Hepatic impairment  hepatic dysfunction including jaundice reported; avoid in severe impairment if renal impairment also present

Renal impairment  use half normal dose if eGFR less than 30 mL/minute/1.73 m²; max. duration 14 days; avoid Klaricid XL® or clarithromycin m/r preparations if eGFR less than 30 mL/minute/1.73 m²

Pregnancy  manufacturer advises avoid, particularly in the first trimester, unless potential benefit outweighs risk

Breast-feeding  manufacturer advises avoid unless potential benefit outweighs risk—present in milk

Side-effects  see notes above; also dyspepsia, taste disturbances, headache, insomnia, hyperhidrosis; less commonly gastritis, flatulence, constipation, dry mouth, stomatitis, glossitis, anorexia, chest pain, anxiety, dizziness, tremor, malaise, blood disorders (including leucopenia), myalgia, tinnitus; also reported confusion, psychotic disorders, depression, abnormal dreams, convulsions, paraesthesia, hypoglycaemia, renal failure, interstitial nephritis, myopathy, tooth and tongue discoloration, smell disturbances

Dose  ● By mouth, ADULT and CHILD over 12 years, 250 mg every 12 hours, increased in pneumonia or severe infections to 500 mg every 12 hours; usual duration 7–14 days (see also Table 1, section 5.1); CHILD body-weight under 8 kg, 7.5 mg/kg twice daily; 8–11 kg, 62.5 mg twice daily; 12–19 kg, 125 mg twice daily; 20–29 kg, 187.5 mg twice daily; 30–40 kg, 250 mg twice daily

Lyme disease (see also section 5.1.1.3), ADULT and CHILD over 12 years, 500 mg every 12 hours for 14–21 days; CHILD 1 month–12 years see BNF for Children

● By intravenous infusion into larger proximal vein, ADULT and CHILD over 12 years, 500 mg twice daily; max. duration 5 days (switch to oral route when appropriate); CHILD 1 month–12 years see BNF for Children

Clarithromycin  (Non-proprietary)  Tablets, clarithromycin 250 mg, net price 14-tab pack = £1.64; 500 mg, 14-tab pack = £2.63. Label: 9

Dental prescribing on NHS  Clarithromycin Tablets may be prescribed

Oral suspension, clarithromycin for reconstitution with water 125 mg/5 mL, net price 70 mL = £4.05; 250 mg/5 mL, 70 mL = £6.91. Label: 9

Dental prescribing on NHS  Clarithromycin Oral Suspension may be prescribed

Intravenous infusion, powder for reconstitution, clarithromycin, net price 500-mg vial = £9.45

Klaricid®  (Abbott Healthcare)  Tablets, both yellow, f/c, clarithromycin 250 mg, net price 14-tab pack = £7.00; 500 mg, 14-tab pack = £11.30, 20-tab pack = £16.15. Label: 9

Paediatric suspension, clarithromycin for reconstitution with water 125 mg/5 mL, net price 70 mL = £5.25, 100 mL = £9.04; 250 mg/5 mL, 70 mL = £10.51. Label: 9

Granules, clarithromycin 250 mg/sachet, net price 14-sachet pack = £11.68. Label: 9, 13

Intravenous infusion, powder for reconstitution, clarithromycin. Net price 500-mg vial = £9.45

Electrolytes  Na⁺ < 0.5 mmol/500-mg vial

Modiﬁed release

Clarithromycin m/r preparations  Tablets, m/r, clarithromycin 500 mg, net price 7 = £6.72, 14 = £13.23. Label: 9, 21, 25

Brands include  Mycefor XL®

Dose ADULT and CHILD over 12 years, 500 mg once daily (doubled in severe infections) for 7–14 days

Klaricid XL®  (Abbott Healthcare)  Tablets, m/r, yellow, clarithromycin 500 mg, net price 7-tab pack = £6.72, 14-tab pack = £13.23. Label: 9, 21, 25

Dose ADULT and CHILD over 12 years, 500 mg once daily (doubled in severe infections) for 7–14 days

ERYTHROMYCN

Indications  susceptible infections in patients with penicillin hypersensitivity; oral infections (see notes above); campylobacter enteritis, syphilis, non-gonococcal urethritis, respiratory-tract infections (including Legionella infection), skin infections (Table 1, section 5.1); chronic prostatitis; prophylaxis of diphtheria, group A streptococcal infection, and pneumococcal infection (Table 2, section 5.1), and pertussis; acne vulgaris and rosacea (section 13.6)

Cautions  see notes above; neonate under 2 weeks (risk of hypertrophic pyloric stenosis); avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (macrolides)

Hepatic impairment  may cause idiosyncratic hepatotoxicity

Renal impairment  max. 1.5 g daily in severe renal impairment (ototoxicity)

Pregnancy  not known to be harmful

Breast-feeding  only small amounts in milk—not known to be harmful

Side-effects  see notes above
Dose

- **By mouth, ADULT and CHILD** over 8 years, 250–500 mg every 6 hours or 0.5–1 g every 12 hours (see notes above); up to 4 g daily in divided doses in severe infections; **NEONATE** 12.5 mg/kg every 6 hours; **CHILD** 1 month–2 years 125 mg every 6 hours or 250 mg every 12 hours, 2–8 years 250 mg every 6 hours or 500 mg every 12 hours, doses doubled for severe infections

Erythrocin

- Early pyelitis, 500 mg 4 times daily for 14 days; **CHILD** under 18 years see **BNF for Children**

- Uncomplicated genital chlamydia, non-gonococcal urethritis, 500 mg twice daily for 14 days; **CHILD** under 18 years see **BNF for Children**

Lyme disease (see also section 5.1.1.3), 500 mg 4 times daily for 14–21 days; **CHILD** under 18 years see **BNF for Children**

**By intravenous infusion, ADULT and CHILD** severe infections, 12.5 mg/kg every 6 hours; mild infections (when oral treatment not possible), 6.25 mg/kg every 6 hours; **NEONATE** see **BNF for Children**

Erythromycin (Non-proprietary) *(BNF)*

- **Capsules**, enclosing e/c microgranules, erythromycin 250 mg, net price 28-cap pack = £5.61. Label: 5, 9, 25

- **Brands include** Tiloryn®

- **Tablets**, e/c, erythromycin 250 mg, net price 28 = £1.61. Label: 5, 9, 25

- **Dental prescribing on NHS** Erythromycin Tablets e/c may be prescribed

Erythromycin Ethyl Succinate (Non-proprietary) *(BNF)*

- **Oral suspension**, erythromycin (as ethyl succinate) for reconstitution with water 125 mg/5 mL, net price 100 mL = £2.79; 250 mg/5 mL, 100 mL = £4.20; 500 mg/5 mL, 100 mL = £7.14. Label: 9

- **Note** Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription

- **Brands include** Primacine®

- **Dental prescribing on NHS** Erythromycin Ethyl Succinate Oral Suspension may be prescribed

Erythromycin Lactobionate (Non-proprietary) *(BNF)*

- **Intravenous infusion**, powder for reconstitution, erythromycin (as lactobionate), net price 1-g vial = £10.98

Erymax® (TEVA UK) *(BNF)*

- **Capsules**, opaque orange/ clear orange, enclosing orange and white e/c pellets, erythromycin 250 mg, net price 28-cap pack = £5.61, 112-cap pack = £22.44. Label: 5, 9, 25

- **Dose** 1 capsule every 6 hours or 2 capsules every 12 hours; acute, 1 capsule twice daily for 1 month then 1 capsule daily

Erythrocin® (AMCo) *(BNF)*

- **Tablets**, both f/c, erythromycin (as stearate), 250 mg, net price 100 = £18.20; 500 mg, 100 = £36.40. Label: 9

- **Dental prescribing on NHS** May be prescribed as Erythromycin Stearate Tablets

Erythroped® (AMCo) *(BNF)*

- **Suspension SF**, sugar-free, banana-flavoured, erythromycin (as ethyl succinate) for reconstitution with water, 125 mg/5 mL. **Suspension PI SF**, net price 140 mL = £3.06; 250 mg/5 mL, 140 mL = £5.95; 500 mg/5 mL **Suspension SF Forte**, 140 mL = £10.56. Label: 9

Erythroped® A® (AMCo) *(BNF)*

- **Tablets**, yellow, f/c, erythromycin 500 mg (as ethyl succinate). Net price 28-tab pack = £10.78. Label: 9

- **Dental prescribing on NHS** May be prescribed as Erythromycin Ethyl Succinate Tablets

---

Telithromycin

The ketolide telithromycin is a derivative of erythromycin. The antibacterial spectrum of telithromycin is similar to that of macrolides and it is also active against penicillin- and erythromycin-resistant Streptococcus pneumoniae. Telithromycin should only be used to treat beta-haemolytic streptococcal pharyngitis and tonsillitis, sinuses, community-acquired pneumonia, and exacerbations of chronic bronchitis if caused by organisms resistant to beta-lactam antibacterials and other macrolides, or if conventional treatment is contra-indicated.

**TELITHROMYCIN**

**Indications** see notes above

**Cautions** coronary heart disease, ventricular arrhythmias, bradycardia, hypokalaemia, hypomagnesaemia—risk of QT interval prolongation; concomitant administration of drugs that prolong QT-interval; avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (telithromycin)

**Hepatic disorders** Patients should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, abdominal pain, jaundice, or dark urine develop

**Driving** Visual disturbances or transient loss of consciousness may affect performance of skilled tasks (e.g. driving); effects may occur after the first dose. Administration at bedtime may reduce these side-effects. Patients should be advised not to drive or operate machinery if affected

**Contra-indications** myasthenia gravis; history of telithromycin-associated hepatitis or jaundice; prolongation of QT interval; congenital or family history of QT interval prolongation (if not excluded by ECG)

**Hepatic impairment** manufacturer advises caution; see also Hepatic Disorders above

**Renal impairment** manufacturer advises avoid if possible if eGFR less than 30 mL/minute/1.73 m²—if no alternative, use alternating daily doses of 800 mg and 400 mg, starting with 800 mg dose

**Pregnancy** toxicity in animal studies—manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** diarrhoea, nausea, vomiting, flatulence, abdominal pain, taste disturbances; dizziness, headache; *less commonly* constipation, stomatitis, anorexia, hepatitis, flushing, palpitations, drowsiness, insomnia, nervousness, eosinophilia, blurred vision, rash, urticaria, and pruritus; *rarely* cholestatic jaundice, arthralgia, hepatitis, hypotension, transient loss of consciousness, paraesthesia, and diplopia; very rarely antibiotic-associated colitis, altered sense of smell, muscle cramp, erythema multiforme; also reported pancreatitis, confusion, hallucinations and arthralgia

**Dose**

- 800 mg once daily for 5 days for sinusitis or exacerbation of chronic bronchitis or for 7–10 days in community-acquired pneumonia; **CHILD** under 18 years safety and efficacy not established

- **Tonsillitis or pharyngitis caused by Streptococcus pyogenes, ADULT and CHILD** over 12 years, 800 mg once daily for 5 days

**Ketek®** (Sanofi-Aventis) *(BNF)*

- **Tablets**, orange, f/c, telithromycin 400 mg, net price 10-tab pack = £18.56. Label: 9, counselling, driving, hepatic disorders
5.1.6 Clindamycin

Clindamycin is active against Gram-positive cocci, including streptococci and penicillin-resistant staphylococci, and also against many anaerobes, especially Bacteroides fragilis. It is well concentrated in bone and excreted in bile and urine.

Clindamycin is recommended for staphylococcal joint and bone infections such as osteomyelitis, and intra-abdominal sepsis: it is an alternative to macrolides for erysipelas or cellulitis in penicillin-allergic patients. Clindamycin can also be used for infections associated with meticillin-resistant Staphylococcus aureus (MRSA) in bronchiectasis, bone and joint infections, and skin and soft-tissue infections.

Clindamycin has been associated with antibiotic-associated colitis (section 1.5), which may be fatal; it is most common in middle-aged and elderly women, especially following an operation. Although antibiotic-associated colitis can occur with most antibacterials, it occurs more frequently with clindamycin. Patients should therefore discontinue treatment immediately if diarrhoea develops.

Oral infections Clindamycin should not be used routinely for the treatment of oral infections because it may be no more effective than penicillins against anaerobes and there may be cross-resistance with erythromycin-resistant bacteria. Clindamycin can be used for the treatment of dentoalveolar abscesses that has not responded to penicillin or to metronidazole.

**CLINDAMYCIN**

**Indications** see notes above; staphylococcal bone and joint infections, peritonitis; falciparum malaria (section 5.4.1)

**Cautions** discontinue immediately if diarrhoea or colitis develops; monitor liver and renal function if treatment exceeds 10 days, and in neonates and infants; avoid rapid intravenous administration; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (clindamycin)

**Contra-indications** diarrhoeal states; avoid injections containing benzyl alcohol in neonates (see under preparations below)

**Pregnancy** not known to be harmful

**Breast-feeding** amount probably too small to be harmful but bloody diarrhoea reported in 1 infant

**Side-effects** diarrhoea (discontinue treatment), abdominal discomfort, oesophagitis, oesophageal ulcers, taste disturbances, nausea, vomiting, antibiotic-associated colitis; jaundice, leucopenia, eosinophilia, and thrombocytopenia reported; polyarthritis reported; rash, pruritus, urticaria, anaphylactic reactions, Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative and vesiculobullous dermatitis reported; pain, induration, and abscess after intramuscular injection; thrombophlebitis after intravenous injection

**Dose**

- By mouth, 150–300 mg every 6 hours; up to 450 mg every 6 hours in severe infections; **NEONATE** see **BNF for Children**; CHILD 1 month–18 years, 3–6 mg/kg (max. 450 mg) every 6 hours; **Counselling** Patients should discontinue immediately and contact doctor if diarrhoea develops; capsules should be swallowed with a glass of water.

- By deep intramuscular injection or by intravenous infusion, 0.6–2.7 g daily (in 2–4 divided doses); life-threatening infection, up to 4.8 g daily; single doses above 600 mg by intravenous infusion only; single doses by intravenous infusion not to exceed 1.2 g; **CHILD** over 1 month, see **BNF for Children**

Clindamycin (Non-proprietary) **Capsules**, clindamycin (as hydrochloride) 150 mg, net price 24-cap pack = £5.08. Label: 9, 27, counselling, see above (diarrhoea)

**Dental prescribing on NHS** Clindamycin Capsules may be prescribed

**Injection**, clindamycin (as phosphate) 150 mg/mL, net price 2-ml amp = £5.90, 4-ml amp = £11.80

Dalacin C® (Pharmacia) **Capsules**, clindamycin (as hydrochloride) 75 mg (green/white), net price 24-cap pack = £7.45; 150 mg (white), 24-cap pack = £13.72. Label: 9, 27, counselling, see above (diarrhoea)

**Dental prescribing on NHS** May be prescribed as Clindamycin Capsules

**Injection**, clindamycin (as phosphate) 150 mg/mL, net price 2-ml amp = £6.20, 4-ml amp = £12.35

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

5.1.7 Some other antibacterials

Antibacterials discussed in this section include chloramphenicol, fusidic acid, glycopeptide antibiotics (vancomycin and teicoplanin), daptomycin, linezolid, fidaxomicin, the polymyxin, colistimethate sodium, and the rifamycins, rifaximin.

**Chloramphenicol**

Chloramphenicol is a potent broad-spectrum antibacterial; however, it is associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections, particularly those caused by Haemophilus influenzae, and also for typhoid fever. Chloramphenicol eye drops (section 11.3.1) and chloramphenicol ear drops (section 12.1.1) are also available.

**CHLORAMPHENICOL**

**Indications** see notes above

**Cautions** avoid repeated courses and prolonged treatment; blood counts required before and periodically during treatment; monitor plasma-chloramphenicol concentration in neonates (see below); **interactions:** Appendix 1 (chloramphenicol)

**Contra-indications** acute porphyria (section 9.8.2)

**Hepatic impairment** avoid if possible—increased risk of bone-marrow depression; reduce dose and monitor plasma-chloramphenicol concentration

**Renal impairment** avoid in severe renal impairment unless no alternative; dose-related depression of haematopoiesis

**Pregnancy** manufacturer advises avoid; neonatal ‘grey syndrome’ if used in third trimester

**Breast-feeding** manufacturer advises avoid; use another antibiotic; may cause bone-marrow toxicity in infant; concentration in milk usually insufficient to cause ‘grey syndrome’
5.1.7 Some other antibacterials

**Fusidic acid**

Fusidic acid and its salts are narrow-spectrum antibiotics. The only indication for their use is in infections caused by penicillin-resistant staphylococci, especially osteomyelitis, as they are well concentrated in bone; they are also used for staphylococcal endocarditis. A second antistaphylococcal antibiotic is usually required to prevent emergence of resistance.

### SODIUM FUSIDATE

**Indications**
penicillin-resistant staphylococcal infection including osteomyelitis; staphylococcal endocarditis in combination with other antibiotics

**Cautions**
monitor liver function with high doses or on prolonged therapy; elimination may be reduced in biliary disease or biliary obstruction; **interactions:** Appendix 1 (fusidic acid)

**Hepatic impairment**
impaired biliary excretion; possibly increased risk of hepatotoxicity; avoid or reduce dose; monitor liver function

**Pregnancy**
not known to be harmful; manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding**
present in milk—manufacturer advises caution

**Side-effects**
nausea, vomiting, abdominal pain, dyspepsia, diarrhoea, drowsiness, dizziness; less commonly: anorexia, headache, malaise, rash, pruritus; also recorded reversible jaundice especially after high dosage (withdraw therapy if persistent), acute renal failure (usually with jaundice), blood disorders

**Dose**
see under Preparations, below

**VANCOMYCIN**

The glycopeptide antibiotics vancomycin and teicoplanin have bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci.

They are used parenterally in the treatment of endocarditis and other serious infections caused by Gram-positive cocci. Vancomycin has a long duration of action and can therefore be given every 12 hours. Teicoplanin is similar to vancomycin, but has a significantly longer duration of action, allowing once daily administration after the loading dose. Teicoplanin is associated with a lower incidence of nephrotoxicity than vancomycin.

Either vancomycin or teicoplanin (added to dialysis fluid) is used in the treatment of peritonitis associated with peritoneal dialysis (Table 1, section 5.1). This is an [unlicensed route] for vancomycin.

They are also used for surgical prophylaxis when there is a high risk of MRSA (Table 2, section 5.1). Vancomycin given by mouth for 10–14 days is effective in the treatment of *Clostridium difficile* infection (see also section 1.5); low doses are considered adequate (higher dose may be considered if the infection fails to respond or it is life threatening). Teicoplanin given by mouth is licensed for the treatment of *Clostridium difficile* infection. Vancomycin and teicoplanin should not be given by mouth for systemic infections because they are not absorbed significantly.

### Table 1 (vancomycin)

<table>
<thead>
<tr>
<th>Dosage</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adult</td>
<td>up to 1 year 50 mg/kg daily (in 3 divided doses), 1–5 years 25 mg/kg every 8 hours, 5–12 years 500 mg every 8 hours</td>

</table>

**Fucidin® (Leo)**

**Tablets, I/v, sodium fusidate 250 mg, net price 10-tab pack = £6.02. Label: 9**

**Dose**
as sodium fusidate, 500 mg every 8 hours, doubled for severe infections

**Skin infection, as sodium fusidate, 250 mg every 12 hours for 5–10 days**

**Suspension**, off-white, banana- and orange-flavoured, fusidic acid 250 mg/5 mL, net price 50 mL = £6.73. Label: 9, 21

**Dose**
as fusidic acid, **ADULT** 750 mg every 8 hours; **CHILD** up to 1 year 50 mg/kg/day (in 3 divided doses), 1–5 years 250 mg every 8 hours, 5–12 years 500 mg every 8 hours

**Note**
Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionally higher than those for fusidate tablets.
Breast-feeding present in milk—significant absorption following oral administration unlikely

Side-effects after parenteral administration: nephrotoxicity including renal failure and interstitial nephritis; ototoxicity (discontinue if tinnitus occurs); blood disorders including neutropenia (usually after 1 week or cumulative dose of 25 g), rarely agranulocytosis and thrombocytopenia; nausea; chills, fever; eosinophilia, anaphylaxis, rashes (including exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis, and vasculitis); phlebitis (irritant to tissue); on rapid infusion, severe hypotension (including shock and cardiac arrest), wheezing, dyspnoea, urticaria, pruritus, flushing of the upper body (‘red man syndrome), pain and muscle spasm of back and chest

Dose
• **By mouth**, *Clostridium difficile* infection, (see also notes above), 125 mg every 6 hours for 10–14 days (increased up to 500 mg every 6 hours if infection fails to respond or is life-threatening)
• **By intravenous infusion**, 1–1.5 g every 12 hours; **ELDERLY** over 65 years, 500 mg every 12 hours or 1 g once daily

*Note* Plasma concentration monitoring required (see Cautions above); pre-dose (‘trough’) concentration should be 10–15 mg/litre (15–20 mg/litre for endocarditis or less sensitive strains of meticillin-resistant *Staphylococcus aureus* or for complicated infections caused by *S. aureus*). An initial loading dose, by intravenous infusion, may be considered—consult local guidelines

• Surgical prophylaxis, by intravenous infusion, 1 g
• **CHILD** under 18 years see BNF for Children

*Note* Vancomycin doses in BNF may differ from those in product literature

**Vancomycin** (Non-proprietary)  
*Capsules*, vancomycin (as hydrochloride) 125 mg, net price 28-cap pack = £132.47; 250 mg, 28-cap pack = £132.47. Label: 9

*Injection*, powder for reconstitution, vancomycin (as hydrochloride), for use as an infusion, net price 500-mg vial = £6.25; 1-g vial = £12.99

*Note* Can be used to prepare solution for oral administration

**Vancocin**® (Finn)  
*Matrigel capsules*, vancomycin (as hydrochloride) 125 mg, net price 28-cap pack = £88.11. Label: 9

*Injection*, powder for reconstitution, vancomycin (as hydrochloride), for use as an infusion, net price 500-mg vial = £6.25; 1-g vial = £12.50

*Note* Can be used to prepare solution for oral administration

**TEICOPLANIN**

*Indications* see notes above and under Dose

*Cautions* vancomycin sensitivity; blood counts and liver and kidney function tests required; monitor renal and auditory function during prolonged treatment in renal impairment or if other nephrotoxic or neurotoxic drugs given; monitor plasma-teicoplanin concentration during parenteral maintenance treatment if severe sepsis or burns, deep-seated staphylococcal infection (including bone and joint infection), endocarditis, renal impairment, in elderly, and in intravenous drug abusers; *interactions*: Appendix 1 (teicoplanin)

*Renal impairment* use normal dose regimen on days 1–4, then use normal maintenance dose every 48 hours if eGFR 30–80 mL/minute/1.73 m² and use normal maintenance dose every 72 hours if eGFR less than 30 mL/minute/1.73 m²; see also Cautions above

5.1.7 Some other antibacterials

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** no information available

**Side-effects** rash, pruritus; *less commonly* nausaea, vomiting, diarrhoea, bronchospasms, dizziness, headache, fever, leucopenia, thrombocytopenia, eosinophilia, tinnitus, mild hearing loss, vestibular disorders, thrombophlebitis, *also reported* renal failure, exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis

**Dose**
• **By mouth**, *Clostridium difficile* infection, **ADULT** 100–200 mg twice daily for 10–14 days
• **By intravenous injection or infusion or by intramuscular injection**, **ADULT** body-weight under 70 kg, initially 400 mg every 12 hours for 3 doses, subsequently 400 mg once daily; body-weight over 70 kg, initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg once daily
• Streptococcal or enterococcal endocarditis (in combination with another antibacterial, see Table 1, section 5.1), by intravenous injection or infusion, **ADULT** initially 10 mg/kg every 12 hours for 3–5 doses, subsequently 10 mg/kg once daily (subsequent doses can be given by intramuscular injection)
• Bone and joint infections, by intravenous injection or by intravenous infusion, **ADULT**, initially 12 mg/kg every 12 hours for 3–5 doses, subsequently 12 mg/kg once daily (subsequent doses can be given by intramuscular injection); increased risk of fever and rash with doses of 12 mg/kg
• Surgical prophylaxis [unlicensed indication], **ADULT**, by intravenous injection or by intravenous infusion, **ADULT**, initially 12 mg/kg every 12 hours for 3–5 doses, subsequently 12 mg/kg once daily (subsequent doses can be given by intramuscular injection); increased risk of fever and rash with doses of 12 mg/kg

**Targocid**® (Sanofi-Aventis)  
*Injection*, powder for reconstitution, teicoplanin, net price 200-mg vial (with diluent) = £3.95; 400-mg vial (with diluent) = £7.32

**Targocid**® (Sanofi-Aventis)  
*Injection*, powder for reconstitution, teicoplanin, net price 200-mg vial (with diluent) = £3.95; 400-mg vial (with diluent) = £7.32

**Electrolytes** Na⁺ < 0.5 mmol/200- and 400-mg vial

*Note* Can be used to prepare solution for oral administration

Daptomycin

Daptomycin is a lipopeptide antibiotic with a spectrum of activity similar to vancomycin but its efficacy against enterococci has not been established. Daptomycin should be reserved for complicated skin and soft tissue infections caused by resistant Gram-positive bacteria including meticillin-resistant *Staphylococcus aureus* (MRSA). It needs to be given with other antibacterials for mixed infections involving Gram-negative bacteria and some anaerobes. Daptomycin is used (in combination with other antibacterials) for staphylococcal endocarditis caused by organisms resistant to vancomycin or in patients intolerant of vancomycin.
The Scottish Medicines Consortium (p. 4) has advised (February 2008) that daptomycin (Cubicin®) is accepted for restricted use within NHS Scotland for the treatment of MRSA bacteraemia associated with right-sided endocarditis or with complicated skin and soft-tissue infections.

**Daptomycin**

**Indications** see under Dose

**Cautions** interference with assay for prothrombin time and INR—take blood sample immediately before daptomycin dose; **interactions:** Appendix 1 (daptomycin)

**Muscle effects** Myalgia, muscle weakness, and myositis may occur uncommonly; rhabdomyolysis is very rare. Monitor creatine kinase before treatment and then weekly during treatment (more frequently if creatine kinase elevated more than 5 times upper limit of normal before treatment, or if receiving another drug known to cause myopathy (preferably avoid concomitant use), or if eGFR less than 80 mL/min/1.73 m²). If unexplained muscle pain, tenderness, weakness, or cramps develop during treatment, measure creatine kinase every 2 days; discontinue if unexplained muscular symptoms and creatine kinase elevated markedly

**Hepatic impairment** manufacturer advises caution in severe hepatic impairment—no information available

**Renal impairment** see Muscle Effects above; also monitor renal function if eGFR less than 80 mL/minute/1.73 m²; use normal dose every 48 hours if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding** present in milk in small amounts, but absorption from gastro-intestinal tract negligible

**Side-effects** nausea, vomiting, abdominal pain, flatulence, diarrhoea (antibiotic-associated colitis reported), constipation, hypertension, hypotension, headache, anxiety, insomnia, dizziness, asthenia, anaemia, arthralgia, rash, pruritus, injection-site reactions; less commonly dyspepsia, anorexia, taste disturbance, glositis, flushing, arrhythmias, tremor, paraesthesia, hyperglycaemia, renal failure, eosinophilia, thrombocythaemia, electrolyte disturbances, muscle effects (see Cautions); rarely jaundice; also reported syncope, wheezing, eosinophilic pneumonia, peripheral neuropathy

**Dose**

- By slow intravenous injection over 2 minutes or by intravenous infusion, complicated skin and soft-tissue infections caused by Gram-positive bacteria, ADULT over 18 years, 4 mg/kg once daily; increased to 6 mg/kg once daily if associated with *Staphylococcus aureus* bacteraemia

Staphylococcal endocarditis, ADULT over 18 years, 6 mg/kg once daily

**Note** not licensed for use in left-sided endocarditis

**Cubicin®** (Novartis) **PhR** intravenous infusion, powder for reconstitution, daptomycin, net price 350-mg vial = £62.00; 500-mg vial = £88.57

**Linezolid**

Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including meticillin-resistant *Staphylococcus aureus* (MRSA), and vancomycin-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is an option if a glycopeptide, such as vancomycin, cannot be used to treat pneumonia or severe skin and soft-tissue infections caused by MRSA. Linezolid is **not** active against Gram-negative organisms and must be given with other anti-bacterials if the infection also involves Gram-negative organisms (the combination should be used for mixed skin and soft tissue infections only when other treatments are not available). A higher incidence of blood disorders and optic neuropathy have been reported in patients receiving linezolid for more than the maximum recommended duration of 28 days.

**Linezolid**

**Indications** pneumonia, complicated skin and soft-tissue infections caused by Gram-positive bacteria (initiated under expert supervision)

**Cautions** monitor full blood count (including platelet count) weekly (see also Blood disorders below); history of seizures; unless close observation and blood-pressure monitoring possible, avoid in uncontrolled hypertension, pheochromocytoma, carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states; **interactions:** Appendix 1 (MAOIs)

**Blood disorders**

Haematopoietic disorders (including thrombocytopenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid, particularly the elderly. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:

- receive treatment for more than 10–14 days;
- have pre-existing myelosuppression;
- are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function;
- have severe renal impairment.

If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which case intensive monitoring of blood counts and appropriate management should be implemented.

**CHM advice (optic neuropathy)**

Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:

- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately;
- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary;
- visual function should be monitored regularly if treatment is required for longer than 28 days.

**Monoamine oxidase inhibition** Linezolid is a reversible, non-selective monoamine oxidase inhibitor (MAOI). Patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, yeast extracts, undistilled alcoholic beverages, and fermented soybean products). In addition, linezolid should not be given with another MAOI or within 2 weeks of stopping another MAOI. Unless close observation and blood-pressure monitoring is possible, avoid in those receiving SSRIs, SHT, agonists (‘triptans’), tricyclic antidepressants, sympathomimetics, dopaminergics, buspirone, pethidine and possibly other opioid analgesics. For other interactions see Appendix 1 (MAOIs)
Contra-indications see Monoamine Oxidase Inhibition above
Hepatic impairment in severe hepatic impairment manufacturer advises use only if potential benefit outweighs risk
Renal impairment manufacturer advises metabolites may accumulate if eGFR less than 30 mL/minute/1.73 m²; see also Blood Disorders, above
Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available
Breast-feeding manufacturer advises avoid—present in milk in animal studies
Side-effects diarrhoea (antibiotic-associated colitis reported), nausea, vomiting, taste disturbances, headache; less commonly thirst, dry mouth, glossitis, stomatitis, tongue discoloration, abdominal pain, dyspepsia, gastritis, constipation, pancreatitis, hypertension, fever, fatigue, dizziness, insomnia, hypoaesthesia, paraesthesia, tinnitus, polyuria, leucopenia, thrombocytopenia, eosinophilia, electrolyte disturbances, blurred vision, rash, pruritus, diaphoresis, injection-site reactions; rarely tachycardia, transient ischaemic attacks, renal failure; also reported tooth discoloration, convulsions, lactic acidosis, hyponatraemia, pancytopenia, anaemia, Stevens–Johnson syndrome, toxic epidermal necrolysis; peripheral and optic neuropathy reported on prolonged therapy (see also CHM advice above)
Dose
- **By mouth**, 600 mg every 12 hours usually for 10–14 days (max. duration of treatment 28 days); **CHILD** [unlicensed] 1 week–12 years, 10 mg/kg every 8 hours; 12–18 years, adult dose
- **By intravenous infusion** over 30–120 minutes, 600 mg every 12 hours; **CHILD** [unlicensed] 1 week–12 years, 10 mg/kg every 8 hours; 12–18 years, adult dose

**Zyvox®** *(Pharmacia)*
- **Tablets**, 600 mg, net price 10-tab pack = £44.50. **Label**: 9, 10. Patient information leaflet
- **Suspension**, yellow, linezolid 100 mg/5 mL when reconstituted with water, net price 150 mL (orange-flavoured) = £222.50. **Label**: 9, 10. Patient information leaflet

**Excipients** include aspartame 20 mg/5 mL (section 9.4.1)

**Intravenous infusion**, linezolid 2 mg/mL, net price 300-mL **Excel®** bag = £44.50

**Excipients** include Na+ 5 mmol/300-mL bag, glucose 13.71 g/300-mL bag

Polymyxins

The polymyxin antibiotic, **colistimethate sodium** (colistin sulfomethate sodium), is active against Gram-negative organisms including *Pseudomonas aeruginosa*, *Acinetobacter baumannii*, and *Klebsiella pneumoniae*. It is not absorbed by mouth and thus needs to be given by injection for a systemic effect. Intravenous administration of colistimethate sodium should be reserved for Gram-negative infections resistant to other antibiotics; its major adverse effects are dose-related neurotoxicity and nephrotoxicity.

Colistimethate sodium is also given by inhalation as an adjunct to standard antibacterial therapy in patients with cystic fibrosis.

### NICE guidance

**Colistimethate sodium by dry powder inhalation for pseudomonal lung infection in cystic fibrosis** *(March 2013)*

Colistimethate sodium dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis who would benefit from continued treatment, but do not tolerate the drug in its nebulised form. The manufacturer must provide colistimethate sodium dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS.

Patients currently receiving colistimethate sodium dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/T276](http://www.nice.org.uk/T276)

Both colistimethate sodium and polymyxin B are included in some preparations for topical application.
5.1.8 Sulfonamides and trimethoprim

- By inhalation of nebulised solution, ADULT and CHILD over 2 years, 1–2 million units twice daily; increased to 2 million units 3 times daily for subsequent respiratory isolates of *Ps. aeruginosa*; CHILD 1 month–2 years, 0.5–1 million units twice daily; increased to 1 million units 3 times daily for subsequent respiratory isolates of *Ps. aeruginosa*
- By inhalation of powder, ADULT and CHILD over 6 years, 1.66 million units twice daily

**Colistimethate sodium (Non-proprietary) Promixin**

Injection, powder for reconstitution, colistimethate sodium, net price 1 million-unit vial = £1.68

**Colomycin® (Forest) Rinse mouth**

Injection, powder for reconstitution, colistimethate sodium, net price 1 million-unit vial = £1.60

**Promixin® (Profile) 0.9%**

Electrolytes (before reconstitution) Na⁺ < 0.5 mmol/1 million-unit and 2 million-unit vial

**Colobreathe® (Forest) Targaxan**

Dry powder for inhalation, hard capsule, colistimethate sodium 1.66 million units/capsule, net price 56-cap pack (with Turbospin® inhaler device) = £968.80. Counselling, administration

**Counselling** Rinse mouth with water after each dose

### Rifaximin

Rifaximin is a rifamycin that is poorly absorbed from the gastro-intestinal tract, and, therefore, should not be used to treat systemic infections. It is licensed for the treatment of travellers’ diarrhoea that is not associated with fever, bloody diarrhoea, blood or leucocytes in the stools, or 8 or more unformed stools in the previous 24 hours, or life-threatening diarrhoea (see also section 1.5). It is not recommended for diarrhoea associated with invasive organisms such as *Campylobacter and Shigella*. Rifaximin is also licensed to reduce the risk of recurrence of hepatic encephalopathy.

### RIFAXIMIN

- **Indications** see under Dose
- **Contra-indications** rifamycin hypersensitivity; intestinal obstruction
- **Hepatic impairment** manufacturer advises caution when used for hepatic encephalopathy in patients with severe hepatic impairment
- **Pregnancy** manufacturer advises avoid—toxicity in animal studies
- **Breast-feeding** unlikely to be present in milk in significant amounts, but manufacturer advises avoid
- **Side-effects** nausea, vomiting, abdominal pain, flatulence, diarrhoea, dyspnoea, headache, depression, dizziness, muscle spasm, rash, pruritus; less commonly anorexia, taste disturbance, dry mouth, peripheral oedema, sleep disturbances, anxiety, memory impairment, convulsions, hypoesthesia, paraesthesia, antibiotic-associated colitis, influenza-like symptoms, dysuria, polyuria, glycosuria, poly-menorrhoea, blood disorders, hyperkalaemia; rarely blood pressure changes, constipation; also reported syncope

### Dose

- Travellers’ diarrhoea that is not associated with fever, bloody diarrhoea, blood or leucocytes in the stool, or 8 or more unformed stools in the previous 24 hours, ADULT over 18 years, 200 mg every 8 hours for 3 days
- Reduction in recurrence of hepatic encephalopathy, ADULT over 18 years, 550 mg twice daily

**Targaxan® (Norgine) Fidaxomicin**

Tablets, pink, f/c, rifaximin 550 mg, net price 56-tab pack = £259.23. Label: 14

**Xifaxanta® (Norgine) Fidaxomicin**

Tablets, pink, f/c, rifaximin 200 mg, net price 9-tab pack = £15.15. Label: 9

**Fidaxomicin**

Fidaxomicin is a macrocyclic antibiotic that is poorly absorbed from the gastro-intestinal tract, and, therefore, it should not be used to treat systemic infections. It is licensed for the treatment of *Clostridium difficile* infection (see also section 1.5), but limited clinical data is available on the use of fidaxomicin in severe or life-threatening *C. difficile* infection.

The Scottish Medicines Consortium (p. 4) has advised (June 2012) that fidaxomicin (Dificlir®) is accepted for restricted use within NHS Scotland to treat the first recurrence of *C. difficile* infection, on the advice of a microbiologist or specialist in infectious diseases.

**FIDAXOMICIN**

- **Indications** *Clostridium difficile* infection
- **Cautions** macrolide hypersensitivity; severe or life-threatening *C. difficile* infection, inflammatory bowel disease; **interactions**: Appendix 1 (fidaxomicin)
- **Hepatic impairment** manufacturer advises caution in moderate to severe impairment—no information available
- **Renal impairment** manufacturer advises caution in severe impairment—no information available
- **Pregnancy** manufacturer advises avoid—no information available
- **Breast-feeding** manufacturer advises avoid—no information available
- **Side-effects** nausea, vomiting, constipation; less commonly taste disturbance, abdominal distension, flatulence, headache, dizziness, decreased appetite, dry mouth
- **Dose** ADULT over 18 years, 200 mg every 12 hours for 10 days

**Dificlir® (Astellas)**

Tablets, f/c, fidaxomicin 200 mg, net price 20-tab pack = £1350.00. Label: 9

### 5.1.8 Sulfonamides and trimethoprim

The importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.
Sulfamethoxazole and trimethoprim are used in combination (as co-trimoxazole) because of their synergistic activity. However, co-trimoxazole is associated with rare but serious side-effects (e.g. Stevens-Johnson syndrome and blood dyscrasias, notably bone marrow depression and agranulocytosis especially in the elderly (see Restrictions on the use of Co-trimoxazole below).

### Restrictions on the use of co-trimoxazole

Co-trimoxazole is the drug of choice in the prophylaxis and treatment of *Pneumocystis jirovecii (Pneumocystis carinii)* pneumonia; it is also indicated for nocardiosis, *Stenotrophomonas maltophilia* infection (unlicensed indication), and toxoplasmosis. It should only be considered for use in acute exacerbations of chronic bronchitis and infections of the urinary tract when there is bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibiotic; similarly it should only be used in *acute otitis media in children* when there is good reason to prefer it. Co-trimoxazole is also used for the treatment of infections caused by *Burkholderia cepacia* in cystic fibrosis (unlicensed indication).

Trimethoprim can be used alone for urinary- and respiratory-tract infections and for prostatitis, shigellosis, and invasive salmonella infections. Trimethoprim has side-effects similar to co-trimoxazole but they are less severe and occur less frequently.

For *topical preparations* of sulfonamides used in the treatment of burns see section 13.10.1.1.

## CO-TRIMOXAZOLE

A mixture of trimethoprim and sulfamethoxazole (sulphamethoxazole) in the proportions of 1 part to 5 parts.

### Indications

- See restrictions above.

### Cautions

- Maintain adequate fluid intake; avoid in blood disorders (unless under specialist supervision); monitor blood counts on prolonged treatment; discontinue immediately if blood disorders or rash develop; predisposition to folate deficiency or hyperkalaemia; elderly (see Restrictions on the use of Co-trimoxazole above); asthma; G6PD deficiency (section 9.1.5); avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia); interactions: Appendix 1 (trimethoprim, sulfamethoxazole).

### Contra-indications

- Acute porphyria (section 9.8.2).

### Hepatic impairment

- Manufacturer advises avoid in severe liver disease.

### Renal impairment

- Use half normal dose if eGFR 15–30 mL/minute/1.73 m²; avoid if eGFR less than 15 mL/minute/1.73 m² and if plasma-sulfamethoxazole concentration cannot be monitored.

### Pregnancy

- Teratogenic risk in first trimester (trimethoprim a folate antagonist). Neonatal haemolysis and methaemoglobinemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.

### Breast-feeding

- Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfamethoxazole).

### Side-effects

- Nausea, diarrhoea; headache; hyperkalaemia; rash (very rarely including Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity)—discontinue immediately; less commonly vomiting; very rarely glossitis, stomatitis, anorexia, liver damage (including jaundice and hepatic necrosis), pancreatitis, antibiotic-associated colitis, myocardiitis, cough and shortness of breath, pulmonary infiltrates, aseptic meningitis, depression, convulsions, peripheral neuropathy, ataxia, tinnitus, vertigo, hallucinations, hypoglycaemia, blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia), hyponatraemia, renal disorders including interstitial nephritis, arthralgia, myalgia, vasculitis, systemic lupus erythematosus and uveitis; rhadomolysis reported in HIV-infected patients.

### Dose

**By mouth**

- 960 mg every 12 hours; **CHILD** every 12 hours, 6–5 months, 120 mg; 6–5 years, 240 mg; 6–12 years, 480 mg.

- **By intravenous infusion**, 960 mg every 12 hours increased to 1.44 g every 12 hours in severe infections; **CHILD** 36 mg/kg daily in 2 divided doses increased to 54 mg/kg daily in severe infections.

- **Treatment of Pneumocystis jirovecii (Pneumocystis carinii) infections** (undertaken where facilities for appropriate monitoring available—consult microbiologist and product literature), by mouth or by intravenous infusion, **ADULT** and **CHILD** over 4 weeks, 120 mg/kg daily in 2–4 divided doses for 14–21 days.

- **Prophylaxis of Pneumocystis jirovecii (Pneumocystis carinii) infections**, by mouth, 960 mg once daily (may be reduced to 480 mg once daily to improve tolerability) or 960 mg on alternate days (3 times a week) or 960 mg twice daily on alternate days (3 times a week); **CHILD** 6 weeks–5 months, 120 mg twice daily on 3 consecutive or alternate days per week or on 7 days per week; 6 months–5 years, 240 mg; 6–12 years, 480 mg.

- Note 480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg.

### Co-trimoxazole (Non-proprietary)

- **Tablets**, co-trimoxazole 480 mg, net price 28-tab pack = £3.74, 960 mg, 100 = £23.46. Label: 9.
- **Brands include** Fectrim®, Fectrim® Forte
- **Paediatric oral suspension**, co-trimoxazole 240 mg/5 mL, net price 100 mL = £1.12. Label: 9.
- **Oral suspension**, co-trimoxazole 480 mg/5 mL. Net price 100 mL = £4.41. Label: 9.

### Septrin® (Aspen)

- **Tablets**, co-trimoxazole 480 mg, net price 100-tab pack = £15.52. Label: 9.
- **Forte tablets**, scored, co-trimoxazole 960 mg, net price 100-tab pack = £23.46. Label: 9.
- **Adult suspension**, co-trimoxazole 480 mg/5 mL, net price 100 mL (vanilla-flavoured) = £4.41. Label: 9.
- **Paediatric suspension**, sugar-free, co-trimoxazole 240 mg/5 mL, net price 100 mL (banana- and vanilla-flavoured) = £2.45. Label: 9.

### Intravenous infusion

- co-trimoxazole 96 mg/mL. To be diluted before use. Net price 5–mL amp = £1.78.

### Electrolytes

- **Na+ 1.7 mmol/5 mL**.

### Excipients

- Include alcohol 13.2%, propylene glycol, sulphites.
SULFADIAZINE
(Sulphadiazine)

Indications prevention of rheumatic fever recurrence, toxoplasmosis [unlicensed]—see section 5.4.7
Cautions see under Co-trimoxazole; interactions: Appendix 1 (sulfonamides)
Contra-indications see under Co-trimoxazole
Hepatic impairment use with caution in mild to moderate impairment; avoid in severe impairment
Renal impairment use with caution in mild to moderate impairment; avoid in severe impairment; high risk of crystalluria
Pregnancy neonatal haemolysis and methaemoglobinemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded
Breast-feeding small risk of kernicterus in jaundiced infants and of methaemoglobinemia in G6PD-deficient infants
Side-effects see under Co-trimoxazole; also hypothyroidism, benign intracranial hypertension, optic neuropathy
Dose
Prevention of rheumatic fever, by mouth, 1 g daily (500 mg daily for patients less than 30 kg)
Sulfadiazine (Non-proprietary) [TA]
Tablets, sulfadiazine 500 mg, net price 56-tab pack = £57.15. Label: 9, 27

TRIMETHOPRIM

Indications urinary-tract infections, acute and chronic bronchitis; pneumocystis pneumonia (section 5.4.8)
Cautions predisposition to folate deficiency; elderly; manufacturer recommends blood counts on long-term therapy (but evidence of practical value unsatisfactory); neonates (specialist supervision required); acute porphyria (section 9.8.2); interactions: Appendix 1 (trimethoprim)
Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop
Contra-indications blood dyscrasias
Renal impairment use half normal dose after 3 days if eGFR 15–30 mL/minute/1.73 m²; use half normal dose if eGFR less than 15 mL/minute/1.73 m² (monitor plasma-trimethoprim concentration if eGFR less than 10 mL/minute/1.73 m²)
Pregnancy teratogenic risk in first trimester (folate antagonist); manufacturers advise avoid
Breast-feeding present in milk—short-term use not known to be harmful
Side-effects gastro-intestinal disturbances including nausea and vomiting, pruritus, rash, hyperkalaemia, depression of haematopoiesis; rarely erythema multiforme, toxic epidermal necrolysis, photosensitivity and other allergic reactions including angioedema and anaphylaxis; aseptic meningitis and uveitis reported
Dose
Acute infections, 200 mg every 12 hours; CHILD 1 month–12 years, 4 mg/kg (max. 200 mg) every 12 hours; or 6 weeks–6 months 25 mg every 12 hours, 6 months–6 years 50 mg every 12 hours, 6–12 years 100 mg every 12 hours

5.1.9 Antituberculosis drugs

Tuberculosis is treated in two phases—an initial phase using 4 drugs and a continuation phase using 2 drugs in fully sensitive cases. Treatment requires specialised knowledge, particularly where the disease involves resistant organisms or non-respiratory organs. The regimens given below are recommended for the treatment of tuberculosis in the UK; variations occur in other countries. Either the unsupervised regimen or the supervised regimen described below should be used; the two regimens should not be used concurrently.

Initial phase The concurrent use of 4 drugs during the initial phase is designed to reduce the bacterial population as rapidly as possible and to prevent the emergence of drug-resistant bacteria. The drugs are best given as combination preparations unless one of the components cannot be given because of resistance or intolerance. The treatment of choice for the initial phase is the daily use of isoniazid, rifampicin, pyrazinamide and ethambutol. Treatment should be started without waiting for culture results if clinical features or histology results are consistent with tuberculosis; treatment should be continued even if initial culture results are negative. The initial phase drugs should be continued for 2 months. Where a positive culture for M. tuberculosis has been obtained, but susceptibility results are not available after 2 months, treatment with rifampicin, isoniazid, pyrazinamide and ethambutol should be continued until full susceptibility is confirmed, even if this is for longer than 2 months.
Streptomycin is rarely used in the UK but it may be used in the initial phase of treatment if resistance to isoniazid has been established before therapy is commenced.

Continuation phase After the initial phase, treatment is continued for a further 4 months with isoniazid and rifampicin (preferably given as a combination preparation). Longer treatment is necessary for meningitis, direct spinal cord involvement, and for resistant organisms which may also require modification of the regimen.

Unsupervised treatment The following regimen should be used for patients who are likely to take antituberculous drugs reliably without supervision. Patients who are unlikely to comply with daily administration of antituberculous drugs should be treated with...
the regimen described under Supervised Treatment.

**Recommended dosage for standard unsupervised 6-month treatment**

**Immunocompromised patients** Multi-resistant *Mycobacterium tuberculosis* may be present in immunocompromised patients. The organism should always be cultured to confirm its type and drug sensitivity. Confirmed *M. tuberculosis* infection sensitive to first-line drugs should be treated with a standard 6-month regimen; after completing treatment, patients should be closely monitored. The regimen may need to be modified if infection is caused by resistant organisms, and specialist advice is needed. Specialist advice should be sought about tuberculosis treatment or chemoprophylaxis in a HIV-positive individual; care is required in choosing the regimen and in avoiding potentially serious interactions. Starting antiretroviral treatment in the first 2 months of antituberculosis treatment increases the risk of immune reconstitution syndrome.

Infection may also be caused by other mycobacteria e.g. *M. avium* complex in which case specialist advice on management is needed.

**Corticosteroids** In meningeval or pericardial tuberculosis, a corticosteroid should be started at the same time as antituberculosis therapy.

**Prevention of tuberculosis** Some individuals may develop tuberculosis owing to reactivation of previously latent disease. Chemoprophylaxis may be required in those who have evidence of latent tuberculosis and are receiving treatment with immunosuppressants (including cytotoxics and possibly long-term treatment with systemic corticosteroids). In these cases, chemoprophylaxis involves use of either isoniazid alone for 6 months or of isoniazid and rifampicin for 3 months, see Table 2, section 5.1; longer chemoprophylaxis is not recommended.

For prevention of tuberculosis in susceptible close contacts or those who have become tuberculin-positive, see Table 2, section 5.1. For advice on immunisation against tuberculosis, see section 14.4.

**Monitoring** Since isoniazid, rifampicin and pyrazinamide are associated with liver toxicity, hepatic function

---

**Pregnancy** The standard regimen (above) may be used during pregnancy. Streptomycin should not be given in pregnancy.

**Breast-feeding** The standard regimen (above) may be used during breast-feeding.

**Children** Children are given isoniazid, rifampicin, pyrazinamide, and ethambutol for the first 2 months followed by isoniazid and rifampicin during the next 4 months. However, care is needed in young children receiving ethambutol because of the difficulty in testing eyesight and in obtaining reports of visual symptoms (see below).

**Supervised treatment** Drug administration needs to be fully supervised (directly observed therapy, DOT) in patients who cannot comply reliably with the treatment regimen. These patients are given isoniazid, rifampicin, pyrazinamide and ethambutol (or streptomycin) 3 times a week under supervision for the first 2 months followed by isoniazid and rifampicin 3 times a week for a further 4 months.
Isoniazid is cheap and highly effective. Like rifampicin, it should always be included in any antituberculous regimen unless there is a specific contra-indication. Its only common side-effect is peripheral neuropathy which is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, pregnancy, malnutrition and HIV infection. In these circumstances pyridoxine 10 mg daily (or 20 mg daily if suitable product not available) (section 9.6.2) should be given prophylactically from the start of treatment. Avoid both excessive and inadequate dosage. Treatment should be supervised by a specialist physician.

Rifampicin, a rifamycin, is a key component of any antituberculous regimen. Like isoniazid, it should always be included unless there is a specific contra-indication. During the first two months (‘initial phase’) of rifampicin administration transient disturbance of liver function with elevated serum transaminases is common but generally does not require interruption of treatment. Occasionally more serious liver toxicity requires a change of treatment particularly in those with pre-existing liver disease (important: see Monitoring above). On intermittent treatment six toxicity syndromes have been recognised—flu-like, abdominal, and respiratory symptoms, shock, renal failure, and thrombocytopenic purpura—and can occur in 20 to 30% of patients.

Rifampicin induces hepatic enzymes which accelerate the metabolism of several drugs including oestrogens, corticosteroids, phenytoin, sulphonylureas, and anticoagulants; interactions: Appendix 1 (rifamycins). Important: the effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered (section 7.3.1).

Rifabutin, another rifamycin, is indicated for prophylaxis against M. avium complex infections in patients with a low CD4 count; it is also licensed for the treatment of non-tuberculous mycobacterial disease and pulmonary tuberculosis. Important: as with rifampicin it induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced requiring alternative family planning methods.

Pyrazinamide is a bactericidal drug only active against intracellular dividing forms of Mycobacterium tuberculosis; it exerts its main effect only in the first two or three months. It is particularly useful in tuberculous meningitis because of good meningeal penetration. It is not active against M. bovis. Serious liver toxicity may occasionally occur (important: see Monitoring above).

Ethambutol is included in a treatment regimen if isoniazid resistance is suspected; it can be omitted if the risk of resistance is low.

Side-effects of ethambutol are largely confined to visual disturbances in the form of loss of acuity, colour blind-ness, and restriction of visual fields. These toxic effects are more common where excessive dosage is used or if the patient’s renal function is impaired. The earliest features of ocular toxicity are subjective and patients should be advised to discontinue therapy immediately if they develop deterioration in vision and promptly seek further advice. Early discontinuation of the drug is almost always followed by recovery of eyesight. Patients who cannot understand warnings about visual side-effects should, if possible, be given an alternative drug. In particular, ethambutol should be used with caution in children until they are at least 5 years old and capable of reporting symptomatic visual changes accurately.

Visual acuity should be tested by Snellen chart before treatment with ethambutol.

Streptomycin (unlicensed) is now rarely used in the UK except for resistant organisms. Plasma-drug concentration should be measured in patients with impaired renal function in whom streptomycin must be used with great care.

Drug-resistant tuberculosis should be treated by a specialist physician with experience in such cases, and where appropriate facilities for infection-control exist. Second-line drugs available for infections caused by resistant organisms, or when first-line drugs cause unacceptable side-effects, include amikacin, capreomycin, cycloserine, newer macrolides (e.g. azithromycin and clarithromycin), moxifloxacin and prothionamide (prothionamide; no longer on UK market).
**CYCLOSERINE**

**Indications** in combination with other drugs, tuberculosis resistant to first-line drugs

**Cautions** monitor haematological, renal, and hepatic function; interactions: Appendix 1 (cycloserine)

**Contra-indications** epilepsy, depression, severe anxiety, psychotic states, alcohol dependence

**Renal impairment** increase interval between doses if creatinine clearance less than 50 mL/minute and monitor blood-cycloserine concentration

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—crosses the placenta

**Breast-feeding** amount too small to be harmful

**Side-effects** mainly neurological, including headache, dizziness, vertigo, drowsiness, tremor, convulsions, confusion, psychosis, depression (discontinue or reduce dose); megaloblastic anaemia; changes in liver function tests; heart failure at high doses reported

**Dose**
- Initially 250 mg every 12 hours for 2 weeks increased according to blood concentration and response to max. 500 mg every 12 hours; CHILD 2–18 years see BNF for Children
- Blood concentration monitoring required especially in renal impairment or if dose exceeds 500 mg daily or if signs of toxicity; blood concentration should not exceed 30 mg/litre

**Cycloserine (King)**

**Injection**, powder for reconstitution, capreomycin sulfate 1 million units (= capreomycin approx. 1 g). Net price per vial = £16.01

**ETHAMBUTOL HYDROCHLORIDE**

**Indications** tuberculosis, in combination with other drugs

**Cautions** see Monitoring in notes above; also slow acetylator status (increased risk of side-effects); epilepsy; history of psychosis; alcohol dependence, malnutrition, diabetes mellitus, HIV infection (risk of peripheral neuritis); acute porphyria (section 9.8.2); interactions: Appendix 1 (isoniazid)

**Hepatic disorders** Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

**Contra-indications** drug-induced liver disease

**Hepatic impairment** use with caution; monitor liver function regularly and particularly frequently in first 2 months; see also Hepatic Disorders above

**Renal impairment** risk of otoxicity and peripheral neuropathy; prophylactic pyridoxine recommended, see notes above

**Pregnancy** not known to be harmful; prophylactic pyridoxine recommended; see also p. 391

**Breast-feeding** monitor infant for possible toxicity; theoretical risk of convulsions and neuropathy; prophylactic pyridoxine advisable in mother; see also p. 391

**Side-effects** nausea, vomiting, constipation, dry mouth; peripheral neuritis with high doses (pyridoxine prophylaxis, see notes above); optic neuritis, convulsions, psychotic episodes, vertigo; hypersensitivity reactions including fever, Stevens-Johnson syndrome, purpura; blood disorders including agranulocytosis, haemolytic anaemia, aplastic anaemia; hepatitis (especially over age of 35 years); pancreatitis; interstitial pneumonia; systemic lupus erythematosus-like syndrome, pellagra, hypeflexia, difficulty with micturition, hyperglycaemia, and gynaecomastia reported; hearing loss and tinnitus (in patients with end-stage renal impairment); when used with tyramine or histamine rich foods, tachycardia, palpitation, hypotension, flushing, headache, dizziness, and sweating also reported

**Dose**
- By mouth or by intramuscular or intravenous injection, see notes above

**Isoniazid**

**Indications** tuberculosis, in combination with other drugs; prophylaxis—Table 2, section 5.1

**Cautions** see Monitoring in notes above; also slow acetylator status (increased risk of side-effects); epilepsy; history of psychosis; alcohol dependence, malnutrition, diabetes mellitus, HIV infection (risk of peripheral neuritis); acute porphyria (section 9.8.2); interactions: Appendix 1 (isoniazid)

**Hepatic disorders** Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

**Contra-indications** drug-induced liver disease

**Hepatic impairment** use with caution; monitor liver function regularly and particularly frequently in first 2 months; see also Hepatic Disorders above

**Renal impairment** risk of otoxicity and peripheral neuropathy; prophylactic pyridoxine recommended, see notes above

**Pregnancy** not known to be harmful; prophylactic pyridoxine recommended; see also p. 391

**Breast-feeding** monitor infant for possible toxicity; theoretical risk of convulsions and neuropathy; prophylactic pyridoxine advisable in mother; see also p. 391

**Side-effects** nausea, vomiting, constipation, dry mouth; peripheral neuritis with high doses (pyridoxine prophylaxis, see notes above); optic neuritis, convulsions, psychotic episodes, vertigo; hypersensitivity reactions including fever, Stevens-Johnson syndrome, purpura; blood disorders including agranulocytosis, haemolytic anaemia, aplastic anaemia; hepatitis (especially over age of 35 years); pancreatitis; interstitial pneumonia; systemic lupus erythematosus-like syndrome, pellagra, hypeflexia, difficulty with micturition, hyperglycaemia, and gynaecomastia reported; hearing loss and tinnitus (in patients with end-stage renal impairment); when used with tyramine or histamine rich foods, tachycardia, palpitation, hypotension, flushing, headache, dizziness, and sweating also reported

**Dose**
- By mouth or by intramuscular or intravenous injection, see notes above

**Isoniazid (Non-proprietary)**

**Tablets**, isoniazid 50 mg, net price 56-tab pack = £13.75; 100 mg, 28-tab pack = £13.75. Label: 8, 22

**Injection**, isoniazid 25 mg/mL, net price 2-mL amp = £24.11
PYRAZINAMIDE

**Indications**  
Tuberculosis in combination with other drugs

**Cautions**  
see Monitoring in notes above; also diabetes; gout (avoid in acute attack); interactions: Appendix 1 (pyrazinamide)

**Hepatic disorders**  
 Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

**Hepatic impairment**  
monitor hepatic function—idiopathic hepatotoxicity more common; avoid in severe hepatic impairment; see also Hepatic Disorders above

**Renal impairment**  
mirror for gout; 25–30 mg/kg 3 times a week if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy**  
manufacturer advises use only if potential benefit outweighs risk; see also p. 391

**Breast-feeding**  
amount too small to be harmful; see also p. 391

**Side-effects**  
hepatotoxicity including fever, anorexia, hepatomegaly, splenomegaly, jaundice, liver failure; nausea, vomiting, flushing, dysuria, arthralgia, sideroblastic anaemia, thrombocytopenia, rash and occasionally photosensitivity

**Dose**  
- See notes above

**Zipamid** (Genus)®

Tablets, scored, pyrazinamide 500 mg. Net price 30-tab pack = £31.35. Label: 8

RIFABUTIN

**Indications**  
see under Dose

**Cautions**  
see under Rifampicin; acute porphyria (section 9.8.2)

**Contra-indications**  
rifamycin hypersensitivity

**Hepatic impairment**  
reduce dose in severe impairment

**Renal impairment**  
use half normal dose if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy**  
manufacturer advises use with caution if dose above 600 mg daily

**Breast-feeding**  
amount too small to be harmful; see also p. 391

**Side-effects**  
nausea, pyrexia, blood disorders (including leucopenia, anaemia, thrombocytopenia, and rarely haemolyisis), myalgia, rash, less commonly vomiting, raised liver enzymes, jaundice, arthralgia, corneal deposits, uveitis especially following high doses or concomitant use with drugs that increase plasma concentration—see also interactions: Appendix 1 (rifampicins), hypersensitivity reactions (including eosinophilia, bronchospasm), skin, urine, saliva and other body secretions coloured orange-red; also reported hepatitis, influenza-like symptoms, chest pain, dyspnoea

**Dose**  
- Prophylaxis of Mycobacterium avium complex infections in immunosuppressed patients with low CD4 count (see product literature), 300 mg daily as a single dose
- Treatment of non-tuberculous mycobacterial disease, in combination with other drugs, 450–600 mg daily as a single dose for up to 6 months after cultures negative
- Treatment of pulmonary tuberculosis, in combination with other drugs, 150–450 mg daily as a single dose for at least 6 months
- CHILD not recommended

**Mycobutin** (Pharmacia)®

Capsules, red-brown, rifabutin 150 mg. Net price 30-cap pack = £90.38. Label: 8. 14. counselling, lenses, see under Rifampicin

RIFAMPICIN

**Indications**  
see under Dose

**Cautions**  
see Monitoring in notes above; also liver function tests and blood counts in hepatic disorders, alcohol dependence, and on prolonged therapy, see also below; important: effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered (see also section 7.3.1); discolours soft contact lenses; see also notes above; interactions: Appendix 1 (rifamycins)

**Note**  
If treatment interrupted re-introduce with low dosage and increase gradually; discontinue permanently if serious side-effects develop

**Hepatic disorders**  
Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

**Contra-indications**  
jaundice; rifamycin hypersensitivity; acute porphyria (section 9.8.2)

**Hepatic impairment**  
impaired elimination; monitor liver function; avoid or do not exceed 8 mg/kg daily; see also Cautions above

**Renal impairment**  
use with caution if dose above 600 mg daily

**Pregnancy**  
manufacturers advise very high doses teratogenic in animal studies in first trimester; risk of neonatal bleeding may be increased in third trimester; see also p. 391

**Breast-feeding**  
amount too small to be harmful; see also p. 391

**Side-effects**  
gastro-intestinal symptoms including anorexia, nausea, vomiting, diarrhoea (antibiotic-associated colitis reported); headache, drowsiness; those occurring mainly on intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, disseminated intravascular coagulation, and acute renal failure; alterations of liver function, jaundice, flushing, urticaria, and rashes; other side-effects reported include oedema, psychoses, adrenal insufficiency, muscular weakness and myopathy, exfoliative dermatitis, toxic epidermal necrolysis, Stevens-Johnson syndrome, pemphigoid reactions, leucopenia, eosinophilia, menstrual disturbances; urine, saliva, and other body secretions coloured orange-red; thrombophlebitis reported if infusion used for prolonged period

**Dose**  
- Brucellosis, legionnaires’ disease, endocarditis and serious staphylococcal infections, in combination with other drugs, by mouth or by intravenous infusion, 0.6–1.2 g daily (in 2–4 divided doses)
- Tuberculosis, in combination with other drugs, see notes above
Leprosy, section 5.1.10

Prophylaxis of meningococcal meningitis and Haemophilus influenzae (type b) infection, Table 2, section 5.1

Rifampicin (Non-proprietary) *(FW)*

Capsules, rifampicin 150 mg, net price 100 = £14.04; 300 mg, 100 = £44.80. Label: 8, 14, 22, counselling, see lenses above

Rifadin® (Sanofi-Aventis) *(FW)*

Capsules, rifampicin 150 mg (blue/red), net price 100-cap pack= £18.32; 300 mg (red), 100-cap pack= £36.63. Label: 8, 14, 22, counselling, see lenses above

Syrup, red, rifampicin 100 mg/5 mL (raspberry-flavoured), net price 120 mL = £3.56. Label: 8, 14, 22, counselling, see lenses above

Intravenous infusion, powder for reconstitution, rifampicin, net price 600 mg vial (with solvent) = £7.67

Electrolytes
Na+: < 0.5 mmol/vial

Rimactane® (Sandoz) *(FW)*

Capsules, rifampicin 150 mg (red), net price 60-cap pack = £15.83; 300 mg (red/brown), 60-cap pack = £25.92. Label: 8, 14, 22, counselling, see lenses above

Combined preparations

Rifater® (Sanofi-Aventis) *(FW)*

Tablets, pink, s/c, rifampicin 120 mg, isoniazid 50 mg, pyrazinamide 300 mg, net price 100-tablet pack= £21.95. Label: 8, 14, 22, counselling, see lenses above

Dose initial treatment of pulmonary tuberculosis, patients up to 40 kg 3 tablets daily preferably before breakfast, 40–49 kg 4 tablets daily, 50–64 kg 5 tablets daily, 65 kg or more, 6 tablets daily, not suitable for use in children

Rifinah® 150/100 (Sanofi-Aventis) *(FW)*

Tablets, pink, s/c, rifampicin 150 mg, isoniazid 100 mg, net price 84-tablet pack = £15.91. Label: 8, 14, 22, counselling, see lenses above

Dose ADULT under 50 kg, 3 tablets daily, preferably before breakfast

Rifinah® 300/150 (Sanofi-Aventis) *(FW)*

Tablets, orange, s/c, rifampicin 300 mg, isoniazid 150 mg, net price 56-tablet pack = £26.24. Label: 8, 14, 22, counselling, see lenses above

Dose ADULT 50 kg and over, 2 tablets daily, preferably before breakfast

Note Some stock packaged as Rifinah 150/100

Voractiv® (Sandoz) *(FW)*

Tablets, brown, f/c, rifampicin 150 mg, isoniazid 75 mg, pyrazinamide 400 mg, ethambutol hydrochloride 275 mg, net price 60-tablet pack = £39.50. Label: 8, 14, 22, counselling, see lenses above

Dose initial treatment of tuberculosis ADULT 30–39 kg 2 tablets daily, 40–54 kg 3 tablets daily, 55–70 kg 4 tablets daily, over 70 kg 5 tablets daily

Note Risk of peripheral neuropathy may be increased by high doses of isoniazid—consider prescribing pyridoxine for those receiving Voractiv® 5 tablets daily (see also Isoniazid prescribing notes, p. 392)

### STREPTOMYCIN

Indications tuberculosis, in combination with other drugs; adjunct to doxycycline in brucellosis; enterococcal endocarditis (Table 1, section 5.1)

**Cautions** see under Aminoglycosides, section 5.1.4; interactions: Appendix 1 (aminoglycosides)

**Contra-indications** see under Aminoglycosides, section 5.1.4

**Renal impairment** see under Aminoglycosides, section 5.1.4

**Pregnancy** see under Aminoglycosides, section 5.1.4; also hypersensitivity reactions, paraesthesia of mouth

**Dose**

- **By deep intramuscular injection**, tuberculosis (unlicensed), 15 mg/kg (max. 1 g) daily (reduced in those under 50 kg, those over 40 years, or those with renal impairment)

Brucellosis, expert advice essential

**Important** Side-effects increase after a cumulative dose of 100 g, which should only be exceeded in exceptional circumstances

**Note** One-hour (‘peak’) concentration should be 15–40 mg/litre; pre-dose (‘trough’) concentration should be less than 5 mg/litre (less than 1 mg/litre in renal impairment or in those over 50 years)

**Streptomycin Sulfate** (Non-proprietary) *(FW)*

Injection, powder for reconstitution, streptomycin (as sulfate), net price 1-g vial = £15.00

Available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104

### 5.1.10 Antileprotic drugs

Advice from a member of the Panel of Leprosy Opinion is essential for the treatment of leprosy (Hansen’s disease). Details can be obtained from the Hospital for Tropical Diseases, London (telephone (020) 3456 7890).

The World Health Organization has made recommendations to overcome the problem of dapsone resistance and to prevent the emergence of resistance to other antileprotic drugs. Drugs recommended are dapsone, rifampicin (section 5.1.9), and clofazimine. Other drugs with significant activity against Mycobacterium leprae include ofloxacin, minocycline and clarithromycin, but none of these are as active as rifampicin; at present they should be reserved as second-line drugs for leprosy.

A three-drug regimen is recommended for multibacillary leprosy (lepromatous, borderline-lepromatous, and borderline leprosy) and a two-drug regimen for paucibacillary leprosy (borderline-tuberculoid, tuberculoid, and indeterminate). The following regimens are widely used throughout the world (with minor local variations):

**Multibacillary leprosy (3-drug regimen)**

Rifampicin 600 mg once-monthly, supervised (450 mg for adults weighing less than 35 kg)

Dapsone 100 mg daily, self-administered (50 mg daily or 1–2 mg/kg daily for adults weighing less than 35 kg)

Clofazimine 300 mg once-monthly, supervised, and 50 mg daily (or 100 mg on alternate days), self-administered

Multibacillary leprosy should be treated for at least 2 years. Treatment should be continued unchanged during both type I (reversal) or type II (erythema nodosum lepromatous) reactions. During reversal reactions neuritic pain or weakness can herald the rapid onset of perma-
5.1.11 Metronidazole and tinidazole

Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa; indications include trichomonal vaginitis (section 5.4.3), bacterial vaginosis (notably Gardnerella vaginalis infections), and Entamoeba histolytica and Giardia lamblia infections (section 5.4.2). It is also used for surgical and gynaecological sepsis in which its activity against colonic anaerobes, especially Bacteroides fragilis, is important. Metronidazole by the rectal route is an effective alternative to the intravenous route when oral administration is not possible. Intravenous metronidazole is used for the treatment of established cases of tetanus; diazepam (section 10.2.2) and tetanus immunoglobulin (section 14.5.2) are also used.

Metronidazole by mouth is effective for the treatment of Clostridium difficile infection, see also section 1.5; it can be given by intravenous infusion if oral treatment is inappropriate.

Topical metronidazole (section 13.10.1.2) reduces the odour produced by anaerobic bacteria in fungating tumours; it is also used in the management of rosacea (section 13.6).

Tinidazole is similar to metronidazole but has a longer duration of action.

Oral infections Metronidazole is an alternative to a penicillin for the treatment of many oral infections where the patient is allergic to penicillin or the infection is due to beta-lactamase-producing anaerobes (Table 1, section 5.1). It is the drug of first choice for the treatment of acute necrotising ulcerative gingivitis (Vincent’s infection) and pericoronitis; amoxicillin is a suitable alternative (section 5.1.1.3). For these purposes metronidazole in a dose of 200 mg 3 times daily for 3 days is sufficient, but the duration of treatment may need to be
longer in pericoronitis. Tinidazole is licensed for the treatment of acute ulcerative gingivitis.

### METRONIDAZOLE

**Indications** anaerobic infections (including dental), see under Dose below; protozoal infections (section 5.4.2); *Helicobacter pylori* eradication (section 1.3); fistulating Crohn’s disease (section 1.5); skin (section 13.10.1.2).

**Cautions** disulfiram-like reaction with alcohol; clinical and laboratory monitoring advised if treatment exceeds 10 days; interactions: Appendix 1 (metronidazole).

**Hepatic impairment** in severe liver disease reduce total daily dose to one-third, and give once daily; use with caution in hepatic encephalopathy.

**Pregnancy** manufacturer advises avoidance of high-dose regimens.

**Breast-feeding** significant amount in milk; manufacturer advises avoidance of high-single doses.

**Side-effects** gastro-intestinal disturbances (including nausea and vomiting), taste disturbances, furred tongue, oral mucositis, anorexia; very rarely hepatitis, jaundice, pancreatitis, drowsiness, dizziness, headache, ataxia, psychotic disorders, darkening of urine, thrombocytopenia, pancytopenia, myalgia, arthralgia, visual disturbances, rash, pruritus, and erythema multiforme; on prolonged or intensive therapy peripheral neuropathy, transient epileptiform seizures, and leucopenia; also reported aseptic meningitis, optic neuropathy.

**Dose**

- Anaerobic infections (usually treated for 7 days and for 10–14 days in *Clostridium difficile* infection), by mouth, either 400 mg every 8 hours or 500 mg every 8 hours, CHILD 1–2 months 7.5 mg/kg every 12 hours, 2 months–12 years 7.5 mg/kg (max. 400 mg) every 8 hours; by rectum, 1 g every 8 hours for 3 days, then 1 g every 12 hours, CHILD every 8 hours for 3 days, then every 12 hours, 1 month–1 year 125 mg, 1–5 years 250 mg, 5–10 years 500 mg, over 10 years, adult dose; by intravenous infusion over 20 minutes, 500 mg every 8 hours; CHILD under 18 years see BNF for Children.
- Leg ulcers and pressure sores, by mouth, 400 mg every 8 hours for 7 days.
- Bacterial vaginosis, by mouth, 400–500 mg twice daily for 5–7 days or 2 g as a single dose.
- Pelvic inflammatory disease (see also Table 1, section 5.1), by mouth, 400 mg twice daily for 14 days; CHILD 12–18 years see BNF for Children.
- Acute ulcerative gingivitis, by mouth, 200–250 mg every 8 hours for 3 days; CHILD 1–3 years 50 mg every 8 hours for 3 days; 3–7 years 100 mg every 12 hours; 7–10 years 100 mg every 8 hours.
- Acute oral infections, by mouth, 200 mg every 8 hours for 3–7 days (see also notes above); CHILD 1–3 years 50 mg every 8 hours for 3–7 days; 3–7 years 100 mg every 12 hours; 7–10 years 100 mg every 8 hours.
- Surgical prophylaxis, by mouth, 400–500 mg 2 hours before surgery; up to 3 further doses of 400–500 mg may be given every 8 hours for high-risk procedures; CHILD 1 month–18 years see BNF for Children.
- By rectum, 1 g 2 hours before surgery; up to 3 further doses of 1 g may be given every 8 hours for high-risk procedures; CHILD 5–18 years see BNF for Children.
- By intravenous infusion (if rectal administration inappropriate), 500 mg up to 30 minutes before the procedure; up to 3 further doses of 500 mg may be given every 8 hours for high-risk procedures; CHILD under 18 years see BNF for Children.

**Note** Metronidazole doses in BNF may differ from those in product literature.

### Metronidazole (Non-proprietary)

**Tablets**

- metronidazole 200 mg, net price 21-tab pack = £1.13; 400 mg, 21-tab pack = £1.21. Label: 4; 9, 21, 25, 27.
- **Brands include** Vagielyn®

**Dental prescribing on NHS** Metronidazole Tablets may be prescribed.

- metronidazole 500 mg, net price 21-tab pack = £35.75. Label: 4, 9, 21, 25, 27.
- **Dental prescribing on NHS** Metronidazole Tablets may be prescribed.

**Suspension**, metronidazole (as benzoate) 200 mg/5 mL. Net price 100 mL = £28.63. Label: 4, 9.

- **Brands include** Norzol®

**Dental prescribing on NHS** Metronidazole Oral Suspension may be prescribed.

**Intravenous infusion**, metronidazole 5 mg/mL. Net price 20-mL amp = £1.96, 100-mL container = £3.10.

**Flagyl®** (Zentiva) **Tablets**, both f/c, ivory, metronidazole 200 mg, net price 21-tab pack = £4.49; 400 mg, 14-tab pack = £6.34. Label: 4, 9, 21, 25, 27.

**Suppositories**, metronidazole 500 mg, net price 10 = £15.18; 1 g, 10 = £23.06. Label: 4, 9.

**Metrolyt®** (Sandoz) **Tablets**,

- intravenous infusion, metronidazole 5 mg/mL, net price 100-mL Steriflex® bag = £1.22.

**Electrolytes** Na⁺ 14.53 mmol/100-mL bag, price 100-mL Steriflex® bag = £1.22.

**Susppositories**, metronidazole 500 mg, net price 10 = £12.34; 1 g, 10 = £18.34. Label: 4, 9.

### TINIDAZOLE

**Indications** anaerobic infections, see under Dose below; protozoal infections (section 5.4.2); *Helicobacter pylori* eradication (section 1.3).

**Cautions** see under Metronidazole; avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (tinidazole).

**Pregnancy** manufacturer advises avoid in first trimester.

**Breast-feeding** present in milk—manufacturer advises avoid breast-feeding during and for 3 days after stopping treatment.

**Side-effects** see under Tinidazole.

**Dose**

- Anaerobic infections, 2 g initially, followed by 1 g daily or 500 mg twice daily, usually for 5–6 days.
- Bacterial vaginosis and acute ulcerative gingivitis, a single 2-g dose.
- Abdominal surgery prophylaxis, a single 2-g dose approximately 12 hours before surgery.

**Fasigyn®** (Pfizer) **Tablets**, f/c, tinidazole 500 mg. Net price 16-tab pack = £11.04. Label: 4; 9, 21, 25.
5.1.12 Quinolones

Nalidixic acid and norfloxacin are effective in uncomplicated urinary-tract infections (section 5.1.13).

Ciprofloxacin is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including salmonella, shigella, campylobacter, neisseria, and pseudomonas. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as Strepococcus pneumoniae and Enterococcus faecalis; it should not be used for pneumococcal pneumonia. It is active against chlamydia and some mycobacteria. Most anaerobic organisms are not susceptible. Ciprofloxacin can be used for respiratory tract infections (but not for pneumococcal pneumonia), urinary-tract infections (section 5.1.13), infections of the gastro-intestinal system (including typhoid fever), bone and joint infections, gonorrhoea and septicaemia caused by sensitive organisms.

Ofloxacin is used for urinary-tract infections (section 5.1.13), lower respiratory-tract infections, gonorrhoea, and non-gonococcal urethritis and cervicitis.

Levofloxacin is active against Gram-positive and Gram-negative organisms. It has greater activity against pneumococci than ciprofloxacin. Levofloxacin is licensed for the treatment of acute sinusitis, acute exacerbations of chronic bronchitis, and community-acquired pneumonia, but it should only be considered for these infections when first-line treatment cannot be used or is ineffective. Levofloxacin is also licensed for the treatment of urinary-tract infections (section 5.1.13).

Although ciprofloxacin, levofloxacin, moxifloxacin, and ofloxacin are licensed for skin and soft-tissue infections, many staphylococci are resistant to the quinolones and their use should be avoided in MRSA infections.

Moxifloxacin should be reserved for the treatment of sinusitis, community-acquired pneumonia, exacerbations of chronic bronchitis, mild to moderate pelvic inflammatory disease, or complicated skin and soft-tissue infections which have failed to respond to other antibacterials or for patients who cannot be treated with other antibacterials. It has been associated with QT interval prolongation and life-threatening hepatotoxicity. Moxifloxacin is active against Gram-positive and Gram-negative organisms. It has greater activity against Gram-positive organisms, including pneumococci, than ciprofloxacin. Moxifloxacin is not active against Pseudomonas aeruginosa or meticillin-resistant Staphylococcus aureus (MRSA).

Anthrax Infection or gastro-intestinal anthrax should be treated initially with either ciprofloxacin [not licensed for gastro-intestinal anthrax] or doxycycline [unlicensed indication] (section 5.1.3) combined with one or two other antibacterials (such as amoxicillin, benzylpenicillin, chloramphenicol, clarithromycin, clindamycin, imipenem with cilastatin, rifampicin [unlicensed indication], and vancomycin). When the condition improves and the sensitivity of the Bacillus anthracis strain is known, treatment may be switched to a single antibacterial. Treatment should continue for 60 days because germination may be delayed.

Cutaneous anthrax should be treated with either ciprofloxacin [unlicensed indication] or doxycycline [unlicensed indication] (section 5.1.3) for 7 days. Treatment may be switched to amoxicillin (section 5.1.1.3) if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck. Ciprofloxacin or doxycycline may be given for post-exposure prophylaxis. If exposure is confirmed, anti-bacterial prophylaxis should continue for 60 days. Anti-bacterial prophylaxis may be switched to amoxicillin after 10–14 days if the strain of B. anthracis is susceptible. Vaccination against anthrax (section 14.4) may allow the duration of antibacterial prophylaxis to be shortened.

Cautions Quinolones should be used with caution in patients with a history of epilepsy or conditions that predispose to seizures, in G6PD deficiency (section 9.1.5), myasthenia gravis (risk of exacerbation), and in children or adolescents (arthropathy has developed in weight-bearing joints in young animals—see below). Exposure to excessive sunlight should be avoided (discontinue if photosensitivity occurs). Quinolones can prolong the QT interval. Moxifloxacin is contra-indicated in patients with risk factors for QT interval prolongation (e.g. electrolyte disturbances, acute myocardial infarction, heart failure with reduced left ventricular ejection fraction, bradycardia, congenital long QT syndrome, concomitant use with other drugs known to prolong the QT interval, history of symptomatic arrhythmias) and the other quinolones should be used with caution in these patients. The CSM has warned that quinolones may induce convulsions in patients with or without a history of convulsions; taking NSAIDs at the same time may also induce them. Other interactions: Appendix 1 (quinolones).

Use in children Quinolones cause arthropathy in the weight-bearing joints of immature animals and are therefore generally not recommended in children and growing adolescents. However, the significance of this effect in humans is uncertain and in some specific circumstances short-term use of either ciprofloxacin or nalidixic acid may be justified in children. For further details see BNF for Children.

Tendon damage Tendon damage (including rupture) has been reported rarely in patients receiving quinolones. Tendon rupture may occur within 48 hours of starting treatment; cases have also been reported several months after stopping a quinolone. Healthcare professionals are reminded that: • quinolones are contra-indicated in patients with a history of tendon disorders related to quinolone use; • patients over 60 years of age are more prone to tendon damage; • the risk of tendon damage is increased by the concomitant use of corticosteroids; • if tenosynovitis is suspected, the quinolone should be discontinued immediately.

Contra-indications Quinolone hypersensitivity. See also Cautions above.

Pregnancy Quinolones should be avoided in pregnancy because they have been shown to cause arthropathy in animal studies; safer alternatives are available; however, a single dose of ciprofloxacin may be used for the prevention of a secondary case of meningococcal meningitis

Side-effects Side-effects of the quinolones include nausea, vomiting, diarrhoea (rarely antibiotic-associated
cinamion, headache, and dizziness. Less frequent side-effects include dyspepsia, abdominal pain, anorexia, sleep disturbances, asthenia, confusion, anxiety, depression, hallucinations, tremor, blood disorders (including eosinophilia, leucopenia, thrombocytopenia), arthralgia, myalgia, rash (very rarely Stevens-Johnson syndrome and toxic epidermal necrolysis), disturbances in vision and taste. Other side-effects reported rarely or very rarely include hepatic dysfunction (including jaundice and hepatitis), hypotension, vasculitis, dyspnoea (more frequent with levofloxacin and moxifloxacin), convulsions, psychoses, symptoms of peripheral neuropathy (sometimes irreversible), renal failure, interstitial nephritis, tendon inflammation and damage (see also Tendon Damage above), photosensitivity, disturbances in hearing and smell. The drug should be discontinued if psychiatric, neurological or hypersensitivity reactions (including severe rash) occur.

