosporins)

**Contra-indications** see under Cefaclor

**Hepatic impairment** manufacturer advises caution in severe impairment

**Renal impairment** reduce dose if eGFR less than 50 mL/minute/1.73 m²—consult product literature

**Pregnancy** see under Cefaclor

**Breast-feeding** see under Cefaclor

**Side-effects** see under Cefaclor; also taste disturbances, paraesthesia
Dose
- By intravenous injection or infusion (or by deep intramuscular injection if intravenous administration not possible) 1–2 g every 8 hours; in meningitis, septicaemia, hospital-acquired pneumonia, or in febrile patients with neutropenia, 2 g every 8 hours; single doses over 1 g intravenous route only; ELDERLY over 80 years usual max. 3 g daily
- Complicated urinary-tract infection, 1–2 g every 8–12 hours; single doses over 1 g intravenous route only; ELDERLY over 80 years usual max. 3 g daily
- Pseudomonal lung infection in cystic fibrosis, ADULT 100–150 mg/kg (daily max. 9 g daily) in 3 divided doses; single doses over 1 g intravenous route only
- Prophylaxis for transurethral resection of prostate, 1 g up to 30 minutes before the procedure, repeated if necessary when catheter removed
- CHILD under 18 years see BNF for Children

Ceftazidine (Non-proprietary) (as cefuroxime axetil), 250 mg twice daily in most infections including mild to moderate lower respiratory-tract infections (e.g. bronchitis); doubled for more severe lower respiratory-tract infections or if pneumonia suspected

CEFTRIAXONE

Indications see under Cefaclor and notes above; surgical prophylaxis; meningitis and Haemophilus influenzae type b disease [unlicensed indications] (Table 2, section 5.1)

Cautions see under Cefaclor; may displace bilirubin from serum albumin, administer over 60 minutes in neonates (see also Contra-indications); treatment longer than 14 days, renal failure, dehydration—risk of ceftriaxone precipitation in gall bladder; interactions: Appendix 1 (cephalosporins)

Contra-indications see under Cefaclor; neonates less than 41 weeks corrected gestational age; neonates over 41 weeks corrected gestational age with jaundice, h ypobalaminemia, or acidosis; concomitant treatment with intravenous calcium (including total parenteral nutrition containing calcium) in neonates over 41 weeks corrected gestational age—risk of precipitation in urine and lungs

Hepatic impairment reduce dose and monitor plasma concentration if both hepatic and severe renal impairment

Renal impairment reduce dose if eGFR less than 10 mL/minute/1.73 m² (max. 2 g daily); monitor plasma concentration if both hepatic and severe renal impairment

Pregnancy see under Cefaclor

Breast-feeding see under Cefaclor

Side-effects see under Cefaclor; calcium ceftriaxone precipitates in urine (particularly in very young, dehydrated or those who are immobilised) or in gall bladder—consider discontinuation if symptomatic; rarely prolongation of prothrombin time, pancreatitis

Dose
- By deep intramuscular injection, or by intravenous injection over at least 2–4 minutes, or by intravenous infusion, 1 g daily; 2–4 g daily in severe infections; intramuscular doses over 1 g divided between more than one site; single intramuscular doses above 1 g by intravenous infusion only

NEONATE, by intravenous infusion over 60 minutes, 20–50 mg/kg daily (max. 50 mg/kg daily); INFANT and CHILD under 50 kg, by deep intramuscular injection, or by intravenous injection over 2–4 minutes, or by intravenous infusion, 20–50 mg/kg daily, up to 80 mg/kg daily in severe infections; doses of 50 mg/kg and over by intravenous infusion only; 50 kg and over, adult dose

Endocarditis caused by haemophilus, actinobacillus, cardio bacterium, eikenella, and kingella species (‘HACEK organisms’) (in combination with another antibacterial, see Table 1, section 5.1; [unlicensed indication]), by intravenous infusion, 2–4 g daily

Early syphilis [unlicensed indication], by deep intramuscular injection, 500 mg daily for 10 days

Uncomplicated gonorrhoea, pelvic inflammatory disease (see also Table 1, section 5.1), by deep intramuscular injection, 500 mg as a single dose [unlicensed dose]

Surgical prophylaxis, by deep intramuscular injection or by intravenous injection over at least 2–4 minutes, 1 g up to 30 minutes before the procedure; colorectal surgery, by deep intramuscular injection or by intravenous infusion, 2 g up to 30 minutes before the procedure; intramuscular doses over 1 g divided between more than one site

Ceftriaxone (Non-proprietary) (as cefuroxime axetil), 250 mg twice daily in most infections including mild to moderate lower respiratory-tract infections (e.g. bronchitis); doubled for more severe lower respiratory-tract infections or if pneumonia suspected

CEFROXIME
Urinary-tract infection, 125 mg twice daily, doubled in pyelonephritis

**CHILD** over 3 months, 125 mg twice daily, if necessary doubled in child over 2 years with otitis media

Lyme disease (see also section 5.1.1.3), **ADULT** and **CHILD** over 12 years, 500 mg twice daily for 14–21 days (for 28 days in Lyme arthritis) [unlicensed duration]

- **By intramuscular injection or intravenous injection or infusion.** 750 mg every 6–8 hours; 1.5 g every 6–8 hours in severe infections; single doses over 750 mg intravenous route only

**CHILD** usual dose 60 mg/kg daily (range 30–100 mg/kg daily) in 3–4 divided doses (2–3 divided doses in neonates)

- **Surgical prophylaxis.** 1.5 g by **intravenous injection** up to 30 minutes before the procedure; up to 3 further doses of 750 mg may be given by **intramuscular or intravenous injection** every 8 hours for high-risk procedures

- **Open fractures, prophylaxis** (see also Table 2, section 5.1), by **intravenous injection or infusion.** 1.5 g every 8 hours until soft-tissue closure (max. duration 72 hours)