**CIPROFLOXACIN**

**Indications** see notes above and under Dose; fistulising Crohn’s disease (section 1.5); eye infections (section 11.3.1)

**Cautions** see notes above; avoid excessive alkalinity of urine and ensure adequate fluid intake (risk of crystalluria); interactions: Appendix 1 (quinolones) Driving May impair performance of skilled tasks (e.g. driving); effects enhanced by alcohol

**Contra-indications** see notes above

**Renal impairment** by mouth, 250–500 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m² (every 24 hours if eGFR less than 30 mL/minute/1.73 m²); by intravenous infusion (200 mg over 30 minutes), 200–400 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m² (every 24 hours if eGFR less than 30 mL/minute/1.73 m²)

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful but manufacturer advises avoid

**Side-effects** see notes above; also flatulence, pain and plebitis at injection site; rarely dysphagia, pancreatitis, chest pain, tachycardia, syncope, oedema, hot flushes, abnormal dreams, sweating, hyperglycaemia, hypoglycaemia, and erythema nodosum; very rarely movement disorders, tinnitus, intracranial hypertension, and tenosynovitis; also reported peripheral neuropathy and polyneuropathy

**Dose**

- **By mouth**, respiratory-tract infections, 500–750 mg twice daily (750 mg twice daily in pseudomonal lower respiratory-tract infection in cystic fibrosis) Urinary-tract infections, 250–750 mg twice daily (250 mg twice daily for 3 days usually adequate for acute uncomplicated cystitis in women) Acute or chronic prostatitis, 500 mg twice daily for 28 days Gonorrhoea (see also Table 1, section 5.1), 500 mg as a single dose Most other infections, 500 mg twice daily (increased to 750 mg twice daily in severe or deep-seated infection) Surgical prophylaxis [unlicensed], 750 mg 60 minutes before procedure Prophylaxis of meningococcal meningitis, Table 2, section 5.1
- **By intravenous infusion** over 60 minutes, 400 mg every 8–12 hours

- Anthrax (treatment and post-exposure prophylaxis, see notes above), by mouth, 500 mg twice daily **By intravenous infusion** over 60 minutes, 400 mg every 12 hours

- **CHILD** under 18 years see BNF for Children

**Ciprofloxacin** (Non-proprietary) ([HM](节)

**Tablets**, ciprofloxacin (as hydrochloride) 100 mg, net price 6-tab pack = £1.26; 250 mg, 10-tab pack = 84p, 20-tab pack = £1.48; 500 mg, 10-tab pack = 98p, 20-tab pack = £1.47; 750 mg, 10-tab pack = £8.90. Label: 7, 9, 25, counselling, driving

**Intravenous infusion**, ciprofloxacin (as lactate) 2 mg/mL, net price 50-mL bottle = £7.57, 100-mL bottle = £14.49, 200-mL bottle = £19.79

**Ciproxin** ([B](节)

**Tablets**, all f/c, ciprofloxacin (as hydrochloride) 250 mg (scored), net price 10-tab pack = £6.59; 500 mg (scored), 10-tab pack = £12.49; 750 mg, 10-tab pack = £17.78. Label: 7, 9, 25, counselling, driving

**Suspension**, strawberry-flavoured, ciprofloxacin for reconstitution with diluent provided, 250 mg/5 mL, net price 100 mL = £19.80. Label: 7, 9, 25, counselling, driving

**Intravenous infusion**, ciprofloxacin (as lactate) 2 mg/mL, in sodium chloride 0.9%, net price 50-mL bottle = £7.61, 100-mL bottle = £15.01, 200-mL bottle = £22.85

**Electrolytes** Na* 15.4 mmol/100-mL bottle

**LEVOFLOXACIN**

**Indications** see notes above and under Dose

**Cautions** see notes above; history of psychiatric illness; interactions: Appendix 1 (quinolones) Driving May impair performance of skilled tasks (e.g. driving)

**Contra-indications** see notes above

**Renal impairment** usual initial dose then use half normal dose if eGFR 20–50 mL/minute/1.73 m²; consult product literature if eGFR less than 20 mL/minute/1.73 m²

**Pregnancy** see notes above

**Breast-feeding** manufacturer advises avoid

**Side-effects** see notes above; also flatulence, constipation, hydropenia; rarely tachycardia, palpitation, abnormal dreams, tinnitus, hypoglycaemia; also reported potentially life-threatening hepatic failure, syncope, benign intracranial hypertension, pneumonitis, peripheral neuropathy, extrapyramidal symptoms, hyperglycaemia, rhombomylolysis, stomatitis; local reactions and transient hypotension reported with infusion

**Dose**

- **By mouth**, acute sinusitis, 500 mg once daily for 10–14 days Acute exacerbation of chronic bronchitis, 500 mg once daily for 7–10 days Community-acquired pneumonia, 500 mg once or twice daily for 7–14 days Urinary-tract infections, 500 mg once daily for 7–14 days (250 mg once daily for 3 days in uncomplicated infection) Chronic prostatitis, 500 mg once daily for 28 days Complicated skin and soft tissue infections, 500 mg once or twice daily for 7–14 days Inhalation anthrax (treatment and post-exposure prophylaxis, see notes above), by mouth, 500 mg twice daily **By intravenous infusion** over 60 minutes, 400 mg every 12 hours

5.1.2 Quinolones 399
5 Infections

soft-tissue infections, inflammatory disease, 7–21 days for complicated skin and
of chronic bronchitis, 7 days in sinusitis, 14 days in pelvic
community-acquired pneumonia, 5–10 days in exacerbations

Note

By mouth.

Dose

Side-effects

Breast-feeding

Pregnancy

Hepatic impairment

Renal impairment

Pregnancy

Breast-feeding

Side-effects

Dose

By mouth, 400 mg once daily

By intravenous infusion over 60 minutes, community-acquired pneumonia, complicated skin and soft-tissue infections, 400 mg once daily

Recommended duration of treatment is 7–14 days for community-acquired pneumonia, 5–10 days in exacerbations of chronic bronchitis, 7 days in sinusitis, 14 days in pelvic inflammatory disease, 7–21 days for complicated skin and soft-tissue infections

NALIDIXIC ACID

Indications

urinary-tract infections

Cautions

see notes above; avoid in acute porphyria (section 9.8.2); false positive urinary glucose (if tested for reducing substances); monitor blood counts, renal and liver function if treatment exceeds 2 weeks;

interactions: Appendix 1 (quinolones)

Contra-indications

see notes above

Hepatic impairment

manufacturer advises caution in liver disease

Renal impairment

use with caution; avoid if eGFR less than 20 mL/minute/1.73 m²

Pregnancy

see notes above

Breast-feeding

risk to infant very small but one case of haemolytic anaemia reported

Side-effects

see notes above; also reported toxic psychosis, increased intracranial pressure, cranial nerve palsy, peripheral neuropathy, and metabolic acidosis

Dose

900 mg every 6 hours for 7 days, reduced in chronic infections to 600 mg every 6 hours; CHILD 3 months–18 years see BNF for Children

Nalidixic Acid (Rosemont) [P]

Suspension, pink, nalidixic acid 300 mg/5 mL, net price 150 mL (raspberry- and strawberry-flavoured) = £17.00. Label: 9, 11

Excipients include sucrose 450 mg/5 mL

NORFLOXACIN

Indications

see under Dose

Cautions

see notes above; interactions: Appendix 1 (quinolones)

Driving

May impair performance of skilled tasks (e.g. driving)

Contra-indications

see notes above

Renal impairment

use 400 mg once daily if eGFR less than 20 mL/minute/1.73 m²

Pregnancy

see notes above

Breast-feeding

no information available—manufacturer advises avoid

Side-effects

see notes above; also tinnitus, epiphora; rarely pancreatitis; very rarely arthritides; also reported, polyneuropathy and exfoliative dermatitis

Dose

‘Lower’ urinary-tract infections, 400 mg twice daily for 7–10 days (for 3 days for uncomplicated infections in women)

Chronic relapsing ‘lower’ urinary-tract infections, 400 mg twice daily for up to 12 weeks; may be reduced to 400 mg once daily if adequate suppression within first 4 weeks

Chronic prostatitis, 400 mg twice daily for 28 days

Mixtures

Laxatives

Dose

Side-effects

Breast-feeding

Pregnancy

Contra-indications

Indications

see under Dose

Cautions

see notes above; interactions: Appendix 1 (quinolones)

Driving

May impair performance of skilled tasks (e.g. driving)

Contra-indications

see notes above

Renal impairment

use 400 mg once daily if eGFR less than 20 mL/minute/1.73 m²

Pregnancy

see notes above

Breast-feeding

no information available—manufacturer advises avoid

Side-effects

see notes above; also tinnitus, epiphora; rarely pancreatitis; very rarely arthritides; also reported, polyneuropathy and exfoliative dermatitis

Dose

‘Lower’ urinary-tract infections, 400 mg twice daily for 7–10 days (for 3 days for uncomplicated infections in women)

Chronic relapsing ‘lower’ urinary-tract infections, 400 mg twice daily for up to 12 weeks; may be reduced to 400 mg once daily if adequate suppression within first 4 weeks

Chronic prostatitis, 400 mg twice daily for 28 days

Mixtures

Pregnancy

Contra-indications
Norfloxacin (Non-proprietary) (Tarivid).
Tablets, norfloxacin 400mg, net price 6-tab pack = £5.40, 14-tab pack = £12.00. Label: 7, 9, 23, counselling, driving

**OFLOXACIN**

**Indications** see under Dose

**Cautions** see notes above; history of psychiatric illness; interactions: Appendix 1 (quinolones)

Driving May affect performance of skilled tasks (e.g. driving); effects enhanced by alcohol

**Contra-indications** see notes above

**Hepatic impairment** use with caution; elimination may be reduced in severe impairment

**Renal impairment** usual initial dose, then use half normal dose if eGFR 20–50 mL/minute/1.73 m²; 100 mg every 24 hours if eGFR less than 20 mL/minute/1.73 m²

**Pregnancy** see notes above

**Breast-feeding** amount probably too small to be harmful but manufacturer advises avoid

**Side-effects** see notes above; also cough, nasopharyngitis, eye irritation; rarely arrhythmias, bronchospasm, abnormal dreams, hot flushes, hyperhidrosis; very rarely neuropathy, extrapyramidal symptoms, tinnitus; also reported pneumonitis, changes in blood sugar, myopathy, rhabdomyolysis; on intravenous infusion, hypotenison and local reactions (including thrombophlebitis)

**Dose**

- **By mouth**, urinary-tract infections, 200–400 mg daily preferably in the morning, increased if necessary in upper urinary-tract infections to 400 mg twice daily
- Acute or chronic prostatitis, 200 mg twice daily for 28 days
- Lower respiratory-tract infections, 400 mg daily preferably in the morning, increased if necessary to 400 mg twice daily
- Skin and soft-tissue infections, 400 mg twice daily
- Uncomplicated gonorrhoea, 400 mg as a single dose
- Uncomplicated genital chlamydial infection, nongonococcal urethritis, 400 mg daily in single or divided doses for 7 days
- Pelvic inflammatory disease (see also section 5.1, table 1), 400 mg twice daily for 14 days
- **By intravenous infusion** (over at least 30 minutes for each 200 mg), complicated urinary-tract infection, 200 mg daily
- Lower respiratory-tract infection, 200 mg twice daily
- Septicaemia, 200 mg twice daily
- Skin and soft-tissue infections, 400 mg twice daily
- Severe or complicated infections, dose may be increased to 400 mg twice daily

**Ofloxacin** (Non-proprietary) (Tarivid).
Tablets, ofloxacin 200 mg, net price 10-tab pack = £7.64, 400 mg, 5-tab pack = £12.67, 10-tab pack = £4.59. Label: 6, 9, 11, counselling, driving

**Tarivid** (Sanofi-Aventis) (Tarivid).
Tablets, f/c, scored, ofloxacin 200mg, net price 10-tab pack = £7.53, 20-tab pack = £15.05, 400 mg (yellow), 5-tab pack = £7.52, 10-tab pack = £14.99. Label: 6, 9, 11, counselling, driving

**Intravenous infusion**, ofloxacin (as hydrochloride) 2 mg/mL, net price 100-mL bottle = £16.16 (hosp. only)

---

**5.1.13 Urinary-tract infections**

Urinary-tract infection is more common in women than in men; when it occurs in men there is frequently an underlying abnormality of the renal tract. Recurrent episodes of infection are an indication for radiological investigation especially in children in whom untreated pyelonephritis may lead to permanent kidney damage.

*Escherichia coli* is the most common cause of urinary-tract infection, *Staphylococcus saprophyticus* is also common in sexually active young women. Less common causes include Proteus and Klebsiella spp. *Pseudomonas aeruginosa* infections usually occur in the hospital setting and may be associated with functional or anatomical abnormalities of the renal tract. *Staphylococcus epidermidis* and *Enterococcus faecalis* infection may complicate catheterisation or instrumentation.

A specimen of urine should be collected for culture and sensitivity testing before starting antibacterial therapy;

- in men;
- in pregnant women;
- in children under 3 years of age;
- in patients with suspected upper urinary-tract infection, complicated infection, or recurrent infection;
- if resistant organisms are suspected;
- if urine dipstick testing gives a single positive result for leucocyte esterase or nitrite;
- if clinical symptoms are not consistent with results of dipstick testing.

Treatment should not be delayed while waiting for results. The antibacterial chosen should reflect current local bacterial sensitivity to antibacterials.

Uncomplicated lower urinary-tract infections often respond to trimethoprim, nitrofurantoin, or amoxicillin given for 7 days (3 days may be adequate for infections in women; see also Table 1, section 5.1); those caused by fully sensitive bacteria respond to two 3-g doses of amoxicillin (section 5.1.1.3). Widespread bacterial resistance to ampicillin, amoxicillin, and trimethoprim has been reported. Alternatives for resistant organisms include co-amoxiclav (amoxicillin with clavulanic acid), an oral cephalosporin, nitrofurantoin, pivmecillinam, or a quinoline.

Fosfomycin [unlicensed] can be used, on the advice of a microbiologist, for the treatment of uncomplicated lower urinary-tract infections caused by multiple-antibacterial resistant organisms when other antibacterials cannot be used; in adults, it is given as a single oral dose of 3 g.

Long-term low dose therapy may be required in selected patients to prevent recurrence of infection; indications include frequent relapses and significant kidney damage. Trimethoprim, nitrofurantoin and cepalexin have been recommended for long-term therapy.

*Methenamine* (hexamine) should not generally be used because it requires an acidic urine for its antimicrobial activity and it is ineffective for upper urinary-tract infections; it may, however, have a role in the prophylaxis and treatment of chronic or recurrent uncomplicated lower urinary-tract infections.

*Acute pyelonephritis* can lead to sepsicaemia and is treated initially by injection of a broad-spectrum antibacterial such as cefuroxime or a quinoline if the patient is severely ill; gentamicin can also be used.
Infections

Prostatitis can be difficult to cure and requires treatment for several weeks with an antibacterial which penetrates prostatic tissue such as trimethoprim, or some quinolones.

Where infection is localised and associated with an indwelling catheter a bladder instillation is often effective (section 7.4.4).

Pregnancy Urinary-tract infection in pregnancy may be asymptomatic and requires prompt treatment to prevent progression to acute pyelonephritis. Penicillins and cephalosporins are suitable for treating urinary-tract infection during pregnancy. Nitrofurantoin may also be used but it should be avoided at term. Sulphonamides and quinolones should be avoided during pregnancy; trimethoprim should also preferably be avoided particularly in the first trimester.

Renal impairment In renal failure antibacterials normally excreted by the kidney accumulate with resultant toxicity unless the dose is reduced. This applies especially to the aminoglycosides which should be used with great caution; tetracyclines, methenamine, and nitrofurantoin should be avoided altogether.

Children Urinary-tract infections in children require prompt antibacterial treatment to minimise the risk of renal scarring. Uncomplicated ‘lower’ urinary-tract infections in children over 3 months of age can be treated with trimethoprim, nitrofurantoin, a first generation cephalosporin (e.g. cefalexin), or amoxicillin for 3 days; children should be reassessed if they continue to be unwell 24–48 hours after the initial assessment. Amoxicillin should only be used if the organism causing the infection is sensitive to it.

Acute pyelonephritis in children over 3 months of age can be treated with a first generation cephalosporin or co-amoxiclav for 7–10 days. If the patient is severely ill, then the infection is best treated initially by injection of a broad-spectrum antibacterial such as cefotaxime or co-amoxiclav; gentamicin is an alternative.

Children under 3 months of age should be transferred to hospital and treated initially with intravenous antibacterial drugs such as ampicillin with gentamicin, or cefotaxime alone, until the infection responds; full doses of oral antibacterials are then given for a further period.

Recurrent episodes of infection are an indication for imaging tests. Antibacterial prophylaxis with low doses of trimethoprim or nitrofurantoin may be considered for children with recurrent infection, significant urinary-tract anomalies, or significant kidney damage.

Nitrofurantoin

Indications urinary-tract infections

Cautions anaemia; diabetes mellitus; electrolyte imbalance; vitamin B and folate deficiency; pulmonary disease; on long-term therapy, monitor liver function and monitor for pulmonary symptoms, especially in the elderly (discontinue if deterioration in lung function); susceptibility to peripheral neuropathy; false positive urinary glucose (if tested for reducing substances); urine may be coloured yellow or brown; interactions: Appendix 1 (nitrofurantoin)

Contra-indications infants less than 3 months old. G6PD deficiency (section 9.1.5); acute porphyria (section 9.8.2)

Hepatic impairment use with caution; cholestatic jaundice and chronic active hepatitis reported

Renal impairment avoid if eGFR less than 60 mL/minute/1.73 m²; risk of peripheral neuropathy; ineffective because of inadequate urine concentrations

Pregnancy avoid at term—may produce neonatal haemolysis

Breast-feeding avoid; only small amounts in milk but could be enough to produce haemolysis in G6PD-deficient infants (section 9.1.5)

Side-effects anaemia, nausea, vomiting, and diarrhoea; acute and chronic pulmonary reactions (pulmonary fibrosis reported; possible association with lupus erythematosus-like syndrome); peripheral neuropathy; also reported, hypersensitivity reactions (including angioedema, anaphylaxis, sialadenitis, urticaria, rash and pruritus); rarely, cholestatic jaundice, hepatitis, exfoliative dermatitis, erythema multiforme, pancreatitis, arthralgia, blood disorders (including agranulocytosis, thrombocytopenia, and aplastic anaemia), benign intracranial hypertension, and transient alopecia

Dose

- Acute uncomplicated infection, 50 mg every 6 hours with food for 7 days (3 days usually adequate in women); CHILD over 3 months, 750 micrograms/kg every 6 hours
- Severe chronic recurrent infection, 100 mg every 6 hours with food for 7 days (dose reduced or discontinued if severe nausea)
- Prophylaxis (but see Cautions), 50–100 mg at night; CHILD over 3 months, 1 mg/kg at night

Nitrofurantoin (Non-proprietary) (BNF 68)

Tablets, nitrofurantoin 50 mg, net price 28-tab pack = £24.35; 100 mg, 28-tab pack = £8.47. Label: 9, 14, 21

Oral suspension, nitrofurantoin 25 mg/5 mL, net price 300 mL = £195.83. Label: 9, 14, 21

Note Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription

Modified release

Macrobid® (AMCo) (BNF 68)

Capsules, m/r, blue/yellow, nitrofurantoin 100 mg (as nitrofurantoin macrocrystals and nitrofurantoin monohydrate), net price 14-cap pack = £9.50. Label: 9, 14, 21, 25

Dose uncomplicated urinary-tract infection, 1 capsule twice daily with food

Genito-urinary surgical prophylaxis, 1 capsule twice daily on day of procedure and for 3 days after

Methenamine Hippurate

(Hexamine hippurate)

Indications prophylaxis and long-term treatment of chronic or recurrent lower urinary-tract infections

Cautions avoid concurrent administration with sulphonamides (risk of crystalluria) or urinary alkalinising agents; interactions: Appendix 1 (methenamine)

Contra-indications severe dehydration, gout, metabolic acidosis

Hepatic impairment avoid

Renal impairment avoid if eGFR less than 10 mL/minute/1.73 m²—risk of hippurate crystalluria

Pregnancy use with caution

Breast-feeding amount too small to be harmful

Side-effects gastro-intestinal disturbances, bladder irritation, rash
Dose
- 1 g every 12 hours (may be increased in patients with catheters to 1 g every 8 hours); CHILD 6–12 years 500 mg every 12 hours

Hiprex® (Meda) Tablets, scored, methenamine hippurate 1 g, net price 60-tab pack = £19.74. Label: 9

5.2 Antifungal drugs

5.2.1 Triazole antifungals
5.2.2 Imidazole antifungals
5.2.3 Polyene antifungals
5.2.4 Echinocandin antifungals
5.2.5 Other antifungals

Treatment of fungal infections

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. For local treatment of fungal infections, see section 7.2.2 (genital), section 7.4.4 (bladder), section 11.3.2 (eye), section 12.1.1 (ear), section 12.3.2 (opharynx), and section 13.10.2 (skin).

Aspergillosis  Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the heart, brain, and skin. Voriconazole (section 5.2.1) is the treatment of choice for aspergillosis; liposomal amphotericin (section 5.2.3) is an alternative first-line treatment when voriconazole cannot be used. Caspofungin (section 5.2.4), itraconazole (section 5.2.1), or posaconazole (section 5.2.1) can be used in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin. Itraconazole is also used for the treatment of chronic pulmonary aspergillosis or as an adjunct in the treatment of allergic bronchopulmonary aspergillosis [unlicensed indication].

Candidiasis  Many superficial candidal infections including infections of the skin (section 13.10.2) are treated locally; widespread or intractable infection requires systemic antifungal treatment. Vaginal candidiasis (section 7.2.2) may be treated with locally acting antifungals or with fluconazole (section 5.2.1) given by mouth; for resistant organisms, itraconazole (section 5.2.1) can be given by mouth.

Oropharyngeal candidiasis generally responds to topical therapy (section 12.3.2); fluconazole is given by mouth for unresponsive infections; it is effective and is reliably absorbed. Itraconazole may be used for infections that do not respond to fluconazole. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred.

For invasive or disseminated candidiasis, an echinocandin (section 5.2.4) can be used. Fluconazole (section 5.2.1) is an alternative for Candida albicans infection in clinically stable patients who have not received an azole antifungal recently. Amphotericin (section 5.2.3) is an alternative when an echinocandin or fluconazole cannot be used, however, amphotericin should be considered for the initial treatment of CNS candidiasis. Voriconazole (section 5.2.1) can be used for infections caused by fluconazole-resistant Candida spp. when oral therapy is required, or in patients intolerant of amphotericin or an echinocandin. In refractory cases, flucytosine (section 5.2.5) can be used with intravenous amphotericin.

Cryptococcosis  Cryptococcosis is uncommon but infection in the immunocompromised, especially in HIV-positive patients, can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is amphotericin (section 5.2.3) by intravenous infusion and flucytosine (section 5.2.5) by intravenous infusion for 2 weeks, followed by fluconazole (section 5.2.1) by mouth for 8 weeks or until cultures are negative. In cryptococcosis, fluconazole is sometimes given alone as an alternative in HIV-positive patients with mild, localised infections or in those who cannot tolerate amphotericin. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

Histoplasmosis  Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons. Itraconazole (section 5.2.1) can be used for the treatment of immunocompetent patients with indolent non-meningeal infection, including chronic pulmonary histoplasmosis. Amphotericin (section 5.2.3) by intravenous infusion is used for the initial treatment of fulminant or severe infections, followed by a course of itraconazole by mouth. Following successful treatment, itraconazole can be used for prophylaxis against relapse until immunity recovers.

Skin and nail infections  Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy (section 13.10.2). Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is difficult to treat as in infections of the nails (onychomycosis) and of the scalp (tinea capitis). Oral imidazole or triazole antifungals (particularly itraconazole) and terbinafine are used more frequently than griseofulvin because they have a broader spectrum of activity and require a shorter duration of treatment. Tinea capitis is treated systemically; additional topical application of an antifungal (section 13.10.2) may reduce transmission. Griseofulvin (section 5.2.5) is used for tinea capitis in adults and children; it is effective against infections caused by Trichophyton tonsurans and Microsporum spp. Terbinafine (section 5.2.5) is used for tinea capitis caused by T. tonsurans [unlicensed indication]. The role of terbinafine in the management of Microsporum infections is uncertain.

Pityriasis versicolor (section 13.10.2) may be treated with itraconazole (section 5.2.1) by mouth if topical therapy is ineffective; fluconazole (section 5.2.1) by mouth is an alternative. Oral terbinafine is not effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. Terbinafine (section 5.2.5) and itraconazole (section 5.2.1) have largely replaced griseofulvin for the systemic treatment of onychomycosis, particularly of the toenail; terbinafine is considered to be the drug of choice. Itraconazole can be administered as intermittent ‘pulse’ therapy. For the role of topical antifungals in the treatment of onychomycosis, see section 13.10.2.

Immunocompromised patients  Immunocompromised patients are at particular risk of fungal infections...

Voriconazole is a broad-spectrum antifungal drug which is licensed for use in life-threatening infections.

FLUCONAZOLE

Dose

Vaginal candidiasis (see also Recurrent Vulvovaginal Candidiasis, section 7.2.2) and candidal balanitis.

ADULT and CHILD over 16 years, by mouth, a single dose of 150 mg

Mucosal candidiasis (except genital), by mouth, 50 mg daily (100 mg daily in unusually difficult infections) given for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompro-

Concomitant use with hepatotoxic drugs, fluconazole is less frequently associated with hepatotoxicity.

Itraconazole capsules require an acid environ-

and associated candidal balanitis in those aged 16–60 years, in a container or packaging containing not more than 150 mg and labelled to show a max. dose of 150 mg

Voriconazole is a broad-spectrum antifungal drug which is licensed for use in life-threatening infections.

Posaconazole (section 5.2.1) can be used for prophylaxis of candidiasis in patients undergoing haematopoietic stem cell transplantation when fluconazole, itraconazole or posaconazole cannot be used.

Antifungal preparations are contraindicated in pregnancy except when the potential benefit to the mother clearly outweighs any possible risk to the fetus.

1 Capsules can be sold to the public for vaginal candidiasis and associated candidal balanitis in those aged 16–60 years, in a container or packaging containing not more than 150 mg and labelled to show a max. dose of 150 mg

**ITRACONAZOLE**

**Indications** see under Dose

**Cautions** absorption reduced in HIV-infection and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary); susceptibility to congestive heart failure (see also Heart Failure, below); **interactions:** Appendix 1 (antifungals, triazole)

**Hepatotoxicity** Potentially life-threatening hepatotoxicity reported very rarely—discontinue if signs of hepatitis develop. Avoid or use with caution if history of hepatotoxicity with other drugs or in active liver disease. **Counselling.** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop

**Heart failure** Following reports of heart failure, caution is advised when prescribing itraconazole to patients at high risk of heart failure. Those at risk include:
- patients receiving high doses and longer treatment courses;
- older patients and those with cardiac disease;
- patients with chronic lung disease (including chronic obstructive pulmonary disease) associated with pulmonary hypertension;
- patients receiving treatment with negative inotropic drugs, e.g. calcium channel blockers.

Itraconazole should be avoided in patients with ventricular dysfunction or a history of heart failure unless the infection is serious.

**Contra-indications** acute porphyria (section 9.8.2)

**Hepatic impairment** use only if potential benefit outweighs risk of hepatotoxicity (see Hepatotoxicity above); dose reduction may be necessary

**Renal impairment** risk of congestive heart failure; bioavailability of oral formulations possibly reduced; use intravenous infusion with caution if eGFR 30–80 mL/minute/1.73 m²; avoid intravenous infusion if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises use only in life-threatening situations (toxicity at high doses in animal studies); ensure effective contraception during treatment and until the next menstrual period following end of treatment

**Breast-feeding** small amounts present in milk—may accumulate; manufacturer advises avoid

**Side-effects** nausea, vomiting, taste disturbances, abdominal pain, diarrhoea, hepatitis (see Hepatotoxicity above), dyspnoea, headache, hypokalaemia, rash; less commonly dyspepsia, flatulence, constipation, oedema, dizziness, peripheral neuropathy (discontinue treatment), menstrual disorder, myalgia; rarely pancreatitis, heart failure (see Cautions above), hypertriglyceridaemia, erectile dysfunction, urinary frequency, leucopenia, visual disturbances, tinnitus, deafness, alopecia, photosensitivity, toxic epidermal necrolysis, Stevens-Johnson syndrome; also reported, blood pressure changes, confusion, drowsiness, tremor, thrombocytopenia, renal impairment, arthralgia; with intravenous injection hyperglycaemia

**Dose**
- **By mouth,** oropharyngeal candidiasis, see under **Sporanox®** oral liquid below
- **Vulvovaginal candidiasis** (see also Recurrent Vulvovaginal Candidiasis, section 7.2.2), 200 mg twice daily for 1 day
- **Pityriasis versicolor**, 200 mg once daily for 7 days
- **Tinea corporis and tinea cruris**, either 100 mg once daily for 15 days or 200 mg once daily for 7 days
- **Tinea pedis and tinea manuum**, either 100 mg once daily for 30 days or 200 mg twice daily for 7 days
- **Onychomycosis**, either 200 mg once daily for 3 months or course (‘pulse’) of 200 mg twice daily for 7 days, subsequent courses repeated after 21-day interval; fingernails 2 courses, toenails 3 courses
- **Aspergillosis**, 200 mg twice daily
- **Histoplasmosis**, 200 mg 3 times daily for 3 days, then 200 mg once or twice daily
- **Systemic candidiasis and cryptococcosis** including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective, 200 mg once daily (candidiasis 100–200 mg once daily) increased in invasive or disseminated disease and in cryptococcal meningitis to 200 mg twice daily
- Maintenance in HIV-infected patients to prevent relapse of underlying fungal infection and prophylaxis in neutropenia when standard therapy inappropriate, 200 mg once daily, increased to 200 mg twice daily if low plasma-itraconazole concentration (see Cautions)
- **Prophylaxis** in patients with haematological malignancy or undergoing bone-marrow transplant, see under **Sporanox®** oral liquid below
- **By intravenous infusion,** systemic aspergillosis, candidiasis and cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective, histoplasmosis, 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days
- **Child** under 18 years see **BNF for Children**
- **Note** Itraconazole doses in BNF may differ from those in product literature

**Itraconazole (Non-proprietary)**

| Capsules, enclosing coated beads, itraconazole 100 mg, net price 15-cap pack = £4.30. Label: 5, 9, 21, 25, counselling, hepatotoxicity |
|---|---|

**Fluconazole Oral Suspension 50 mg/5 mL**

- **By intravenous infusion** fluconazole 2 mg/mL in sodium chloride intravenous infusion 0.9%, net price 100-mL bottle = £29.28.
- **Electrolytes** Na+ 15 mmol/100-mL bottle = £25.72; 60-cap pack = £55.10. Label: 5, 9, 21, 25, counselling, hepatotoxicity
5 Infections

5.2.1 Triazole antifungals

Oral liquid, sugar-free, cherry-flavoured, itraconazole 10 mg/mL. net price 150 mL (with 10-mL measuring cup) = £58.34. Label: 9, 23, counselling, administration, hepatotoxicity

Dose oral or oesophageal candidiasis in HIV-positive or other immunocompromised patients, 20 mL (2 measuring cups) daily in 1–2 divided doses for 1 week (continue for another week if no response) Oral or oesophageal candidiasis that has not responded to fluconazole, 10–20 mL (1–2 measuring cups) twice daily for 2 weeks (continue for another 2 weeks if no response; the higher dose should not be used for longer than 2 weeks if no signs of improvement)

Prophylaxis of deep fungal infections (when standard therapy is inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic, 5 mg/kg daily, in 2 divided doses; starting before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers; CHILD and ELDERLY safety and efficacy not established

Contraindications Do not take with food; swish around mouth and swallow, do not rinse afterwards

Concentrate for intravenous infusion, itraconazole 10 mg/mL. For dilution before use. Net price 25-mL amp (with infusion bag and filter) = £79.71

Excipients include propylene glycol

POSAConAOZLe

Indications invasive aspergillosis (see notes above); fusariosis either unresponsive to, or in patients intolerant of, amphotericin; chromoblastomycosis and mycetoma either unresponsive to, or in patients intolerant of, itraconazole; coccidioidomycosis either unresponsive to, or in patients intolerant of, amphotericin, itraconazole, or fluconazole; see also under preparations below

Cautions cardiomypathy, bradycardia, symptomatic arrhythmias, history of QT interval prolongation, concomitant use with other drugs known to cause QT-interval prolongation; monitor electrolytes (including potassium, magnesium, and calcium) before and during therapy, monitor liver function before and during therapy; body-weight under 60 kg—risk of side-effects increased; body-weight over 120 kg—risk of treatment failure possibly increased; interactions: Appendix 1 (antifungals, triazole)

Contra-indications acute porphyria (section 9.8.2)

Hepatic impairment monitor liver function; manufacturer advises caution

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk and recommends effective contraception during treatment; toxicity in animal studies

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects gastro-intestinal disturbances (including nausea, vomiting, abdominal pain, diarrhoea, constipation, dyspepsia, and flatulence); dizziness, headache, paraesthesia, drowsiness, fatigue, fever, anorexia; blood disorders (including anaemia, neutropenia, and thrombocytopenia); electrolyte disturbances; dry mouth; rash, pruritus; less commonly pancreatitis, hepatic disorders, gastro-oesophageal reflux, arrhythmias, bradycardia, tachycardia, palpitations, changes in blood pressure, oedema, vasculitis, cough, hiccup, convulsions, neuropathy, tremor, aphasia, insomnia, hyperglycaemia, menstrual disorders, renal failure, musculoskeletal pain, visual disturbances, mouth ulcers, and alopecia; rarely ileus, cardiac failure, myocardial infarction, stroke, thrombosis, syncope, pneumonitis, psychosis, depression, encephalopathy, adrenal insufficiency, breast pain, hearing impairment, and Stevens-Johnson syndrome

Dose

See under preparations below

Noxafil® (MSD) Tablets, yellow, e/c, posaconazole 100 mg, net price 24-tab pack = £596.96, 96-tab pack = £2387.85. Label: 3, 9, 25

Note Tablets not licensed for oropharyngeal candidiasis

Dose ADULT over 18 years, 300 mg twice daily on first day, then 300 mg once daily Prophylaxis of invasive fungal infections in patients undergoing bone-marrow transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome who are expected to become neutropenic, and who are intolerant of fluconazole or itraconazole, ADULT over 18 years, 300 mg twice daily on first day, then 300 mg once daily, starting before transplantation or before chemotherapy and continued until neutrophil count recovers

Suspension, posaconazole 200 mg/5 mL, net price 105 mL (cherry-flavoured) = £491.20. Label: 3, 9, 21

Dose ADULT over 18 years, 400 mg twice daily with food or if food not tolerated, 200 mg 4 times daily

Oropharyngeal candidiasis (severe infection or in immunocompromised patients only), ADULT over 18 years, 200 mg with food on first day, then 100 mg once daily with food for 13 days

Prophylaxis of invasive fungal infections in patients undergoing bone-marrow transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome who are expected to become neutropenic, and who are intolerant of fluconazole or itraconazole, ADULT over 18 years, 200 mg 3 times daily with food, starting before transplantation or before chemotherapy and continued until neutrophil count recovers

Note Where possible, Noxafil® tablets should be used in preference to the suspension because the tablets have a higher bioavailability; the suspension is not interchangeable with the tablets on a milligram-for-milligram basis

VorICOnAOZLe

Indications invasive aspergillosis; serious infections caused by Scedosporium spp., Fusarium spp., or invasive fluconazole-resistant Candida spp. (including C. krusei)

Cautions electrolyte disturbances, cardiomyopathy, bradycardia, symptomatic arrhythmias, history of QT interval prolongation, concomitant use with other drugs that prolong QT interval; patients at risk of pancreatitis; monitor renal function; interactions: Appendix 1 (antifungals, triazole)

Hepatotoxicity Hepatitis, cholestasis, and fulminant hepatic failure reported uncommonly; risk increased in patients with haematological malignancy. Monitor liver function before starting treatment, then at least weekly for 1 month, and then monthly during treatment. Consider treatment discontinuation if severe abnormalities in liver function tests. Patients should be told how to recognise signs of liver disorder, and advised to seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

Phototoxicity Phototoxicity occurs commonly. Patients should be advised to avoid intense or prolonged exposure to direct sunlight, and to avoid use of sunbeds. In sunlight, patients should cover sun-exposed areas of skin and use a sunscreen with a high sun protection factor. Patients should seek medical attention if they experience sunburn or a severe skin reaction following exposure to light or sun. If phototoxicity occurs, consider treatment discontinuation; if
treatment is continued, monitor for pre-malignant skin lesions and squamous cell carcinoma, and discontinue treatment if they occur. Patients should be advised to keep the Alert Card with them at all times.

**Contra-indications** acute porphyria (section 9.8.2)

**Hepatic impairment** in mild to moderate hepatic cirrhosis use usual loading dose then halve maintenance dose; no information available for severe hepatic cirrhosis—manufacturer advises use only if potential benefit outweighs risks. See also Hepatotoxicity above

**Renal impairment** intravenous vehicle may accumulate if eGFR less than 50 mL/minute/1.73 m²—use intravenous infusion only if potential benefit outweighs risk, and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required)

**Pregnancy** toxicity in animal studies—manufacturer advises avoid unless potential benefit outweighs risks; effective contraception required during treatment

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, jaundice (see Hepatotoxicity above), oedema, hypotension, chest pain, respiratory distress syndrome, sinusitis, headache, dizziness, asthma, anxiety, depression, confusion, agitation, hallucinations, paraesthesia, tremor, influenza-like symptoms, hypoglycaemia, haematuria, blood disorders (including anaemia, thrombocytopenia, leucopenia, pancytopenia), acute renal failure, hypokalaemia, visual disturbances (including altered perception, blurred vision, photophobia, rash, pruritus, photosensitivity, alopecia, cheilitis, injection-site reactions; less commonly dyspepsia, duodenitis, cholecystitis, pancreatitis, hepatitis (see Hepatotoxicity above), constipation, arrhythmias (including QT interval prolongation), syncope, hypotension, pressure headache, dizziness, chest pain, tachypnoea, allergic reactions, rash, pruritus, photosensitivity, pseudomembranous colitis, taste disturbances (more common with oral suspension), convulsions, extrapyramidal effects, insomnia, tinnitus, hearing disturbances, hyperpyrexia, hypothyroidism, hyperparathyroidism, discoid lupus erythematosus, toxic epidermal necrolysis, pseudo-porphyrja, retinal haemorrhage, optic atrophy; also reported on long-term treatment squamous cell carcinoma of skin (particularly in presence of photo-toxicity) and periostitis (particularly in transplant patients)

**Dose**

- **By mouth** ADULT over 18 years, body-weight over 40 kg, 400 mg every 12 hours for 2 doses then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours; body-weight under 40 kg, 200 mg every 12 hours for 2 doses then 100 mg every 12 hours; body-weight under 40 kg, 400 mg every 12 hours for 2 doses then 200 mg every 12 hours, increased if necessary to 150 mg every 12 hours; CHILD 2–18 years see BNF for Children

- **By Intravenous Infusion** 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours (reduced to 3 mg/kg every 12 hours if not tolerated) for max. 6 months; CHILD 2–18 years see BNF for Children

**Vend®** (Pfizer)

- Tablets, 1, 2, 3, voriconazole 50 mg, net price 28-tablet pack = £275.68; 200 mg, 28-tab pack = £1102.74.

- Label: 9, 11, 23, counselling, hepatotoxicity, phototoxicity

**Oral suspension**, voriconazole 200 mg/5 mL when reconstituted with water, net price 75 mL (orange-flavoured) = £551.37. Label: 9, 11, 23, counselling, hepatotoxicity, phototoxicity

**Intravenous infusion**, powder for reconstitution, voriconazole, net price 200-mg vial = £77.14; 200-mg vial (with solvent) = £77.14

**Excipients** include sulfobutylether beta cyclodextrin sodium (risk of accumulation in renal impairment)

**Electrolytes** Na⁺ 9.47 mmol/vial

### 5.2.2 Imidazole antifungals

The imidazole antifungals include clotrimazole, econazole, ketoconazole, and miconazole. They are used for the local treatment of vaginal candidiasis (section 7.2.2) and for dermatophyte infections (section 13.10.2).

**CHMP advice**

**Ketoconazole (July 2013)**

The CHMP has recommended that the marketing authorisation for oral ketoconazole should be suspended. The CHMP concluded that the risk of hepatotoxicity associated with oral ketoconazole is greater than the benefit in treating fungal infections. Doctors should review patients who are being treated with oral ketoconazole for fungal infections, with a view to stopping treatment or choosing an alternative treatment. Patients with a prescription of oral ketoconazole for fungal infections should be referred back to their doctors.

Topical products containing ketoconazole are not affected by this advice.

**Miconazole** (section 12.3.2) can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.

### 5.2.3 Polyene antifungals

The polyene antifungals include amphotericin and nystatin; neither drug is absorbed when given by mouth. Nystatin is used for oral, oropharyngeal, and perioral infections by local application in the mouth (section 12.3.2). Nystatin is also used for *Candida albicans* infection of the skin (section 13.10.2).

**Amphotericin** by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (Abelcet® and AmBisome®) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive. For the role of amphotericin in the systemic treatment of fungal infections, see p. 403.

**AMPHOTERICIN**

**Amphotericin B**

**Indications** See under Dose

**Cautions** when given parenterally, toxicity common (close supervision necessary and test dose
required; see Anaphylaxis below); hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required; corticosteroids (avoid except to control reactions); avoid rapid infusion (risk of arrhythmias); interactions: Appendix 1 (amphotericin)

Anaphylaxis
Anaphylaxis can occur with any intravenous amphotericin product and a test dose is advisable before the first infusion, the patient should be carefully observed for at least 30 minutes after the test dose. Prophylactic antihistamines or hydrocortisone should only be used in patients who have previously experienced acute adverse reactions (in whom continued treatment with amphotericin is essential)

Renal impairment
use only if no alternative; nephrotoxicity may be reduced with use of lipid formulation

Pregnancy
not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk

Breast-feeding
no information available

Side-effects
nausea, vomiting, abdominal pain, diarrhoea, cardiovascular effects (including arrhythmias, blood pressure changes, chest pain), dyspnoea, headache, febrile reactions, electrolyte disturbances (including hypokalaemia and hyponatraemia), disturbances in renal function (including renal tubular acidosis), abnormal liver function (discontinue treatment), blood disorders (including anaemia, thrombocytopenia, rash; less commonly anaphylactoid reactions (see Anaphylaxis, above), bronchospasm, neurological disorders (including convulsions, peripheral neuropathy, tremor, encephalopathy, hearing loss, diplopia); also reported anorexia, myalgia, arthralgia, toxic epidermal necrolysis, Stevens-Johnson syndrome

Dose
- By intravenous infusion, see preparations

Note
Different preparations of intravenous amphotericin vary in their pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should not be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed

Fungizone® (Squibb) 
Intravenous infusion, powder for reconstitution, amphotericin (as sodium deoxycholate complex), net price 50-mg vial = £3.88
Electrolytes Na⁺ < 0.5 mmol/vial
Dose by intravenous infusion, systemic fungal infections, initial test dose of 1 mg over 20–30 minutes then 250 micrograms/kg daily, gradually increased over 2–4 days, if tolerated, to 1 mg/kg daily; max (severe infection) 1.5 mg/kg daily or on alternate days; CHILD under 18 years see BNF for Children

Note
Prolonged treatment usually necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg and increase gradually

Lipid formulations

Abelcet® (TEVA UK) 
Intravenous infusion, amphotericin 5 mg/mL as lipid complex with L-α-dimyristoylphosphatidylcholine and L-α-dimyristoylphosphatidylglycerol, net price 20-mL vial = £77.50 ( hosp. only)
Electrolytes Na⁺ 3.12 mmol/vial
Dose by intravenous infusion, severe invasive candidiasis; severe systemic fungal infections in patients not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin, including invasive aspergillosis, cryptococcal meningitis and disseminated cryptococcosis in HIV patients, initial test dose 1 mg over 15 minutes then 5 mg/kg once daily for at least 14 days; CHILD under 18 years see BNF for Children

AmBisome® (Gilead) 
Intravenous infusion, powder for reconstitution, amphotericin 50 mg encapsulated in liposomes, net price 50-mg vial = £96.69
Electrolytes Na⁺ < 0.5 mmol/vial
Excipients include sucrose 900 mg/vial
Dose by intravenous infusion, severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin; suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibiotics; aspergillosis, initial test dose 1 mg over 10 minutes then 3 mg/kg once daily, max 5 mg/kg once daily (unlicensed dose); CHILD under 18 years see BNF for Children

Visceral leishmaniasis, see section 5.4.5 and product literature

The echinocandin antifungals include anidulafungin, caspofungin and micafungin. They are only active against Aspergillus spp. and Candida spp.; however, anidulafungin and micafungin are not used for the treatment of aspergillosis. Echinocandins are not effective against fungal infections of the CNS. For the role of echinocandin antifungals in the prevention and systemic treatment of fungal infections, see p. 403.

ANIDULAFUNGIN
Indications
invasive candidiasis (see notes above)

Pregnancy
manufacturer advises avoid—no information available

Breast-feeding
manufacturer advises avoid unless potential benefit outweighs risk—present in milk in animal studies

Side-effects
diarrhoea, nausea, vomiting, flushing, convulsion, headache, coagulopathy, hypokalaemia, raised serum creatinine, rash, pruritus; less commonly abdominal pain, cholestasis, hypertension, hyperglycaemia, urticaria, injection-site pain; also reported, hypotension, dyspnoea, bronchospasm, hepatitis

Dose
- By intravenous infusion, ADULT over 18 years, 200 mg on first day then 100 mg once daily

Ecalta® (Pfizer) 
Intravenous infusion, powder for reconstitution, anidulafungin, net price 100-mg vial = £299.99

CASPOFUNGIN
Indications
invasive aspergillosis (see notes above); invasive candidiasis (see notes above); empirical treatment of systemic fungal infections in patients with neutropenia

Cautions
interactions: Appendix 1 (caspofungin)

Hepatic impairment
70 mg on first day then 35 mg once daily in moderate impairment; no information available for severe impairment

Pregnancy
manufacturer advises avoid unless essential—toxicity in animal studies

Breast-feeding
present in milk in animal studies—manufacturer advises avoid

Side-effects
nausea, diarrhoea, vomiting; dyspnoea; headache; hypokalaemia; arthralgia; rash, pruritus, sweating, injection-site reactions; less commonly abdominal pain, dyspepsia, dry mouth, dysphagia, taste disturbances, anorexia, constipation, flatulence,
cholestasis, hepatic dysfunction, ascites, palpitation, arrhythmia, chest pain, heart failure, thrombophlebitis, flushing, hypotension, hypertension, bronchospasm, cough, dizziness, fatigue, paraesthesia, hypoaesthesia, sleep disturbances, tremor, anxiety, disorientation, hyperglycaemia, renal failure, hypomagnesaemia, hypocalcaemia, metabolic acidosis, anaemia, thrombocytopenia, leucopenia, myalgia, muscular weakness, blurred vision, and erythema multiforme; also reported, adult respiratory distress syndrome and anaphylaxis

**Dose**
- By intravenous infusion, 70 mg on first day then 50 mg once daily (70 mg once daily if body-weight over 80 kg); **CHILD** under 18 years see BNF for Children

**Cancidas®** (MSD) intravenous infusion, powder for reconstitution, caspofungin (as acetate), net price 50-mg vial = £327.67; 70-mg vial = £416.78

**Indications** see under Dose

**Cautions** monitor renal function; interactions:
- Appendix 1 (micafungin) Hepatotoxicity Potentially life-threatening hepatotoxicity reported. Monitor liver function—discontinue if significant and persistent abnormalities in liver function tests develop. Use with caution in hepatic impairment (avoid if severe) or if receiving other hepatotoxic drugs. Risk of hepatic side-effects greater in children under 1 year of age

**Hepatic impairment** use with caution in mild to moderate impairment; avoid in severe impairment; see also Hepatotoxicity above

**Renal impairment** use with caution; renal function may deteriorate

**Pregnancy** manufacturer advises avoid unless essential—toxicity in animal studies

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risks—present in milk in animal studies

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain; headache, fever, hypokalaemia, hypomagnesaemia, hypocalcaemia, leucopenia, anaemia; rash, phlebitis, less commonly dyspepsia, constipation, hepatomegaly, hepatitis and cholestasis (see also Hepatotoxicity above), taste disturbances, anorexia, tachycardia, palpitation, bradycardia, blood pressure changes, flushing, dyspnoea, sleep disturbances, anxiety, confusion, dizziness, tremor, pancytopenia, thrombocytopenia, eosinophilia, hypopnaemia, hypophosphataemia, hyperkalaemia, hyperhidrosis, and pruritus; rarely haemolytic anaemia; also reported disseminated intravascular coagulation, renal failure (more frequent in children), Stevens-Johnson syndrome, toxic epidermal necrolysis

**Dose**
- By intravenous infusion, invasive candidiasis, **ADULT** body-weight over 40 kg, 100 mg once daily (increased to 200 mg daily if inadequate response) for at least 14 days; body-weight under 40 kg, 2 mg/kg once daily (increased to 4 mg/kg daily if inadequate response) for at least 14 days; **CHILD** under 18 years see BNF for Children

Oesophageal candidiasis, **ADULT** body-weight over 40 kg, 150 mg once daily; body-weight under 40 kg, 3 mg/kg once daily; **CHILD** 16–18 years see BNF for Children

Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days, **ADULT** body-weight over 40 kg, 50 mg once daily; body-weight under 40 kg, 1 mg/kg once daily; continue for at least 7 days after neutrophil count in desirable range; **CHILD** under 18 years see BNF for Children

**Mycamine®** (Astellas) intravenous infusion, powder for reconstitution, micafungin (as sodium), net price 50-mg vial = £196.08; 100-mg vial = £341.00

**Indications** systemic yeast and fungal infections; adjunct to amphotericin in cryptococcal meningitis (see Cryptococcosis, p. 403), adjunct to amphotericin in severe systemic candidiasis and in other severe or long-standing infections

**Cautions** elderly; blood disorders; liver- and kidney-function tests and blood counts required (weekly in blood disorders); interactions: Appendix 1 (fluconazole)

**Renal impairment** liver- and kidney-function tests and blood counts required (weekly in blood disorders)

**Pregnancy** teratogenic in animal studies; manufacturer advises avoid if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid

**Side-effects** nausea, vomiting, diarrhoea, rashes; less frequently cardiotoxicity, confusion, hallucinations, convulsions, headache, sedation, vertigo, alterations in liver function tests (hepatitis and hepatic necrosis reported), and toxic epidermal necrolysis; blood disorders including thrombocytopenia, leucopenia, and aplastic anaemia reported

**Fluconazole** (MSD) intravenous infusion, powder for reconstitution, fluconazole (as acetate), net price 50-mg vial = £196.08; 100-mg vial = £341.00

**Indications** systemic yeast and fungal infections; adjunct to amphotericin in cryptococcal meningitis (see Cryptococcosis, p. 403), adjunct to amphotericin in severe systemic candidiasis and in other severe or long-standing infections

**Cautions** elderly; blood disorders; liver- and kidney-function tests and blood counts required (weekly in blood disorders); interactions: Appendix 1 (fluconazole)

**Renal impairment** liver- and kidney-function tests and blood counts required (weekly in blood disorders)

**Pregnancy** teratogenic in animal studies; manufacturer advises avoid if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid

**Side-effects** nausea, vomiting, diarrhoea, rashes; less frequently cardiotoxicity, confusion, hallucinations, convulsions, headache, sedation, vertigo, alterations in liver function tests (hepatitis and hepatic necrosis reported), and toxic epidermal necrolysis; blood disorders including thrombocytopenia, leucopenia, and aplastic anaemia reported

**Flucytosine** is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in HIV-positive patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment. For the role of flucytosine in the treatment of systemic candidiasis and cryptococcal meningitis, see p. 403.

**Griseofulvin** is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. It is the drug of choice for trichophytosis infections in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months. For the role of griseofulvin in the treatment of tinea capitis, see p. 403.

**Terbinafine** is the drug of choice for fungal nail infections and is also used for ringworm infections where oral treatment is considered appropriate (see p. 405).
### 5.3 Antiviral drugs

#### TERBINAFINE

**Indications**
- Dermatophyte infections of the nails, ringworm infections (including tinea pedis, cruris, and corporis) where oral therapy is appropriate (due to site, severity or extent)

**Cautions**
- Psoriasis (risk of exacerbation); autoimmune disease (risk of lupus-erythematosus-like effect); monitor hepatic function before treatment and then every 4–6 weeks during treatment — discontinue if abnormalities in liver function tests; **interactions:** Appendix 1 (terbinafine)

**Hepatic impairment**
- Manufacturer advises avoid — elimination reduced

**Renal impairment**
- Use half normal dose if eGFR less than 50 mL/minute/1.73 m² and no suitable alternative available

**Pregnancy**
- Manufacturer advises use only if potential benefit outweighs risk — no information available

**Breast-feeding**
- Avoid — present in milk

**Side-effects**
- Abdominal discomfort, anorexia, nausea, diarrhoea, dyspepsia, headache, arthralgia, myalgia, rash, urticaria; *less commonly* taste disturbance; rarely liver toxicity (including jaundice, cholestasis, and hepatitis) — discontinue treatment, dizziness, malaise, paraesthesia, hypoesthesia; very rarely blood disorders (including neutropenia and thrombocytopenia), lupus erythematosus-like effect, photosensitivity, alopecia, serious skin reactions (including Stevens-Johnson syndrome and toxic epidermal necrolysis) — discontinue treatment if progressive skin rash; also reported, pancreatitis, vasculitis, influenza-like symptoms, rhabdomyolysis, disturbances in smell, hearing disturbances, exacerbation of psoriasis

**Dose**
- **By mouth**
  - 250 mg daily usually for 2–6 weeks in tinea pedis, 2–4 weeks in tinea cruris, 4 weeks in tinea corporis, 6 weeks–3 months in nail infections (occasionally longer in toenail infections); **CHILD** (unlicensed) usually for 4 weeks, tinea capitis, over 1 year, body-weight 10–20 kg, 62.5 mg once daily; body-weight 20–40 kg, 125 mg once daily; body-weight over 40 kg, 250 mg once daily

**Terbinafine** (Novartis) **®**
- **Tablets**
  - 250 mg, net price 14-tab pack = £1.47, 28-tab pack = £2.63. Label: 9

**Lamisil®** (Novartis) **®**
- **Tablets**
  - 250 mg, net price 14-tab pack = £21.30, 28-tab pack = £41.09. Label: 9

#### 5.3.1 HIV infection

#### 5.3.2 Herpesvirus infections

#### 5.3.3 Viral hepatitis

#### 5.3.4 Influenza

#### 5.3.5 Respiratory syncytial virus

The majority of virus infections resolve spontaneously in immunocompetent subjects. A number of specific treatments for viral infections are available, particularly for the immunocompromised. This section includes notes on herpes simplex and varicella-zoster, human immunodeficiency virus, cytomegalovirus, respiratory syncytial virus, viral hepatitis and influenza.
5.3.1 HIV infection

There is no cure for infection caused by the human immunodeficiency virus (HIV) but a number of drugs slow or halt disease progression. Drugs for HIV infection (antiretrovirals) may be associated with serious side-effects. Although antiretrovirals increase life expectancy considerably and decrease the risk of complications associated with premature ageing, mortality and morbidity remain slightly higher than in uninfected individuals. Treatment should be undertaken only by those experienced in their use.

Principles of treatment

Treatment aims to prevent the mortality and morbidity associated with chronic HIV infection whilst minimising drug toxicity. Although it should be started before the immune system is irreversibly damaged, the need for early drug treatment should be balanced against the risk of toxicity. Commitment to treatment and strict adherence over many years are required; the regimen chosen should take into account convenience and patient tolerance. The development of drug resistance is reduced by using a combination of drugs; such combinations should have synergistic or additive activity while ensuring that their toxicity is not additive. It is recommended that viral sensitivity to antiretroviral drugs is established before starting treatment or before switching drugs if the infection is not responding. Treatment also reduces the risk of HIV transmission to sexual partners, but the risk is not eliminated completely, therefore, other methods to reduce transmission should continue to be recommended.

Initiation of treatment

The optimum time for initiating antiretroviral treatment depends primarily on the CD4 cell count. The timing and choice of treatment should also take account of clinical symptoms, comorbidities, and the possible effect of antiretroviral drugs on factors such as the risk of cardiovascular events. Treatment includes a combination of drugs known as ‘highly active antiretroviral therapy’. Treatment of HIV-1 infection is initiated with 2 nucleoside reverse transcriptase inhibitors and either a non-nucleoside reverse transcriptase inhibitor, or a boosted protease inhibitor, or an integrase inhibitor; the regimens of choice contain tenofovir and emtricitabine with either efavirenz or ritonavir-boosted atazanavir, or ritonavir-boosted darunavir, or raltegravir. Alternative regimens contain abacavir and lamivudine with either ritonavir-boosted lopinavir, or ritonavir-boosted fosamprenavir, or nevirapine, or ritipivirine. Patients who require treatment for both HIV and chronic hepatitis B should be treated with antivirals active against both diseases (section 5.3.3.1).

Switching therapy

Deterioration of the condition (including clinical and virological changes) may require a change in therapy. The choice of an alternative regimen depends on factors such as the response to previous treatment, tolerance and the possibility of cross-resistance.

Pregnancy

Treatment of HIV infection in pregnancy aims to reduce the risk of toxicity to the fetus (although information on the teratogenic potential of most antiretroviral drugs is limited), to minimise the viral load and disease progression in the mother, and to prevent transmission of infection to the neonate. All treatment options require careful assessment by a specialist.
Lipodystrophy syndrome

Improvement

Immune reconstitution syndrome

Nucleoside reverse transcriptase inhibitors

Cautions

Side-effects

ABACAVIR

Indications

Cautions

Hypersensitivity reactions

Life-threatening hypersensitivity reactions reported—characterised by fever or rash and possibly nausea, vomiting, diarrhoea, abdominal pain, dyspnoea, cough, lethargy, malaise, headache, and
myalgia, less frequently mouth ulceration, oedema, hypotension, sore throat, acute respiratory distress syndrome, anaphylaxis, pancreatitis, arthralgia, conjunctivitis, lymphadenopathy, lymphocytopenia and renal failure; rarely myositis; laboratory abnormalities may include raised liver function tests (see Lactic Acidosis p. 412) and creatine kinase; symptoms usually appear in the first 6 weeks, but may occur at any time; monitor for symptoms every 2 weeks for 2 months; discontinue immediately if any symptoms of hypersensitivity develop and do not rechallenge (risk of more severe hypersensitivity reaction); discontinue if hypersensitivity cannot be ruled out, even when other diagnoses possible—if rechallenge necessary it must be carried out in hospital setting, if abacavir is stopped for any reason other than hypersensitivity, exclude hypersensitivity reaction as the cause and rechallenge only if medical assistance is readily available; care needed with concomitant use of drugs which cause skin toxicity

Counselling Patients should be told the importance of regular dosing (intermittent therapy may increase the risk of sensitisation), how to recognise signs of hypersensitivity, and advised to seek immediate medical attention if symptoms develop or before re-starting treatment; patients should be advised to keep Alert Card with them at all times

Hepatic impairment see notes above; also avoid in severe injury

Renal impairment manufacturer advises avoid in end-stage renal disease; avoid Kivexa® or Trizivir® if eGFR less than 50 mL/minute/1.73 m² (consult product literature)

Pregnancy see p. 411

Breast-feeding see p. 411

Side-effects see notes above; also hypersensitivity reactions (see above); very rarely Stevens-Johnson syndrome and toxic epidermal necrolysis; rash and gastro-intestinal disturbances more common in children

Dose

- 600 mg daily in 1–2 divided doses; CHILD 3 months–18 years see BNF for Children

Ziagen® (ViiV)® Tablets, yellow, f/c, scored, abacavir (as sulfate) 300 mg, net price 60-tab pack = £177.60. Counselling, hypersensitivity reactions

Oral solution, sugar-free, banana and strawberry flavoured, abacavir (as sulfate) 20 mg/mL, net price 240-mL = £47.36. Counselling, hypersensitivity reactions

With lamivudine

For cautions, contra-indications, side-effects, and other prescribing information see under individual drugs

Kivexa® (ViiV)® Tablets, orange, f/c, abacavir (as sulfate) 600 mg, lamivudine 300 mg, net price 30-tab pack = £299.41. Counselling, hypersensitivity reactions

Dose ADULT body-weight over 40 kg, 1 tablet once daily; CHILD 12–18 years see BNF for Children

With lamivudine and zidovudine

Note For patients stabilised (for 6–8 weeks) on the individual components in the same proportions. For cautions, contra-indications, side-effects, and other prescribing information see under individual drugs

Trizivir® (ViiV)® Tablets, blue-green, f/c, abacavir (as sulfate) 300 mg, lamivudine 150 mg, zidovudine 300 mg, net price 60-tab pack = £432.70. Counselling, hypersensitivity reactions

Dose 1 tablet twice daily; CHILD under 18 years, body-weight over 30 kg see BNF for Children

DIDANOSINE (ddI, DDI)

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; also history of pancreatitis (preferably avoid, otherwise extreme caution, see also below); peripheral neuropathy or hyperuricaemia (see under Side-effects); ophthalmological examination (including visual acuity, colour vision, and dilated fundus examination) recommended annually or if visual changes occur; interactions: Appendix 1 (didanosine)

Pancreatitis Suspend treatment if serum lipase raised (even if asymptomatic) or if symptoms of pancreatitis develop; discontinue if pancreatitis confirmed. Whenever possible avoid concomitant treatment with other drugs known to cause pancreatic toxicity (e.g. intravenous pentamidine isetionate); monitor closely if concomitant therapy unavoidable. Since significant elevations of triglycerides cause pancreatitis monitor closely if elevated

Hepatic impairment see notes above; also insufficient information but monitor for toxicity

Renal impairment reduce dose if eGFR less than 60 mL/minute/1.73 m²; consult product literature

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding see p. 411

Side-effects see notes above; also pancreatitis (see also under Cautions), liver failure, non-cirrhotic portal hypertension, anaphylactic reactions, peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops), diabetes mellitus, hypoglycaemia, acute renal failure, rhabdomyolysis, dry eyes, retinal and optic nerve changes, dry mouth, parotid gland enlargement, sialadenitis, alopecia, hyperuricaemia (suspend if raised significantly)

Dose

- ADULT under 60 kg, 250 mg daily in 1–2 divided doses; 60 kg and over, 400 mg daily in 1–2 divided doses; CHILD under 18 years see BNF for Children

Videx® (Bristol-Myers Squibb)® Tablets, with calcium and magnesium antacids, didanosine 25 mg, net price 60-tab pack = £25.06. Label: 25, counselling, administration, see below

Excipients include aspartame equivalent to phenylalanine 36.5 mg per tablet (section 9.4.1)

Note Antacids in formulation may affect absorption of other drugs—see interactions: Appendix 1 (antacids)

Counselling To ensure sufficient antacid, each dose to be taken as at least 2 tablets chewed thoroughly, crushed or dispersed in water; clear apple juice may be added for flavoured; tablets to be taken 2 hours after lopinavir with ritonavir capsules and oral solution or atazanavir with ritonavir

Videx® EC capsules, enclosing e/c granules, didanosine 125 mg, net price 30-cap pack = £48.18; 200 mg, 30-cap pack = £77.09; 250 mg, 30-cap pack = £96.37; 400 mg, 30-cap pack = £154.19. Label: 25, counselling, administration, see below

Counselling Capsules to be taken at least 2 hours before or 2 hours after food

EMTRICITABINE (FTC)

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; also on discontinuation, monitor patients with hepatitis B (risk of exacerbation of hepatitis); interactions: Appendix 1 (emtricitabine)
LAMIVUDINE (3TC)

Indications see preparations below

Cautions see notes above; Interactions: Appendix 1 (lamivudine)

Chronic hepatitis B Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lamivudine. When treating chronic hepatitis B with lamivudine, monitor liver function tests every 3 months, and viral markers of hepatitis B every 3–6 months, more frequently in patients with advanced liver disease or following transplantation (monitoring to continue for at least 1 year after discontinuation)

Hepatic impairment see notes above and Cautions above

Renal impairment reduce dose if eGFR less than 50 mL/minute/1.73 m²; consult product literature

Pregnancy see p. 411

Breast-feeding can be used with caution in women infected with chronic hepatitis B alone, providing that adequate measures are taken to prevent hepatitis B infection in infants; for women infected with HIV, see p. 411

Side-effects see notes above; also peripheral neuropathy, muscle disorders including rhabdomyolysis, nasal symptoms, alopecia

Dose see preparations below

STAVUDINE (d4T)

Indications HIV infection in combination with other antiretroviral drugs when no suitable alternative available and when prescribed for shortest period possible

Cautions see notes above; also history of peripheral neuropathy, excessive alcohol intake, concomitant use of isoniazid—risk of peripheral neuropathy (see under Side-effects); history of pancreatitis or concomitant use with other drugs associated with pancreatitis; interactions: Appendix 1 (stavudine)

Hepatic impairment see notes above

Renal impairment risk of peripheral neuropathy; use half normal dose every 12 hours if eGFR 25–50 mL/minute/1.73 m²; use half normal dose every 24 hours if eGFR less than 25 mL/minute/1.73 m²

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding see p. 411

Side-effects see notes above; also peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops), abnormal dreams, cognitive dysfunction, drowsiness, depression, pruritus; less commonly anxiety, gynecomastia

Dose

- ADULT under 60 kg, 30 mg every 12 hours preferably at least 1 hour before food; 60 kg and over, 40 mg every 12 hours; CHILD 1 month–18 years see BNF for Children
5.3.1 HIV infection

Viread® (Gilead) 
Tablets, f/c, blue, tenofovir disoproxil (as fumarate) 245 mg, net price 30-tab pack = £240.46. Label: 21
Granules, sugar-free, tenofovir disoproxil (as fumarate) 33 mg/g, net price 60 g (with 1-g scoop) = £54.50. Label: 21, counselling, administration
Note: 7.5 scoops of granules contains approx. 245 mg tenofovir disoproxil (as fumarate)
Counselling Mix 1 scoop of granules with 1 tablespoon of soft food (e.g. yoghurt, apple sauce) and take immediately without chewing. Do not mix granules with liquids

With emtricitabine
For cautions, contra-indications, side-effects, and other prescribing information see under individual drugs

Truvada® (Gilead) 
Tablets, blue, f/c, tenofovir disoproxil (as fumarate) 245 mg, emtricitabine 200 mg, net price 30-tab pack = £418.50. Label: 21, counselling, administration
Counselling Patients with swallowing difficulties may disperse tablet in half a glass of water, orange juice, or grape juice (but bitter taste)
Dose HIV infection in combination with other antiretroviral drugs, ADULT over 18 years, 1 tablet once daily
Missed dose If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

With efavirenz and emtricitabine
For cautions, contra-indications, side-effects, and other prescribing information see under individual drugs

Atripla® (Gilead) 
Tablets, pink, f/c, efavirenz 600 mg, emtricitabine 200 mg, tenofovir disoproxil (as fumarate) 245 mg, net price 30-tab pack = £626.90. Label: 23, 25
Dose HIV infection stabilised on antiretroviral therapy for more than 3 months, ADULT over 18 years, 1 tablet once daily
Missed dose If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

With emtricitabine and rilpivirine
For cautions, contra-indications, side-effects, and other prescribing information see under individual drugs

Eviplera® (gilead) 
Tablets, purple-pink, f/c, emtricitabine 200 mg, rilpivirine (as hydrochloride) 25 mg, tenofovir disoproxil (as fumarate) 245 mg, net price 30-tab pack = £618.77. Label: 21, 25, counselling, antacids
Dose HIV infection in patients with plasma HIV-1 RNA concentration less than 100,000 copies/mL, ADULT over 18 years, 1 tablet once daily
Missed dose If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

With cobicistat, elvitegravir, and emtricitabine

StriBild® (Gilead) 
Tablets, green, f/c, cobicistat 150 mg, elvitegravir 150 mg, emtricitabine 200 mg, tenofovir disoproxil (as fumarate) 245 mg, net price 30-tab pack = £1034.72. Label: 21, counselling, antacids
Counselling Avoid antacids 2 hours before or 4 hours after taking StriBild®
Dose HIV infection in patients with plasma HIV-1 RNA concentration less than 100,000 copies/mL, ADULT over 18 years, 1 tablet once daily
Missed dose If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

BNF 68

Zerit® (Bristol-Myers Squibb) 
Capsules, stavudine 20 mg (brown), net price 56-cap pack = £139.46; 30 mg (light orange/dark orange), 56-cap pack = £146.25; 40 mg (dark orange), 56-cap pack = £150.66 (all hosp. only)
Oral solution, cherry-flavoured, stavudine for reconstitution with water, 1 mg/mL, net price 200 mL = £22.94

TENOFOVIR DISOPROXIL

Indications HIV infection in combination with other antiretroviral drugs; chronic hepatitis B infection with either compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) or decompensated liver disease

Cautions see notes above; also test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment/discontinuation for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases; concomitant or recent use of nephrotoxic drugs; interactions: Appendix 1 (tenofovir)

Chronic hepatitis B When treating chronic hepatitis B with tenofovir, monitor liver function tests every 3 months and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recent hepatitis may occur on discontinuation)

Hepatic impairment see notes above and Cautions above; manufacturer of Atripla® advises caution in moderate to severe impairment; manufacturer of Eviplera® advises caution in moderate impairment; avoid Eviplera® or StriBild® in severe impairment

Renal impairment monitor renal function—interrupt treatment if further deterioration.

Granules: 132 mg once daily if eGFR 30–50 mL/minute/1.73 m²; 66 mg once daily if eGFR 20–30 mL/minute/1.73 m²; 33 mg once daily if eGFR 10–20 mL/minute/1.73 m².

Tablets: 245 mg every 2 days if eGFR 30–50 mL/minute/1.73 m²; 245 mg every 3–4 days if eGFR 10–30 mL/minute/1.73 m². Avoid Artilpa® if eGFR less than 50 mL/minute/1.73 m²; avoid Eviplera® if eGFR less than 50 mL/minute/1.73 m²; use normal dose of Truvada® every 2 days if eGFR 30–50 mL/minute/1.73 m²; avoid Tru- vada® if eGFR less than 30 mL/minute/1.73 m²; if eGFR less than 90 mL/minute/1.73 m², only initiate StriBild® if other treatments cannot be used (avoid initiating StriBild® if eGFR less than 70 mL/minute/1.73 m²); if eGFR less than 70 mL/minute/1.73 m², only continue StriBild® if potential benefit outweighs risk (discontinue StriBild® if eGFR less than 50 mL/minute/1.73 m²)

Pregnancy see p. 411

Breast-feeding see p. 411

Side-effects see notes above; also hypophosphataemia; rarely renal failure, proximal tubulopathy, nephrogenic diabetes insipidus; also reported reduced bone density

Dose

ADULT over 18 years, 245 mg once daily; CHILD 2–18 years see BNF for Children
Missed dose If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

5Infections
glucose before treatment, then every 4 weeks for 1 year and then every 3 months; women of child-bearing potential should use effective contraception during treatment (if using a hormonal contraceptive, it must contain nooestradiol as the progestogen and at least 30 micrograms ethinylestradiol). Interactions: Appendix 1 (cobicistat, elvitegravir, emtricitabine, and tenofovir).

Hepatic impairment see notes above and also Contra-indications under Tenofovir Disoproxil

Renal impairment see Tenofovir Disoproxil

Pregnancy see also Cautions; manufacturer advises use only if potential benefit outweighs risk

Breast-feeding see p. 411

Pregnancy see p. 411

Renal impairment reduce oral dose to 300–400 mg see notes above; also accumulation may occur

Hepatic impairment see notes above; also accumulation may occur

Renal impairment reduce oral dose to 300–400 mg daily in divided doses or intravenous dose to 1 mg/kg 3–4 times daily if eGFR is less than 10 mL/minute/1.73 m²; avoid Combivir® (or non-proprietary equivalents) if eGFR less than 50 mL/minute/1.73 m² (consult product literature)

Pregnancy see p. 411

Breast-feeding see p. 411

Side-effects see notes above; also anaemia (may require transfusion), taste disturbance, chest pain, influenza-like symptoms, paraesthesia, neuropathy, convulsions, dizziness, drowsiness, anxiety, depression, loss of mental acuity, myopathy, myalgia, amenorrhoea, pancreatitis, urinary frequency, sweating, pruritus, pigmentation of nails, skin and oral mucosa

Dose

- By mouth, 250–300 mg twice daily; CHILD 1 month–18 years see BNF for Children

- Prevention of maternal-fetal HIV transmission, seek specialist advice (combination therapy preferred)

- Patients temporarily unable to take zidovudine by mouth, by intravenous infusion over 1 hour, 0.8–1 mg/kg every 4 hours (approximating to 1.2–1.5 mg/kg every 4 hours by mouth) usually for not more than 2 weeks; CHILD 3 months–18 years see BNF for Children

Zidovudine (Non-proprietary) (Patent)

Capsules, zidovudine 100 mg, net price 60-cap pack = £50.17; 250 mg, 60-cap pack = £125.44

Retrovir® (ViiV) (Patent)

Capsules, zidovudine 100 mg (white), net price 100-cap pack = £88.86; 250 mg (blue/white), 40-cap pack = £88.86

Oral solution, sugar-free, strawberry-flavoured, zidovudine 50 mg/5 mL, net price 200-mL pack with 10-mL oral syringe = £17.78

Injection, zidovudine 10 mg/mL. For dilution and use as an intravenous infusion. Net price 20-mL vial = £8.92

With lamivudine For cautions, contra-indications, side-effects, and other prescribing information see under individual drugs

Zidovudine and lamivudine (Non-proprietary) (Patent)

Tablets, IF/c, scored, zidovudine 300 mg, lamivudine 150 mg, net price 60-tab pack = £70.61

Dose 1 tablet twice daily; CHILD body-weight over 14 kg see BNF for Children

Combivir® (ViiV) (Patent)

Tablets, IF/c, scored, zidovudine 300 mg, lamivudine 150 mg, net price 60-tab pack = £255.10

Dose 1 tablet twice daily; CHILD body-weight over 14 kg see BNF for Children

Note Tablets may be crushed and mixed with semi-solid food or liquid just before administration

With abacavir and lamivudine See under Abacavir

Protease inhibitors

Cautions Protease inhibitors are associated with hyperglycaemia and should be used with caution in diabetes (see Lipodystrophy Syndrome, p. 412). Caution is also needed in patients with haemophilia who may be at increased risk of bleeding.

Contra-indications Protease inhibitors should not be given to patients with acute porphyria (but see section 9.8.2).

Hepatic impairment Protease inhibitors should be used with caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects)

Pregnancy See p. 411

Breast-feeding See p. 411

Side-effects Side-effects of the protease inhibitors include gastro-intestinal disturbances (including diarrhoea, nausea, vomiting, abdominal pain, flatulence), anorexia, hepatic dysfunction, pancreatitis; blood disorders including anaemia, neutropenia, and thrombocytopenia; sleep disturbances, fatigue, headache, dizziness, paraesthesia, myalgia, myositis, rhabdomyolysis; taste disturbances; rash, pruritus, Stevens-Johnson syndrome, hypersensitivity reactions including anaphylaxis; see also notes above for lipodystrophy and metabolic effects (Lipodystrophy Syndrome, and Osteonecrosis).
**ATAZANAVIR**

**Indications**  
HIV infection in combination with other antiretroviral drugs

**Cautions**  
see notes above; also concomitant use with drugs that prolong PR interval; cardiac conduction disorders; predisposition to QT interval prolongation (including electrolyte disturbances, concomitant use of drugs that prolong QT interval); interactions: Appendix 1 (atazanavir)

**Rash**  
Mild to moderate rash occurs commonly, usually within the first 3 weeks of therapy. Severe rash occurs less frequently and may be accompanied by systemic symptoms. Discontinue if severe rash develops

**Contra-indications**  
see notes above

**Hepatic impairment**  
see notes above; also manufacturer advises caution in mild impairment; avoid in moderate to severe impairment

**Pregnancy**  
see p. 411; monitor viral load and plasma-atazanavir concentration during third trimester; theoretical risk of hyperbilirubinaemia in neonate if used at term

**Breast-feeding**  
see p. 411

**Side-effects**  
see notes above; also AV block (in children); rash; theoretical risk of hyperbilirubinaemia in neonate if used at term

**BNF for Children**  
18 years see

**Dose**

- With low-dose ritonavir, ADULT over 18 years previously treated with antiretroviral therapy, 600 mg twice daily or (if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells $\times 10^6$/litre) 800 mg once daily; CHILD 3–18 years see BNF for Children

- With low-dose ritonavir, ADULT over 18 years not previously treated with antiretroviral therapy, 800 mg once daily; CHILD 12–18 years see BNF for Children

**Missed dose**  
If a dose is more than 6 hours late on the twice daily regimen (or more than 12 hours late on the once daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time

**Prezista** (Janssen) Tablets, f/c, darunavir (as ethanolate) 75 mg (white), net price 40-tab pack = £46.70; 150 mg (white), 240-tab pack = £46.70; 400 mg (light orange), 60-tab pack = £297.80; 600 mg (orange), 60-tab pack = £46.70; 800 mg (red), 30-tab pack = £297.80. Label: 21

**Oral suspension**, sugar-free, strawberry-flavoured, darunavir (as ethanolate) 100 mg/mL, net price 200-mL = £248.17. Label: 21

**DARUNAVIR**

**Indications**  
HIV infection in combination with other antiretroviral drugs

**Cautions**  
see notes above; also sulfonamide sensitivity; monitor liver function before and during treatment; interactions: Appendix 1 (darunavir)

**Rash**  
Mild to moderate rash occurs commonly, usually within the first 4 weeks of therapy and resolves without stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if severe rash develops

**Contra-indications**  
see notes above

**Hepatic impairment**  
see notes above; also manufacturer advises caution in mild to moderate impairment; avoid in severe impairment—no information available

**Pregnancy**  
see notes above; also manufacturer advises use only if potential benefit outweighs risk; if required, use the twice daily dose regimen; see also p. 411

**Breast-feeding**  
see p. 411

**Side-effects**  
see notes above; also peripheral neuropathy; less commonly myocardial infarction, angina, QT interval prolongation, tachycardia, hypertension, flushing, peripheral oedema, dyspnoea, cough, anxiety, memory impairment, depression, abnormal dreams, increased appetite, weight changes, pyrexia, hypothyroidism, osteoporosis, gynaecomastia, erectile dysfunction, reduced libido, dysuria, polycythaemia, nephrolithiasis, renal failure, arthralgia, dry eyes, conjunctival hyperaemia, throat irritation, dry mouth, stomatitis, nail discoloration, acne, eczema, increased sweating, alopecia; rarely haematemesis, syncope, bradycardia, palpitation, confusion, convulsions, visual disturbances, rhinorrhoea, seborrhoeic dermatitis

**Dose**

- With low-dose ritonavir, ADULT over 18 years previously treated with antiretroviral therapy, 600 mg twice daily or (if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells $\times 10^6$/litre) 800 mg once daily; CHILD 3–18 years see BNF for Children

- With low-dose ritonavir, ADULT over 18 years not previously treated with antiretroviral therapy, 800 mg once daily; CHILD 12–18 years see BNF for Children

**Missed dose**  
If a dose is more than 6 hours late on the twice daily regimen (or more than 12 hours late on the once daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time

**FOSAMPRENAVIR**

**Note**  
Fosamprenavir is a pro-drug of amprenavir

**Indications**  
HIV infection in combination with other antiretroviral drugs

**Cautions**  
see notes above; interactions: Appendix 1 (fosamprenavir)

**Rash**  
May occur, usually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or, mucosal involvement; if rash mild or moderate, may continue without interruption—usually resolves within 2 weeks and may respond to antihistamines

**Contra-indications**  
see notes above

**Hepatic impairment**  
see notes above; also manufacturer advises caution in mild impairment; reduce dose to 450 mg twice daily in moderate impairment; reduce dose to 300 mg twice daily in severe impairment

**Pregnancy**  
see animal studies; manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding**  
see p. 411

**Side-effects**  
see notes above; also reported, rash including rarely Stevens-Johnson syndrome (see also Rash above)

**Dose**

- With low-dose ritonavir, 700 mg twice daily; CHILD 6–18 years see BNF for Children

**Note**  
700 mg fosamprenavir is equivalent to approx. 600 mg amprenavir
Telzir® (ViiV) Tablets, f/c, pink, fosamprenavir (as calcium) 700 mg, net price 60-tab pack = £220.13
Oral suspension, fosamprenavir (as calcium) 50 mg/mL, net price 225-mL pack (grape-bubblegum-and peppermint-flavoured) (with 10-mL oral syringe) = £58.70. Counselling, administration
Cautions see notes above; also increased risk of nephrolithiasis; patients at risk of nephrolithiasis (monitor for nephrolithiasis); patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%); interactions: Appendix 1 (indinavir)
Contra-indications see notes above
Hepatic impairment see notes above; also increased risk of nephrolithiasis; reduce dose in mild to moderate impairment; not studied in severe impairment
Renal impairment use with caution; monitor for nephrolithiasis
Pregnancy toxicity in animal studies; manufacturer advises use only if potential benefit outweighs risk; theoretical risk of hyperbilirubinaemia and renal stones in neonate if used at term
Breast-feeding see p. 411
Side-effects see notes above; also reported, dry mouth, hypoaesthesia, dry skin, hyperpigmentation, alopecia, paronychia, interstitial nephritis (with medullary calcification and cortical atrophy), haematuria, crystalluria, proteinuria, pyelonephritis; haemolytic anaemia
Dose
- ADULT over 18 years, seek specialist advice

Crixivan® (MSD) Capsules, indinavir (as sulfate), 200 mg, net price 360-cap pack = £181.02; 400 mg, 180-cap pack = £181.02. Label: 27, counselling, administration
Counselling Administer 1 hour before or 2 hours after a meal; may be administered with a low-fat light meal; in combination with didanosine tablets, allow 1 hour between each drug (antacids in didanosine tablets reduce absorption of indinavir); in combination with low-dose ritonavir, give with food
Note Dispense in original container (contains desiccant)

LOPINAVIR WITH RITONAVIR
Indications HIV infection in combination with other antiretroviral drugs
Cautions see notes above; concomitant use with drugs that prolong QT or PR interval; cardiac conduction disorders, structural heart disease; pancreatitis (see below); monitor liver function before and during treatment; interactions: Appendix 1 (lopinavir, ritonavir)
Pancreatitis Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed
Contra-indications see notes above

Hepatic impairment see notes above; also avoid oral solution due to propylene glycol content; manufacturer advises avoid capsules and tablets in severe impairment
Renal impairment avoid oral solution due to propylene glycol content; use tablets with caution in severe impairment
Pregnancy avoid oral solution due to high propylene glycol content; use tablets only if potential benefit outweighs risk (toxicity in animal studies); for tablets see also p. 411
Breast-feeding see p. 411
Side-effects see notes above; also colitis, weight changes, hypertension, anxiety, neuropathy, sexual dysfunction, amenorrhea, menorrhagia, arthralgia, night sweats; less commonly gastro-intestinal ulcer, rectal bleeding, dry mouth, stomatitis, myocardial infarction, AV block, cerebrovascular accident, deep vein thrombosis, abnormal dreams, convulsions, tremor, nephritis, haematuria, visual disturbances, tinnitus, alopecia
Dose
- See preparations below

Kaletra® (AbbVie) Tablets, pale yellow, f/c, lopinavir 100 mg, ritonavir 25 mg, net price 60-tab pack = £76.85. Label: 25
Dose CHILD 2–18 years see BNF for Children
Tablets, yellow, f/c, lopinavir 200 mg, ritonavir 50 mg, net price 120-tab pack = £285.41. Label: 25
Dose 2 tablets twice daily; alternatively, in adults with a HIV strain that has less than 3 mutations to protease inhibitors, 4 tablets may be taken once daily; CHILD 2–18 years see BNF for Children
Oral solution, lopinavir 400 mg, ritonavir 100 mg/5 mL, net price 5 × 60-mL packs = £307.39. Label: 21
Excipients include propylene glycol 153 mg/mL (see Excipients, p. 2), alcohol 42%
Dose 5 mL twice daily with food; CHILD 2–18 years see BNF for Children

RITONAVIR
Indications HIV infection in combination with other antiretroviral drugs; low doses used to increase effect of some protease inhibitors
Cautions see notes above; concomitant use with drugs that prolong PR interval; cardiac conduction disorders, structural heart disease; pancreatitis (see below); interactions: Appendix 1 (ritonavir)
Pancreatitis Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed
Contra-indications see notes above
Hepatic impairment see notes above; also avoid in compensated liver disease; in severe impairment without decompensation, use ‘booster’ doses with caution (avoid treatment doses)
Pregnancy only use low-dose booster to increase the effect of other protease inhibitors; see also p. 411
Breast-feeding see p. 411
Side-effects see notes and Cautions above; also gastrointestinal haemorrhage, blood pressure changes, oedema, syncope, flushing, cough, pharyngitis, anxiety, confusion, seizures, peripheral neuropathy, fever, decreased blood thyroxine concentration, menorrhagia, renal impairment, arthralgia, blurred vision, mouth ulcers, acne; less commonly
myocardial infarction, electrolyte disturbances; rarely toxic epidermal necrolysis

**Dose**
- Initially 300 mg every 12 hours for 3 days, increased in steps of 100 mg every 12 hours over not longer than 14 days to 600 mg every 12 hours; **CHILD 2–18 years see BNF for Children**
- Low-dose booster to increase effect of other protease inhibitors, 100–200 mg once or twice daily; **CHILD 2–18 years see BNF for Children**

**Norvir**® (AbbVie)

**Tablets**, 1/c, ritonavir 100 mg, net price 30-tab pack = £19.44. Label: 21, 25

**Oral solution**, sugar-free, ritonavir 400 mg/5 mL, net price 5 x 90-mL packs (with measuring cup) = £403.20. Label: 21, counselling, administration

**Excipients** include propylene glycol 26% (see Excipients, p. 2), alcohol 43%

**Counselling** Bitter taste of oral solution can be masked by mixing with chocolate milk; do not mix with water, measuring cup must be dry

**With lopinavir**

See under Lopinavir with Ritonavir

---

**SAQUINAVIR**

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above; monitor ECG before starting treatment and then on day 3 or 4 of treatment—discontinue if QT interval over 480 milliseconds, if QT interval more than 20 milliseconds above baseline, or if prolongation of PR interval; concomitant use of garlic (avoid garlic capsules—reduces plasma-saquinavir concentration); **interactions:** Appendix 1 (saquinavir)

**Counselling** Patients should be told how to recognise signs of arhythmia and advised to seek medical attention if symptoms such as palpitation or syncope develop

**Contra-indications** see notes above; predisposition to cardiac arrhythmias (including congenital QT prolongation, bradycardia, history of symptomatic arrhythmias, heart failure with reduced left ventricular ejection fraction, electrolyte disturbances, concomitant use of drugs that prolong QT or PR interval); concomitant use of drugs that increase plasma-saquinavir concentration (avoid unless no alternative treatment available)

**Hepatic impairment** see notes above; also manufacturer advises caution in moderate impairment; avoid in decompensated liver disease

**Renal impairment** use with caution if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** see p. 411

**Breast-feeding** see p. 411

**Side-effects** see notes above; also dyspnoea, anorexia, peripheral neuropathy, influenza-like symptoms, renal impairment and photosensitivity; rarely dehydration

**Dose**
- See preparations

**Aptivus**® (Boehringer Ingelheim)

**Caplets**, pink, tipranavir 250 mg, net price 120-cap pack = £441.00. Label: 5, 21

**Excipients** include ethanol 100 mg per capsule

Dose with low-dose ritonavir, 500 mg twice daily; **CHILD 12–18 years see BNF for Children**

**Oral Solution**, toffee-and mint-flavoured, tipranavir 100 mg/mL, net price 95–mL pack = £129.65. Label: 5, 21, counselling, crystallisation

**Excipients** include vitamin E 78 mg/mL

Dose with low-dose ritonavir, **CHILD 2–12 years see BNF for Children**

**Note** The bioavailability of Aptivus® oral solution is higher than that of the capsules; the oral solution is not interchangeable with the capsules on a milligram-for-milligram basis

**Counselling** Patients should be told to observe the oral solution for crystallisation; the bottle should be replaced if more than a thin layer of crystals form (doses should continue to be taken at the normal time until the bottle is replaced)

**EFAVIRENZ**

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** elderly; history of mental illness or seizures; monitor liver function if receiving other hepatotoxic drugs; **interactions:** Appendix 1 (efavirenz)

**Rash** Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering
5.3.1 HIV infection

**Estravirine**

**Indications** in combination with other antiretroviral drugs (including a boosted protease inhibitor) for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors

**Cautions** interactions: Appendix 1 (estravirine)

**Hypersensitivity reactions** Rash, usually in the second week, is the most common side-effect and appears more frequently in women. Life-threatening hypersensitivity reactions reported usually during week 3–6 of treatment and characterised by rash, eosinophilia, and systemic symptoms (including fever, general malaise, myalgia, arthralgia, blistering, oral lesions, conjunctivitis, and hepatitis). Discontinue permanently if hypersensitivity reaction or severe rash develops. If rash mild or moderate (without signs of hypersensitivity reaction), may continue without interruption—usually resolves within 2 weeks

**Counselling** Patients should be told how to recognise hypersensitivity reactions and advised to seek immediate medical attention if hypersensitivity reaction or severe rash develops

**Contra-indications** acute porphyria (but see section 9.8.2)

**Hepatic impairment** in mild liver disease, monitor for dose related side-effects (e.g. CNS effects) and monitor liver function; avoid in moderate to severe impairment; greater risk of hepatic side-effects in chronic hepatitis B or C

**Renal impairment** manufacturer advises caution in severe renal failure—no information available

**Pregnancy** see p. 411

**Breast-feeding** see p. 411

**Side-effects** rash including Stevens-Johnson syndrome (see Rash above); abdominal pain, diarrhoea, nausea, vomiting; anxiety, depression, sleep disturbances, abnormal dreams, dizziness, headache, fatigue, impaired concentration (administration at bedtime especially in first 2–4 weeks reduces CNS effects); pruritus; less commonly pancreatitis, hepatitis, flushing, psychosis, mania, suicidal ideation, amnesia, ataxia, tremor, convulsions, gynaecomastia, blurred vision, tinnitus; rarely hepatic failure, photosensitivity; also reported raised serum cholesterol (see Lipodystrophy Syndrome, p. 412); see also Osteonecrosis, p. 412; also reported raised serum cholesterol (see Lipodystrophy Syndrome, p. 412); see also Osteonecrosis, p. 412

**Dose**

- See preparations below

**Sustiva**® (Bristol-Myers Squibb) (Phys)

**Capsules**, efavirenz 50 mg (yellow/white), net price 30-cap pack = £16.73; 100 mg (white), 30-cap pack = £33.41; 200 mg (yellow), 90-cap pack = £200.27. Label: 23

**Dose** 600 mg once daily; **CHILD** 3–18 years see BNF for Children

**Tablets**, f/c, yellow, efavirenz 600 mg, net price 30-tab pack = £200.27. Label: 23

**Dose** 600 mg once daily; **CHILD** body-weight over 40 kg see BNF for Children

**Oral solution**, sugar-free, strawberry and mint flavour, efavirenz 30 mg/mL, net price 180-mL pack = £53.84

**Dose** 720 mg once daily; **CHILD** 3–18 years see BNF for Children

**Note** The bioavailability of Sustiva® oral solution is lower than that of the capsules and tablets; the oral solution is not interchangeable with either capsules or tablets on a milligram-for-milligram basis

**With emtricitabine and tenofovir**

See under Tenofovir

---

**NEVIRAPINE**

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** chronic hepatitis B or C, high CD4 cell count, and women (all at greater risk of hepatic side-effects—if plasma HIV-1 RNA detectable, manufacturer advises avoid in women with CD4 cell count greater than 250 cells/mm³ or in men with CD4 cell count greater than 400 cells/mm³ unless potential benefit outweighs risk); interactions: Appendix 1 (nevirapine)

**Hepatic disease** Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; close monitoring required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly; discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if
significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction

**Rash** Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased after 14 days; monitor closely for skin reactions during first 18 weeks; discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves

**Counselling** Patients should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention if severe skin reaction, hypersensitivity reactions, or symptoms of hepatitis develop

**Contra-indications** acute porphyria (but see section 9.6.2); post-exposure prophylaxis

**Hepatic impairment** manufacturer advises avoid modified-release preparation—no information available; use ‘immediate-release’ preparation with caution in moderate impairment and avoid in severe impairment; see also Hepatic Disease, above

**Renal impairment** manufacturer advises use only if potential benefit outweighs risk

**Pregnancy** manufacturer advises caution in severe impairment—no information available

**Breast-feeding** see p. 411

**Side-effects** nausea, vomiting, abdominal pain, anorexia, dry mouth, raised serum amylase and lipase, hyperlipidaemia (see also Lipodystrophy Syndrome, p. 412), depression, abnormal dreams, sleep disturbances, headache, dizziness, malaise, rash; see also Osteonecrosis, p. 412

**Dose**
- 200 mg once daily of ‘immediate-release’ preparation for first 14 days then (if no rash present) 200 mg twice daily of ‘immediate-release’ preparation or 400 mg once daily of modified-release preparation; CHILD under 18 years see **BNF for children**

**Note** Duration of once daily dose regimen of ‘immediate-release’ preparation should not exceed 28 days; if rash not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart using the once daily dose regimen of the ‘immediate-release’ preparation for the first 14 days as for new treatment

**Missed dose** If a dose is more than 8 hours late with the ‘immediate-release’ preparation or more than 12 hours late with the modified-release preparation, the missed dose should not be taken and the next dose should be taken at the usual time

With emtricitabine and tenofovir

See under Tenofovir

**Other antiretrovirals**

**DOLUTEGRAVIR**

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** avoid concomitant use with etravirine, unless used in combination with atazanavir, darunavir, or lopinavir

**Interactions:** Appendix 1 (dolutegravir)

**Hypersensitivity reactions** Hypersensitivity reactions (including severe rash, or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, oral lesions, conjunctivitis, angioedema, eosinophilia, or raised liver enzymes) reported uncommonly. Discontinue immediately if any sign or symptoms of hypersensitivity reactions develop

**Hepatic impairment** manufacturer advises caution in severe impairment—no information available

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** see p. 411

**Side-effects** diarrhea, nausea, vomiting, abdominal pain, flatulence, headache, dizziness, insomnia, abnormal dreams, fatigue, rash, pruritus, raised creatine kinase; less commonly hepatitis, hypersensitivity reactions (see Cautions); see also Osteonecrosis, p. 412
5.3.1 HIV infection

Dose
- 50 mg once daily; if resistance to other inhibitors of HIV integrase suspected, 50 mg twice daily with food;  
  CHILD 12–18 years see BNF for Children

Note
50 mg twice daily with concomitant efavirenz, nevirapine, tipranavir, or rifampin, however, avoid concomitant use with these drugs if resistance to other inhibitors of HIV integrase suspected

Missed dose
If a dose is more than 20 hours late on the once daily regimen (or more than 8 hours late on the twice daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time

Tivicay® (GSK) T

Tablets, yellow, f/c, dolutegravir (as sodium salt)  
50 mg, net price 30-tab pack = £498.75. Counselling, antacids

Cautions
HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens

Indications
HIV infection in combination with other antiretroviral drugs

Hypersensitivity reactions
Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge

Counselling
Patients should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop

Hepatic impairment
Manufacturer advises caution—no information available; chronic hepatitis B or C (possibly greater risk of hepatic side-effects)

Pregnancy
Manufacturer advises use only if potential benefit outweighs risk

Breast-feeding
See p. 411

Side-effects
Injection-site reactions; pancreatitis, gastro-oesophageal reflux disease, anorexia, weight loss; hypertriglyceridaemia; peripheral neuropathy, asthenia, tremor, anxiety, nightmares, irritability, impaired concentration, vertigo; pneumonia, sinusitis, influenza-like illness; diabetes mellitus; haematuria; renal calculi, lymphadenopathy; myalgia; conjunctivitis; dry skin, acne, erythema, skin papilloma; less commonly hypersensitivity reactions (see Cautions); see also Osteonecrosis, p. 412

Dose
- By subcutaneous injection, 90 mg twice daily; CHILD 6–18 years see BNF for Children

Fuzeon® (Roche) T

Injection, powder for reconstitution, enfuvirtide  
108 mg (= enfuvirtide 90 mg/mL when reconstituted with 1.1 mL. Water for Injections), net price 108-mg vial = £18.03 (with solvent, syringe, and alcohol swabs). Counselling, hypersensitivity reactions

Electrolytes
Na⁺ < 1 mmol/mL

5.3.2 Infections

MARAVIROC

Indications
CCR5-tropic HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretrovirals

Cautions
Cardiovascular disease; chronic hepatitis B or C; interactions: Appendix 1 (maraviroc)

Hepatic impairment
Manufacturer advises caution

Renal impairment
If eGFR less than 80 mL/minute/1.73 m², consult product literature

Pregnancy
Manufacturer advises use only if potential benefit outweighs risk—tocicity in animal studies

Breast-feeding
See p. 411

Side-effects
Nausea, diarrhoea, abdominal pain, flatulence, anorexia, depression, insomnia, malaise, headache, anaemia, rash; less commonly seizures, renal failure, proteinuria, myositis; rarely hepatitis, angina, pancytopenia, granulocytopenia, Stevens-Johnson syndrome, toxic epidermal necrolysis; also reported hypersensitivity reactions (including rash, fever, eosinophilia, and hepatic reactions); see also Osteonecrosis, p. 412

Dose
- ADULT over 18 years, 300 mg twice daily

Celsentri® (ViiV) T

Tablets, blue, f/c, maraviroc, 150 mg, net price 60-tab pack = £441.27; 300 mg, 60-tab pack = £441.27

RALTEGRAVIR

Indications
HIV infection in combination with other antiretroviral drugs

Cautions
Risk factors for myopathy or rhabdomyolysis; chronic hepatitis B or C (greater risk of hepatic side-effects); psychiatric illness (may exacerbate underlying illness including depression); interactions: Appendix 1 (raltegravir)

Rash
Rash occurs commonly. Discontinue if severe rash or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, mouth ulceration, conjunctivitis, angioedema, hepatitis, or eosinophilia

Hepatic impairment
Manufacturer advises caution in severe impairment—no information available

Pregnancy
Manufacturer advises avoid—tocicity in animal studies

Breast-feeding
See p. 411

Side-effects
Diarrhoea, nausea, vomiting, dyspepsia, abdominal pain, flatulence, hypertriglyceridaemia, dizziness, headache, depression, insomnia, abnormal dreams, hyperactivity, asthenia, rash (including less commonly Stevens-Johnson syndrome, rash with eosinophilia and systemic symptoms; see also Rash above), less commonly gastritis, hepatitis, pancreatitis, dry mouth, taste disturbances, pain on swallowing, peptic ulcer, constipation, rectal bleeding, lipodystrophy (see Lipodystrophy Syndrome, p. 412), palpitation, ventricular extrasystoles, bradycardia, hypertension, flushing, chest pain, oedema, dysphonia, epistaxis, nasal congestion, drowsiness, anxiety, appetite changes, confusion, impaired memory and attention, suicidal ideation, pyrexia, chills, carpal tunnel syndrome, tremor, peripheral neuropathy, erectile dysfunction, gynaecomastia, menopausal symptoms, osteopenia, renal failure, nocturia, polydipsia, anaemia, thrombocytopenia, neutropenia, arthralgia, myalgia, rhabdomyolysis, visual disturbances, tinnitus, gingivitis, glossitis, acne, pruritus, hyperhidrosis, dry skin, skin papilloma, alopecia; see also Osteonecrosis, p. 412

Dose
- 400 mg twice daily; CHILD 2–18 years see BNF for Children

Isentress® (MSD) T

Tablets, pink, f/c, raltegravir (as potassium salt)  
400 mg, net price 60-tab pack = £523.79. Label: 25
### 5.3.2 Herpesvirus infections

#### 5.3.2.1 Herpes simplex and varicella–zoster infection

The two most important herpesvirus pathogens are herpes simplex virus (herpesvirus hominis) and varicella–zoster virus.

**Herpes simplex infections** Herpes infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV-1. Treatment of herpes simplex infection should start as early as possible and usually within 5 days of the appearance of the infection. In individuals with good immune function, mild infection of the eye (ocular herpes, section 11.3.3) and of the lips (herpes labialis or cold sores, section 13.10.3) is treated with a topical antiviral drug. Primary herpetic gingivostomatitis is managed by changes to diet and with analgesics (section 12.3.2). Severe infection, neonatal herpes infection or infection in immunocompromised individuals requires treatment with a systemic antiviral drug. Primary or recurrent genital herpes simplex infection is treated with an antiviral drug given by mouth. Persistence of a lesion or recurrence in an immunocompromised patient may signal the development of resistance. Specialist advice should be sought for systemic treatment of herpes simplex infection in pregnancy.

**Varicella–zoster infections** Regardless of immune function and the use of any immunoglobulins, neonates with chickenpox should be treated with a parenteral antiviral to reduce the risk of severe disease. Chickenpox in otherwise healthy children between 1 month and 12 years is usually mild and antiviral treatment is not usually required. Chickenpox is more severe in adolescents and adults than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adults and adolescents. Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g. because of severe cardiovascular or respiratory disease or chronic skin disorder); in such cases, an antiviral is given for 10 days with at least 7 days of parenteral treatment.

Pregnant women who develop severe chickenpox may be at risk of complications, especially varicella pneumonia. Specialist advice should be sought for the treatment of chickenpox during pregnancy.

Those who have been exposed to chickenpox and are at special risk of complications may require prophylaxis with varicella–zoster immunoglobulin (see under Disease Specific Immunoglobulins, section 14.5.3).

In herpes zoster (shingles) systemic antiviral treatment can reduce the severity and duration of pain, reduce complications, and reduce viral shedding. Treatment with the antiviral should be started within 72 hours of the onset of rash and is usually continued for 7–10 days.

#### 5.3.2.2 Cytomegalovirus infection

Immunocompromised patients at high risk of disseminated or severe infection should be treated with a parenteral antiviral drug.

Chronic pain which persists after the rash has healed (postherpetic neuralgia) requires specific management (section 4.7.3).

**Choice** Aciclovir is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella–zoster and the systemic and topical treatment of herpes simplex infections of the skin (section 13.10.3) and mucous membranes (section 7.2.2). It is used by mouth for severe herpetic stomatitis (see also p. 776). Aciclovir eye ointment (section 11.3.3) is used for herpes simplex infections of the eye; it is combined with systemic treatment for ophthalmic zoster.

Famciclovir, a prodrug of penciclovir, is similar to aciclovir and is licensed for use in herpes zoster and genital herpes. Penciclovir itself is used as a cream for herpes simplex labialis (section 13.10.3).

Valaciclovir is an ester of aciclovir, licensed for herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); it is also licensed for preventing cytomegalovirus disease following solid organ transplantation. Famciclovir or valaciclovir are suitable alternatives to aciclovir for oral lesions associated with herpes zoster. Valaciclovir once daily may reduce the risk of transmitting genital herpes to heterosexual partners—specialist advice should be sought.

Foscarnet (section 5.3.2.2) is used for mucocutaneous herpes simplex virus infection unresponsive to aciclovir in immunocompromised patients; it is toxic and can cause renal impairment.

Insosine pranobex has been used by mouth for herpes simplex infections; its effectiveness remains unproven.

### ACICLOVIR (Acyclovir)

**Indications** herpes simplex and varicella–zoster (see also under Dose)

**Cautions** maintain adequate hydration (especially with infusion or high doses, or during renal impairment); elderly (risk of neurological reactions); inter-actions: Appendix 1 (aciclovir)

**Renal impairment** see Cautions above; also risk of neurological reactions increased; use normal intravenous dose every 12 hours if eGFR 25–50 mL/minute/1.73 m² (every 24 hours if eGFR 10–25 mL/minute/1.73 m²); consult product literature for intravenous dose if eGFR less than 10 mL/minute/1.73 m²; for herpes zoster, use normal oral dose every 8 hours if eGFR 10–25 mL/minute/1.73 m² (every 12 hours if eGFR less than 10 mL/minute/1.73 m²);

### Breast-feeding

significant amount in milk after systemic therapy—manufacturers advise use only when potential benefit outweighs risk for the neonate.

**Pregnancy** not known to be harmful—manufacturers advise use only when potential benefit outweighs risk for the fetus.

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, headache, fatigue, rash, urticaria, pruritus, photosensitivity; very rarely hepatitis, jaundice, dyspnoea, neurological reactions (including dizziness, confusion, hallucinations, convulsions, ataxia, dysar-
5 Infections

5.3.2 Herpesvirus infections

**By mouth.** non-genital herpes simplex, treatment, 300 mg (400 mg in the immunocompromised or if absorption impaired) 5 times daily, usually for 5 days (longer if new lesions appear during treatment or if healing incomplete); CHILD 1 month–2 years, half adult dose, over 2 years, adult dose

Genital herpes simplex, treatment of first episode, 200 mg 5 times daily or 400 mg 3 times daily usually for 5 days, longer if new lesions appear during treatment or if healing is incomplete (400 mg 5 times daily for 7–10 days in immunocompromised or HIV-positive patients); treatment of recurrent infection, 800 mg 3 times daily for 2 days or 200 mg 5 times daily for 5 days or 400 mg 3 times daily for 3–5 days (400 mg 3 times daily for 5–10 days in immunocompromised or HIV-positive patients)

Herpes simplex, suppression, 400 mg twice daily or 200 mg 4 times daily; increased to 400 mg 3 times daily if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation); therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Herpes simplex, prophylaxis in the immunocompromised, 200–400 mg 4 times daily; CHILD 1 month–2 years, half adult dose, over 2 years, adult dose

Varicella and herpes zoster, treatment, 800 mg 5 times daily for 7 days (for herpes zoster in immunocompromised continue for 2 days after crusting of lesions); CHILD 1 month–2 years 200 mg 4 times daily for 5 days (for herpes zoster in immunocompromised continue for 2 days after crusting of lesions); 2–6 years 400 mg 4 times daily for 5 days (for herpes zoster in immunocompromised continue for 2 days after crusting of lesions); 6–12 years 800 mg 4 times daily for 5 days (for herpes zoster in immunocompromised continue for 2 days after crusting of lesions)

Attenuation of chickenpox (if varicella–zoster immunoglobulin not indicated) [unlicensed use]

**By intravenous infusion.** treatment of herpes simplex in the immunocompromised, severe initial genital herpes, 5 mg/kg every 8 hours usually for 5 days, doubled to 10 mg/kg every 8 hours if resistant organisms suspected or in simplex encephalitis (given for at least 14 days in encephalitis (at least 21 days if also immunocompromised)—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment)

Treatment of varicella-zoster 5 mg/kg every 8 hours usually for 5 days, doubled to 10 mg/kg every 8 hours in the immunocompromised or in encephalitis (given for 10–14 days in encephalitis, possibly longer if also immunocompromised or if severe infection)

Prophylaxis of herpes simplex in the immunocompromised, 5 mg/kg every 8 hours

**By topical application.** see section 13.10.3 (skin) and section 11.3.3 (eye)

**Note** Aciclovir doses in BNF may differ from those in product literature

**Aciclovir** (Non-proprietary)

- **Tablets.** aciclovir 200 mg, net price 25-tab pack = £1.66; 400 mg, 25-tab pack = £4.30; 800 mg, 35-tab pack = £4.30. Label: 9
- **Dental prescribing on NHS.** Aciclovir Tablets 200 mg or 800 mg may be prescribed
- **Dispersible tablets.** aciclovir 200 mg, net price 25-tab pack = £2.17; 400 mg, 56-tab pack = £9.91; 800 mg, 35-tab pack = £9.29. Label: 9
- **Suspension.** aciclovir 200 mg/5 mL, net price 125 mL = £35.82; 400 mg/5 mL, 100 mL = £39.54. Label: 9

**Note** Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription

- **Dental prescribing on NHS.** Aciclovir Oral Suspension 200 mg/5 mL may be prescribed
- **Intravenous infusion.** powder for reconstitution, aciclovir (as sodium salt), net price 250-mg vial = £9.13; 500-mg vial = £20.22
- **Electrolytes.** Na⁺ 1.1 mmol/250-mL vial
  - **Intravenous infusion.** aciclovir (as sodium salt), net price 25-mL vial = £10.18; 20-mL (500-mg) vial = £19.61; 40-mL (1-g) vial = £40.44
  - **Electrolytes.** Na⁺ 1.1 mmol/250-mL vial

**Zovirax®** (GSK)

- **Tablets.** all dispersible, f/c, aciclovir 200 mg, net price 25-tab pack = £2.85; 400 mg (scored, Shingles Treatment Pack), 35-tab pack = £10.50. Label: 9
- **Suspension.** both off-white, sugar-free, aciclovir 200 mg/5 mL (banana-flavoured), net price 125 mL = £29.56; 400 mg/5 mL (Double Strength Suspension, orange-flavoured) 100 mL = £33.02. Label: 9
- **Intravenous infusion.** powder for reconstitution, aciclovir (as sodium salt), net price 250-mg vial = £3.34; 500-mg vial = £3.40
- **Electrolytes.** Na⁺ 1.1 mmol/250-mg vial

**FAMCICLOVIR**

**Note** Famiclovir is a pro-drug of penciclovir

**Indications** see under Dose

**Cautions** interactions: Appendix 1 (famiclovir)

**Hepatic impairment** usual dose in well compensated liver disease (information not available on decompensated)

**Renal impairment** reduce dose; consult product literature

**Pregnancy** manufacturers advise avoid unless potential benefit outweighs risk

**Breast-feeding** no information available—present in milk in animal studies

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea; headache, fatigue; sweating, pruritus; rarely confusion; very rarely jaundice, dizziness, drowsiness, hallucinations, thrombocytopenia, rash (including Stevens-Johnson syndrome); also reported, constipation and fever

**Dose**

- Herpes zoster, treatment, 500 mg 3 times daily for 7 days or 750 mg 1–2 times daily for 7 days (in immunocompromised, 500 mg 3 times daily for 10 days, continue for 2 days after crusting of lesions)
• Genital herpes, treatment of first episode, 250 mg 3 times daily for 5 days, longer if new lesions appear during treatment or if healing incomplete (500 mg twice daily for 10 days in immunocompromised or HIV-positive patients); treatment of recurrent infection, 125 mg twice daily for 5 days or 1 g twice daily for 1 day (500 mg twice daily for 5–10 days in immunocompromised or HIV-positive patients)
• Genital herpes, suppression, 250 mg twice daily (500 mg twice daily in immunocompromised or HIV-positive patients); therapy interrupted every 6–12 months to re-assess recurrence frequency—consider restarting after two or more recurrences
• Non-genital herpes simplex, treatment in the immunocompromised, 500 mg twice daily for 7 days
• CHILD not recommended
Note Famciclovir doses in BNF may differ from those in product literature

**Famciclovir (Non-proprietary) (Famvir)**

**Tablets**
- Famciclovir 125 mg, net price 10-tab pack = £31.60; 250 mg, 15-tab pack = £103.75; 21-tab pack = £145.25, 56-tab pack = £387.33; 500 mg, 14-tab pack = £179.00; 30-tab pack = £399.34, 56-tab pack = £831.46; 750 mg, 7-tab pack = £134.88. Label: 9

**Famvir**® (Novartis)

**Tablets**
- all f/c, famciclovir 125 mg, net price 10-tab pack = £44.54; 250 mg, 15-tab pack = £133.62; 21-tab pack = £187.04; 56-tab pack = £498.80; 500 mg, 14-tab pack = £249.43, 30-tab pack = £534.34, 56-tab pack = £997.75. Label: 9

**INOSINE PRANOBEX**

(Inosine acedoben dimepranol)

**Indications** see under Dose

**Cautions** history of gout or hyperuricaemia

**Renal impairment** manufacturer advises caution; metabolised to uric acid

**Pregnancy** manufacturer advises avoid

**Side-effects** reversible increase in serum and urinary uric acid; less commonly nausea, vomiting, epigastric discomfort, headache, vertigo, fatigue, arthralgia, rashes and itching; rarely diarrhoea, constipation, anxiety, sleep disturbances, and polyuria

**Dose**
- Mucocutaneous herpes simplex, 1 g 4 times daily for 7–14 days
- Adjunctive treatment of genital warts, 1 g 3 times daily for 14–28 days
- Subacute sclerosing panencephalitis, 50–100 mg/kg daily in 6 divided doses

**Imunovir**® (Novartis)

**Tablets**
- scored, inosine pranobex 500 mg, net price 100-tab pack = £39.50. Label: 9

**VALACICLOVIR**

**Note** Valaciclovir is a pro-drug of aciclovir

**Indications** treatment of herpes zoster; treatment of initial and suppression of recurrent herpes simplex infections of skin and mucous membranes including initial and recurrent genital herpes; reduction of transmission of genital herpes; prevention of cytomegalovirus disease following solid organ transplantation when ganciclovir or ganciclovir cannot be used

**Cautions** see under Aciclovir

**Hepatic impairment** manufacturer advises caution with high doses used for herpes labialis and prevention of cytomegalovirus disease—no information available

**Renal impairment** maintain adequate hydration; for herpes zoster, 1 g every 12 hours if eGFR 30–50 mL/minute/1.73 m² (1 g every 24 hours if eGFR 10–30 mL/minute/1.73 m²); 500 mg every 24 hours if eGFR less than 10 mL/minute/1.73 m², for treatment of herpes simplex, 500 mg (1 g in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m²; for treatment of herpes labialis, if eGFR 30–50 mL/minute/1.73 m², initially 1 g, then 1 g every 12 hours after initial dose (if eGFR 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg every 12 hours after initial dose; if eGFR less than 10 mL/minute/1.73 m², 500 mg as a single dose); for suppression of herpes simplex, 250 mg (500 mg in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m²; for reduction of genital herpes transmission, 250 mg every 24 hours if eGFR less than 15 mL/minute/1.73 m²; reduce dose according to eGFR for cytomegalovirus prophylaxis following solid organ transplantation (consult product literature)

**Pregnancy** see under Aciclovir

**Breast-feeding** see under Aciclovir

**Side-effects** see under Aciclovir but neurological reactions more frequent with high doses

**Dose**
- Herpes zoster, 1 g 3 times daily for 7 days (in immunocompromised continue for 2 days after crusting of lesions); CHILD 12–18 years see BNF for Children
- Herpes simplex, treatment of first episode, 500 mg twice daily for 5 days, longer if new lesions appear during treatment or if healing incomplete (1 g twice daily for 10 days in immunocompromised or HIV-positive patients); treatment of recurrent infection, 500 mg twice daily for 3–5 days (1 g twice daily for 5–10 days in immunocompromised or HIV-positive patients); CHILD 12–18 years see BNF for Children
- Herpes labialis, treatment, ADULT and CHILD over 12 years, initially 2 g, then 2 g 12 hours after initial dose
- Herpes simplex, suppression, 500 mg daily in 1–2 divided doses (in immunocompromised or HIV positive patients, 500 mg twice daily); therapy interrupted every 6–12 months to re-assess recurrence frequency—consider restarting after two or more recurrences; CHILD 12–18 years see BNF for Children
- Reduction of transmission of genital herpes, seek specialist advice, 500 mg once daily to be taken by the infected partner
- Prevention of cytomegalovirus disease following solid organ transplantation (preferably starting within 72 hours of transplantation), 2 g 4 times daily usually for 90 days; CHILD 12–18 years see BNF for Children

**Valaciclovir (Non-proprietary) (Valaciclovir)**

**Tablets**
- valaciclovir 500 mg, net price 10-tab pack = £3.83, 42-tab pack = £8.50. Label: 9

**Valtrex**® (GSK)

**Tablets**
- f/c, valaciclovir (as hydrochloride) 250 mg, net price 60-tab pack = £123.28; 500 mg, 10-tab pack = £20.59, 42-tab pack = £86.30. Label: 9
**5.3.2.2 Cytomegalovirus infection**

Ganciclovir is related to aciclovir but it is more active against cytomegalovirus (CMV); it is also much more toxic than aciclovir and should therefore be prescribed only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the initial treatment of CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine; the two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load or in those who receive the drug over a long duration; cross-resistance to cidofovir is common.

Valaciclovir (see p. 425) is licensed for prevention of cytomegalovirus disease following renal transplantation.

Valganciclovir is an ester of ganciclovir which is licensed for the initial treatment and maintenance treatment of CMV retinitis in AIDS patients. Valganciclovir is also licensed for preventing CMV disease following solid organ transplantation from a cytomegalovirus-positive donor.

Foscarnet is active against cytomegalovirus; it is toxic and can cause renal impairment. Cidofovir is given in combination with probenecid for CMV retinitis in AIDS patients when ganciclovir and foscarnet are contra-indicated. Cidofovir is nephrotoxic.

For local treatment of CMV retinitis, see section 11.3.3.

**CIDOFOVIR**

**Indications** cytomegalovirus retinitis in AIDS patients for whom other drugs are inappropriate

**Cautions** monitor renal function (serum creatinine and urinary protein) and neutrophil count within 24 hours before each dose; co-treatment with probenecid and prior hydration with intravenous fluids necessary to minimise potential nephrotoxicity (see below); diabetes mellitus (increased risk of oculary hypotony); interactions: Appendix 1 (cidofovir)

**Nephrotoxicity** Do not initiate treatment in renal impairment (assess creatinine clearance and proteinuria—consult product literature); discontinue treatment and give intravenous fluids if renal function deteriorates—consult product literature

**Ocular disorders** Regular ophthalmological examinations recommended; iris and uveitis have been reported which may respond to a topical corticosteroid with or without a cycloplegic drug—discontinue cidofovir if no response to topical corticosteroid or if condition worsens, or if iritis or uveitis recurs after successful treatment

**Contra-indications** concomitant administration of potentially nephrotoxic drugs (discontinue potentially nephrotoxic drugs at least 7 days before starting cidofovir)

**Renal impairment** avoid if creatinine clearance less than 55 mL/minute; nephrotoxic

**Pregnancy** avoid (toxicity in animal studies); effective contraception required during and for 3 months after treatment; also men should avoid fathering a child during and for 3 months after treatment

**Breast-feeding** avoid—no information available

**Side-effects** nephrotoxicity (see Cautions above); nausea, vomiting, diarrhoea; dysphagia; headache; fever, asthenia; neutropenia; decreased intra-ocular pressure, iritis, uveitis (see Cautions above); alopecia, rash; less commonly Fanconi syndrome; also reported, hearing impairment and pancreatitis

**Dose**

- Initial (induction) treatment, **ADULT** over 18 years, by intravenous infusion over 1 hour, 5 mg/kg once weekly for 2 weeks (give probenecid and intravenous fluids with each dose, see below)
- Maintenance treatment, beginning 2 weeks after completion of induction, ADULT over 18 years, by intravenous infusion over 1 hour, 5 mg/kg over every 2 weeks (give probenecid and intravenous fluids with each dose, see below)

**Probenecid co-treatment** By mouth (preferably after food), probenecid 2 g 3 hours before cidofovir infusion followed by probenecid 1 g at 2 hours and 1 g at 8 hours after the end of cidofovir infusion (total probenecid 4 g); for cautions, contra-indications and side-effects of probenecid see section 10.1.4

**Prior hydration** Sodium chloride 0.9%, by intravenous infusion, 1 litre over 1 hour immediately before cidofovir infusion (if tolerated an additional 1 litre may be given over 1–3 hours, starting at the same time as the cidofovir infusion or immediately afterwards)

**Vistide** (Gilead) ®

**Intravenous infusion**, cidofovir 75 mg/mL, net price 5 mL vial = £532.22

**Caution in handling** Cidofovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with water.

**GANCICLOVIR**

**Indications** life-threatening or sight-threatening cytomegalovirus infections in immunocompromised patients only; prevention of cytomegalovirus disease during immunosuppressive therapy following organ transplantation; local treatment of CMV retinitis (section 11.3.3)

**Cautions** close monitoring of full blood count (severe deterioration may require correction and possibly treatment interruption); history of cytopenia; potential carcinogen and teratogen; radiotherapy; ensure adequate hydration during intravenous administration; vesicant—infuse into vein with adequate flow preferably using plastic cannula; children (possible risk of long-term carcinogenic or reproductive toxicity); interactions: Appendix 1 (ganciclovir)

**Contra-indications** hypersensitivity to valganciclovir, ganciclovir, aciclovir, or valaciclovir; abnormally low haemoglobin, neutrophil, or platelet counts (consult product literature)

**Renal impairment** reduce dose if eGFR less than 70 mL/minute/1.73 m²; consult product literature

**Pregnancy** avoid—teratogenic risk; ensure effective contraception during treatment and barrier contraception for men during and for at least 90 days after treatment

**Breast-feeding** avoid—no information available

**Side-effects** diarrhoea, nausea, vomiting, dyspepsia, abdominal pain, constipation, flatulence, dysphagia, taste disturbance, hepatic dysfunction; dysphonia, chest pain, cough; headache, insomnia, convulsions, dizziness, peripheral neuropathy, depression, anxiety, confusion, abnormal thinking, fatigue, weight loss, anorexia; infection, pyrexia, night sweats; anaemia, leucopenia, thrombocytopenia, pancytopenia, renal impairment; myalgia, arthralgia; macular oedema, retinal detachment, vitreous floaters, eye pain; ear pain; dermatitis, pruritis; injection-site reactions; less commonly mouth ulcers, pancreatitis, arrhythmias,
hypotension, anaphylactic reactions, psychosis, tremor, male infertility, haematuria, disturbances in hearing and vision, and alopecia

**Dose**
- **By intravenous infusion,** initially (induction) 5 mg/kg every 12 hours for 14–21 days for treatment or for 7–14 days for prevention; maintenance (for patients at risk of relapse of retinitis) 6 mg/kg daily on 5 days per week or 5 mg/kg daily until adequate recovery of immunity; if retinitis progresses initial induction treatment may be repeated; **CHILD** under 18 years, see **BNF for Children**

**Cymevene® (Roche) (Po)**

**Intravenous infusion,** powder for reconstitution, ganciclovir (as sodium salt). Net price 500-mg vial = £29.77

**Electrolytes** Na⁺ 2 mmol/500-mg vial

**Caution in handling** Ganciclovir is toxic and personnel should be adequately protected during handling and administration, if solution comes into contact with skin or mucosa, wash off immediately with soap and water

**Indications**
cytomegalovirus disease [licensed for cytomegalovirus retinitis in AIDS patients only]; mucocutaneous herpes simplex virus infections unresponsive to aciclovir in immunocompromised patients

**Cautions**
monitor electrolytes, particularly calcium and magnesium; monitor serum creatinine every second day during induction and every week during maintenance; ensure adequate hydration; avoid rapid infusion; men should avoid fathering a child during and for 6 months after treatment; **interactions:** Appendix 1 (foscarnet)

**Renal impairment** reduce dose; consult product literature

**Pregnancy**
mother advises avoid

**Breast-feeding** avoid—present in milk in **animal studies**

**Side-effects**
nausea (reduce infusion rate), vomiting, diarrhoea, abdominal pain, constipation, dyspepsia, anorexia, hepatic dysfunction, pancreatitis, changes in blood pressure and ECG, palpitation, oedema, dizziness, headache, malaise, aggression, agitation, anxiety, confusion, depression, paraesthesia (reduce infusion rate), convulsions, tremor, and other neurological disorders, anaemia, granulocytopenia, leucopenia, thrombocytopenia, dysuria, polyuria, renal impairment (including acute renal failure), electrolyte disturbances (including hypokalaemia, hypomagnesaemia, and hypocalcaemia), myalgia, rash, pruritus, thrombophlebitis if given undiluted by peripheral vein, genital irritation and ulceration (due to high concentrations excreted in urine); less commonly acidois; also reported oesophageal ulceration, ventricular arrhythmias, diabetes insipidus, myasthenia, myositis, rhabdomyolysis

**Dose**
- **CMV disease** [licensed for CMV retinitis only]. **by intravenous infusion,** initially (induction) 60 mg/kg every 8 hours or 90 mg/kg every 12 hours, for 2–3 weeks; maintenance 60 mg/kg daily, increased to 90–120 mg/kg if tolerated; if disease progresses on maintenance dose, repeat induction regimen

- **Mucocutaneous herpes simplex infection, by intravenous infusion,** 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal

**Note**
Foscarnet doses in BNF may differ from those in product literature

**Foscavir® (Clinigen) (Fi)**

**Intravenous infusion,** foscarnet sodium hexahydrate 24 mg/mL, net price 250-mL bottle = £119.85

**Electrolytes** Na⁺ 0.24 mmol/mL

**VALGANCICLOVIR**

**Note**
Valganciclovir is a pro-drug of ganciclovir

**Indications**
induction and maintenance treatment of cytomegalovirus retinitis in AIDS patients; prevention of cytomegalovirus disease following solid organ transplantation from a cytomegalovirus-positive donor.

**Cautions**
see under Ganciclovir

**Contra-indications**
see under Ganciclovir

**Renal impairment** reduce dose; consult product literature

**Pregnancy**
see under Ganciclovir

**Breast-feeding**
see under Ganciclovir

**Side-effects**
see under Ganciclovir

**Dose**
- **CMV retinitis, induction, ADULT** over 18 years, 900 mg twice daily for 21 days then 900 mg once daily; induction regimen may be repeated if retinitis progresses

- **Prevention of cytomegalovirus disease following solid organ transplantation (starting within 10 days of transplantation), ADULT** over 18 years, 900 mg once daily for 100 days (for 100–200 days following kidney transplantation)

**Note**
Oral valganciclovir 900 mg twice daily is equivalent to intravenous ganciclovir 5 mg/kg twice daily

**Valcyte® (Roche) (Fi)**

**Tablets** pink, f/c, valganciclovir (as hydrochloride) 450 mg, net price 60-tab pack = £1081.66. Label: 21

**Oral solution** tutti-frutti flavoured, valganciclovir (as hydrochloride) 250 mg/5 mL when reconstituted with water, net price 100 mL = £230.32. Label: 21

**Caution in handling** Valganciclovir is a potential teratogen and carcinogen and caution is advised when handling the powder, reconstituted solution, or broken tablets; if these come into contact with skin or mucosa, wash off immediately with water; avoid inhalation of powder

---

**5.3.3 Viral hepatitis**

**5.3.3.1 Chronic hepatitis B**

**5.3.3.2 Chronic hepatitis C**

Treatment for viral hepatitis should be initiated by a specialist. The management of uncomplicated acute viral hepatitis is largely symptomatic. Early treatment of acute hepatitis C with interferon alfa [unlicensed indication] may reduce the risk of chronic infection. Hepatitis B and hepatitis C viruses are major causes of chronic hepatitis. For details on immunisation against hepatitis A and B infections, see section 14.4 (active immunisation), section 14.5.1 (passive immunisation against hepatitis A), and section 14.5.2 (passive immunisation against hepatitis B).
5 Infections

dinated between HIV and hepatology specialists.

occurs. Management of these patients should be coor-
continued long-term, even if adequate seroconversion
as peginterferon alfa or adefovir. Treatment may be
receive antivirals that are not active against HIV, such
require treatment for chronic hepatitis B, they should
infected with both HIV and chronic hepatitis B only
ment for both HIV and chronic hepatitis B. If patients
with lamivudine in lamivudine-resistant chronic hepat-
itis B; tenofovir disoproxil can be used in patients with decomp-
ated liver disease.

Entecavir or tenofovir disoproxil (see p. 415) are options for the initial treatment of chronic hepatitis B. If the response is inadequate after 6–9 months of treatment, a change in treatment should be considered. Other drugs that are licensed for the treatment of chronic hepatitis B include adecon dipivoxil, lamivu-
dine (see p. 414), or telbivudine (but see NICE gui-
dance below).

Entecavir alone, tenofovir disoproxil alone, or a combi-
nation of lamivudine with either adecon dipivoxil or tenofovir disoproxil can be used in patients with decomp-
ated liver disease.

If drug-resistant hepatitis B virus emerges during treat-
ent, another antiviral drug to which the virus is sensi-
tive should be added. Hepatitis B viruses with reduced susceptibility to lamivudine have emerged following extended therapy. Adefovir or tenofovir can be given with lamivudine in lamivudine-resistant chronic hepat-
itis B; telbivudine or entecavir should not be used because cross-resistance can occur.

If there is no toxicity or loss in efficacy, treatment with adecon, entecavir, lamivudine, telbivudine, or tenofovir is usually continued until 6 months after adequate seroconversion has occurred. Treatment is usually con-
tinued long-term in patients with decompensated liver
disease.

Tenofovir, or a combination of tenofovir with either emtricitabine or lamivudine may be used with other antiretrovirals, as part of ‘highly active antiretroviral therapy’ (section 5.3.1) in patients who require treat-
ment for both HIV and chronic hepatitis B. If patients infected with both HIV and chronic hepatitis B only require treatment for chronic hepatitis B, they should receive antivirals that are not active against HIV, such as peginterferon alfa or adecon. Treatment may be continued long-term, even if adequate seroconversion occurs. Management of these patients should be coor-
dinated between HIV and hepatology specialists.

Entecavir is an option for the treatment of chronic hepatitis B.

Entecavir for chronic hepatitis B (August 2008)

Entecavir is not recommended for the treatment of chronic hepatitis B. Patients currently receiving entecavir can continue treatment until they and their clinician consider it appropriate to stop.

Tenofovir for chronic hepatitis B (July 2009)

Tenofovir is an option for the treatment of chronic hepatitis B.

Adefovir dipivoxil

Indications chronic hepatitis B infection with either compensated liver disease with evidence of viral replication, and histologically documented active liver inflammation and fibrosis, when other treatment not appropriate or decompensated liver disease in combination with another antiviral for chronic hepatitis B that has no cross-resistance to adecon

Cautions monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation); monitor renal function before treatment then every 3 months, more fre-
quently in renal impairment or in patients receiving nephrotoxic drugs; elderly; discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis

Renal impairment 10 mg every 48 hours if eGFR 30–
50 mL/minute/1.73 m2; 10 mg every 72 hours if eGFR 10–30 mL/minute/1.73 m2; no information available if eGFR less than 10 mL/minute/1.73 m2; see also Cautions above

Pregnancy toxicity in animal studies—manufacturer advises use only if potential benefit outweighs risk; effective contraception required during treatment

Breast-feeding manufacturer advises avoid—no information available

Side-effects nausea, vomiting, dyspepsia, abdominal pain, flatulence, diarrhoea, asthenia, headache; renal failure; hypophosphataemia; rash and pruritus; also reported pancreatitis

Dose • ADULT over 18 years, 10 mg once daily

Hepsera® (Gilead) Tablets, adecon dipivoxil 10 mg, net price 30-tab pack = £296.73

Entecavir

Indications chronic hepatitis B infection either with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) or decompensated liver disease

Cautions monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1
BNF 68

5.3.3 Viral hepatitis 429

Pregnancy manufacture advises use only if potential benefit outweighs risk.

Renal impairment reduce dose if eGFR less than 50 mL/min/1.73 m²; consult product literature

Pregnancy toxicity in animal studies—manufacturer advises use only if potential benefit outweighs risk; effective contraception required during treatment

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Indications

Baraclude

Decompensated liver disease,

Compensated liver disease not previously treated.

Dose

• Compensated liver disease not previously treated with nucleoside analogues, ADULT over 18 years, 500 micrograms once daily

• Compensated liver disease with lamivudine-resistant chronic hepatitis B (but see notes above), ADULT over 18 years, 1 mg once daily; consider other treatment if inadequate response after 6 months

Counselling To be taken at least 2 hours before or 2 hours after food

• Decompensated liver disease, ADULT over 18 years, 1 mg once daily

Counselling To be taken at least 2 hours before or 2 hours after food

Baraclude® (Bristol-Myers Squibb) ™ Tablets, f/c, entecavir (as monohydrate) 500 micrograms (white), net price 30-tab pack = £363.26; 1 mg (pink), 30-tab pack = £363.26. Counselling, administration

Oral solution, entecavir (as monohydrate) 50 micrograms/mL, net price 210-mL pack (orange-flavoured) = £423.80. Counselling, administration

TELBIVUDINE

Indications chronic hepatitis B infection with compensated liver disease, evidence of viral replication, and histologically documented active liver inflammation or fibrosis, when other treatment is not appropriate

Cautions monitor liver function tests every 3 months and viral markers of hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation); lamivudine-resistant chronic hepatitis B—risk of telbivudine resistance; discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis; interactions: Appendix 1 (telbivudine)

Counselling Patients should be advised to promptly report unexplained muscle pain, tenderness, or weakness; peripheral neuropathy, tingling or burning sensations

Renal impairment 600 mg every 48 hours if eGFR 30–49 mL/min/1.73 m²; 600 mg every 72 hours if eGFR less than 30 mL/min/1.73 m²

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises avoid—present in milk for animal studies

Side-effects

Nausea, diarrhoea, abdominal pain, raised serum amylase and lipase; cough, dizziness, headache, fatigue; rash; less commonly taste disturbances, arthralgia, myalgia, myopathy (discontinue treatment), and peripheral neuropathy; rarely lactic acidosis, rhabdomyolysis

Dose

• ADULT over 18 years, 600 mg once daily

Sebivo® (Novartis) ™ Tablets, f/c, telbivudine 600 mg, net price 28-tab pack = £290.33. Counselling, muscle effects, peripheral neuropathy

5.3.3.2 Chronic hepatitis C

Before starting treatment, the genotype of the infecting hepatitis C virus should be determined and the viral load measured as this may affect the choice and duration of treatment. A combination of ribavirin (see p. 433) and peginterferon alfa (section 8.2.4) is used for the treatment of chronic hepatitis C (see NICE guidance, below).

The combination of ribavirin and interferon alfa is less effective than the combination of peginterferon alfa and ribavirin. Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Ribavirin monotherapy is ineffective.

NICE guidance

Peginterferon alfa and ribavirin for mild chronic hepatitis C (August 2006 and September 2010)

The combination of peginterferon alfa and ribavirin can be used for treating mild chronic hepatitis C in patients over 18 years. Alternatively, treatment can be delayed until the disease has reached a moderate stage (‘watchful waiting’). Peginterferon alfa alone can be used if ribavirin is contra-indicated or not tolerated.

www.nice.org.uk/TA200

NICE guidance

Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010)

The combination of peginterferon alfa and ribavirin should be used for treating moderate to severe chronic hepatitis C in patients aged over 18 years:

• not previously treated with interferon alfa or peginterferon alfa,

• treated previously with interferon alfa alone or in combination with ribavirin,

• whose condition did not respond to peginterferon alfa alone or to a combination of peginterferon alfa and ribavirin, or responded but subsequently relapsed,

• co-infected with HIV.

Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk. Patients receiving interferon alfa may be switched to peginterferon alfa.

www.nice.org.uk/TA200
Boceprevir and telaprevir are protease inhibitors that inhibit the replication of hepatitis C virus genotype 1, but they are less effective against other genotypes of the virus. Monotherapy is not recommended because there is a high likelihood of resistance developing. Either boceprevir or telaprevir is licensed for use in combination with ribavirin and peginterferon alfa for the treatment of chronic hepatitis C infection of genotype 1 in patients with compensated liver disease; these combinations are more effective than dual therapy with ribavirin and peginterferon alfa. However, triple therapy is associated with a higher incidence and greater severity of anaemia than dual therapy. Neutropenia seems to be more frequent during treatment with regimens containing boceprevir than with those containing telaprevir. Rash is a particular concern with telaprevir, and to a lesser extent with boceprevir.

**NICE guidance**

**Boceprevir for chronic hepatitis C infection of genotype 1 (April 2012)**

Boceprevir in combination with ribavirin and peginterferon alfa is an option for the treatment of chronic hepatitis C infection of genotype 1 in adults with compensated liver disease:
- who have not been treated previously;
- in whom previous treatment (e.g. with peginterferon alfa in combination with ribavirin) has failed.

www.nice.org.uk/TA253

**Telaprevir for chronic hepatitis C infection of genotype 1 (April 2012)**

Telaprevir in combination with ribavirin and peginterferon alfa is an option for the treatment of chronic hepatitis C infection of genotype 1 in adults with compensated liver disease:
- who have not been treated previously;
- in whom previous treatment (e.g. with peginterferon alfa in combination with ribavirin) has failed.

www.nice.org.uk/TA252

Sofosbuvir is a pro-drug of a nucleoside inhibitor that is effective against hepatitis C virus polymerase NS5B. It is licensed for use in combination with ribavirin, with or without peginterferon alfa, for the treatment of chronic hepatitis C infection of genotypes 1, 2, 3, 4, 5, or 6 in patients with compensated liver disease. Sofosbuvir monotherapy is not recommended because it is less effective than combination therapy.

**Breast-feeding** manufacturer advises avoid; present in milk in animal studies

**Side-effects** in combination with ribavirin and peginterferon alfa, anaemia, nausea, vomiting, abdominal pain, gastro-oesophageal reflux, flatulence, diarrhoea, constipation, haemorrhoids, dry mouth, disturbances in taste and smell, mouth ulcers, stomatitis, tooth disorder, palpitation, blood pressure changes, syncope, peripheral oedema, hypertriglyceridaemia, cough, dyspnoea, dizziness, headache, decreased appetite, weight loss, anxiety, depression, insomnia, agitation, amnesia, asthenia, hypoaesthesia, paraesthesia, tremor, influenza-like symptoms, hyperglycaemia, hypothyroidism, changes in libido, erectile dysfunction, polyuria, leucopenia, thrombocytopenia, pancytopenia, arthralgia, myalgia, muscle spasms, hyperuricaemia, visual disturbances, dry eyes, tinnitus, alopecia, rash (also reported Stevens-Johnson syndrome, rash with eosinophilia and systemic symptoms), pruritus, hyperhidrosis, psoriasis, less commonly gingivitis, tongue discoloration, hyper-salivation, dysphagia, pancreatitis, colitis, hyperbiliary-ubinaemia, arrhythmias, venous thromboembolism, flushing, pallor, dysphonia, hyperaesthesia, homicidal and suicidal ideation, hyperthyroidism, amenorrhoea, menorrhagia, dysuria, hypokalaemia, hypercalcaemia, gout, retinal ischaemia, retinopathy, conjunctival haemorrhage, eye pain, increased lacrimation, photophobia, hearing impairment, photosensitivity, skin ulceration; rarely cholecystitis, acute myocardial infarction, coronary artery disease, pericarditis, pleural fibrosis, respiratory failure, bilarard disorder, hallucinations, encephalopathy, thyroid neoplasms, aspermia, sarcoidosis.

**Dose**
- In combination with ribavirin and peginterferon alfa, ADULT over 18 years, 800 mg 3 times daily (for duration of treatment consult product literature)
- Missed dose If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

**VICTRELIS® (MSD) ▼ Foll**

Capsules, brown-yellow/white, boceprevir 200 mg, net price 336-cap pack = £2800.00. Label: 21

**SOFSUBVIR**

**Indications** in combination with ribavirin, with or without peginterferon alfa, for chronic hepatitis C infection of genotypes 1, 2, 3, 4, 5, or 6, only use sofosbuvir with ribavirin in those with intolerance or contra-indications to peginterferon alfa who require urgent treatment; **Interactions:** Appendix 1 (sofosbuvir)

**Renal impairment** safety and efficacy not established if eGFR less than 30 mL/minute/1.73m²—accumulation may occur

**Pregnancy** manufacturer advises avoid; see also under Ribavirin

**Breast-feeding** manufacturer advises avoid—metabolites present in milk in animal studies

**Side-effects** in combination with ribavirin (with or without peginterferon alfa), anaemia, nausea, constipation, abdominal discomfort, gastro-oesophageal
TELAPREVIR

**Indications** in combination with ribavirin and peginterferon alfa for chronic hepatitis C infection of genotype 1 in patients with compensated liver disease

**Cautions** monitor full blood count, platelets, electrolytes, serum creatinine, uric acid, and liver and thyroid function tests before starting treatment and then on weeks 2, 4, 8, and 12 of treatment, then as indicated clinically; electrolyte disturbances; prolongation of QT interval, bradycardia, heart failure with reduced left ventricular ejection fraction, concomitant use with other drugs known to prolong QT interval; congenital or family history of QT interval prolongation, family history of sudden death; effectiveness of hormonal contraceptives reduced during treatment and for 2 months after stopping telaprevir—effective non-hormonal methods of contraception necessary during this time (see also Cautions under Ribavirin); interactions: Appendix 1 (telaprevir)

**Rash** Rash occurs very commonly. If rash mild or moderate, may continue without interruption, but monitor for deterioration. If moderate rash deteriorates, consider permanent discontinuation of telaprevir; if rash does not improve within 7 days of discontinuation, suspend ribavirin. If severe rash or if rash accompanied by blistering or mucosal ulceration, discontinue telaprevir permanently; if rash does not improve within 7 days of discontinuation, consider discontinuation of ribavirin and peginterferon alfa. If serious rash, or if severe rash deteriorates, or if rash accompanied by systemic symptoms, discontinue telaprevir, ribavirin, and peginterferon alfa permanently

**Counselling** Patients should be told to seek immediate medical attention if a rash develops or if an existing rash worsens

**Hepatic impairment** manufacturer advises avoid in moderate to severe impairment

**Pregnancy** manufacturer advises avoid; see Cautions above and also see under Ribavirin

**Breast-feeding** manufacturer advises avoid—present in milk in animal studies

**Side-effects** in combination with ribavirin and peginterferon alfa, rash (including eczema and rarely Stevens-Johnson syndrome and toxic epidermal necrolysis; see also Rash above), pruritus, anaemia, nausea, vomiting, diarrhoea, haemorrhoids, anal fissure, hyperbilirubinaemia, taste disturbances, syncope, peripheral oedema, hypothyroidism, hypokalaemia, thrombocytopenia, lymphopenia, hyperuricaemia; less commonly proctitis, gut, retinopathy, urticaria

**Dose**
- In combination with ribavirin and peginterferon alfa, ADULT over 18 years, 1.125 g every 12 hours or 750 mg every 8 hours (for duration of treatment consult product literature)
- Missed dose If a dose is more than 6 hours late with the 12 hourly regimen (or more than 4 hours late with the 8 hourly regimen), the missed dose should not be taken and the next dose should be taken at the normal time

**Sovaldi® (Gilead) ▼ (TA)**

Tablets, yellow, f/c, sofosbuvir 400 mg, net price 28-tablet pack = £11660.98 Label: 21, counselling, rash

**Note** Dispense in original container (contains desiccant)

5.3.4 Influenza

For advice on immunisation against influenza, see section 14.4.

Oseltamivir and zanamivir reduce replication of influenza A and B viruses by inhibiting viral neuraminidase. They are most effective for the treatment of influenza if started within a few hours of the onset of symptoms; they are licensed for use within 48 hours (within 36 hours for zanamivir in children) of the first symptoms. In otherwise healthy individuals they reduce the duration of symptoms by about 1–1.5 days. Oseltamivir or zanamivir can reduce the risk of complications from influenza in the elderly and in patients with chronic disease (see also NICE guidance, p. 432).

Oseltamivir and zanamivir are licensed for post-exposure prophylaxis of influenza when influenza is circulating in the community. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza (see also NICE guidance, p. 432). However, in patients with severe influenza or in those who are immunocompromised, antivirals may still be effective after this time if viral shedding continues [unlicensed use]. Oseltamivir and zanamivir are also licensed for use in exceptional circumstances (e.g. when vaccination does not cover the infecting strain) to prevent influenza in an epidemic.

There is evidence that some strains of influenza A virus have reduced susceptibility to oseltamivir, but may retain susceptibility to zanamivir. Resistance to oseltamivir and zanamivir is more likely to occur in severely immunocompromised patients.

Zanamivir should be reserved for patients who are severely immunocompromised, or when oseltamivir cannot be used, or when resistance to oseltamivir is suspected. For those unable to use the dry powder for inhalation, zanamivir is available as a solution that can be administered by nebuliser or intravenously [unlicensed].

Amanadine is licensed for prophylaxis and treatment of influenza A but it is no longer recommended (see NICE guidance).

Information on pandemic influenza, avian influenza, and swine influenza may be found at www.hpa.org.uk
Oseltamivir in children under 1 year of age

Data on the use of oseltamivir in children under 1 year of age is limited. Furthermore, oseltamivir may be ineffective in neonates because they may not be able to metabolise oseltamivir to its active form. However, oseltamivir can be used (under specialist supervision) for the treatment or post-exposure prophylaxis of influenza in children under 1 year of age. The Department of Health has advised (May 2009) that during a pandemic, treatment with oseltamivir can be overseen by healthcare professionals experienced in assessing children.

Pregnancy and breast-feeding Although safety data are limited, either oseltamivir or zanamivir can be used in women who are pregnant or breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Oseltamivir is the preferred drug in women who are breast-feeding.

NICE guidance Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008)

The drugs described here are not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

- Amantadine is not recommended for prophylaxis of influenza.
- Oseltamivir or zanamivir are not recommended for seasonal prophylaxis against influenza.
- When influenza is circulating in the community1, either oseltamivir or zanamivir is recommended (in accordance with UK licensing) for the treatment of influenza in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza.
- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, either oseltamivir or zanamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.
- At risk2 patients include those aged over 65 years or those who have one or more of the following conditions:
  - chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
  - chronic heart disease;
  - chronic renal disease;
  - chronic neurological disease;
  - immunosuppression;
  - diabetes mellitus.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

www.nice.org.uk/TA158

NICE guidance Oseltamivir, zanamivir, and amantadine for treatment of influenza (February 2009)

The drugs described here are not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

- Amantadine is not recommended for treatment of influenza.
- When influenza is circulating in the community1, either oseltamivir or zanamivir is recommended (in accordance with UK licensing) for the treatment of influenza in at-risk patients who can start treatment within 48 hours (within 36 hours for zanamivir in children) of the onset of symptoms.
- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, either oseltamivir or zanamivir may be used for treatment in at-risk patients living in long-term residential or nursing homes.

At risk2 patients include those aged over 65 years or those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

www.nice.org.uk/TA168

AMANTADINE HYdrochloride

Indications see under Dose; parkinsonism (section 4.9.1)

Cautions section 4.9.1

Contra-indications section 4.9.1

Renal impairment section 4.9.1

Pregnancy section 4.9.1

Breast-feeding section 4.9.1

Side-effects section 4.9.1

Dose

- Oseltamivir, 75 mg capsules: dose 5 mg twice daily
- Zanamivir, 10 mg capsules: dose 5 mg twice daily

Lysovir® (Alliance)

Capsules, red-brown, amantadine hydrochloride 100 mg, net price 5-cap pack = £2.40, 14-cap pack = £3.00. Counselling, driving

Symmetrel® (Alliance)

Section 4.9.1

OSelTAMIVIR

Indications see notes above

Renal impairment for treatment, use 30 mg twice daily if eGFR 30–60 mL/minute/1.73 m² (30 mg once daily if eGFR 10–30 mL/minute/1.73 m²); for prevention, use 30 mg once daily if eGFR 30–60 mL/minute/1.73 m² (30 mg every 48 hours if eGFR 10–30 mL/minute/1.73 m²); avoid for treatment and prevention if eGFR less than 10 mL/minute/1.73 m²

1. National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.
2. The Department of Health in England has advised (November 2010 and April 2011) that ‘at risk’ patients also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant.
Pregnancy use only if potential benefit outweighs risk (e.g. during a pandemic); see also p. 432

Breast-feeding amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic); see also p. 432

Side-effects nausea, vomiting, abdominal pain, dyspepsia, headache; less commonly arthritiasmias, convulsions and altered consciousness (usually in children and adolescents), eczema, rash; rarely hepatitis, gastro-intestinal bleeding, neuropsychiatric disorders (usually in children and adolescents), thrombocytopenia, visual disturbances, Stevens-Johnson syndrome, toxic epidermal necrolysis

Dose
- Prevention of influenza, ADULT and CHILD over 13 years. 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic; NEONATE (see notes above), 2 mg/kg once daily for 10 days for post-exposure prophylaxis; CHILD 1–3 months (see notes above), 2.5 mg/kg once daily for 10 days for post-exposure prophylaxis; 3 months–1 year (see notes above), 3 mg/kg once daily for 10 days for post-exposure prophylaxis; 1–13 years, body-weight 10–15 kg, 30 mg once daily for 10 days for post-exposure prophylaxis (for up to 6 weeks during an epidemic); body-weight 15–23 kg, 45 mg once daily for 10 days for post-exposure prophylaxis (for up to 6 weeks during an epidemic); body-weight 23–40 kg, 60 mg once daily for 10 days for post-exposure prophylaxis (for up to 6 weeks during an epidemic); body-weight over 40 kg, adult dose
- Treatment of influenza, ADULT and CHILD over 13 years. 75 mg every 12 hours for 5 days; NEONATE (see notes above), 2 mg/kg every 12 hours for 5 days; CHILD 1–3 months (see notes above), 2.5 mg/kg every 12 hours for 5 days; 3 months–1 year (see notes above), 3 mg/kg every 12 hours for 5 days; 1–13 years, body-weight 10–15 kg, 30 mg every 12 hours for 5 days, body-weight 15–23 kg, 45 mg every 12 hours for 5 days, body-weight 23–40 kg, 60 mg every 12 hours for 5 days, body-weight over 40 kg, adult dose

Note Not licensed for use in children under 1 year of age unless there is a pandemic

Tamiflu® (Roche) Capsules, oseltamivir (as phosphate) 30 mg (yellow), net price 10-cap pack = £7.71; 45 mg (grey), 10-cap pack = £15.41; 75 mg (grey-yellow), 10-cap pack = £15.41. Label: 9

Note If suspension not available, capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration

Oral suspension, sugar-free, tutti-frutti-flavoured, oseltamivir (as phosphate) for reconstitution with water, 30 mg/5 mL, net price 65 mL = £10.27. Label: 9

Excipients include sorbitol 900 mg/5 mL

Note Solutions prepared by ‘special order’ manufacturers may be a different concentration

ZANAMIVIR

Indications see notes above

Cautions asthma and chronic pulmonary disease (risk of bronchospasm—short-acting bronchodilator

1 Tamiflu® (Roche) as indicated in the notes above and NICE guidance, endorse prescription ‘SLS’

5.3.5 Respiratory syncytial virus

Ribavirin inhibits a wide range of DNA and RNA viruses. It is licensed for administration by inhalation for the treatment of severe bronchiolitis caused by the respiratory syncytial virus (RSV) in infants, especially when they have other serious diseases. However, there is no evidence that ribavirin produces clinically relevant benefit in RSV bronchiolitis. Ribavirin is given by mouth with peginterferon alfa or interferon alfa for the treatment of chronic hepatitis C infection (see section 5.3.3.2, p. 429). Ribavirin is also effective in Lassa fever [unlicensed indication].

Palivizumab is a monoclonal antibody licensed for preventing serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease; it should be prescribed under specialist supervision and on the basis of the likelihood of hospitalisation.

Palivizumab is recommended for:
- children under 9 months of age with chronic lung disease (defined as requiring oxygen for at least 28 days from birth) and who were born preterm;
- children under 6 months of age with haemodynamically significant, acyanotic congenital heart disease who were born preterm.

Palivizumab should be considered for:
- children under 2 years of age with severe combined immunodeficiency syndrome;
- children under 1 year of age who require long-term ventilation;

1 For details of the preterm age groups included in the recommendations, see Immunisation against Infectious Disease (2006), available at www.gov.uk/dh
\textbf{PALIVIZUMAB}

\textbf{Indications} see notes above

\textbf{Cautions} moderate to severe acute infection or febrile illness; thrombocytopenia; serum-palivizumab concentration may be reduced after cardiac surgery; hypersensitivity to humanised monoclonal antibodies

\textbf{Side-effects} fever, injection-site reactions, nervousness; less commonly diarrhea, vomitting, constipation, haemorrhage, rhinitis, cough, wheeze, pain, drowsiness, asthma, hyperkinesia, leucopenia, and rash; also reported, anphoi, hypersensitivity reactions (including anaphylaxis), convulsions and thrombocytopenia

\textbf{Dose} by intramuscular injection (preferably in anterolateral thigh), 15 mg/kg once a month during season of RSV risk (child undergoing cardiac bypass surgery, 15 mg/kg as soon as stable after surgery, then once a month during season of risk); injection volume over 1 mL should be divided between more than one site

\textbf{Synagis} (AbbVie) \textcopyright injection, powder for reconstitution, palivizumab, net price 50-mg vial = £306.34; 100-mg vial = £563.64

\textbf{RIBAVIRIN} (Tribavirin)

\textbf{Indications} severe respiratory syncytial virus bronchiolitis in infants and children; in combination with peginterferon alfa or interferon alfa for chronic hepatitis C in patients without liver decompensation (see also section 5.3.3.2)

\textbf{Cautions} Specific cautions for inhaled treatment Maintain standard supportive respiratory and fluid management therapy; monitor electrolytes closely; monitor equipment for precipitation; pregnant women (and those planning pregnancy) should avoid exposure to aerosol

Specific cautions for oral treatment Exclude pregnancy before treatment; effective contraception essential during treatment and for 4 months after treatment in women and for 7 months after treatment in men; routine monthly pregnancy tests recommended; condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen); cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration); gout, determine full blood count, platelet, electrolytes, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature); eye examination recommended before treatment; eye examination also recommended during treatment if pre-existing ophthalmological disorder or if decrease in vision reported—discontinue treatment if ophthalmological disorder deteriorates or if new ophthalmological disorder develops; patients with a transplant—risk of rejection; test thyroid function before treatment and then every 3 months in children; risk of growth retardation in children, the reversibility of which is uncertain—if possible, consider starting treatment after pubertal growth spurt

\textbf{Interactions:} Appendix 1 (ribavirin)

\textbf{Contra-indications} Specific contra-indications for oral treatment Severe cardiac disease, including unstable or uncontrolled cardiac disease in previous 6 months; haemoglobinopathies; severe debilitating medical conditions; autoimmunecom immune disease (including autoimmune hepatitis), uncontrolled severe psychiatric condition; history of severe psychiatric condition in children

\textbf{Hepatic impairment} no dosage adjustment required; use oral ribavirin with caution in severe hepatic dysfunction or decompensated cirrhosis

\textbf{Renal impairment} plasma-ribavirin concentration increased; avoid oral ribavirin unless essential if eGFR less than 50 mL/minute/1.73 m²—monitor haemoglobin concentration closely

\textbf{Pregnancy} avoid; teratogenicity in animal studies; see also Cautions above

\textbf{Breast-feeding} avoid—no information available

\textbf{Side-effects} Specific side-effects for inhaled treatment Worsening respiration, bacterial pneumonia, and pneumothorax reported, rarely non-specific anaemia and haemolytic anaemia

Specific side-effects for oral treatment Haemolytic anaemia (anaemia may be improved by epoetin); also (in combination with peginterferon alfa or interferon alfa) nausea, vomiting, dyspepsia, abdominal pain, flatulence, constipation, diarrhoea, colitis, chest pain, palpitation, tachycardia, peripheral oedema, changes in blood pressure, syncope, flushing, cough, dyspnoea, headache, dizziness, asthenia, impaired concentration and memory, sleep disturbances, abnormal dreams, anxiety, depression, suicidal ideation (more frequent in children), psychoses, dysphagia, weight loss, dysphonia, paraesthesia, hypoaesthesia, ataxia, hypertonia, influenza-like symptoms, thyroid disorders, hyperglycaemia, menstrual disturbances, breast pain, prostatitis, sexual dysfunction, micturition disorders, leucopenia, thrombocytopenia, lymphadenopathy, dehydration, hypocalcaemia, myalgia, arthralgia, hyperuricaemia, visual disturbances, eye pain, dry eyes, hearing impairment, tinnitus, earache, dry mouth, taste disturbances, mouth ulcers, stomatitis, glossitis, tooth disorder, gingivitis, alopecia, pruritus, dry skin, rash

(including very rarely Stevens-Johnson syndrome and toxic epidermal necrolysis), increased sweating, psoriasis, photosensitivity, and acne; less commonly pancreatitis, gastro-intestinal bleeding, and hypertiglycaemia; rarely peptic ulcer, arthrythiasis, cardiomyopathy, myocardial infarction, pericarditis, stroke, interstitial pneumonitis, pulmonary embolism, seizures, renal failure, vasculitis, rheumatoid arthritis, systemic lupus erythematous; sarcoidosis, optic neuropathy, and retinal haemorrhage, very rarely aplastic anaemia and peripheral ischaemia, in children also growth retardation (including decrease in height and weight), pallor, tachypnoea, hyperkinesia, virilism, and skin discoloration

\textbf{Dose} see preparations below

\textbf{Copegus} (Roche) \textregistered Tablets, 1/4, ribavirin 200 mg (pink), net price 42-tab pack = £92.50, 112-tab pack = £246.65, 168-tab pack = £369.98; 400 mg (red-brown), 56-tab pack = £246.65. Label: 21

Dose chronic hepatitis C (in combination with interferon alfa), usual dose 400 mg twice daily

\textbf{Note} Patients with chronic hepatitis C genotype 2 or 3 (not previously treated), or patients infected with HIV and hepatitis C require a lower dose of Copegus \textregistered (in combination with peginterferon alfa), usual dose 400 mg twice daily

\textbf{Rebetol} (MSD) \textregistered Capsules, ribavirin 200 mg, net price 84-cap pack = £160.69, 140-cap pack = £267.81, 168-cap pack = £321.38. Label: 21

Dose chronic hepatitis C (in combination with interferon alfa or peginterferon alfa), \textit{ADULT} over 18 years, body-weight under 75 kg, 400 mg in the morning and 600 mg in the evening; body-weight 75 kg and over, 600 mg twice daily

\textbf{Oral solution}, ribavirin 200 mg/5 mL, net price 100 mL (bubble-gum-flavoured) = £67.08. Label: 21

Dose chronic hepatitis C (in combination with interferon alfa or peginterferon alfa), \textit{ADULT} over 18 years, body-weight under 65 kg, 400 mg twice daily; body-weight 65–
81 kg, 400 mg in the morning and 600 mg in the evening; body-weight 81–105 kg, 600 mg twice daily; body-weight over 105 kg, 800 mg in the morning and 800 mg in the evening. **CHILD** 3–18 years see **BNF for Children**

**Virazole** (Meda) **Inhalation**, ribavirin 6 g for reconstitution with 300 mL water for injections. Net price 3 x 6-g vials = £349.00

**Dose** bronchiolitis, by aerosol inhalation or nebulisation (via small particle aerosol generator) of solution containing 20 mg/mL for 12–18 hours for at least 3 days; max. 7 days

---

### 5.4 Antiprotozoal drugs

#### 5.4.1 Antimalarials

**Quinine**

- **体制性** 退の症例では、首脳性のための治療として使用される。Plasmodium falciparum に感染した場合は、首脳性のための治療として使用される。

**Falciparum malaria (treatment)**

Falciparum malaria (malignant malaria) is caused by Plasmodium falciparum. In most parts of the world P. falciparum is now resistant to chloroquine which should not therefore be given for treatment. **Quinine**, **Malarone** (proguanil with atovaquone), or **Riamet** (artemether with lumefantrine) can be given by mouth if the patient can swallow and retain tablets and there are no serious manifestations (e.g. impaired consciousness); quinine should be given by intravenous infusion (see below) if the patient is seriously ill or unable to take tablets. Meloquine is now rarely used for treatment because of concerns about resistance.

**Oral.** The adult dosage regimen for **quinine** by mouth is: 600 mg (of quinine salt\(^1\)) every 8 hours for 5–7 days together with or followed by either **doxycycline** 200 mg once daily for 7 days or **clindamycin** 450 mg every 8 hours for 7 days [unlicensed indication]. If the parasite is likely to be sensitive, **pyrimethamine** 75 mg with **sulfadoxine** 1.5 g as a single dose [unlicensed] may be given (instead of either clindamycin or doxycycline) together with, or after, a course of quinine.

Alternatively, **Malarone** or **Riamet** may be given instead of quinine. It is not necessary to give doxycycline, clindamycin or pyrimethamine with sulfadoxine after **Malarone** or **Riamet** treatment.

The adult dose of **Malarone** by mouth is: 4 ('standard') tablets once daily for 3 days.

The dose of **Riamet** by mouth for adult with body-weight over 35 kg is: 4 tablets initially, followed by 5 further doses of 4 tablets each given at 8, 24, 36, 48, and 60 hours (total 24 tablets over 60 hours).

**Parenteral.** If the patient is seriously ill or unable to take tablets, or if more than 2% of red blood cell are parasitized, **quinine** should be given by intravenous infusion [unlicensed]. The adult dosage regimen for quinine by infusion is:

- loading dose\(^1\) of 20 mg/kg\(^4\) (up to maximum 1.4 g) of quinine salt infused over 4 hours then 8 hours after the start of the loading dose; maintenance dose of 10 mg/kg\(^5\) (up to maximum 700 mg) of quinine salt\(^2\) infused over 4 hours every 8 hours (until patient can swallow tablets to complete the 7-day

---

1. Valid for quinine hydrochloride, dihydrochloride, and sulfate; not valid for quinine bisulfate which contains a correspondingly smaller amount of quinine.
2. In intensive care units the loading dose can alternatively be given as quinine salt\(^2\) 7 mg/kg infused over 30 minutes followed immediately by 10 mg/kg over 4 hours then (after 8 hours) maintenance dose as described.
3. **Important:** the loading dose of 20 mg/kg should not be used if the patient has received quinine or methoquine during the previous 12 hours.
4. Maintenance dose should be reduced to 5–7 mg/kg of quinine salt\(^2\) in patients with severe renal impairment, severe hepatic impairment, or if parenteral treatment is required for more than 48 hours.
course together with or followed by either doxycycline or clindamycin as above). Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for ‘named-patient’ use.

Children

Oral. Quinine is well tolerated by children although the salts are bitter. The dosage regimen for quinine by mouth for children is:

- 10 mg/kg (of quinine salt); max. 600 mg) every 8 hours for 7 days together with or followed by Clindamycin 7–13 mg/kg (max. 450 mg) every 8 hours for 7 days [unlicensed indication] or 60 hours (total 12 tablets over 60 hours); body-weight 21–31 kg, 2 ‘standard’ tablets once daily for 3 days

Alternatively, Malarone® or Riamet® may be given instead of quinine; it is not necessary to give clindamycin, doxycycline or pyrimethamine with sulfadoxine after Malarone® or Riamet® treatment. The dose regimen for Malarone® by mouth for children over 40 kg is the same as for adults (see above); the dose regimen for Malarone® for smaller children is reduced as follows:

- body-weight 5–9 kg, 2 ‘paediatric’ tablets once daily for 3 days; body-weight 9–11 kg, 3 ‘paediatric’ tablets once daily for 3 days; body-weight 11–21 kg, 1 ‘standard’ tablet once daily for 3 days; body-weight 21–31 kg, 2 ‘standard’ tablets once daily for 3 days; body-weight 31–40 kg, 3 ‘standard’ tablets once daily for 3 days.

The dose regimen of Riamet® by mouth for children over 12 years and body-weight over 35 kg is the same as for adults (see above). The dose regimen for Riamet® for children under 12 years is as follows:

- body-weight 5–15 kg 1 tablet initially, followed by 5 further doses of 1 tablet each given at 8, 24, 36, 48, and 60 hours (total 6 tablets over 60 hours); body-weight 15–25 kg 2 tablets initially, followed by 5 further doses of 2 tablets each given at 8, 24, 36, 48, and 60 hours (total 12 tablets over 60 hours); body-weight 25–35 kg 3 tablets initially, followed by 5 further doses of 3 tablets each given at 8, 24, 36, 48, and 60 hours (total 18 tablets over 60 hours)

Parenteral. The dose regimen for quinine by intravenous infusion for children is calculated on a mg/kg basis as for adults (see above).

Pregnancy

Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The adult treatment doses of oral and intravenous quinine given above (including the loading dose) can safely be given to pregnant women. Clindamycin 450 mg every 8 hours for 7 days [unlicensed indication] should be given with or after quinine. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development); pyrimethamine with sulfadoxine, Malarone®, and Riamet® are also best avoided until more information is available. Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for ‘named-patient’ use.

Non-falciparum malaria (treatment)

Non-falciparum malaria is usually caused by Plasmodium vivax and less commonly by P. ovale and P. malariae. P. knowlesi is also present in the Asia-Pacific region. Chloroquine® is the drug of choice for the treatment of non-falciparum malaria (but chloroquine-resistant P. vivax has been reported in the Indonesian archipelago, the Malay Peninsula, including Myanmar, and eastward to Southern Vietnam).

The adult dosage regimen for chloroquine by mouth is:

- initial dose of 620 mg of base then a single dose of 310 mg of base after 6 to 8 hours then a single dose of 310 mg of base daily for 2 days (approximate total cumulative dose of 25 mg/kg of base)

Chloroquine alone is adequate for P. malariae and P. knowlesi infections but in the case of P. vivax and P. ovale, a radical cure (to destroy parasites in the liver and thus prevent relapses) is required. This is achieved with primaquine®[unlicensed] given after chloroquine; in P. vivax infection primaquine is given in an adult dosage of 30 mg daily for 14 days and for P. ovale infection it is given in an adult dosage of 15 mg daily for 14 days.

Children

The dosage regimen of chloroquine for non-falciparum malaria in children is:

- initial dose of 10 mg/kg of base (max. 620 mg) then a single dose of 5 mg/kg of base (max. 310 mg) after 6–8 hours then a single dose of 5 mg/kg of base (max. 310 mg) daily for 2 days

For a radical cure, primaquine®[unlicensed] is then given to children over 6 months of age; specialist advice should be sought for children under 6 months of age. In P. vivax infection primaquine is given in a dose of 500 micrograms/kg (max. 30 mg) daily for 14 days, and for P. ovale infection it is given in a dose of 250 micrograms/kg (max. 15 mg) daily for 14 days.