**Cefuroxime** (Non-proprietary) (Ph)

**Tables.** cefuroxime (as axetil) 250 mg, net price 14-tab pack = £14.72. Label: 9, 21, 25

**Injection.** powder for reconstitution, cefuroxime (as sodium salt), net price 750-mg vial = £2.52; 1.5-g vial = £5.05

**Zinacef®** (GSK) (Ph)

**Injection.** powder for reconstitution, cefuroxime (as sodium salt). Net price 250-mg vial = 94p; 750-mg vial = £2.34; 1.5-g vial = £4.70

**Electrolytes** Na+ 1.8 mmol/750-mg vial

**Zinnat®** (GSK) (Ph)

**Tables.** both f/c, cefuroxime (as axetil) 125 mg, net price 14-tab pack = £4.56; 250 mg, 14-tab pack = £9.11. Label: 9, 21, 25

**Suspension.** cefuroxime (as axetil) 125 mg/5 mL when reconstituted with water, net price 70 mL (tutti-frutti-flavoured) = £5.20. Label: 9, 21

**Excipients** include aspartame (section 9.4.1), sucrose 3 g/15 mL

5.1.2 Carbapenems

The carbapenems are beta-lactam antibacterials with a broad-spectrum of activity which includes many Gram-positive and Gram-negative bacteria, and anaerobes; **imipenem and meropenem** have good activity against **Pseudomonas aeruginosa.** The carbapenems are not active against meticillin-resistant **Staphylococcus aureus** and **Enterococcus faecium.**

Imipenem and meropenem are used for the treatment of severe hospital-acquired infections and polymicrobial infections including septicaemia, hospital-acquired pneumonia, intra-abdominal infections, skin and soft-tissue infections, and complicated urinary-tract infections.

Ertapenem is licensed for treating abdominal and gynaecological infections and for community-acquired pneumonia, but it is not active against atypical respiratory pathogens and it has limited activity against penicillin-resistant pneumococci. It is also licensed for treating foot infections of the skin and soft tissue in patients with diabetes. Unlike the other carbapenems, ertape-
Cautions sensitivity to beta-lactam antibacterials (avoid if history of immediate hypersensitivity reaction, see also p. 360); CNS disorders (e.g. epilepsy); interactions: Appendix 1 (imipenem with cilastatin)

Renal impairment risk of CNS side-effects; reduce dose if eGFR less than 70 mL/minute/1.73 m²—consult product literature

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk (toxicity in animal studies)

Breast-feeding present in milk but unlikely to be absorbed

Side-effects nausea (may reduce rate of infusion), vomiting, diarrhoea (rarely antibiotic-associated colitis), eosinophilia, rash (rarely toxic epidermal necrolysis and Stevens-Johnson syndrome); less commonly hypotension, seizures, myoclonic activity, dizziness, drowsiness, hallucinations, confusion, leucopenia, thrombocytopenia, thrombocytosis, positive Coombs’ test; rarely taste disturbances, hepatitis, encephalopathy, anaphylactic reactions, paraesthesia, tremor, acute renal failure, polyuria, tooth, tongue or urine discoloration, hearing loss; very rarely, abdominal pain, heartburn, glossitis, tachycardia, palpitation, flushing, cyanosis, dyspnoea, hyperventilation, headache, anaphylaxis, haemolytic anaemia, aggravation of myasthenia gravis, polyarthralgia, tinnitus, hypersalivation, hyperhidrosis

Dose
- By intravenous infusion, in terms of imipenem, 500 mg every 6 hours or 1 g every 8 hours; infection caused by *Pseudomonas* or other less sensitive organisms, life-threatening infection, or empirical treatment of infection in febrile patients with neutropenia, 1 g every 6 hours; CHILD under 1 year see BNF for Children, 1 year and older, 15 mg/kg (max. 500 mg) every 6 hours; infection caused by *Pseudomonas* or other less sensitive organisms, life-threatening infection, or empirical treatment of infection in febrile patients with neutropenia, 25 mg/kg (max. 1 g) every 6 hours

Imipenem with cilastatin (Non-proprietary) Intravenous infusion, powder for reconstitution, imipenem (as monohydrate) 500 mg with cilastatin (as sodium salt) 500 mg, net price per vial = £12.00

Primaxin® (MSD) Intravenous infusion, powder for reconstitution, imipenem (as monohydrate) 500 mg with cilastatin (as sodium salt) 500 mg, net price per vial = £12.00 Electrolytes Na⁺ 1.6 mmol/vial

Breast-feeding unlikely to be absorbed (however, manufacturer advises avoid)

Side-effects nausea, vomiting, diarrhoea (antibiotic-associated colitis reported), abdominal pain, disturbances in liver function tests, headache, thrombocytopenia, rash, pruritus; less commonly paraesthesia, eosinophilia, thrombocytopenia, leucopenia; rarely convulsions; also reported haemolytic anaemia, positive Coombs’ test, Stevens-Johnson syndrome, toxic epidermal necrolysis

Dose
- By intravenous injection over 5 minutes or by intravenous infusion, 0.5–1 g every 8 hours; CHILD 3 months–12 years 10–20 mg/kg every 8 hours, body-weight over 50 kg, adult dose
- Exacerbations of chronic lower respiratory-tract infection in cystic fibrosis, meningitis, 2 g every 8 hours; CHILD 3 months–12 years 40 mg/kg every 8 hours, body-weight over 50 kg, adult dose
- Endocarditis (in combination with another antibiotic [unlicensed]), see Table 1, section 5.1), ADULT over 18 years, 2 g every 8 hours

Meropenem (Non-proprietary) ® Injection, powder for reconstitution, meropenem (as trihydrate), net price 500-mg vial = £8.00; 1-g vial = £16.00

Meropenem® (AstraZeneca) ® Injection, powder for reconstitution, meropenem (as trihydrate), net price 500-mg vial = £10.31; 1-g vial = £20.63 Electrolytes Na⁺ 3.9 mmol/g

5.1.2.3 Other beta-lactam antibiotics

Aztreonam is a monocyclic beta-lactam (‘monobac- tam’) antibiotic with an antibacterial spectrum limited to Gram-negative aerobic bacteria including *Pseudo- monas aeruginosa*, *Neisseria meningitidis*, and *Haemo- philus influenzae*; it should not be used alone for ‘blind’ treatment since it is not active against Gram-positive organisms. Aztreonam is also effective against *Neisseria gonorrhoeae* (but not against concurrent chlamydial infection). Side-effects are similar to those of the other beta-lactams although aztreonam may be less likely to cause hypersensitivity in penicillin-sensitive patients. Aztreonam may be administered by nebuliser for the treatment of chronic *P. aeruginosa* infection in cystic fibrosis. The *Scottish Medicines Consortium* (p. 4) has advised (January 2012) that aztreonam powder for nebuliser solution (*Cayston®*) is not recommended for use within NHS Scotland.