Parenteral

If the patient is unable to take oral therapy, quinine can be given by intravenous infusion [unlicensed].

2. For the treatment of chloroquine-resistant non-falciparum malaria, Malarone®[unlicensed indication], quinine, or Riamet®[unlicensed indication] can be used; as with chloroquine, primaquine should be given for radical cure.

3. Before starting primaquine, blood should be tested for glucose-6-phosphate dehydrogenase (G6PD) activity since the drug can cause haemolysis in G6PD-deficient patients. Specialist advice should be obtained in G6PD deficiency; in mild G6PD deficiency primaquine in a dose for adults of 45 mg once a week (children 750 micrograms/kg once a week; max. 45 mg once a week) for 8 weeks, has been found useful and without undue harmful effects.
censed). The dose (for adults and children) is 10 mg/kg\(^3\) (max. 700 mg) of quinine salt\(^2\) infused over 4 hours every 8 hours, changed to oral chloroquine as soon as the patient’s condition permits.

**Pregnancy** The adult treatment doses of chloroquine can be given for non-falciparum malaria. In the case of *P. vivax* or *P. ovale*, however, the radical cure with primaquine should be postponed until the pregnancy is over; instead chloroquine should be continued at a dose of 310 mg each week during the pregnancy.

**Prophylaxis against malaria**

The recommendations on prophylaxis reflect guidelines agreed by UK malaria specialists; the advice is aimed at residents of the UK who travel to endemic areas. The choice of drug for a particular individual should take into account:

- risk of exposure to malaria;
- extent of drug resistance;
- efficacy of the recommended drugs;
- side-effects of the drugs;
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen).

**Protection against bites** Prophylaxis is not absolute, and breakthrough infection can occur with any of the drugs recommended. Personal protection against being bitten is very important. Mosquito nets impregnated with permethrin provide the most effective barrier protection against insects; mats and vapourised insecticides are also useful. Diethyltoluamide (DEET) 20–50% in lotions, sprays, or roll-on formulations is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be used during pregnancy and breast-feeding. The duration of protection varies according to the concentration of DEET and is longest for DEET 50%. When sunscreen is also required, DEET should be applied after the sunscreen. Long sleeves and trousers worn after dusk also provide protection against bites.

**Length of prophylaxis** In order to determine tolerance and to establish habit, prophylaxis should generally be started one week (2–3 weeks in the case of mefloquine) before travel into an endemic area; *Malarone\(^\text{®}\)* or doxycycline prophylaxis should be started 1–2 days before travel. Prophylaxis should be continued for 4 weeks after leaving (except for *Malarone\(^\text{®}\)* prophylaxis which should be stopped 1 week after leaving).

In those requiring long-term prophylaxis, chloroquine and proguanil may be used for periods of over 5 years. Mefloquine is licensed for up to 1 year (although, if it is tolerated in the short term, there is no evidence of harm when it is used for up to 3 years). Doxycycline can be used for up to 2 years. *Malarone\(^\text{®}\)* can be used for up to 1 year. Prophylaxis with mefloquine, doxycycline, or *Malarone\(^\text{®}\)* may be considered for longer durations if it is justified by the risk of exposure to malaria. Specialist advice should be sought for long-term prophylaxis.

**Return from malarial region** It is important to be aware that any illness that occurs within 1 year and especially within 3 months of return might be malaria even if all recommended precautions against malaria were taken. Travellers should be warned of this and told that if they develop any illness particularly within 3 months of their return they should go immediately to a doctor and specifically mention their exposure to malaria.

**Children** Prophylactic doses are based on guidelines agreed by UK malaria experts and may differ from advice in product literature. Weight is a better guide than age. If in doubt telephone centres listed on p. 435.

**Epilepsy** Both chloroquine and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In areas without chloroquine resistance prophylaxis should be with chloroquine resistance, doxycycline or *Malarone\(^\text{®}\)* may be considered; the metabolism of doxycycline may be influenced by antiepileptics (see interactions: Appendix 1 (tetracyclines)).

**Asplenia** Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

**Renal impairment** Avoidance (or dosage reduction) of proguanil is recommended since it is excreted by the kidneys. *Malarone\(^\text{®}\)* should not be used for prophylaxis in patients with estimated glomerular filtration rate less than 30 mL/minute/1.73 m\(^2\). Chloroquine is only partially excreted by the kidneys and reduction of the dose for prophylaxis is not required except in severe impairment. Mefloquine is considered to be appropriate to use in renal impairment and does not require dosage reduction. Doxycycline is also considered to be appropriate.

**Pregnancy** Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, effective prophylaxis must be used. Chloroquine and proguanil can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined, particularly in Sub-Saharan Africa; in the case of proguanil, folic acid 5 mg daily should be given for at least the first trimester. The centres listed on p. 435 should be consulted for advice on prophylaxis in chloroquine-resistant areas. Although the manufacturer advises that mefloquine should not be used during pregnancy, particularly in the first trimester, unless the potential benefit outweighs the risk, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas. Doxycycline is contra-indicated during pregnancy (see section 5.1.3); however, it can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks’ gestation [unlicensed]. *Malarone\(^\text{®}\)* should be avoided during pregnancy; however, it can be considered during the second and third trimesters if there is no suitable alternative.

**Breast-feeding** Prophylaxis is required in breast-fed infants; although antimalarials are present in milk, the amounts are too variable to give reliable protection.

**Anticoagulants** Travellers taking warfarin should begin chemoprophylaxis 2–3 weeks before departure. The INR should be stable before departure. It should be
measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

**Specific recommendations**

Where a journey requires two regimens, the regimen for the higher risk area should be used for the whole journey. Those travelling to remote or little-visited areas may require expert advice.

---

---

**Important**

Settled immigrants (or long-term visitors) to the UK may be unaware that any immunity they may have acquired while living in malarious areas is lost rapidly after migration to the UK, or that any non-malarious areas where they lived previously may now be malarious.

Standby treatment

Travellers visiting remote, malarious areas for prolonged periods should carry standby treatment if they are likely to be more than 24 hours away from medical care. Self-medication should be avoided if medical help is accessible.

In order to avoid excessive self-medication, the traveller should be provided with written instructions that urgent medical attention should be sought if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset. In view of the continuing emergence of resistant strains and of the different regimens required for different areas expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller.

Artemether with lumefantrine

Artemether with lumefantrine is licensed for the treatment of acute uncomplicated falciparum malaria.

**Indications** treatment of acute uncomplicated falciparum malaria; treatment of non-falciparum malaria [unlicensed indication]

**Cautions** electrolyte disturbances, concomitant use with other drugs known to cause QT-interval prolongation; monitor patients unable to take food (greater risk of recrudescence); avoid in acute porphyria (section 9.8.2); **interactions**: Appendix 1 (artemether with lumefantrine)

**Driving** Dizziness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** history of arrhythmias, of clinically relevant bradycardia, and of congestive heart failure accompanied by reduced left ventricular ejection fraction; family history of sudden death or of congenital QT interval prolongation

**Hepatic impairment** manufacturer advises caution in severe impairment

**Renal impairment** manufacturer advises caution in severe impairment—monitor ECG and plasma potassium concentration

**Pregnancy** toxicity in animal studies with artemether; manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises avoid breastfeeding for at least 1 week after last dose; present in milk in animal studies

**Side-effects** abdominal pain, anorexia, diarrhoea, vomiting, nausea; palpitation, prolonged QT interval; cough; headache, dizziness, sleep disturbances, asthenia, paraesthesia; arthralgia, myalgia; pruritus, rash; less commonly ataxia, hypoesthesia, and clonus

**Dose**

- Treatment of malaria, see p. 435

Riamet® (Novartis) Tablets, yellow, artemether 20 mg, lumefantrine 120 mg, net price 24-tab pack = £22.50. Label: 21, counselling, driving

**Note** Tablets may be crushed just before administration

Chloroquine

Chloroquine is used for the prophylaxis of malaria in areas of the world where the risk of chloroquine-resistant
Infections

5 Infections

Chloroquine is no longer recommended for the treatment of falciparum malaria owing to widespread resistance, nor is it recommended if the infective species is not known or if the infection is mixed; in these cases treatment should be with quinine, Malarone®, or Rimo¯d® (for details, see p. 435). It is still recommended for the treatment of non-falciparum malaria (for details, see p. 436).

CHLOROQUINE

Indications chemoprophylaxis and treatment of malaria, rheumatoid arthritis and lupus erythematosus (section 10.1.3)

Cautions may exacerbate psoriasis; neurological disorders (avoid for prophylaxis if history of epilepsy, see notes above); may aggravate myasthenia gravis; severe gastro-intestinal disorders; G6PD deficiency (see section 9.1.5); ophthalmic examination and long-term therapy, see under Chloroquine, section 10.1.3; avoid concurrent therapy with hepatotoxic drugs—other interactions: Appendix 1 (chloroquine and hydroxychloroquine).

Hepatic impairment use with caution in moderate to severe impairment

Renal impairment manufacturers advise caution; see also Prophylaxis Against Malaria, p. 437

Pregnancy benefit of prophylaxis and treatment in malaria outweighs risk; see also Non-falciparum Malaria (treatment), p. 437 and Prophylaxis Against Malaria, p. 437

Breast-feeding amount in milk probably too small to be harmful; see also Prophylaxis Against Malaria, p. 437

Side-effects gastro-intestinal disturbances, headache, skin reactions (rashes, pruritus); also hypotension, convulsions, extrapyramidal symptoms, visual disturbances, depigmentation or loss of hair; rarely bone-marrow suppression, hypersensitivity reactions such as urticaria and angioedema; other side-effects (not usually associated with malaria prophylaxis or treatment), see under Chloroquine, section 10.1.3; very toxic in overdosage—immediate advice from poisons centres essential (see also p. 39)

Dose

Note Doses expressed as chloroquine base

• Prophylaxis of malaria, started 1 week before entering endemic area and continued for 4 weeks after leaving (see notes above), 310 mg once weekly; CHILD up to 6 weeks body-weight under 4.5 kg, 25 mg once weekly; 6 weeks−6 months body-weight 4.5−8 kg, 50 mg once weekly; 6 months−1 year body-weight 8−11 kg, 75 mg once weekly; 1−3 years body-weight 11−15 kg, 100 mg once weekly; 3−4 years body-weight 15−16.5 kg, 125 mg once weekly; 4−8 years body-weight 16.5−25 kg, 150 mg once weekly (or 155 mg once weekly if tablets used); 8−13 years body-weight 25−45 kg, 225 mg once weekly (or 225.5 mg once weekly if tablets used); over 15 years body-weight over 45 kg, adult dose.

Counselling Warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return. For details, see notes above

Mefloquine

Mefloquine is used for the prophylaxis of malaria in areas of the world where there is a high risk of chloroquine-resistant falciparum malaria (for details, see specific recommendations by country, p. 438). Mefloquine is now rarely used for the treatment of falciparum malaria because of increased resistance. It is rarely used for the treatment of non-falciparum malaria because better tolerated alternatives are available. Mefloquine should not be used for treatment if it has been used for prophylaxis.

MEFLOQUINE

Indications chemoprophylaxis of malaria, treatment of malaria, see notes above

Cautions cardiac conduction disorders; epilepsy (avoid for prophylaxis); traumatic brain injury; not recommended in infants under 3 months (5 kg);

interactions: Appendix 1 (mefloquine)

Neuropsychiatric reactions Mefloquine is associated with potentially serious neuropsychiatric reactions. Abnormal dreams, insomnia, anxiety, and depression occur commonly. Psychosis, suicidal ideation, and suicide have also been reported. Psychiatric symptoms such as nightmares, acute anxiety, depression, restlessness, or confusion should be regarded as potentially prodromal for a more serious event. If neuropsychiatric symptoms occur, patients should be advised to discontinue mefloquine and to seek immediate medical attention so that mefloquine can be replaced with an alternative antimalarial. Adverse reactions may occur and persist up to several months after discontinuation because mefloquine has a long half-life. Mefloquine is contra-indicated for malaria prophylaxis in those with a history of psychiatric disorders or convulsions

Driving Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may occur and persist up to several months after stopping mefloquine

Contra-indications hypersensitivity to quinine; history of blackwater fever; avoid for standby treatment if history of convulsions; avoid for prophylaxis if

1. Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria. Drugs for malaria prophylaxis not import-prescribable on the NHS, health authorities may investigate circumstances under which antimalarials are prescribed
BNF 68

5.4.1 Antimalarials 445

history of psychiatric disorders (including depression) or convulsions

Hepatic impairment elimination may be prolonged; avoid in severe impairment

Renal impairment manufacturer advises caution

Pregnancy manufacturer advises adequate contra-

ception during prophylaxis and for 3 months after stopping (teratogenicity in animal studies), but see also p. 437

Breast-feeding present in milk but risk to infant minimal; see also p. 437

Side-effects nausea, vomiting, abdominal pain, diarrhoea, headache, dizziness, visual disturbances, pruritus; see also Neuropsychiatric Reactions above; also reported anorexia, dyspepsia, hepatic failure, hypotension, hypertension, flushing, chest pain, bradycardia, tachycardia, palpitation, arrhythmias, syncope, oedema, dyspnoea, pneumonitis, drowsi-

ness, sensory and motor neuropathies, tremor, ataxia, panic attacks, confusion, amnesia, seizures, encephalopathy, speech disturbances, malaise, fever, blood disorders (including leucopenia, leucocytosis, thrombocytopenia), muscle weakness, myalgia, arthralgia, cataract, optic neuropathy, vestibular dis-

orders, rash (including Stevens-Johnson syndrome), alopecia, hyperhidrosis

Dose

Prophylaxis of malaria, started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving (see notes above), ADULT and CHILD body-weight over 45 kg, 250 mg once weekly; body-weight 5–16 kg, 62.5 mg once weekly; body-weight 16–25 kg, 125 mg once weekly; body-weight 25–45 kg, 187.5 mg once weekly

Treatment of malaria, see notes above

Counselling Inform travellers about adverse reactions of mosquito bites, importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return. For details, see notes above

Note Mefloquine doses in BNF may differ from those in product literature

1 Lariam® (Roche) Tablets, scored, mefloquine (as hydrochloride) 250 mg. Net price 8-tab pack = £14.53. Label: 21, 27, counselling, driving, prophylaxis, see above

Note Tablet may be crushed and mixed with food such as jam or honey just before administration

Piperazine with artenimo1

Piperazine with artenimo1 is not recommended for the first-line treatment of acute uncomplicated falciparum malaria because there is limited experience of its use in travellers who usually reside in areas where malaria is not endemic. Piperazine has a long half-life.

Piperazine phosphate with artenimo1

(Piperazine tetraphosphate with dihydroartemisinin)

Indications see notes above

Cautions obtain ECG as soon as possible after starting treatment then continue monitoring in those taking

medicines that increase plasma-piperazine concentra-
tion, in children who are vomiting, in females, or in the elderly; consider obtaining ECG in all patients before third dose and 4–6 hours after third dose; if QTc interval more than 500 milliseconds, discontinue treatment and monitor ECG for a further 24–48 hours;

interactions: Appendix 1 (piperazine with artemi-

mol)

Contra-indications risk factors for QT interval pro-

longation (e.g. electrolyte disturbances, acute myocar-
dial infarction, severe hypertension, left ventricular hypertrophy, heart failure with reduced left ventri-
cular ejection fraction, bradycardia, congenital long QT syndrome, family history of sudden death, con-

comitant use with other drugs known to prolong the QT interval, history of symptomatic arrhythmias)

Hepatic impairment no information available in moderate to severe impairment—manufacturer advises monitor ECG and plasma-potassium concentra-

Renal impairment no information available in moderate to severe impairment—manufacturer advises monitor ECG and plasma-potassium concentration

Pregnancy teratogenic in animal studies—manufacturer advises use only if other antimalarials cannot be used

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects QT interval prolonged, tachycardia, headache, malaise, anaemia; less commonly nausea, vomiting, abdominal pain, diarrhoea, anorexia, hepatitis, hepatomegaly, arrhythmias, bradycardia, cough, dizziness, convulsions, influenza-like symp-
toms, arthralgia, myalgia, pruritus; also reported in children stomatitis, jaundice, heart murmur, blood disorders (including leucopenia and thrombocytopenia), conjunctivitis, rash, ancahthosis

Dose

See preparations

Euartesim® (Sigma-Tau) Tablets, f/c, scored, piperazine phosphate 320 mg, artemi1nol 40 mg, net price 12-tab pack = £40.00. Counselling, administration

Counselling Tablets to be taken at least 3 hours before and at least 3 hours after food. Tablets may be crushed and mixed with water immediately before administration

Dose Treatment of uncomplicated falciparum malaria, ADULT and CHILD over 6 months, body-weight 7–13 kg, ¼ tablet once daily for 3 days; body-weight 13–24 kg, 1 tablet once daily for 3 days; body-weight 24–36 kg, 2 tablets once daily for 3 days; body-weight 36–75 kg, 3 tablets once daily for 3 days; body-weight 75–100 kg, 4 tablets once daily for 3 days

Note Max. 2 courses in 12 months; second course given at least 2 months after first course

Primazine

Primazine is used to eliminate the liver stages of P. vivax or P. ovale following chloroquine treatment (for details, see p. 436).

PRIMAQUINE

Indications adjunct in the treatment of Plasmodium vivax and P. ovale malaria (eradication of liver stages)

Cautions G6PD deficiency (test blood, see under Non-

falciparum Malaria (treatment), p. 436); systemic diseases associated with granulocytopenia (e.g.
rheumatoid arthritis, lupus erythematosus); interac-
tions: Appendix 1 (proguanil)

Pregnancy  risk of neonatal haemolysis and
methaemoglobinemia in third trimester; see also
p. 437

Breast-feeding  no information available; theoretical
risk of haemolysis in G6PD-deficient infants

Side-effects  nausea, vomiting, anorexia, abdominal
pain; less commonly methaemoglobinemia, haemo-
lytic anaemia especially in G6PD deficiency, leuco-
enia

Dose
● Treatment of non-falciparum malaria, see p. 436

Proguanil
Proguanil is used (usually with chloroquine, but occa-
sionally alone) for the prophylaxis of malaria. (For details,
see specific recommendations by country, p. 438.)

Proguanil used alone is not suitable for the treatment of
malaria; however, Malarone® (a combination of atova-
quone with proguanil) is licensed for the treatment of
acute uncomplicated falciparum malaria. Malarone® is
also used for the prophylaxis of falciparum malaria
in areas of widespread mefloquine or chloroquine resistance.
Malarone® is also used as an alternative to mefloquine
or doxycycline. Malarone® is particularly suitable for
short trips to highly chloroquine-resistant areas because
it needs to be taken only for 7 days after leaving an
endemic area.

PROGUANIL HYDROCHLORIDE

Indications  chemoprophylaxis of malaria

Cautions  interactions: Appendix 1 (proguanil)

Renal impairment  100 mg once daily if eGFR 20–
60 mL/minute/1.73 m²; 50 mg on alternate days if
eGFR 10–20 mL/minute/1.73 m²; 50 mg once weekly
if eGFR less than 10 mL/minute/1.73 m² (increased
risk of haematological toxicity)

Pregnancy  benefit of prophylaxis in malaria out-
weighs risk; adequate folate supplements should be
given to mother; see also p. 437

Breast-feeding  amount in milk probably too small to
be harmful when used for malaria prophylaxis; see
also p. 437

Side-effects  mild gastric intolerance, diarrhoea, and
constipation; occasionally mouth ulcers and stomat-
itis; very rarely cholestatic, vasculitis, skin reactions,
and hair loss

Dose
● Prophylaxis of malaria, started 1 week before entering
endemic area and continued for 4 weeks after leaving
(see notes above), 200 mg once daily; INFANT up to 12
weeks body-weight under 6 kg, 25 mg once daily; 12
weeks–1 year body-weight 6–10 kg, 50 mg once daily;
CHILD 1–4 years body-weight 10–16 kg, 75 mg once
daily; 4–8 years body-weight 16–25 kg, 100 mg once
daily; 8–13 years, body-weight 25–45 kg, 150 mg once
daily; over 13 years body-weight over 45 kg, adult
dose.

Counselling  Warn travellers about importance of avoiding
mosquito bites, importance of taking prophylaxis regularly,
and importance of immediate visit to doctor if ill within 1
year and especially within 3 months of return. For details,
see notes above

Note  Proguanil doses in BNF may differ from those in
product literature

Paludrine® (Alliance)
Tablets, scored, proguanil hydrochloride 100 mg.
Net price 98-tab pack = £8.65. Label: 21, counsel-
ings, prophylaxis, see above

Note  Tablet may be crushed and mixed with food such as
milk, jam, or honey just before administration

With chloroquine
See under Chloroquine

PROGUANIL HYDROCHLORIDE
WITH ATOVAQUONE

Indications  treatment of acute uncomplicated falci-
parum malaria and prophylaxis of falciparum malaria,
particularly where resistance to other antimalarial
drugs suspected; treatment of non-falciparum malaria
(unlicensed indication)

Cautions  diarrhoea or vomiting (reduced absorption
of atovaquone); efficacy not evaluated in cerebral or
complicated malaria (including hyperparasitaemia,
pulmonary oedema or renal failure); interactions: see
Appendix 1 (proguanil, atovaquone)

Renal impairment  avoid for malaria prophylaxis (and
if possible for malaria treatment) if eGFR less than
30 mL/minute/1.73 m²

Pregnancy  manufacturer advises avoid unless essen-
tial; see also p. 437

Breast-feeding  use only if no suitable alternative
available; see also p. 437

Side-effects  abdominal pain, nausea, vomiting,
diarrhoea; cough, headache, dizziness, insomnia,
abnormal dreams, depression, anorexia, fever, rash,
pruritus; less frequently stomatitis, palpitation, anxiety,
blood disorders, hyponatraemia, and hair loss; also
reported, hepatitis, cholestasis, tachycardia, halluci-
inations, seizures, vasculitis, mouth ulcers, photo-
sensitivity, and Stevens-Johnson syndrome

Dose
● See preparations

Counselling  Warn travellers about importance of avoiding
mosquito bites, importance of taking prophylaxis regularly,
and importance of immediate visit to doctor if ill within 1
year and especially within 3 months of return. For details,
see notes above

Malarone® (GSK)
Tablets (‘standard’), pink, f/c, proguanil hydro-
chloride 100 mg, atovaquone 250 mg. Net price 12-
tab pack = £25.21. Label: 21, counselling, prophyl-
axis, see above

Dose prophylaxis of malaria, started 1–2 days before
entering endemic area and continued for 1 week after
leaving, ADULT and CHILD over 40 kg, 1 tablet daily
Treatment of malaria, ADULT and CHILD body-weight over
40 kg, 4 tablets once daily for 3 days; CHILD body-weight
11–21 kg 1 tablet daily for 3 days, body-weight 21–31 kg 2
tablets once daily for 3 days; body-weight 31–40 kg 3
tablets once daily for 3 days

1. Can be sold to the public provided it is licensed and
labelled for the prophylaxis of malaria. Drugs for malaria
prophylaxis not prescribable on the NHS; health author-
ities may investigate circumstances under which anti-
malarials are prescribed

2. Drugs for malaria prophylaxis not prescribable on the
NHS; health authorities may investigate circumstances under
which antimalarials prescribed
Pyrimethamine

Pyrimethamine should not be used alone, but is used with sulfadoxine.

Pyrimethamine with sulfadoxine is not recommended for the prophylaxis of malaria, but it can be used in the treatment of falciparum malaria with (or following) quinine.

**PYRIMETHAMINE**

**Indications** malaria (but used only in combined preparations incorporating sulfadoxine); toxoplasmosis—section 5.4.7

**Cautions** blood counts required with prolonged treatment; predisposition to folate deficiency; history of seizures—avoid large loading doses; **interactions**: Appendix 1 (pyrimethamine)

**Hepatic impairment** manufacturer advises caution

**Renal impairment** manufacturer advises caution

**Pregnancy** theoretical teratogenic risk in *first trimester* (folate antagonist); adequate folate supplements should be given to mother

**Breast-feeding** significant amount in milk—avoid administration of other folate antagonists to infant; avoid breast-feeding during toxoplasmosis treatment

**Side-effects** nausea, vomiting, diarrhoea, headache, dizziness, blood disorders with high doses (including anaemia, leucopenia, thrombocytopenia), rash; less commonly fever, abnormal skin pigmentation; very rarely colic, buccal ulceration, convulsions

**Dose**

- Malaria, no dose stated because not recommended alone, see Pyrimethamine with Sulfadoxine below
- Toxoplasmosis, section 5.4.7

**Daraprim®** (GSK) Tablets, scored, pyrimethamine 25 mg. Net price 3-tab pack = £13.00

**PYRIMETHAMINE WITH SULFADOXINE**

**Indications** adjunct to quinine in treatment of *Plasmodium falciparum* malaria; not recommended for prophylaxis

**Cautions** see under Pyrimethamine and under Co-trimoxazole (section 5.1.8); not recommended for prophylaxis

**contraindications** see under Pyrimethamine and under Co-trimoxazole (section 5.1.8); sulfonamide allergy

**Pregnancy** possible teratogenic risk in *first trimester* (pyrimethamine a folate antagonist); in *third trimester*—risk of neonatal haemolysis and methaemoglobinemia; fear of increased risk of kernicterus in neonates appears to be unfounded; see also p. 436

**Breast-feeding** small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfadoxine)

**Side-effects** see under Pyrimethamine and under Co-trimoxazole (section 5.1.8); pulmonary infiltrates (e.g. eosinophilic or allergic alveolitis) reported—discontinue if cough or shortness of breath

**Dose**

- Treatment of falciparum malaria, see p. 435
- Prophylaxis, not recommended by UK malaria experts

**Pyrimethamine with sulfadoxine (Non-proprietary)** Tablets, scored, pyrimethamine 25 mg, sulfadoxine 500 mg, net price 3-tab pack = 74p

**Note** Also known as Fansidar® Available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104

**Quinine**

Quinine is not suitable for the prophylaxis of malaria. Quinine is used for the treatment of falciparum malaria or if the infective species is *not known* or if the infection is mixed (for details see p. 435).

**QUININE**

**Indications** falciparum malaria; nocturnal leg cramps, see section 10.2.2

**Cautions** cardiac disease (including atrial fibrillation, conduction defects, heart block), elderly—monitor ECG during parenteral treatment; monitor blood glucose and electrolyte concentration during parenteral treatment; G6PD deficiency (see section 9.1.5); **interactions**: Appendix 1 (quinine)

**Contra-indications** haemoglobinuria, myasthenia gravis, optic neuritis, tinnitus

**Hepatic impairment** for treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt

**Renal impairment** for treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt

**Pregnancy** high doses are teratogenic in *first trimester*, but in malaria benefit of treatment outweighs risk; see also p. 436

**Breast-feeding** present in milk but not known to be harmful

**Side-effects** cinchonism, including tinnitus, hearing impairment, vertigo, headache, nausea, vomiting, abdominal pain, diarrhoea, visual disturbances (including temporary blindness); agitation, confusion; cardiovascular effects (see Cautions); dyspnoea; hypersensitivity reactions including angioedema, rashes, hot and flushed skin; hypoglycaemia (espe-
5.4.2 Amoebicides

448  5.4.2 Amoebicides

Diloxanide furoate is the drug of choice for asymptomatic patients with *E. histolytica* cysts in the faeces; metronidazole and tinidazole are relatively ineffective. Diloxanide furoate is relatively free from toxic effects and the usual course is of 10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For amoebic abscesses of the liver metronidazole is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with more than 100 mL of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate is not effective against hepatic amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.

### 5.4.2 Amoebicides

**Diloxanide furoate**

- **Indications**: see notes above; chronic amoebiasis and as adjunct to metronidazole or tinidazole in acute amoebiasis.
- **Pregnancy**: manufacturer advises avoid—no information available.
- **Breast-feeding**: manufacturer advises avoid.
- **Side-effects**: flatulence, vomiting, urticaria, pruritus.
- **Dose**: 500 mg every 8 hours for 10 days; *Child* body-weight over 25 kg, 20 mg/kg daily in 3 divided doses for 10 days; body-weight under 25 kg, see [BNF for Children](https://www.gov.uk). See also notes above.

**Diloxanide** (Non-proprietary) (\(\text{FM}\))

- **Tablets**: diloxanide furoate 500 mg, net price 30-tab pack = £93.50. Label: 9.

### Metronidazole

- **Indications**: see under Dose below; anaerobic infections, section 5.1.11.
- **Cautions**: section 5.1.11.
- **Hepatic impairment**: section 5.1.11.
- **Pregnancy**: section 5.1.11.
- **Breast-feeding**: section 5.1.11.
- **Side-effects**: section 5.1.11.

**Dose**: By mouth, invasive intestinal amoebiasis, extra-intestinal amoebiasis (including liver abscess), 800 mg every 8 hours for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection); *Child* 1–3 years 200 mg every 8 hours; 3–7 years 200 mg every 6 hours; 7–10 years 400 mg every 8 hours.

- Urogenital trichomoniasis, 200 mg every 8 hours for 7 days or 400–500 mg every 12 hours for 5–7 days, or 2 g as a single dose; *Child* 1–3 years 50 mg every 8 hours for 7 days; 3–7 years 100 mg every 12 hours; 7–10 years 100 mg every 8 hours.

- Giardiasis, 2 g daily for 3 days or 400 mg 3 times daily for 5 days or 500 mg twice daily for 7–10 days; *Child* 1–3 years 500 mg daily for 3 days; 3–7 years 600–800 mg daily; 7–10 years 1 g daily.

**Preparations**: Section 5.1.11.

### Diloxanide Furoate

- **Indications**: prophylaxis of malaria; adjunct to quinine in treatment of *Plasmodium falciparum* malaria; see also section 5.1.3.
- **Cautions**: section 5.1.3.
- **Contra-indications**: section 5.1.3.
- **Hepatic impairment**: section 5.1.3.
- **Renal impairment**: section 5.1.3.
- **Pregnancy**: section 5.1.11.
- **Breast-feeding**: section 5.1.11.
- **Side-effects**: section 5.1.11.
- **Dose**: Prophylaxis of malaria, started 1–2 days before entering endemic area and continued for 4 weeks after leaving (see notes above), *Adult* and *Child* over 12 years, 100 mg once daily.

**Preparations**: Section 5.1.3.

### Metronidazole

- **Indications**: prophylaxis of malaria; adjunct to quinine in the treatment of *falciparum malaria* (for details see p. 435).

**DOXYCYCLINE**

- **Indications**: prophylaxis of malaria; adjunct to quinine in treatment of *Plasmodium falciparum* malaria; see also section 5.1.3.
- **Cautions**: section 5.1.3.
- **Contra-indications**: section 5.1.3.
- **Hepatic impairment**: section 5.1.3.
- **Renal impairment**: section 5.1.3.
- **Pregnancy**: section 5.1.11.
- **Breast-feeding**: section 5.1.11.
- **Side-effects**: section 5.1.11.
- **Dose**: Treatment of malaria, see p. 435.

**Preparations**: Section 5.1.3.

### Tetracyclines

**Doxycycline** (section 5.1.3) is used for the prophylaxis of malaria in areas of widespread mefloquine or chloroquine resistance. Doxycycline is also used as an alternative to mefloquine or *Malarone*® (for details, see specific recommendations by country, p. 438).

**Diloxanide** is also used as an adjunct to quinine in the treatment of *falciparum malaria* (for details see p. 435).

**Quinine** (anhydrous base) 100 mg = quinine bisulfate 169 mg = quinine dihydrochloride 122 mg = quinine hydrochloride 121 mg. Quinine bisulfate 300-mg tablets are available but provide less quinine than 300 mg of the dihydrochloride, hydrochloride, or sulfate.

**Quinine Sulfate** (Non-proprietary) (\(\text{FM}\))

- **Tablets**: coated, quinine sulfate 200 mg, net price 28-tab pack = £1.68; 300 mg, 28-tab pack = £1.80.

**Quinine Dihydrochloride** (Non-proprietary) (\(\text{FM}\))

- **Injection**: quinine dihydrochloride 300 mg/mL. For dilution and use as an infusion, 1- and 2-mL amps Available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104.

**Note**: Intravenous injection of quinine is so hazardous that it has been superseded by infusion.
**5.4.3 Trichomonacides**

Metronidazole (section 5.4.2) is the treatment of choice for *Trichomonas vaginalis* infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, tinidazole (section 5.4.2) may be tried.

**5.4.4 Antigiardial drugs**

Metronidazole (section 5.4.2) is the treatment of choice for *Giardia lamblia* infections. Alternative treatments are tinidazole (section 5.4.2) or mepacrine hydrochloride.

**MEPACRINE HYDROCHLORIDE**

**Indications** giardiasis; discoid lupus erythematosus (Antimalariais, section 10.1.3)

**Cautions** hepatic impairment, elderly, history of psychosis; avoid in psoriasis; interactions: Appendix 1 (mepacrine)

**Side-effects** gastro-intestinal disturbances; dizziness, headache; with large doses nausea, vomiting and occasionally transient acute toxic psychosis and CNS stimulation; on prolonged treatment yellow discoloration of skin and urine, chronic dermatoses (including severe exfoliative dermatitis), hepatitis, aplastic anaemia; also reported blue/black discoloration of palate and nails and cornal deposits with visual disturbances

**Dose**
- *Giardiasis* [unlicensed], 100 mg every 8 hours for 5–7 days
- *Mepacrine Hydrochloride*
  - Tablets, mepacrine hydrochloride 100 mg. Label: 4, 9, 14, 21
  - Available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104

**5.4.5 Leishmaniacides**

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

**SODIUM STIBOGLUCONATE**

Sodium stibogluconate, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dose is 20 mg/kg daily by intramuscular or intravenous injection for 28 days in visceral leishmaniasis and for 20 days in cutaneous infection; the dosage varies with different geographical regions and expert advice should be obtained. Some early non-inflamed lesions of cutaneous leishmaniasis can be treated with intralesional injections of sodium stibogluconate under specialist supervision.

*Amphotericin* is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin (AmBisome™—section 5.2.3) at a dose of 1–3 mg/kg daily for 10–21 days to a cumulative dose of 21–30 mg/kg or at a dose of 3 mg/kg for 5 consecutive days followed by a single dose of 3 mg/kg 6 days later. *Abelcet®,* a lipid formulation of amphotericin is also likely to be effective but less information is available.

*Pentamidine isethionate* (pentamidine isethionate) (section 5.4.8) has been used in antimony-resistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include paromomycin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104).

TINIDAZOLE

**Indications** see under Dose below; anaerobic infections, section 5.1.11

**Cautions** section 5.1.11

**Pregnancy** section 5.1.11

**Breast-feeding** section 5.1.11

**Side-effects**
- Intestinal amoebiasis, 2 g daily for 2–3 days; *CHILD* 50–60 mg/kg daily for 3 days
- Amoebic involvement of liver, 1.5–2 g daily for 3–6 days; *CHILD* 50–60 mg/kg daily for 5 days
- Urogenital trichomoniasis and giardiasis, single 2 g dose; *CHILD* single dose of 50–75 mg/kg (repeated once if necessary)

**Preparations**
- Section 5.1.11

**5.4.3 Trichomonacides**

Metronidazole (section 5.4.2) is the treatment of choice for *Trichomonas vaginalis* infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, tinidazole (section 5.4.2) may be tried.

**Indications** see under Dose below; anaerobic infections, section 5.1.11

**Cautions** section 5.1.11

**Pregnancy** section 5.1.11

**Breast-feeding** section 5.1.11

**Side-effects**
- Gastro-intestinal disturbances; dizziness, headache; with large doses nausea, vomiting and occasionally transient acute toxic psychosis and CNS stimulation; on prolonged treatment yellow discoloration of skin and urine, chronic dermatoses (including severe exfoliative dermatitis), hepatitis, aplastic anaemia; also reported blue/black discoloration of palate and nails and cornal deposits with visual disturbances

**Dose**
- *Giardiasis* [unlicensed], 100 mg every 8 hours for 5–7 days
- *Mepacrine Hydrochloride* Tables, mepacrine hydrochloride 100 mg. Label: 4, 9, 14, 21
  - Available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104

**5.4.5 Leishmaniacides**

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.
5.4.6 Trypanocides

The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

5.4.7 Drugs for toxoplasmosis

Most infections caused by Toxoplasma gondii are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma choroidoretinitis), and those who are immunosuppressed. Toxoplasmic encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine and sulfadiazine, given for several weeks (expert advice essential). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folic acid supplements and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine with clindamycin or clari-thromycin or azithromycin. Long-term secondary prophylaxis is required after treatment of toxoplasmiasis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus. Spiramycin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) may reduce the risk of transmission of maternal infection to the fetus.

5.4.8 Drugs for pneumocystis pneumonia

Pneumonia caused by Pneumocystis jirovecii (Pneumocystis carinii) occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. Pneumocystis jirovecii pneumonia should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

Treatment

Mild to moderate disease  Co-trimoxazole (section 5.1.8) in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

Atovaquone is licensed for the treatment of mild to moderate pneumocystis infection in patients who cannot tolerate co-trimoxazole. A combination of dapsone 100 mg daily (section 5.1.10) with trimethoprim 5 mg/kg every 6–8 hours (section 5.1.8) is given by mouth for the treatment of mild to moderate disease [unlicensed indication].

A combination of clindamycin 600 mg by mouth every 8 hours (section 5.1.6) and primaquine 30 mg daily by mouth (section 5.4.1) is used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

Severe disease  Co-trimoxazole (section 5.1.8) in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. Pentamidine isetionate given by intravenous infusion is an alternative for patients who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion.

Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia (see Adjunctive Therapy below).

Adjunctive therapy  In moderate to severe infections associated with HIV infection, prednisolone 50–80 mg daily is given by mouth for 5 days (alternatively, hydrocortisone may be given parenterally); the dose is then reduced to complete 21 days of treatment. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

Prophylaxis

Prophylaxis against pneumocystis pneumonia should be given to all patients with a history of the infection. Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised patients. Prophylaxis should continue until immunity recovers sufficiently. It should not be discontinued if the patient has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy.

Co-trimoxazole by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. It is given in a dose of 960 mg daily or 960 mg on alternate days (3 times a week); the dose may be reduced to co-trimoxazole 480 mg daily to improve tolerance.

Inhaled pentamidine isetionate is better tolerated than parenteral pentamidine. Intermittent inhalation of pentamidine isetionate is used for prophylaxis against pneumocystis pneumonia in patients unable to tolerate co-trimoxazole. It is effective but patients may be prone to extrapolmonary infection. Alternatively, dapsone 100 mg daily (section 5.1.10) can be used. Atovaquone 750 mg twice daily has also been used for prophylaxis [unlicensed indication].

ATOVAQUONE

Indications  treatment of mild to moderate Pneumocystis jirovecii (Pneumocystis carinii) pneumonia in patients intolerant of co-trimoxazole

Cautions initial diarrhoea and difficulty in taking with food may reduce absorption (and require alternative therapy); other causes of pulmonary disease should be sought and treated; elderly; interactions: Appendix 1 (atovaquone)

Hepatic impairment manufacturer advises caution—monitor more closely

Renal impairment manufacturer advises caution—monitor more closely

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—no information available

Breast-feeding manufacturer advises avoid

Side-effects nausea, diarrhoea, vomiting; headache, insomnia; fever, anaemia, neutropenia, hyponatraemia; rash, pruritus; also reported, Stevens-Johnson syndrome
5.5 Anthelmintics

5.5.1 Drugs for threadworms

Enterobius vermicularis (pinworms, Enterobius vermicularis)

Anthelmintics are effective in threadworm infections, but their use needs to be combined with hygienic measures to break the cycle of auto-infection. All members of the family require treatment.

Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Washing hands and scrubbing nails before each meal and after each visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

Mebendazole is the drug of choice for treating threadworm infection in patients of all ages over 2 years. It is given as a single dose; as reinfection is very common, a second dose may be given after 2 weeks.

Dose

- 750 mg twice daily with food (particularly high fat) for 21 days; CHILD not recommended

Wellvone® (GSK) (sub)

Suspension, sugar-free, atovaquone 750 mg/5 mL, net price 226 mL (tutti-frutti-flavoured) = £405.31. Label: 21

With proguanil hydrochloride

See section 5.4.1

PENTAMIDINE ISETIONATE

Indications see under Dose (should only be given by specialists)

Cautions risk of severe hypotension following administration (monitor blood pressure before starting treatment, during administration, and at regular intervals, until treatment concluded; patient should be lying down when receiving drug parenterally); hypokalaemia, hypoglycaemia, coronary heart disease, bradycardia, history of ventricular arrhythmias, concomitant use with other drugs which prolong QT-interval; hypertension or hypotension; hyperglycaemia or hypoglycaemia; leucopenia, thrombocytopenia, periarthritis, or anaemia; carry out laboratory monitoring according to product literature; care required to protect personnel during handling and administration; interactions: Appendix 1 (pentamidine isetionate)

Hepatic impairment manufacturer advises caution

Renal impairment reduce intravenous dose for pneumocystis pneumonia if creatinine clearance less than 10 mL/minute: in life-threatening infection, use 4 mg/kg once daily for 7–10 days, then 4 mg/kg on alternate days to complete course of at least 14 doses; in less severe infection, use 4 mg/kg on alternate days for at least 14 doses

Pregnancy manufacturer advises avoid unless essential

Breast-feeding manufacturer advises avoid unless essential—no information available

Side-effects severe reactions, sometimes fatal, due to hypotension, hypoglycaemia, pancreatitis, and arrhythmias; also leucopenia, thrombocytopenia, acute renal failure, hypocalcaemia; also reported: azotaemia, abnormal liver-function tests, anaemia, hyperkalaemia, nausea and vomiting, dizziness, syncope, flushing, hyperglycaemia, rash, and taste disturbances; Stevens-Johnson syndrome reported; on inhalation, bronchoconstriction (may be prevented by prior use of bronchodilators), cough, and shortness of breath; discomfort, pain, induration, abscess formation, and muscle necrosis at injection site

Dose

- Treatment of Pneumocystis jirovecii (Pneumocystis carinii) pneumonia, by intravenous infusion, 4 mg/kg once daily for at least 14 days

- Prophylaxis of Pneumocystis jirovecii (Pneumocystis carinii) pneumonia, by inhalation of nebulised solution (using suitable equipment—consult product literature), 300 mg every 4 weeks or 150 mg every 2 weeks [unlicensed for primary prevention]

- Visceral leishmaniasis (kala-azar, section 5.4.5), by deep intramuscular injection, 3–4 mg/kg on alternate days to max. total of 10 injections; course may be repeated if necessary
MEBENDAZOLE

Indications threadworm, roundworm, whipworm, and hookworm infections

Cautions interactions: Appendix 1 (mebendazole)

Note: The package insert in the Vermox® pack includes the statement that it is not suitable for women known to be pregnant or children under 2 years

Pregnancy manufacturer advises toxicity in animal studies

Breast-feeding amount too small to be harmful but manufacturer advises avoid

Side-effects abdominal pain; less commonly diarrhoea, flatulence; rarely hepatitis, convulsions, dizziness, neutropenia, urticaria, alopecia, rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis)

Dose

- Threadworms, ADULT and CHILD over 2 years, 100 mg as a single dose; if reinfection occurs second dose may be needed after 2 weeks; CHILD under 2 years, see BNF for Children
- Whipworms, ADULT and CHILD over 2 years, 100 mg twice daily for 3 days; CHILD under 2 years, see BNF for Children
- Roundworms—section 5.5.2
- Hookworms—section 5.5.4

Mebendazole (Non-proprietary)  Tablets, chewable, mebendazole 100 mg

Vermox® (Janssen)  Tablets, orange, scored, chewable, mebendazole 100 mg. Net price 6-tab pack = £1.36
Oral suspension, mebendazole 100 mg/5 mL (banana-flavoured). Net price 30 mL = £1.59

5.5.2 Ascaricides (common roundworm infections)

Mebendazole (section 5.5.1) is effective against Ascaris lumbricoides and is generally considered to be the drug of choice; the usual dose is 100 mg twice daily for 3 days or 500 mg as a single dose [unlicensed single dose].

Levamisole [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) is an alternative when mebendazole cannot be used. It is very well tolerated; mild nausea or vomiting has been reported in about 1% of treated patients; it is given as a single dose of 120–150 mg in adults.

5.5.3 Drugs for tapeworm infections

Taenicides

Niclosamide [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastro-intestinal upset, lightheadedness, and pruritus; it is not effective against larval worms. Fears of developing cysticercosis in Taenia solium infections have proved unfounded. All the same, an antiemetic can be given before treatment and a laxative can be given 2 hours after niclosamide.

Praziquantel [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) is as effective as niclosamide and is given as a single dose of 5–10 mg/kg after a light breakfast (a single dose of 25 mg/kg for Hymenolepis nana).

Hydatid disease

Cysts caused by Echinococcus granulosus grow slowly and asymptomatic patients do not always require treatment. Surgical treatment remains the method of choice in many situations. Albendazole [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Alveolar echinococcosis due to E. multilocularis is usually fatal if untreated. Surgical removal with albendazole cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albendazole (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

5.5.4 Drugs for hookworms (ancylostomiasis, necatoriasis)

Hookworms live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia.

Mebendazole (section 5.5.1) has a useful broad-spectrum activity, and is effective against hookworms; the usual dose is 100 mg twice daily for 3 days. Albendazole [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) given as a single dose of 400 mg, is an alternative.

5.5.5 Schistosomicides (bilharziasis)

Adult Schistosoma haematobium worms live in the genito-urinary tract and portal system.

Praziquantel [unlicensed] is available from Merck Serono (Cysticide®) and is effective against all human schistosomes. The dose is 20 mg/kg followed after 4–6 hours by one further dose of 20 mg/kg (20 mg/kg given 3 times on one day for S. japonicum infections). No serious adverse effects have been reported. Of all the available schistosomicides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

Hycanthone, lucanthone, niridazole, oxamnique, and sodium stibocaptate have now been superseded.

5.5.6 Filaricides

Diethylcarbamazine [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see Appendix 1 (mebendazole)).
panies, see p. 1104) is effective against microfilariae and adults of *Loa loa*, *Wuchereria bancrofti*, and *Brugia malayi*. To minimise reactions treatment is commenced with a dose of diethylcarbamazine citrate 1 mg/kg on the first day and increased gradually over 3 days to 6 mg/kg daily in divided doses (up to 9 mg/kg daily in divided doses for *Loa loa*); this dosage is maintained for a further period. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy *Loa loa* infection there is a small risk of encephalopathy. In such cases specialist advice should be sought, and treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement.

Ivermectin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) is very effective in onchocerciasis and it is now the drug of choice. A single dose of 150 micrograms/kg by mouth produces a prolonged reduction in microfilarial levels. Retreatment at intervals of 6 to 12 months depending on symptoms must be given until the adult worms die out. Reactions are usually slight and most commonly take the form of temporary aggravation of itching and rash. Diethylcarbamazine or suramin should no longer be used for onchocerciasis because of their toxicity.

5.5.7 Drugs for cutaneous larva migrans

(creeplng eruptiom)

Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical tiabendazole (no commercial preparation available). Multiple infections respond to ivermectin, albendazole or tiabendazole (thiabendazole) by mouth [all unlicensed] and available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104).

5.5.8 Drugs for strongyloidiasis

Adult *Strongyloides stercoralis* live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. Ivermectin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) in a dose of 200 micrograms/kg daily for 2 days is the treatment of choice for chronic *Strongyloides* infection. Albendazole [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) is an alternative given in a dose of 400 mg twice daily for 3 days, repeated after 3 weeks if necessary.

For hormonal contraception, see section 7.3.
disease such as smoking (section 4.10.2), hypertension (section 2.5), obesity (section 4.5), and hyperlipidaemia (section 2.12) should be addressed. Cardiovascular risk in patients with diabetes can be further reduced by the use of an ACE inhibitor (section 2.5.5.1), low-dose aspirin (section 2.9) and a lipid-regulating drug (section 2.12).

Prevention of diabetic complications Optimal glycaemic control in both type 1 diabetes and type 2 diabetes reduces, in the long term, the risk of microvascular complications including retinopathy, development of proteinuria and to some extent neuropathy. However, a temporary deterioration in established diabetic retinopathy may occur when normalising blood-glucose concentration. For reference to the use of an ACE inhibitor or an angiotensin-II receptor antagonist in the management of diabetic nephropathy, see section 6.1.5.

A measure of the total glycosylated (or glycated) haemoglobin (HbA$_1c$) or a specific fraction (HbA$_1c$) provides a good indication of glycaemic control over the previous 2–3 months. Overall it is ideal to aim for an HbA$_1c$ (glycosylated haemoglobin) concentration of 48–59 mmol/mol or less (reference range 20–42 mmol/mol) but this cannot always be achieved and for those using insulin there is a significantly increased risk of disabling hypoglycaemia; in those at risk of arterial disease, the aim should be to maintain the HbA$_1c$ concentration at 48 mmol/mol or less. HbA$_1c$ should be measured every 3–6 months.

Measurement of HbA$_1c$

HbA$_1c$ values are expressed in mmol of glycosylated haemoglobin per mol of haemoglobin (mmol/mol), a standardised unit specific for HbA$_1c$, created by the International Federation of Clinical Chemistry and Laboratory Medicine (IFCC). HbA$_1c$ values were previously aligned to the assay used in the Diabetes Control and Complications Trial (DCCT) and expressed as a percentage.

Equivalent values

Laboratory measurement of serum-fructosamine concentration is technically simpler and cheaper than the measurement of HbA$_1c$, and can be used to assess control over short periods of time, particularly when HbA$_1c$ monitoring is invalid (e.g. disturbed erythrocyte turnover or abnormal haemoglobin type).

Tight control of blood pressure in hypertensive patients with type 2 diabetes reduces mortality and protects visual acuity (by reducing considerably the risks of maculopathy and retinal photocoagulation) (see also section 2.5).

Driving Drivers with diabetes may be required to notify the Driver and Vehicle Licensing Agency (DVLA) of their condition depending on their treatment, the type of licence, and whether they have diabetic complications. Detailed guidance on eligibility to drive, and precautions required, is available from the DVLA (www.gov.uk/government/publications/at-a-glance).

Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems. Drivers treated with insulin should normally check their blood-glucose concentration before driving and, on long journeys, at 2-hour intervals as specified by DVLA guidance; depending on the type of licence, monitoring may also be necessary for drivers taking oral antidiabetic drugs which carry a risk of hypoglycaemia (e.g. sulfonylureas, nateglinide, repaglinide). Drivers treated with insulin should ensure that a supply of sugar is always available in the vehicle and they should avoid driving if their meal is delayed. If hypoglycaemia occurs, or warning signs develop, the driver should:

- stop the vehicle in a safe place;
- switch off the ignition and move from the driver’s seat;
- eat or drink a suitable source of sugar;
- wait until 45 minutes after blood glucose has returned to normal, before continuing journey.
Insulin is needed by all patients with ketoacidosis, and it is likely to be needed by most patients with:

- rapid onset of symptoms;
- substantial loss of weight;
- weakness;
- ketonuria;
- a first-degree relative who has type 1 diabetes.

Insulin is required by almost all children with diabetes. It is also needed for type 2 diabetes when other methods have failed to achieve good control, and temporarily in the presence of intercurrent illness or peri-operatively. Pregnant women with type 2 diabetes may be treated with insulin when diet alone fails. For advice on use of oral antidiabetic drugs in the management of diabetes in pregnancy, see section 6.1.2.

Examples of recommended insulin regimens

- Multiple injection regimen: short-acting insulin or rapid-acting insulin analogue, before meals
  With intermediate-acting or long-acting insulin, once or twice daily;
- Short-acting insulin or rapid-acting insulin analogue mixed with intermediate-acting or long-acting insulin, once or twice daily (before meals);
- Intermediate-acting or long-acting insulin, once or twice daily
  With or without short-acting insulin or rapid-acting insulin before meals;
- Continuous subcutaneous insulin infusion (see below).

Management of diabetes with insulin

The aim of treatment is to achieve the best possible control of blood-glucose concentration without making the patient obsessional and to avoid disabling hypoglycaemia; close co-operation is needed between the patient and the medical team because good control reduces the risk of complications.

Insulin preparations can be divided into 3 types:

- those of short duration which have a relatively rapid onset of action, namely soluble insulin and the rapid-acting insulin analogues, insulin aspart, insulin glulisine, and insulin lispro (section 6.1.1.1);
- those with an intermediate action, e.g. isophane insulin (section 6.1.1.2); and
- those whose action is slower in onset and lasts for long periods, e.g. protamine zinc insulin, insulin detemir, and insulin glargine (section 6.1.1.2).

The duration of action of a particular type of insulin varies considerably from one patient to another, and needs to be assessed individually.

Mixtures of insulin preparations may be required and appropriate combinations have to be determined for the individual patient. Treatment should be started with a short-acting insulin (e.g. soluble insulin) or a rapid-acting insulin analogue (e.g. insulin aspart) given before meals with intermediate-acting or long-acting insulin once or twice daily. Alternatively, for those who have difficulty with, or prefer not to use, multiple injection regimens, a mixture of premixed short-acting insulin or rapid acting insulin analogue with an intermediate-acting or long-acting insulin (most commonly in a proportion of 30% soluble insulin and 70% isophane insulin) can be given once or twice daily. The dose of short-acting or rapid-acting insulin (or the proportion of the short-acting soluble insulin component in premixed insulin) can be increased in those with excessive post-prandial hyperglycaemia. The dose of insulin is increased gradually according to the patient’s individual requirements, taking care to avoid troublesome hypoglycaemic reactions.

Insulin requirements may be increased by infection, stress, accidental or surgical trauma, and during puberty. Requirements may be decreased in those with certain endocrine disorders (e.g. Addison’s disease, hypopituitarism), or in coeliac disease.

Renal impairment

Insulin requirements may decrease in patients with renal impairment.

Pregnancy and breast-feeding

During pregnancy and breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician. The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy. The short-acting insulin analogues, insulin aspart and insulin lispro, are not known to be harmful, and may be used during pregnancy and lactation. Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

Hepatic impairment

Insulin requirements may be decreased in patients with hepatic impairment.

Insulin administration

Insulin is generally given by subcutaneous injection; the injection site should be rotated to prevent lipodystrophy. Injection devices (‘pens’) (section 6.1.1.3), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulins not available in cartridge form.

For intensive insulin regimens multiple subcutaneous injections (3 or more times daily) are usually recommended.

Short-acting injectable insulins (soluble insulin, insulin aspart, insulin glulisine, and insulin lispro) can also be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens (see also NICE guidance, below). Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.
BNF 68

6.1.1 Insulins 457

Endocrine system

Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008)

Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:

- who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens; or
- whose glycaemic control remains inadequate (HbA\(_1c\), over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

www.nice.org.uk/TA151

Soluble insulin by the intravenous route is reserved for urgent treatment, e.g. in diabetic ketoacidosis, and for fine control in serious illness and in the peri-operative period (see under Diabetes and Surgery, below).

Units

The word ‘unit’ should not be abbreviated.

Monitoring

Many patients now monitor their own blood-glucose concentrations (section 6.1.6). Since blood-glucose concentration varies substantially throughout the day, ‘normoglycaemia’ cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia. It is therefore best to recommend that patients should maintain a blood-glucose concentration of between 4 and 9 mmol/litre for most of the time (4–7 mmol/litre before meals and less than 9 mmol/litre after meals), while accepting that on occasions, for brief periods, it will be above these values; strenuous efforts should be made to prevent the blood-glucose concentration from falling below 4 mmol/litre. Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided.

Hypoglycaemia

Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed on how to avoid it.

Loss of warning of hypoglycaemia among insulin-treated patients can be a serious hazard, especially for drivers and those in dangerous occupations. Very tight control of diabetes lowers the blood-glucose concentration needed to trigger hypoglycaemic symptoms; an increase in the frequency of hypoglycaemic episodes may reduce the warning symptoms experienced by the patient. Beta-blockers can also blunt hypoglycaemic awareness (and also delay recovery).

To restore the warning signs, episodes of hypoglycaemia must be minimised; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

Some patients have reported loss of hypoglycaemia warning after transfer to human insulin. Clinical studies do not confirm that human insulin decreases hypoglycaemia awareness. If a patient believes that human insulin is responsible for the loss of warning it is reasonable to revert to animal insulin and essential to educate the patient about avoiding hypoglycaemia. Great care should be taken to specify whether a human or an animal preparation is required.

Few patients are now treated with beef insulins; when undertaking conversion from beef to human insulin, the total dose should be reduced by about 10% with careful monitoring for the first few days. When changing between pork and human-sequence insulins, a dose change is not usually needed, but careful monitoring is still advised.

Diabetes and surgery

Perioperative control of blood-glucose concentrations in patients with type 1 diabetes is achieved via an adjustable, continuous, intravenous infusion of insulin. Detailed local protocols should be available to all healthcare professionals involved in the treatment of these patients; in general, the following steps should be followed:

- Give an injection of the patient’s usual insulin on the night before the operation;
- Early on the day of the operation, start an intravenous infusion of glucose containing potassium chloride (provided that the patient is not hyperkalaemic) and infuse at a constant rate appropriate to the patient’s fluid requirements (usually 125 ml per hour); make up a solution of soluble insulin in sodium chloride 0.9% and infuse intravenously using a syringe pump piggy-backed to the intravenous infusion. Glucose and potassium infusions, and insulin infusions should be made up according to locally agreed protocols;
- The rate of the insulin infusion should be adjusted according to blood-glucose concentration (frequent monitoring necessary) in line with locally agreed protocols.

Protocols should include specific instructions on how to manage resistant cases (such as patients who are in shock or severely ill or those receiving corticosteroids or sympathomimetics) and those with hypoglycaemia.

If a syringe pump is not available, soluble insulin should be added to the intravenous infusion of glucose and potassium chloride (provided the patient is not hyperkalaemic), and the infusion run at the rate appropriate to the patient’s fluid requirements (usually 125 ml per hour) with the insulin dose adjusted according to blood-glucose concentration in line with locally agreed protocols.

Once the patient starts to eat and drink, give subcutaneous insulin before breakfast and stop intravenous insulin 30 minutes later; the dose may need to be 10–20% more than usual if the patient is still in bed or unwell. If the patient was not previously receiving insulin, an appropriate initial dose is 30–40 units daily in four divided doses using soluble insulin before meals and intermediate-acting insulin at bedtime and the dose adjusted from day to day. Patients with hyperglycaemia often relapse after conversion back to subcutaneous insulin calling for one of the following approaches:
6.1.1 Insulins

- additional doses of soluble insulin at any of the four injection times (before meals or bedtime) or
- temporary addition of intravenous insulin infusion (while continuing the subcutaneous regimen) until blood-glucose concentration is satisfactory or
- complete reversion to the intravenous regimen (especially if the patient is unwell).

**Insulin Passport**  
Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient’s current insulin preparations and contains a section for emergency information. The patient information booklet provides advice on the safe use of insulin. They are available for purchase from:  
3M Security Print and Systems Limited  
Gorse Street, Chadderton  
Oldham  
OL9 9QH  
Tel: 0845 610 1112  
GP practices can obtain supplies through their Local Area Team stores.

NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com.

Further information is available at www.npsa.nhs.uk.

### 6.1.1.1 Short-acting insulins

**Soluble insulin** is a short-acting form of insulin. For maintenance regimens it is usual to inject it 15 to 30 minutes before meals.

Soluble insulin is the most appropriate form of insulin for use in diabetic emergencies e.g. diabetic ketoacidosis (section 6.1.3) and at the time of surgery. It can be administered intravenously and can be used as a temporary addition of insulin infusion pumps—may precipitate in catheter or needle.

**Hypurin® Bovine Neutral (Wockhardt)**  
Injection, soluble insulin (bovine, highly purified) 100 units/mL. Net price 10-mL vial = £27.72; cartridges (for Autopen® Classic) 5 x 3 mL = £41.58

**Hypurin® Porcine Neutral (Wockhardt)**  
Injection, soluble insulin (porcine, highly purified) 100 units/mL. Net price 10-mL vial = £25.20; cartridges (for Autopen® Classic) 5 x 3 mL = £37.80

**Humulin S® (Lilly)**  
Injection, soluble insulin (human, prb) 100 units/mL. Net price 10-mL vial = £15.68; 5 x 3 mL cartridge (for most Autopen® Classic and HumaPen®) = £19.08

**Insuman® Rapid (Sanofi-Aventis)**  
Injection, soluble insulin (human, crb) 100 units/mL, net price 5 x 3-mL cartridge (for ClikSTAR® and Autopen® 24) = £17.50

**Note** Not recommended for use in subcutaneous insulin infusion pumps

### Mixed preparations

- By subcutaneous infusion, or intravenous injection, or intravenous infusion, according to requirements

Humalog® (Lilly) FIA
Injection, insulin lispro (recombinant human insulin analogue) 100 units/mL, net price 10-mL vial = £16.61; 5 × 3-mL cartridge (for Autopen® Classic or HumaPen®) = £28.31; 5 × 3-mL Humalog® KwikPen prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £29.46

Counselling
- Show container to patient and confirm that patient is expecting the version dispensed

6.1.1.2 Intermediate- and long-acting insulins

When given by subcutaneous injection, intermediate- and long-acting insulins have an onset of action of approximately 1–2 hours, a maximal effect at 4–12 hours, and a duration of 16–42 hours. Some are given twice daily in conjunction with short-acting (soluble) insulin, and others are given once daily, particularly in elderly patients. Soluble insulin can be mixed with intermediate and long-acting insulins (except insulin detemir, insulin glargine, and insulin degludec) in the syringe, essentially retaining the properties of the two components, although there may be some blunting of the initial effect of the soluble insulin component (especially on mixing with protamine zinc insulin, see below).

Isophane insulin is a suspension of insulin with protamine zinc; it is of particular value for initiation of twice-daily insulin regimens. Patients usually mix isophane with soluble insulin but ready-mixed preparations may be appropriate (biphasic isophane insulin, biphasic insulin aspart, or biphasic insulin lispro).

Insulin zinc suspension (30% amorphous, 70% crystal-line) has a more prolonged duration of action.

Protamine zinc insulin is usually given once daily with short-acting (soluble) insulin. It has the drawback of binding with the soluble insulin when mixed in the same syringe and is therefore rarely used.

Insulin glargine and insulin detemir are both long-acting human insulin analogues with a prolonged duration of action; insulin glargine is given once daily and insulin detemir is given once or twice daily. NICE (December 2002) has recommended that insulin glargine should be available as an option for patients with type 1 diabetes.

NICE (May 2009) has recommended that, if insulin is required in patients with type 2 diabetes, insulin detemir or insulin glargine may be considered for those:
- who require assistance with injecting insulin or
- whose lifestyle is significantly restricted by recurrent symptomatic hypoglycaemia or
- who would otherwise need twice-daily basal insulin injections in combination with oral antidiabetic drugs or
- who cannot use the device needed to inject isophane insulin.
Insulin detemir is also licensed as add-on therapy in patients receiving treatment with liraglutide.

**INSULIN DEGLUDEC**

(Recombinant human insulin analogue—long acting)

**Indications** diabetes mellitus

**Cautions** section 6.1.1; interactions: Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Side-effects** see under Insulin (section 6.1.1.1)

**Dose**

- By subcutaneous injection, **ADULT** over 18 years, according to requirements

**Tresiba**® (Novo Nordisk) ▼

**Injection**, insulin degludec (recombinant human insulin analogue) 100 units/mL, net price 5 × 3-mL Penfill® cartridges (for Novo Nordisk® devices) = £72.00; 100 units/mL, 5 × 3-mL FlexTouch® prefilled disposable injection devices (range 1–80 units, allowing 1-unit dosage adjustment) = £72.00; 200 units/mL, 3 × 3-mL FlexTouch® prefilled disposable injection devices (range 2–160 units, allowing 2-unit dosage adjustment) = £86.40

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed

**INSULIN DETEMIR**

(Recombinant human insulin analogue—long acting)

**Indications** diabetes mellitus

**Cautions** section 6.1.1; interactions: Appendix 1 (antidiabetics)

**Hepatic impairment** section 6.1.1

**Renal impairment** section 6.1.1

**Pregnancy** section 6.1.1

**Breast-feeding** section 6.1.1

**Side-effects** see under Insulin (section 6.1.1.1)

**Dose**

- By subcutaneous injection, **ADULT** and **CHILD** over 2 years, according to requirements

**Lantus**® (Sanofi-Aventis) ▼

**Injection**, insulin glargine (recombinant human insulin analogue) 100 units/mL, net price 10-mL vial = £30.68; 5 × 3-mL cartridge (for ClikStar® and Autopen® 24) = £41.50; 5 × 3-mL Lantus® SoloStar® prefilled disposable injection devices (range 1–80 units, allowing 1-unit dosage adjustment) = £41.50

**Note** The Scottish Medicines Consortium (p. 4) has advised (March 2013) that insulin glargine is accepted for restricted use within NHS Scotland for the treatment of type 1 diabetes:

- in those who are at risk of or experience unacceptable frequency or severity of nocturnal hypoglycaemia on attempting to achieve better hypoglycaemic control during treatment with other insulins

- as a once daily insulin therapy for patients who require a carer to administer their insulin.

It is not recommended for routine use in patients with type 2 diabetes unless they suffer from recurrent episodes of hypoglycaemia or require assistance with their insulin injections.

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed

(Novo Nordisk) (Protamine Insulin Injection; Isophane Insulin Injection; Isophane Insulin (NPH)—intermediate acting)

**Injection**
isophane insulin (human, pyr) 100 units/mL. Net price 10-mL vial = £7.48; Insulatard Penfill® cartridge (for Novopen® devices) 5 × 3 mL = £22.90; 5 × 3-mL Insulatard InnoLet® prefilled disposable injection devices (range 1–50 units, allowing 1-unit dosage adjustment) = £20.40

**Humulin I®** (Lilly) (Protamine Zinc Insulin Injection; Isophane Zinc Insulin Injection; Isophane Zinc Insulin (NPH)—intermediate acting)

**Injection**
isophane insulin (human, prb) 100 units/mL. Net price 10-mL vial = £15.61; 5 × 3-mL cartridge (for Autopen® Classic or Humulin PenFills®) = £19.08; 5 × 3-mL Humulin 1 KiWickPen® prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £21.70

**Humulin R®** (Lilly) (Protamine Zinc Insulin Injection; Isophane Zinc Insulin Injection; Isophane Zinc Insulin (NPH)—intermediate acting)

**Injection**
isophane insulin (human, crb) 100 units/mL. Net price 5-mL vial = £5.61; 5 × 3-mL cartridge (for ClikSTAR® and Autopen® 24) = £17.50; 5 × 3-mL Humulin R® Basal SoloStar® prefilled disposable injection devices (range 1–80 units, allowing 1-unit dosage adjustment) = £19.80

**Mixed preparations**
See Biphasic Isophane Insulin (p. 462)

**BIPHASIC INSULIN ASPART**
(Intermediate-acting insulin)

**Indications**
diabetes mellitus

**Cautions**
see section 6.1.1.1; interactions: Appendix 1 (antidiabetics)

**Hepatic impairment**
section 6.1.1

**Renal impairment**
section 6.1.1

**Pregnancy**
section 6.1.1

**Breast-feeding**
section 6.1.1

**Side-effects**
see under Insulin (section 6.1.1.1); protamine may cause allergic reactions

**Dose**
- By subcutaneous injection, up to 10 minutes before or soon after a meal, according to requirements

NovoMix® 30 (Novo Nordisk) (Protamine Zinc Isophane Insulin Injection; Isophane Zinc Insulin Injection; Isophane Zinc Insulin (NPH)—intermediate acting)

**Injection**
recombinant human insulin aspart (recombinant human insulin analogue), 30% insulin aspart, 70% insulin aspart protamine, 100 units/mL. Net price 5 × 3-mL Penfill® cartridges (for NovoPen® devices) = £28.79; 5 × 3-mL FlexPen® prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £29.89

**Counselling**
Show container to patient and confirm that patient is expecting the version dispensed; the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries)

**BIPHASIC INSULIN LISPRO**
(Intermediate-acting insulin)

**Indications**
diabetes mellitus

**Cautions**
see section 6.1.1.1 and Insulin Lispro; interactions: Appendix 1 (antidiabetics)

**Hepatic impairment**
section 6.1.1

**Renal impairment**
section 6.1.1

**Side-effects**
see under Insulin (section 6.1.1.1); protamine may cause allergic reactions

**Dose**
- By subcutaneous injection, according to requirements

**Hypurin**
Bovine Protamine Zinc (Wockhardt) (Protamine Zinc Insulin Injection; Isophane Zinc Insulin Injection; Isophane Zinc Insulin (NPH)—intermediate acting)

**Injection**
protamine zinc insulin (bovine, highly purified) 100 units/mL. Net price 10-mL vial = £27.72

**Counselling**
Show container to patient and confirm that patient is expecting the version dispensed

**Appendix 1 (antidiabetics)**
interactions: Appendix 1 (antidiabetics)
6.1.1 Insulins

Pregnancy  section 6.1.1
Breast-feeding  section 6.1.1
Side-effects  see under Insulin (section 6.1.1.1); protamine may cause allergic reactions

Dose
• By subcutaneous injection, up to 15 minutes before or soon after a meal, according to requirements

Humalog® Mix25 (Lilly) (FSH
Injection, biphasic insulin lispro (recombinant human insulin analogue), 25% insulin lispro, 75% insulin lispro protamine, 100 units/mL, net price 10-mL vial = £16.61; 5 x 3-mL cartridge (for Autopen® Classic or HumaPen®) = £29.46; 5 x 3-mL Humalog® Mix25 KwikPen prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £30.98
Counselling  Show container to patient and confirm that patient is expecting the version dispensed; the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries)

Humalog® Mix50 (Lilly) (FSH
Injection, biphasic insulin lispro (recombinant human insulin analogue), 50% insulin lispro, 50% insulin lispro protamine, 100 units/mL, net price 5 x 3-mL cartridge (for Autopen® Classic or HumaPen®) = £29.46; 5 x 3-mL Humalog® Mix50 KwikPen prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £30.98
Counselling  Show container to patient and confirm that patient is expecting the version dispensed; the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries)

BIPHASIC ISOPHANE INSULIN
(Biphasic Isophane Insulin Injection—intermediate acting)
A sterile buffered suspension of either porcine or human insulin complexed with protamine sulfate (or another suitable protamine) in a solution of insulin of the same species

Indications  diabetes mellitus
Cautions  section 6.1.1.1; interactions: Appendix 1 (antidiabetics)
Hepatic impairment  section 6.1.1
Renal impairment  section 6.1.1
Pregnancy  section 6.1.1
Breast-feeding  section 6.1.1
Side-effects  see under Insulin (section 6.1.1.1); protamine may cause allergic reactions

Dose
• By subcutaneous injection, according to requirements

Highly purified animal
counselling  Show container to patient and confirm that patient is expecting the version dispensed; the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries)

Hypurin® Porcine 30/70 Mix (Wockhardt) (FSH
Injection, biphasic insulin porcine (highly purified), 30% soluble, 70% isophane, 100 units/mL, net price 10-mL vial = £25.20; cartridges (for Autopen® Classic) 5 x 3 mL = £37.80

Human sequence
Counselling  Show container to patient and confirm that patient is expecting the version dispensed; the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries)

Humulin M3® (Lilly) (FSH
Injection, biphasic isophane insulin (human, prb), 30% soluble, 70% isophane, 100 units/mL, net price 10-mL vial = £15.68; 5 x 3-mL cartridge (for most Autopen® Classic or HumaPen®) = £19.08; 5 x 3-mL Humulin M3 KwikPen® prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £21.70

Insulan® Comb 15 (Sanofi-Aventis) (FSH
Injection, biphasic isophane insulin (human, crb), 15% soluble, 85% isophane, 100 units/mL, net price 5 x 3-mL cartridge (for ClikSTAR® and Autopen® 24) = £17.50

Insulan® Comb 25 (Sanofi-Aventis) (FSH
Injection, biphasic isophane insulin (human, crb), 25% soluble, 75% isophane, 100 units/mL, net price 5-mL vial = £35.61; 5 x 3-mL cartridge (for ClikSTAR® and Autopen® 24) = £17.50; 5 x 3-mL Insulan® Comb 25 SoloStar® prefilled disposable injection devices (range 1–80 units, allowing 1-unit dosage adjustment) = £19.80

Insulan® Comb 50 (Sanofi-Aventis) (FSH
Injection, biphasic isophane insulin (human, crb), 50% soluble, 50% isophane, 100 units/mL, net price 5 x 3-mL cartridge (for ClikSTAR® and Autopen® 24) = £17.50

6.1.1.3 Hypodermic equipment

Patients should be advised on the safe disposal of lancets, single-use syringes, and needles. Suitable arrangements for the safe disposal of contaminated waste must be made before these products are prescribed for patients who are carriers of infectious diseases.

Injection devices
Autopen® (Owen Mumford)
Injection device, Autopen® 24 (for use with Sanofi-Aventis 3-mL insulin cartridges), allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2-unit dosage adjustment, max. 42 units (2-unit version), net price (both) = £16.47; Autopen® Classic (for use with Lilly and Wockhardt 3-mL insulin cartridges), allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2-unit dosage adjustment, max. 42 units (2-unit version), net price (all) = £16.72

ClikSTAR® (Sanofi-Aventis)
Injection device, for use with Lantus®, Apidra®, and Insuman® 3-mL insulin cartridges; allowing 1-unit dose adjustment, max. 80 units, net price = £25.00

HumaPen® Luxura (Lilly)
Injection device, for use with Humulin® and Humalog® 3-mL cartridges; allowing 1-unit dosage adjustment, max. 60 units, net price = £26.82

HumaPen® Luxura HD (Lilly)
Injection device, for use with Humulin® and Humalog® 3-mL cartridges; allowing 0.5-unit dosage adjustment, max. 30 units, net price = £26.82
HumaPen® Memoir (Lilly) Injection device, for use with Humalog® 3-mL cartridges; allowing 1-unit dosage adjustment, max. 60 units, net price = £26.82.

Injex (Injex UK) Needle-free insulin delivery device, for use with any 10-mL vial of insulin, allowing 1-unit dosage adjustment, max. 30 units, net price starter set (Injex® device, reset box, transporter, 9 × 10-mL vial adaptors, 165 ampoules) = £149.36; 4-month refill pack (6 × 10-mL vial adaptors, 100 ampoules) = £24.47; ampoule pack (50 ampoules) = £12.28; vial adaptor pack (20 × 10-mL vial adaptors) = £12.23.

Insulet (European Pharma) Needle-free insulin delivery device, for use with any 10-mL vial or 3-mL cartridge of insulin, allowing 1-unit dosage adjustment, max. 40 units, net price starter set (Insulet® device, nozzle cap, nozzle and piston, 1 × 10-mL adaptor, 1 × 3-mL adaptor, 1 cartridge cap removal key) = £143.60, nozzle pack (15 nozzles) = £28.40, cartridge adaptor pack (15 adaptors) = £21.70, vial adaptor pack (15 adaptors) = £21.70.

NovoPen® 4 (Novo Nordisk) Injection device, for use with Penfill® 3-mL insulin cartridges; allowing 1-unit dosage adjustment, max. 60 units, net price = £26.86.

Lancets, needles, syringes, and accessories Lancets, needles, syringes, and accessories are listed under Hypodermic Equipment in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 of the Scottish Drug Tariff).

The Drug Tariffs can be accessed online at: National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm

6.1.2 Antidiabetic drugs

6.1.2.1 Sulfonylureas

6.1.2.2 Biguanides

6.1.2.3 Other antidiabetic drugs

Oral antidiabetic drugs are used for the treatment of type 2 diabetes mellitus. They should be prescribed only if the patient fails to respond adequately at least 3 months’ restriction of energy and carbohydrate intake and an increase in physical activity. They should be used to augment the effect of diet and exercise, and not to replace them.

For patients not adequately controlled by diet and oral hypoglycaemic drugs, insulin may be added to the treatment regimen or substituted for oral therapy. When insulin is added to oral therapy, it is generally given at bedtime as isophane or long-acting insulin, and when insulin replaces an oral regimen it may be given as twice-daily injections of a biphasic insulin (or isophane insulin mixed with soluble insulin), or a multiple injection regimen. Weight gain and hypoglycaemia may be complications of insulin therapy but weight gain may be reduced if the insulin is given in combination with metformin.

The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action. All may cause hypoglycaemia but this is uncommon and usually indicates excessive dosage. Sulfonylurea-induced hypoglycaemia may persist for many hours and must always be treated in hospital.

Sulfonylureas are considered for patients who are not overweight, or in whom metformin is contra-indicated or not tolerated. Several sulfonylureas are available and choice is determined by side-effects and the duration of action as well as the patient’s age and renal function. Glibenclamide, a long-acting sulfonylurea, is associated with a greater risk of hypoglycaemia; for this reason it should be avoided in the elderly, and short-acting alternatives, such as gliclazide or tolbutamide, should be used instead.

When the combination of strict diet and sulfonylurea treatment fails, other options include: combining with metformin (section 6.1.2.2); combining with pioglitazone, but see section 6.1.2.3; combining with alogliptin, linagliptin, saxagliptin, sitagliptin, or vildagliptin (section 6.1.2.3); combining with canagliflozin or dapagliflozin (section 6.1.2.3); combining with exenatide, liraglutide, or lixisenatide (section 6.1.2.3); combining with acarbose (section 6.1.2.3), which may have a small beneficial effect, but flatulence can be a problem; combining with bedtime isophane insulin (section 6.1.1) but weight gain and hypoglycaemia can occur.

The risk of hypoglycaemia associated with sulfonylureas (see notes above) should be discussed with the patient, especially when concomitant glucose-lowering drugs are prescribed. Insulin therapy should be instituted temporarily during intermittent illness (such as myocardial infarction, coma, infection, and trauma). Sulfonylureas should be...
omitted on the morning of surgery; insulin is required because of the ensuing hyperglycaemia in these circumstances.

Cautions Sulfonylureas can encourage weight gain and should be prescribed only if poor control and symptoms persist despite adequate attempts at dieting; metformin (section 6.1.2.2) is considered the drug of choice in obese patients. Caution is needed in the elderly and in patients with G6PD deficiency (section 9.1.5).

Contra-indications Sulfonylures should be avoided where possible in acute porphyria (section 9.8.2) but glipizide and glimepiride are thought to be safe. Sulfonylures are contra-indicated in the presence of ketoacidosis.

Hepatic impairment Sulfonylures should be avoided or a reduced dose should be used in severe hepatic impairment, because there is an increased risk of hypoglycaemia. Jaundice may occur.

Renal impairment Sulfonylures should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia; they should be avoided where possible in severe renal impairment. Glipizide should also be avoided if the patient has both renal and hepatic impairment. If necessary, the short-acting drug tolbutamide can be used in renal impairment, as can gliclazide which is principally metabolised in the liver, but careful monitoring of blood-glucose concentration is essential; care is required to use the lowest dose that adequately controls blood glucose.

Pregnancy The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used during the second and third trimesters of pregnancy in women with gestational diabetes, see section 6.1.2.

Breast-feeding The use of sulfonylures (except glibenclamide [unlicensed use], see section 6.1.2) in breast-feeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.

Side-effects Side-effects of sulfonylureas are generally mild and infrequent and include gastro-intestinal disturbances such as nausea, vomiting, diarrhoea, and constipation. Hypoglycaemia has rarely been reported with glipizide. Blood glucose can occasionally cause a disturbance in liver function, which may rarely lead to cholestatic jaundice, hepatitis, and hepatic failure. Hypersensitivity reactions can occur, usually in the first 6–8 weeks of therapy. They consist mainly of allergic skin reactions which progress rarely to erythema multiforme and exfoliative dermatitis, fever, and jaundice; photosensitivity has rarely been reported with glipizide. Blood disorders are also rare but may include leucopenia, thrombocytopenia, agranulocytosis, pancytopenia, haemolytic anaemia, and aplastic anaemia.

Glibenclamide

Indications type 2 diabetes mellitus
Cautions see notes above; interactions: Appendix 1 (antidiabetics)
Contra-indications see notes above
Hepatic impairment see notes above

Renal impairment see notes above
Pregnancy see notes above
Breast-feeding see notes above
Side-effects see notes above
Dose
- Initially 5 mg daily with or immediately after breakfast, dose adjusted according to response (ELDERLY avoid, see notes above); max. 15 mg daily

Glibenclamide (Non-proprietary) Tablets, glibenclamide 2.5 mg, net price 28-tab pack = £18.50; 5 mg, 28-tab pack = 97p

GLICLAZIDE

Indications type 2 diabetes mellitus
Cautions see notes above; interactions: Appendix 1 (antidiabetics)
Contra-indications see notes above
Hepatic impairment see notes above
Renal impairment see notes above

Gliclazide (Non-proprietary) Tablets, gliclazide 40 mg, net price 28-tab pack = £3.36; 80 mg, 28-tab pack = £1.04, 60-tab pack = £2.23

Diamicron® (Servier) Tablets, scored, gliclazide 80 mg, net price 60-tab pack = £4.38

Modified release

Gliclazide (Non-proprietary) Tablets, m/r, gliclazide 30 mg, net price 28-tab pack = £2.06, 56-tab pack = £4.10. Label: 25

Brands include Diodat® MR, Vitile® XL

Dose ADULT over 18 years, initially 30 mg daily with breakfast, adjusted according to response every 4 weeks (after 2 weeks if no decrease in blood glucose); max. 120 mg daily

Note Gliclazide modified release 30 mg may be considered to be approximately equivalent in therapeutic effect to standard formulation gliclazide 80 mg

Diamicron® MR (Servier) Tablets, m/r, gliclazide 30 mg, net price 28-tab pack = £2.81, 56-tab pack = £5.62. Label: 25

Dose ADULT initially 30 mg daily with breakfast, adjusted according to response every 4 weeks (after 2 weeks if no decrease in blood glucose); max. 120 mg daily

Note Diamicron® MR 30 mg may be considered to be approximately equivalent in therapeutic effect to standard formulation Diamicron® 80 mg

GLIMEPIRIDE

Indications type 2 diabetes mellitus
Cautions see notes above; manufacturer recommends regular hepatic and haematological monitoring but limited evidence of clinical value; interactions: Appendix 1 (antidiabetics)
Contra-indications see notes above
Hepatic impairment see notes above
Renal impairment see notes above
Pregnancy see notes above
Breast-feeding see notes above
Side-effects see notes above

Dose
- Initially 1 mg daily, adjusted according to response in 1-mg steps at 1–2 week intervals; usual max. 4 mg daily (exceptionally, up to 6 mg daily may be used); taken shortly before or with first main meal

Glimepiride (Non-proprietary) (PW)
Tablets, glimepiride 1 mg, net price 30-tab pack = £1.20; 2 mg, 30-tab pack = £1.12; 3 mg, 30-tab pack = £7.25; 4 mg, 30-tab pack = £1.33

Amaryl® (Sanofi-Aventis) (PW)
Tablets, all scored, glimepiride 1 mg (pink), net price 30-tab pack = £4.33; 2 mg (green), 30-tab pack = £7.13; 3 mg (yellow), 30-tab pack = £10.75; 4 mg (blue), 30-tab pack = £14.24

GLIPIZIDE

Indications type 2 diabetes mellitus
Cautions see notes above; interactions: Appendix 1 (antidiabetics)
Contra-indications see notes above
Hepatic impairment see notes above
Renal impairment see notes above
Pregnancy see notes above
Breast-feeding see notes above
Side-effects see notes above; also dizziness, drowsiness
Dose
- Initially 2.5–5 mg daily shortly before breakfast or lunch, adjusted according to response; max. 20 mg daily; up to 15 mg may be given as a single dose; higher doses divided

Gliclazide (Non-proprietary) (PW)
Tablets, glipizide 5 mg, net price 56-tab pack = £5.36

Minodiab® (Pharmacia) (PW)
Tablets, scored, glipizide 5 mg, net price 28-tab pack = £1.26

TOLBUTAMIDE

Indications type 2 diabetes mellitus
Cautions see notes above; interactions: Appendix 1 (antidiabetics)
Contra-indications see notes above
Hepatic impairment see notes above
Renal impairment see notes above
Pregnancy see notes above
Breast-feeding see notes above
Side-effects see notes above; also headache, tinnitus
Dose
- 0.5–1.5 g (max. 2 g) daily in divided doses with or immediately after meals or as a single dose with or immediately after breakfast

Tolbutamide (Non-proprietary) (PW)
Tablets, tolbutamide 500 mg, net price 28-tab pack = £22.64

6.1.2 Antidiabetic drugs

Metformin, the only available biguanide, has a different mode of action from the sulfonylureas, and is not interchangeable with them. It exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

Metformin is the drug of first choice in overweight patients in whom strict dieting has failed to control diabetes, if appropriate it may also be considered as an option in patients who are not overweight. It is also used when diabetes is inadequately controlled with sulfonylurea treatment. When the combination of strict diet and metformin treatment fails, other options include:
- combining with a sulfonylurea (section 6.1.2.1);
- combining with pioglitazone (section 6.1.2.3);
- combining with repaglinide or nateglinide (section 6.1.2.3);
- combining with alogliptin, linagliptin, saxagliptin, sitagliptin, or vildagliptin (section 6.1.2.3);
- combining with canagliflozin or dapagliflozin (section 6.1.2.3);
- combining with exenatide, liraglutide, or lixisenatide (section 6.1.2.3);
- combining with acarbose (section 6.1.2.3), which may have a small beneficial effect, but flatulence can be a problem;
- combining with insulin (section 6.1.1) but weight gain and hypoglycaemia can be problems (weight gain minimised if insulin given at night).

Insulin treatment is almost always required in medical and surgical emergencies; insulin should also be substituted before elective surgery (omit metformin on the morning of surgery and give insulin if required). Hypoglycaemia does not usually occur with metformin; other advantages are the lower incidence of weight gain and lower plasma-insulin concentration. It does not exert a hypoglycaemic action in non-diabetic subjects unless given in overdose.

Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses such as 3 g daily are given. Very rarely, metformin can provoke lactic acidosis. It is most likely to occur in patients with renal impairment, see Lactic Acidosis below.

Metformin is used for the symptomatic management of polycystic ovary syndrome [unlicensed indication]; however, treatment should be initiated by a specialist. Metformin improves insulin sensitivity, may aid weight reduction, helps to normalise menstrual cycle (increasing the rate of spontaneous ovulation), and may improve hirsutism.

METFORMIN HYDROCHLORIDE

Indications diabetes mellitus (see notes above); polycystic ovary syndrome [unlicensed indication]
Cautions see notes above; determine renal function before treatment and at least annually (at least twice a
year in patients with additional risk factors for renal impairment, or if deterioration suspected; interactions: Appendix 1 (antidiabetics)

Lactic acidosis Use with caution in renal impairment—increased risk of lactic acidosis; avoid in significant renal impairment. NICE recommends that the dose should be reviewed if eGFR less than 45 mL/minute/1.73 m² and to avoid if eGFR less than 30 mL/minute/1.73 m². Withdraw or interrupt treatment in those at risk of tissue hypoxia or sudden deterioration in renal function, such as those with dehydration, severe infection, shock, sepsis, acute heart failure, respiratory failure or hepatic impairment, or those who have recently had a myocardial infarction.

Contra-indications ketoacidosis, see also Lactic Acidosis above; use of general anaesthesia (suspend metformin on the morning of surgery and restart when renal function returns to baseline) intravenous containing X-ray contrast media. Intravascular administration of iodinated contrast agents can cause renal failure, which can increase the risk of lactic acidosis with metformin—see Lactic Acidosis above. Suspend metformin prior to the test; restart no earlier than 48 hours after the test if renal function has returned to baseline.

Renal impairment withdraw if tissue hypoxia likely

Hepatic impairment may be used during breast-feeding—see p. 463.

Breast-feeding may be used during breast-feeding—see p. 463.

Side-effects anorexia, nausea, vomiting, diarrhoea

Pregnancy used in pregnancy for both pre-existing and gestational diabetes—see also p. 463.

Diabetes mellitus, ADULT and CHILD over 10 years initially 500 mg with breakfast for at least 1 week then 500 mg with breakfast and evening meal for at least 1 week then 500 mg with breakfast, lunch and evening meal; usual max. 2 g daily in divided doses

- Poly cystic ovary syndrome [unlicensed], initially 500 mg with breakfast for 1 week, then 500 mg with breakfast and evening meal for 1 week, then 1.5–1.7 g daily in 2–3 divided doses

Note Metformin doses in the BNF may differ from those in the product literature.

Metformin (Non-proprietary) Tablets, coated, metformin hydrochloride 500 mg, net price 28-tab pack = £2.66, 56-tab pack = £5.32. Label: 21, 25

Glucophage® Tablets, 1/f/c, metformin hydrochloride 500 mg, net price 84-tab pack = £2.88, 850 mg, 56-tab pack = £3.20. Label: 21

Glucophage® SR Tablets, m/r, metformin hydrochloride 500 mg, net price 28-tab pack = £2.66, 56-tab pack = £5.32. Label: 21, 25

Brands include Boliynn® SR, Glucions® SR, Metabex® SR

Dose initially 500 mg once daily, increased every 10–15 days, max. 2 g once daily with evening meal, if control not achieved, use 1 g twice daily with meals, and if control still not achieved change to standard-release tablets.

Note Patients taking up to 2 g daily of the standard-release metformin may start with the same daily dose of metformin modified release, not suitable if dose of standard-release tablets more than 2 g daily.

Glucophage® SR Tablets, m/r, metformin hydrochloride 500 mg, net price 28-tab pack = £2.66, 56-tab pack = £5.32.

750 mg, 28-tab pack = £3.20, 56-tab pack = £6.40; 1 g, 28-tab pack = £4.26, 56-tab pack = £8.52. Label: 21, 25

Dose initially 500 mg once daily, increased every 10–15 days, max. 2 g once daily with evening meal, if control not achieved, use 1 g twice daily with meals, and if control still not achieved change to standard-release tablets.

Note Patients taking up to 2 g daily of the standard-release metformin may start with the same daily dose of Glucophage® SR, not suitable if dose of standard-release tablets more than 2 g daily.

The Scottish Medicines Consortium (p. 4) has advised (September 2009) that Glucophage® SR is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in adult patients who are intolerant of standard-release metformin, and in whom the prolonged-release tablet allows the use of a dose of metformin not previously tolerated, or in patients for whom a once daily preparation offers a clinically significant benefit.

With alogliptin Section 6.1.2.3

With dapagliflozin Section 6.1.2.3

With linagliptin Section 6.1.2.3

With pioglitazone Section 6.1.2.3

With saxagliptin Section 6.1.2.3

With sitagliptin Section 6.1.2.3

With vildagliptin Section 6.1.2.3

Acarbose, an inhibitor of intestinal alpha glucosidases, delays the digestion and absorption of starch and sucrose; it has a small but significant effect in lowering blood glucose. Use of acarbose is usually reserved for when other oral hypoglycaemics are not tolerated or are contra-indicated. Postprandial hyperglycaemia in type 1 diabetes can be reduced by acarbose, but it has been little used for this purpose. Flatulence deters some from using acarbose although this side-effect tends to decrease with time.

Nateglinide and repaglinide stimulate insulin secretion. Both drugs have a rapid onset of action and...
short duration of activity, and should be administered shortly before each main meal. Repaglinide may be given as monotherapy for patients who are not overweight or for those in whom metformin is contra-indicated or not tolerated, or it may be given in combination with metformin. Nateglinide is licensed only for use with metformin.

The thiazolidinedione, pioglitazone, reduces peripheral insulin resistance, leading to a reduction of blood-glucose concentration. Pioglitazone can be used alone or in combination with metformin or with a sulfonylurea (if metformin inappropriate), or with both; the combination of pioglitazone plus metformin is preferred to pioglitazone plus sulfonylurea, particularly for obese patients. Inadequate response to a combination of metformin and sulfonylurea may indicate failing insulin release; the introduction of pioglitazone has a limited role in these circumstances and the initiation of insulin is often more appropriate. Pioglitazone is also licensed in combination with insulin, in patients who have not achieved adequate glycaemic control with insulin alone, when metformin is inappropriate. Blood-glucose control may deteriorate temporarily when pioglitazone is substituted for an oral antidiabetic drug that is being used in combination with another. Long-term benefits of pioglitazone have not yet been demonstrated. NICE (May 2009) has recommended that, when glycaemic control is inadequate with existing treatment, pioglitazone can be added to:

- a sulfonylurea, if metformin is contra-indicated or not tolerated;
- metformin, if risks of hypoglycaemia with sulfonylurea are unacceptable or a sulfonylurea is contra-indicated or not tolerated;
- a combination of metformin and a sulfonylurea, if insulin is unacceptable because of lifestyle or other personal issues, or because the patient is obese.

NICE has recommended that treatment with pioglitazone is continued only if HbA1c concentration is reduced by at least 0.5 percentage points within 6 months of starting treatment.

The Scottish Medicines Consortium (p. 4) accepts use of pioglitazone (February 2007) with metformin and a sulfonylurea, for patients (especially if overweight) whose glycaemic control is inadequate despite the use of 2 oral hypoglycaemic drugs and who are unable or unwilling to take insulin; treatment should be initiated and monitored by an experienced diabetes physician.

**Alogliptin, linagliptin, saxagliptin, sitagliptin, and vildagliptin** inhibit dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion. Linagliptin is licensed for use in type 2 diabetes as monotherapy (if metformin inappropriate), or in combination with metformin (when treatment with metformin alone fails to achieve adequate glycaemic control), or both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). Linagliptin may also be used in combination with insulin (with or without metformin) when a stable dose of insulin has not provided adequate glycaemic control. Saxagliptin and vildagliptin are licensed for use in type 2 diabetes as monotherapy (if metformin inappropriate), or in combination with metformin or a sulfonylurea (if metformin inappropriate), or pioglitazone (when treatment with either metformin or a sulfonylurea or pioglitazone fails to achieve adequate glycaemic control), and also in combination with both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control).

**MHRA/CHM advice**

**Pioglitazone cardiovascular safety**

(December 2007 and January 2011)

Incidence of heart failure is increased when pioglitazone is combined with insulin especially in patients with predisposing factors e.g. previous myocardial infarction. Patients who take pioglitazone should be closely monitored for signs of heart failure; treatment should be discontinued if any deterioration in cardiac status occurs. Pioglitazone should not be used in patients with heart failure or a history of heart failure.

Pioglitazone: risk of bladder cancer (July 2011)

The European Medicines Agency has advised that there is a small increased risk of bladder cancer associated with pioglitazone use. However, in patients who respond adequately to treatment, the benefits of pioglitazone continue to outweigh the risks. Pioglitazone should not be used in patients with active bladder cancer or a past history of bladder cancer, or in those who have uninvestigated macroscopic haematuria. Pioglitazone should be used with caution in elderly patients as the risk of bladder cancer increases with age.

Before initiating treatment with pioglitazone, patients should be assessed for risk factors of bladder cancer (including age, smoking status, exposure to certain occupational or chemotherapy agents, or previous radiation therapy to the pelvic region) and any macroscopic haematuria should be investigated. The safety and efficacy of pioglitazone should be reviewed after 3–6 months and pioglitazone should be stopped in patients who do not respond adequately to treatment. Patients already receiving treatment with pioglitazone should be assessed for risk factors of bladder cancer and treatment should be reviewed after 3–6 months, as above. Patients should be advised to report promptly any haematuria, dysuria, or urinary urgency during treatment.

Alogliptin, linagliptin, saxagliptin, sitagliptin, and vildagliptin inhibit dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion. Linagliptin is licensed for use in type 2 diabetes as monotherapy (if metformin inappropriate), or in combination with metformin (when treatment with metformin alone fails to achieve adequate glycaemic control), or both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). Linagliptin may also be used in combination with insulin (with or without metformin) when a stable dose of insulin has not provided adequate glycaemic control. Saxagliptin and vildagliptin are licensed for use in type 2 diabetes as monotherapy (if metformin inappropriate), or in combination with metformin or a sulfonylurea (if metformin inappropriate), or pioglitazone (when treatment with either metformin or a sulfonylurea or pioglitazone fails to achieve adequate glycaemic control), and also in combination with both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). The combination of either saxagliptin or vildagliptin, and insulin (with or without metformin) is also licensed for use when a stable dose of insulin has not provided adequate glycaemic control. Sitagliptin is licensed for use in type 2 diabetes as monotherapy (if metformin inappropriate), or in combination with metformin or a sulfonylurea (if metformin inappropriate), or pioglitazone (when treatment with either metformin or a sulfonylurea or pioglitazone fails to achieve adequate glycaemic control), and also in combination with both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). Sitagliptin is also licensed for use in combination with both metformin and pioglitazone when dual therapy with these drugs
fails to achieve adequate glycaemic control, and may also be used in combination with insulin (with or without metformin) when a stable dose of insulin has not provided adequate glycaemic control. Alogliptin is licensed for use in type 2 diabetes as dual therapy in combination with either metformin, pioglitazone, a sulfonylurea, or insulin (when treatment with these drugs alone fails to achieve adequate glycaemic control); it is also licensed for use as triple therapy in combination with metformin and either pioglitazone or insulin.

NICE (May 2009) has recommended that, when glycaemic control is inadequate with existing treatment:

- sitagliptin or vildagliptin (instead of a sulfonylurea) can be added to metformin, if there is a significant risk of hypoglycaemia or if a sulfonylurea is contraindicated or not tolerated;
- sitagliptin or vildagliptin can be added to a sulfonylurea, if metformin is contraindicated or not tolerated;
- sitagliptin can be added to both metformin and a sulfonylurea, if insulin is unacceptable because of lifestyle or other personal issues, or because the patient is obese.

NICE has recommended that treatment with sitagliptin or vildagliptin is continued only if HbA1c concentration is reduced by at least 0.5 percentage points within 6 months of starting treatment.

The Scottish Medicines Consortium (p. 4) has advised that vildagliptin (Galvus®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as monotherapy when treatment with metformin or a sulfonylurea is inadequate (December 2012), and in combination with metformin when addition of a sulfonylurea is inappropriate (March 2008), and in combination with a sulfonylurea if metformin is inappropriate (September 2009), and also as triple therapy in combination with metformin and a sulfonylurea, as an alternative to existing dipeptidyl peptidase-4 inhibitors, when treatment with metformin and a sulfonylurea is inadequate (November 2013).

The Scottish Medicines Consortium (p. 4) has advised that linagliptin (Trajento®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as monotherapy when both metformin and a sulfonylurea are inappropriate (January 2013), and in combination with metformin when addition of a sulfonylurea is inappropriate (December 2011), and also in combination with both a sulfonylurea and metformin when dual therapy is ineffective (January 2013).

The Scottish Medicines Consortium (p. 4) has advised that saxagliptin (Onglyza®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as triple therapy in combination with metformin and a sulfonylurea, as an alternative to existing dipeptidyl peptidase-4 inhibitors, when treatment with metformin and a sulfonylurea is inadequate (November 2013).

Exenatide, liraglutide, and lixisenatide bind to, and activate, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppress glucagon secretion, and slow gastric emptying. Treatment with exenatide, liraglutide, and lixisenatide is associated with the prevention of weight gain and possible promotion of weight loss which can be beneficial in overweight patients. They are given by subcutaneous injection for the treatment of type 2 diabetes mellitus.

Exenatide is licensed in combination with metformin or a sulfonylurea, or both, or with pioglitazone, or with both metformin and pioglitazone, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination; standard-release exenatide is also licensed in combination with basal insulin alone or with metformin or pioglitazone (or both).

NICE (May 2009) has recommended that, when glycaemic control is inadequate with metformin and sulfonylurea treatment, the addition of standard-release exenatide may be considered if the patient has:

- a body mass index of 35 kg/m² or over and is of European descent (with appropriate adjustment for other ethnic groups) and weight-related psychological or medical problems or
- a body mass index less than 35 kg/m², and insulin would be unacceptable for occupational reasons or weight loss would benefit other significant obesity-related comorbidities.

NICE has recommended that treatment with standard-release exenatide is continued only if HbA1c concentration is reduced by at least 1 percentage point and a weight loss of at least 3% is achieved within 6 months of starting treatment.

The Scottish Medicines Consortium (p. 4) has advised (June 2007) that standard-release exenatide (Byetta®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin or sulfonylurea (or both), as an alternative to treatment with insulin in patients where treatment with metformin or sulfonylurea (or both) at maximally tolerated doses has been inadequate, and treatment with insulin would be the next option.

The Scottish Medicines Consortium (p. 4) has also advised (February 2011) that standard-release exenatide (Byetta®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin and pioglitazone as a third-line pre-insulin treatment option.
### NICE guidance

**Exenatide modified-release for the treatment of type 2 diabetes mellitus (February 2012)**

Modified-release exenatide in triple therapy regimens (in combination with metformin and a sulphonylurea, or metformin and a thiazolidinedione) is recommended for the treatment of type 2 diabetes, only when glycaemic control is inadequate and the patient has:

- a body mass index (BMI) $\geq 35$ kg/m$^2$ (in those of European descent, with appropriate adjustment for other ethnic groups) and weight-related psychological or medical problems, or
- a BMI $< 35$ kg/m$^2$, and insulin would be unacceptable for occupational reasons, or weight loss would benefit other significant obesity-related comorbidities.

Treatment with modified-release exenatide in a triple therapy regimen should be continued only if HbA$_1c$ concentration is reduced by at least 1 percentage point and a weight loss of at least 3% is achieved within 6 months of starting treatment.

Modified-release exenatide in dual therapy regimens (in combination with metformin or a sulphonylurea) is recommended only if:

- treatment with metformin or a sulphonylurea is contra-indicated or not tolerated, and
- treatment with thiazolidinediones and dipeptidylpeptidase-4 inhibitors is contra-indicated or not tolerated.

Modified-release exenatide in a dual therapy regimen should be continued only if HbA$_1c$ concentration is reduced by at least 1 percentage point within 6 months of starting treatment.

www.nice.org.uk/TA248

---

### NICE guidance

**Liraglutide for the treatment of type 2 diabetes mellitus (October 2010)**

Liraglutide in triple therapy regimens (in combination with metformin and a sulphonylurea, or metformin and a thiazolidinedione) is recommended for the treatment of type 2 diabetes, only when glycaemic control is inadequate, and the patient has:

- a body mass index of 35 kg/m$^2$ or over and is of European descent (with appropriate adjustment for other ethnic groups) and weight-related psychological or medical problems, or
- a body mass index of less than 35 kg/m$^2$, and insulin would be unacceptable for occupational reasons or weight loss would benefit other significant obesity-related comorbidities.

Treatment with liraglutide in a triple therapy regimen should be continued only if HbA$_1c$ concentration is reduced by at least 1 percentage point and a weight loss of at least 3% is achieved within 6 months of starting treatment.

Liraglutide in dual therapy regimens (in combination with metformin or a sulphonylurea) is recommended only if:

- treatment with metformin or a sulphonylurea is contra-indicated or not tolerated, and
- treatment with thiazolidinediones and dipeptidylpeptidase-4 inhibitors is contra-indicated or not tolerated.

Liraglutide, in combination with metformin or a sulphonylurea should be continued only if HbA$_1c$ concentration is reduced by at least 1 percentage point within 6 months of starting treatment.

Liraglutide 1.8 mg daily is not recommended.

www.nice.org.uk/TA203

---

**Lixisenatide** is licensed for the treatment of type 2 diabetes mellitus in combination with oral antidiabetic drugs (e.g. metformin, pioglitazone, or a sulphonylurea) or basal insulin, or both, when adequate glycaemic control has not been achieved with these drugs; lixisenatide should not be used in combination with both basal insulin and a sulphonylurea because of an increased risk of hypoglycaemia.

**Canagliflozin and dapagliflozin** reversibly inhibit sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion. Canagliflozin and dapagliflozin are licensed for use in type 2 diabetes as monotherapy (if metformin inappropriate), or in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control). Dapagliflozin is not recommended in combination with pioglitazone.
ACARBOSE

Indications diabetes mellitus inadequately controlled by diet or by diet with oral antidiabetic drugs

Cautions monitor liver function; may enhance hypoglycaemic effects of insulin and sulfonylureas (hypoglycaemic episodes may be treated with oral glucose but not with sucrose); interactions: Appendix 1 (antidiabetics)

Contra-indications inflammatory bowel disease, predisposition to partial intestinal obstruction; hernia, previous abdominal surgery

Hepatic impairment avoid

Renal impairment avoid if eGFR less than 25 mL/minute/1.73 m²

Pregnancy avoid

Breast-feeding avoid

Side-effects flatulence, soft stools, diarrhoea (may need to reduce dose or withdraw), abdominal dis- tention and pain; rarely, nausea, abnormal liver func-
tion tests and skin reactions; very rarely, ileus, oedema, jaundice, and hepatitis

Note Antacids unlikely to be beneficial for treating side-effects

Dose

- ADULT over 18 years, initially 50 mg daily increased to 50 mg 3 times daily, then increased if necessary after 6–8 weeks to 100 mg 3 times daily; max. 200 mg 3 times daily

Counselling Tablets should be chewed with first mouthful of food or swallowed whole with a little liquid immediately before food. To counteract possible hypoglycaemia, patients receiving insulin or a sulfonylurea as well as acarbose need to carry glucose (not sucrose—acarbose interferes with sucrose absorption)
ADULT. Dose and side-effects
hypoglycaemia (in combination with
avoid—toxicity in
Pregnancy
Renal impairment
Hepatic impairment
manufacturer advises avoid in
severe impairment—no information available.
Renal impairment
monitor renal function at least
twice a year in moderate impairment; avoid initiation
if eGFR less than 60 mL/minute/1.73 m²; reduce
dose to 100 mg once daily if eGFR falls persistently
below 60 mL/minute/1.73 m² and existing canagliflozin
treatment tolerated; avoid if eGFR less than
45 mL/minute/1.73 m²
Pregnancy
avoid—vagility in animal studies
Breast-feeding
avoid—present in milk in animal stud-
ies
Side-effects
constipation, thirst, nausea, dyslipidae-
 mia, urinary-tract infection, hypoglycaemia (in combination
with insulin or sulfonylurea), genital infection,
polyuria, urinary frequency, raised haematocrit; less commonly
postural hypotension, dizziness, syn-
cope, dehydration, hypovolaemia, rash, raised serum creatinine and urea
Dose
• ADULT over 18 years, 100 mg once daily preferably
before breakfast; if necessary and if tolerated, increase
to 300 mg once daily
Note Dose of concomitant insulin or drugs that stimulate
insulin secretion may need to be reduced
Invokana® (Janssen)
Tablets, f/c, canagliflozin 100 mg (yellow), net price
30-tab pack = £39.20; 300 mg (white), 30-tab pack =
£49.99. Counselling, volume depletion, see above
DAPAGLIFLOZIN
Indications see notes above
Cautions determine renal function before treatment
and at least annually thereafter; hypotension;
electrolyte disturbances; cardiovascular disease or elderly (risk of hypotension); raised haematocrit;
interactions: Appendix 1 (anti diabetics)
Volume depletion Correct hypovolaemia before starting treatment. Consider interrupting treatment if volume depletion occurs
Contra-indications ketoacidosis
Hepatic impairment initial dose 5 mg daily in severe impairment, increased according to response; in combination with metformin (Xigduo®); avoid
Renal impairment avoid if eGFR less than 60 mL/
minute/1.73 m² (ineffective)
Pregnancy avoid—vagility in animal studies
Breast-feeding avoid—present in milk in animal stud-
ies
Side-effects hypoglycaemia (in combination with
insulin or sulphonylurea), constipation, dyslipidaemia,
back pain, genital infection, urinary-tract infection,
dysuria, polyuria, thirst, sweating; less commonly
nausea, hypotension, dizziness, rash, nocturia, dehy-
dration, hypovolaemia, raised serum creatinine and urea
Dose
• ADULT over 18 years, 10 mg once daily; ELDERLY over 75 years, initiation not recommended
Note Dose of concomitant insulin or drugs that stimulate
insulin secretion may need to be reduced

Forxiga® (Bristol-Myers Squibb, AstraZeneca)
Tablets, yellow, f/c, dapagliflozin (as propanediol monohydrate) 5 mg, net price 28-tab pack = £36.59; 10 mg, 28-tab pack = £36.59
With metformin
For prescribing information on metformin, see section 6.1.2.2
Xigduo® (Bristol-Myers Squibb, AstraZeneca)
Theft, f/c, brown, dapagliflozin (as propanediol monohydrate) 5 mg, met-
formin hydrochloride 850 mg, net price 56 tab-pack = £36.59. Label: 21
Xigduo® 5 mg/1 g tablets, f/c, yellow, dapagliflozin (as propanediol monohydrate) 5 mg, metformin hydrochloride 1 g, net price 56 tab-pack = £36.59. Label: 21
Dose type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with insulin or other antidiabetic drugs, ADULT over 18 years, 1 tablet twice
daily (based on patient’s current metformin dose), ELDERLY over 75 years, initiation not recommended
Note Dose of concomitant insulin or drugs that stimulate
insulin secretion may need to be reduced

EXENATIDE
Indications see notes above
Cautions elderly; pancreatitis (see below); may cause weight loss greater than 1.5 kg weekly; interactions: Appendix 1 (anti diabetics)
Pancreatitis Severe pancreatitis (sometimes fatal), including haemorrhagic or necrotising pancreatitis, has been reported rarely. Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek prompt medical attention if symptoms such as abdominal pain, nausea, and vomiting develop. Discontinue permanently if pancreatitis is diagnosed
Contra-indications ketoacidosis; severe gastro-intes-
tinal disease
Renal impairment
• for standard-release injection, use with caution if
eGFR 30–50 mL/minute/1.73 m²; avoid if eGFR
less than 30 mL/minute/1.73 m²
• for modified-release injection, avoid if eGFR less
than 50 mL/minute/1.73 m²
Pregnancy avoid—vagility in animal studies. Women of child-bearing age should use effective contra-
ception during treatment with modified-release exen-
ateide and for 12 weeks after discontinuation
Breast-feeding avoid—no information available
Side-effects gastro-intestinal disturbances including
nausea, vomiting, diarrhoea, dyspepsia, abdominal
pain and distension, gastro-oesophageal reflux dis-
ease, increased appetite, weight loss, headache, diz-
ziness, agitation, asthenia, hypoglycaemia, increased
sweating, injection-site reactions, antibody formation;
less commonly pancreatitis (see Cautions above); rarely
alopecia; very rarely anaphylactic reactions; also
reported constipation, flatulence, eructation, dehy-
dration, taste disturbance, renal impairment, drowsi-
ness, rash, pruritus, urticaria, and angioedema
Dose
• By subcutaneous injection, ADULT over 18 years,
initially 5 micrograms twice daily within 1 hour before
2 main meals (at least 6 hours apart), increased if
necessary after at least 1 month to max. 10 micro-
grams twice daily
Counselling If a dose is missed, continue with the next
scheduled dose—do not administer after a meal. Some oral
medications should be taken at least 1 hour before or 4 hours after exenatide injection—consult product literature for details

**Note** Dose of concomitant sulfonylurea may need to be reduced

**Bydureon** (Bristol-Myers Squibb) ▼ (Pen)

**Injection**, exenatide 250 micrograms/mL, net price 5 microgram/dose prefilled pen (60 doses) = £86.24, 10 microgram/dose prefilled pen (60 doses) = £86.24. Label: 10, counselling, administration

**Modified release**

**Bydureon** (Bristol-Myers Squibb) ▼ (Pen)

**Injection**, m/r, powder for reconstitution, exenatide, net price 2 mg vial (with solvent) = £18.34. Label: 10, counselling, administration

**Dose**

By subcutaneous injection, **ADULT** over 18 years, 2 mg once weekly

**Counselling** Patients changing from standard-release exenatide formulation may experience initial transient increase in blood glucose. Some oral medications should be taken at least 1 hour before or 4 hours after exenatide injection—consult product literature for details

**Note** Dose of concomitant sulfonylurea may need to be reduced

**Important** Effect of **Bydureon** may persist for 10 weeks after discontinuation

**LINAGLIPTIN**

**Indications** see notes above

**Cautions** discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); **interactions**: Appendix 1 (antidiabetics)

**Pregnancy** avoid—no information available

**Breast-feeding** avoid—no information available

**Side-effects** less commonly cough, nasopharyngitis; also reported pancreatitis

**Dose**

**ADULT** over 18 years, 5 mg once daily

**Note** Dose of concomitant sulfonylurea or insulin may need to be reduced

**Trajenta**® (Boehringer Ingelheim) ▼ (Tablets)

**Tablets**, light red, f/c, linagliptin 5 mg, net price 28-tab pack = £33.26

**With metformin**

For prescribing information on metformin, see section 6.1.2.2

**Jentadueto**® (Boehringer Ingelheim) ▼ (Tablets)

**Jentadueto**® 2.5 mg/850 mg tablets, f/c, light orange, linagliptin 2.5 mg, metformin hydrochloride 850 mg, net price 56-tab pack = £33.26. Label: 21

**Jentadueto**® 2.5 mg/1 g tablets, f/c, light pink, linagliptin 2.5 mg, metformin hydrochloride 1 g, net price 56-tab pack = £33.26. Label: 21

**Dose**

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or insulin, **ADULT** over 18 years, 1 Jentadueto® tablet twice daily (based on patient’s current metformin dose)

**Note** Dose of concomitant sulfonylurea or insulin may need to be reduced

**LIRAGLUTIDE**

**Indications** see notes above

**Cautions** discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); **interactions**: Appendix 1 (antidiabetics)

**Contra-indications** ketoacidosis; inflammatory bowel disease; diabetic gastroparesis

**Hepatic impairment** avoid—limited experience

**Renal impairment** avoid if eGFR less than 60 mL/minute/1.73 m²—limited experience

**Pregnancy** avoid—toxicity in animal studies

**Breast-feeding** avoid—no information available

**Side-effects** gastro-intestinal disturbances including nausea, vomiting, constipation, diarrhoea, dyspepsia, abdominal pain and distension, flatulence, gastritis, gastro-oesophageal reflux disease, decreased appetite; headache, dizziness, fatigue, fever, bronchitis, nasopharyngitis; hypoglycaemia; injection site reactions; also reported acute pancreatitis, thyroid neonplasia, goitre, increased blood calcitonin, angioedema

**Dose**

By subcutaneous injection, **ADULT** over 18 years, initially 0.6 mg once daily, increased after at least 1 week to 1.2 mg once daily, further increased if necessary after an interval of at least 1 week to max. 1.8 mg once daily

**Note** Dose of concomitant sulfonylurea may need to be reduced

**Victoza**® (Novo Nordisk) ▼ (Pen)

**Injection**, liraglutide 6 mg/mL, net price 2 × 3 mL prefilled pens = £78.48, 3 × 3 mL prefilled pens = £117.72. Counselling, administration

**LIXISENATIDE**

**Indications** see notes above

**Cautions** discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); **interactions**: Appendix 1 (antidiabetics)

**Contra-indications** ketoacidosis; severe gastro-intestinal disease

**Renal impairment** use with caution if eGFR 30–50 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²—no information available

**Pregnancy** avoid—toxicity in animal studies; women of child-bearing age should use effective contraception

**Breast-feeding** avoid—no information available

**Side-effects** nausea, vomiting, diarrhoea, dyspepsia, palpitation, headache, dizziness, drowsiness, hypoglycaemia, injection-site reactions; less commonly tachycardia, urticaria

**Dose**

By subcutaneous injection, **ADULT** over 18 years, initially 10 micrograms once daily within 1 hour before the first meal of the day or the evening meal for 14 days, increased to 20 micrograms once daily thereafter

**Counselling** If a dose is missed, inject within 1 hour before the next meal—do not administer after a meal. Some oral medications should be taken at least 1 hour before or 4 hours after lixisenatide injection—consult product literature for details

**Note** Dose of concomitant sulfonylurea or insulin may need to be reduced

**Lyxumia**® (Sanofi-Aventis) ▼ (Pen)

**Injection**, 50 micrograms/mL, net price 10 micrograms/dose prefilled pen (14 doses) = £27.07; 100 micrograms/mL, 20 micrograms/dose prefilled pen (14 doses) × 2 = £54.14; treatment initiation pack, 10 micrograms/dose prefilled pen and 20 micrograms/dose prefilled pen = £54.14. Label: 10, counselling, administration
**NATEGLINIDE**

**Indications** type 2 diabetes mellitus in combination with metformin (section 6.1.2.2) when metformin alone inadequate

**Cautions** substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery (omit nateglinide on morning of surgery and recommence when eating and drinking normally); elderly, debilitated and malnourished patients; **interactions**: Appendix 1 (antidiabetics)

**Contra-indications** ketoacidosis

**Hepatic impairment** caution in moderate hepatic impairment; avoid in severe impairment—no information available

**Pregnancy** avoid—**toxicity** in animal studies

**Breast-feeding** avoid—presence in milk in animal studies

**Side-effects** hypoglycaemia; hypersensitivity reactions including pruritus, rashes and urticaria

**Dose**
- **ADULT** over 18 years, initially 60 mg 3 times daily within 30 minutes before main meals, adjusted according to response up to max. 180 mg 3 times daily

**Starlix**
- Tablets, f/c, nateglinide 60 mg (pink), net price 84-tab pack = £22.71; 120 mg (yellow), 84-tab pack = £25.88; 180 mg (red), 84-tab pack = £25.88

**Note** former marketed as NovoNorm

---

**PIOGLITAZONE**

**Indications** type 2 diabetes mellitus (alone or combined with metformin or a sulfonylurea, or with both, or with insulin—see also notes above)

**Cautions** monitor liver function (see below); cardiovascular disease or in combination with insulin (risk of heart failure—see MHRA/CHM advice p. 467); substitute insulin during peri-operative period (omit pioglitazone on morning of surgery and recommence when eating and drinking normally); increased risk of bone fractures, particularly in women; avoid in acute porphyria (but see section 9.8.2); risk factors for bladder cancer (see Risk of Bladder Cancer, p. 467); elderly (increased risk of heart failure, fractures, and bladder cancer); **interactions**: Appendix 1 (antidiabetics)

**Liver toxicity** Rare reports of liver dysfunction; monitor liver function before treatment, and periodically thereafter; advise patients to seek immediate medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue and dark urine develop; discontinue if jaundice occurs

**Contra-indications** history of heart failure; uninvestigated macroscopic haematuria, previous or active bladder cancer

**Hepatic impairment** avoid; see also Cautions above

**Pregnancy** avoid—**toxicity** in animal studies

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** abdominal pain, diarrhoea, constipation, nausea, vomiting; rarely hypoglycaemia, hypersensitivity reactions including pruritus, rashes, vasculitis, urticaria, and visual disturbances

**Dose**
- **ADULT** over 18 years, initially 500 micrograms within 30 minutes before main meals (1 mg if transferring from another oral hypoglycaemic), adjusted according to response at intervals of 1–2 weeks; up to 4 mg may be given as a single dose, max. 16 mg daily; **ELDERLY** over 75 years, not recommended

**Replaglinide**
- Tablets, f/c, pioglitazone (as hydrochloride) 15 mg, metformin hydrochloride 850 mg, net price 56-tab pack = £35.89. Label: 21
- **Dose** ADULT over 18 years, type 2 diabetes not controlled by metformin alone, 1 tablet twice daily

**Note** titration with the individual components (pioglitazone and metformin) desirable before initiating Competact®

---

**Dose**
- **ADULT** over 18 years, initially 15–30 mg once daily increased to 45 mg once daily according to response, (ELDERLY, initiate with lowest possible dose and increase gradually); review treatment after 3–6 months and regularly thereafter

**Note** Dose of concomitant sulfonylurea or insulin may need to be reduced

**Pioglitazone** (Non-proprietary)

**Tablets**, pioglitazone (as hydrochloride) 15 mg, net price 28-tab pack = £1.29; 30 mg, 28-tab pack = £1.57; 45 mg, 28-tab pack = £1.79

**Actos** (Takeda)

**Tablets**, pioglitazone (as hydrochloride) 15 mg, net price 28-tab pack = £25.83; 30 mg, 28-tab pack = £35.89; 45 mg, 28-tab pack = £93.55

---

**With metformin**

For prescribing information on metformin, see section 6.1.2.2

**Competact** (Takeda)

**Tablets**, f/c, pioglitazone (as hydrochloride) 15 mg, metformin hydrochloride 850 mg, net price 56-tab pack = £35.89. Label: 21

**Dose** ADULT over 18 years, type 2 diabetes not controlled by metformin alone, 1 tablet twice daily

**Note** Titration with the individual components (pioglitazone and metformin) desirable before initiating Competact®

---

**REPLAGLINIDE**

**Indications** type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate)

**Cautions** substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery (omit repaglinide on morning of surgery and recommence when eating and drinking normally); debilitated and malnourished patients; **interactions**: Appendix 1 (antidiabetics)

**Contra-indications** ketoacidosis

**Hepatic impairment** avoid in severe liver disease

**Renal impairment** use with caution

**Pregnancy** avoid

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** hypoglycaemia, weight gain, oedema, anaemia, headache, visual disturbances, dizziness, arthralgia, hypoaesthesia, haematuria, impotence; less commonly hypoglycaemia, fatigue, insomnia, vertigo, sweating, altered blood lipids, proteinuria, bladder cancer; see also Liver Toxicity above

**Dose**
- **ADULT** over 18 years, initially 500 micrograms within 30 minutes before main meals; (1 mg if transferring from another oral hypoglycaemic), adjusted according to response at intervals of 1–2 weeks; up to 4 mg may be given as a single dose, max. 16 mg daily; **ELDERLY** over 75 years, not recommended

**Replaglinide** (Non-proprietary)

**Tablets**, repaglinide 500 micrograms, net price 30-tab pack = £2.67, 90-tab pack = £8.70; 1 mg, 30-tab pack = £2.82, 90-tab pack = £9.08; 2 mg, 90-tab pack = £5.74

**Prandin** (Takeda)

**Tablets**, repaglinide 500 micrograms, net price 30-tab pack = £3.92, 90-tab pack = £11.76; 1 mg (yellow), 30-tab pack = £3.92, 90-tab pack = £11.76; 2 mg (peach), 90-tab pack = £11.76

Formerly marketed as NovoNorm®
Endocrine system

6.1.2 Antidiabetic drugs

**SAXAGLIPTIN**

**Indications** see notes above

**Cautions** elderly; determine renal function before treatment and periodically thereafter; discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors

**Hepatic impairment** use with caution in moderate impairment; avoid in severe impairment

**Renal impairment** reduce dose to 2.5 mg once daily in moderate to severe impairment; use with caution in severe impairment

**Pregnancy** avoid unless essential—toxicity in animal studies

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** vomiting, dyspepsia, gastritis; peripheral oedema; headache, dizziness, fatigue; upper respiratory tract infection, urinary tract infection, gastroenteritis, sinuitis, nasopharyngitis; hypoglycaemia, myalgia; less commonly dyslipidaemia, hypertriglyceridaemia, pancreatitis, erectile dysfunction, arthralgia, hypersensitivity reactions (including anaphylaxis); also reported rash

**Dose**  
- **ADULT** over 18 years, 5 mg once daily  
- **Note** Dose of concomitant sulfonylurea or insulin may need to be reduced

**Onglyza**® (Bristol-Myers Squibb) (Pom) Tablets, f/c, saxagliptin (as hydrochloride) 2.5 mg (yellow), net price 28-tab pack = £31.60; 5 mg (pink), net price 28-tab pack = £31.60

**With metformin** For prescribing information on metformin, see section 6.1.2.2

**Komboglyze**® (Bristol-Myers Squibb, AstraZeneca) (Pom) Komboglyze® 2.5 mg/850 mg tablets, f/c, brown, saxagliptin (as hydrochloride) 2.5 mg, metformin hydrochloride 850 mg, net price 56-tab pack = £31.60. Label: 21

Komboglyze® 2.5 mg/1 g tablets, f/c, yellow, saxagliptin (as hydrochloride) 2.5 mg, metformin hydrochloride 1 g, net price 56-tab pack = £31.60. Label: 21

**Dose** type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or pioglitazone or insulin, **ADULT** over 18 years, 1 tablet twice daily (based on patient’s current metformin dose)  
- **Note** Dose of concomitant sulfonylurea or insulin may need to be reduced

The Scottish Medicines Consortium (p. 4) has advised (May 2013) that Komboglyze® is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in patients unable to achieve adequate glycaemic control with metformin alone and when the addition of a sulfonylurea is inappropriate

**VILDAGLIPTIN**

**Indications** see notes above

**Cautions** monitor liver function (see below); manufacturer advises avoid in severe heart failure—no information available; discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); **interactions:** Appendix 1 (antidiabetics)

**Liver toxicity** Rare reports of liver dysfunction; monitor liver function before treatment and every 3 months for first year and periodically thereafter; advise patients to seek prompt medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue, and dark urine develop, discontinue if jaundice or other signs of liver dysfunction occur

**Contra-indications** ketoacidosis

**Hepatic impairment** avoid; see also Cautions above

**Renal impairment** reduce dose to 50 mg once daily if eGFR less than 50 mL/minute/1.73 m²

**Pregnancy** avoid—toxicity in animal studies

**Breast-feeding** avoid—present in milk in animal studies

**Sitagliptin**

**Indications** see notes above

**Cautions** discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** ketoacidosis

**Indications** see notes above

**Cautions** discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** ketoacidosis

**Indications** see notes above

**Cautions** elderly; determine renal function before treatment and periodically thereafter; discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors

**Hepatic impairment** use with caution in moderate impairment; avoid in severe impairment

**Renal impairment** reduce dose to 2.5 mg once daily in moderate to severe impairment; use with caution in severe impairment

**Pregnancy** avoid unless essential—toxicity in animal studies

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** vomiting, dyspepsia, gastritis; peripheral oedema; headache, dizziness, fatigue; upper respiratory tract infection, urinary tract infection, gastroenteritis, sinuitis, nasopharyngitis; hypoglycaemia, myalgia; less commonly dyslipidaemia, hypertriglyceridaemia, pancreatitis, erectile dysfunction, arthralgia, hypersensitivity reactions (including anaphylaxis); also reported rash

**Dose**  
- **ADULT** over 18 years, 5 mg once daily  
- **Note** Dose of concomitant sulfonylurea or insulin may need to be reduced

**Onglyza**® (Bristol-Myers Squibb) (Pom) Tablets, f/c, saxagliptin (as phosphate monohydrate) 25 mg (pink), net price 28-tab pack = £33.26; 50 mg (light beige), 28-tab pack = £33.26; 100 mg (beige), 28-tab pack = £33.26

The Scottish Medicines Consortium (p. 4) has advised (June 2010) that Januvia® is accepted for restricted use within NHS Scotland as monotherapy, to improve glycaemic control in patients with type 2 diabetes mellitus, for whom both metformin and sulfonylureas are not appropriate

**With metformin** For prescribing information on metformin, see section 6.1.2.2

**Janumet**® (MSD) (Pom) Tablets, f/c, red, sitagliptin 50 mg, metformin hydrochloride 1 g, net price 56-tab pack = £33.26. Label: 21

**Dose** type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or pioglitazone or insulin, **ADULT** over 18 years, 1 tablet twice daily  
- **Note** Dose of concomitant sulfonylurea or insulin may need to be reduced

The Scottish Medicines Consortium (p. 4) has advised (July 2008) that Janumet® is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus when the addition of a sulfonylurea to metformin is not appropriate; it is also accepted for use in NHS Scotland in combination with a sulfonylurea in patients inadequately controlled on maximum tolerated doses of metformin and a sulfonylurea.

**Sitagliptin**

**Indications** see notes above

**Cautions** monitor liver function (see below); manufacturer advises avoid in severe heart failure—no information available; discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); **interactions:** Appendix 1 (antidiabetics)

**Liver toxicity** Rare reports of liver dysfunction; monitor liver function before treatment and every 3 months for first year and periodically thereafter; advise patients to seek prompt medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue, and dark urine develop, discontinue if jaundice or other signs of liver dysfunction occur

**Contra-indications** ketoacidosis

**Hepatic impairment** avoid; see also Cautions above

**Renal impairment** reduce dose to 50 mg once daily if eGFR less than 50 mL/minute/1.73 m²

**Pregnancy** avoid—toxicity in animal studies

**Breast-feeding** avoid—present in milk in animal studies
6.1.3 Diabetic ketoacidosis

The management of diabetic ketoacidosis involves the replacement of fluid and electrolytes and the administration of insulin. Guidelines for the Management of Diabetic Ketoacidosis in Adults, published by the Joint British Diabetes Societies Inpatient Care Group, should be followed.

- To restore circulating volume if systolic blood pressure is below 90 mmHg (adjusted for age, sex, and medication as appropriate), give 500 mL sodium chloride 0.9% by intravenous infusion over 10–15 minutes; repeat if blood pressure remains below 90 mmHg and seek senior medical advice.

- When blood pressure is over 90 mmHg, sodium chloride 0.9% should be given by intravenous infusion at a rate that replaces deficit and provides maintenance; see guideline for suggested regimen.

- Include potassium chloride in the fluids unless anuria is suspected; adjust according to plasma-potassium concentration (measure at 60 minutes, 2 hours, and 2 hourly thereafter; measure hourly if outside the normal range).

- Start an intravenous insulin infusion: soluble insulin should be diluted (and mixed thoroughly) with sodium chloride 0.9% intravenous infusion to a concentration of 1 unit/mL; infuse at a fixed rate of 0.1 units/kg/hour.

- Established subcutaneous therapy with long-acting insulin analogues (insulin detemir or insulin glargine) should be continued during treatment of diabetic ketoacidosis.

- Monitor blood-ketone and blood-glucose concentrations hourly and adjust the insulin infusion rate accordingly. Blood-ketone concentration should fall by at least 0.5 mmol/litre/hour and blood-glucose concentration should fall by at least 3 mmol/litre/hour.

- Once blood-glucose concentration falls below 14 mmol/litre, glucose 10% should be given by intravenous infusion (into a large vein through a large-gauge needle) at a rate of 125 mL/hour, in addition to the sodium chloride 0.9% infusion.

- Continue insulin infusion until blood-ketone concentration is below 0.3 mmol/litre, blood pH is above 7.3 and the patient is able to eat and drink; ideally give subcutaneous fast-acting insulin and a meal, and stop the insulin infusion 1 hour later.

For the management of diabetic ketoacidosis in children under 18 years, see BNF for Children. The management of hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion are usually necessary and slower rehydration may be required.

6.1.4 Treatment of hypoglycaemia

Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. Approximately 10 g of glucose is available from non-diet versions of Lucozade® Energy Original 55 mL, Coca-Cola® 100 mL, Ribena® Blackcurrant 19 mL (to be diluted), 2 teaspoons of sugar, and also from 3 sugar lumps®. If necessary this may be repeated in 10–15 minutes. After initial treatment, a snack providing sustained availability of carbohydrate (e.g. a sandwich, fruit, milk, or biscuits) or the next meal, if it is due, can prevent blood-glucose concentration from falling again.

Hypoglycaemia which causes unconsciousness is an emergency. Glucagon, a polypeptide hormone produced by the alpha cells of the islets of Langerhans, increases plasma-glucose concentration by mobilising glycogen stored in the liver. In hypoglycaemia, if sugar cannot be given by mouth, glucagon can be given by injection. Carbohydrates should be given as soon as possible to restore liver glycogen; glucagon is not appropriate for chronic hypoglycaemia. Glucagon may be available on prescription for the patient to keep to hand in case of hypoglycaemia.

2. Proprietary products of quick-acting carbohydrate (e.g. GlucoGel®, Dextrose®, GSF Syrup®, Rapilose® gel) are available on prescription for the patient to keep to hand in case of hypoglycaemia.
be issued to close relatives of insulin-treated patients for emergency use in hypoglycaemic attacks. It is often advisable to prescribe on an ‘if necessary’ basis to hospitalised insulin-treated patients, so that it may be given rapidly by the nurses during an hypoglycaemic emergency. If not effective in 10 minutes intravenous glucose should be given.

Alternatively, 50 mL of glucose intravenous infusion 20% (section 9.2.2) may be given intravenously into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs. Glucose intravenous infusion 10% may also be used but larger volumes are needed. Glucose intravenous infusion 50% is not recommended because of the higher risk of extravasation injury and because administration is difficult. Close monitoring is necessary in the case of an overdose with a long-acting insulin because further administration of glucose may be required. Patients whose hypoglycaemia is caused by an oral antidiabetic drug should be transferred to hospital because the hypoglycaemic effects of these drugs may persist for many hours.

For advice on the emergency management of hypoglycaemia in dental practice, see p. 29.

### Glucagon

**Indications**
- see notes above and under Dose

**Cautions**
- see notes above, insulinoma, glucagonoma; ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency.

**Contra-indications**
- pheochromocytoma

**Side-effects**
- nausea, vomiting, abdominal pain, hypokalaemia, hypotension, rarely hypersensitivity reactions

**Dose**
- Insulin-induced hypoglycaemia, by subcutaneous or intramuscular injection, adult and child over 8 years (or body-weight over 25 kg), 1 mg; child under 8 years (or body-weight under 25 kg), 500 micrograms; if no response within 10 minutes intravenous glucose must be given
- Diagnostic aid, consult product literature
- Beta-blocker poisoning, see p. 39

**Note**
- 1 unit of glucagon = 1 mg of glucagon

**Glucagon® HypoKit** (Novo Nordisk)

**Injection**
- powder for reconstitution, glucagon (rys) as hydrochloride with lactose, net price 1-mg vial with prefilled syringe containing water for injection = £11.52

### Chronic Hypoglycaemia

Diazoxide, administered by mouth, is useful in the management of patients with chronic hypoglycaemia from excess endogenous insulin secretion, either from an islet cell tumour or islet cell hyperplasia. It has no place in the management of acute hypoglycaemia.

### Diazoxide

**Indications**
- chronic intractable hypoglycaemia

**Cautions**
- impaired cardiac or cerebral circulation; heart failure; aortic coarctation; aortic stenosis; arteriovenous shunt; monitor blood pressure; hyper-
Duloxetine (p. 259) is effective for the treatment of painful diabetic neuropathy; amitriptyline (p. 250) [unlicensed use] can be used if duloxetine is ineffective or unsuitable. Nortriptyline (p. 252) [unlicensed] may be better tolerated than amitriptyline. If treatment with amitriptyline or duloxetine is inadequate, treatment with pregabalin (p. 304) should be tried. Combination therapy of duloxetine or amitriptyline with pregabalin can be used if monotherapy at the maximum tolerated dose does not control symptoms.

Neuropathic pain may respond to opioid analgesics. There is evidence of efficacy for tramadol (p. 290), morphine (p. 286), and oxycodone (p. 287); however, treatment with morphine or oxycodone should be initiated only under specialist supervision. Tramadol can be prescribed while the patient is waiting for assessment by a specialist if other treatments have been unsuccessful.

Gabapentin (p. 303) and carbamazepine (p. 300) are sometimes used for the treatment of neuropathic pain. Capsaicin cream 0.075% (p. 738) is licensed for painful diabetic neuropathy and may have some effect, but it produces an intense burning sensation during the initial treatment period.

In autonomic neuropathy diabetic diarrhoea can often be managed by 2 or 3 doses of tetracycline 250 mg [unlicensed use] (p. 375). Otherwise codeine (p. 59) is the best drug, but other antidiarrhoeal preparations can be tried. Erythromycin (especially when given intravenously) may be beneficial for gastroparesis [unlicensed use] (p. 375). Otherwise tetracycline managed by 2 or 3 doses.

For the management of postural hypotension, see section 13.12.

In some patients with neuropathic oedema, ephedrine hydrochloride [unlicensed use] 30–60 mg 3 times daily offers effective relief.

For the management of erectile dysfunction, see section 7.4.5.

### 6.1.6 Diagnostic and monitoring devices for diabetes mellitus

#### Blood monitoring

Blood glucose monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia. Patients should be properly trained in the use of blood glucose monitoring systems and to take appropriate action on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

1. Meter no longer available
2. Free of charge from diabetes healthcare professionals
Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen.

Self-monitoring of blood-glucose concentration is appropriate for patients with type 2 diabetes:

- who are treated with insulin;
- who are treated with oral hypoglycaemic drugs e.g. sulfonylureas, to provide information on hypoglycaemia;
- to monitor changes in blood-glucose concentration resulting from changes in lifestyle or medication, and during intercurrent illness;
- to ensure safe blood-glucose concentration during activities, including driving.

### Note
In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used.

It is advisable to check that the meter is pre-set in the correct units.

If the patient is unwell and diabetic ketoacidosis is suspected, blood ketones should be measured according to local guidelines (section 6.1.3). Patients and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

### Urinalysis
Reagent strips are available for measuring for glucose in the urine. Tests for ketones by patients are rarely

Albustix® (Siemens)
Reagent strips, for detection of protein in urine. Net price 50-strip pack = £4.10

Medi-Test® Protein 2 (BHR)
Reagent strips, for detection of protein in urine. Net price 50-strip pack = £3.27

*Other reagent strips available for urinalysis include:*

Combur-3 Test® (glucose and protein—Roche Diagnostics)
Clinitek Microalbumin® (albumin and creatinine—Siemens)
Ketodiatix® (glucose and ketones—Bayer Diagnostics)
Medi-Test Combi® (glucose and protein—BHR)
Micral-Test II® (albumin—Roche Diagnostics)
Microalbuminstix® (albumin and creatinine—Siemens)
Uristix® (glucose and protein—Siemens)

**Oral glucose tolerance test**

The oral glucose tolerance test is used mainly for diagnosis of impaired glucose tolerance; it is not recommended or necessary for routine diagnostic use when severe symptoms of hyperglycaemia are present. In patients who have less severe symptoms and blood glucose levels that do not establish or exclude diabetes (e.g. impaired fasting glycaemia), an oral glucose tolerance test may be required. It is also used to establish the presence of gestational diabetes. The oral glucose tolerance test generally involves giving anhydrous glucose 75 g (equivalent to Glucose BP 82.5 g) by mouth to the fasting patient, and measuring blood-glucose concentrations at intervals.

The appropriate amount of glucose should be given with 200–300 mL fluid. Anhydrous glucose 75 g may alternatively be given as 113 mL Polycat® with extra fluid to administer a total volume of 200–300 mL, or as Rapi-lose® OGTT oral solution.

**6.2 Thyroid and antithyroid drugs**

**6.2.1 Thyroid hormones**

**6.2.2 Antithyroid drugs**

Thyroid hormones are used in hypothyroidism (myxoedema), and also in diffuse non-toxic goitre, Hashimoto's thyroiditis (lymphadenoid goitre), and thyroid carcinoma. Neonatal hypothyroidism requires prompt treatment for normal development. Levothyroxine sodium (thyroxine sodium) is the treatment of choice for maintenance therapy.

In infants and children with congenital hypothyroidism and juvenile myxoedema, the dose of levothyroxine should be titrated according to clinical response, growth assessment, and measurements of plasma thyroxine and thyroid-stimulating hormone. See BNF for Children (section 6.2.1) for suitable dosage regimens.

Liothyronine sodium has a similar action to levothyroxine but is more rapidly metabolised and has a more rapid effect; 20–25 micrograms is equivalent to 100 micrograms of levothyroxine. Its effects develop after a few hours and disappear within 24 to 48 hours of discontinuing treatment. It may be used in severe hypothyroid states when a rapid response is desired.

Liothyronine by intravenous injection is the treatment of choice in hypothyroid coma. Adjunctive therapy includes intravenous fluids, hydrocortisone, and treatment of infection; assisted ventilation is often required.

**LEVOTHYROXINE SODIUM**

(Thyroxine sodium)

**Indications** hypothyroidism; see also notes above

**Cautions** panhypopituitarism or predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine), elderly, cardiovascular disorders (including hypertension, myocardial insufficiency or myocardial infarction, see Initial Dosage below), long-standing hypothyroidism, diabetes insipidus, diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased); inter-actions: Appendix 1 (thyroid hormones)

**Initial dosage** Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia. If metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose

**Contra-indications** thyrotoxicosis

**Pregnancy** levothyroxine may cross the placenta; excessive or insufficient maternal thyroid hormones can be detrimental to fetus; levothyroxine require-
ment may increase during pregnancy; assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levothyroxine).

**Breast-feeding** amount too small to affect tests for neonatal hypothyroidism.

**Side-effects** usually at excessive dosage (see Initial Dosage above) include diarrhoea, vomiting, anginal pain, arthralgias, palpitation, tachycardia, tremor, restlessness, excitability, insomnia; headache, flushing, sweats, fever, heat intolerance, weight-loss, muscle cramp, and muscular weakness; transient hair loss in children; hypersensitivity reactions including rash, pruritus and oedema also reported.

**Dose**

- **ADULT** over 18 years, initially 50–100 micrograms once daily, preferably taken at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication, adjusted in steps of 25–50 micrograms every 3–4 weeks according to response (usual maintenance dose 100–200 micrograms once daily); in cardiac disease, severe hypothroidism, and patients over 50 years, initially 25 micrograms once daily, adjusted in steps of 25 micrograms every 4 weeks according to response (usual maintenance dose 50–200 micrograms once daily); **CHILD** under 18 years see BNF for Children (section 6.2.1).

- **Congenital** hypothryoidism and juvenile myxoedema, see BNF for Children (section 6.2.1).

**Levothyroxine (Non-proprietary)** (Thyroxine)

**Tablets**, levothyroxine sodium 25 micrograms, net price 28-tab pack = £2.58; 50 micrograms, 28-tab pack = £1.76; 100 micrograms, 28-tab pack = £1.76. Brands include Eltroxin®.

**Oral solution**, levothyroxine sodium 25 micrograms/5 mL, net price 100 mL = £52.83; 50 micrograms/5 mL, 100 mL = £58.80; 100 micrograms/5 mL, 100 mL = £84.72.

**LIOTHYRONINE SODIUM** (L-Tri-iodothyronine sodium)

**Indications** see notes above.

**Cautions** see under Levothyroxine Sodium; interactions: Appendix 1 (thyroid hormones).

**Contra-indications** see under Levothyroxine Sodium.

**Pregnancy** does not cross the placenta in significant amounts; excessive or insufficient maternal thyroid hormones can be detrimental to fetus; liothyronine requirement may increase during pregnancy; assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of liothyronine).

**Breast-feeding** amount too small to affect tests for neonatal hypothyroidism.

**Side-effects** see under Levothyroxine Sodium.

**Dose**

- **By mouth**, initially 10–20 micrograms daily gradually increased to 60 micrograms daily in 2–3 divided doses; **ELDERLY** smaller initial doses; **CHILD**, adult dose reduced in proportion to body-weight.

- **By slow intravenous injection**, hypothryoid coma, 5–20 micrograms repeated every 12 hours or as often as every 4 hours if necessary; alternatively initially 50 micrograms then 25 micrograms every 8 hours reducing to 25 micrograms twice daily.

**Liothyronine sodium** (Non-proprietary) (Total)

**Important** Patients switched to a different brand should be monitored (particularly if pregnant or if heart disease present) as brands without a UK licence may not be bioequivalent and dose adjustment may be necessary; pregnant women or those with heart disease should undergo an early review of thyroid status, and other patients should have thyroid function assessed if experiencing a significant change in symptoms. If liothyronine is continued long-term, thyroid function tests should be repeated 1–2 months after any change in brand.

**Injection**, powder for reconstitution, liothyronine sodium, net price 20-microgram vial = £22.50.

### 6.2.2 Antithyroid drugs

Antithyroid drugs are used for hyperthyroidism either to prepare patients for thyroidectomy or for long-term management. In the UK carbimazole is the most commonly used drug. Propylthiouracil should be reserved for patients who are intolerant of carbimazole or for those who experience sensitivity reactions to carbimazole (sensitivity is not necessarily displayed to both drugs), and for whom other treatments are inappropriate. Both drugs act primarily by interfering with the synthesis of thyroid hormones.

**Neutropenia and agranulocytosis**

Doctors are reminded of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.

1. **Patient** should be asked to report symptoms and signs suggestive of infection, especially sore throat.
2. A white blood cell count should be performed if there is any clinical evidence of infection.
3. Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.

Carbimazole is given in a dose of 15 to 40 mg daily; higher doses should be prescribed under specialist supervision only. This dose is continued until the patient becomes euthyroid, usually after 4 to 6 weeks and the dose is then gradually reduced to a maintenance dose of 5 to 15 mg. Therapy is usually given for 12 to 18 months. Treatment in children should be undertaken by a specialist, see BNF for Children. Rashes and pruritus are common but they can be treated with antihistamines without discontinuing therapy; alternatively propylthiouracil can be substituted. All patients should be advised to report any sore throat immediately because of the rare complication of agranulocytosis (see Neutropenia and Agranulocytosis, above).

Propylthiouracil is given in a dose of 200 to 400 mg daily in divided doses in adults and this dose is maintained until the patient becomes euthyroid; the dose may then be gradually reduced to a maintenance dose of 50 to 150 mg daily in divided doses. Over-treatment with antithyroid drugs can result in the rapid development of hypothyroidism and should be avoided particularly during pregnancy because it can cause fetal goitre.
A combination of carbimazole, 40 to 60 mg daily with levothyroxine, 50 to 150 micrograms daily, may be used in a blocking-replacement regimen; therapy is usually given for 18 months. The blocking-replacement regimen is not suitable during pregnancy.

Iodine has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide (¹³¹I) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroidectomy.

Propranolol is useful for rapid relief of thyrotoxic symptoms and may be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism. Propranolol has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol but nadolol is also used. For doses and preparations of beta-blockers see section 2.4.

Thyrotoxic crisis (‘thyroid storm’) requires emergency treatment with intravenous administration of fluids, propranolol (5 mg) and hydrocortisone (100 mg every 6 hours, as sodium succinate), as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

Pregnancy Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen (see above) is not suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate, therefore propylthiouracil remains the drug of choice during the first trimester of pregnancy. In the second trimester, consider switching to carbimazole because of the potential risk of hepatoxicity with propylthiouracil. Both propylthiouracil and carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy).

Breast-feeding Carbimazole and propylthiouracil are present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used.

**CARBIMAZOLE**

**Indications** hyperthyroidism

**Contra-indications** severe blood disorders

**Hepatic impairment** use with caution in mild to moderate impairment; avoid in severe impairment

**Pregnancy** neonatal goitre and hypothyroidism; has been associated with congenital defects including aplasia cutis of the neonate; see also notes above

**Breast-feeding** amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used; see also notes above

**Side-effects** nausea, mild gastro-intestinal disturbances, taste disturbance, headache, fever, malaise, rash, pruritus, arthralgia; rarely myopathy, alopecia, bone marrow suppression (including pancytopenia and agranulocytosis, see Neutropenia and Agranulocytosis above), and jaundice.

Counselling Warn patient to tell doctor immediately if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops

**Dose**

- See notes above

**Carbimazole** (Non-proprietary) (Pott)

- Tablets, carbimazole 5 mg, net price 100-tab pack = £45.67; 20 mg, 100-tab pack = £112.86. Counselling, blood disorder symptoms

**IODINE AND IODIDE**

**Indications** thyrotoxicosis (pre-operative)

**Cautions** children; not for long-term treatment

**Pregnancy** neonatal goitre and hypothyroidism; see also notes above

**Breast-feeding** stop breast-feeding; danger of neonatal hypothyroidism or goitre; appears to be concentrated in milk; see also notes above

**Side-effects** hypersensitivity reactions including corneal-like symptoms, headache, lacrimation, conjunctivitis, pain in salivary glands, laryngitis, bronchitis, rashes; on prolonged treatment depression, insomnia, impotence; goitre in infants of mothers taking iodides

**Dose**

- See under preparation

**Aqueous Iodine Oral Solution**

- Oral solution, iodine 5%, potassium iodide 10% in purified water, freshly boiled and cooled, total iodine 130 mg/mL, net price 500 mL = £9.40. Label: 27

**Dose** 0.1–0.3 mL 3 times daily well diluted with milk or water

**PROPYLTHIOURACIL**

**Indications** hyperthyroidism

**Cautions** monitor for hepatotoxicity

**Hepatotoxicity** Severe hepatic reactions have been reported, including fatal cases and cases requiring liver transplant—discontinue if significant liver-enzyme abnormalities develop.

Counselling Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, or pruritus develop

**Hepatic impairment** reduce dose (see also Hepatotoxicity above)

**Renal impairment** use three-quarters normal dose if eGFR 10–50 mL/minute/1.73 m²; use half normal dose if eGFR less than 10 mL/minute/1.73 m²

**Pregnancy** neonatal goitre and hypothyroidism; see also notes above

**Breast-feeding** monitor infant’s thyroid status but amount in milk probably too small to affect infant; high doses may affect neonatal thyroid function; see also notes above

**Side-effects** see under Carbimazole; leucopenia; rarely cutaneous vasculitis, thrombocytopenia, aplastic anaemia, hypoprothrombinaemia, hepatic disorders (including hepatitis, hepatic failure, encephalopathy, hepatic necrosis; see also Hepato-
In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids below). The mineralocorticoid activity of fludrocortisone (section 6.3.1) is so high that its anti-inflammatory activity is of no clinical relevance. The table below shows equivalent anti-inflammatory doses.

**Equivalent anti-inflammatory doses of corticosteroids**

The relatively high mineralocorticoid activity of hydrocortisone, and the resulting fluid retention, makes it unsuitable for disease suppression on a long-term basis. However, hydrocortisone can be used for adrenal replacement therapy (section 6.3.1). Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked (section 13.4).

Prednisolone and prednisone have predominantly glucocorticoid activity. Prednisolone is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone and dexamethasone have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion (e.g. congenital adrenal hyperplasia). Some esters of betamethasone and of beclometasone (beclomethasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

Deflazacort has a high glucocorticoid activity; it is derived from prednisolone.

---

**6.3.1 Replacement therapy**

The adrenal cortex normally secretes hydrocortisone (cortisol) which has glucocorticoid activity and weak mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of hydrocortisone (section 6.3.2) and the mineralocorticoid fludrocortisone; hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In Addison’s disease or following adrenalectomy, hydrocortisone 20 to 30 mg daily by mouth is usually required. This is given in 2 doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone 50 to 300 micrograms daily.

In acute adrenocortical insufficiency, hydrocortisone is given intravenously (preferably as sodium succinate) in doses of 100 mg every 6 to 8 hours in sodium chloride intravenous infusion 0.9%.

In hypopituitarism glucocorticoids should be given as in adrenocortical insufficiency, but since production of aldosterone is also regulated by the renin-angiotensin system a mineralocorticoid is not usually required. Additional replacement therapy with levothyroxine (section 6.2.1) and sex hormones (section 6.4) should be given as indicated by the pattern of hormone deficiency.

---

**6.3.2 Glucocorticoid therapy**

---

**FLUDROCORTISONE ACETATE**

**Indications** mineralocorticoid replacement in adrenocortical insufficiency

**Cautions** section 6.3.2; interactions: Appendix 1 (corticosteroids)

**Contra-indications** section 6.3.2

**Hepatic impairment** section 6.3.2

**Renal impairment** section 6.3.2

**Pregnancy** section 6.3.2

**Breast-feeding** section 6.3.2

**Side-effects** section 6.3.2

**Dose**

- 50–300 micrograms daily; CHILD 1 month–18 years see BNF for Children

**Florinef® (Squibb)**

| Tablets, scored, fludrocortisone acetate 100 micrograms. Net price 100-tab pack = £5.05. Label: 10, steroid card |

---

**Propylthiouracil** (Non-proprietary)

| Tablets, propylthiouracil 50 mg, net price 56-tab pack = £58.93, 100-tab pack = £96.32 |

---

**Additional replacement therapy with levothyroxine** system a mineralocorticoid is not usually required. Aldosterone is also regulated by the renin-angiotensin system.
Use of corticosteroids

Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used topically for the treatment of inflammatory conditions of the skin (section 13.4). Corticosteroids should be avoided or used only under specialist supervision in psoriasis (section 13.5).

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn’s disease (section 1.5). They are also included in locally applied creams for haemorrhoids (section 1.7.2).

Use can be made of the mineralocorticoid activity of fludrocortisone to treat postural hypotension in autonomic neuropathy (section 6.1.5).

High-dose corticosteroids should be avoided for the management of septic shock. However, there is evidence that administration of lower doses of hydrocortisone (50 mg intravenously every 6 hours) and fludrocortisone (50 micrograms daily by mouth) is of benefit in adrenocortical insufficiency resulting from septic shock.

Dexamethasone and betamethasone have little if any mineralocorticoid action and their long duration of action makes them particularly suitable for suppressing corticotropin secretion in congenital adrenal hyperplasia where the dose should be tailored to clinical response and by measurement of adrenal androgens and 17-hydroxyprogesterone. In common with all glucocorticoids their suppressive action on the hypothalamic-pituitary-adrenal axis is greatest and most prolonged when they are given at night. In most individuals a single dose of 1 mg of dexamethasone at night, is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the ‘overnight dexamethasone suppression test’ for diagnosing Cushings’s syndrome.

Betamethasone and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid may be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see also Prescribing in Palliative Care p.); high doses of betamethasone or dexamethasone are generally used. However, a corticosteroid should not be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

In acute hypersensitivity reactions such as angioedema of the upper respiratory tract and anaphylaxis, corticosteroids are indicated as an adjunct to emergency treatment with adrenaline (epinephrine) (section 3.4.3). In such cases hydrocortisone (as sodium succinate) by intravenous injection in a dose of 100 to 300 mg may be required.

Corticosteroids are preferably used by inhalation in the management of asthma (section 3.2) but systemic therapy in association with bronchodilators is required for the emergency treatment of severe acute asthma (section 3.1.1).

Corticosteroids may also be useful in conditions such as autoimmune hepatitis, rheumatoid arthritis and sarcoidosis; they may also lead to remissions of acquired haemolytic anaemia (section 9.1.3), and some cases of the nephrotic syndrome (particularly in children) and thrombocytopenic purpura (section 9.1.4).

Corticosteroids can improve the prognosis of serious conditions such as systemic lupus erythematosus, temporal arteritis, and polyarteritis nodosa; the effects of the disease process may be suppressed and symptoms relieved, but the underlying condition is not cured, although it may ultimately remit. It is usual to begin therapy in these conditions at fairly high dose, such as 40 to 60 mg prednisolone daily, and then to reduce the dose to the lowest commensurate with disease control.

For other references to the use of corticosteroids see Prescribing in Palliative Care, section 8.2.2 (immunosuppression), section 10.1.2 (rheumatic diseases), section 11.4 (eye), section 12.1.1 (otitis externa), section 12.2.1 (allergic rhinitis), and section 12.3.1 (aphthous ulcers).

Administration

Whenever possible local treatment with creams, intra-articular injections, inhalations, eye-drops, or enemas should be used in preference to systemic treatment. The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the total dose for two days can sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma (section 3.2). Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug (section 8.2.1).

Cautions and contra-indications of corticosteroids

Adrenal suppression

During prolonged therapy with corticosteroids, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension or death (see Withdrawal of Corticosteroids, below). Withdrawal can also be associated with fever, myalgia, arthralgia, rhinitis, conjunctivitis, painful itchy skin nodules and weight loss.

To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary reintroduction of corticosteroid treatment. To avoid a precipitous fall in blood pressure during anaesthesia or in the immediate postoperative period, anaesthetists must know whether a patient is taking or has been taking a corticosteroid. A suitable regimen for cortico-
steroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of surgery, is:

- **Minor surgery under general anaesthesia**—usual oral corticosteroid dose on the morning of surgery or hydrocortisone 25–50 mg (usually the sodium succinate) intravenously at induction; the usual oral corticosteroid dose is recommenced after surgery.

- **Moderate or major surgery**—usual oral corticosteroid dose on the morning of surgery and hydrocortisone 25–50 mg intravenously at induction, followed by hydrocortisone 25–50 mg 3 times a day by intravenous injection for 24 hours after moderate surgery or for 48–72 hours after major surgery; the usual pre-operative oral corticosteroid dose is recommenced on stopping hydrocortisone injections.

Patients on long-term corticosteroid treatment should carry a Steroid Treatment Card (see p. 487) which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

**Infections**

Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. septicaemia and tuberculosis may reach an advanced stage before being recognised, and amoebiasis or strongyloidiasis may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral ocular infections may also be exacerbated (see also section 11.4.1).

**Chickenpox** Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being at risk of severe chickenpox (see Steroid Treatment Card). Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature. Passive immunisation with varicella–zoster immunoglobulin (section 14.5.2) is needed for exposed non-immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment (section 5.3.2.1). Corticosteroids should not be stopped and dosage may need to be increased.

Topical, inhaled or rectal corticosteroids are less likely to be associated with an increased risk of severe chickenpox.

**Measles** Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin (section 14.5.1) may be needed.

**Withdrawal of corticosteroids**

The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case-by-case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. **Gradual withdrawal of systemic corticosteroids** should be considered in those whose disease is unlikely to relapse and have:

- received more than 40 mg prednisolone (or equivalent) daily for more than 1 week;
- been given repeat doses in the evening;
- received more than 3 weeks’ treatment;
- recently received repeated courses (particularly if taken for longer than 3 weeks);
- taken a short course within 1 year of stopping long-term therapy;
- other possible causes of adrenal suppression.

Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse and who have received treatment for 3 weeks or less and who are not included in the patient groups described above.

During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 7.5 mg daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

---

**STERIOD TREATMENT CARD**

I am a patient on STEROID treatment which must not be stopped suddenly

- If you have been taking this medicine for more than three weeks, the dose should be reduced gradually when you stop taking steroids unless your doctor says otherwise.

- Read the patient information leaflet given with the medicine.

- Always carry this card with you and show it to anyone who treats you (for example a doctor, nurse, pharmacist or dentist). For one year after you stop the treatment, you must mention that you have taken steroids.

- If you become ill, or if you come into contact with anyone who has an infectious disease, consult your doctor promptly. If you have never had chickenpox, you should avoid close contact with people who have chickenpox or shingles. If you do come into contact with chickenpox, see your doctor urgently.

- Make sure that the information on the card is kept up to date.
Psychiatric reactions

Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, nightmares, insomnia, irritability, mood lability, suicidal thoughts, psychotric reactions, and behavioural disturbances. A serious paranoid state or depression with risk of suicide can be induced, particularly in patients with a history of mental disorder. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment.

Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid-induced psychosis, or who have a personal or family history of psychiatric disorders.

Advice to patients

A patient information leaflet should be supplied to every patient when a systemic corticosteroid is prescribed. Patients should especially be advised of the following (for details, see Infections, Adrenal Suppression, Psychiatric Reactions, and Withdrawal of Corticosteroids above):

- **Immunosuppression** Prolonged courses of corticosteroids can increase susceptibility to infection and serious infections can go unrecognised. Unless already immune, patients are at risk of severe chickenpox and should avoid close contact with people who have chickenpox or shingles. Similarly, precautions should also be taken against contracting measles.
- **Adrenal suppression** If the corticosteroid is given for longer than 3 weeks, treatment must not be stopped abruptly. Adrenal suppression can last for a year or more after stopping treatment and the patient must mention the course of corticosteroid when receiving treatment for any illness or injury.
- **Mood and behaviour changes** Corticosteroid treatment, especially with high doses, can alter mood and behaviour early in treatment—the patient can become confused, irritable and suffer from delusion and suicidal thoughts. These effects can also occur when corticosteroid treatment is being withdrawn. Medical advice should be sought if worrying psychological changes occur.
- **Other serious effects** Serious gastro-intestinal, mucocutaneous, and ophthalmic effects which require medical help can also occur; for details see Side-effects of Corticosteroids, p. 487.

Steroid treatment cards

Steroid treatment cards (see p. 487) should be issued where appropriate, and are available for purchase from:

3M Security Print and Systems Limited
Gorse Street, Chaderton
Oldham, OL9 9QH
Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team Stores.

NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com.

Other cautions and contra-indications

Other cautions include: children and adolescents (growth restriction possibly irreversible), elderly (close supervision required particularly on long-term treatment); frequent monitoring required if history of tuberculosis (or X-ray changes), hypertension, recent myocardial infarction (rupture reported), congestive heart failure, diabetes mellitus including family history, osteoporosis (post-menopausal women at special risk), glaucoma (including family history), ocular herpes simplex—risk of corneal perforation, severe affective disorders (particularly if history of steroid-induced psychosis—see also Psychiatric Reactions, above), epilepsy, peptic ulcer, hypothyroidism, history of steroid myopathy, ulcerative colitis, diverticulitis, recent intestinal anastomoses, thromboembolic disorders; myasthenia gravis; interactions: Appendix 1 (corticosteroids).

Other contra-indications include: systemic infection (unless specific therapy given); avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished).

Hepatic impairment

When corticosteroids are administered orally or parenterally, the plasma-drug concentration may be increased in patients with hepatic impairment. Corticosteroids should be used with caution in hepatic impairment and the patient should be monitored closely.

Renal impairment

Oral and parenteral preparations of corticosteroids should be used with caution in patients with renal impairment.

Pregnancy and breast-feeding

The benefit of treatment with corticosteroids during pregnancy and breast-feeding outweighs the risk; pregnant women with fluid retention should be monitored closely. Corticosteroid cover is required during labour. Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM (May 1998) has concluded:

- corticosteroids vary in their ability to cross the placenta; betamethasone and dexamethasone cross the placenta readily while 88% of prednisolone is inactivated as it crosses the placenta;
- there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip;
- when administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome);
- any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important;
- prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant; infants should be monitored for adrenal suppression if the mothers are taking a higher dose.
Side-effects of corticosteroids

Overdosage or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

Mineralocorticoid side-effects include hypertension, sodium and water retention, and potassium and calcium loss. They are most marked with fludrocortisone, but are significant with hydrocortisone, corticotropin, and tetracosactide. Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone, prednisolone, and triamcinolone.

Glucocorticoid side-effects include diabetes and osteoporosis (section 6.6), which is a danger, particularly in the elderly, as it can result in osteoporotic fractures for example of the hip or vertebrae; in addition high doses are associated with avascular necrosis of the femoral head. Muscle wasting (proximal myopathy) can also occur. Corticosteroid therapy is also weakly linked with peptic ulceration and perforation; there is no conclusive evidence that the use of enteric-coated preparations of prednisolone reduces the risk of peptic ulceration. See also Psychiatric Reactions, p. 486.

High doses of corticosteroids can cause Cushing’s syndrome, with moon face, striae, and acne; it is usually reversible on withdrawal of treatment, but this must always be gradually tapered to avoid symptoms of acute adrenal insufficiency (important: see also Adrenal Suppression, p. 484).

In children, administration of corticosteroids may result in suppression of growth. For the effect of corticosteroids given in pregnancy, see Pregnancy and Breast-feeding, p. 486.

Side-effects can be minimised by using lowest effective dose for minimum period possible.

Other side-effects include: gastro-intestinal effects: dyspepsia, abdominal distension, acute pancreatitis, oesophageal ulceration and candidiasis; musculoskeletal effects: muscle weakness, vertebral and long bone fractures, tendon rupture; endocrine effects: menstrual irregularities and amenorrhoea, hirsutism, weight gain, hypercholesterolaemia, hyperlipidaemia, negative nitrogen and calcium balance, increased appetite; increased susceptibility to and severity of infection, reactivation of dormant tuberculosis; neuropsychiatric effects: psychological dependence, insomnia, increased intracranial pressure with papilloedema in children (usually after withdrawal), aggravation of schizophrenia, aggravation of epilepsy; ophthalmic effects: glaucoma, papilloedema, posterior subcapsular cataracts, corneal or scleral thinning and exacerbation of ophthalmic viral or fungal disease, increased intra-ocular pressure, exophthalmos; also impaired healing, petechiae, ecchymoses, facial erythema, suppression of skin test reactions, urticaria, hyperhidrosis, skin atrophy, bruising, telangiectasia, myocardial rupture following recent myocardial infarction, congestive heart failure, leucocytosis, hyperglycaemia, thromboembolism, nausea, malaise, hiccups, headache, vertigo.