AZTREONAM

Indications Gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, and *Neisseria meningitidis*

Cautions hypersensitivity to beta-lactam antibiotics; interactions: Appendix 1 (aztreonam) Specific cautions for inhaled treatment: Other inhaled drugs should be administered before aztreonam; a bronchodilator should be administered before each dose. Measure lung function before and after initial dose of aztreonam and monitor for bronchospasm. Haemoptysis—risk of further haemorrhage

Contra-indications aztreonam hypersensitivity

Hepatic impairment use injection with caution and monitor liver function

Infections
5.1.3 Tetracyclines

The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. They remain, however, the treatment of choice for infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever), brucella (doxycycline with either streptomycin or rifampicin), and the spirochaetes, Borrelia burgdorferi (Lyme disease—see section 5.1.1.3). They are also used in respiratory and genital mycoplasma infections, in acne, in destructive (refractory) periodontal disease, in exacerbations of chronic bronchitis (because of their activity against Haemophilus influenzae), and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin).

For the role of tetracyclines in the management of meticillin-resistant Staphylococcus aureus (MRSA) infection, see p. 362. Microbiologically, there is little to choose between the various tetracyclines, the only exception being minocycline which has a broader spectrum; it is active against Neisseria meningitidis and has been used for meningococcal prophylaxis but is no longer recommended because of side-effects including dizziness and vertigo (see section 5.1, table 2 for current recommendations). Compared to other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

Oral infections In adults, tetracyclines can be effective against oral anaerobes but the development of resistance (especially by oral streptococci) has reduced their usefulness for the treatment of acute oral infections; they may still have a role in the treatment of destructive (refractory) forms of periodontal disease. Doxycycline has a longer duration of action than tetracycline or oxytetracycline and need only be given once daily; it is reported to be more active against anaerobes than some other tetracyclines.

For the use of doxycycline in the treatment of recurrent aphthous ulceration, or as an adjunct to gingival scaling and root planing for periodontitis, see section 12.3.1.

Cautions Tetracyclines may increase muscle weakness in patients with myasthenia gravis, and exacerbate systemic lupus erythematosus. Antacids, and aluminium, calcium, iron, magnesium and zinc salts decrease the absorption of tetracyclines; milk also reduces the absorption of demeclocycline, oxytetracycline, and tetracycline. Other interactions: Appendix 1 (tetracyclines).

Contra-indications Deposition of tetracyclines in growing bone and teeth (by binding to calcium) causes staining and occasionally dental hypoplasia, and they should not be given to children under 12 years, or to pregnant or breast-feeding women. However, doxycycline may be used in children for treatment and post-exposure prophylaxis of anthrax when an alternative antibacterial cannot be given [unlicensed indication].

Hepatic impairment Tetracyclines should be avoided or used with caution in patients with hepatic impairment. Tetracyclines should also be used with caution in those receiving potentially hepatotoxic drugs.

Renal impairment With the exception of doxycycline and minocycline, the tetracyclines may exacerbate renal failure and should not be given to patients with renal impairment.

Pregnancy Tetracyclines should not be given to pregnant women. Effects on skeletal development have been documented when tetracyclines have been used in the first trimester in animal studies. Administration during the second or third trimester may cause discoloration of the child’s teeth, and maternal hepatotoxicity has been reported with large parenteral doses. However, when travel to malaria areas is unavoidable during pregnancy, doxycycline can be used for malaria prophylaxis if other regimens are unsuitable (section

Renal impairment if eGFR 10–30 mL/minute/1.73 m², usual initial dose of injection, then half normal dose; if eGFR less than 10 mL/minute/1.73 m², usual initial dose of injection, then one-quarter normal dose

Pregnancy no information available; manufacturer of injection advises avoid; manufacturer of powder for nebuliser solution advises avoid unless essential

Breast-feeding amount in milk probably too small to be harmful

Side-effects

Specific side-effects for parenteral treatment Rarely gastro-intestinal bleeding, antibiotic-associated colitis, jaundice, hepatitis, hypotension, chest pain, dysphonia, seizures, paraesthesia, confusion, dizziness, asthma, headache, insomnia, breast tenderness, blood disorders (including thrombocytopenia and neutropenia), myalgia, diplopia, tinnitus, haitiosis; also reported nausea, vomiting, abdominal pain, diarrhoea, mouth ulcers, taste disturbances, flushing, bronchospasm, rash (including toxic epidermal necrolysis and erythema multiforme)

Specific side-effects for inhaled treatment Wheezing, bronchospasm, cough, haemoptysis, pyrexia, arthralgia, rash, rhinorrhoea, pharyngolaryngeal pain

Dose

By deep intramuscular injection or by intravenous injection over 3–5 minutes or by intravenous infusion, 1 g every 8 hours or 2 g every 12 hours; 2 g every 6–8 hours for severe infections (including systemic Pseudomonas aeruginosa and lung infections in cystic fibrosis); single doses over 1 g intravenous route only

Urinary-tract infections, 0.5–1 g every 8–12 hours

CHILD over 1 week, by intravenous injection or infusion, 30 mg/kg every 6–8 hours increased in severe infections (including systemic Pseudomonas aeruginosa and lung infections in cystic fibrosis); single doses over 1 g intravenous route only

Contra-indications

Parenteral

Azactam® (Squibb) \text{CH}

Injection, powder for reconstitution, aztreonam, net price 1 g vial = £9.40; 2-g vial = £18.82

Inhalation

Cayston® (Gilead) \text{CH}

Powder for nebuliser solution, aztreonam (as lysine), net price 84 × 75 mg vials (with solvent and nebuliser handset) = £2181.53

5.1.3 Tetracyclines

BNF 68
5.4.1), and if the entire course of doxycycline can be completed before 15 weeks’ gestation [unlicensed].