For other references to the side-effects of corticosteroids see section 3.2 (asthma), section 11.4 (eye) and section 13.4 (skin).
6 Endocrine system

6.3.2 Glucocorticoid therapy

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also perineal irritation may follow intravenous administration of the phosphate ester

**Dose**
- By mouth, usual range 0.5–10 mg daily; **CHILD** 10–100 micrograms/kg daily; see also Administration (above)
- By intramuscular injection or slow intravenous injection or infusion, see under preparations

**Dexamethasone** (Non-proprietary) **(Pfizer)**

**Tablets**
- dexamethasone 500 micrograms, net price 28-tab pack = £48.00; 2 mg, 50-tab pack = £21.16. 100-tab pack = £12.05. Label: 10, steroid card, 21
- Oral solution, sugar-free, dexamethasone (as sodium phosphate) 2 mg/5 mL, net price 75-mL = £32.50, 150 mL = £42.30. Label: 10, steroid card, 21
- Brands include Dexam®, Martplan™

**Injection**
- dexamethasone (as sodium phosphate) 4 mg/mL, net price 1-mL amp = 91p. Label: 10, steroid card

**Dose**
- By intramuscular injection or slow intravenous injection or infusion, 0.4–20 mg; **CHILD** 200–400 micrograms/kg daily
- Cerebral oedema, by intravenous injection 8–16 mg initially, then 5 mg by intramuscular injection or intravenous injection every 6 hours as required for 2–4 days then gradually reduced and stopped over 5–7 days
- Adjunctive treatment of bacterial meningitis, (starting before or with first dose of antibiotic treatment), [unlicensed indication], by intravenous injection 8.3 mg every 6 hours for 4 days, **CHILD** 3 months–18 years see **BNF for Children**

**Injection**
- dexamethasone (as sodium phosphate) 3.3 mg/mL, net price 1-mL amp = £1.14, 2-mL vial = £4.80. Label: 10, steroid card

**Dose**
- By intramuscular injection or slow intravenous injection or infusion, 0.4–20 mg; **CHILD** 167–333 micrograms/kg daily
- Cerebral oedema associated with malignancy, by intravenous injection 8.3 mg initially, then 3.3 mg by intramuscular injection every 6 hours as required for 2–4 days then gradually reduced and stopped over 5–7 days
- Adjunctive treatment of bacterial meningitis, (starting before or with first dose of antibiotic treatment), [unlicensed indication], by intravenous injection 8.3 mg every 6 hours for 4 days, **CHILD** 3 months–18 years see **BNF for Children**

**Hydrocortisone** (Non-proprietary) **(Pfizer)**

**Tablets**
- scored, hydrocortisone 10 mg, net price 30-tab pack = £58.52. 20 mg, 30-tab pack = £65.03. Label: 10, steroid card, 21

**Efcortesol** (AMCo) **(Pfizer)**

**Injection**
- hydrocortisone 100 mg (as sodium phosphate)/mL, net price 1-mL amp = £1.08, 5-mL amp = £4.89. Label: 10, steroid card

**Note**
- Cerebral oedema associated with malignancy, (starting before or with first dose of antibiotic treatment), [unlicensed indication], by intravenous injection 8.3 mg every 6 hours for 4 days, **CHILD** 3 months–18 years see **BNF for Children**

**Injection**
- hydrocortisone 100 mg (as sodium phosphate)/mL, net price 1-mL amp = £1.08, 5-mL amp = £4.89. Label: 10, steroid card

**Note**
- Cerebral oedema associated with malignancy, (starting before or with first dose of antibiotic treatment), [unlicensed indication], by intravenous injection 8.3 mg every 6 hours for 4 days, **CHILD** 3 months–18 years see **BNF for Children**

**Solu-Cortef** (Pharmacia) **(Pfizer)**

**Injection**
- powder for reconstitution, hydrocortisone (as sodium succinate). Net price 100-mg vial = 92p, 100-mg vial with 2-mL amp water for injections = £1.16. Label: 10, steroid card

**Modified release**

**Plenadren** (ViroPharma) **(Pfizer)**

**Tablets**
- scored, hydrocortisone 5 mg (pink), net price 50-tab pack = £242.50; 20 mg (white), 50-tab pack = £400.00. Label: 10, steroid card, 22, 25

**Dose**
- replacement in adrenocortical insufficiency, **ADULT** over 18 years, usual dose 20–30 mg once daily in the morning, adjusted according to response

**Note**
- When switching from immediate-release hydrocortisone tablets to **Plenadren** use same total daily dose. Bioavailability of **Plenadren** lower than immediate-release tablets—monitor clinical response

**Methyprednisolone**

**Indications** suppression of inflammatory and allergic disorders; severe inflammatory bowel disease (section 1.5); cerebral oedema associated with malignancy; see also notes above; rheumatic disease (section 10.1.2); skin (section 13.4)

**Cautions** see notes above; also rapid intravenous administration of large doses associated with cardiovascular collapse

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**
- By mouth, replacement therapy, 20–30 mg daily in divided doses—see section 6.3.1; **CHILD** 1 month–18 years see **BNF for Children**
- By intramuscular injection or slow intravenous injection or infusion, 100–500 mg; 3–4 times in 24 hours or as required; **CHILD** by slow intravenous injection up to 1 year 25 mg, 1–5 years 50 mg, 6–12 years 100 mg

**Hydrocortisone** (Non-proprietary) **(Pfizer)**

**Tablets**
- scored, hydrocortisone 10 mg, net price 30-tab pack = £58.52. 20 mg, 30-tab pack = £65.03. Label: 10, steroid card, 21

**Methyldprednisolone**

**Indications** suppression of inflammatory and allergic disorders; severe inflammatory bowel disease (section 1.5); cerebral oedema associated with malignancy; see also notes above; rheumatic disease (section 10.1.2); skin (section 13.4)

**Cautions** see notes above; also rapid intravenous administration of large doses associated with cardiovascular collapse

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**
- By mouth, usual range 2–40 mg daily; see also Administration (above)
- By intramuscular injection or slow intravenous injection or infusion, initially 10–500 mg; graft rejection, up to 1 g daily by intravenous infusion for up to 3 days

**Medrone** (Pfizer) **(Pfizer)**

**Tablets**
- scored, methylprednisolone 2 mg (pink), net price 30-tab pack = £3.88; 4 mg, 30-tab pack = £6.19; 16 mg, 30-tab pack = £17.17; 100 mg (blue), 20-tab pack = £48.32. Label: 10, steroid card, 21

1. **BNF** restriction does not apply where administration is for saving life in emergency
PREDNISOLONE

**Indications** suppression of inflammatory and allergic disorders; see also notes above; inflammatory bowel disease (section 1.5); asthma (section 3.1 and section 3.2); croup (section 3.1); immunosuppression (section 8.2.2); rheumatic disease (section 10.1.2); eye (section 11.4.1); ear (section 12.1.1)

**Cautions** see notes above; also Duchenne’s muscular dystrophy (possible transient rhabdomyolysis and myoglobinuria following strenuous physical activity)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**

- **By mouth**, initially, up to 10–20 mg daily (severe disease, up to 60 mg daily), preferably taken in the morning after breakfast; can often be reduced within a few days but may need to be continued for several weeks or months

- Maintenance, usual range, 2.5–15 mg daily, but higher doses may be needed; cushingoid side-effects increasingly likely with doses above 7.5 mg daily

- **By intramuscular injection**, prednisolone acetate (section 10.1.2.2), 25–100 mg once or twice weekly

**Prednisolone (Non-proprietary)**

- **Tablets**, prednisolone 1 mg, net price 28-tab pack = £1.03; 5 mg, 28-tab pack = £1.31; 25 mg, 56-tab pack = £4.00. Label: 10, steroid card, 21
- **Tablets**, e/c, prednisolone 2.5 mg (brown), net price 28-tab pack = £1.86, 100-tab pack = £13.43; 5 mg (red), 28-tab pack = £1.89, 100-tab pack = £13.54. Label: 5, 10, steroid card, 25

- **Brands include** Delta cortisol®

- **Soluble tablets**, prednisolone 5 mg (as sodium phosphate), net price 30-tab pack = £42.78. Label: 10, steroid card, 13, 21

**Injection**, see section 10.1.2.2

**PREDNISONE**

**Indications** moderate to severe rheumatoid arthritis (section 10.1.2.1)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Indications** moderate to severe rheumatoid arthritis

**Side-effects** see notes above

**Dose**

- **ADULT** over 18 years, initially 10–20 mg at bedtime, adjusted according to response

**Lodotra® (Napp)**

- **Tablets**, m/r, yellow, prednisone 1 mg, net price 30-tab pack = £26.70; 2 mg, 30-tab pack = £26.70, 100-tab pack = £89.00; 5 mg, 30-tab pack = £26.70, 100-tab pack = £89.00. Label: 10, steroid card, 21, 25

**TRIAMCINOLONE**

**Indications** suppression of inflammatory and allergic disorders; see also notes above; rheumatic disease (section 10.1.2); skin (section 13.4)

**Cautions** see notes above; also high dosage may cause proximal myopathy, avoid in chronic therapy

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**

- **By deep intramuscular injection**, into gluteal muscle, 40–120 mg, a second injection may be given after 2–3 weeks if required

**Lodotra® (Napp)**

- **Tablets**, m/r, yellow, prednisone 1 mg, net price 30-tab pack = £26.70; 2 mg, 30-tab pack = £26.70, 100-tab pack = £89.00; 5 mg, 30-tab pack = £26.70, 100-tab pack = £89.00. Label: 10, steroid card, 21, 25

**6.4 Sex hormones**

**6.4.1 Female sex hormones and their modulators**

**6.4.2 Male sex hormones and antagonists**

**6.4.3 Anabolic steroids**

**6.4.1 Female sex hormones and their modulators**

**6.4.1.1 Oestrogens and HRT**

**6.4.1.2 Progestogens and progesterone receptor modulators**

**6.4.1.3 Oestrogens and HRT**

Oestrogens are necessary for the development of female secondary sexual characteristics; they also stimulate myometrial hypertrophy with endometrial hyperplasia.

In terms of oestrogenic activity natural oestrogens (estradiol (oestradiol), estrone (oestrone), and estriol (oestradiol)) have a more appropriate profile for hormone replacement therapy (HRT) than synthetic oestrogens (ethinylestradiol (ethinylestrodiol) and mestranol). Tibolone has oestrogenic, progestogenic and weak androgenic activity.
Oestrogen therapy is given cyclically or continuously for a number of gynaecological conditions. If long-term therapy is required in women with a uterus, a progestogen should normally be added to reduce the risk of cystic hyperplasia of the endometrium (or of endometriotic foci in women who have had a hysterectomy) and possible transformation to cancer.

Oestrogens are no longer used to suppress lactation because of their association with thromboembolism.

### Hormone replacement therapy

Hormone replacement therapy (HRT) with small doses of an oestrogen (together with a progestogen in women with a uterus) is appropriate for alleviating menopausal symptoms such as vaginal atrophy or vasomotor instability. Oestrogen given systemically in the perimenopausal and postmenopausal period or tibolone given in the postmenopausal period also diminish postmenopausal osteoporosis (section 6.6.1) but other drugs (section 6.6) are preferred. Menopausal atrophic vaginitis may respond to a short course of a topical vaginal preparation (section 7.2.1) used for a few weeks and repeated if necessary.

1. Tibolone increases the risk of breast cancer but to a lesser extent than with combined HRT.
2. Evidence suggests an increased risk of endometrial cancer with tibolone. After 2.7 years of use (in women of average age 68 years), 1 extra case of endometrial hyperplasia and 4 extra cases of endometrial cancer were diagnosed compared with placebo users.
3. The risk of endometrial cancer cannot be reliably estimated in those using combined HRT because the addition of progestogen for at least 10 days per 28-day cycle greatly reduces the additional risk. Tibolone combines oestrogenic and progestogenic activity with weak androgenic activity; it is given continuously, without cyclical progestogen.
4. Limited data does not suggest an increased risk of thromboembolism with tibolone compared with combined HRT or women not taking HRT.
5. Although the level of risk of thromboembolism associated with non-oral routes of administration of HRT has not been established, it may be lower for the transdermal route. Tibolone is given systemically in the perimenopausal and postmenopausal period or tibolone given in the postmenopausal period also diminish postmenopausal osteoporosis (section 6.6.1) but other drugs (section 6.6) are preferred.
6. Tibolone increases the risk of stroke about 2.2 times from the first year of treatment; risk of stroke is age-dependent and therefore the absolute risk of stroke with tibolone increases with age.
7. Increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause.
8. There is insufficient data to draw a conclusion on the risk of coronary heart disease with tibolone.

</table>

**Note:** Where background incidence or additional cases have not been included in the table, this indicates a lack of available data. NS indicates a non-significant difference.

The minimum effective dose of HRT should be used for the shortest duration. Treatment should be reviewed at least annually and for osteoporosis alternative treatments considered (section 6.6). HRT does not prevent coronary heart disease or protect against a decline in cognitive function and it should not be prescribed for these purposes. Experience of treating women over 65 years with HRT is limited.

For the treatment of menopausal symptoms the benefits of short-term HRT outweigh the risks in the majority of women, especially in those aged under 60 years.

**Risk of breast cancer** It is estimated that using all types of HRT, including tibolone, increases the risk of breast cancer within 1–2 years of initiating treatment, see HRT Risk table, p. 490 for details. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.

Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use; tibolone has only a limited effect on mammographic density.

**Risk of endometrial cancer** The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT, see HRT Risk table, p. 490 for details.

In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

**Risk of ovarian cancer** Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer, see HRT Risk table, p. 490 for details; this excess risk disappears within a few years of stopping.

**Risk of venous thromboembolism** Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use, see HRT Risk table, p. 490 for details.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. See below for advice on surgery.

**Travel** involving prolonged immobility further increases the risk of deep vein thrombosis, see under Travel in section 7.3.1.

**Risk of stroke** Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke. Tibolone increases the risk of stroke about 2.2 times from the first year of treatment, see HRT Risk table, p. 490 for details.

**Risk of coronary heart disease** HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause, see HRT Risk table, p. 490 for details. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

**Choice** The choice of HRT for an individual depends on an overall balance of indication, risk, and convenience. A woman with a uterus normally requires oestrogen with cyclical progestogen for the last 12 to 14 days of the cycle or a preparation which involves continuous administration of an oestrogen and a progestogen (or one which provides both oestrogenic and progestogenic activity in a single preparation). Continuous combined preparations or tibolone are not suitable for use in the perimenopause or within 12 months of the last menstrual period; women who use such preparations may bleed irregularly in the early stages of treatment—if bleeding continues endometrial abnormality should be ruled out and consideration given to changing to cyclical HRT.

An oestrogen alone is suitable for continuous use in women without a uterus. However, in endometriosis, endometrial foci may remain despite hysterectomy and the addition of a progestogen should be considered in these circumstances.

An oestrogen may be given by mouth or by transdermal administration, which avoids first-pass metabolism. For the use of topical HRT preparations see section 7.2.1.

**Contraception** HRT does not provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill (section 7.3.1) to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary.

Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.

**Surgery** Major surgery under general anaesthesia, including orthopaedic and vascular leg surgery, is a predisposing factor for venous thromboembolism and it may be prudent to stop HRT 4–6 weeks before surgery (see Risk of Venous Thromboembolism, above); it should be restarted only after full mobilisation. If HRT is continued or if discontinuation is not possible (e.g. in non-elective surgery), prophylaxis with unfractionated or low molecular weight heparin and graduated compression hosiery is advised.

**Reasons to stop HRT** For circumstances in which HRT should be stopped, see p. 537.
6.4.1 Female sex hormones and their modulators

**Conjugated oestrogens with progestogen**

For prescribing information on progestogens, see section 6.4.1.2.

**Premique** (Pfizer) 7 days

Premique Low Dose tablets, m/r, ivory, s/c, conjugated oestrogen (equine) 300 micrograms and medroxyprogesterone acetate 1.5 mg, net price 3 × 28-tab pack = £6.52

**Dose**

Menopausal symptoms in women with a uterus, 1 tablet daily continuously

Premique tablets, s/c, blue, conjugated oestrogen (equine) 625 micrograms and medroxyprogesterone acetate 5 mg, net price 3 × 28-tab pack = £10.61

**Dose**

Menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 tablet daily continuously

**Prempak-C** (Pfizer) 7 days

Prempak C 0.625 Calendar pack, s/c, 28 maroon tablets, conjugated oestrogens (equine) 625 micrograms; 12 light brown tablets, norgestrel 150 micrograms (equiv. levonorgestrel 75 micrograms), net price 3 × 40-tab pack = £8.25

**Dose**

Menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 maroon tablet daily continuously, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), and 1 brown tablet daily on days 17–28 of each 28-day treatment cycle; subsequent courses are repeated without interval

**Prempak C** 1.25 Calendar pack, s/c, 28 yellow tablets, conjugated oestrogens (equine) 1.25 mg; 12 light brown tablets, norgestrel 150 micrograms (equiv. levonorgestrel 75 micrograms), net price 3 × 40-tab pack = £7.40

**Dose**

See under 0.625 Calendar pack, but taking 1 yellow tablet daily continuously (instead of 1 maroon tablet) if symptoms not fully controlled with lower strength

**Estradiol with progestogen**

For prescribing information on progestogens, see section 6.4.1.2

**Angeliq** (Bayere) 7 days

Tablets, f/c, red, estradiol 1 mg, drospirenone 2 mg, net price 3 × 28-tab pack = £29.00

**Dose**

Menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously (if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase)

**Cautions**

Use with care if an increased concentration of potassium might be hazardous

**Renal impairment**

Avoid if eGFR less than 30 mL/minute/1.73 m²

**Climageset** (Novartis) 7 days

Climageset 1-mg tablets, 16 grey-blue, estradiol valerate 1 mg; 12 white, estradiol valerate 1 mg and norethisterone 1 mg, net price 28-tab pack = £5.51; 3 × 28-tab pack = £16.02

**Dose**

Menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously (if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase)

**Cautions**

Use with care if an increased concentration of potassium might be hazardous

**Renal impairment**

Avoid if eGFR less than 30 mL/minute/1.73 m²

**Climageset** 2-mg tablets, 16 blue, estradiol valerate 2 mg; 12 yellow, estradiol valerate 2 mg and norethisterone 1 mg, net price 28-tab pack = £5.51; 3 × 28-tab pack = £16.02

**Dose**

See Climageset 1-mg, but starting with 1 tablet daily (instead of 1 grey-blue tablet) if symptoms not controlled with lower strength
Climesse® (Novartis)®
Tablets, pink, estradiol valerate 2 mg, norethisterone 700 micrograms, net price 1 × 28-tab pack = £9.92; 3 × 28-tab pack = £29.78
Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously

Clinorette® (ReSource Medical)®
Tablets, f/c, 16 white, estradiol 2 mg; 12 pink, estradiol 2 mg and norethisterone 1 mg, net price 3 × 28-tab pack = £9.23
Dose menopausal symptoms and osteoporosis prophylaxis (daily on 6.6), in women with a uterus, 1 tablet daily for 16 days starting on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 pink tablet daily for 12 days; subsequent courses repeated without interval

Cyclo-Progynova® (Meda)®, Cyclo-Progynova® 2-mg tablets, s/c, 11 white, estradiol valerate 2 mg; 10 brown, estradiol valerate 2 mg and norgestrel 500 micrograms (equiv. levonorgestrel 250 micrograms), net price per pack = £3.11
Dose menopausal symptoms and osteoporosis prophylaxis (daily on 6.6), in women with a uterus, 1 white tablet daily for 16 days starting on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 brown tablet daily for 10 days, followed by a 7-day tablet-free interval

E lleste-Duet® (Meda)®
E lleste-Duet® 1-mg tablets, 16 white, estradiol 1 mg; 12 green, estradiol 1 mg and norethisterone acetate 1 mg, net price 3 × 28-tab pack = £9.20
Dose menopausal symptoms, 1 tablet daily for 16 days starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 green tablet daily for 12 days, subsequent courses are repeated without interval

E lleste-Duet® 2-mg tablets, 16 orange, estradiol 2 mg; 12 grey, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 × 28-tab pack = £9.20
Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 orange tablet daily for 16 days, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent) then 1 grey tablet daily for 12 days, subsequent courses are repeated without interval

E lleste-Duet® Conti® tablets, f/c, grey, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 × 28-tab pack = £17.02
Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily on a continuous basis (if changing from cyclical HRT begin treatment at the end of scheduled bleed)

E vorol® (Janssen)®
E vorol® Conti patch, self-adhesive, (releasing estradiol approx. 50 micrograms/24 hours and norethisterone acetate approx. 170 micrograms/24 hours), net price 8-patch pack = £13.00, 24-patch pack = £37.22. Counselling, administration
Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 patch to be applied twice weekly continuously

E vorol® Sequi combination pack, 4 self-adhesive patches of E vorol® 50 (releasing estradiol approx. 50 micrograms/24 hours) and 4 self-adhesive patches of E vorol® Conti (releasing estradiol approx. 50 micrograms/24 hours and norethisterone acetate approx. 170 micrograms/24 hours), net price 8-patch pack = £11.09. Counselling, administration
Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 E vorol® 50 patch to be applied twice weekly for 2 weeks, starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), followed by 1 E vorol® Conti patch twice weekly for 2 weeks; subsequent courses are repeated without interval

F emoston® (Abbott Healthcare)®
F emoston® 1 mg/10 mg tablets, f/c, 14 white, estradiol 1 mg; 14 grey, estradiol 1 mg, dydrogesterone 10 mg, net price 3 × 28-tab pack = £16.16
Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 white tablet daily for 14 days, starting within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent) then 1 grey tablet daily for 14 days; subsequent courses repeated without interval

F emoston® 2 mg/10 mg tablets, f/c, 14 red, estradiol 2 mg; 14 yellow, estradiol 2 mg, dydrogesterone 10 mg, net price 3 × 28-tab pack = £16.16
Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously (if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase)

F emoston®-conti 0.5 mg/2.5 mg tablets, f/c, yellow, estradiol 0.5 mg, dydrogesterone 2.5 mg, net price 3 × 28-tab pack = £20.36
Dose menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously (if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase)

F emston®-Conti (TEVA UK)®
Patches, self-adhesive (releasing estradiol approx. 50 micrograms/24 hours and levonorgestrel approx. 7 micrograms/24 hours); net price 4-patch pack = £15.48, 12-patch pack = £44.12. Counselling, administration
Dose menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously, 1 patch to be applied once a week continuously

F emston®-Sequi (TEVA UK)®
Combination pack, self-adhesive patches of FemSeven® Sequi Phase 1 (releasing estradiol approx. 50 micrograms/24 hours) and of FemSeven® Sequi Phase 2 (releasing estradiol approx. 50 micrograms/24 hours and levonorgestrel approx. 10 micrograms/24 hours); net price 1-month pack (2 of each) = £13.18, 3-month pack (6 of each) = £37.54. Counselling, administration
Dose menopausal symptoms in women with a uterus, 1 Phase 1 patch applied once a week for 2 weeks followed by 1 Phase 2 patch once a week for 2 weeks; subsequent courses are repeated without interval

I ndivina® (Orion)®
I ndivina® 1 mg/2.5 mg tablets, estradiol valerate 1 mg, medroxyprogesterone acetate 2.5 mg, net price 3 × 28-tab pack = £20.58
6.4.1 Female sex hormones and their modulators

**Estradiol only**

**Bedel**® (ReSource Medical) **(BNM)**

- **Tablets**, f/c, estradiol 2 mg, net price 3 × 28-tab pack = £5.07

**Dose**
menopausal symptoms and osteoporosis prophylaxis (see section 6.6), with cyclical progesterone for 12–14 days of each cycle in women with a uterus, 2 mg daily starting on day 1–5 of menstruation (or at any time if cycles have ceased or are infrequent)

**Climaval**® (Novartis) **(BNM)**

- **Tablets**, estradiol valerate 1 mg (grey-blue), net price 1 × 28-tab pack = £2.94, 3 × 28-tab pack = £8.82;
  2 mg (blue), 1 × 28-tab pack = £2.94, 3 × 28-tab pack = £8.82

**Dose**
menopausal symptoms (if patient has had a hysterectomy), 1–2 mg daily

**Elleste-Solo**® (Meda) **(BNM)**

- **Elleste-Solo** 1 mg tablets, estradiol 1 mg, net price 3 × 28-tab pack = £5.06

**Dose**
menopausal symptoms with cyclical progesterone for 12–14 days of each cycle in women with a uterus, 1 mg daily starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent)

**Elleste-Solo** 2 mg tablets, orange, estradiol 2 mg, net price 3 × 28-tab pack = £5.06

**Dose**
menopausal symptoms not controlled with lower strength and osteoporosis prophylaxis (see section 6.6), with cyclical progesterone for 12–14 days of each cycle in women with a uterus, 2 mg daily starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent)

**Elleste Solo** MX (Meda) **(BNM)**

- **Patches**, self-adhesive, estradiol, MX 40 patch (releasing approx. 40 micrograms/24 hours), net price 8-patch pack = £5.19; MX 80 patch (releasing approx. 80 micrograms/24 hours), 8-patch pack = £5.99.

Counselling, administration

**Dose**
menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied twice weekly continuously starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), with cyclical progesterone for 12–14 days of each cycle in women with a uterus; for menopausal symptoms initiate therapy with MX 40, subsequently adjust according to response, for osteoporosis prophylaxis, initiate therapy with MX 80

**Estraderm MX**® (Novartis) **(BNM)**

- **Patches**, self-adhesive, estradiol, MX 25 patch (releasing approx. 25 micrograms/24 hours), net price 8-patch pack = £5.50, 24-patch pack = £16.46; MX 50 patch (releasing approx. 50 micrograms/24 hours), 8-patch pack = £5.51, 24-patch pack = £16.46, 20-patch pack (hosp. only) = £13.04; MX 75 patch (releasing approx. 75 micrograms/24 hours), 8-patch pack = £6.42, 24-patch pack = £19.27; MX 100 patch (releasing approx. 100 micrograms/24 hours), 8-patch pack = £6.86, 24-patch pack = £19.99.

Counselling, administration

**Dose**
menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied twice weekly continuously starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), with cyclical progesterone for at least 12 days of each cycle in women with a uterus; for menopausal symptoms initiate therapy with MX25 for first 3 months; for osteoporosis prophylaxis, initiate therapy with MX50; subsequently adjust according to response

**Premarin**® (Pfizer) **(BNM)**

- **Tablets**, all s/c, conjugated oestrogens (equine) 0.625 mg tablets (green) net price 3 × 28-tab pack = £6.07, 625 micrograms (maroon), 3 × 28-tab pack = £4.02; 1.25 mg (yellow), 3 × 28-tab pack = £3.58

**Dose**
menopausal symptoms, 0.3–1.25 mg daily continuously, osteoporosis prophylaxis (see section 6.6), 0.625–1.25 mg daily continuously, with cyclical progesterone for 12–14 days of each cycle in women with a uterus

**Trimestra**® (Bayer) **(BNM)**

- **Tablets**, f/c, yellow, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 × 28-tab pack = £11.43

**Dose**
menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously, start at end of scheduled bleed if changing from cyclical HRT

**Indivina**® 2 mg/5 mg tablets, estradiol valerate 2 mg, medroxyprogesterone acetate 5 mg, net price 3 × 28-tab pack = £20.58

**Dose**
menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 3 years previously, 1 tablet daily continuously, initiate therapy with Indivina® 1 mg/2.5 mg tablets and adjust according to response, start at end of scheduled bleed if changing from cyclical HRT

**Klofenom**® (Novo Nordisk) **(BNM)**

- **Tablets**, f/c, yellow, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 × 28-tab pack = £13.20

**Dose**
menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously, start at end of scheduled bleed if changing from cyclical HRT

**Kloinance**® (Novo Nordisk) **(BNM)**

- **Tablets**, f/c, estradiol 1 mg, norethisterone acetate 500 micrograms, net price 3 × 28-tab pack = £11.13

**Dose**
menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously, if changing from cyclical HRT, start treatment the day after finishing oestrogen plus progesterone phase

**Nuvelle® Continuous** (Bayer) **(BNM)**

- **Tablets**, f/c, pink, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 × 28-tab pack = £19.00

**Dose**
menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus, 1 red tablet daily for 16 days then 1 white tablet daily for 12 days; subsequent courses are repeated without interval, start treatment with red tablet at any time or if changing from cyclical HRT, start treatment the day after finishing oestrogen plus progesterone phase

**Tridestra**® (Orion) **(BNM)**

- **Tablets**, 70 white, estradiol valerate 2 mg; 14 blue, estradiol valerate 2 mg and medroxyprogesterone acetate 20 mg; 7 yellow, inactive, net price 91-tab pack = £20.49

**Dose**
menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus, 1 red tablet daily for 70 days, then 1 blue tablet daily for 14 days, then 1 yellow tablet daily for 7 days, subsequent courses are repeated without interval

**Trisqueen®** (Novo Nordisk) **(BNM)**

- **Tablets**, 12 blue, estradiol 2 mg; 10 white, estradiol 2 mg, norethisterone acetate 1 mg; 6 red, estradiol 1 mg, net price 3 × 28-tab pack = £11.10

**Dose**
menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 blue tablet daily for 12 days followed by 1 white tablet for 10 days, then 1 red tablet daily for 8 days; subsequent courses are repeated without interval

**Conjugated oestrogens only**

**Premarin**® (Pfizer) **(BNM)**

- **Tablets**, all s/c, conjugated oestrogens (equine) 0.625 mg tablets (green) net price 3 × 28-tab pack = £6.07, 625 micrograms (maroon), 3 × 28-tab pack = £4.02; 1.25 mg (yellow), 3 × 28-tab pack = £3.58

**Dose**
menopausal symptoms, 0.3–1.25 mg daily continuously, osteoporosis prophylaxis (see section 6.6), 0.625–1.25 mg daily continuously, with cyclical progesterone for 12–14 days of each cycle in women with a uterus

**Elleste-Solo**® (Meda) **(BNM)**

- **Elleste-Solo** 1 mg tablets, estradiol 1 mg, net price 3 × 28-tab pack = £5.06

**Dose**
menopausal symptoms with cyclical progesterone for 12–14 days of each cycle in women with a uterus, 1 mg daily starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent)

**Estraderm** (Novartis) **(BNM)**

- **Patches**, self-adhesive, estradiol, 25’ patch (releasing approx. 25 micrograms/24 hours), net price 8-patch pack = £5.50, 24-patch pack = £16.46; 37.5’ patch (releasing approx. 37.5 micrograms/24 hours), 8-patch pack = £5.00;
Progynova® TS (Bayer)

Patches, self-adhesive, Progynova® TS 50 (releasing estradiol approx. 50 micrograms/24 hours), net price 12-patch pack = £18.90; Progynova® TS 100 (releasing estradiol approx. 100 micrograms/24 hours), 12-patch pack = £20.70. Counselling, administration

Dose
Menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied once a week, with cyclical progestogen for 12–14 days of each cycle in women with a uterus; therapy should be initiated with Evorel 50 patch; subsequently adjust according to response.

Note
Women receiving Progynova TS 100 patches for menopausal symptoms may continue with this strength for osteoporosis prophylaxis (see section 6.6).

Sandrena® (Orion)

Gel, estradiol (0.1%), 500 microgram/500 mg sachet, net price 28-sachet pack = £5.08, 1 mg/1 g sachet, 28-sachet pack = £5.85. Counselling, administration

Dose
Menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1–2 tablets daily starting within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), with cyclical progestogen for 12–14 days of each cycle in women with a uterus; dose may be adjusted after 2–3 cycles to lowest effective dose (usual dose of estradiol 0.5–1.5 mg (0.5–1.5 g gel daily)

Counselling
Apply gel to intact areas of skin such as lower trunk or thighs, using right and left sides on alternate days. Wash hands after application. Not to be applied on the breasts or face and avoid contact with eyes. Allow area of application to dry for 5 minutes and do not wash area for at least 1 hour.

Zumenon® (Abbott Healthcare)

Tablets, f/c, estradiol 1 mg, net price 84-tab pack = £6.89; 2 mg (red), 84-tab pack = £6.89

Dose
Menopausal symptoms, initially 1 mg daily starting within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), with cyclical progestogen for 12–14 days of each cycle in women with a uterus; dose may be adjusted after 2–3 cycles to lowest effective dose (usual dose of estradiol 0.5–1.5 mg (0.5–1.5 g gel daily)

Estradiol, estril and estrone

Hormonin® (AMCo)

Tablets, pink, estradiol 600 micrograms, estril 270 micrograms, estrone 1.4 mg, net price 84-tab pack = £7.93

Dose
Menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1–2 tablets daily starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), with cyclical progestogen for 12–14 days of each cycle in women with a uterus

Note
Hormonin® tablets can be given continuously or cyclically (21 days out of 28)

TIBOLONE

Indications
Short-term treatment of symptoms of oestrogen deficiency (including women being treated with gonadotrophin releasing hormone analogues); osteoporosis prophylaxis in women at high risk of fractures when other prophylaxis contra-indicated or not tolerated.

Cautions
See Hormone Replacement Therapy, p. 490 and under Oestrogens for HRT; vaginal bleeding (investigate for endometrial cancer if bleeding continues beyond 6 months or after stopping treatment); history of liver disease, epilepsy, migraine, diabetes mellitus, hypertiglyceridaemia; withdraw if signs of thromboembolic disease, abnormal liver function tests or cholestatic jaundice; see also Note below; interactions: Appendix 1 (tibolone)
**Contraindications** see notes above and under Oestrogens for HRT; history of cardiovascular or cerebrovascular disease (e.g. thrombophlebitis, thromboembolism), uninvestigated vaginal bleeding

**Hepatic impairment** avoid in acute liver disease or if history of liver disease and liver function tests not returned to normal

**Renal impairment** risk of fluid retention—patients with renal impairment should be closely monitored

**Pregnancy** avoid; toxicity in animal studies

**Breast-feeding** avoid

**Side-effects** see notes above; also abdominal pain, weight changes, vaginal bleeding, leucorrhoea, facial hair, and rarely amenae; gastro-intestinal disturbances, oedema, dizziness, headache, migraine, depression, breast cancer (see notes above and section 6.4.1.1), arthralgia, myalgia, visual disturbances, seborrheic dermatitis, rash and pruritus also reported

**Dose**
- 2.5 mg daily

  **Note** Unsuitable for use in the premenopause (unless being treated with gonadotrophin-releasing hormone analogue) and as (or with) an oral contraceptive; also unsuitable for use within 12 months of last menstrual period (may cause irregular bleeding). If transferring from cyclical HRT, start at end of regimen; if transferring from continuous-combined HRT, start at any time

**Livial**

- **Tablets,** tibolone 2.5 mg, net price 28-tab pack = £10.36; 3 × 28-tab pack = £31.08

---

**Ethinylestradiol**

Ethinylestradiol (ethinylestradiol) is licensed for short-term treatment of symptoms of oestrogen deficiency, for osteoporosis prophylaxis if other drugs (section 6.6) cannot be used and for the treatment of female hypogonadism and menstrual disorders.

Ethinylestradiol is occasionally used under specialist supervision for the management of hereditary haemorrhagic telangiectasia (but evidence of benefit is limited).

Side-effects include nausea, fluid retention, and thrombosis. Impotence and gynaecomastia have been reported in men.

For use in prostate cancer, see section 8.3.1.

---

**ERTHINYLESTRA DIOL**

(Ethinylestradiol)

**Indications** see notes above

**Cautions** cardiovascular disease (sodium retention with oedema, thromboembolism); see also under Combined Hormonal Contraceptives (section 7.3.1) and Under Oestrogens for HRT (p. 491)

**Contra-indications** see under Combined Hormonal Contraceptives (section 7.3.1) and Under Oestrogens for HRT (p. 491)

**Hepatic impairment** avoid; see also Combined Hormonal Contraceptives, section 7.3.1

**Pregnancy** see Combined Hormonal Contraceptives, section 7.3.1

**Breast-feeding** see Combined Hormonal Contraceptives, section 7.3.1

**Side-effects** feminising effects in men; see also under Combined Hormonal Contraceptives (section 7.3.1) and Under Oestrogens for HRT (p. 492)

**Dose**
- Menopausal symptoms and osteoporosis prophylaxis, (with progestogen for 12–14 days per cycle in women with intact uterus), 10–50 micrograms daily for 21 days, repeated after 7-day tablet-free period
- Female hypogonadism, 10–50 micrograms daily, usually on cyclical basis; initial oestrogen therapy should be followed by combined oestrogen and progestogen therapy
- Menstrual disorders, 20–50 micrograms daily from day 5 to 25 of each cycle, with progestogen added either throughout the cycle or from day 15 to 25

**Ethinylestradiol**

- **(Non-proprietary) Ethinylestradiol**
- **Tablets,** ethinylestradiol 10 micrograms, net price 21-tab pack = £139.22; 50 micrograms, 21-tab pack = £139.22; 1 mg, 28-tab pack = £139.22

---

**Raloxifene**

Raloxifene is licensed for the treatment and prevention of postmenopausal osteoporosis; unlike hormone replacement therapy, raloxifene does not reduce menopausal vasomotor symptoms.

Raloxifene may reduce the incidence of oestrogen-receptor-positive breast cancer but its role in established breast cancer is not yet clear. The manufacturer advises avoiding its use during treatment for breast cancer.

**RALOXIFENE HYDROCHLORIDE**

**Indications** treatment and prevention of postmenopausal osteoporosis

**Cautions** risk factors for venous thromboembolism (discontinue if prolonged immobilisation); risk factors for stroke; breast cancer (see notes above); history of oestrogen-induced hypertiglyceridaemia (monitor serum triglycerides); avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (raloxifene)

**Contra-indications** history of venous thromboembolism, undiagnosed uterine bleeding, endometrial cancer, cholestasis

**Hepatic impairment** avoid

**Renal impairment** caution in mild to moderate impairment; avoid in severe impairment

**Side-effects** hot flushes, leg cramps, peripheral oedema, influenza-like symptoms; less commonly venous thromboembolism, thromboplastis; rarely rashes, gastro-intestinal disturbances, hypertension, arterial thromboembolism, headache (including migraine), breast discomfort, thrombocytopenia

**Dose**
- 60 mg once daily

**Evista**

- **(Daiichi Sankyo) Evista**
- **Tablets,** raloxifene hydrochloride 60 mg, net price 28-tab pack = £17.06; 84-tab pack = £59.59

---

**6.4.1.2 Progestogens and progesterone receptor modulators**

There are two main groups of progestogen, progesterone and its analogues (dydrogesterone and medroxy-progesterone) and testosterone analogues (norethisterone and norgestrel). The newer progestogens (desogestrel, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel is the active isomer of norgestrel and has twice its potency. Progesterone
and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

Where endometriosis requires drug treatment, it may respond to a progestogen, e.g. norethisterone, administered on a continuous basis. Danazol and gonadorenal analogues are also available (section 6.7.2).

Although oral progestogens have been used widely for menorrhagia they are relatively ineffective compared with tranexamic acid (section 2.11) or, particularly where dysmenorrhoea is also a factor, mefenamic acid (section 10.1.1); the levonorgestrel-releasing intra-uterine system (section 7.3.2.3) may be particularly useful for women also requiring contraception. Oral progestogens have also been used for severe dysmenorrhoea, but where contraception is also required in younger women the best choice is a combined oral contraceptive (section 7.3.1).

Progestogens have also been advocated for the alleviation of premenstrual symptoms, but no convincing physiological basis for such treatment has been shown. Progestogens have been used for the prevention of miscarriage in women with a history of recurrent miscarriage but there is no evidence of benefit and they are not recommended for this purpose. In pregnant women with antiphospholipid antibody syndrome who have suffered recurrent miscarriage, administration of low-dose aspirin (section 2.9) and a prophylactic dose of a low molecular weight heparin (section 2.8.1) may decrease the risk of fetal loss (use under specialist supervision only).

Hormone replacement therapy In women with a uterus a progestogen needs to be added to long-term oestrogen therapy for hormone replacement, to prevent cystic hyperplasia of the endometrium and possible transformation to cancer; it can be added on a cyclical or a continuous basis (see section 6.4.1.1). Combined packs incorporating suitable progestogen tablets are available, see p. 492.

Oral contraception Desogestrel, gestodene, levonorgestrel, norethisterone, and norgestimate are used in combined oral contraceptives and in progestogen-only contraceptives (section 7.3.1 and section 7.3.2).

Cancer Progestogens also have a role in neoplastic disease (section 8.3.2).

Cautions Progestogens should be used with caution in conditions that may worsen with fluid retention e.g. epilepsy, hypertension, migraine, asthma, or cardiac dysfunction, and in those susceptible to thromboembolism (particular caution with high dose). Care is also required in those with a history of depression. Progestogens can decrease glucose tolerance and patients with diabetes should be monitored closely. For interactions see Appendix 1 (progestogens).

Contra-indications Progestogens should be avoided in patients with a history of liver tumours. They are also contra-indicated in those with genital or breast cancer (unless progestogens are being used in the management of these conditions), severe arterial disease, undiagnosed vaginal bleeding and acute porphyria (section 9.8.2). Progestogens should not be used if there is a history during pregnancy of idiopathic jaundice, severe pruritus, or pempigoid gestations.

Side-effects Side-effects of progestogens include menstrual disturbances, premenstrual-like syndrome (including bloating, fluid retention, breast tenderness), weight change, nausea, headache, dizziness, insomnia, drowsiness, depression, change in libido; also skin reactions (including urticaria, pruritus, rash, and acne), hirsutism and alopecia. Jaundice and anaphylactoid reactions have also been reported.

### Dydrogestosterone

**Indications** HRT (section 6.4.1.1)

**Contra-indications** see notes above

**Hepatic impairment** avoid, see also Combined Hormonal Contraceptives, section 7.3.1

**Renal impairment** use with caution

**Pregnancy** not known to be harmful

**Breast-feeding** present in milk—no adverse effects reported

**Dose**

- See under combined preparations (section 6.4.1.1)

### Medroxyprogesterone acetate

**Indications** see under Dose; contraception (section 7.3.2.2); malignant disease (section 8.3.2)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** section 8.3.2

**Renal impairment** use with caution

**Pregnancy** section 8.3.2

**Breast-feeding** section 8.3.2

**Side-effects** see notes above; indigestion

**Dose**

- By mouth, 2.5–10 mg daily for 5–10 days beginning on day 16 to 21 of cycle, repeated for 2 cycles in dysfunctional uterine bleeding and 3 cycles in secondary amenorrhoea
- Mild to moderate endometriosis, 10 mg 3 times daily for 90 consecutive days, beginning on day 1 of cycle
- Progestogen opposition of oestrogen HRT, 10 mg daily for the last 14 days of each 28-day oestrogen HRT cycle

**Provera**® (Pharmacia) tablets, all scored, medroxyprogesterone acetate 2.5 mg (orange), net price 30-tab pack = £1.84; 5 mg (blue), 10-tab pack = £1.23; 10 mg (white), 10-tab pack = £2.47, 90-tab pack = £22.16

**Climanor**® (ReSource Medical) tablets, f/c, medroxyprogesterone acetate 5 mg, net price 28-tab pack = £3.27

**Combined preparations**

Section 6.4.1.1

### Norlethisterone

**Indications** see under Dose; HRT (section 6.4.1.1); contraception (section 7.3.1 and section 7.3.2); malignant disease (section 8.3.2)

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** section 8.3.2

**Renal impairment** use with caution

**Pregnancy** section 8.3.2
Breast-feeding section 8.3.2

Side-effects see notes above

Dose
- Endometriosis, by mouth, 10–15 mg daily for 4–6 months or longer, starting on day 5 of cycle (if spotting occurs increase dose to 20–25 mg daily, reduced once bleeding has stopped)
- Dysfunctional uterine bleeding, menorrhagia (but see notes above), by mouth, 5 mg 3 times daily for 10 days to arrest bleeding; to prevent bleeding 5 mg twice daily from day 19 to 26
- Dysmenorrhoea (but see notes above), by mouth, 5 mg 3 times daily from day 5 to 24 for 3–4 cycles
- Premenstrual syndrome (but not recommended, see notes above), by mouth, 5 mg 2–3 times daily from day 19 to 26 for several cycles
- Postponement of menstruation, by mouth, 5 mg 3 times daily starting 3 days before expected onset (menstruation occurs 2–3 days after stopping)

Norethisterone (Non-proprietary)
- Tablets, norethisterone 5 mg, net price 30-tab pack = £2.04
- Tablets, norethisterone 5 mg, net price 30-tab pack = £2.26

Primolut N® (Bayer) Tests
- Tablets, norethisterone 5 mg, net price 30-tab pack = £1.40, 90-tab pack = £4.21

Combined preparations Section 6.4.1.1

PROGESTERONE

Indications see under preparations

Cautions see notes above

Contra-indications see notes above; missed or incomplete miscarriage

Hepatic impairment avoid; see also Combined Hormonal Contraceptives, section 7.3.1

Renal impairment use with caution

Pregnancy not known to be harmful

Breast-feeding present—in milk

Side-effects see notes above; injection-site reactions; with rectal administration, pain, diarrhoea and flatulence; with vaginal administration, local irritation

Dose
- See under preparations

Crinone® (Merck Serono)
- Vaginal gel, progesterone 90 mg/application (8%), net price 15 = £30.83
- Dose by vagina, infertility due to inadequate luteal phase, insert 1 applicatorful daily starting either after documented ovulation or on day 18–21 of cycle. In vitro fertilisation, daily application continued for 30 days after laboratory evidence of pregnancy

Cyclogest® (Actavis)
- Pessaries, progesterone 200 mg, net price 15 = £8.95; 400 mg, 15 = £12.96
- Dose by vagina or rectum, premenstrual syndrome and post-natal depression, 200 mg daily to 400 mg twice daily; for premenstrual syndrome start on day 12–14 and continue until onset of menstruation (but not recommended, see notes above); rectally if barrier methods of contraception are used, in patients who have recently given birth or in those who suffer from vaginal infection or recurrent cystitis

Gestone® (Nordic)
- Injection, progesterone 50 mg/mL, net price 1-mL amp = £4.50, 2-mL amp = £4.50
- Dose by deep intramuscular injection into buttock, dysfunctional uterine bleeding, 5–10 mg daily for 5–10 days until 2 days before expected onset of menstruation
- Recurrent miscarriage due to inadequate luteal phase (but not recommended, see notes above) or following in vitro fertilisation or gamete intra-fallopian transfer, 25–100 mg 2–7 times a week from day 15, or day of embryo or gamete transfer, until 8–16 weeks of pregnancy; max. 200 mg daily

Lublon® (Pharmasure)
- Injection, progesterone, net price 25-mg vial = £8.00
- Dose by subcutaneous or intramuscular injection, supplementation of luteal phase during assisted reproductive technology (ART) treatment in women for whom vaginal preparations are inappropriate, 25 mg once daily from day of oocyte retrieval up to week 12 of pregnancy

Ulipristal acetate is a progesterone receptor modulator with a partial progesterone antagonist effect. Ulipristal is used in the pre-operative treatment of moderate to severe symptoms of uterine fibroids; it is also used as an hormonal emergency contraceptive (see section 7.3.5).

ULIPRISTAL ACETATE

Indications pre-operative treatment of moderate to severe symptoms of uterine fibroids

Cautions uncontrolled severe asthma; non-hormonal contraceptive methods (barrier methods or intra-uterine device) should be used during treatment and for 12 days after stopping, if required; interactions: see Appendix 1 (ulipristal)

Contra-indications undiagnosed vaginal bleeding, vaginal bleeding not caused by uterine fibroids; uterine, ovarian, cervical, or breast cancer

Hepatic impairment caution in moderate to severe impairment—no information available

Renal impairment caution in severe impairment—no information available

Pregnancy manufacturer advises avoid—no information available

Breast-feeding manufacturer advises avoid—no information available

Side-effects nausea, abdominal pain, oedema, hot flushes, headache, dizziness, malaise, menstrual disturbances, uterine haemorrhage, endometrial thickening, ovarian cyst (including rupture), breast pain,
pelvic pain, myalgia, acne, hyperhidrosis; less commonly dypnea, dry mouth, flatulence, constipation, epistaxis, anxiety, urinary incontinence

**Dose**
- **ADULT** over 18 years, 5 mg daily for up to 3 months starting during the first week of menstruation; if necessary, repeat course once, starting during the second menstruation after first course completed; max. 2 courses of 3 months

**Esmyla®** (Gedeon Richter) ▼ (in)
Tablets, ulipristal acetate 5 mg, net price 28-tab pack = £114.13

### 6.4.2 Male sex hormones and antagonists

Androgens cause masculinisation; they may be used as replacement therapy in castrated adults and in those who are hypogonadal due to either pituitary or testicular disease. In the normal male they inhibit pituitary gonadotrophin secretion and depress spermatogenesis. Androgens also have an anabolic action which led to the development of anabolic steroids (section 6.4.3).

Androgens are useless as a treatment of impotence and impaired spermatogenesis unless there is associated hypogonadism; they should not be given until the hypogonadism has been properly investigated. Treatment should be under expert supervision.

When given to patients with hypopituitarism they can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone (section 6.5.1) which will stimulate spermatogenesis as well as androgen production.

Caution should be used when androgens or chorionic gonadotrophin are used in treating boys with delayed puberty since the fusion of epiphyses is hastened and may result in short stature; skeletal maturation should be monitored.

Intramuscular depot preparations of testosterone esters are preferred for replacement therapy. Testosterone enantate, propionate or undecanoate, or alterations are preferred for replacement therapy. Testosterone implants can be used in postmenopausal women as an adjunct to hormone replacement therapy.

**TESTOSTERONE AND ESTERS**

**Indications** see under preparations

**Cautions** cardiac impairment, elderly, ischaemic heart disease, hypertension, epilepsy, migraine, diabetes mellitus, skeletal metastases (risk of hypercalcaemia), undertake regular examination of the prostate and breast during treatment; monitor full blood count, lipid profile and liver function; pre-pubertal boys (see notes above and under Side-effects); interactions: Appendix 1 (testosterone)

**Women** Regularly assess for androgenic side-effects; women should be advised to report any signs of virilisation e.g. deepening of the voice or hirsutism

**Contra-indications** breast cancer in men, prostate cancer, history of primary liver tumours, hypercalcaemia, nephrotic syndrome

**Hepatic impairment** avoid if possible—fluid retention and dose-related toxicity

**Renal impairment** caution—potential for fluid retention

**Pregnancy** avoid; causes masculinisation of the female fetus

**Breast-feeding** avoid; may cause masculinisation in the female infant or precocious development in the male infant; high doses suppress lactation

**Side-effects** prostate abnormalities and prostate cancer, headache, depression, gastro-intestinal bleeding, nausea, vomiting, cholestatic jaundice, changes in libido, gynaecomastia, polycystic ovaries, anxiety, irritability, nervousness, asthenia, parasthesia, hypertension, electrolyte disturbances including sodium retention with oedema and hypercalcaemia, weight gain; increased bone growth, muscle cramps, arthralgia; androgenic effects such as hirsutism, male-pattern baldness, seborrhoea, acne, pruritus, excessive frequency and duration of penile erection, precocious sexual development and premature closure of epiphyseal development in pre-pubertal males, suppression of spermatogenesis in men and virilism in women; rarely liver tumours; sleep apnoea also reported; with buccal tablets and gel, local irritation and allergic reactions, and taste disturbances

**Dose**
- See under preparations

#### Oral

**Restandol®** (Testocaps (MSD)) (in)
Capsules, orange, testosterone undecanoate 40 mg in oily solution, net price 30-cap pack = £8.55; 60-cap pack = £17.10. Label: 21, 25

**Dose** androgen deficiency, 120–160 mg daily for 2–3 weeks; maintenance 40–120 mg daily

#### Buccal

**Striant® SR** (The Urology Co.) (in)
Mucoadhesive buccal tablets, m/r, testosterone 30 mg, net price 60-tab pack = £28.00. Counselling, see under Dose below.

**Dose** hypogonadism, 30 mg every 12 hours; CHILD and ADOLESCENT under 18 years not recommended

**Counselling** Place rounded side of tablet on gum above front teeth and hold lip firmly over the gum for 30 seconds. If tablet detaches within 4 hours of next dose, replace with new tablet which is considered the second dose for the day.

#### Intramuscular

**Testosterone Enantate** (Non-proprietary) (in)
Injection (oily), testosterone enantate 250 mg/mL, net price 1-mL amp = £19.62

**Dose** by slow intramuscular injection, hypogonadism, initially 250 mg every 2–3 weeks; maintenance 250 mg every 3–6 weeks

**Breast cancer**, 250 mg every 2–3 weeks

**Nebido®** (Bayer) (in)
Injection (oily), testosterone undecanoate 250 mg/mL, net price 4-mL amp = £80.00; 4-mL vial = £80.00

**Dose** by deep intramuscular injection over 2 minutes, hypogonadism in men over 18 years, 1 g every 10–14 weeks; if necessary, second dose may be given after 6 weeks to achieve rapid steady state plasma testosterone levels and then every 10–14 weeks

**Notes** Always use a new vial of testosterone undecanoate, unless in a clinic setting, where multiple patients can be catered for; it is not possible to open and close a vial of testosterone undecanoate and re-use for another patient.

</table>

**Pro-Viron** | (Bayer) | (Rx) |
| **Tablets** | scored, mesterolone 25 mg. Net price 30-tab pack = £4.19 |

**Anti-androgens**

**Cyproterone acetate**

Cyproterone acetate is an anti-androgen used in the treatment of severe hypersexuality and sexual deviation in the male. It inhibits spermatogenesis and produces reversible infertility (but is not a male contraceptive); abnormal sperm forms are produced. Fully informed consent is recommended and an initial spermogram. As hepatic tumours have been produced in animal studies, careful consideration should be given to the risk/benefit ratio before treatment. Cyproterone acetate is also used as an adjunct in prostatic cancer (section 8.3.4.2) and in the treatment of acne and hirsutism in women (section 13.6.2).

**CYPROTERONE ACETATE**

| **Indications** see notes above; prostate cancer (section 8.3.4.2) |
| **Cautions** ineffective for male hypersexuality in chronic alcoholism (relevance to prostate cancer not known); blood counts initially and throughout treatment; monitor hepatic function regularly (liver function tests should be performed before treatment, see also under Side-effects below); monitor adrenocortical function regularly; diabetes mellitus (see also Contra-indications) |
| **Driving** Fatigue and lassitude may impair performance of skilled tasks (e.g. driving) |
| **Contra-indications** (do not apply in prostate cancer); severe diabetes (with vascular changes), sickle-cell anaemia, liver-disease including Dubin-Johnson andRotor syndromes, previous or existing liver tumours, malignant or wasting diseases, meningioma or history of meningioma, severe depression, history of thromboembolic disorders; youths under 18 years (may arrest bone maturation and testicular development) |

**Sustanon 250** | (MSD) | (Rx) |
| **Injection** (oily); testosterone propionate 30 mg; testosterone phenylpropionate 60 mg; testosterone isocaproate 60 mg, and testosterone decanoate 100 mg/mL, net price 1-mL amp = £2.45 |
| **Excipients** include arachis (peanut) oil, benzyl alcohol (see Excipients p. 2) |
| **Dose** by deep intramuscular injection, androgen deficiency, 1 mL usually every 3 weeks |

**Viormone** | (Nordic) | (Rx) |
| **Injection**, testosterone propionate 50 mg/mL, net price 2-mL amp = £4.50 |
| **Dose** by intramuscular injection, androgen deficiency, 50 mg 2–3 times weekly |
| Delayed puberty, 50 mg weekly |
| Breast cancer in women, 100 mg 2–3 times weekly |

**Implant**

**Testosterone** | (MSD) | (Rx) |
| **Implant**, testosterone 100 mg, net price = £9.99; 200 mg = £15.17 |
| **Dose** by implantation, male hypogonadism, 100–600 mg; 600 mg usually maintains plasma-testosterone concentration within the normal range for 4–5 months |

**Transdermal preparations**

**Testim** | (Ferring) | (Rx) |
| **Gel**, testosterone 50 mg/5 g tube, net price 30-tube pack = £32.00. Counselling, administration |
| **Excipients** include propylene glycol (see section 13.1.3) |
| **Dose** hypogonadism due to testosterone deficiency in men (over 18 years), 50 mg testosterone (5 g gel) applied once daily; subsequent application adjusted according to response, max. 100 mg (10 g gel) daily |
| **Counselling** Squeeze entire content of tube on to one palm and apply as a thin layer on clean, dry, healthy skin of shoulder or upper arm, preferably in the morning after washing or bathing (if 2 tubes required use 1 per shoulder or upper arm), rub in and allow to dry before putting on clothing to cover site; wash hands with soap after application, avoid washing application site for at least 6 hours |
| Avoid skin contact with application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature |

**Testogel** | (Bayer) | (Rx) |
| **Gel**, testosterone 50 mg/5 g sachet, net price 30-sachet pack = £31.11. Counselling, administration |
| **Dose** hypogonadism due to androgen deficiency in men (over 18 years), 50 mg testosterone (5 g gel) to be applied once daily; subsequent application adjusted according to response in 25-mg (2.5 g gel) increments to max. 100 mg (10 g gel) daily |
| **Counselling** Apply thin layer of gel on clean, dry, healthy skin such as shoulders, arms or abdomen, immediately after sachet is opened. Not to be applied on genital area as high alcohol content may cause local irritation. Allow to dry for 3–5 minutes before dressing. Wash hands with soap and water after applying gel, avoid shower or bath for at least 6 hours |
| Avoid skin contact with gel application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature |

**Tostran** | (ProStrakan) | (Rx) |
| **Gel**, testosterone 2% (10 mg/metered application), net price 60-g multidose dispenser = £28.67. Counselling, administration |
| **Excipients** include butylhydroxytoluene, propylene glycol (see section 13.1.3) |
| **Dose** hypogonadism due to testosterone deficiency in men (over 18 years), initially 60 mg testosterone (3 g gel) applied once daily; subsequent applications adjusted according to response; max. 80 mg (4 g gel) daily |
| **Counselling** Apply gel on clean, dry, intact skin of abdomen or both inner thighs, preferably in the morning. Gently rub in with a finger until dry before dressing. Wash hands with soap and water after applying gel; avoid washing application site for at least 2 hours. Not to be applied on genital area. Avoid skin contact with gel application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature |
**DUTASTERIDE**

**Indications**  
benign prostatic hyperplasia

**Cautions**  
see notes above; also obstructive uropathy

**Male breast cancer**  
Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge

**Side-effects**  
see notes above; also testicular pain, hypersensitivity reactions (including lip and face swelling, pruritus and rash); male breast cancer also reported (see Cautions above)

**Dosage**  
- **Adult**
  - over 18 years, male hyposexual activity, 50 mg twice daily after food

**Cyproterone Acetate** *(Non-proprietary)*  
Tablets, cyproterone acetate 50 mg, net price 56-tab pack = £29.00. Label: 21, counselling, driving

**Androcur®** *(Bayes)*  
Tablets, scored, cyproterone acetate 50 mg, net price 56-tab pack = £29.25. Label: 21, counselling, driving

**FINASTERIDE**

**Indications**  
benign prostatic hyperplasia; male-pattern baldness in men (section 13.9)

**Cautions**  
see notes above; also obstructive uropathy

**Male breast cancer**  
Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge

**Side-effects**  
see notes above; also testicular pain, hypersensitivity reactions (including lip and face swelling, pruritus and rash); male breast cancer also reported (see Cautions above)

**Dosage**  
- 5 mg daily, review treatment at 3–6 months and then every 6–12 months (may require several months’ treatment before benefit is obtained)

**Finasteride** *(Non-proprietary)*

Tablets, finasteride 5 mg, net price 28-tab pack = £1.48

**Proscar®** *(MSD)*

Tablets, blue, f /c, finasteride 5 mg, net price 28-tab pack = £13.94

**6.4.3 Anabolic steroids**

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in women. They are used in the treatment of some aplastic anae-mias (section 9.1.3). Anabolic steroids have been given for osteoporosis in women but they are no longer advocated for this purpose.

The protein-building properties of anabolic steroids have not proved beneficial in the clinical setting. Their use as body builders or tonics is unjustified; some athletes abuse them.

**NANDROLONE**

**Indications**  
osteoporosis in postmenopausal women (but not recommended, see notes above); aplastic anaemia (section 9.1.3)

**Cautions**  
cardiac impairment, hypertension, diabetes mellitus, epilepsy, migraine; monitor skeletal maturation in young patients; skeletal metastases (risk of hypercalcaemia); **interactions**: Appendix 1 (anabolic steroids)

**Contra-indications**  
prostate cancer, male breast cancer, acute porphyria (section 9.8.2)

**Hepatic impairment**  
use in severe hepatic impairment only if benefit outweighs risk

**Renal impairment**  
use with caution—may cause sodium and water retention

**Side-effects**  
acne, sodium retention with oedema, virilisation with high doses including voice changes
6.5 Hypothalamic and pituitary hormones and anti-oestrogens

6.5.1 Hypothalamic and anterior pituitary hormones and anti-oestrogens

Anti-oestrogens

The anti-oestrogens clomifene (clomiphene) and tamoxifen (section 8.3.4.1) are used in the treatment of female infertility due to oligomenorrhoea or secondary amenorrhoea (e.g. associated with polycystic ovarian disease). They induce gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; choricron gonadotrophin is sometimes used as an adjunct. Patients should be warned that there is a risk of multiple pregnancy (rarely more than twins).

Pregnancy exclude pregnancy before treatment; possible effects on fetal development

Breast-feeding may inhibit lactation

Side-effects visual disturbances (withdraw), ovarian hyperstimulation (withdraw), hot flushes, abdominal discomfort, occasionally nausea, vomiting, depression, insomnia, breast tenderness, headache, intermenstrual spotting, menorrhagia, endometriosis, convulsions, weight gain, rashes, dizziness, hair loss

Dose

- 50 mg daily for 5 days, starting within about 5 days of onset of menstruation (preferably on 2nd day) or at any time (normally preceded by a progestogen-induced withdrawal bleed) if cycles have ceased; second course of 100 mg daily for 5 days may be given in absence of ovulation; most patients who are going to respond will do so to first course; 3 courses should constitute adequate therapeutic trial; long-term cyclical therapy not recommended—see CSM advice, above

Clomifene (Non-proprietary) Tablet, clomifene citrate 50 mg, net price 30-tab pack = £21.74

Clomid® (Sanofi-Aventis) Tablet, yellow, scored, clomifene citrate 50 mg. Net price 30-tab pack = £8.46

Anterior pituitary hormones

Corticotrophins

Tetracosactide (tetracosactrin), an analogue of corticotropin (ACTH), is used to test adrenocortical function; failure of the plasma cortisol concentration to rise after administration of tetracosactide indicates adrenocortical insufficiency.

Both corticotropin and tetracosactide were formerly used as alternatives to corticosteroids in conditions such as Crohn’s disease or rheumatoid arthritis; their value was limited by the variable and unpredictable therapeutic response and by the waning of their effect with time.

TETRACOSACTIDE

(Tetracosactrin)

Indications see notes above

Cautions as for corticosteroids, section 6.3.2; important: risk of anaphylaxis (medical supervision; consult product literature); history of atopic allergy (e.g. asthma, eczema, hayfever); history of hypersensitivity; interactions: Appendix 1 (corticosteroids)

Contra-indications as for corticosteroids, section 6.3.2; avoid injections containing benzyl alcohol in neonates (see under preparations); history of hypersensitivity to corticotrophins

Hepatic impairment see section 6.3.2

Renal impairment see section 6.3.2

Pregnancy avoid (but may be used diagnostically if essential)

Breast-feeding avoid (but may be used diagnostically if essential)

Side-effects as for corticosteroids, section 6.3.2

Dose

- See under preparations below
Synacthen® (Alliance)®
Injection, tetracosactide 250 micrograms (as acetate)/mL. Net price 1-mL amp = £2.93
Dose diagnostic (30-minute test), by intramuscular or intravenous injection, 250 micrograms as a single dose

Synacthen Depot® (Alliance)®
Injection (aqueous suspension), tetracosactide acetate 1 mg/mL, with zinc phosphate complex. Net price 1-mL amp = £4.18
Excipients include benzyl alcohol (avoid in neonates, see Excipients p. 2)
Dose diagnostic (5-hour test), by intramuscular injection, 1 mg as a single dose
Note Formerly used therapeutically by intramuscular injection, in an initial dose of 1 mg daily (or every 12 hours in acute cases); reduced to 1 mg every 2–3 days, then 1 mg weekly (or 500 micrograms every 2–3 days) but value was limited (see notes above)

Chorionic gonadotrophins
Follicle-stimulating hormone (FSH) and luteinising hormone (LH) together (as in human menopausal gonadotrophin), follicle-stimulating hormone alone (as in follicitropin), or chorionic gonadotrophin, are used in the treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene, or in superovulation treatment for assisted conception (such as in vitro fertilisation).
The gonadotrophins are also occasionally used in the treatment of hypogonadotrophic hypogonadism and associated oligospermia. There is no justification for their use in primary gonadal failure.
Chorionic gonadotrophin has also been used in delayed puberty in the male to stimulate endogenous testosterone production, but has little advantage over testosterone (section 6.4.2).

CHORIONIC GONADOTROPIN
(Human Chorionic Gonadotrophin; HCG)
A preparation of a glycoprotein fraction secreted by the placenta and obtained from the urine of pregnant women having the action of the pituitary luteinising hormone
Indications see notes above
Cautions cardiac impairment, asthma, epilepsy, migraine; prepubertal boys (risk of premature epiphyseal closure or precocious puberty)
Contra-indications androgen-dependent tumours
Renal impairment use with caution
Side-effects oedema (particularly in males—reduce dose), headache, tiredness, mood changes, gynaecomastia, local reactions; may aggravate ovarian hyperstimulation, multiple pregnancy
Dose
• By subcutaneous or intramuscular injection, according to patient’s response
Choragon® (Ferring)®
Injection, powder for reconstitution, chorionic gonadotrophin. Net price 5000-unit amp (with solvent) = £3.26. For intramuscular injection
Pregnyl® (MSD)®
Injection, powder for reconstitution, chorionic gonadotrophin. Net price 1500-unit amp = £2.12; 5000-unit amp = £3.15 (both with solvent). For subcutaneous or intramuscular injection

CHORIOGONADOTROPIN ALFA
(Human chorionic gonadotropin)
Indications see notes above
Cautions acute porphyria (section 9.8.2)
Contra-indications ovarian enlargement or cyst (unless caused by polycystic ovarian disease); ectopic pregnancy in previous 3 months; acute thromboembolic disorders; hypothalamus, pituitary, ovarian, uterine or mammary malignancy
Side-effects nausea, vomiting, abdominal pain; headache, tiredness; injection-site reactions; ovarian hyperstimulation syndrome; rarely diarrhoea, depression, irritability, breast pain; ectopic pregnancy and ovarian torsion reported
Dose
• By subcutaneous injection, according to patient’s response
Ovitrelle® (Merck Serono)®
Injection, choriogonadotropin alfa, net price 6500-unit/0.5 mL (250-micrograms/0.5 mL) prefilled syringe or prefilled pen = £31.38

CORIFOLLITROPIN ALFA
Indications controlled ovarian stimulation in combination with a gonadotrophin-releasing hormone agonist
Cautions risk factors for thromboembolism; risk of ovarian hyperstimulation syndrome; acute porphyria (section 9.8.2)
Contra-indications ovarian enlargement or cyst; polycystic ovarian syndrome; tumours of hypothalamus, pituitary, ovaries, uterus, or breast; vaginal bleeding of unknown cause; history of ovarian hyperstimulation syndrome
Renal impairment avoid
Breast-feeding avoid
Side-effects nausea; headache, fatigue; ovarian hyperstimulation, pelvic pain, breast pain; less commonly vomiting, abdominal distension and pain, diarrhoea, constipation, dizziness, ovarian torsion; also reported ectopic pregnancy, miscarriage, and multiple pregnancies
Dose
• By subcutaneous injection, body-weight under 60 kg, 100 micrograms; body-weight over 60 kg, 150 micrograms
Elonva® (MSD)®
Injection, prefilled syringe, corifollitropin alfa, net price 100 micrograms/0.5 mL = £638.00; 150 micrograms/0.5 mL = £638.00

FOLLITROPIN ALFA and BETA
(Recombinant human follicle stimulating hormone)
Indications see notes above
Cautions acute porphyria (section 9.8.2)
Contra-indications see under Human Menopausal Gonadotrophins
Pregnancy avoid
Breast-feeding avoid
Side-effects see under Human Menopausal Gonadotrophins
6 Endocrine system

504 6.5.1 Hypothalamic and anterior pituitary hormones and anti-oestrogens  BNF 68

Dose
• By subcutaneous or intramuscular injection, according to patient’s response

Follitropin alfa
Gonal-F® (Merck Serono)  
Injection, powder for reconstitution, follitropin alfa. Net price 75-unit amp = £21.02; 450 units/0.75 mL, multidose vial = £126.10; 1050 units/1.75 mL, multidose vial = £294.22 (all with solvent). For subcutaneous injection
Injection, prefilled pen, follitropin alfa 600 units/mL, net price 0.5 mL (300 units) = £94.00, 0.75 mL (450 units) = £141.00, 1.5 mL (900 units) = £282.00. For subcutaneous injection

Follitropin alfa with lutropin alfa
Pergoveris® (Merck Serono)  
Injection, powder for reconstitution, follitropin alfa 150 units (11 micrograms), lutropin alfa 75 units (3 micrograms), net price per vial (with solvent) = £60.29. For subcutaneous injection

Follitropin beta
Puregon® (MSD)  
Injection, follitropin beta 100 units/mL, net price 0.5-mL (50-unit) vial = £18.03; 200 units/mL, 0.5-mL (100-unit) vial = £36.06; 0.36-mL (300-unit) cartridge = £97.41, 0.72-mL (600-unit) cartridge = £194.82, 1.08-mL (900-unit) cartridge = £292.23, (cartridges for use with Puregon® pen). For subcutaneous (cartridges and vials) or intramuscular injection (vials)
Excipients may include neomycin and streptomycin

HUMAN MENOPAUSAL GONADOTROPHINS

Indications  see notes above
Cautions  acute porphyria (section 9.8.2)
Contra-indications  ovarian enlargement or cyst (unless caused by polycystic ovarian disease); undiagnosed vaginal bleeding; tumours of hypothalamus and pituitary; ovarian, uterine or mammary carcinoma
Side-effects  nausea, vomiting, abdominal and pelvic pain; headache, somnolence; injection-site reactions; ovarian hyperstimulation syndrome, ovarian cyst, breast pain, ectopic pregnancy; thromboembolism, adnexal torsion, and haemoperitoneum
Dose  • By subcutaneous injection, in conjunction with follitropin-stimulating hormone, according to response

Luveris® (Merck Serono)  
Injection, powder for reconstitution, lutropin alfa, net price 75-unit vial = £31.38 (with solvent)

Growth hormone

Growth hormone is used to treat deficiency of the hormone in children and in adults (see NICE guidance below). In children it is used in Prader-Willi syndrome, Turner syndrome, chronic renal insufficiency, short children considered small for gestational age at birth, and short stature homeobox-containing gene (SHOX) deficiency.

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human sequence, somatropin, produced using recombinant DNA technology.

LUTROPIN ALFA
(Recombinant human luteinising hormone)

Indications  see notes above
Cautions  acute porphyria (section 9.8.2)
Contra-indications  ovarian enlargement or cyst (unless caused by polycystic ovarian disease); undiagnosed vaginal bleeding; tumours of hypothalamus and pituitary; ovarian, uterine or mammary carcinoma
Side-effects  nausea, vomiting, abdominal and pelvic pain; headache, somnolence; injection-site reactions; ovarian hyperstimulation syndrome, ovarian cyst, breast pain, ectopic pregnancy; thromboembolism, adnexal torsion, and haemoperitoneum
Dose  • By subcutaneous injection, in conjunction with follitropin-stimulating hormone, according to response
NICE guidance

**Somatropin for the treatment of growth failure in children (May 2010)**

Somatropin is recommended for children with growth failure who:

- have growth-hormone deficiency;
- have Turner syndrome;
- have Prader-Willi syndrome;
- have chronic renal insufficiency;
- are born small for gestational age with subsequent growth failure at 4 years of age or later;
- have short stature homeobox-containing gene (SHOX) deficiency.

Treatment should be discontinued if growth velocity increases by less than 50% from baseline in the first year of treatment.

www.nice.org.uk/TA188

---

**Somatropin for adults with growth hormone deficiency (August 2003)**

Somatropin is recommended in adults only if the following 3 criteria are fulfilled:

- Severe growth hormone deficiency, established by an appropriate method;
- Impaired quality of life, measured by means of a specific questionnaire;
- Already receiving treatment for another pituitary hormone deficiency.

Somatropin treatment should be discontinued if the quality of life has not improved sufficiently by 9 months.

Severe growth hormone deficiency developing after linear growth is complete but before the age of 25 years should be treated with growth hormone; treatment should continue until adult peak bone mass has been achieved. Treatment for adult-onset growth hormone deficiency should be stopped only when the patient and the patient’s physician consider it appropriate.

Treatment with somatropin should be initiated and managed by a physician with expertise in growth hormone disorders; maintenance treatment can be prescribed in the community under a shared-care protocol.

www.nice.org.uk/TA64

---

**Mecasermin**, a human insulin-like growth factor-I (rhIGF-I), is licensed to treat growth failure in children and adolescents with severe primary insulin-like growth factor-I deficiency (section 6.7.4).

Silver-Russell syndrome; rotate subcutaneous injection sites to prevent lipoatrophy; interactions: Appendix 1 (somatropin)

**Contra-indications** evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting); not to be used after renal transplantation or for growth promotion in children with closed epiphyses (or near closure in Prader-Willi syndrome); severe obesity or severe respiratory impairment in Prader-Willi syndrome

**Pregnancy** discontinue if pregnancy occurs—no information available

**Breast-feeding** no information available

**Side-effects** headache, funduscopiy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported); fluid retention (peripheral oedema), arthralgia, myalgia, carpal tunnel syndrome, paraesthesia, antibody formation, hypothyroidism, insulin resistance, hyperglycaemia, hypoglycaemia, reactions at injection site; leukaemia in children with growth hormone deficiency also reported

**Dose**

- Gonadal dysgenesis (Turner syndrome), by subcutaneous injection, 45–50 micrograms/kg daily or 1.4 mg/m² daily
- Deficiency of growth hormone in children, by subcutaneous or intramuscular injection, 23–39 micrograms/kg daily or 0.7–1 mg/m² daily
- Growth disturbance in short children born small for gestational age whose growth has not caught up by 4 years or later, by subcutaneous injection, 35 micrograms/kg daily or 1 mg/m² daily
- Prader-Willi syndrome, by subcutaneous injection in children with growth velocity greater than 1 cm/year, in combination with energy-restricted diet, 35 micrograms/kg daily or 1 mg/m² daily; max. 2.7 mg daily
- Chronic renal insufficiency in children (renal function decreased to less than 50%), by subcutaneous injection, 45–50 micrograms/kg daily or 1.4 mg/m² daily (higher doses may be needed) adjusted if necessary after 6 months
- Adult growth hormone deficiency, by subcutaneous injection, initially 150–300 micrograms daily, gradually increased if required to max. 1 mg daily; use minimum effective dose (requirements may decrease with age)
- SHOX deficiency in children, by subcutaneous injection, 45–50 micrograms/kg daily

**Note** Dose formerly expressed in units; somatropin 1 mg = 3 units

---

**SOMATROPIN**

*(Recombinant Human Growth Hormone)*

**Indications** see under Dose

**Cautions** diabetes mellitus (adjustment of antidiabetic therapy may be necessary), papilloedema (see under Side-effects), relative deficiencies of other pituitary hormones (notably hypothyroidism—manufacturers recommend periodic thyroid function tests but limited evidence of clinical value), history of malignant disease, disorders of the epiphysis of the hip (monitor for limping), resolved intracranial hypertension (monitor closely), initiation of treatment close to puberty not recommended in child born small for gestational age;

**Genotropin** *(Pharmacia)*

**Injection**, two-compartment cartridge containing powder for reconstitution, somatropin (rbe) and diluent, net price 5.3-mg (16-unit) cartridge = £92.15, 12-mg (36-unit) cartridge = £208.65. For use with Genotropin® Pen device (available free of charge from clinics). For subcutaneous injection

**GoQuick®** injection, two-compartment, multi-dose disposable, prefilled pen containing powder for reconstitution, somatropin (rbe) and diluent, net price 5.3-mg (16-unit) prefilled pen = £92.15; 12-mg (36-unit) prefilled pen = £208.65. For subcutaneous injection
6.5.1 Hypothalamic and anterior pituitary hormones and anti-oestrogens  BNF 68

**MiniQuick** injection, two-compartment single-dose syringe containing powder for reconstitution, somatropin (rbe) and diluent, net price 0.2-mg (6-unit) syringe = £3.48; 0.4-mg (12-unit) syringe = £6.95; 0.6-mg (18-unit) syringe = £10.43; 0.8-mg (24-unit) syringe = £13.91; 1-mg (30-unit) syringe = £17.59; 1.2-mg (36-unit) syringe = £20.87; 1.4-mg (42-unit) syringe = £24.34; 1.6-mg (48-unit) syringe = £27.82; 1.8-mg (54-unit) syringe = £31.30; 2-mg (60-unit) syringe = £34.77. For subcutaneous injection

**Humatrope** (Lilly) 
Injection, powder for reconstitution, somatropin (rbe), net price 6-mg (18-unit) cartridge = £108.00; 12-mg (36-unit) cartridge = £216.00; 24-mg (72-unit) cartridge = £432.00; all supplied with diluent. For subcutaneous or intramuscular injection, cartridges for subcutaneous injection

**Norditropin** (Novo Nordisk) 
**Simplex** injection, somatropin (rbe) 3.3 mg (10 units)/mL, net price 1.5-mL (5-mg, 15-unit) cartridge = £106.35; 6.7 mg (20 units)/mL, 1.5-mL (10-mg, 30-unit) cartridge = £212.70; 10 mg (30 units)/mL, 1.5-mL (15-mg, 45-unit) cartridge = £319.05. For use with appropriate NordiPen® device (available free of charge from clinics). For subcutaneous injection

**NordiFlex** injection, multidose disposable prefilled pen, somatropin (rbe) 10 mg (30 units)/mL, net price 1.5 mL (15-mg, 45-unit) prefilled pen = £347.70. For use with NovoFine® or NovoTwist® needles. For subcutaneous injection

**NutropinAq** ( Ipsen) 
Injection, somatropin (rbe), net price 10 mg (30 units)/mL, net price 1.5 mL (5-mg, 15-unit) cartridge = £73.75; 6.7 mg (20 units)/mL, 1.5 mL (10-mg, 30-unit) cartridge = £147.50. For use with Omnitrope Pen® and Omnitrope Pen 10® devices respectively (available free of charge from clinics). For subcutaneous injection

**Omnitrope** (Sandoz) 
**Injection**, somatropin (rbe) 3.3 mg (10 units)/mL, net price 1.5 mL (5-mg, 15-unit) cartridge = £106.35; 6.7 mg (20 units)/mL, 1.5 mL (10-mg, 30-unit) cartridge = £212.70. For use with Omnitrope Pen 5® and Omnitrope Pen 10® devices respectively (available free of charge from clinics). For subcutaneous injection

**Excipients** include benzyl alcohol (in 5-mg cartridge) (avoid in neonates, see Excipients, p. 2)

**Note** Biosimilar medicine, see p. 1

**Saizen** (Merck Serono) 
**Injection**, somatropin (rmc), 5.83 mg (17.5 units)/mL, net price 1.05-mL (6-mg, 18-unit) cartridge = £139.08; 8 mg (24 units)/mL, 1.5 mL (12-mg, 36-unit) cartridge = £278.16; 2.5 mg (20 units), 60-unit cartridge = £463.60. For use with cool click® needle-free autoinjector device or easypod® autoinjector device (available free of charge from clinics). For subcutaneous injection

**Click.easy®**, powder for reconstitution, somatropin (rmc), net price 8-mg (24-unit) vial (in click easy® device with diluent) = £185.44. For use with one click easy® autoinjector device or cool click® needle-free autoinjector device or easypod® autoinjector device (available free of charge from clinics). For subcutaneous injection

**Zomacton** (Ferring) 
**Injection**, powder for reconstitution, somatropin (rbe), net price 4-mg (12-unit) vial (with diluent) = £79.69, for use with ZomaJet 2® Vision® needle-free device (available free of charge from clinics) or with needles and syringes; 10 mg (30-unit) vial (with diluent) = £199.23, for use with ZomaJet Vision® needle-free device (available free of charge from clinics) or with needles and syringes. For subcutaneous injection

**Excipients** include benzyl alcohol (in 4-mg vial) (avoid in neonates, see Excipients, p. 2)

**Growth hormone receptor antagonists**

**Pegvisomant** is a genetically modified analogue of human growth hormone and is a highly selective growth hormone receptor antagonist. Pegvisomant is licensed for the treatment of acromegaly in patients with inadequate response to surgery, radiation, or both, and to treatment with somatostatin analogues. Pegvisomant should be initiated only by physicians experienced in the treatment of acromegaly.

**PEGVISOMANT**

**Indications** see notes above

**Cautions** liver disease (monitor liver enzymes every 4–6 weeks for 6 months or if symptoms of hepatitis develop); diabetes mellitus (adjustment of antidiabetic therapy may be necessary); possible increase in female fertility

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** diarrhoea, constipation, nausea, vomiting, abdominal distension, dyspepsia, flatulence, elevated liver enzymes; hypertension; headache, asthenia, dizziness, drowsiness, tremor, sleep disturbances; influenza-like syndrome, weight gain, hyperglycaemia, hypoglycaemia; arthralgia, myalgia; injection-site reactions (rotate injection sites to avoid lipohypertrophy), sweating, pruritus, rash; fatigue; hypercholesterolaemia; less commonly thrombocytopenia, leucopenia, leucocytosis, bleeding tendency

**Dose**

- By subcutaneous injection, initially 80 mg, then 10 mg daily, increased in steps of 5 mg daily according to response; max. 30 mg daily; **CHLD** not recommended

**Somavert** (Pfizer) 
**Injection**, powder for reconstitution, pegvisomant, net price 10-mg vial = £50.00; 15-mg vial = £75.00; 20-mg vial = £100.00 (all with solvent)

**Thyrotrophin**

**Thyrotropin alfa** is a recombinant form of thyrotrophin (thyroid stimulating hormone). It is licensed for use with or without radioiodine imaging, together with serum thyroglobulin testing, for the detection of thyroid remnants and thyroid cancer in post-thyroidectomy patients. It is also licensed to increase radio-iodine uptake for the ablation of thyroid remnant tissue in suitable post-thyroidectomy patients.

**THYROTROPIN ALFA**

**Recombinant human thyroid stimulating hormone, rhTSH**

**Indications** see notes above and product literature

**Cautions** presence of thyroglobulin autoantibodies may give false negative results
Contra-indications hypersensitivity to bovine or human thyrotropin
Pregnancy avoid
Breast-feeding avoid
Side-effects nausea, vomiting; headache, dizziness, fatigue; less commonly asthena, paraesthesia, back pain, influenza-like symptoms, rash, urticaria; rarely diarrhoea; very rarely palpitation, flushing, dyspnoea, pain at site of metastases, tremor, arthralgia, myalgia, hyperhidrosis, and injection-site reactions including pain, pruritus, and rash
Dose
- By intramuscular injection into the gluteal muscle, 900 micrograms every 24 hours for 2 doses, consult product literature
Thyrogen® (Genzyme) (PMS) Injection, powder for reconstitution, thyrotropin alfa 900 micrograms/vial, net price = £291.52

Hypothalamic hormones
Gonadorelin when injected intravenously in normal subjects leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. Gonadorelin analogues are indicated in endometriosis and infertility (section 6.7.2) and in breast and prostate cancer (section 8.3.4).

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus. Following a dose of 2 micrograms intramuscularly or 20 micrograms intranasally, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of cranial diabetes insipidus. Failure to respond occurs in nephrogenic diabetes insipidus.

In nephrogenic and partial pituitary diabetes insipidus benefit may be gained from the paradoxical antidiuretic effect of thiazides (section 2.2.1) e.g. chlorothalidone 100 mg twice daily reduced to maintenance dose of 50 mg daily.

Carbamazepine (section 4.8.1) is sometimes useful in partial pituitary diabetes insipidus (in a dose of 200 mg once or twice daily) [unlicensed]; it may act by sensitising the renal tubules to the action of remaining endogenous vasopressin.

Other uses Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand’s disease; it is also used to test fibrinolytic response. For a comment on use of desmopressin in nocturnal enuresis see section 7.4.2.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, prior to more definitive treatment and with variable results. Terlipressin, a derivative of vasopressin with reportedly less pressor and antidiuretic activity, is used similarly.