**Breast-feeding** Tetracyclines should not be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).

**Side-effects** Side-effects of the tetracyclines include nausea, vomiting, diarrhoea (antibiotic-associated colitis reported occasionally), dysphagia, and oesophageal irritation. Other rare side-effects include hepatotoxicity, pancreatitis, blood disorders, photosensitivity (particularly with demeclocycline), and hypersensitivity reactions (including rash, exfoliative dermatitis, Stevens-Johnson syndrome, urticaria, angioedema, anaphylaxis, pericarditis). Headache and visual disturbances may indicate benign intracranial hypertension (discontinue treatment); bulging fontanelles have been reported in infants.

### TETRACYCLINE

**Indications** see notes above; acne vulgaris, rosacea (section 13.6)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above; max. 1 g daily in divided doses

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also acute renal failure, skin discolouration

**Dose**
- 250 mg every 6 hours, increased in severe infections to 500 mg every 6–8 hours
- Acne, see section 13.6.2
- Non-gonococcal urethritis, 500 mg every 6 hours for 7–14 days (21 days if failure or relapse after first course)

**Counselling** Tablets should be swallowed whole with plenty of fluid during meals while sitting or standing

**Tetracycline (Non-proprietary)**

*Capsules* coated, tetracycline hydrochloride 250 mg, net price 28-tab pack = £2.73. Label: 7, 9, 23, counselling, posture

**Dental prescribing on NHS** Tetracycline Tablets may be prescribed

### DEMECLOCYCLINE HYDROCHLORIDE

**Indications** see notes above; also inappropriate secretion of antidiuretic hormone, section 6.5.2

**Cautions** see notes above, but photosensitivity more common (avoid exposure to sunlight or sun lamps)

**Contra-indications** see notes above

**Hepatic impairment** see notes above; max. 1 g daily in divided doses

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also reversible nephrogenic diabetes insipidus, acute renal failure

**Dose**
- 150 mg every 6 hours or 300 mg every 12 hours

**DOXYCYCLINE**

**Indications** see notes above; chronic prostatitis; sinusitis, syphilis, pelvic inflammatory disease (Table 1, section 5.1); treatment and prophylaxis of anthrax [unlicensed indication]; malaria treatment and prophylaxis (section 5.4.1); recurrent aphthous ulceration, adjunct to gingival scaling and root planning for periodontitis (section 12.3.1); rosacea, acne vulgaris (section 13.6)

**Cautions** see notes above; alcohol dependence; photosensitivity reported (avoid exposure to sunlight or sun lamps)

**Contra-indications** see notes above

**Renal impairment** use with caution (avoid excessive doses)

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also anorexia, dry mouth, flushing, anxiety, and tinnitus

**Dose**
- 200 mg on first day, then 100 mg daily; severe infections (including refractory urinary-tract infections), 200 mg daily
- Early syphilis, 100 mg twice daily for 14 days; late latent syphilis, 100 mg twice daily for 28 days; neurosyphilis, 200 mg twice daily for 28 days
- Uncomplicated genital chlamydia, non-gonococcal urethritis, 100 mg twice daily for 7 days (14 days in pelvic inflammatory disease, see also Table 1, section 5.1)
- Lyme disease (see also section 5.1.1.3), 100 mg twice daily for 10–14 days (28 days in Lyme arthritis)
- Anthrax (treatment or post-exposure prophylaxis; see also section 5.1.12), 100 mg twice daily; [CHILD (only if alternative antibacterial cannot be given) [unlicensed dose]] 3 mg/kg daily in 2 divided doses (max. 200 mg daily)

**Counselling** Capsules should be swallowed whole with plenty of fluid during meals while sitting or standing

**Note** Doxycycline doses in BNF may differ from those in product literature

**Doxycycline (Non-proprietary)**

*Capsules* doxycycline (as hyclate) 50 mg, net price 28-cap pack = £1.50; 100 mg, 8-cap pack = £1.05. Label: 6, 9, 11, 27, counselling, posture

**Brands include** Doxylar®

**Dental prescribing on NHS** Doxycycline Capsules 100 mg may be prescribed

**Vibramycin®** (Pfizer)

*Dispersible tablets* yellow, scored, doxycycline 100 mg, net price 8-tab pack = £4.91. Label: 6, 9, 11, 13

**Dental prescribing on NHS** May be prescribed as Dispersible Doxycycline Tablets

**Modified-release**

**Ehracea®** (Galderma)

*Capsules* m/r, beige, doxycycline (as monohydrate) 40 mg, net price 56-cap pack = £29.78. Label: 6, 11, 27, counselling, posture

**Dose** papulopustular, facial rosacea (without ocular involvement), 40 mg daily in the morning for 16 weeks; consider discontinuing treatment if no response after 6 weeks
**LYMECYCLINE**

**Indications** see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**
- 408 mg every 12 hours, increased to 1.224–1.632 g daily in severe infections
- Acne, 408 mg daily for at least 8 weeks

**Lymecycline** (Non-proprietary) **(PR)**

**Capsules**, lymecycline 408 mg (= tetracycline 300 mg), net price 28-cap pack = £5.71. Label: 6, 9

**Tetralysal 300**® (Galderma) **(PR)**

**Capsules**, red/yellow, lymecycline 408 mg (= tetracycline 300 mg), net price 28-cap pack = £4.98. Label: 6, 9

---

**MINOCYCLINE**

**Indications** see notes above; meningococcal carrier state; acne vulgaris (section 13.6.2)

**Cautions** see notes above; if treatment continued for longer than 6 months, monitor every 3 months for hepatotoxicity, pigmentation and for systemic lupus erythematosus—discontinue if these develop or if pre-existing systemic lupus erythematosus worsens

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** use with caution (avoid excessive doses)