Oxytocin, another posterior pituitary hormone, is indicated in obstetrics (section 7.1.1).
headache, nausea, vomiting, allergic reactions, and emotional disturbance in children also reported; epistaxis, nasal congestion, rhinitis with nasal spray

Dose

- By mouth (as desmopressin acetate)
  
  Diabetes insipidus, treatment, ADULT and CHILD initially 300 micrograms daily (in 3 divided doses); maintenance, 300–400 micrograms daily in 3 divided doses; range 0.2–1.2 mg daily

  Primary nocturnal enuresis, ADULT (under 65 years) and CHILD over 5 years 200 micrograms at bedtime, only increased to 400 micrograms if lower dose not effective (important: see also Cautions); withdraw for at least 1 week for reassessment after 3 months

  Postoperative polyuria or polydipsia, adjust dose according to urine osmolality

- Sublingually (as desmopressin base)
  
  Diabetes insipidus, treatment, ADULT and CHILD initially 180 micrograms daily in 3 divided doses; range 120–720 micrograms daily

  Primary nocturnal enuresis, ADULT (under 65 years) and CHILD over 5 years 120 micrograms at bedtime, only increased to 240 micrograms if lower dose not effective (important: see also Cautions); withdraw for at least 1 week for reassessment after 3 months

  Polyuria or polydipsia after hypophysectomy, adjust dose according to urine osmolality

- Intranasally (as desmopressin acetate)
  
  Diabetes insipidus, diagnosis, ADULT and CHILD 20 micrograms (limit fluid intake to 500 mL from 1 hour before to 8 hours after administration)

  Diabetes insipidus, treatment, ADULT 10–40 micrograms daily (in 1–2 divided doses); CHILD 5–20 micrograms daily; infants may require lower doses

  Nocturia associated with multiple sclerosis (when other treatments have failed), ADULT (under 65 years) 10–20 micrograms at bedtime (important: see also Cautions); dose not to be repeated within 24 hours

  Renal function testing (empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration), ADULT 40 micrograms; INFANT under 1 year 10 micrograms (restrict fluid intake to 50% at next 2 feeds to avoid fluid overload), CHILD 1–15 years 20 micrograms

  Mild to moderate haemophilia and von Willebrand’s disease, (subcutaneous or intravenous), ADULT and CHILD over 1 month 300 nanograms/kg as a single dose immediately before surgery or after trauma; may be repeated at intervals of 12 hours

  Fibrinolytic response testing, (subcutaneous or intravenous), ADULT and CHILD 300 nanograms/kg; blood sampled after 20 minutes for fibrinolytic activity

  Lumbar-puncture-associated headache, consult product literature

Desmopressin acetate (Non-proprietary) 

Tablets, desmopressin acetate 100 micrograms, net price 90-tab pack = £61.40; 200 micrograms, 30-tab pack = £9.03. Counselling, fluid intake, see above

Nasal spray, desmopressin acetate 10 micrograms/ metered spray, net price 6-mL unit (60 metered sprays) = £9.34. Counselling, fluid intake, see above

Brands include Presenes®

Note Children requiring dose of less than 10 micrograms should be given DDAVP® intranasal solution

DDAVP® (Ferring) 

Tablets, both scored, desmopressin acetate 100 micrograms, net price 90-tab pack = £44.12; 200 micrograms, 90-tab pack = £88.23. Counselling, fluid intake, see above

Oral lyophilisates (DDAVP® Melt), desmopressin (as acetate) 60 micrograms, net price 100-tab pack = £50.53; 120 micrograms, 100-tab pack = £101.07; 240 micrograms, 100-tab pack = £202.14. Label: 26, counselling, fluid intake, see above. For sublingual administration

Intranasal solution, desmopressin acetate 100 micrograms/mL. Net price 2.5-mL dropper bottle and catheter = £9.72. Counselling, fluid intake, see above

Injection, desmopressin acetate 4 micrograms/mL. Net price 1-mL amp = £1.32

DesmoMelt® (Ferring) 

Oral lyophilisates, desmopressin (as acetate) 120 micrograms, net price 30-tab pack = £30.34; 240 micrograms, 30-tab pack = £60.68. Label: 26, counselling, fluid intake, see above. For sublingual administration

Desmotabs® (Ferring) 

Tablets, scored, desmopressin acetate 200 micrograms, net price 30-tab pack = £29.43. Counselling, fluid intake, see above

Desmospray® (Ferring) 

Nasal spray, desmopressin acetate 10 micrograms/ metered spray. Net price 6-mL unit (60 metered sprays) = £25.02. Counselling, fluid intake, see above

Note Children requiring dose of less than 10 micrograms should be given DDAVP® intranasal solution

Oclim® (Ferring) 

Nasal spray, desmopressin acetate 150 micrograms/ metered spray, net price 2.5-mL unit (25 metered sprays) = £75.66. Counselling, fluid intake, see above

Injection, desmopressin acetate 15 micrograms/mL, net price 1-mL amp = £19.22
**TERLIPRESSIN ACETATE**

**Indications**  
bleeding from oesophageal varices

**Cautions**  
elderly; uncontrolled hypertension; vascular disease; heart disease; history of QT-interval prolongation; concomitant use of drugs that prolong the QT-interval; arrhythmia; respiratory disease; septic shock; electrolyte and fluid disturbances

**Renal impairment**  
use with caution in chronic renal failure

**Pregnancy**  
avoid unless benefits outweigh risk—uterine contractions and increased intra-uterine pressure in early pregnancy, and decreased uterine blood flow reported

**Breast-feeding**  
avoid unless benefits outweigh risk—no information available

**Side-effects**  
abdominal cramps, diarrhoea, hyperglycaemia; very rarely stroke, hyperglycaemia; also reported heart failure, skin necrosis

**Dose**  
- See under preparations

**Glypressin® (Ferring)**  
Injection, powder for reconstitution, terlipressin acetate, net price 1-mg vial with 5 mL diluent = £18.47

**Injection**  
solution for injection, terlipressin acetate, 0.12 mg/mL, net price 1-mg (8.5 mL) amp = £19.39

**Dose**  
by intravenous injection, 2 mg every 4 hours until bleeding controlled (after initial dose, may reduce to 1 mg every 4 hours if not tolerated or body-weight under 50 kg); max. duration 48 hours; **CHILD** under 18 years see **BNF** for **Children**

**Variquel® (Sinclair IS)**  
Injection, powder for reconstitution, terlipressin acetate, net price 1-mg vial with 5 mL diluent = £17.90

**Dose**  
by intravenous injection over 1 minute, initially 1 mg if body-weight under 50 kg (initial dose 1.5 mg if body-weight 50–70 kg, or 2 mg if body-weight over 70 kg), then 1 mg every 4–6 hours for up to 72 hours; **CHILD** under 18 years see **BNF** for **Children**

**VASOPRESSIN**

**Indications**  
pituitary diabetes insipidus; bleeding from oesophageal varices

**Cautions**  
heart failure, hypertension, asthma, epilepsy, migraine or other conditions which might be aggravated by water retention; avoid fluid overload

**Contra-indications**  
vascular disease (especially disease of coronary arteries) unless extreme caution, chronic nephritis (unti reasonable blood nitrogen concentrations attained)

**Renal impairment**  
see Contra-indications

**Pregnancy**  
oxytocic effect in third trimester

**Breast-feeding**  
not known to be harmful

**Side-effects**  
fluid retention, pallor, tremor, sweating, vertigo, headache, nausea, vomiting, belching, abdominal cramps, desire to defecate, hypersensitivity reactions (including anaphylaxis), constriction of coronary arteries (may cause anginal attacks and myocardial ischaemia), peripheral ischaemia and rarely gangrene

**Dose**

- By subcutaneous or intramuscular injection, diabetes insipidus, 5–20 units every four hours
- By intravenous infusion, initial control of variceal bleeding, 20 units over 15 minutes

**Synthetic vasopressin**

**Argiressin** (Non-proprietary)

**Injection**  
arginpressin (synthetic vasopressin) 20 units/mL, net price 1-mL amp = £22.50 (hosp. only)

### Antidiuretic hormone antagonists

Demeclocycline (section 5.1.3) can be used in the treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable. Demeclocycline is thought to act by directly blocking the renal tubular effect of antidiuretic hormone.

**Tolvaptan**

Tolvaptan is a vasopressin V$_2$-receptor antagonist licensed for the treatment of hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion; treatment duration with tolvaptan is determined by the underlying disease and its treatment.

Rapid correction of hyponatraemia during tolvaptan therapy can cause osmotic demyelination, leading to serious neurological events; close monitoring of serum-sodium concentration and fluid balance is essential.

**TOLVAPTAN**

**Indications**  
see notes above

**Cautions**  
ensure adequate fluid intake (monitor for dehydration in patients who are fluid-restricted); monitor serum-sodium concentration and fluid balance no later than 6 hours after initiating treatment and every 6 hours during the first 1–2 days of treatment and until dose stabilised; discontinue if rapid rise in serum-sodium concentration (greater than 12 mmol/litre in 24 hours or 18 mmol/litre in 48 hours); diabetes mellitus; pseudohyponatraemia associated with diabetes mellitus (exclude before treatment); increased risk of demyelination syndrome in alcoholism, hypoxia, or malnutrition if rapid correction of hyponatraemia; avoid concomitant drugs that increase serum-sodium concentration; discontinue and perform liver-function tests promptly if symptoms of hepatic impairment (anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, pruritus); **Interactions**: Appendix 1 (tolvaptan)

**Contra-indications**  
anuria; volume depletion; hypovolaemic hyponatraemia; hypermeglaemia; impaired perception of thirst

**Hepatic impairment**  
use with caution in severe impairment—no information available; see also Cautions above

**Renal impairment**  
no information available in severe impairment

**Pregnancy**  
avoid—toxicity in animal studies

**Breast-feeding**  
avoid—present in milk in animal studies
Endocrine system

6.6 Drugs affecting bone metabolism

Side-effects nausea, constipation, dry mouth, postural hypotension, thirst, decreased appetite, fever, malaise, hyperglycaemia, urinary frequency, hyperkalaemia, dehydration, ecchymosis, increased blood creatinine, pruritus, neurological disturbance (following rapid correction of hypoaesthesia); less commonly taste disturbance, renal impairment; also reported hepatic impairment (discontinue), hypernatraemia, hyperuricaemia, hypoglycaemia, syncope, dizziness

Dose
- ADULT over 18 years, 15 mg once daily, increased as required to max. 60 mg daily

Samsc® (Otsuka) Tablets, blue, tolvaptan 15 mg, net price 10-tab pack = £746.80; 30 mg, 10-tab pack = £746.80

6.6 Drugs affecting bone metabolism

6.6.1 Calcitonin and parathyroid hormone

See also calcium (section 9.5.1.1), phosphorus (section 9.5.2), vitamin D (section 9.6.4), and oestrogens in postmenopausal osteoporosis (section 6.4.1.1).

Osteoporosis

Osteoporosis occurs most commonly in postmenopausal women and in those taking long-term oral corticosteroids (glucocorticosteroids). Other risk factors for osteoporosis include low body weight, cigarette smoking, excess alcohol intake, lack of physical activity, family history of osteoporosis, and early menopause.

Those at risk of osteoporosis should maintain an adequate intake of calcium and vitamin D and any deficiency should be corrected by increasing dietary intake or taking supplements.

Elderly patients, especially those who are housebound or live in residential or nursing homes, are at increased risk of calcium and vitamin D deficiency and may benefit from supplements (section 9.5.1.1 and section 9.6.4). Reversible secondary causes of osteoporosis such as hyperthyroidism, hyperparathyroidism, osteomalacia or hypogonadism should be excluded, in both men and women, before treatment for osteoporosis is initiated.

Postmenopausal osteoporosis The bisphosphonates (alendronic acid and risedronate, section 6.6.2) are effective for preventing postmenopausal osteoporosis. Hormone replacement therapy (HRT section 6.4.1.1) is an option where other therapies are contra-indicated, cannot be tolerated, or if there is a lack of response. The CSM has advised that HRT should not be considered first-line therapy for long-term prevention of osteoporosis in women over 50 years of age. HRT is of most benefit for the prophylaxis of postmenopausal osteoporosis if started early in menopause and continued for up to 5 years, but bone loss resumes (possibly at an accelerated rate) on stopping HRT. Women of Afro-Caribbean origin appear to be less susceptible to osteoporosis than those who are white or of Asian origin.

Postmenopausal osteoporosis may be treated with a bisphosphonate (section 6.6.2). The bisphosphonates (such as alendronate and risedronate) decrease the risk of vertebral fracture; alendronate and risedronate have also been shown to reduce non-vertebral fractures. If bisphosphonates are unsuitable calcitriol (section 9.6.4) or strontium ranelate (but see section 6.6.2) may be considered. Calcitonin is no longer recommended for the treatment of postmenopausal osteoporosis as the benefits are outweighed by the risk of malignancy associated with long-term use. Calcitonin [unlicensed indication] has been used for pain relief for up to 3 months after a vertebral fracture when other analgesics were ineffective, but the benefits of treatment should be balanced against the risks. Parathyroid hormone, and teriparatide (section 6.6.1) have been introduced for the treatment of postmenopausal osteoporosis.

Raloxifene (section 6.4.1.1) is licensed for the prophylaxis and treatment of vertebral fractures in postmenopausal women.

NICE guidance

Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008)

Alendronate is recommended as a treatment option for the primary prevention of osteoporotic fractures in the following susceptible postmenopausal women:
- Women over 70 years who have an independent risk factor for fracture (parental history of hip fracture, alcohol intake of 4 or more units per day, or rheumatoid arthritis) or an indicator of low bone mineral density (body mass index under 22 kg/m², ankylosing spondylitis, Crohn’s disease, prolonged immobility, untreated prematurity, or rheumatoid arthritis) and confirmed osteoporosis
- Women aged 65–69 years who have an independent risk factor for fracture and confirmed osteoporosis
- Women under 65 years who have an independent risk factor for fracture and at least one additional indicator of low bone mineral density and confirmed osteoporosis

Risedronate or etidronate [now discontinued] are recommended as alternatives for women:
- in whom alendronate is contra-indicated or not tolerated and
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance

Strontium ranelate [but see also Strontium Ranelate, p. 518] is recommended as an alternative for women:
- in whom alendronate and either risedronate or etidronate are contra-indicated or not tolerated and
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance

Raloxifene is not recommended as a treatment option in postmenopausal women for primary prevention of osteoporotic fractures.

www.nice.org.uk/TA160

1. Available at www.nice.org.uk/TA160
Corticosteroid-induced osteoporosis

To reduce the risk of osteoporosis doses of oral corticosteroids should be as low as possible and courses of treatment as short as possible. The risk of osteoporosis may be related to cumulative dose of corticosteroids; even intermittent courses can therefore increase the risk. The greatest rate of bone loss occurs during the first year of treatment and intermittent courses can therefore increase the risk. Long-term use of high-dose inhaled corticosteroids may also contribute to corticosteroid-induced osteoporosis (section 3.2).

Patients taking (or who are likely to take) an oral corticosteroid for 3 months or longer should be assessed and where necessary given prophylactic treatment; those aged over 65 years are at greater risk. Patients taking oral corticosteroids who have sustained a low-trauma fracture should receive treatment for osteoporosis. The therapeutic options for prophylaxis and treatment of corticosteroid-induced osteoporosis are the same:

- a bisphosphonate (section 6.6.2);
- calcitriol [unlicensed indication] (section 9.6.4);
- hormone replacement (HRT in women (section 6.4.1), testosterone in men [unlicensed indication] (section 6.4.2)).

Calcitonin and parathyroid hormone

Calcitonin is involved with parathyroid hormone in the regulation of bone turnover and hence in the maintenance of calcium balance and homeostasis. Calcitonin (salmon) (salcatonin, synthetic or recombinant salmon calcitonin) is used to lower the plasma-calcium concentration in patients with hypercalcaemia associated with malignancy, see also section 9.5.1.2. Calcitonin is also licensed for treatment of Paget’s disease of bone when other treatments are ineffective or inappropriate; it is also licensed for the prevention of acute bone loss due to sudden immobility. Calcitonin is no longer recommended for the prevention or treatment of postmenopausal osteoporosis because the benefits are outweighed by the risk of malignancy associated with long-term use.

Recombinant parathyroid hormone is used for the treatment of postmenopausal osteoporosis. Teriparatide (a recombinant fragment of parathyroid hormone) is used for the treatment of postmenopausal osteoporosis. Teriparatide (a recombinant fragment of parathyroid hormone) is used for the treatment of postmenopausal osteoporosis in men at increased risk of fracture, and corticosteroid-induced osteoporosis. The Scottish Medicines Consortium, p. 4 has advised (February 2007) that parathyroid hormone (Preotact®) should be initiated by specialists experienced in the treatment of osteoporosis; also that the use of teriparatide (Forteo®) (December 2003) in postmenopausal women should be restricted to the treatment of established (severe) osteoporosis and should be initiated by specialists experienced in the treatment of osteoporosis. Cinacalcet (section 9.5.1.2) is licensed for the treatment of hypercalcaemia in parathyroid carcinoma.

Calcitonin is recommended as an alternative for women:
- in whom alendronate is contra-indicated or not tolerated and
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture (parental history of hip fracture, alcohol intake of 4 or more units per day, or rheumatoid arthritis, as indicated in the full NICE guidance).

Strontium ranelate (but see also Strontium Ranelate, p. 518) or raloxifene are recommended as alternatives for women:
- in whom alendronate and either risedronate or etidronate are contra-indicated or not tolerated and
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance.

Teriparatide is recommended as an alternative for women:
- in whom alendronate and either risedronate or etidronate, or strontium ranelate are contra-indicated or not tolerated, or where treatment with alendronate, risedronate or etidronate has been unsatisfactory (indicated by another fragility fracture and a decline in bone mineral density despite treatment for 1 year) and
- who comply with particular combinations of bone mineral density measurement, age, and number of fractures, as indicated in the full NICE guidance.

1. Available at www.nice.org.uk/TA161
PARATHYROID HORMONE
(Human recombinant parathyroid hormone)

Indications treatment of osteoporosis in postmeno-
pausal women at high risk of fractures (to reduce the
risk of vertebral fractures) (see also section
9.5.1.2).

Cautions monitor serum or urinary calcium concen-
tration at 1, 3 and 6 months after initiation of treat-
ment (consult product literature for guidance if
serum-calcium concentration raised); concomitant cardiac glycosides

Contra-indications previous radiation therapy to
skeletal malignancies or bone metastases, metabolic
bone diseases, including hyperparathyroidism and Paget’s disease,
unexplained raised levels of alkaline phosphatase

Hepatic impairment avoid

Renal impairment avoid if eGFR less than 30 mL/
minute/1.73m²

Pregnancy avoid

Breast-feeding avoid

Side-effects nausea, vomiting, dyspepsia, constipa-
tion, diarrhoea; palpitation; headache, dizziness, fati-
gue, asthenia; transient hypercalcaemia, hypercal-
curia; muscle cramp, pain in extremities, back pain;
Injection-site reactions; less commonly abdominal pain,
nausea, altered sense of smell, taste disturbance, anorexia,
influenza, hyperuricaemia

Dose

TERIPARATIDE

Indications treatment of osteoporosis in postmeno-
pausal women and in men at increased risk of frac-
tures; treatment of corticosteroid-induced osteo-
porosis; see also notes above.

Contra-indications pre-existing hypercalcaemia,
skeletal malignancies or bone metastases, metabolic
bone diseases, including Paget’s disease and hyper-
parathyroidism, unexplained raised alkaline phos-
phatase, previous radiation therapy to the skeleton

Renal impairment caution in moderate impairment;
avoid if severe

Pregnancy avoid

Breast-feeding avoid

Side-effects gastro-intestinal disorders (including
nausea, reflux and haemorrhoids); palpitation; dys-
pnoea; headache, fatigue, asthenia, depression, dizzi-
ness, vertigo; anaemia, increased sweating, muscle
cramps, sciatica, myalgia, arthralgia; less commonly
urinary disorders, hypercalcaemia; injection-site
reactions; rarely hypersensitivity reactions

Dose

Bisphosphonates are adsorbed onto hydroxyapatite
crystals in bone, slowing both their rate of growth and
dissolution, and therefore reducing the rate of bone
turnover. Bisphosphonates have an important role in
the prophylaxis and treatment of osteoporosis and
corticosteroid-induced osteoporosis; *alendronic acid*
or *risedronate sodium* are considered the drugs of
choice for these conditions (see also section 6.6).

Bisphosphonates are also used in the treatment of
*Paget’s disease*, hypercalcaemia of malignancy (section
9.5.1.2), and in bone metastases in breast cancer (section
8.3.4.1). Etidronate disodium can impair bone
mineralisation when used continuously or in high doses.
Bisphosphonates: osteonecrosis of the jaw

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget’s disease.

Risk factors for developing osteonecrosis of the jaw that should be considered are: potency of bisphosphonate (highest for zoledronate), route of administration, cumulative dose, duration and type of malignant disease, concomitant treatment, smoking, comorbid conditions, and history of dental disease. All patients should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. During bisphosphonate treatment patients should maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms. Guidance for dentists in primary care is included in Oral Health Management of Patients Prescribed Bisphosphonates: Dental Clinical Guidance, Scottish Dental Clinical Effectiveness Programme, April 2011 (available at www.sdcep.org.uk).

MHRA/CHM advice

Bisphosphonates: atypical femoral fractures (June 2011)

Atypical femoral fractures have been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term treatment for osteoporosis. The need to continue bisphosphonate treatment for osteoporosis should be re-evaluated periodically based on an assessment of the benefits and risks of treatment for individual patients, particularly after 5 or more years of use. Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

ALENDRONIC ACID

Indications see under Dose

Cautions upper gastrointestinal disorders (dysphagia, symptomatic oesophageal disease, gastritis, duodenitis, or ulcers—see also under Contra-indications and Side-effects); history (within 1 year) of ulcers, active gastro-intestinal bleeding, or surgery of the upper gastro-intestinal tract; correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting and monitor serum-calcium concentration during treatment; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see Bisphosphonates: Osteonecrosis of the Jaw, above); exclude other causes of osteoporosis; atypical femoral fractures, see MHRA/CHM advice, above; interactions: Appendix 1 (bisphosphonates)

Contra-indications abnormalities of oesophagus and other factors which delay emptying (e.g. stricture or achalasia), hypocalcaemia

Renal impairment avoid if eGFR less than 35 mL/minute/1.73 m²

Pregnancy avoid

Breast-feeding no information available

Side-effects oesophageal reactions (see below), abdominal pain and distension, dyspepsia, regurgitation, melena, diarrhea or constipation, flatulence, muscularkeletal pain, headache; rarely rash, pruritus, erythema, photosensitivity, urticaria, scleritis, transient decrease in serum calcium and phosphate; nausea, vomiting, gastritis, peptic ulceration, hypersensitivity reactions (including urticaria and angioedema), atypical femoral fractures with long-term use (see MHRA/CHM advice, above); myalgia, malaise, and fever at initiation of treatment; very rarely severe skin reactions (including Stevens-Johnson syndrome), osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, above)

Oesophageal reactions Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain

Dose

• Treatment of postmenopausal osteoporosis, 10 mg daily or 70 mg once weekly
• Treatment of osteoporosis in men, 10 mg daily
• Prevention and treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving hormone replacement therapy, 10 mg daily

Counselling Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet

Alendronic acid (Non-proprietary) Tablets, alendronic acid (as sodium alendronate) 70 mg once weekly = 84p. Counselling, administration

Oral solution, sugar-free, alendronic acid (as sodium alendronate) 70 mg/100 mL, net price 4 × 100 mL = £22.80. Counselling, administration

Counselling Oral solution should be swallowed as a single 100 mL dose with plenty of water while sitting or standing, to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patients should stand or sit upright for at least 30 minutes after taking the solution.

Fosamax® (MSD) Tablets, alendronic acid (as sodium alendronate) 10 mg, net price 28-tab pack = £23.12. Counselling, administration

Fosamax® Once Weekly (MSD) Tablets, alendronic acid (as sodium alendronate) 70 mg, net price 4-tab pack = £22.80. Counselling, administration

With colecalciferol For prescribing information on colecalciferol, see section 9.6.4

Fosavance® (MSD) Tablets, alendronic acid (as sodium alendronate) 70 mg, colecalciferol 70 micrograms (2 800 units), net price 4-tab pack = £22.80. Counselling, administration

Dose treatment of postmenopausal osteoporosis in women at risk of vitamin D deficiency, 1 tablet once weekly

Counselling Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet
514 6.6.2 Bisphosphonates and other drugs affecting bone metabolism  BNF 68

**ETIDRONATE DISODIUM**

**Indications** Paget’s disease of bone

**Cautions** consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); atypical femoral fractures, see MHRA/CHM advice, p. 513; **interactions:** Appendix 1 (bisphosphonates)

**Contra-indications** osteomalacia

**Renal impairment** reduce dose in mild impairment; avoid in moderate to severe renal impairment

**Pregnancy** avoid

**Breast-feeding** no information available

**Side-effects** nausea, diarrhoea or constipation, abdominal pain, increased bone pain, also increased risk of fractures with high doses (discontinue if fractures occur); rarely exacerbation of asthma, skin reactions (including angioedema, rash, urticaria and pruritus), transient hyperphosphataemia, headache, paraesthesia, peripheral neuropathy, atypical femoral fractures (see MHRA/CHM advice, p. 513); **very rarely** osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); blood disorders (including leucopenia, agranulocytosis and pancytopenia) also reported

**Dose**

- Paget’s disease of bone, 5 mg/kg as a single daily dose for up to 6 months; doses above 10 mg/kg daily for up to 3 months may be used with caution but doses above 20 mg/kg daily are not recommended; after interval of not less than 3 months may be repeated where evidence of reactivation—including biochemical indices (avoid premature retreatment) Monitoring Serum phosphate, serum alkaline phosphatase, and (if possible) urinary hydroxyproline should be measured before starting and at intervals of 3 months—consult product literature for further details

**Counselling** Avoid food for at least 2 hours before and after treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids

**Didronel® (Warner Chilcott)**

**Tablets** etidronate disodium 200 mg. Net price 60-tab pack = £19.48. Counselling, food and calcium (see above)

**IBANDRONIC ACID**

**Indications** see under Dose

**Cautions** consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); atypical femoral fractures, see MHRA/CHM advice, p. 513; monitor renal function and serum calcium, phosphate and magnesium; cardiac disease (avoid fluid overload); **interactions:** Appendix 1 (bisphosphonates)

**Contra-indications** hypocalcaemia; oral route abnormalities of the oesophagus and other factors which delay emptying (e.g. stricture or achalasia)

**Renal impairment** for treatment of osteoporosis, avoid if eGFR less than 30 mL/minute/1.73 m²; for reduction of bone damage in bone metastases, if eGFR 30–50 mL/minute/1.73 m² reduce intravenous dose to 2 mg and infuse over 1 hour, reduce oral dose to 50 mg on alternative days, if eGFR less than 30 mL/minute/1.73 m² reduce intravenous dose to 2 mg and infuse over 1 hour, reduce oral dose to 50 mg once weekly

**Pregnancy** avoid

**Breast-feeding** avoid—present in milk in *animal* studies

**Side-effects** hypocalcaemia, hypophosphataemia, influenza-like symptoms (including fever, chills, and muscle pain); bone pain; oesophageal reactions (see below), diarhoea, nausea, vomiting, gastritis, abdominal pain, dyspepsia, pharyngitis; headache, asthenia, rash; **very rarely** anaemia, atypical femoral fractures (see MHRA/CHM advice, p. 513), hypersensitivity reactions (pruritus, bronchospasm and angioedema reported); urticaria; injection-site reactions; **very rarely** osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 513)

**Oesophageal reactions** Severe oesophageal reactions reported with all oral bisphosphonates; patients should be advised to stop tablets and seek medical attention for symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn

**Dose**

- Reduction of bone damage in bone metastases in breast cancer, by mouth, 50 mg daily, or by intravenous infusion, 6 mg every 3–4 weeks

- Hypercalcaemia of malignancy by intravenous infusion, according to serum calcium concentration, 2–4 mg in single infusion

- Treatment of postmenopausal osteoporosis, by mouth, 150 mg once a month or by intravenous injection over 15–30 seconds, 3 mg every 3 months

- CHILD not recommended

**Counselling** Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes (ibandronic acid tablets, 50 mg) or 1 hour (Bonviva® tablets, 150 mg) before first food or drink (other than water) of the day, or another oral medicine; patient should stand or sit upright for at least 1 hour after taking tablet

**Ibandronic acid** (Non-proprietary) **Tablets** ibandronic acid 50 mg, net price 28-tab pack = £11.99. Counselling, administration

**Brands include** Ibasbon®

**Bondronat® (Roche)** **Tablets**, 1 mg/mL, net price 28-tab pack = £183.69. Counselling, administration

**Concentrate for intravenous infusion, ibandronic acid 1 mg/mL, net price 2-mL vial = £89.36, 6-mL vial = £183.69**

**Bonviva® (Roche)** **Tablets**, 1 mg/mL, net price 28-tab pack = £184.00. Counselling, administration

**Injection** ibandronic acid 1 mg/mL, net price 3-mL prefilled syringe = £68.64

**PAMIDRONATE DISODIUM**

Pamidronate disodium was formerly called aminohydroxypropylidenediphosphonate disodium (APD)

**Indications** see under Dose

**Cautions** assess renal function before each dose; ensure adequate hydration; cardiac disease (especially in elderly); previous thyroid surgery (risk of hypocalcaemia); monitor serum electrolytes, calcium and phosphate—possibility of convulsions due to electrolyte changes; avoid concurrent use with other
biphosphonates; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw; see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); atypical femoral fractures, see MHRA/CHM advice, p. 513; Interactions: Appendix 1 (bisphosphonates)

Driving Patients should be warned against driving or operating machinery immediately after treatment (somnolence or dizziness can occur)

Hepatic impairment caution in severe hepatic impairment—no information available

Renal impairment max. infusion rate 20 mg/hour; avoid if eGFR less than 30 mL/minute/1.73 m², except in life-threatening hypercalcaemia if benefit outweighs risk; if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value

Pregnancy avoid
Breast-feeding avoid

Side-effects hypophosphataemia, fever and influenza-like symptoms (sometimes accompanied by malaise, rigors, fatigue and flushes); nausea, vomiting, anorexia, abdominal pain, diarrhoea, constipation; symptomatic hypocalcaemia (paraesthesia, tetany), hypomagnesaemia, headache, insomnia, drowsiness; hypertension; anaemia, thrombocytopenia, lymphopenia, cytopenia; rash; arthralgia, myalgia, bone pain; rarely muscle cramps, atypical femoral fractures (see MHRA/CHM advice, p. 513), dyspepsia, agitation, confusion, dizziness, lethargy; leucopenia, hypotension, pruritus, hyperkalaemia or hypokalaemia, and hypematraemia; osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 513), isolated cases of seizures, hallucinations, haematuria, acute renal failure, deterioration of renal disease, conjunctivitis and other ocular symptoms; atrial fibrillation, and reactivation of herpes simplex and zoster also reported; also injection-site reactions

Dose

- By slow intravenous infusion (via cannula in a relatively large vein), see also Appendix 4

Hypercalcaemia of malignancy, according to serum calcium concentration 15–60 mg in single infusion or in divided doses over 2–4 days; max. 90 mg per treatment course

Osteolytic lesions and bone pain in bone metastases associated with breast cancer or multiple myeloma, 90 mg every 4 weeks (or every 3 weeks to coincide with chemotherapy in breast cancer)

Paget’s disease of bone, 30 mg once a week for 6 weeks (total dose 180 mg); max. 90 mg every other week (total dose 210 mg); max. total 360 mg (in divided doses of 60 mg) per treatment course; may be repeated every 6 months

CHILD not recommended

Calcium and vitamin D supplements Oral supplements are advised to minimise potential risk of hypocalcaemia for those with mainly lytic bone metastases or multiple myeloma at risk of calcium or vitamin D deficiency (e.g. through malabsorption or lack of exposure to sunlight) and in those with Paget’s disease

Pamidronate disodium (Non-proprietary) [Top] Concentrate for intravenous infusion, pamidronate disodium 3 mg/mL, net price 5-mL vial = £13.33, 10-mL vial = £26.66, 60-mL vial = £53.33; 9 mg/mL, 10-mL vial = £80.00; 15 mg/mL, 1-mL vial = £29.83, 2-mL vial = £59.66, 4-mL vial = £119.32, 6-mL vial = £170.46

Aredia Dry Powder [Top] (Novartis) Intravenous infusion, powder for reconstitution, pamidronate disodium, net price 15-mg vial = £29.83, 30-mg vial = £59.66, 90-mg vial = £170.45 (all with diluent)

RISEDRONATE SODIUM [Top] Indications see under Dose

Cautions oesophageal abnormalities and other factors which delay transit or emptying (e.g. stricture or achalasia—see also under Side-effects); correct hypocalcaemia before starting, correct other disturbances of bone and mineral metabolism (e.g. vitamin-D deficiency) at onset of treatment; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw; see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); atypical femoral fractures, see MHRA/CHM advice, p. 513; Interactions: Appendix 1 (bisphosphonates)

Contra-indications hypocalcaemia (see Cautions above)

Renal impairment avoid if eGFR less than 30 mL/minute/1.73 m²

Pregnancy avoid
Breast-feeding avoid

Side-effects abdominal pain, dyspepsia, nausea, diarrhoea, constipation, head, musculoskeletal pain; less commonly oesophagitis, esophageal ulcer, dysphagia, gastritis, duodenitis, ulcer; rarely glossitis, oesophageal stricture, atypical femoral fractures (see MHRA/CHM advice, p. 513); also reported gastro-duodenal ulceration, hepatic disorders, Stevens-Johnson syndrome, toxic epidermal necrolysis, hair loss, cutaneous vasculitis, oesophageal necrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 513)

Oesophageal reactions Patients should be advised to stop taking the tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn

Dose

- Paget’s disease of bone, 30 mg daily for 2 months; may be repeated if necessary after at least 2 months

- Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures, 5 mg daily or 35 mg once weekly

- Prevention of osteoporosis (including corticosteroid-induced osteoporosis) in postmenopausal women, 5 mg daily

- Treatment of osteoporosis in men at high risk of fractures, 35 mg once weekly

- CHILD see BNF for Children Counselling Swallow tablets whole with full glass of water, on rising, take on an empty stomach at least 30 minutes before first food or drink of the day or, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk, also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising

Risedronate Sodium (Non-proprietary) Tablets, risedronate sodium 5 mg, net price 28-tab pack = £13.24, 30 mg, 28-tab pack = £105.70; 35 mg, 4-tab pack = £1.08. Counselling, administration, food, and calcium (see above)
Actonel® (Warner Chilcott) Tablets, f/c, risedronate sodium 5 mg (yellow), net price 28-tab pack = £17.99; 30 mg (white), 28-tab pack = £143.95. Counselling, administration, food and calcium (see above)

Actonel Once a Week® (Warner Chilcott) Tablets, f/c, orange, risedronate sodium 35 mg, net price 4-tab pack = £19.12. Counselling, administration, food and calcium (see above)

With calcium carbonate and colecalciferol

For cautions, contra-indications, and side-effects of calcium carbonate, see section 9.5.1.1 and of colecalciferol, see section 9.6.4

Actonel® Combi (Warner Chilcott) Tablets, f/c, orange, risedronate sodium 35 mg (Actonel Once a Week®);

Granules, effervescent, lemon flavour, calcium carbonate 2.5 g (calcium 1 g or Ca++ 25 mmol) and colecalciferol 22 micrograms (880 units)/sachet, net price 24-sachet plus 4-tab pack = £19.12. Counselling, administration, food and calcium (see above)

Dose treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures, given in weekly cycles, 1 Actonel Once a Week® tablet on the first day followed by 1 calcium and colecalciferol sachet daily for 6 days

Counselling Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet. Granules should be stirred into a glass of water and after dissolution complete taken immediately

SODIUM CLODRONATE

Indications see under Dose

Cautions monitor renal and hepatic function and white cell count; also monitor serum calcium and phosphate periodically; renal dysfunction reported in patients receiving concomitant NSAIDs; maintain adequate fluid intake during treatment; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); atypical femoral fractures, see MHRA/CHM advice, p. 513; interactions: Appendix 1 (bisphosphonates)

Contra-indications acute gastro-intestinal inflammatory conditions

Renal impairment use half normal dose if eGFR 10–30 mL/minute/1.73 m²; avoid if eGFR less than 10 mL/minute/1.73 m²

Pregnancy avoid

Breast-feeding manufacturer advises avoid—no information available

Side-effects nausea, vomiting, diarrhoea, skin reactions, bronchospasm; rarely atypical femoral fractures (see MHRA/CHM advice, p. 513); very rarely osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); also reported renal impairment

Dose

- Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma, by mouth, 1.6 g daily in single or 2 divided doses increased if necessary to a max. of 3.2 g daily in 2 divided doses

Counselling Avoid food for 2 hours before and 1 hour after treatment, particularly calcium-containing products e.g. milk, also avoid iron and mineral supplements and antacids; maintain adequate fluid intake

Bonefos® (Bayer) Capsules, yellow, sodium clodronate 400 mg, net price 120-cap pack = £139.83. Counselling, food and calcium

Tablets, f/c, scored, sodium clodronate 800 mg, net price 60-tab pack = £146.43. Counselling, food and calcium

Clasteon® (Beacon) Capsules, blue/white, sodium clodronate 400 mg, net price 30-cap pack = £34.96, 120-cap pack = £139.83. Counselling, food and calcium

Loron 520® (Intrapharm) Tablets, f/c, scored, sodium clodronate 520 mg, net price 60-tab pack = £152.59. Label: 10, patient information leaflet, counselling, food and calcium

Dose 2 tablets daily in single or two divided doses, may be increased to max. 4 tablets daily

ZOLEDRONIC ACID

Indications see under preparations

Cautions correct disturbances of calcium metabolism (e.g. vitamin D deficiency, hypocalcaemia) before starting; monitor serum electrolytes, calcium, phosphate and magnesium; cardiac disease (avoid fluid overload); consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); atypical femoral fractures, see MHRA/CHM advice, p. 513; interactions: Appendix 1 (bisphosphonates)

Renal function Renal impairment and renal failure have been reported. Before each dose ensure patient is hydrated and assess renal function. Continue to monitor renal function in patients at risk, such as those with pre-existing renal impairment, those of advanced age, those taking concomitant nephrotoxic drugs or diuretics, or those who are dehydrated. Use with caution with concomitant medicines that affect renal function

Contra-indications women of child-bearing potential

Hepatic impairment caution in severe hepatic impairment—limited information available

Renal impairment avoid if serum creatinine above 400 micromol/litre in tumour-induced hypercalcaemia; in advanced malignancies involving bone, if eGFR 50–60 mL/minute/1.73 m² reduce dose to 3.5 mg every 3–4 weeks, if eGFR 40–50 mL/minute/1.73 m² reduce dose to 3.5 mg every 3–4 weeks, if eGFR 30–40 mL/minute/1.73 m² reduce dose to 3 mg every 3–4 weeks, avoid if eGFR less than 30 mL/minute/1.73 m² (or if serum creatinine greater than 265 micromol/litre); if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value; avoid in Paget’s disease, treatment of postmenopausal osteoporosis and osteoporosis in men if eGFR less than 35 mL/minute/1.73 m²; see also Cautions above

Pregnancy avoid—toxicity in animal studies

Breast-feeding avoid—no information available
**Side-effects** hypophosphataemia, anaemia, influenza-like symptoms including bone pain, myalgia, arthralgia, fever and rigors; gastro-intestinal disturbances; atrial fibrillation; headache, dizziness, conjunctivitis, renal impairment (rarely acute renal failure); less commonly anorexia, taste disturbance, dry mouth, stomatitis, chest pain, hypertension, hypotension, dyspnœa, cough, paraesthesia, tremor, anxiety, lethargy, sleep disturbance, blurred vision, weight gain, pruritus, rash, sweating, muscle cramps, haematuria, proteinuria, urinary frequency, hypersensitivity reactions (including angioœdema), asthma, peripheral oedema, thrombocytopaenia, leucopenia, hypomagnesaemia, hypokalaemia, also injection-site reactions; rarely bradycardia, confusion, hyperkalaemia, hypernatraemia, pancytopenia, osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 513), atypical femoral fractures (see MHRA/CHM advice, p. 513); very rarely uveitis and episcleritis

**Dose**

- See under preparations

**Aclasta**\(^\text{®}\) (Novartis) [Full]

**Intravenous infusion**, zoledronic acid 50 micrograms/mL, net price 100-mL bottle = £253.38

**Dose** treatment of Paget’s disease of bone, by **intravenous infusion**, 5 mg as a single dose over at least 15 minutes

**Note** At least 500 mg elemental calcium twice daily (with vitamin D, section 9.6.4) for at least 10 days is recommended following infusion.

Treatment of postmenopausal osteoporosis and osteoporosis in men (including corticosteroid-induced osteoporosis), by **intravenous infusion**, 5 mg over at least 15 minutes once a year

**Note** In patients with a recent low-trauma hip fracture, the dose should be given 2 or more weeks following hip fracture repair, before first infusion give 50 000–125 000 units of vitamin D (section 9.6.4)

**Note** The Scottish Medicines Consortium (p. 4) has advised (February 2008) that in postmenopausal women Aclasta is accepted for restricted use within the NHS Scotland for the treatment of osteoporosis in those for whom oral treatment options for osteoporosis are inappropriate and when initiated by a specialist

**Zometa**\(^\text{®}\) (Novartis) [Full]

**Concentrate for intravenous infusion**, zoledronic acid, 800 micrograms/mL, net price 5-mL (4-mg) vial = £174.17

**Solution for intravenous infusion**, zoledronic acid, 40 micrograms/mL, net price 100-mL (4-mg) bottle = £174.14

**Dose** reduction of bone damage in advanced malignancies involving bone, by **intravenous infusion**, 4 mg over at least 15 minutes every 3–4 weeks; **CHILD** not recommended

**Note** Calcium 500 mg daily and vitamin D 400 units daily should also be taken

Hypercalcaemia of malignancy, by **intravenous infusion**, 4 mg as a single dose over at least 15 minutes; **CHILD** not recommended

**Note** The Scottish Medicines Consortium (p. 4) has advised (May 2003) that for the prevention of skeletal related events Zometa is accepted for restricted use within NHS Scotland for the treatment of patients with breast cancer and multiple myeloma if prescribed by an oncologist

---

**Denosumab**

Denosumab is a human monoclonal antibody that inhibits osteoclast formation, function, and survival, thereby decreasing bone resorption.

---

**NICE guidance**

**Denosumab for the prevention of osteoporotic fractures in postmenopausal women (October 2010)**

Denosumab is recommended as a treatment option for the **primary prevention** of osteoporotic fragility fractures in postmenopausal women at increased risk of fractures:

- who are unable to comply with the special instructions for administering alendronate and either risedronate or etidronate, or have an intolerance of, or a contra-indication to, those treatments
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance (available at www.nice.org.uk/TA204).

Denosumab is recommended as a treatment option for the **secondary prevention** of osteoporotic fragility fractures only in postmenopausal women at increased risk of fractures who are unable to comply with the special instructions for administering alendronate and either risedronate or etidronate, or have an intolerance of, or a contra-indication to, those treatments.

www.nice.org.uk/TA204

---

The Scottish Medicines Consortium (p. 4) has advised (November 2010) that denosumab (Prolia) is accepted for restricted use within NHS Scotland for the treatment of osteoporosis in postmenopausal women at increased risk of fractures who have a bone mineral density T-score <−2.5 and >−4.0 and for whom bisphosphonates are unsuitable.

---

**NICE guidance**

**Denosumab for the prevention of skeletal-related events in adults with bone metastases from solid tumours (October 2012)**

Denosumab is recommended for the prevention of skeletal-related events in adults with bone metastases from breast cancer and from solid tumours other than prostate if:

- bisphosphonates would otherwise be prescribed, and
- the manufacturer provides denosumab with the discount agreed in the patient access scheme.

Denosumab is **not** recommended for preventing skeletal-related events in adults with bone metastases from prostate cancer.

Patients with bone metastases from solid tumours currently receiving denosumab whose disease does not meet the above criteria can continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA265
Denosumab: atypical femoral fractures (February 2013)

Atypical femoral fractures have been reported rarely in patients receiving denosumab for the long-term treatment (2.5 or more years) of postmenopausal osteoporosis. Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab. Discontinuation of denosumab in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

**Denosumab**

**Indications** see under preparations

**Cautions** correct hypocalcaemia and vitamin D deficiency before starting (monitor plasma-calcium concentration during therapy); consider dental check-up and carry out invasive procedures before initiating treatment (risk of osteonecrosis of the jaw); atypical femoral fractures (see MHRA/CHM advice, above)

**Renal impairment** increased risk of hypocalcaemia if eGFR less than 30 mL/minute/1.73 m²—monitor plasma-calcium concentration

**Pregnancy** avoid

**Breast-feeding** avoid

**Side-effects** diarrhoea, constipation, dyspnoea, urinary tract infection, upper respiratory tract infection, pain in extremity, sciatica, hypocalcaemia (fetal cases reported), hypophosphataemia, cataracts, rash, sweating; less commonly diverticulitis, cellulitis (seek prompt medical attention), ear infection; rarely osteonecrosis of the jaw, atypical femoral fractures (see MHRA/CHM advice, above)

**Dose**

- See under preparations

**Prolia® (Amgen)** ▼ **(TA)**

Injection, denosumab 60 mg/mL, net price 1-mL prefilled syringe = £183.00

**Dose** treatment of postmenopausal osteoporosis in women at increased risk of fractures and bone loss associated with hormone ablation in men with prostate cancer at increased risk of fractures, by subcutaneous injection, 60 mg every 6 months

**Note** Supplement with calcium and vitamin D

**XGEVA® (Amgen)** ▼ **(TA)**

Injection, denosumab 70 mg/mL, net price 1.7-mL (120-mg) vial = £309.86

**Dose** reduction of bone damage in patients with bone metastases from solid tumours, ADULT over 18 years, by subcutaneous injection, 120 mg every 4 weeks

**Note** Calcium 500 mg daily and vitamin D 400 units daily should also be taken

**Strontium ranelate**

Strontium ranelate stimulates bone formation and reduces bone resorption. Strontium ranelate treatment has been associated with an increased risk of serious cardiovascular disease, including myocardial infarction, and the risk should be assessed before treatment and regularly during treatment. Strontium ranelate should be initiated only by specialists for the treatment of severe osteoporosis in postmenopausal women or men at high risk of fracture for whom other treatments are contra-indicated or not tolerated.

**Severe allergic reactions**

Severe allergic reactions, including drug rash with eosinophilia and systemic symptoms (DRESS), have been reported in patients taking strontium ranelate. DRESS starts with rash, fever, swollen glands, and increased white cell count, and it can affect the liver, kidneys and lungs; DRESS can also be fatal. Patients should be advised to stop taking strontium ranelate and consult their doctor immediately if skin rash develops. Treatment with strontium ranelate should not be restarted.

**Dose**

- 2 g once daily in water, preferably at bedtime

**Counselling** Avoid food for 2 hours before and after taking granules, particularly calcium-containing products e.g. milk; also preferably avoid concomitant antacids containing aluminium and magnesium hydroxides for 2 hours after taking granules

**Protelos® (Servier)** ▼ **(TA)**

Granules, yellow, strontium ranelate, 2 g/sachet, net price 28-sachets = £27.08. Label: 5, 13, counselling, food and calcium

**Excipients** include aspartame (section 9.4.1)

**Other endocrine drugs**

**6.7.1 Bromocriptine and other dopaminergic drugs**

Bromocriptine is a stimulant of dopamine receptors in the brain; it also inhibits release of prolactin by the pituitary. Bromocriptine is used for the treatment of galactorrhoea, and for the treatment of prolactinomas (when it reduces both plasma prolactin concentration and tumour size). Bromocriptine also inhibits the release of growth hormone and is sometimes used in the treat-
ment of acromegaly, but somatostatin analogues (such as octreotide, section 8.3.4.3) are more effective.

Cabergoline has actions and uses similar to those of bromocriptine, but its duration of action is longer. It has similar side-effects to bromocriptine, however patients intolerant of bromocriptine may be able to tolerate cabergoline (and vice versa).

Quinagolide is a non-ergot dopamine D₂ agonist; it has actions and uses similar to those of ergot-derived dopamine agonists, but its side-effects differ slightly.

Cautions see notes below; also bromocriptine and cabergoline should be used with caution in patients with a history of peptic ulcer, particularly in acromegalic patients. Treatment should be withdrawn if gastro-intestinal bleeding occurs. In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment). Bromocriptine and cabergoline should be used with caution in patients with Raynaud’s syndrome and cardiovascular disease (see also Contra-indications under Bromocriptine, below). Monitor for fibrotic disease (see Fibrotic Reactions, below). Caution is also advised in patients with a history of serious mental disorders (especially psychotic disorders) and in those with acute porphyria (see section 9.8.2). Tolerance may be reduced by alcohol.

Contra-indications Bromocriptine and cabergoline should not be used in patients with hypersensitivity to ergot alkaloids. They are contra-indicated in those with cardiac valvulopathy (exclude before treatment, see Fibrotic Reactions, below). They should also be avoided in pre-eclampsia (see also Contra-indications under Bromocriptine, below).

Side-effects Nausea, constipation, and headache are common side-effects of bromocriptine and cabergoline. Paraesthesia has been reported rarely. Other reported side-effects include hypotension (see also Hypotensive Reactions, below), drowsiness (see also Driving, below), dyskinesia, pathological gambling, increased libido, hypersexuality, leg cramps, allergic skin reactions, alopecia, and peripheral oedema. Bromocriptine and cabergoline have been associated with pleuritis, pleural effusion, cardiac valvulopathy, periardial effusion, constrictive pericarditis, and retroperitoneal, pleural, and pulmonary fibrosis (see Fibrotic Reactions).

Ergot-derived dopamine-receptor agonists, bromocriptine, cabergoline, lisuride [discontinued], and pergolide have been associated with pulmonary, retroperitoneal, and periardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for chronic endocrine disorders (excludes suppression of lactation) or Parkinson’s disease; it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatine and to obtain chest X-ray. Patients should be monitored for dyspnœa, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking cabergoline or pergolide should be regularly monitored for cardiac fibrosis, by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

Driving Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopaminergic drugs. Patients starting treatment with these drugs should be warned of the possibility of these effects and of the need to exercise caution when driving or operating machinery. Patients who have suffered excessive sedation or sudden onset of sleep should refrain from driving or operating machines until those effects have stopped recurring.

Hypotensive reactions Hypotensive reactions can be disturbing in some patients during the first few days of treatment with bromocriptine, cabergoline, or quinagolide—monitor blood pressure for a few days after starting treatment and following dosage increases; particular care should be exercised when driving or operating machinery.

Suppression of lactation Although bromocriptine and cabergoline are licensed to suppress lactation, they are not recommended for routine suppression (or for the relief of symptoms of postpartum pain and engorgement) that can be adequately treated with simple analgesics and breast support. If a dopamine-receptor agonist is required, cabergoline is preferred. Quinagolide is not licensed for the suppression of lactation.

BROMOCRIPTINE

Indications see notes above and under Dose; Parkinson’s disease (section 4.9.1)

Cautions see notes above; also specialist evaluation—monitor for pituitary enlargement, particularly during pregnancy; monitor visual field to detect secondary field loss in macroprolactinoma; contraceptive advice if appropriate (oral contraceptives may increase prolactin concentration); interactions: Appendix 1 (bromocriptine)

Contra-indications see notes above; also hypertension in postpartum women or in puerperium (see also below)

Postpartum or puerperium Should not be used postpartum or in puerperium in women with high blood pressure, coronary artery disease, or symptoms (or history) of serious mental disorder; monitor blood pressure carefully (especially during first few days) in postpartum women. Very rarely hypertension, myocardial infarction, seizures or stroke (both sometimes preceded by severe headache or visual disturbances), and mental disorders have been reported in postpartum women given bromocriptine for lactation suppression—caution with antihypertensive therapy and avoid other ergot alkaloids. Discontinue immediately if hypertension, unrelenting headache, or signs of CNS toxicity develop.

Hepatic impairment dose reduction may be necessary

Pregnancy see Cautions above

Breast-feeding suppresses lactation; avoid breast feeding for about 5 days if lactation prevention fails

Side-effects see notes above; also nasal congestion; less commonly vomiting, postural hypotension, fatigue, dizziness, dry mouth, also, particularly with high doses, confusion, psychomotor excitation, hallucinations; rarely diarrhoea, gastric intestinal bleeding, gastric ulcer, abdominal pain, tachycardia, bradycardia, arrhythmia, insomnia, psychosis, visual disturbances, tinnitus; very rarely vasospasm of fingers and toes particularly in patients with Raynaud’s syndrome, and
effects like neuroleptic malignant syndrome on withdrawal; urinary incontinence, leukocoria, thrombocytopenia, hyponatraemia, reversible hearing loss, increased libido, and hypersexuality also reported

**Dose**
- Prevention or suppression of lactation (but see notes above and under Cautions), 2.5 mg on day 1 (prevention) or daily for 2–3 days (suppression); then 2.5 mg twice daily for 14 days
- Hypogonadism, galactorrhoea, infertility, initially 1–1.25 mg at bedtime, increased gradually; usual dose 7.5 mg daily in divided doses, increased if necessary to max. 30 mg daily, usual dose in infertility without hyperprolactinemia, 2.5 mg twice daily
- Acromegaly, initially 1–1.25 mg at bedtime, increase gradually to 5 mg every 6 hours
- Prolactinoma, initially 1–1.25 mg at bedtime; increased gradually to 5 mg every 6 hours (occasional patients may require up to 30 mg daily)
- CHILD under 15 years, not recommended

**Bromocriptine** (Non-proprietary)

*Tablets*, bromocriptine (as mesilate) 1 mg, net price 100-tab pack = £60.10; 2.5 mg, 30-tab pack = £66.21. Label: 10, 21, counselling, driving, see notes above

**Parlodel**® (Meda)

*Capsules*, bromocriptine (as mesilate) 5 mg (blue/white), net price 100-cap pack = £37.57; 10 mg (white), 100-cap pack = £69.50. Label: 10, 21, counselling, driving, see notes above

**CABERGOLINE**

**Indications** see notes above and under Dose

**Cautions** see notes above; also monthly pregnancy tests during the amenorrhoeic period; advise non-hormonal contraception if pregnancy not desired (see also Pregnancy, below); **Interactions:** Appendix 1 (cabergoline)

**Contra-indications** see notes above; history of puereperal psychosis; history of pulmonary, pericardial, or retroperitoneal fibrotic disorders (see Fibrotic Reactions in notes above); cardiac valvulopathy

**Hepatic impairment** reduce dose in severe hepatic impairment

**Pregnancy** exclude pregnancy before starting and discontinue 1 month before intended conception (ovulatory cycles persist for 6 months)—discontinue if pregnancy occurs during treatment (specialist advice needed)

**Breast-feeding** suppresses lactation; avoid breast-feeding if lactation failure prevails

**Side-effects** see notes above; also cardiac valvulopathy, dyspepsia, gastritis, epigastric and abdominal pain, angina, syncope, depression, confusion, hallucinations, breast pain; rarely vomiting, palpitation, epistaxis, digital vasospasm, hot flushes, transient hemianopia, muscle weakness; also reported erythromelalgia

**Dose**
- Prevention of lactation (but see notes above and under Contra-indications), during first day postpartum, 1 mg as a single dose; suppression of established lactation (but see notes above) 250 micrograms every 12 hours for 2 days; *CHILD* under 16 years, not recommended
- Hyperprolactinemic disorders, 500 micrograms weekly (as a single dose or as 2 divided doses on separate days) increased at monthly intervals in steps of 500 micrograms until optimal therapeutic response (usually 1 mg weekly, range 0.25–2 mg weekly) with monthly monitoring of serum prolactin levels; reduce initial dose and increase more gradually if patient intolerant; over 1 mg weekly give as divided doses; up to 4.5 mg weekly has been used in hyperprolactinemic patients; *CHILD* under 16 years, not recommended
- Parkinson’s disease, section 4.9.1

**Cabergoline** (Non-proprietary)

*Tablet*, scored, cabergoline 500 micrograms, net price 8-tab pack = £34.33. Label: 10, 21, counselling, driving, see notes above

**Note** Dispense in original container (contains desiccant)

**Dostinex**® (Pharmacia)

*Tablets*, scored, cabergoline 500 micrograms. Net price 8-tab pack = £30.04. Label: 10, 21, counselling, driving, see notes above

**Note** Dispense in original container (contains desiccant)

**QUINAGOLIDE**

**Indications** see notes above and under Dose

**Cautions** see notes above; history of psychotic illness; advise non-hormonal contraception if pregnancy not desired; **Interactions:** Appendix 1 (quinagolide)

**Contra-indications** hypersensitivity to quinagolide (but not ergot alkaloids)

**Hepatic impairment** avoid—no information available

**Renal impairment** avoid—no information available

**Pregnancy** discontinue when pregnancy confirmed unless medical reason for continuing (specialist advice needed)

**Breast-feeding** suppresses lactation

**Side-effects** nausea, vomiting, anorexia, abdominal pain, constipation or diarrhoea; syncope, hypotension (see also notes above), oedema, flushing; nasal congestion; headache, dizziness, fatigue, insomnia; very rarely psychosis

**Dose**
- Hyperprolactinemia, 25 micrograms at bedtime for 3 days; increased at intervals of 3 days in steps of 25 micrograms to usual maintenance dose of 75–150 micrograms daily; for doses higher than 300 micrograms daily increase in steps of 75–150 micrograms at intervals of not less than 4 weeks; *CHILD* not recommended

**Norprolac**® (Ferring)

*Tablets*, quinagolide (as hydrochloride) 75 micrograms (white), net price 30-tab pack = £27.00; starter pack of 3 × 25-microgram tabs (pink) with 3 × 50-microgram tabs (blue) = £4.50. Label: 10, 21, counselling, driving, see notes above

**6.7.2 Drugs affecting gonadotrophins**

Danazol inhibits pituitary gonadotrophins; it combines androgenic activity with antioestrogenic and anti-progestogenic activity. It is licensed for the treatment of endometriosis and for the relief of severe pain and tenderness in benign fibrocystic breast disease where other measures have proved unsatisfactory. It may also be effective in the long-term management of hereditary angioedema [unlicensed indication].

Cetrorelix and ganirelix are luteinising hormone releasing hormone antagonists, which inhibit the release
of gonadotrophins (luteinising hormone and follicle-stimulating hormone). They are used in the treatment of infertility by assisted reproductive techniques.

### CETORELIX

**Indications** adjunct in the treatment of female infertility (under specialist supervision)

**Hepatic impairment** avoid in moderate or severe liver impairment

**Renal impairment** avoid in moderate or severe renal impairment

**Pregnancy** avoid in confirmed pregnancy

**Breast-feeding** avoid

**Side-effects** nausea, headache, injection site reactions; rarely hypersensitivity reactions

**Dose**
- By subcutaneous injection into the lower abdominal wall, either 250 micrograms in the morning, starting on day 5 or 6 of ovarian stimulation with gonadotrophins (or each evening starting on day 5 of ovarian stimulation); continue throughout administration of gonadotrophin including day of ovulation induction (or evening before ovulation induction)
- or 3 mg on day 7 of ovarian stimulation with gonadotrophins; if ovulation induction not possible on day 5 after 3-mg dose, additional 250 micrograms once daily until day of ovulation induction

**Cetrotide®** (Merck Serono) \( \text{HPR} \)
- Injection, powder for reconstitution, cetorelix (as acetate), net price 250-micrograms vial = £22.61; 3-mg vial = £158.26 (both with solvent)

### DANAZOL

**Indications** see notes above and under Dose

**Cautions** cardiac impairment (avoid if severe), elderly, polycythaemia, epilepsy, diabetes mellitus, hypertensive, migraine, lipoprotein disorder; history of thrombosis or thromboembolic disease; withdraw if virilisation (may be irreversible on continued use); non-hormonal contraceptive methods should be used, if appropriate; interactions: Appendix 1 (danazol)

**Contra-indications** ensure that patients with amenorrhoea are not pregnant; thromboembolic disease; undiagnosed genital bleeding; androgen-dependent tumours; acute porphyria (section 9.8.2)

**Hepatic impairment** caution in hepatic impairment (avoid if severe)

**Renal impairment** caution in renal impairment (avoid if severe)

**Pregnancy** avoid; has weak androgenic effects and virilisation of female fetus reported

**Breast-feeding** no data available but avoid because of possible androgenic effects in infant

**Side-effects** nausea, dizziness, skin reactions including rashes, photosensitivity and exfoliative dermatitis, fever, backache, nervousness, mood changes, anxiety, changes in libido, vertigo, fatigue, epigastric and pleuritic pain, headache, weight gain; menstrual disturbances, vaginal dryness and irritation, flushing and reduction in breast size; musculo-skeletal spasm, joint pain and swelling, hair loss; androgenic effects including acne, oily skin, oedema, hirsutism, voice changes and rarely clitoral hypertrophy (see also Cautions); temporary alteration in lipoproteins and other metabolic changes, insulin resistance; thrombotic events; leucopenia, thrombocytopenia, eosinophilia, reversible erythrocytosis or polycythaemia reported; headache and visual disturbances may indicate benign intracranial hypertension; rarely cholestatic jaundice, pancreatitis, peliosis hepatitis and benign hepatic adenomata

**Dose Note** In women of child-bearing potential, treatment should start during menstruation, preferably on day 1
- Endometrosis, 200–800 mg daily in up to 4 divided doses, adjusted to achieve amenorrhoea, usually for 3–6 months
- Severe pain and tenderness in benign fibrocystic breast disease not responding to other treatment, 300 mg daily in divided doses usually for 3–6 months
- Hereditary angioedema [unlicensed indication], initially 100–200 mg daily, reduced according to response

**Danazol (Non-proprietary)** \( \text{GB} \)
- **Capsules**, danazol 100 mg, net price 28-cap pack = £7.64, 60-cap pack = £16.38; 200 mg, 56-cap pack = £54.60

**Danol®** (Sanofi-Aventis) \( \text{GB} \)
- **Capsules**, danazol 100 mg (grey/white), net price 60-cap pack = £16.38; 200 mg (pink/white), 60-cap pack = £32.43

### GANIRELIX

**Indications** adjunct in the treatment of female infertility (under specialist supervision)

**Hepatic impairment** avoid in moderate or severe hepatic impairment

**Renal impairment** avoid in moderate to severe renal impairment

**Pregnancy** avoid in confirmed pregnancy—toxicity in animal studies

**Breast-feeding** avoid—no information available

**Side-effects** nausea, headache, malaise, injection-site reactions; very rarely hypersensitivity reactions including rash, facial oedema, and dyspnoea also reported

**Dose**
- By subcutaneous injection preferably into the upper leg (rotate injection sites to prevent lipatrophy), 250 micrograms in the morning (or each afternoon) starting on day 5 or day 6 of ovarian stimulation with gonadotrophins; continue throughout administration of gonadotrophins including day of ovulation induction (if administering in afternoon, give last dose in afternoon before ovulation induction)

**Orgalutran®** (MSD) \( \text{EB} \)
- **Injection**, ganirelix, 500 micrograms/mL, net price 0.5-mL prefilled syringe = £21.48

### Gonadorelin analogues

Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

Gonadorelin analogues are used in the treatment of endometriosis, precocious puberty, infertility, male hypersexuality with severe sexual deviation, anaemia due to uterine fibroids (together with iron supplementa-
tion), breast cancer (section 8.3.4.1), prostate cancer (section 8.3.4.2) and before intra-uterine surgery. Use of leuprolrelin and triptorelin for 3 to 4 months before surgery reduces the uterine volume, fibroid size and associated bleeding. For women undergoing hysterectomy or myomectomy, a vaginal procedure is made more feasible following the use of a gonadorelin analogue.

Cautions Non-hormonal, barrier methods of contraception should be used during entire treatment period with gonadorelin analogues; also use with caution in patients with metabolic bone disease because decrease in bone mineral density can occur.

Contra-indications Gonadorelin analogues are contra-indicated for use longer than 6 months in the treatment of endometriosis (do not repeat) and when there is unexplained vaginal bleeding.

Pregnancy The use of gonadorelin analogues in pregnancy is contra-indicated. Pregnancy should be excluded before treatment; the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

Breast-feeding Gonadorelin analogues are contra-indicated in breast-feeding.

Side-effects Side-effects of the gonadorelin analogues related to the inhibition of oestrogen production include menopausal-like symptoms (e.g. hot flushes, increased sweating, vaginal dryness, dyspareunia and loss of libido) and a decrease in trabecular bone density; these effects can be reduced by hormone replacement (e.g. with an oestrogen and a progestogen or with tibolone). Side-effects of gonadorelin analogues also include headache (rarely migraine) and hypersensitivity reactions including urticaria, pruritus, rash, asthma and anaphylaxis; when treating uterine fibroids, bleeding associated with fibroid degeneration can occur; spray formulations can cause irritation of the nasal mucosa including nose bleeds; local reactions at injection site can occur; other side-effects also reported with some gonadorelin analogues include palpitation, hypertension, ovarian cysts (may require withdrawal), changes in breast size, musculoskeletal pain or weakness, visual disturbances, paraesthesia, changes in scalp and body hair, oedema of the face and extremities, weight changes, and mood changes including depression.

GOSERELIN

Indications see under Dose; prostate cancer (section 8.3.4.2); early and advanced breast cancer (section 8.3.4.1)

Cautions see notes above; polycystic ovarian disease; diabetes

Contra-indications see notes above

Pregnancy use non-hormonal contraceptives during treatment; see also notes above

Breast-feeding see notes above

Side-effects see notes above; withdrawal bleeding

Dose

- Endometriosis, intranasally, 300 micrograms (one 150-microgram spray in each nostril) 3 times daily (starting on days 1 or 2 of menstruation); max. duration of treatment 6 months (do not repeat)

- Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under specialist supervision), by subcutaneous injection, 200–500 micrograms daily given as a single injection (occasionally up to 500 micrograms twice daily may be needed) starting in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually about 1–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

Intranasally, 150 micrograms (one spray in one nostril) 4 times daily during waking hours (occasionally up to 300 micrograms 4 times daily may be needed) starting in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually about 2–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

Counselling Avoid use of nasal decongestants before and for at least 30 minutes after treatment

Suprecur® (Sanofi-Aventis) (©)

Nasal spray, buserelin (as acetate) 150 micrograms/ metered spray. Net price 2 x 100-dose pack (with metered dose pumps) = £87.63. Counselling, nasal decongestants

Injection, buserelin (as acetate) 1 mg/mL. Net price 5.5-mL vial = £13.76

BUSERELIN

Indications see under Dose; prostate cancer (section 8.3.4.2)

Cautions see notes above; polycystic ovarian disease; depression, hypertension, diabetes

Contra-indications see notes above; hormone-dependent tumours

Pregnancy use non-hormonal contraceptives during treatment; see also notes above

Breast-feeding see notes above

Side-effects see notes above; withdrawal bleeding

Dose

- By subcutaneous injection into anterior abdominal wall (as Zoladex®) Endometriosis, 3.6 mg every 28 days; max. duration of treatment 6 months (do not repeat)

Endometrial thinning before intra-uterine surgery, 3.6 mg (may be repeated after 28 days if uterus is large or to allow flexible surgical timing). Before surgery in women who have anaemia due to uterine fibroids. 3.6 mg every 28 days (with supplementary iron); max. duration of treatment 3 months

Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under specialist supervision), after exclusion of pregnancy,
LEUPROLRELIN ACETATE

Indications  see under Dose; prostate cancer (section 8.3.4.2)

Cautions  see notes above; monitor liver function; family history of osteoporosis; chronic use of other drugs which reduce bone density including alcohol and tobacco; diabetes

Contra-indications  see notes above

Pregnancy  teratogenic in animal studies; see also notes above

Breast-feeding  see notes above

Side-effects  see notes above; breast tenderness; nausea, vomiting, diarrhoea, anorexia; fever, chills; sleep disturbances, dizziness, fatigue, leucopenia, thrombocytopenia, altered blood lipids, pulmonary embolism; spinal fracture, paralysis, hypotension and worsening of depression also reported

Dose  ● By subcutaneous or intramuscular injection (as Prostap® SR DCS)
Endometriosis, 3.75 mg as a single dose in first 5 days of menstrual cycle then every month for max. 6 months (course not to be repeated)
Endometrial thinning before intra-uterine surgery, 3.75 mg as a single dose (given between days 3 and 5 of menstrual cycle) 5–6 weeks before surgery
Reduction of size of uterine fibroids and of associated bleeding before surgery, 3.75 mg as a single dose every month usually for 3–4 months (max. 6 months)
● By intramuscular injection (as Prostap® 3 DCS)
Endometriosis, 11.25 mg as a single dose in first 5 days of menstrual cycle then every 3 months for max. 6 months (course not to be repeated)

Preparations  Section 8.3.4.2

NAFARELIN

Indications  see under Dose

Cautions  see notes above

Contra-indications  see notes above

Pregnancy  see notes above

Breast-feeding  see notes above

Side-effects  see notes above; acne

Dose  ● Endometriosis, women over 18 years, 200 micrograms twice daily as one spray in one nostril in the morning and one spray in the other nostril in the evening (starting on days 2–4 of menstruation), max. duration of treatment 6 months (do not repeat)
● Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under specialist supervision), 400 micrograms (one spray in each nostril) twice daily starting in early follicular phase (day 2) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually within 4 weeks) then maintained (usually for 8–12 days) during gonadotrophin administration (stopping gonadotrophin and nafarelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

Preparation  Section 8.3.4.2

TRIPTORELIN

Indications  endometriosis; precocious puberty; reduction in size of uterine fibroids; male hypersexuality with severe sexual deviation; advanced prostate cancer (section 8.3.4.2)

Cautions  see notes above

Contra-indications  see notes above

Pregnancy  see notes above

Breast-feeding  see notes above

Side-effects  see notes above; also gastrointestinal disturbances; in precocious puberty, withdrawal bleeding in females may occur in the first month of treatment; asthenia

Dose  ● See under preparations below

Decapeptyl® SR (Ipsen) (Phar)
Injection, (powder for suspension), m/r, triptorelin (as acetate), net price 3-mg vial (with diluent) = £69.00
Dose by intramuscular injection, endometriosis and reduction in size of uterine fibroids, 3 mg every 4 weeks starting during first 5 days of menstrual cycle; for uterine fibroids continue treatment for at least 3 months; max. duration of treatment 6 months (not to be repeated)
Note  Each vial includes an overage to allow accurate administration of 3-mg dose
Injection, (powder for suspension), m/r, triptorelin (as acetate), net price 11.25-mg vial (with diluent) = £207.00
Dose by intramuscular injection, endometriosis, 11.25 mg every 3 months starting during first 5 days of menstrual cycle; max. duration of treatment 6 months (not to be repeated)
Precocious puberty, 11.25 mg every 3 months; discontinue when bone maturation consistent with age of 12 years in girls or 13–14 years in boys
Note  Each vial includes an overage to allow accurate administration of 11.25-mg dose

Gonapeptyl Depot® (Ferring) (Phar)
Injection, (powder for suspension), triptorelin (as acetate), net price 3.75-mg prefilled syringe (with prefilled syringe of vehicle) = £81.69
Dose by subcutaneous or deep intramuscular injection, endometriosis and reduction in size of uterine fibroids, 3.75 mg every 4 weeks starting during first 5 days of menstrual cycle; max. duration of treatment 6 months (not to be repeated)
Precocious puberty, body-weight over 30 kg, initially 3.75 mg every 2 weeks for 3 doses, then every 3–4 weeks; body-weight 20–30 kg, initially 2.5 mg every 2 weeks for 3 doses, then every 3–4 weeks; body-weight under 20 kg, initially 1.875 mg every 2 weeks for 3 doses, then every 3–4 weeks; discontinue when bone maturation consistent with age over 12 years in girls or over 13 years in boys

Gonapeptyl Depot® (Ferring) (Phar)
Injection, (powder for suspension), triptorelin (as acetate), net price 3.75-mg prefilled syringe (with prefilled syringe of vehicle) = £81.69
Dose by subcutaneous or deep intramuscular injection, endometriosis and reduction in size of uterine fibroids, 3.75 mg every 4 weeks starting during first 5 days of menstrual cycle; max. duration of treatment 6 months (not to be repeated)
Precocious puberty, body-weight over 30 kg, initially 3.75 mg every 2 weeks for 3 doses, then every 3–4 weeks; body-weight 20–30 kg, initially 2.5 mg every 2 weeks for 3 doses, then every 3–4 weeks; body-weight under 20 kg, initially 1.875 mg every 2 weeks for 3 doses, then every 3–4 weeks; discontinue when bone maturation consistent with age over 12 years in girls or over 13 years in boys

Precocious puberty, body-weight over 30 kg, initially 3.75 mg every 2 weeks for 3 doses, then every 3–4 weeks; body-weight 20–30 kg, initially 2.5 mg every 2 weeks for 3 doses, then every 3–4 weeks; body-weight under 20 kg, initially 1.875 mg every 2 weeks for 3 doses, then every 3–4 weeks; discontinue when bone maturation consistent with age over 12 years in girls or over 13 years in boys

Precocious puberty, body-weight over 30 kg, initially 3.75 mg every 2 weeks for 3 doses, then every 3–4 weeks; body-weight 20–30 kg, initially 2.5 mg every 2 weeks for 3 doses, then every 3–4 weeks; body-weight under 20 kg, initially 1.875 mg every 2 weeks for 3 doses, then every 3–4 weeks; discontinue when bone maturation consistent with age over 12 years in girls or over 13 years in boys
6.7.3 Metyrapone

Metyrapone is a competitive inhibitor of 11β-hydroxylation in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production, which, in turn, leads to increased synthesis and release of cortisol precursors. It may be used as a test of anterior pituitary function.

Although most types of Cushing’s syndrome are treated surgically, which occurs when the adrenal cortex is not usually the source of acute stress or surgery. Metyrapone has been found helpful in controlling the symptoms of the disease; it is also used in other forms of Cushing’s syndrome to prepare the patient for surgery. The dosages used are either low, and tailored to cortisol production or high, in which case corticosteroid replacement therapy is also needed.

Contra-indications
adenocortical insufficiency (see Cautions)
Hepatic impairment use with caution in hepatic impairment (delayed response)
Pregnancy avoid (may impair biosynthesis of fetal-placental steroids)
Breast-feeding avoid—no information available
Side-effects occasional nausea, vomiting, dizziness, headache, hypotension, sedation; rarely abdominal pain, allergic skin reactions, hypoadrenalism, hirsutism

Dose
- Differential diagnosis of ACTH-dependent Cushing’s syndrome, 750 mg every 4 hours for 6 doses; CHILD 15 mg/kg (minimum 250 mg) every 4 hours for 6 doses
- Management of Cushing’s syndrome, range 0.25–6 g daily, tailored to cortisol production; see notes above
- Resistant oedema due to increased aldosterone secretion in cirrhosis, nephrotic syndrome, and congestive heart failure (with glucocorticoid replacement therapy) 3 g daily in divided doses

Metopiron® (HRA Pharma) Capsules, ivory, metyrapone 250 mg, net price 100-cap pack = £363.66. Label: 21, counselling, driving

6.7.4 Somatomedics

Somatomedics are a group of polypeptide hormones structurally related to insulin and commonly known as insulin-like growth factors (IGFs). Mecasermin, a human insulin-like growth factor-I (rHIGF-I), is the principal mediator of the somatotropic effects of human growth hormone and is used to treat growth failure in children and adolescents with severe primary insulin-like growth factor-I deficiency.

Mecasermin
(Recombinant human insulin-like growth factor-I; rHIGF-I)

Indications see notes above
Cautions correct hypothyroidism before initiating treatment; diabetes mellitus (adjustment of antidiabetic therapy may be necessary), monitor ECG before and on termination of treatment (and during treatment if ECG abnormal), papilloedema (see under Side-effects), monitor for disorders of the epiphysis of the hip (monitor for limping), monitor for signs of tonsillar hypertrophy (snoring, sleep apnoea, and chronic middle ear effusions)
Contra-indications evidence of tumour activity (discontinue treatment)
Pregnancy avoid unless essential; contraception advised in women of child-bearing potential
Breast-feeding avoid
Side-effects headache, fundoscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported); cardiomegaly, ventricular hypertrophy, tachycardia; convulsions, sleep apnoea, night terrors, dizziness, nervousness; tonsillar hypertrophy (see Cautions above); hypoglycaemia (especially in first month, and in younger children), hyperglycaemia, glycaemastia; arthralgia, myalgia;
visual disturbance, impaired hearing; antibody formation; injection-site reactions (rotate site)

**Dose**

- By subcutaneous injection, ADOLESCENT and CHILD over 2 years, initially 40 micrograms/kg twice daily for 1 week, if tolerated increase dose in steps of 40 micrograms/kg to max. 120 micrograms/kg twice daily; discontinue if no response within 1 year

**Counselling**
Dose should be administered just before or after food; do not increase dose if a dose is missed

**Note** Reduce dose if hypoglycaemia occurs despite adequate food intake, withhold injection if patient unable to eat

**Increlex® (Ipsen)**
Injection, mecsamerin 10 mg/mL, net price 4-mL vial = £605.00. Counselling, administration

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)
7 Obstetrics, gynaecology, and urinary-tract disorders

7.1 Drugs used in obstetrics

7.1.1 Prostaglandins and oxytocics

7.1.1.1 Drugs affecting the ductus arteriosus

7.1.2 Mifepristone

7.1.3 Myometrial relaxants

7.2 Treatment of vaginal and vulval conditions

7.2.1 Preparations for vaginal and vulval changes

7.2.2 Vaginal and vulval infections

7.3 Contraceptives

7.3.1 Combined hormonal contraceptives

7.3.2 Progestogen-only contraceptives

7.3.2.1 Oral progestogen-only contraceptives

7.3.2.2 Parenteral progestogen-only contraceptives

7.3.2.3 Intra-uterine progestogen-only device

7.3.3 Spermicidal contraceptives

7.3.4 Contraceptive devices

7.3.5 Emergency contraception

7.4 Drugs for genito-urinary disorders

7.4.1 Drugs for urinary retention

7.4.2 Drugs for urinary frequency, enuresis, and incontinence

7.4.3 Drugs used in urological pain

7.4.4 Bladder instillations and urological surgery

7.4.5 Drugs for erectile dysfunction

For hormonal therapy of gynaecological disorders see section 6.4.1 (including HRT), section 6.5.1 and section 6.7.2.

7.1.1 Prostaglandins and oxytocics

Prostaglandins and oxytocics are used to induce abortion or induce or augment labour and to minimise blood loss from the placental site. They include oxytocin, carbetocin, ergometrine, and the prostaglandins. All induce uterine contractions with varying degrees of pain according to the strength of contractions induced.

Induction of abortion Gemeprost, a prostaglandin administered vaginally as pessaries, is suitable for the medical induction of late therapeutic abortion; gemeprost is also used to ripen the cervix before surgical abortion, particularly in primigravidas. The prostaglandin misoprostol (section 7.1.2) is given by mouth, buccally, sublingually, or vaginally, to induce medical abortion [unlicensed indication]; intravaginal use ripens the cervix before surgical abortion [unlicensed indication]. Extra-amniotic dinoprostone is rarely used nowadays.

Pre-treatment with mifepristone (section 7.1.2) can facilitate the process of medical abortion. It sensitises the uterus to subsequent administration of a prostaglandin and, therefore, abortion occurs in a shorter time and with a lower dose of prostaglandin.

Induction and augmentation of labour Dinoprostone is available as vaginal tablets, pessaries and vaginal gels for the induction of labour. The intravenous solution is rarely used; it is associated with more side-effects.

Oxytocin (Syntocinon®) is administered by slow intravenous infusion, using an infusion pump, to induce or augment labour, usually in conjunction with amniotomy. Uterine activity must be monitored carefully and
hyperstimulation avoided. Large doses of oxytocin may result in excessive fluid retention. 

**Misoprostol** is given orally or vaginally for the induction of labour [unlicensed indication].

---

### Prevention and treatment of haemorrhage

Bleeding due to incomplete miscarriage or abortion can be controlled with **ergometrine** and **oxytocin** (Syntometrine®) given intramuscularly, the dose is adjusted according to the patient’s condition and blood loss. This is commonly used before surgical evacuation of the uterus, particularly when surgery is delayed. Oxytocin and ergometrine combined are more effective in early pregnancy than either drug alone.

Active management of the third stage of labour reduces the risk of postpartum haemorrhage; oxytocin is given by intramuscular injection [unlicensed] on delivery of the anterior shoulder or, at the latest, immediately after the baby is delivered. Alternatively, ergometrine 500 micrograms with oxytocin 5 units (Syntometrine® 1 mL) can be given by intramuscular injection in the absence of hypertension; oxytocin alone causes less nausea, vomiting, and hypertension than when given with ergometrine.

In excessive uterine bleeding, any placental products remaining in the uterus should be removed. Oxytocic drugs are used to treat postpartum haemorrhage caused by uterine atony; treatment options are as follows:

- **oxytocin** 5 units by slow intravenous injection (dose may be repeated), followed in severe cases by intravenous infusion of oxytocin 40 units in 500 mL infusion fluid (prolonged administration—see Appendix 4) at a rate that controls uterine atony or
- **ergometrine** 250–500 micrograms by intramuscular injection or
- **ergometrine** 250–500 micrograms by slow intravenous injection (use with caution—risk of hyperstimulation) or
- **ergometrine** 500 micrograms with oxytocin 5 units (Syntometrine® 1 mL) by intramuscular injection

**Carboprost** has an important role in severe postpartum haemorrhage unresponsive to ergometrine and oxytocin.

**Misoprostol** [unlicensed] can be used in postpartum haemorrhage when oxytocin, ergometrine, and carboprost are not available or are inappropriate.

---

### CARBOPROST

**Indications** postpartum haemorrhage due to uterine atony in patients unresponsive to ergometrine and oxytocin

**Cautions** history of glaucoma or raised intra-ocular pressure, asthma, hypertension, hypotenoesis, anaemia, jaundice, diabetes, epilepsy; uterine scars; excessive dosage may cause uterine rupture; interactions: Appendix 1 (prostaglandins)

**Contra-indications** untreated pelvic infection; cardiac or pulmonary disease

**Hepatic impairment** manufacturer advises avoid

**Renal impairment** manufacturer advises avoid

**Side-effects** nausea, vomiting, diarrhoea, hyperthermia, and flushing; bronchospasm; less frequent effects include raised blood pressure, dyspnoea, and pulmonary oedema; chills, headache, diaphoresis, dizziness; cardiovascular collapse also reported; erythema and pain at injection site reported

**Dose**

- By deep intramuscular injection, 250 micrograms repeated if necessary at intervals of not less than 15 minutes; total dose should not exceed 2 mg (8 doses)

**Hemabate®** (Pharmacia)

**Injection**, carboprost as trometamol salt (tromethamine salt) 250 micrograms/mL, net price 1-mL amp = £17.64

---

### DINOPROSTONE

**Indications** see notes above and under preparations below

**Cautions** history of asthma, glaucoma and raised intra-ocular pressure; hypertension; history of epilepsy; uterine scarring; monitor uterine activity and fetal status (particular care if history of uterine hypotony); uterine rupture; see also notes above; monitor for disseminated intravascular coagulation after parturition; risk factors for disseminated intravascular coagulation; effect of oxytocin enhanced (care needed in monitoring uterine activity when used in sequence); interactions: Appendix 1 (prostaglandins)

**Contra-indications** active cardiac, or pulmonary disease; placenta praevia or unexplained vaginal bleeding during pregnancy, ruptured membranes, major cephalopelvic disproportion or fetal malpresentation, history of caesarean section or major uterine surgery, untreated pelvic infection, fetal distress, grand multiparas and multiple pregnancy, history of difficult or traumatic delivery; avoid extra-aminiotic route in cervicitis or vaginitis

**Hepatic impairment** manufacturer advise avoid

**Renal impairment** manufacturer advise avoid

**Side-effects** nausea, vomiting, diarrhoea; other side-effects include uterine hypertonos, fever
contractions, pulmonary or amniotic fluid embolism, abruptio placenta, fetal distress, maternal hypertension, bronchospasm, rapid cerebral dilation, fever, backache; uterine hypercontractility with or without fetal bradycardia, low Apgar scores; cardiac arrest, uterine rupture, stillbirth or neonatal death also reported; vaginal symptoms (warmth, irritation, pain); after intravenous administration—shivering, shivering, headache, dizziness, temporary pyrexia and raised white blood cell count; disseminated intravascular coagulation reported; also local tissue reaction and erythema after intravenous administration and possibility of infection after extra-aminotic administration

**Dose**
- See under preparations, below
- **Important** Do not confuse dose of Prostin E2® vaginal gel with that of Prostin E2® vaginal tablets—not bioequivalent.