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also dizziness and vertigo (more common in women); rarely anorexia, tinnitus, impaired hearing, hyperaesthesia, paraesthesia, acute renal failure, pigmentation (sometimes irreversible), and alopecia; very rarely systemic lupus erythematosus, discoloration of conjunctiva, tears, and sweat

**Dose**
- 100 mg twice daily
- Acne, see section 13.6.2 and under preparations, below
- Prophylaxis of asymptomatic meningococcal carrier state (but no longer recommended, see notes above), 100 mg twice daily for 5 days usually followed by rifampicin

**Counselling** Tablets or capsules should be swallowed whole with plenty of fluid while sitting or standing

**Minocycline** (Non-proprietary) **(PR)**

**Capsules**, minocycline (as hydrochloride) 50 mg, net price 56-cap pack = £15.27; 100 mg, 28-cap pack = £13.09. Label: 6, 9, counselling, posture

**Brands include** *Aknefin®*, *Minocin MR®, Sebomin MR®*

**Dose** acne, 100 mg daily

---

**OXYTETRACYCLINE**

**Indications** see notes above; acne vulgaris, rosacea (section 13.6)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**
- 250–500 mg every 6 hours
- Acne, see section 13.6.2

**Oxytetracycline** (Non-proprietary) **(PR)**

**Tablets**, coated, oxytetracycline dihydrate 250 mg, net price 28-tab pack = £1.10. Label: 7, 9, 23

**Brands include** *Oxytetr®*

**Dental prescribing on NHS** Oxytetracycline Tablets may be prescribed

**Tigecycline**

**Tigecycline** is a glycyclline antibacterial structurally related to the tetracyclines; side-effects similar to those of the tetracyclines can potentially occur. Tigecycline is active against Gram-positive and Gram-negative bacteria, including tetracycline-resistant organisms, and some anaerobes. It is also active against meticillin-resistant *Staphylococcus aureus* and vancomycin-resistant enterococci, but *Pseudomonas aeruginosa* and many strains of *Proteus spp* are resistant to tigecycline. Tigecycline should be reserved for the treatment of complicated skin and soft-tissue infections and complicated abdominal infections caused by multiple-antibacterial resistant organisms when other antibacterials cannot be used; it is not recommended for the treatment of foot infections in patients with diabetes.

---

**TIGECYCLINE**

**Indications** see notes above

**Cautions** cholestasis; **interactions**: Appendix 1 (tigecycline)

**Contra-indications** hypersensitivity to tetracyclines

**Hepatic impairment** initially 100 mg then 25 mg every 12 hours in severe impairment

**Pregnancy** see under Tetracyclines, p. 374

**Breast-feeding** manufacturer advises caution—present in milk in animal studies

**Side-effects** see notes above; also nausea, vomiting, abdominal pain, dyspepsia, diarrhoea, anorexia, bilirubinaemia, dizziness, headache, hypoglycaemia, prolonged prothrombin time, prolonged activated partial thromboplastin time, rash, pruritus, and injec-
tions; less commonly pancreatitis, cholestatic jaundice, and hydropoikinaemia; also reported, antibiotic-associated colitis, hepatic failure, thrombocytopenia, Stevens-Johnson syndrome.

**Dose**
- **By intravenous infusion, ADULT over 18 years,** initially 100 mg, then 50 mg every 12 hours for 5–14 days.

**Tygacil® (Pfizer) ▼ (FBI)**
Intravenous infusion, powder for reconstitution, tigecycline, net price 50-mg vial = £32.31

### 5.1.4 Aminoglycosides

These include amikacin, gentamicin, neomycin, streptomycin, and tobramycin. All are bactericidal and active against most Gram-positive and many Gram-negative organisms. Amikacin, gentamicin, and tobramycin are also active against *Pseudomonas aeruginosa*; streptomycin is active against *Mycobacterium tuberculosis* and is now almost entirely reserved for tuberculosis (section 5.1.9).

The aminoglycosides are not absorbed from the gut (although there is a risk of absorption in inflammatory bowel disease and liver failure) and must therefore be given by injection for systemic infections.

The important side-effects of aminoglycosides are ototoxicity and nephrotoxicity; they occur most commonly in the elderly and in patients with renal failure.

**Gentamicin** is the aminoglycoside of choice in the UK and is used widely for the treatment of serious infections. It has a broad spectrum but is inactive against anaerobes and has poor activity against haemolytic streptococci and pneumococci. When used for the ‘blind’ therapy of undiagnosed serious infections it is usually given in conjunction with a penicillin or metronidazole (or both). Gentamicin is used together with another antibiotic for the treatment of endocarditis (see below and Table 1, section 5.1).

Loading and maintenance doses of gentamicin may be calculated on the basis of the patient’s weight and renal function (e.g. using a nomogram); adjustments are then made according to serum-gentamicin concentrations. High doses are occasionally indicated for serious infections, especially in the neonate, in the patient with cystic fibrosis, or in the immunocompromised patient. Whenever possible treatment should not exceed 7 days.

**Amikacin** is more stable than gentamicin to enzyme inactivation. Amikacin is used in the treatment of serious infections caused by gentamicin-resistant Gram-negative bacilli.

**Tobramycin** has similar activity to gentamicin. It is slightly more active against *Ps. aeruginosa* but shows less activity against certain other Gram-negative bacteria. Tobramycin can be administered by nebuliser or by inhalation of powder on a cyclical basis (28 days of tobramycin followed by a 28-day tobramycin-free interval) for the treatment of chronic pulmonary *Ps. aeruginosa* infection in cystic fibrosis; however, resistance may develop and some patients do not respond to treatment.

### NICE guidance

**Tobramycin by dry powder inhalation for pseudomonal lung infection in cystic fibrosis (March 2013)**

Tobramycin dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis only if there is an inadequate response to colistimethate sodium, or if colistimethate sodium cannot be used because of contra-indications or intolerance. The manufacturer must provide tobramycin dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS.

Patients currently receiving tobramycin dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA276

**Neomycin** is too toxic for parenteral administration and can only be used for infections of the skin or mucous membranes or to reduce the bacterial population of the colon prior to bowel surgery or in hepatic failure. Oral administration may lead to malabsorption. Small amounts of neomycin may be absorbed from the gut in patients with hepatic failure and, as these patients may also be uremic, cumulation may occur with resultant ototoxicity.

**Endocarditis** Gentamicin is used in combination with other antibiotics for the treatment of bacterial endocarditis (Table 1, section 5.1). Serum-gentamicin concentration should be measured after 3 or 4 doses, then at least every 3 days and after a dose change (more frequently in renal impairment). **Streptomycin** may be used as an alternative in gentamicin-resistant enterococcal endocarditis.

**Once daily dosage** Once daily administration of aminoglycosides is more convenient, provides adequate serum concentrations, and in many cases has largely superseded multiple daily dose regimens (given in 2–3 divided doses during the 24 hours). Local guidelines on dosage and serum concentrations should be consulted. A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with endocarditis due to Gram-positive bacteria, HACEK endocarditis, burns of more than 20% of the total body surface area, or creatinine clearance less than 20 mL/minute. There is insufficient evidence to recommend a once daily, high-dose regimen of an aminoglycoside in pregnancy.

**Serum concentrations** Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. Serum-aminoglycoside concentrations should be measured in all patients receiving parenteral aminoglycosides, and **must** be determined in the elderly, in obesity, and in cystic fibrosis, or if high doses are being given, or if there is renal impairment.

In patients with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen and after a dose change; patients with renal impairment may require earlier and more frequent measurement of aminoglycoside concentration.

For multiple daily dose regimens, blood samples should be taken approximately 1 hour after intramuscular or
intravenous administration (‘peak’ concentration) and also just before the next dose (‘trough’ concentration). If the pre-dose (‘trough’) concentration is high, the interval between doses must be increased. If the post-dose (‘peak’) concentration is high, the dose must be decreased. For once daily dose regimens, consult local guidelines on serum concentration monitoring.

**Cautions**  The main side-effects of the aminoglycosides are dose-related, therefore, care must be taken with dosage, and, whenever possible, parenteral treatment should not exceed 7 days. Renal function should be assessed before starting an aminoglycoside and during treatment. If possible, dehydration should be corrected before starting an aminoglycoside. Auditory and vestibular function should also be monitored during treatment. In order to optimise the dose and avoid toxicity, serum-aminoglycoside concentrations should be monitored in patients receiving parenteral aminoglycosides (see also Serum Concentrations). Ototoxicity and nephrotoxicity occur most commonly in the elderly; therefore, monitoring is particularly important in these patients, who may require reduced doses.

Aminoglycosides should be used with caution in those with conditions characterised by muscular weakness (avoid in myasthenia gravis). If possible, aminoglycosides should not be given with potentially ototoxic drugs (e.g. cisplatin). Administration of an aminoglycoside and of an ototoxic diuretic (e.g. furosemide) should be separated by as long a period as practicable. Interactions: Appendix 1 (aminoglycosides)

**Contra-indications** Aminoglycosides may impair neuromuscular transmission and should not be given to patients with myasthenia gravis

**Renal impairment** Excretion of aminoglycosides is principally via the kidney and accumulation occurs in renal impairment. Ototoxicity and nephrotoxicity occur commonly in patients with renal failure. If there is impairment of renal function, the interval between doses must be increased; if the renal impairment is severe, the dose itself should be reduced as well. Serum-aminoglycoside concentrations must be monitored in patients with renal impairment, see Serum Concentrations above; renal, auditory, and vestibular function should also be monitored. A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with a creatinine clearance less than 20 mL/minute.

**Pregnancy** There is a risk of auditory or vestibular nerve damage in the infant when aminoglycosides are used in the second and third trimesters of pregnancy. The risk is greatest with streptomycin (section 5.1.9). The risk is probably very small with gentamicin and tobramycin, but their use should be avoided unless essential (if given, serum-aminoglycoside concentration monitoring is essential).

**Side-effects** The important side-effects of the aminoglycosides are nephrotoxicity and irreversible ototoxicity (including vestibular and auditory damage). Rash occurs commonly with streptomycin, but less frequently with the other aminoglycosides. Rare side-effects include nausea, vomiting, antibiotic-associated colitis, peripheral neuropathy, electrolyte disturbances (notably hyponatraemia on prolonged therapy, but also hypocalcaemia and hypokalaemia), and stomatitis. Side-effects reported very rarely include blood disorders and CNS effects (including headache, encephalopathy, and convulsions). Aminoglycosides may impair neuromuscular transmission; large doses given during surgery have been responsible for a transient myasthenic syndrome in patients with normal neuromuscular function.

**GENTAMICIN**

**Indications** septicaemia and neonatal sepsis; meningitis and other CNS infections; biliary-tract infection, acute pyelonephritis or prostatitis, endocarditis (see notes above); pneumonia in hospital patients, adjunct in listerial meningitis (Table 1, section 5.1); eye (section 11.3.1); ear (section 12.1.1)

**Cautions** see notes above; interactions: Appendix 1 (aminoglycosides)

**Contra-indications** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Side-effects** see notes above

**Dose**

To avoid excessive dosage in obese patients, use ideal weight for height to calculate dose and monitor serum-gentamicin concentration closely.

- Multiple daily dose regimen, by intramuscular or by slow intravenous injection over at least 3 minutes or by intravenous infusion, 3–5 mg/kg daily (in divided doses every 8 hours), see also notes above; CHILD under 18 years see BNF for Children
  - Gram-positive bacterial endocarditis or HACEK endocarditis (in combination with other antibacterials, see Table 1, section 5.1), ADULT 1 mg/kg every 12 hours; CHILD under 18 years see BNF for Children
  - Once daily dose regimen (see notes above and also consult local guidelines), by intravenous infusion, initially 5–7 mg/kg, then adjust according to serum-gentamicin concentration; CHILD under 18 years see BNF for Children
  - Surgical prophylaxis, ADULT over 18 years, by slow intravenous injection over at least 3 minutes, 1.5 mg/kg up to 30 minutes before the procedure (up to 3 further doses of 1.5 mg/kg may be given every 8 hours for high-risk procedures) or (for joint replacement surgery) by intravenous infusion, 5 mg/kg as a single dose up to 30 minutes before the procedure
  - By intrathecal injection, seek specialist advice, 1 mg daily (increased if necessary to 5 mg daily); only preservative-free, intrathecal preparation should be used; CHILD under 18 years see BNF for Children

**Note** For multiple daily dose regimen, one-hour (‘peak’) serum concentration should be 5–10 mg/litre (3–5 mg/litre for endocarditis); pre-dose (‘trough’) concentration should be less than 2 mg/litre (less than 1 mg/litre for endocarditis). For once-daily dose regimen, consult local guidelines on monitoring serum-gentamicin concentration

**Gentamicin (Non-proprietary) (Nm)**

**Injection**, gentamicin (as sulfate), net price 40 mg/mL, 1-mL amp = £1.40, 2-mL amp = £1.00, 2-mL vial = £4.00

**Paediatric injection**, gentamicin (as sulfate) 10 mg/mL, net price 2-mL vial = £2.25

**Intrathecal injection**, gentamicin (as sulfate) 5 mg/mL, net price 1-mL amp = 74p

**Intravenous infusion**, gentamicin (as sulfate) 1 mg/mL in sodium chloride intravenous infusion 0.9%, net price 80-mL (80 mg) bottle = £1.95; 3 mg/mL, 80-mL (240 mg) bottle = £5.95, 120-mL (360 mg) bottle = £8.45
Tobramycin

**Indications** see under Gentamicin and notes above

**Cautions** see notes above; **interactions:** Appendix 1 (aminoglycosides)

**Specific cautions for inhaled treatment** Other inhaled drugs should be administered before tobramycin. Measure lung function before and after each dose of tobramycin and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using bronchodilator. Monitor renal function before treatment and then annually. Severe haemoptysis—risk of further haemorrhage.

**Contra-indications** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Side-effects** see notes above; **on inhalation**, cough (more frequent by inhalation of powder), bronchospasm (see Cautions), dysphonia, taste disturbances, pharyngitis, mouth ulcers, salivary hypersecretion, laryngitis, haemoptysis, epistaxis

**Dose**

To avoid excessive dosage in obese patients, use ideal weight for height to calculate dose and monitor serum-tobramycin concentration closely

- **By intramuscular injection** or **by slow intravenous injection** or **by infusion**, 3 mg/kg daily in divided doses every 8 hours, see also notes above; in severe infections up to 5 mg/kg daily in divided doses every 6–8 hours (reduced to 3 mg/kg as soon as clinically indicated); **CHILD** under 18 years see **BNF for Children**

**Note** For multiple daily dose regimens, one-hour (‘peak’) serum concentration should not exceed 30 mg/litre; pre-dose (‘trough’) concentration should be less than 10 mg/litre. For once daily dose regimen, pre-dose (‘trough’) concentration should be less than 5 mg/litre

**Amikacin** (Non-proprietary) *(Bristol-Myers Squibb)*

**Injection**, amikacin (as sulfate) 250 mg/mL. Net price 2-mL vial = £9.64

**Electrolytes** Na⁺ 0.56 mmol/500-mg vial

**Amikin®** *(Bristol-Myers Squibb)*

**Injection**, amikacin (as sulfate) 50 mg/mL. Net price 2-mL vial = £2.07

**Electrolytes** Na⁺ < 0.5 mmol/vial

**Neomycin Sulfate**

**Indications** bowel sterilisation before surgery, see also notes above

**Cautions** see notes above, but too toxic for systemic use; **interactions:** Appendix 1 (aminoglycosides)

**Contra-indications** see notes above; also intestinal obstruction

**Hepatic impairment** absorbed from gastro-intestinal tract in liver disease—increased risk of ototoxicity

**Renal impairment** avoid; ototoxic; nephrotoxic

**Pregnancy** see notes above

**Side-effects** see notes above, but poorly absorbed on oral administration; increased salivation, impaired intestinal absorption with steatorrhoea and diarrhoea

**Dose**

- **By mouth**, pre-operative bowel sterilisation, 1 g every hour for 4 hours, then 1 g every 4 hours for 2–3 days

**Neomycin** (Non-proprietary) *(Pfizer)*

**Tablets**, neomycin sulfate 500 mg. Net price 100 = £24.78

**Brands include** Nicomycin®

**TOBRAMYCIN**

**Indications** see under Gentamicin and notes above

**Cautions** see notes above; **interactions:** Appendix 1 (aminoglycosides)

**Specific cautions for inhaled treatment** Other inhaled drugs should be administered before tobramycin. Measure lung function before and after each dose of tobramycin and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using bronchodilator. Monitor renal function before treatment and then annually. Severe haemoptysis—risk of further haemorrhage.

**Contra-indications** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Side-effects** see notes above; **on inhalation**, cough (more frequent by inhalation of powder), bronchospasm (see Cautions), dysphonia, taste disturbances, pharyngitis, mouth ulcers, salivary hypersecretion, laryngitis, haemoptysis, epistaxis

**Dose**

To avoid excessive dosage in obese patients, use ideal weight for height to calculate parenteral dose and monitor serum-tobramycin concentration closely

- **By intramuscular injection** or **by slow intravenous injection** or **by intravenous infusion**, 3 mg/kg daily in divided doses every 8 hours, see also notes above; in severe infections up to 5 mg/kg daily in divided doses every 6–8 hours (reduced to 3 mg/kg as soon as clinically indicated); **CHILD** under 18 years see **BNF for Children**

**Note** One-hour (‘peak’) serum concentration should not exceed 10 mg/litre; pre-dose (‘trough’) concentration should be less than 2 mg/litre

**Chronic pulmonary Pseudomonas aeruginosa** infection in patients with cystic fibrosis, by **inhalation of nebulised solution**, **ADULT** and **CHILD** over 6 years, 300 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution

**By inhalation of powder**, **ADULT** and **CHILD** over 6 years, 112 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin inhalation powder

**Parenteral**

**Tobramycin** (Non-proprietary) *(Pfizer)*

**Injection**, tobramycin (as sulfate) 40 mg/mL. Net price 1-mL (40-mg) vial = £3.70, 2-mL (80-mg) vial = £3.77, 6-mL (240-mg) vial = £45.00

**Inhalation**

**Bramitol®** *(Chiesi)* *(Pfizer)*

**Nebuliser solution**, tobramycin 75 mg/mL, net price 56 × 4-mL (300-mg) unit = £1187.00
The macrolides have an antibacterial spectrum that is similar but not identical to that of penicillin; they are thus an alternative in penicillin-allergic patients. They are active against many penicillin-resistant staphylococci, but some are now also resistant to the macrolides.

Indications for the macrolides include campylobacter enteritis, respiratory infections (including pneumonia, whooping cough, Legionella, chlamydia, and mycoplasma infection), and skin infections.

Erythromycin is also used in the treatment of early syphilis, uncomplicated genit al chlamydial infection, and non-gonococcal urethritis. Erythromycin has poor activity against Haemophilus influenzae. Erythromycin causes nausea, vomiting, and diarrhoea in some patients; in mild to moderate infections this can be avoided by giving a lower dose (250 mg 4 times daily), but if a more serious infection, such as Legionella pneumonia, is suspected higher doses are needed.

Azithromycin is a macrolide with slightly less activity than erythromycin against Gram-positive bacteria, but enhanced activity against some Gram-negative organisms including H. Influenzae. Plasma concentrations are very low, but tissue concentrations are much higher. It has a long tissue half-life and once daily dosage is recommended. Azithromycin is also used in the treatment of uncomplicated genital chlamydial infection, non-gonococcal urethritis, uncomplicated gonorrhoea, typhoid [unlicensed indication], and trachoma [unlicensed indication] (section 11.3.1).

Clarithromycin is an erythromycin derivative with slightly greater activity than the parent compound. Tissue concentrations are higher than with erythromycin. It is given twice daily. Clarithromycin is also used in regimens for Helicobacter pylori eradication (section 1.3).

For the role of erythromycin, azithromycin, and clarithromycin in the treatment of Lyme disease, see section 5.1.1.3

Spiramycin is also a macrolide (section 5.4.7).

Oral infections The macrolides are an alternative for oral infections in penicillin-allergic patients or where a beta-lactamase producing organism is involved. However, many organisms are now resistant to macrolides or rapidly develop resistance; their use should therefore be limited to short courses. Metronidazole (section 5.1.11) may be preferred as an alternative to a penicillin.

Cautions Macrolides should be used with caution in patients with a predisposition to QT interval prolongation (including electrolyte disturbances and concomitant use of drugs that prolong the QT interval). Macrolides may aggravate myasthenia gravis. Interactions: Appendix 1 (macrolides).

Side-effects Nausea, vomiting, abdominal discomfort, and diarrhoea are the most common side-effects of the macrolides, but they are mild and less frequent with azithromycin and clarithromycin than with erythromycin. Hepatotoxicity (including cholestatic jaundice) and rash occur less frequently. Other side-effects reported rarely or very rarely include pancreatitis, anti-biotic-associated colitis, QT interval prolongation, arthrythmias, Stevens-Johnson syndrome, and toxic epidermal necrolysis. Generally reversible hearing loss (sometimes with tinnitus) can occur after large doses of a macrolide; it occurs commonly after long-term therapy with azithromycin. Intravenous infusion may cause local tenderness and phlebitis.

Azithromycin

Indications respiratory-tract infections; otitis media; skin and soft-tissue infections; uncomplicated gonorrhoea [unlicensed indication], uncomplicated genital chlamydial infections and non-gonococcal urethritis (see also Table 1, section 5.1); mild or moderate typhoid due to multiple-antibacterial-resistant organisms [unlicensed indication]; Lyme disease (see also section 5.1.1.3 [unlicensed indication]); prophylaxis of group A streptococcal infection (Table 2, section 5.1)

Cautions see notes above; interactions: Appendix 1 (macrolides)

Hepatic impairment manufacturers advise avoid in severe liver disease—no information available

Renal impairment use with caution if eGFR less than 10 mL/minute/1.73 m²

Pregnancy manufacturers advise use only if adequate alternatives not available

Breast-feeding present in milk; use only if no suitable alternatives

Side-effects see notes above; also anorexia, dyspepsia, flatulence, dizziness, headache, malaise, paraesthesia, arthralgia, disturbances in taste and vision; less commonly constipation, gastritis, chest pain, oedema, anxiety, sleep disturbances, hypoaeesthesia, leucopenia, photosensitivity; rarely agitation; also reported syncope, convulsions, smell disturbances, intestinal nephritis, acute renal failure, thrombocytopenia, haemolytic anemia, tongue discoloration

Dose

- 500 mg once daily for 3 days or 500 mg on first day then 250 mg once daily for 4 days; CHILD over 6 months 10 mg/kg once daily for 3 days; or body-weight 15–25 kg, 200 mg once daily for 3 days; body-weight 26–35 kg, 300 mg once daily for 3 days; body-weight 36–45 kg, 400 mg once daily for 3 days
- Uncomplicated gonorrhoea [unlicensed indication] (see also Table 1, section 5.1), uncomplicated genital chlamydial infections and non-gonococcal urethritis, 1 g as a single dose
- Lyme disease (see also section 5.1.1.3), typhoid [unlicensed indications], 500 mg once daily for 7–10 days (7 days in typhoid)

Azithromycin (Non-proprietary) Podhaler

Capsules, azithromycin (as dihydrate) 250 mg, net price 4-cap pack = £9.83, 6-cap pack = £14.85. Label: 5, 9, 23

Dental prescribing on NHS Azithromycin Capsules may be prescribed
CLARITHROMYCN

Indications  respiratory-tract infections, mild to moderate skin and soft-tissue infections, otitis media; Lyme disease (see also section 5.1.1.3); prevention of pertussis (Table 2, section 5.1); Helicobacter pylori eradication (section 1.3)

Cautions  see notes above; interactions: Appendix 1 (macrolides)