**Propess®** (Ferring)  
**Pessaries** (within retrieval device), releasing dinoprostone approx. 10 mg over 24 hours; net price 1-pessary pack = £30.00

**Dose by vagina**, cervical ripening and induction of labour at term, 1 pessary (in retrieval device) inserted high into posterior fornix and removed when cervical ripening adequate, if oxytocin necessary, remove 30 minutes before oxytocin infusion, remove if cervical ripening inadequate after 24 hours (dose not to be repeated)

**Prostin E2®** (Pharmacia)  
**Intravenous solution**, for dilution and use as an infusion, dinoprostone 1 mg/mL, net price 0.75-mL amp = £8.52; 10 mg/mL, 0.5-mL amp = £18.40 (both hosp. only; rarely used, consult product literature for dose and indications)

**Extra-aminotic solution**, dinoprostone 10 mg/mL, net price 0.5-mL amp (with diluent) = £18.40 (hosp. only; less commonly used nowadays, consult product literature for dose and indications)

**Vaginal gel**, dinoprostone 400 micrograms/mL, net price 2.5 mL (1 mg) = £13.28; 800 micrograms/mL, 2.5 mL (2 mg) = £13.28

**Dose by vagina**, induction of labour, inserted high into posterior fornix (avoid administration into cervical canal), 1 mg (unfavoured primigravida 2 mg), followed after 6 hours by 1–2 mg if required, max. gel 3 mg (unfavoured primigravida 4 mg)

**Vaginal tablets**, dinoprostone 3 mg, net price 8-vaginal tab pack = £106.23

**Dose by vagina**, induction of labour, inserted high into posterior fornix, 3 mg, followed after 6–8 hours by 3 mg if labour is not established; max. 6 mg (vaginal tablets)

**Note** Prostin E2 Vaginal Gel and Vaginal Tablets are not bioequivalent

**ERGOMETRINE MALEATE**

**Indications** see notes above

**Cautions** cardiac disease; hypertension; multiple pregnancy; acute porphyria (section 9.8.2); **interactions**: Appendix 1 (ergot alkaloids)

**Contra-indications** induction of labour, first and second stages of labour, vascular disease, severe cardiac disease, sepsis, severe hypertension, eclampsia

**Hepatic impairment** manufacturer advises caution in mild or moderate impairment and avoid in severe impairment

**Renal impairment** manufacturer advises caution in mild or moderate impairment and avoid in severe impairment

**Side-effects** nausea, vomiting, abdominal pain; chest pain, arrhythmias (including bradycardia), palpitation, hypertension, vasosconstriction; dyspnoea, pulmonary oedema; headache, dizziness; tinnitus; rash; very rarely myocardial infarction

**Dose**
- See notes above

**Ergometrine (Non-proprietary) ([†](#))**

**Injection**, ergometrine maleate 500 micrograms/mL, net price 1-mL amp = 93p

**With oxytocin**

**Syntometrine®** (Alliance)  
**Injection**, ergometrine maleate 500 micrograms, oxytocin 5 units/mL, net price 1-mL amp = £1.57

**Dose by intramuscular injection**, 1 mL; by intravenous injection, no longer recommended

**GEMEPROST**

**Indications** see under Dose

**Cautions** obstructive airways disease, cardiovascular insufficiency, raised intraocular pressure, cervicitis or vaginitis; **interactions**: Appendix 1 (prostaglandins)

**Important** For warnings relating to use of gemeprost in a patient undergoing induction of abortion with mifepristone, refer to under Mifepristone and Note below

**Contra-indications** unexplained vaginal bleeding, uterine scarring, placenta praevia

**Renal impairment** manufacturer advises avoid

**Side-effects** vaginal bleeding and uterine pain; nausea, vomiting, or diarrhoea; headache, muscle weakness, dizziness, flushing, chills, backache, dyspnoea, chest pain, palpitation and mild pyrexia; uterine rupture reported (most commonly in multi-paras or if history of uterine surgery or if given with intravenous oxytocics); also reported severe hypotension, coronary artery spasm and myocardial infarction

**Dose**
- **By vagina**, cervical ripening prior to first trimester surgical abortion, 1 mg inserted into posterior fornix 3 hours before surgery
- **Second trimester abortion**, 1 mg inserted into posterior fornix every 3 hours for max. of 5 administrations; second course may begin 24 hours after start of treatment (if treatment fails pregnancy should be terminated by another method)
- **Second trimester intra-uterine death**, 1 mg inserted into posterior fornix every 3 hours for max. of 5 administrations only; monitor for coagulopathy

**Note** If used in combination with mifepristone, carefully monitor blood pressure and pulse for 3 hours

**Gemeprost** (Sanofi-Aventis)  
**Pessaries**, gemeprost 1 mg, net price 5-pessary pack = £215.00

**OXYTOCIN**

**Indications** see under Dose and notes above

**Cautions** induction or enhancement of labour—pre- }

---

*References and notes can be found in the original text.*
intake by mouth (risk of hyponatraemia and water-intoxication—see also Appendix 4); effects enhanced by concomitant prostaglandins (very careful monitoring of uterine activity); caudal block anaesthesia (may enhance hypertensive effects of sympathomimetic vasopressors); see also interactions: Appendix 1 (oxytocin).

**Contra-indications**
- Hypertonic uterine contractions.
- Fetal distress; any condition where spontaneous labour or vaginal delivery inadvisable; avoid prolonged administration in oxytocin-resistant uterine inertia, severe pre-eclamptic toxaemia, or severe cardiovascular disease.

**Side-effects**
- Nausea, vomiting; arrhythmia; headache; rarely disseminated intravascular coagulation, rash, and anaphylactoid reactions (with dyspnoea, hypotension, or shock); uterine spasm (may occur at low doses), uterine hyperstimulation (usually with excessive doses)—may cause fetal distress, asphyxia, and death, or may lead to hypertonicity, tetanic contractions, soft-tissue damage or uterine rupture; water intoxication and hyponatraemia associated with high doses with large infusion volumes of electrolyte-free fluid (see also under Dose below); placental abruption and amniotic fluid embolism also reported on overdose.

**Dose**
- Induction of labour for medical reasons or stimulation of labour in hypotonic uterine inertia, by intravenous infusion (not to be started for at least 6 hours after administration of vaginal prostaglandin), initially 0.001–0.004 units/minute, increased at intervals of at least 30 minutes until a maximum of 3–4 contractions occur every 10 minutes (0.01 units/minute is often adequate) up to max. 0.02 units/minute; if regular contractions not established after total of 5 units stop induction attempt (may be repeated next day starting again at 0.001–0.004 units/minute).

Important: Careful monitoring of fetal heart rate and uterine motility essential for dose titration (avoid intravenous injection during labour); discontinue immediately in uterine hyperactivity or fetal distress.
- Caesarean section, by slow intravenous injection immediately after delivery, 5 units.
- Prevention of postpartum haemorrhage, after delivery of placenta, by slow intravenous injection, 5 units (if infusion used for induction or enhancement of labour, increase rate during third stage and for next few hours).

Important: Avoid rapid intravenous injection (may transiently reduce blood pressure).

Note: Can be given in a dose of 10 units by intramuscular injection (unlicensed route) instead of oxytocin with ergometrine (Syntometrine®), see notes above.

- Treatment of postpartum haemorrhage, by slow intravenous injection, 5 units (dose may be repeated), followed in severe cases by intravenous infusion of 40 units in 500 mL infusion fluid at a rate sufficient to control uterine atony.

Important: Avoid rapid intravenous injection (may transiently reduce blood pressure); prolonged administration, see warning below.

- Incomplete, inevitable, or missed miscarriage, by slow intravenous injection, 5 units followed if necessary by intravenous infusion, 0.02–0.04 units/minute or faster.

Important: Prolonged intravenous administration at high doses with large volume of fluid (which is possible in inevitable or missed miscarriage or postpartum haemorrhage) may cause water intoxication with hyponatraemia. To avoid: use electrolyte-containing diluent (i.e. not glucose), increase oxytocin concentration to reduce fluid, restrict fluid intake by mouth; monitor fluid and electrolytes.

**Note:** Oxytocin doses in the BNF may differ from those in the product literature.

**Syntocinon® (Alliance) Prolonged intravenous infusion**
- Oxytocin, net price 5 units/mL, 1-mL amp = 80p; 10 units/mL, 1-mL amp = 91p

With ergometrine
- See Syntometrine®, p. 528

### 7.1.2 Mifepristone

Mifepristone, an antiprogestogenic steroid, sensitises the myometrium to prostaglandin-induced contractions and ripens the cervix. For termination of pregnancy, a single dose of mifepristone is followed by administration of a prostaglandin (gemeprost or misoprostol [unlicensed]). Guidelines of the Royal College of Obstetricians and Gynaecologists (November 2011) include the following [unlicensed] regimens for inducing medical abortion:

- For gestation up to 49 days, mifepristone 200 mg by mouth followed 24–48 hours later by misoprostol 400 micrograms by mouth.
- For gestation at 50–63 days, mifepristone 200 mg by mouth followed 24–48 hours later by misoprostol 800 micrograms vaginally, buccally, or sublingually; if abortion has not occurred 4 hours after misoprostol dose, a further dose of misoprostol 400 micrograms may be given vaginally or by mouth.
- For gestation between 9 and 13 weeks, mifepristone 200 mg by mouth followed 36–48 hours later by misoprostol 800 micrograms vaginally, followed if necessary by a maximum of 4 further doses at 3-hourly intervals of misoprostol 400 micrograms vaginally or by mouth.
- For gestation between 13 and 24 weeks, mifepristone 200 mg by mouth followed 36–48 hours later by misoprostol 800 micrograms vaginally, followed if necessary by a maximum of 4 further doses at 3-hourly intervals of misoprostol 400 micrograms vaginally or by mouth; if abortion has not occurred 3 hours after the last dose of misoprostol, a further dose of mifepristone may be given, and misoprostol may be recommended 12 hours later.

**MIFEPRISTONE**

#### Indications
- see under dose

**Cautions**
- Asthma (avoid if severe and uncontrolled);
- Haemorrhagic disorders and anticoagulant therapy;
- Prosthetic heart valve or history of endocarditis (see section 5.1 table 2);
- Risk factors for or existing cardiovascular disease; adrenal suppression (may require corticosteroid);
- Interactions: Appendix 1 (mifepristone).

**Important**
- For warnings relating to use of gemeprost in a patient undergoing induction of abortion with mifepristone, see under Gemeprost.

**Contra-indications**
- Uncontrolled severe asthma; suspected ectopic pregnancy (use other specific means of termination); chronic adrenal failure; acute porphyria (section 9.8.2).

**Hepatic impairment**
- Manufacturer advises avoid

**Renal impairment**
- Manufacturer advises avoid
7 Obstetrics, gynaecology, and urinary-tract disorders

7.1.3 Myometrial relaxants

**Side-effects**
- gastro-intestinal cramps; uterine contractions, vaginal bleeding (sometimes severe) may occur between administration of mifepristone and surgery (and rarely abortion may occur before surgery); less commonly hypersensitivity reactions including rash and urticaria; rarely hypotension, malaise, headache, fever, hot flushes, dizziness, and chills; infections (including toxic shock syndrome) also reported

**Dose**
- Medical termination of intra-uterine pregnancy of up to 49 days gestation, by mouth, mifepristone 600 mg as a single dose under medical supervision followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina or misoprostol 400 micrograms by mouth [unlicensed]; alternative regimen, mifepristone 200 mg by mouth as a single dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding
- Medical termination of intra-uterine pregnancy of 50–63 days gestation, by mouth, mifepristone 600 mg (200 mg also effective) as a single dose under medical supervision, followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding
- Medical termination of intra-uterine pregnancy of 13–24 weeks gestation, by mouth, mifepristone 600 mg as a single dose under medical supervision 36–48 hours before procedure
- Termination of pregnancy of 13–24 weeks gestation (in combination with a prostaglandin), by mouth, mifepristone 600 mg (200 mg may be effective) as a single dose under medical supervision followed 36–48 hours later by gemeprost 1 mg by vagina every 3 hours up to max. 5 mg or misoprostol (see above [unlicensed]); if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended

**Note**
- Careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension)
- Labour induction in fetal death in utero where prostaglandin or oxytocin inappropriate, by mouth, mifepristone 600 mg daily as a single dose for 2 days under medical supervision; if labour not started within 72 hours of first dose, another method should be used

**Mifegyne® (Nordic)**
- Tablets, yellow, mifepristone 200 mg, net price 3-tab pack = £52.66 (supplied to NHS hospitals and premises approved under Abortion Act 1967). Label: 10, patient information leaflet

**Tractocile® (Ferring)**
- Injection, atosiban (as acetate) 7.5 mg/mL, net price 0.9-mL (6.75-mg) vial = £18.41
- Concentrate for intravenous infusion, atosiban (as acetate) 7.5 mg/mL, net price 5-mL vial = £52.82

**Indications**
- uncomplicated premature labour (see notes above)

**Cautions**
- monitor blood loss after delivery; intra-uterine growth restriction; abnormal placental site

**Contra-indications**
- eclampsia and severe pre-eclampsia, intra-uterine infection, intra-uterine fetal death, antepartum haemorrhage (requiring immediate delivery), placenta praevia, abruptio placenta, intra-uterine growth restriction with abnormal fetal heart rate, premature rupture of membranes after 30 weeks’ gestation

**Hepatic impairment**
- no information available

**Renal impairment**
- no information available

**Side-effects**
- nausea, vomiting, tachycardia, hypotension, headache, dizziness, hot flushes, hyperglycaemia, injection-site reaction; less commonly pruritus, rash, fever, insomnia

**Dose**
- By intravenous injection, initially 6.75 mg over 1 minute, then by intravenous infusion 18 mg/hour for 3 hours, then 6 mg/hour for up to 45 hours; max. duration of treatment 48 hours

**Atosiban**

BNF 68

- ATOSIBAN

- Indications
- uncomplicated premature labour (see notes above)

- Cautions
- monitor blood loss after delivery; intra-uterine growth restriction; abnormal placental site

- Contra-indications
- eclampsia and severe pre-eclampsia, intra-uterine infection, intra-uterine fetal death, antepartum haemorrhage (requiring immediate delivery), placenta praevia, abruptio placenta, intra-uterine growth restriction with abnormal fetal heart rate, premature rupture of membranes after 30 weeks’ gestation

- Hepatic impairment
- no information available

- Renal impairment
- no information available

- Side-effects
- nausea, vomiting, tachycardia, hypotension, headache, dizziness, hot flushes, hyperglycaemia, injection-site reaction; less commonly pruritus, rash, fever, insomnia

- Dose
- By intravenous injection, initially 6.75 mg over 1 minute, then by intravenous infusion 18 mg/hour for 3 hours, then 6 mg/hour for up to 45 hours; max. duration of treatment 48 hours

- Tractocile® (Ferring)
- Injection, atosiban (as acetate) 7.5 mg/mL, net price 0.9-mL (6.75-mg) vial = £18.41
- Concentrate for intravenous infusion, atosiban (as acetate) 7.5 mg/mL, net price 5-mL vial = £52.82

**Myometrial relaxants**

Tocolytic drugs postpone premature labour and they are used with the aim of reducing harm to the child. However, there is no satisfactory evidence that the use of these drugs reduces mortality. The greatest benefit is gained by using the delay to administer corticosteroid therapy or to implement other measures which improve perinatal health (including transfer to a unit with neonatal intensive care facility).

The oxytocin receptor antagonist, atosiban, is licensed for the inhibition of uncomplicated premature labour between 24 and 33 weeks of gestation. Atosiban may be preferable to a beta₂ agonist because it has fewer side-effects.

The dihydropyridine calcium-channel blocker nifedipine (section 2.6.2) also has fewer side-effects than a beta₂ agonist. Nifedipine [unlicensed indication] can be given initially in a dose of 20 mg followed by 10–20 mg 3–4 times daily adjusted according to uterine activity.

The beta₂ agonists salbutamol and terbutaline are licensed for inhibiting uncomplicated premature labour between 22 and 37 weeks of gestation to permit a delay in delivery of up to 48 hours. Use of high-dose short-acting beta₂ agonists in obstetric indications has been associated with serious, sometimes fatal cardiovascular events in the mother and fetus, particularly when used for a prolonged period of time. Oral therapy is no longer recommended and parenteral therapy should be restricted to a maximum duration of 48 hours, given under the supervision of a specialist, and with close monitoring (see under Beta₂ agonists).

Indometacin (section 10.1.1), a cyclo-oxygenase inhibitor, also inhibits labour [unlicensed indication] and it can be useful in situations where a beta₂ agonist is not appropriate; however, there are concerns about neonatal complications such as transient impairment of renal function and premature closure of ductus arteriosus.
**Beta₂ agonists**

**Cautions** Beta₂ agonists should be used with caution in patients with hypertension, mild to moderate pre-eclampsia, hyperthyroidism, and hypokalaemia (particular risk with potassium-depleting diuretics—see also Hypokalaemia, p. 186). Patients with suspected cardiovascular disease should be assessed by a cardiologist before initiating therapy—see also Contra-indications, below. It is important to monitor blood pressure, pulse rate (should not exceed 120 beats per minute), ECG (discontinue treatment if signs of myocardial ischaemia develop), blood glucose and lactate concentrations, and the patient’s fluid and electrolyte status (avoid overhydration—discontinue drug immediately and initiate diuretic therapy if pulmonary oedema occurs). Beta₂ agonists should also be used with caution in diabetes—monitor blood glucose (risk of hyperglycaemia and ketoacidosis, especially with intravenous beta₂ agonists).

**Contra-indications** Beta₂ agonists are contra-indicated in patients with a history of cardiac disease and in patients with significant risk factors for myocardial ischaemia; they should also be avoided in pulmonary hypertension, antepartum haemorrhage, intra-uterine infection, intra-uterine fetal death, placenta praevia, abruptio placenta, threatened miscarriage, cord compression, and eclampsia or severe pre-eclampsia.

**Side-effects** Side-effects of the beta₂ agonists include nausea, vomiting, pulmonary oedema (see Cautions above), palpitation, tachycardia, arrhythmias, myocardial ischaemia, hypotension, peripheral vasodilation, headache, tremor, hyperglycaemia, hypokalaemia (see Cautions), muscle cramps and tension, and hypersensitivity reactions (including angioedema, urticaria, rash, bronchospasm, hypotension, and collapse).

**SALBUTAMOL**

(Albuterol)

**Indications** uncomplicated premature labour under specialist supervision (see notes above); asthma (section 3.1.1)

**Cautions** see notes above; interactions: Appendix 1 (sympathomimetics, beta₂)

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- By intravenous infusion, 5 micrograms/minute for 20 minutes, increased every 20 minutes in steps of 2.5 micrograms/minute until contractions have ceased (more than 10 micrograms/minute should seldom be given—20 micrograms/minute should not be exceeded), continue for 1 hour then decrease every 20 minutes in steps of 2.5 micrograms/minute to lowest dose that maintains suppression; max. total duration 48 hours

**Preparations** Section 3.1.1.1

**TERBUTALINE SULFATE**

**Indications** uncomplicated premature labour under specialist supervision (see notes above); asthma (section 3.1.1)

**Cautions** see notes above; interactions: Appendix 1 (sympathomimetics, beta₂)

**Contra-indications** see notes above

**Side-effects** see notes above; also reported sleep disturbances and behavioural disturbances

**Dose**

- By intravenous infusion, 5 micrograms/minute for 20 minutes, increased every 20 minutes in steps of 2.5 micrograms/minute until contractions have ceased (more than 10 micrograms/minute should seldom be given—20 micrograms/minute should not be exceeded), continue for 1 hour then decrease every 20 minutes in steps of 2.5 micrograms/minute to lowest dose that maintains suppression; max. total duration 48 hours

**Preparations** Section 3.1.1.1

### 7.2 Treatment of vaginal and vulval conditions

#### 7.2.1 Preparations for vaginal and vulval changes

**Topical HRT for vaginal atrophy**

A cream containing an oestrogen may be applied on a short-term basis to improve the vaginal epithelium in menopausal atrophic vaginitis. It is important to bear in mind that topical oestrogens should be used in the smallest effective amount to minimise systemic effects. Modified-release vaginal tablets and an impregnated vaginal ring are now also available. The risk of endometrial hyperplasia and carcinoma is increased when systemic oestrogens are administered alone for prolonged periods (section 6.4.1.1). The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma. Topical oestrogens are also used in postmenopausal women before vaginal surgery for prolapse when there is epithelial atrophy.

For a general comment on hormone replacement therapy, including the role of topical oestrogens, see section 6.4.1.1.
7 Obstetrics, gynaecology, and urinary-tract disorders

**OESTROGENS, TOPICAL**

**Indications** see notes above

**Cautions** see notes above; see also Oestrogens for HRT (section 6.4.1.1); interrupt treatment periodically to assess need for continued treatment

**Contra-indications** see notes above; see also Oestrogens for HRT (section 6.4.1.1)

**Hepatic impairment** see Combined Hormonal Contraceptives, section 7.3.1

**Pregnancy** see Combined Hormonal Contraceptives, section 7.3.1

**Breast-feeding** avoid; adverse effects on lactation; see Combined Hormonal Contraceptives, section 7.3.1

**Side-effects** see notes above; see also Oestrogens for HRT (section 6.4.1.1), local irritation

**Gynest**

- **Intravaginal cream**, estradiol 0.01%, net price 80 g with applicator = £4.67
- **Excipients** include arachis (peanut) oil
- **Condoms** may damage latex condoms and diaphragms
- **Dose** insert 1 applicatorful daily, preferably in the evening, until improvement occurs, reduced to 1 applicatorful twice a week; attempts to discontinue should be made at 3–6 month intervals with re-examination

**Ortho-Gynest**

- **Pessaries**, estradiol 500 micrograms, net price 15 pessaries = £4.73
- **Excipients** include butylated hydroxytoluene
- **Condoms** damage latex condoms and diaphragms
- **Dose** insert 1 pessary daily, preferably in the evening, until improvement occurs; maintenance 1 pessary twice a week; attempts to reduce or discontinue should be made at 3–6 month intervals with re-examination

**Ovestin**

- **Intravaginal cream**, estradiol 0.1%, net price 15 g with applicator = £4.45
- **Excipients** include cetyl alcohol, polyisorbates, stearyl alcohol
- **Condoms** effect on latex condoms and diaphragms not yet known
- **Dose** insert 1 applicator-dose daily for 2–3 weeks; then reduce to twice a week (discontinue every 2–3 months for 4 weeks to assess need for further treatment); vaginal surgery, 1 applicator-dose daily for 2 weeks before surgery, resuming 2 weeks after surgery

**Vagifem**

- **Vaginal tablets**, f/c, estradiol 10 micrograms in disposable applicators, net price 24-applicator pack = £16.72
- **Excipients** none as listed in section 13.1.3
- **Condoms** no evidence of damage to latex condoms and diaphragms
- **Dose** insert 1 vaginal tablet daily for 2 weeks then reduce to 1 tablet twice weekly

**Vaginal ring**

**Estring**

- **Intravaginal ring**, releasing estradiol approx. 7.5 micrograms/24 hours, net price 1-ring pack = £31.42
- **Label**: 10, patient information leaflet
- **Dose** for postmenopausal urogenital conditions (not suitable for vasomotor symptoms or osteoporosis prophylaxis), to be inserted into upper third of vagina and worn continuously, replace after 3 months, max. duration of continuous treatment 2 years

---

**Non-hormonal preparations for vaginal atrophy**

*Replens MD®* and *Sylk®* are acidic, non-hormonal vaginal moisturisers; *Replens MD®* provides a high moisture content for up to 3 days.

---

**7.2.2 Vaginal and vulval infections**

Effective specific treatments are available for the common vaginal infections.

**Fungal infections**

*Candidal vulvitis* can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. *Vaginal candidiasis* is treated primarily with antifungal pessaries or cream inserted high into the vagina (including during menstruation). Single-dose preparations offer an advantage when compliance is a problem. Local irritation may occur on application of vaginal antifungal products.

**Imidazole** drugs ( clotrimazole, econazole, fenticonazole, and miconazole) are effective against candida in short courses of 1 to 14 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if symptoms recur. Vaginal applications may be supplemented with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with *fluconazole* or *itraconazole* (section 5.2.1) is also effective.

**Vulvovaginal candidiasis in pregnancy**

Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.

**Recurrent vulvovaginal candidiasis**

Recurrence of vulvovaginal candidiasis is particularly likely if there are predisposing factors, such as antibacterial therapy, pregnancy, diabetes mellitus, or possibly oral contraceptive use. Reservoirs of infection may also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus as well as the gastro-intestinal tract and the bladder. The partner may also be the source of re-infection and, if symptomatic, should be treated with a topical imidazole cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis. Some recommended regimens [all unlicensed] include:

- initially, *fluconazole* (section 5.2.1) by mouth 150 mg every 72 hours for 3 doses, then 150 mg once every week for 6 months;
- initially, intravaginal application of a topical imidazole for 10–14 days, then clotrimazole vaginally 500-mg pessary once every week for 6 months;
- initially, intravaginal application of a topical imidazole for 10–14 days, then *itraconazole* (section 5.2.1) by mouth 50–100 mg daily for 6 months.
PREPARATIONS FOR VAGINAL AND VULVAL CANDIDIASIS

Indications  see notes above

Cautions  interactions: Appendix 1 (miconazole)

Pregnancy  see notes above

Side-effects  occasional local irritation

Dose

● See under preparations below

Clotrimazole (Non-proprietary)

Cream (topical), clotrimazole 1%, net price 20 g = £1.26; 50 g = £3.15

Condoms  damages latex condoms and diaphragms

Dose  apply to anogenital area 2–3 times daily

Pessary, clotrimazole 500 mg, net price 1 pessary with applicator = £3.12

Dose  insert 1 pessary at night as a single dose; can be repeated once if necessary

Canesten® (Bayer Consumer Care)

Cream (topical), clotrimazole 1%, net price 20 g = £2.14; 50 g = £3.50

Excipients  include benzyalcohol, cetostearyl alcohol, polysorbates

Condoms  damages latex condoms and diaphragms

Dose  apply to anogenital area 2–3 times daily

Pessary, clotrimazole 2%, net price 20 g = £4.46

Excipients  include benzyalcohol, cetostearyl alcohol, polysorbates

Condoms  damages latex condoms and diaphragms

Dose  apply to anogenital area 2–3 times daily

Intravaginal cream (10% VC®) (intravaginal use), clotrimazole 10%, net price 5-g applicator pack = £4.50

Excipients  include benzyalcohol, cetostearyl alcohol, polysorbates

Condoms  damages latex condoms and diaphragms

Dose  insert 5 g at night as a single dose; can be repeated once if necessary

Note  Brands for sale to the public include Canesten® Internal Cream

Cream Combi, clotrimazole 10% vaginal cream and 2% topical cream, net price 5-g vaginal cream (with applicator) and 10-g topical cream = £8.21

Excipients  include benzyalcohol, cetostearyl alcohol, polysorbates

Condoms  damages latex condoms and diaphragms

Dose  see under individual components

Pessaries, clotrimazole 100 mg, net price 6 pessaries with applicator = £3.50; 200 mg, 3 pessaries with applicator = £3.10

Condoms  damages latex condoms and diaphragms

Dose  insert 200 mg for 3 nights or 100 mg for 6 nights; course can be repeated once if necessary

Pessary, clotrimazole 500 mg, net price 1 pessary with applicator = £2.00

Condoms  damages latex condoms and diaphragms

Dose  insert 1 pessary at night as a single dose; can be repeated once if necessary

Pessary Combi, clotrimazole 500-mg pessary and cream (topical) 2%, net price 1 pessary and 10-g cream = £8.21

Excipients  include benzyalcohol, cetostearyl alcohol, polysorbates

Dose  see under individual components

Soft Gel Pessary, clotrimazole 500 mg, net price 1 pessary with applicator = £5.41

Condoms  damages latex condoms and diaphragms

Dose  insert 1 pessary at night as a single dose; can be repeated once if necessary

Soft Gel Pessary Combi, clotrimazole 500-mg soft gel pessary and cream (topical) 2%, net price 1 pessary and 10-g cream = £5.73

Excipients  include benzyalcohol, cetostearyl alcohol, polysorbates

Condoms  damages latex condoms and diaphragms

Dose  see under individual components

Gyno-Daktarin® (Janssen) (intravaginal use)

Intravaginal cream, miconazole nitrate 2%, net price 78 g with applicators = £4.33

Excipients  include butylated hydroxyanisole

Condoms  damages latex condoms and diaphragms

Dose  insert 5-g applicatorful once daily for 10–14 days or twice daily for 7 days; course can be repeated once if necessary, topical, apply to anogenital area twice daily

Ovule  (= vaginal capsule) (Gyno-Daktarin®), miconazole nitrate 1.2 g in a fatty basis, net price 1 ovule = £2.94

Excipients  include hydroxybenzoates (parabens)

Condoms  damages latex condoms and diaphragms

Dose  insert 1 ovule at night as a single dose; can be repeated once if necessary

Gyno-Pevaryl® (Janssen) (intravaginal use)

Cream, econazole nitrate 1%, net price 15 g = £2.11; 30 g = £3.78

Excipients  none as listed in section 13.1.3

Condoms  damages latex condoms and diaphragms

Dose  ADULT over 16 years, insert 1 pessary for 3 nights; course can be repeated once if necessary

Pessaries, econazole nitrate 150 mg, net price 3 pessaries = £4.17

Excipients  none as listed in section 13.1.3

Condoms  damages latex condoms and diaphragms

Dose  ADULT over 18 years, apply to anogenital area once or twice daily

Nizoral® (Janssen) (topical), ketoconazole 2%, net price 30 g with applicator = £3.74

Excipients  include cetyl alcohol, hydrogenated wool fat, propylene glycol

Condoms  damages latex condoms and diaphragms

Dose  ADULT over 16 years, insert 1 pessary for 3 nights; course can be repeated once if necessary

Pessaries (Nizoral®), econazole nitrate 150 mg, formulated for single-dose therapy, net price 1 pessary with applicator = £3.69

Excipients  none as listed in section 13.1.3

Condoms  damages latex condoms and diaphragms

Dose  ADULT over 16 years, insert 1 pessary at night as a single dose; can be repeated once if necessary

Gynoxin® (Recordati) (topical)

Intravaginal cream, fenticonazole nitrate 2%, net price 30 g with applicator = £3.74

Excipients  include cetyl alcohol, hydrogenated wool fat, propylene glycol

Condoms  damages latex condoms and diaphragms

Dose  insert 5-g applicatorful intravaginally for 3 days; course can be repeated once if necessary

Pessary (Gynoxin® 1®), econazole nitrate 150 mg, formulated for single-dose therapy, net price 1 pessary with applicator = £3.69

Excipients  none as listed in section 13.1.3

Condoms  damages latex condoms and diaphragms

Dose  ADULT over 16 years, insert 1 pessary at night as a single dose; can be repeated once if necessary

Vaginal capsule, fenticonazole nitrate 200 mg, net price 3 vaginal capsules = £2.42

Excipients  include hydrobenzoates (parabens)

Condoms  damages latex condoms and diaphragms

Dose  insert 1 vaginal capsule at night for 3 nights

Vaginal capsule, fenticonazole nitrate 400 mg, net price 1 vaginal capsule = £2.62

Excipients  include hydrobenzoates (parabens)

Condoms  damages latex condoms and diaphragms

Dose  insert 1 vaginal capsule at night as a single dose

Nizoral® (Janssen) (topical), ketoconazole 2%, net price 30 g = £4.24

Excipients  include polysorbates, propylene glycol, stearyl alcohol

Condoms  effect on latex condoms and diaphragms not yet known

Dose  ADULT over 18 years, apply to anogenital area once or twice daily
Other infections

Trichomonal infections commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole or tinidazole (section 5.1.11). Bacterial infections with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against certain Gram-negative organisms, especially Bacteroides spp. and can be used prophylactically in gynaecological surgery.

Clindamycin cream and metronidazole gel are indicated for bacterial vaginosis.

Vaginal preparations intended to restore normal acidity may prevent recurrence of vaginal infections and permit the re-establishment of the normal vaginal flora.

The antiviral drugs aciclovir, famciclovir, and valaciclovir can be used in the treatment of genital infection due to herpes simplex virus, the HSV type 2 being a major cause of genital ulceration; they have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms. See section 5.3.2.1 for systemic preparations, and section 13.10.3 for topical preparations.

**PREPARATIONS FOR OTHER VAGINAL INFECTIONS**

| Balance Activ Rx® (BBI Healthcare) |
| Vaginal gel, lactic acid 4.9%, glycogen 0.1%, net price 7 x 5 mL-tube = £5.25 |
| Excipients include propylene glycol |
| Dose prevention of bacterial vaginosis, insert contents of 1 tube once or twice weekly |

| Dalacin® (Pharmacia) (Ro) |
| Cream, clindamycin 2% (as phosphate), net price 40-g pack with 7 applicators = £10.86 |
| Excipients include benzyl alcohol, cetostearyl alcohol, polysorbates, propylene glycol |
| Dose bacterial vaginosis, insert 5-g applicatorful at night for 3–7 nights |

| Relactagel® (KoKu) |
| Vaginal gel, lactic acid 4.5%, glycogen 0.1%, net price 7 x 5 mL-tube = £5.25 |
| Excipients include propylene glycol |
| Cautions not recommended if trying to conceive |
| Dose prevention of bacterial vaginosis, ADULT over 18 years insert contents of 1 tube at night for 2–3 nights after menstruation |

| Zidoval® (Meda) (Ro) |
| Vaginal gel, metronidazole 0.75%, net price 40-g pack with 5 applicators = £4.31 |
| Excipients include disodium edetate, hydroxybenzoates (parabens), propylene glycol |
| Cautions not recommended during menstruation; some absorption may occur, see section 5.1.11 for systemic effects |
| Dose bacterial vaginosis, insert 5-g applicatorful at night for 5 nights |

---

### 7.3 Contraceptives

#### 7.3.1 Combined hormonal contraceptives

Oral contraceptives containing an oestrogen and a progestogen (combined oral contraceptives) are effective preparations for general use. Advantages of combined oral contraceptives include:

- reliable and reversible;
- reduced dysmenorrhea and menorrhagia;
- reduced incidence of premenstrual tension;
- less symptomatic fibroids and functional ovarian cysts;
- less benign breast disease;
- reduced risk of ovarian and endometrial cancer;
- reduced risk of pelvic inflammatory disease.

Combined oral contraceptives containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed ‘monophasic’, those with varying amounts of the two hormones are termed ‘phasic’. A transdermal patch and a vaginal ring, both containing an oestrogen with a progestogen, are also available.

**Choice** The majority of combined oral contraceptives contain ethinylestradiol as the oestrogen component; mestranol and estradiol are also used. The ethinylestradiol content of combined oral contraceptives ranges from 20 to 40 micrograms. Generally a preparation with the lowest oestrogen and progestogen content should be followed when prescribing contraception for women under 16 years. The UK Medical Eligibility Criteria for Contraceptive Use (available at [www.fsrh.org](http://www.fsrh.org)) is published by the Faculty of Sexual and Reproductive Healthcare; it categorises the risks of using contraceptive methods with pre-existing medical conditions.

Hormonal contraception is the most effective method of fertility control, but can have major and minor side-effects, especially for certain groups of women.

Intra-uterine devices are a highly effective method of contraception but may produce undesirable local side-effects. They may be used in women of all ages irrespective of parity, but are less appropriate for those with an increased risk of pelvic inflammatory disease.

Barrier methods alone (condoms, diaphragms, and caps) are less effective but can be reliable for well-motivated couples if used in conjunction with a spermicide. Occasionally sensitivity reactions occur. A female condom (Femidom®) is also available; it is pre-lubricated but does not contain a spermicide.

---

1. See Department of Health Guidance (July 2004): Best practice guidance for doctors and other health professionals on the provision of advice and treatment to young people under 16 on contraception, sexual and reproductive health. Available at [tinyurl.com/bpg16](http://tinyurl.com/bpg16)
which gives good cycle control and minimal side-effects in the individual woman is chosen. It is recommended that combined hormonal contraceptives are not continued beyond 50 years of age since more suitable alternatives exist.

- **Low strength preparations** (containing ethinylestradiol 20 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable.

- **Standard strength preparations** (containing ethinylestradiol 30 or 35 micrograms or in 30–40 microgram phased preparations) are appropriate for standard use—but see Risk of Venous Thromboembolism below. Phased preparations are generally reserved for women who either do not have withdrawal bleeding or who have breakthrough bleeding with monophasic products.

The progestogens desogestrel, drospirenone, and gestodene (in combination with ethinylestradiol) may be considered for women who have side-effects (such as acne, headache, depression, breast symptoms, and breakthrough bleeding) with other progestogens. Drospirenone, a derivative of spironolactone, has anti-androgenic and anti-mineralocorticoid activity; it should be used with care if an increased plasma-potassium concentration might be hazardous.

The progestogen dienogest is combined with estradiol in the combined oral contraceptive Qlaira®. Nomegestrol is the progestogen contained in the combined oral contraceptive Zoely®, in combination with estradiol.

The progestogen norelgestromin is combined with ethinylestradiol in a transdermal patch (Evra®). The vaginal contraceptive ring contains the progestogen etonogestrel combined with ethinylestradiol (NuvaRing®).

**Risk of venous thromboembolism** There is an increased risk of venous thromboembolic disease in users of combined hormonal contraceptives particularly during the first year and possibly after restarting combined hormonal contraceptives following a break of four weeks or more. This risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100 000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors, such as obesity. The risk also varies depending on the type of progestogen, see the Combined Hormonal Contraception and Risk of Venous Thromboembolism table for details.

Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

Combined hormonal contraceptives also slightly increase the risk of arterial thromboembolism; however, there is no evidence to suggest that this risk varies between different preparations.

**Travel** Women taking oral contraceptives or using the patch or vaginal ring are at an increased risk of deep-vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

---

1. Combined with ethinylestradiol
2. Combined with estradiol

**Missed pill** The critical time for loss of contraceptive protection is when a pill is omitted at the beginning or end of a cycle (which lengthens the pill-free interval).

If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late; for women taking Qlaira® or Zoely®, see below. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary.

If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of everyday (ED) pills, omitting the 7 inactive tablets).

A missed pill for a woman taking Qlaira® or Zoely® is one that is 12 hours or more late; for information on how to manage missed pills in women taking Qlaira® or Zoely®, refer to product literature.

Emergency contraception (section 7.3.5) is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

**Delayed application or detached patch** If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual ‘change day’. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new ‘Day 1’; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch
should be applied as soon as remembered giving a new ‘Day 1’; additional non-hormonal methods of contraception should be used for the first 7 days of the new cycle. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch ‘change day’ remains the same and no additional contraception is required;
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new ‘Day 1’; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 28), remove it as soon as possible and start the next cycle on the usual ‘change day’, the day after day 28; no additional contraception is required.

Expulsion, delayed insertion or removal, or broken vaginal ring

If the vaginal ring is expelled for less than 3 hours, rinse the ring with cool water and reinsert immediately; no additional contraception is needed. If the ring remains outside the vagina for more than 3 hours or if the user does not know when the ring was expelled, contraceptive protection may be reduced:

- If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
- If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.

If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

Diarrhoea and vomiting

Vomiting and persistent, severe diarrhoea can interfere with the absorption of combined oral contraceptives. If vomiting occurs within 2 hours of taking a combined oral contraceptive another pill should be taken as soon as possible. In cases of persistent vomiting or severe diarrhoea lasting more than 24 hours, additional precautions should be used during and for 7 days (9 days for Qlaira (E)) after recovery (see also under Missed pill, above). If the vomiting and diarrhoea occurs during the last 7 tablets, the next pill-free interval should be omitted (in the case of ED tablets the inactive ones should be omitted).

Interactions

The effectiveness of combined oral contraceptives, progestogen-only oral contraceptives (section 7.3.2.1), contraceptive patches, and vaginal rings can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine, eslicarbazepine, nevirapine, oxcarbazepine, phenytoin, phenobarbital, primidone, ritonavir, St John’s Wort, topiramate, and, above all, rifabutin and rifampicin). A condom together with a long-acting method, such as an injectable contraceptive, may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists.

Women taking combined hormonal contraceptives who require enzyme-inducing drugs should be advised to change to a contraceptive method that is unaffected by enzyme-inducers (e.g. some parenteral progestogen-only contraceptives (p. 543), intra-uterine devices) for the duration of treatment and for 4 weeks after stopping. If a change in contraceptive method is undesirable or inappropriate the following options should be discussed:

- For a short course (2 months or less) of an enzyme-inducing drug, continue with a combined oral contraceptive providing ethinylestradiol 50 micrograms or more daily and use a ‘tricycling’ regimen (i.e. taking 3 packets of monophasic tablets without a break followed by a shortened tablet-free interval of 4 days [unlicensed use]). Additional contraceptive precautions should also be used whilst taking the enzyme-inducing drug and for 4 weeks after stopping. Another option (except for rifampicin or rifabutin—see below) is to follow the advice for long-term courses, below.
- For a long-term course (over 2 months) of an enzyme-inducing drug (except rifampicin or rifabutin—see below), adjust the dose of combined oral contraceptive to provide ethinylestradiol 50 micrograms or more daily [unlicensed use] and use a ‘tricycling’ regimen (as above); continue for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping.

If concomitant administration runs beyond the 3 weeks of patch or vaginal ring use, a new treatment cycle should be started immediately, without a patch-free or ring-free break.

- For a short course (2 months or less) of an enzyme-inducing drug (except rifampicin or rifabutin—see below), adjust the dose of combined oral contraceptive to provide ethinylestradiol 50 micrograms or more daily [unlicensed use] and use a ‘tricycling’ regimen (as above); continue for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping.

If breakthrough bleeding occurs (and all other causes are ruled out) it is recommended that the dose of ethinylestradiol is increased by increments of 10 micrograms up to a maximum of 70 micrograms daily [unlicensed use], or to use additional precautions, or to change to a method unaffected by enzyme-inducing drugs. Contraceptive patches and vaginal rings are not recommended for women taking enzyme-inducing drugs over a long period.

- For a long-term course (over 2 months) of rifampicin or rifabutin, an alternative method of contraception (such as an IUD) is always recommended because they are such potent enzyme-inducing drugs; the alternative method of contraception should be continued for 4 weeks after stopping the enzyme-inducing drug.
For information on interactions of oral progestogen-only contraceptives, see also p. 539; for information on interactions of parenteral progestogen-only contraceptives, see also p. 543; for information on interactions of the intra-uterine progestogen-only device, see also p. 544; for information on interactions of hormonal emergency contraception, see also p. 547.

**Antibacterials that do not induce liver enzymes** Latest recommendations are that no additional contraceptive precautions are required when combined oral contraceptives are used with antibacterials that do not induce liver enzymes, unless diarrhoea or vomiting occur (see above). These recommendations should be discussed with the woman, who should also be advised that guidance in patient information leaflets may differ.

It is also currently recommended that no additional contraceptive precautions are required when contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes. There have been concerns that some antibacterials that do not induce liver enzymes (e.g. ampicillin, doxycycline) reduce the efficacy of combined oral contraceptives by impairing the bacterial flora responsible for recycling ethinylestradiol from the large bowel. However, there is a lack of evidence to support this interaction.

**Surgery** Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb; they should normally be recommenced at the first menses occurring at least 2 weeks after full mobilisation. A progestogen-only contraceptive may be offered as an alternative and the oestrogen-containing contraceptive restarted after mobilisation, as above. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thrombophlebitis (with unfraccionated or low molecular weight heparin and graduated compression hosiery) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives.

**Reason to stop immediately** Combined hormonal contraceptives or hormone replacement therapy (HRT) should be stopped (pending investigation and treatment), if any of the following occur:

- Sudden severe chest pain (even if not radiating to left arm);
- Sudden breathlessness (or cough with blood-stained sputum);
- Unexplained swelling or severe pain in calf of one leg;
- Severe stomach pain;
- Serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- Hepatitis, jaundice, liver enlargement;
- Blood pressure above systolic 160 mmHg or diastolic 95 mmHg;
- Prolonged immobility after surgery or leg injury;
- Detection of a risk factor which contra-indicates treatment (see Cautions and Contra-indications under Combined Hormonal Contraceptives below and under Oestrogens for HRT (section 6.4.1.1)).
immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour—see also Reason To Stop Immediately in notes above)

Contra-indications see notes above; personal history of venous or arterial thrombosis, severe or multiple risk factors for arterial disease or for venous thromboembolism (see above), heart disease associated with pulmonary hypertension or risk of embolus; sclerosing treatment for varicose veins; migraine with aura (see also above); transient cerebral ischaemic attacks without headaches; systemic lupus erythematosus with (or unknown) antiphospholipid antibodies; acute porphyria (section 9.8.2); gallstones; history of haematolytic uraemic syndrome or history during pregnancy of pruritus, cholestatic jaundice, chorea, pemphigoid gestationis; history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable; undiagnosed vaginal bleeding

Hepatic impairment avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours

Pregnancy not known to be harmful; for Zoely®—toxicity in animal studies

Breast-feeding avoid until weaning or for 6 months after birth (adverse effects on lactation)

Side-effects see notes above; also nausea, vomiting, abdominal cramps, liver impairment, hepatic tumours; fluid retention, thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB; see also notes above), hypertension, changes in lipid metabolism; headache, depression, chorea, nervousness, irritability; changes in libido, breast tenderness, enlargement, and secretion; reduced menstrual loss, ‘spotting’ in early cycles, absence of withdrawal bleeding, amenorrhoea after discontinuation, changes in vaginal discharge, cervical erosion; contact lenses may irritate, visual disturbances; leg cramps; skin reactions, chloasma, photosensitivity; rarely gallstones and systemic lupus erythematosus

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill, this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years

Cervical cancer Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer, the risk diminishes after stopping and disappears by about 10 years. The risk of cervical cancer with transdermal patches and vaginal rings is not yet known

Note The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium

Dose

• By mouth, each tablet should be taken at approximately the same time each day; if delayed, contraceptive protection may be lost (see missed pill, p. 535)

21-day combined (monophasic) preparations, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days

Every day (ED) combined (monophasic) preparations, 1 active tablet daily for 21 days, followed by 1 inactive tablet daily for 7 days (see also Combined Oral Contraceptives table, below); subsequent courses repeated without interval (withdrawal bleeding occurs when inactive tablets being taken); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days; for Zoely® see Combined Oral Contraceptives table, below

Phasic preparations, see Combined Oral Contraceptives table, below

Changing to combined preparation containing different progestogen If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first active tablet of new brand immediately

Changing to Qlaira®, start the first active Qlaira® tablet on the day after taking the last active tablet of the previous brand

Changing to Zoely®, start the first active Zoely® tablet on the day after taking the last active tablet of the previous brand or, at the latest, the day after the tablet-free or inactive tablet interval of the previous brand

Changing from Qlaira® or Zoely®: start the new brand after taking the last active tablets; if the inactive tablets are taken before starting new brand, additional precautions (barrier methods) should be used during first 7 days of taking the new brand

Changing from progestogen-only tablet If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start new brand immediately, additional precautions (barrier methods) necessary for first 7 days

Secondary amenorrhoea (exclude pregnancy) Start any day, additional precautions (barrier methods) necessary during first 7 days (9 days for Qlaira®)

After childbirth (not breast-feeding) Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 3 weeks postpartum additional precautions (barrier methods) necessary for first 7 days (9 days for Qlaira®)

After abortion or miscarriage Start same day

• By transdermal application, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free interval to start subsequent contraceptive cycle

Note If first patch applied later than day 1, additional precautions (barrier methods) should be used for the next 7 days

Changing from combined oral contraception Apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last active tablet, rule out pregnancy before applying first patch. Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days

Changing from progestogen-only method From an implant, apply first patch on the day implant removed; from an injection, apply first patch when next injection due; from oral progestogen, first patch may be applied on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days

After childbirth (not breast-feeding) Start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days

After abortion or miscarriage Before 20 weeks’ gestation start immediately; no additional contraception required if started immediately. After 20 weeks’ gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch

• By vagina, insert ring into vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring-free interval (during which withdrawal bleeding occurs)

Note If first ring inserted later than day 1, additional
7.3.2 Progestogen-only contraceptives

### Oral (low and standard strength)
For information on these preparations, see Combined Oral Contraceptives table, p. 540

### Transdermal (standard strength)

**Ethinylestradiol with Norelgestromin**
See Risk of Venous Thromboembolism (in notes above) before prescribing

**Evra®** (Janssen)
**Patches**, self-adhesive (releasing ethinylestradiol approx. 33.9 micrograms/24 hours and norelgestromin approx. 203 micrograms/24 hours); net price 9 micrograms/24 hours and etonogestrel approx. 120 micrograms/24 hours, net price 3-ring pack = £27.00. Counselling, administration

**Dose** 1 patch to be applied once weekly for three weeks, followed by a 7-day patch-free interval; subsequent courses repeated after 7-day patch-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

**Note** Adhesives or bandages should not be used to hold patch in place. If patch no longer sticky do not reapply but use a new patch.

The Scottish Medicines Consortium has advised (September 2003) that Evra® patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives

### Vaginal (low strength)

**Ethinylestradiol with Etonogestrel**
See Risk of Venous Thromboembolism (in notes above) before prescribing

**NuvaRing®** (MSD)
**Vaginal ring**, releasing ethinylestradiol approx. 15 micrograms/24 hours and etonogestrel approx. 120 micrograms/24 hours, net price 3-ring pack = £27.00. Counselling, administration

**Dose** 1 ring to be inserted into the vagina, removed on day 22, subsequent courses repeated after 7-day ring-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

**Counselling** The presence of the ring should be checked regularly. In case of expulsion see Expulsion, Delayed Insertion or Removal, or Broken Vaginal Ring, p. 536

### Oral progestogen-only contraceptives
Oral progestogen-only preparations alter cervical mucus to prevent sperm penetration and may inhibit ovulation in some women; oral desogestrel-only preparations consistently inhibit ovulation and this is their primary mechanism of action. There is insufficient clinical trial evidence to compare the efficacy of oral progestogen-only contraceptives with each other or with combined hormonal contraceptives. Progestogen-only contraceptives offer a suitable alternative to combined hormonal contraceptives when oestrogens are contraindicated (including those with venous thrombosis or a past history or predisposition to venous thrombosis, heavy smokers, those with hypertension above systolic 160 mmHg or diastolic 95 mmHg, valvular heart disease, diabetes mellitus with complications, and migraine with aura). Menstrual irregularities (oligomenorrhoea, menorrhagia) are more common but tend to resolve on long-term treatment.

**Interactions**
Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes. The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs and an alternative contraceptive method may be used, unaffected by the interacting drug, is recommended during treatment with an enzyme-inducing drug and for at least 4 weeks afterwards—see p. 536 and Appendix 1 (progestogens). For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the progestogen-only oral method may be continued in combination with additional contraceptive precautions (e.g. barrier methods) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping.

**Surgery**
All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

**Starting routine**
One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours (12 hours for desogestrel) contraceptive protection may be lost). Additional contraceptive precautions are not necessary when initiating treatment.

**Changing from a combined oral contraceptive**
Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

|                                                             | Ethinylestradiol 30 micrograms | Levonorgestrel 150 micrograms | 21 active | Microgynon 30 ED® | £2.99 | Bayer |
|                                                             |                                 |                     | 7 inactive |                   | |

| **4. Monophasic (28-day ‘Every day’ preparation)** | Estradiol (as hemihydrate) 1.5 mg | Nonegestrol acetate 2.5 mg | 24 active | Zoely® | £16.50 | MSD |
|                                                             |                                 |                     | 4 inactive |                   | |

1. Dose 1 tablet daily for 21 days starting on day 1–5 of cycle (if reasonably certain woman is not pregnant, first course can be started on any day of cycle); subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting and changing routines see under Dose above

2. Caution use with care if increased plasma-potassium concentration might be hazardous; renal impairment avoid if eGFR less than 30 mL/minute/1.73 m²

3. Dose 1 tablet daily for 28 days starting on day 1–5 of cycle with first active tablet (withdrawal bleeding occurs when inactive tablets being taken) (if reasonably certain woman is not pregnant, first course can be started on any day of cycle); subsequent courses repeated without interval for starting and changing routines see under Dose above

4. Dose 1 tablet daily for 28 days starting on day 1 of cycle with first active tablet (withdrawal bleeding occurs when inactive tablets being taken); subsequent courses repeated without interval; for starting and changing routines see under Dose above

1. Dose 1 tablet daily for 21 days starting on day 1–5 of cycle (if reasonably certain woman is not pregnant, first course can be started on any day of cycle); subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting and changing routines see under Dose above.

2. Dose 1 tablet daily for 28 days starting on day 1–5 of cycle with first active tablet (withdrawal bleeding occurs when inactive tablets being taken) (if reasonably certain woman is not pregnant, first course can be started on any day of cycle); subsequent courses repeated without interval; for changing routines see under Dose above.

3. Dose 1 tablet daily for 28 days starting on day 1 of cycle with first active tablet (withdrawal bleeding occurs when inactive tablets being taken); subsequent courses repeated without interval; for starting and changing routines see under Dose above.
After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

Missed pill The following advice is recommended: ‘If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours (12 hours for desogestrel) overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.’

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception (see p. 547) if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours (12 hours for desogestrel) late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours (12 hours for desogestrel) of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery (see also under Missed pill above).

**ORAL PROGESTOGEN-ONLY CONTRACEPTIVES** (Progestogen-only pill, ‘POP’)

**Indications** contraception

**Cautions** arterial disease; sex-steroid dependent cancer; post ectopic pregnancy; malabsorption syndrome; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentrations)—seek specialist advice; systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies; functional ovarian cysts; history of jaundice in pregnancy; **interactions:** see notes above and Appendix 1 (progestogens)

**Other conditions** The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory

**Contra-indications** undiagnosed vaginal bleeding; severe arterial disease; acute porphyria (section 9.8.2); history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable

**Hepatic impairment** caution in severe liver disease and recurrent cholestatic jaundice; avoid in liver tumour

**Pregnancy** not known to be harmful

**Breast-feeding** progestogen-only contraceptives do not affect lactation; see also After Childbirth above

**Side-effects** menstrual irregularities (see also notes above); nausea, vomiting, headache, dizziness, breast discomfort, depression, skin disorders, disturbance of appetite, changes in libido

**Breast cancer** There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill, this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits

**Dose**

- 1 tablet daily at same time each day, starting on day 1 of cycle then continuously; if administration delayed for 3 hours (12 hours for desogestrel) or more it should be regarded as a ‘missed pill’, see notes above

**Desogestrel** (Non-proprietary) Tablets, desogestrel 75 micrograms, net price 3 × 28-tab pack = £3.51

**Cerazette** (MSD) Tablets, 1/c, desogestrel 75 micrograms, net price 3 × 28-tab pack = £8.68

The Scottish Medicines Consortium (p. 4) has advised (September 2003) that Cerazette should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom such preparations are contra-indicated

**Micronor** (Janssen) Tablets, norethisterone 35 micrograms, net price 3 × 28-tab pack = £1.80

**Norgeston** (Bayer) Tablets, s/c, levonorgestrel 30 micrograms, net price 35-tab pack = 92p

**Noriday** (Pharmacia) Tablets, norethisterone 35 micrograms, net price 3 × 28-tab pack = £2.10

**7.3.2.2 Parenteral progestogen-only contraceptives**

Medroxyprogesterone acetate (Depo-Provera®, SAYA-NA PRESS®) is a long-acting progestogen given by injection; it is at least as effective as the combined oral preparations but because of its prolonged action it should never be given without full counselling backed by the patient information leaflet. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Troublesome bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of troublesome bleeding may be increased). The manufacturers advise that in women who are breast-feeding, the first dose should be delayed until 6 weeks after birth; however, evidence suggests no harmful effect to infant if given earlier. The benefits of using medroxyprogesterone acetate in breast-feeding women outweigh any risks.

Reduction in bone mineral density and, rarely, osteoporosis and osteoporotic fractures have also been reported with medroxyprogesterone acetate. The
Norethisterone enantate (Noristerat®) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective.

An etonogestrel-releasing implant (Nexplanon®) is also available. It is a highly effective long-acting contraceptive, consisting of a single flexible rod that is inserted subdermally into the lower surface of the upper arm and provides contraception for up to 3 years. The manufacturer advises that in heavier women, blood-etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement may be considered in such patients—however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant. The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.

Implanon®, also an etonogestrel-releasing implant, has been discontinued (October 2010), but some women may have the implant in place until 2013.

Cautions, contra-indications, and side-effects

The cautions, contra-indications, and side-effects of oral progestogen-only contraceptives apply to parenteral progestogen-only contraceptives, except that parenteral preparations reliably inhibit ovulation and therefore protect against ectopic pregnancy and functional ovarian cysts.

Interactions

Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of norethisterone intramuscular injection and medroxyprogesterone acetate intramuscular and subcutaneous injections is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs. However, effectiveness of the etonogestrel-releasing implant may be reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the enzyme-inducing drug and for at least 4 weeks after stopping. For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the implant may be continued in combination with additional contraceptive precautions (e.g. condom) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping it.

PARENTERAL PROGESTOGEN-ONLY CONTRACEPTIVES

Indications contraception, see also notes above and under preparations (roles vary according to preparation)

Cautions see notes above and under preparations; possible risk of breast cancer, see oral progestogen-only contraceptives (section 7.3.2.1); history during pregnancy of puritus or of deterioration of oto-sclerosis, disturbances of lipid metabolism; interactions: see notes above and Appendix 1 (progestogens)

Counselling Full counselling backed by patient information leaflet required before administration

Contra-indications see notes above; history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable

Hepatic impairment see Oral Progestogen-only Contraceptives, section 7.3.2.1

Pregnancy not known to be harmful; for Implanon® or Nexplanon® if pregnancy occurs remove implant

Breast-feeding progestogen-only contraceptives do not affect lactation; see also notes above and under preparations

Side-effects see notes above; injection-site reactions; with medroxyprogesterone acetate injection, weight gain also reported

Cervical cancer Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives, see p. 538. The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

Dose

- See under preparations

Injectable preparations

Depo-Provera® (Pfizer®) Injection (aqueous suspension), medroxyprogesterone acetate 150 mg/mL, net price 1-mL prefilled syringe = £6.01, 1-mL vial = £6.01. Counselling, see patient information leaflet

Dose by deep intramuscular injection, 150 mg within first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding); for long-term contraception, repeated every 12 weeks (if interval greater than 12 weeks, rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection)

Noristerat® (Bayec®) Injection (only), norethisterone enantate 200 mg/mL, net price 1-mL amp = £4.05. Counselling, see patient information leaflet

Dose by deep intramuscular injection given very slowly into gluteal muscle, short-term contraception, 200 mg within first 5 days of cycle or immediately after parturition (duration 8 weeks), may be repeated once every 8 weeks (withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment)

SAYANA PRESS® (Pharma Ltd) Injection (suspension), medroxyprogesterone acetate 104 mg/0.65 mL, net price 0.65-mL prefilled injector device = £6.90. Counselling, see patient information leaflet

Dose by subcutaneous injection into anterior thigh or abdomen, no hormonal contraceptive use in previous month, 104 mg within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), for long-term contraception, repeated every 13 weeks (if interval greater than 13 weeks and 7 days, rule out pregnancy before next injection); changing from other hormonal contraceptive, consult product literature
Obstetrics, gynaecology, and urinary-tract disorders

7.3.3 Spermicidal contraceptives

**Implants**

**Nexplanon® (MSD)**  
Implant, containing etonogestrel 68 mg in radiopaque flexible rod, net price = £79.46. Counselling, see patient information leaflet

**Dose** by subdermal implantation, no hormonal contraceptive use in previous month, 1 implant inserted after 28 days; changing from other hormonal contraceptive, consult product literature, remove implant within 3 years of insertion.

**Mirena**

The progestogen-only intra-uterine system, Mirena®, releases levonorgestrel directly into the uterine cavity. It is licensed for use as a contraceptive, for the treatment of primary menorrhagia and for the prevention of endometrial hyperplasia during oestrogen replacement therapy. This may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete. 

**Advantages** of the progestogen-only intra-uterine system are that there may be an improvement in any dysmenorrhoea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time (section 6.4.1.2).

**Cautions and contra-indications** Generally the cautions and contra-indications for the progestogen-only intra-uterine system are as for standard intra-uterine devices (section 7.3.4). Although the progestogen-only intra-uterine system produces little systemic progestogenic activity, it is usually avoided for 5 years after any evidence of breast cancer. However, the system can be considered for a woman in long-term remission from breast cancer who has menorrhagia and requires effective contraception. Since levonorgestrel is released close to the site of the main contraceptive action (on cervical mucus and endometrium) progestogenic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the contraceptive effect of the progestogen-only intra-uterine system and additional contraceptive precautions are not required.

**Side-effects** Initially, changes in the pattern and duration of menstrual bleeding (spotting or prolonged bleeding) are common; endometrial disorders should be ruled out before insertion and the patient should be fully counselled (and provided with a patient information leaflet). Improvement in progestogenic side-effects, such as mastalgia and in the bleeding pattern usually occurs a few months after insertion and bleeding may often become very light or absent. Functional ovarian cysts (usually asymptomatic) can occur and usually resolve spontaneously (ultrasound monitoring recommended).

**INTRA-UTERINE PROGESTOGEN-ONLY SYSTEM**

**Indications** see under preparation

**Cautions** see notes above; history of depression; advanced uterine atrophy; systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies; **interactions**: see notes above and Appendix 1 (progestogens)

**Contra-indications** see notes above; not suitable for emergency contraception

**Hepatic impairment** see Oral Progestogen-only Contraceptives, section 7.3.2.1

**Pregnancy** avoid; if pregnancy occurs remove system

**Breast-feeding** progestogen-only contraceptives do not affect lactation

**Side-effects** see notes above; abdominal pain, expulsion, peripheral oedema, depression (sometimes severe), nervousness, salpingitis, pelvic inflammatory disease, pelvic pain, back pain; rarely uterine perforation, hirsutism, hair loss, pruritus, migraine, rash

**Dose** 
- See under preparation

**Mirena® (Bayer)**  
Intra-uterine system, T-shaped plastic frame (impregnated with barium sulfate and with threads attached to base) with polydimethylsiloxane reservoir releasing levonorgestrel 20 micrograms/24 hours, net price = £88.00. Counselling, see patient information leaflet

**Dose** contraception and menorrhagia, insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions e.g. barrier methods) necessary for next 7 days, or immediately after first-trimester termination by curettage; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years.

**Prevention of endometrial hyperplasia during oestrogen replacement therapy, insert during last days of menstruation or withdrawal bleeding or any time if amenorrhoeic, effective for 4 years**

**Note** When system is removed (and not immediately replaced) and pregnancy is not desired, remove during the first few days of menstruation, otherwise additional precautions (e.g. barrier methods) should be used for at least 7 days before removal.

**7.3.3 Spermicidal contraceptives**

Spermicidal contraceptives are useful additional safeguards but do not give adequate protection if used alone unless fertility is already significantly diminished (section 6.4.1.1). They have two components: a spermicide
and a vehicle which itself may have some inhibiting effect on sperm activity. They are suitable for use with barrier methods, such as diaphragms or caps; however, spermicidal contraceptives are not generally recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted infections (including HIV); high frequency use of the spermicide nonoxinol ‘9’ has been associated with genital lesions, which may increase the risk of acquiring these infections.

Products such as petroleum jelly (Vaseline®), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms and contraceptive diaphragms made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

Gygel® (Marlborough)

Gel, nonoxinol ‘9’ 2%, net price 30 g = £4.25
Excipients include hydroxybenzoates (parabens), propylene glycol, sorbic acid
Condoms no evidence of harm to latex condoms and diaphragms
Pregnancy toxicity in animal studies
Breast-feeding present in milk in animal studies

7.3.4 Contraceptive devices

Intra-uterine devices

The intra-uterine device (IUD) is a suitable contraceptive for women of all ages irrespective of parity; however, it is less appropriate for those with an increased risk of pelvic inflammatory disease (see below).

The most effective intra-uterine devices have at least 380 mm² of copper and have banded copper on the arms. Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper.

Fertility declines with age and therefore a copper intra-uterine device which is fitted in a woman over the age of 40, may remain in the uterus until menopause.

A frameless, copper-bearing intra-uterine device (Gyne-Fix®) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus.

The timing and technique of fitting an intra-uterine device are critical for its subsequent performance. The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling backed, where available, by the patient information leaflet. Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation.

The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:

- they are under 25 years old
- they are over 25 years old and
- have a new partner or
- have had more than one partner in the past year or
- their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, Neisseria gonorrhoeae) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.

An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible.

INTRA-UTERINE CONTRACEPTIVE DEVICES

Indications see notes above
Cautions see notes above; also anaemia, menorrhagia (progestogen intra-uterine system might be preferable, section 7.3.2.3), endometriosis, severe primary dysmenorrhoea, history of pelvic inflammatory disease, diabetes, fertility problems, nulliparity and young age, severely scarred uterus (including after endometrial resection) or severe cervical stenosis; drug- or disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression); epilepsy (risk of seizure at time of insertion); increased risk of expulsion if inserted before uterine involution; gynaecological examination before insertion, 6–8 weeks after then annually but counsel women to seek medical attention promptly in case of significant symptoms, especially pain; anticoagulant therapy (avoid if possible)
Contra-indications severe anaemia, recent sexually transmitted infection (if not fully investigated and treated), unexplained uterine bleeding, distorted or small uterine cavity, genital malignancy, active inflammatory disease, established or marked immunosuppression; copper devices: copper allergy, Wilson’s disease, medical diathermy
Pregnancy remove device; if pregnancy occurs, increased likelihood that it may be ectopic
Breast-feeding not known to be harmful
Side-effects uterine or cervical perforation, displacement, expulsion; pelvic infection may be exacerbated, menorrhagia, dysmenorrhoea, allergy; on insertion: pain (alleviated by NSAID such as ibuprofen 30 minutes before insertion) and bleeding, occasionally epileptic seizure and vasovagal attack
### Contraceptive devices

#### Ancora® 375 Ag (RF Medical)
**Intra-uterine device**, copper wire with silver core, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm², impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem; preloaded in inserter, net price = £9.95
For uterus length over 6.5 cm; replacement every 5 years (see also notes above)

#### Ancora® 375 Cu (RF Medical)
**Intra-uterine device**, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm², impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem; preloaded in inserter, net price = £7.95
For uterus length over 6.5 cm; replacement every 5 years (see also notes above)

#### Copper T 380A® (RF Medical)
**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier with copper sleeve on each arm, total surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem; pre-loaded in inserter, net price = £8.95
For uterus length over 6.5–9 cm, replacement every 10 years (see also notes above)

#### Cu-Safe® T300 (Williams)
**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 300 mm², impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; with loading capsule, net price = £9.11
For uterus length over 5 cm; replacement every 5 years (see also notes above)

#### Flexi-T® 300 (Durbin)
**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 300 mm², impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £9.47
For uterus length over 5 cm; replacement every 5 years (see also notes above)

#### Flexi-T® + 380 (Durbin)
**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier with copper sleeve on each arm, total surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £10.06
For uterus length over 6 cm; replacement every 5 years (see also notes above)

#### GyneFix® (Williams)
**Intra-uterine device**, 6 copper sleeves with surface area of 330 mm² on polypropylene net, price = £27.11
Suitable for all uterine sizes; replacement every 5 years

#### Load® 375 (Durbin)
**Intra-uterine device**, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm², impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.52
For uterus length over 7 cm; replacement every 5 years (see also notes above)

#### Mini TT 380® Slimline (Durbin)
**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier with copper sleeves fitted flush on to distal portion of each horizontal arm, total surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, thread attached to base of vertical stem; easy-loading system, no capsule, net price = £12.46
For minimum uterine length 5 cm; replacement every 5 years (see also notes above)

#### Multiload® Cu375 (MSD)
**Intra-uterine device**, as Load® 375, with copper surface area approx. 375 mm² and vertical stem length 3.3 cm, net price = £9.24
For uterine length 6–9 cm; replacement every 5 years (see also notes above)

#### Multi-Safe® 375 (Williams)
**Intra-uterine device**, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm², impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.95
For uterine length over 6–9 cm; replacement every 5 years (see also notes above)

#### Multi-Safe® 375 Short Stem (Williams)
**Intra-uterine device**, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm², impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.80
For uterine length 5–7 cm; replacement every 5 years (see also notes above)

#### Neo-Safe® T380 (Williams)
**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem, net price = £13.31
For uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

#### Novaplus T 380® Ag (RF Medical)
**Intra-uterine device**, copper wire with silver core, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem, net price = £12.50
'Mini' size for minimum uterine length 5 cm; 'Normal' size for uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

#### Novaplus T 380® Cu (RF Medical)
**Intra-uterine device**, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem, net price = £15.20
For uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

#### Nova-T® 380 (Bayert)
**Intra-uterine device**, copper wire with silver core, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem, net price = £15.20
For uterine length 6.5–9 cm; replacement every 5 years (see also notes above)
**Other contraceptive devices**

**Silicone contraceptive caps**
Silicone Contraceptive Pessary
Silicone, sizes 22, 26, and 30 mm, net price = £15.29
Brands include FemCap®

**Silicone contraceptive diaphragms**

**Type A Diaphragm with Flat Metal Spring**
Transparent rubber with flat metal spring, sizes 55–95 mm (rising in steps of 5 mm), net price = £6.22
Brands include Reflexions®

**Type B Diaphragm with Coiled Metal Spring**
Silicone with coiled metal spring, sizes 60–90 mm (rising in steps of 5 mm), net price = £8.35
Brands include Miles Omniflex®

**Type C Arcing Spring Diaphragm**
Silicone with arcing spring, sizes 60–90 mm (rising in steps of 5 mm), net price = £9.31
Brands include Miles Arcing Style®; Ortho All-flex®

**Rubber contraceptive diaphragms**

**Type A Diaphragm with Flat Metal Spring**
Silicone with arcing spring, sizes 60–90 mm (rising in steps of 5 mm), net price = £10.39
Also available with a capsule loading device (7-Safe® 380A Capped), net price = £10.47
For uterine length 6.5–9 cm; replacement every 10 years (see also notes above)

**Type B Diaphragm with Coiled Metal Spring**
Silicone with arcing spring, sizes 60–90 mm (rising in steps of 5 mm), net price = £9.31
Brands include Miles Omniflex®

**Type C Arcing Spring Diaphragm**
Silicone with arcing spring, sizes 60–90 mm (rising in steps of 5 mm), net price = £8.35
Brands include Miles Arcing Style®; Ortho All-flex®

**Silicone Contraceptive Pessary**

**Other contraceptive devices**

**Brands include**

Milex Omniflex
Silicone with arcing spring, sizes 60–90 mm (rising in steps of 5 mm), net price = £9.31
Silicone with coiled metal spring, sizes 60–90 mm

**TT 380® Thin** (Durbin)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, thread attached to base of vertical stem; net price = £11.22
For uterine length 5–7 cm; replacement every 5 years (see also notes above)

**TT 380® Slimline** (Durbin)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, thread attached to base of vertical stem; net price = £11.22
For uterine length 6.5–9 cm; replacement every 10 years (see also notes above)

**TT 380® Short** (Durbin)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, thread attached to base of vertical stem; net price = £11.22
For uterine length 5–7 cm; replacement every 5 years (see also notes above)

**UT 380 Standard®** (Durbin)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, thread attached to base of vertical stem; net price = £11.22
For uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

**UT 380® 380A QuickLoad (Williams)**
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier with copper collar fitted flush on to distal portion of each horizontal arm, total surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, thread attached to base of vertical stem; net price = £10.47
For uterine length 6.5–9 cm; replacement every 10 years (see also notes above)

**UT 380A® 380A QuickLoad** (Williams)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier with copper collar fitted flush on to distal portion of each horizontal arm, total surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, thread attached to base of vertical stem; net price = £10.47
For uterine length 6.5–9 cm; replacement every 10 years (see also notes above)

**UT 380® 380A Capped** (Williams)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier with copper collar fitted flush on to distal portion of each horizontal arm, total surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, thread attached to base of vertical stem; net price = £11.22
For uterine length 5–7 cm; replacement every 5 years (see also notes above)

**UT 380® 380A Capped** (Williams)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier with copper collar fitted flush on to distal portion of each horizontal arm, total surface area approx. 380 mm², impregnated with barium sulfate for radio-opacity, thread attached to base of vertical stem; net price = £11.22
For uterine length 6.5–9 cm; replacement every 10 years (see also notes above)

**Hormonal methods**

Hormonal emergency contraceptives include levonorgestrel and ulipristal; either drug should be taken as soon as possible after unprotected intercourse to increase efficacy.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used between 72 and 96 hours after unprotected intercourse [unlicensed use], but efficacy decreases with time. Ulipristal, a progesterone receptor modulator, is effective if taken within 120 hours (5 days) of unprotected intercourse.

Levonorgestrel is less effective than insertion of an intra-uterine device (see below). Ulipristal is as effective as levonorgestrel, but its efficacy compared to an intra-uterine device is not yet known.

If vomiting occurs within 2 hours of taking levonorgestrel or within 3 hours of taking ulipristal, a replacement dose should be given.

When prescribing or supplying hormonal emergency contraception, women should be advised:
- that their next period may be early or late;
- that a barrier method of contraception needs to be used until the next period;
- to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;
- to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).

**Interactions**

The effectiveness of levonorgestrel, and possibly ulipristal, is reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise women accordingly]. There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

**ERYTHROMYCIN**

**Indications**
Emergency contraception

**Cautions**
see notes above; past ectopic pregnancy; severe malabsorption syndromes; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice; interactions: see notes above and Appendix 1 (progestogens)

**Contra-indications**
acute porphyria (section 9.8.2)

**Pregnancy**
not known to be harmful

**Breast-feeding**
progesterogen-only contraceptives do not affect lactation

**Side-effects**
menstrual irregularities (see also notes above), nausea, low abdominal pain, fatigue, headache, dizziness, breast tenderness, vomiting.
7 Obstetrics, gynaecology, and urinary-tract disorders

**Dose**
- 1.5 mg as a single dose as soon as possible after coitus, preferably within 12 hours but no later than after 72 hours (but see also notes above)

- **Levonelle® One Step** (Bayer)
  - Tablets, levonorgestrel 1.5 mg, net price 1-tab pack = £13.83

- **Levonelle® 1500** (Bayer)
  - Tablets, levonorgestrel 1.5 mg, net price 1-tab pack = £5.20

---

**ULIPRISTAL ACETATE**

**Indications** emergency contraception; uterine fibroids, see section 6.4.1.2

**Cautions** see notes above; uncontrolled severe asthma; effectiveness of combined hormonal and progestogen-only contraceptives may be reduced—additional precautions (barrier methods) required for 14 days after combined and parenteral progestogen-only hormonal contraceptives (16 days for Qlaira®) and 9 days for oral progestogen-only contraceptives; interactions: see notes above and Appendix 1 (ulipristal)

**Contra-indications** repeated use within a menstrual cycle

**Hepatic impairment** manufacturer advises avoid in severe impairment—no information available

**Pregnancy** limited information available

**Breast-feeding** manufacturer advises avoid for 1 week after administration—present in milk

**Side-effects** gastro-intestinal disturbances (including nausea, vomiting, diarrhoea, and abdominal pain), dizziness, fatigue, headache, menstrual irregularities (see notes above), back pain, muscle spasms; less commonly tremor, hot flushes, uterine spasm, breast tenderness, dry mouth, blurred vision, pruritus, and rash

**Dose**
- 30 mg as a single dose as soon as possible after coitus, but no later than after 120 hours

- **ellaOne®** (HRA Pharma)
  - Tablets, ulipristal acetate 30 mg, net price 1-tab pack = £16.95

---

**Intra-uterine device**

Insertion of an intra-uterine device is more effective than oral levonorgestrel for emergency contraception. A copper intra-uterine contraceptive device (section 7.3.4) can be inserted up to 120 hours (5 days) after unprotected intercourse; sexually transmitted infections should be tested for and insertion of the device should usually be covered by antibacterial prophylaxis (e.g. azithromycin 1 g by mouth as a single dose). If intercourse has occurred more than 5 days previously, the device can still be inserted up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle.

---

**7.4 Drugs for genito-urinary disorders**

**7.4.1 Drugs for urinary retention**

**Acute retention** is painful and is treated by catheterisation.

**Chronic retention** is painless and often long-standing. Catheterisation is unnecessary unless there is deterioration of renal function. After the cause has initially been established and treated, drugs may be required to increase detrusor muscle tone.

**Benign prostatic hyperplasia** is treated either surgically or medically with alpha-blockers (see below). Dutasteride and finasteride (section 6.4.2) are alternatives to alpha-blockers, particularly in men with a significantly enlarged prostate. Tadalafil (section 7.4.5), a phosphodiesterase type-5 inhibitor, may also be used in the management of benign prostatic hyperplasia.

**Alpha-blockers**

The alpha1-selective alpha blockers, alfuzosin, doxazosin, indoramin, prazosin, tamulosin and terazosin relax smooth muscle in benign prostatic hyperplasia producing an increase in urinary flow-rate and an improvement in obstructive symptoms.

**Cautions** Since alpha1-selective alpha blockers reduce blood pressure, patients receiving antihypertensive treatment may require reduced dosage and specialist supervision. Caution is required in the elderly and in patients undergoing cataract surgery (risk of intra-operative floppy iris syndrome). For interactions, see Appendix 1 (alpha-blockers).

**Contra-indications** Alpha-blockers should be avoided in patients with a history of postural hypotension and micturition syncope.

**Side-effects** Side-effects of alpha1-selective alpha blockers include drowsiness, hypotension (notably postural hypotension), syncope, asthenia, dizziness, depression, headache, dry mouth, gastrointestinal disturbances, oedema, blurred vision, intra-operative floppy iris syndrome (most strongly associated with tamsulosin), rhinitis, erectile disorders (including priapism), tachycardia, and palpitations. Hypersensitivity reactions including rash, pruritus and angioedema have also been reported.

---

**ALFUZOSIN HYDROCHLORIDE**

**Indications** benign prostatic hyperplasia

**Cautions** see notes above; discontinue if angina worsens; acute heart failure; history of QT-interval pro-

---
DOXAZOSIN

Indications  benign prostatic hyperplasia; hypertension (section 2.5.4)
Cautions  see notes above
Contra-indications  see notes above
Hepatic impairment  section 2.5.4
Side-effects  see notes above and section 2.5.4

Indications  benign prostatic hyperplasia; hypertension (section 2.5.4)
Cautions  see notes above and section 2.5.4
Contra-indications  see notes above
Hepatic impairment  section 2.5.4
Renal impairment  section 2.5.4
Side-effects  see notes above and section 2.5.4
Dose
• Initially 1 mg daily; dose may be doubled at intervals of 1–2 weeks according to response, up to max. 8 mg daily; usual maintenance 2–4 mg daily

Preparations  Section 2.5.4

INDORAMIN

Indications  benign prostatic hyperplasia; hypertension, congestive heart failure and Raynaud’s syndrome (section 2.5.4)
Cautions  see notes above and section 2.5.4
Contra-indications  see notes above and section 2.5.4
Hepatic impairment  section 2.5.4
Renal impairment  section 2.5.4
Side-effects  see notes above and section 2.5.4
Dose
• Initially 1 mg daily; dose may be doubled at intervals of 1–2 weeks according to response, up to max. 8 mg daily; usual maintenance 2–4 mg daily

Preparations  Section 2.5.4

PRAZOSIN

Indications  benign prostatic hyperplasia; hypertension, congestive heart failure and Raynaud’s syndrome (section 2.5.4)
Cautions  see notes above and section 2.5.4
Contra-indications  see notes above and section 2.5.4
Hepatic impairment  section 2.5.4
Renal impairment  section 2.5.4
Side-effects  see notes above and section 2.5.4
Dose
• Initially 1 mg daily; dose may be doubled at intervals of 1–2 weeks according to response, up to max. 8 mg daily; usual maintenance 2–4 mg daily

Preparations  Section 2.5.4

TAMSULOSIN HYDROCHLORIDE

Indications  benign prostatic hyperplasia
Cautions  see notes above
Driving  May affect performance of skilled tasks e.g. driving
Contra-indications  see notes above
Hepatic impairment  avoid in severe impairment
Renal impairment  use with caution if eGFR less than 30 mL/minute/1.73 m²
Side-effects  see notes above
Dose
• 400 micrograms daily
7 Obstetrics, gynaecology, and urinary-tract disorders

7.4.2 Drugs for urinary frequency, enuresis, and incontinence

Tamsulosin hydrochloride (Non-proprietary) (TM)
Capsules, m/r, tamsulosin hydrochloride 400 micrograms, net price 30-cap pack = £5.04. Label: 25, counselling, driving

Brands include Bazetham® MR, Contiflo® XL, Diffodox® XL, Loxmate® MR, Finse® PR, Praavis® XL, Strozona® MR, Tolphy® MR

Flomaxtra® XL (Astellas) (TM)
Tablets, m/r, tamsulosin hydrochloride 400 micrograms, net price 30-tab pack = £10.47. Label: 25, counselling, driving

With dutasteride
For prescribing information on dutasteride, see section 6.4.2

Combodart® (GSK) (TM)
Capsules, m/r, brown/orange, tamsulosin hydrochloride 400 micrograms, dutasteride 500 micrograms, net price 30-cap pack = £19.80. Label: 25, counselling, driving

Dose
benign prostatic hyperplasia, 1 capsule daily

With solifenacin
For prescribing information on solifenacin, see section 7.4.2

Vesomni® (Astellas) (TM)
Tablets, m/r, f/c, red, tamsulosin hydrochloride 400 micrograms, solifenacin succinate 6 mg, net price 30-tab pack = £27.62. Label: 3, 25

Dose
ADULT
A
1 mg at bedtime; if necessary dose may be doubled at intervals of 1–2 weeks according to maintenance 5–10 mg daily

First dose effect
First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely

TERTAZOSIN

Indications
benign prostatic hyperplasia; hypertension (section 2.5.4)

Cautions
see notes above and section 2.5.4

Driving
May affect performance of skilled tasks e.g. driving

Contra-indications
see notes above

Side-effects
see notes above and section 2.5.4

Dose

• Initially 1 mg at bedtime; if necessary dose may be doubled at intervals of 1–2 weeks according to response, up to max. 10 mg once daily; usual maintenance 5–10 mg daily

First dose effect
First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely

Terazosin (Non-proprietary) (TM)
Tablets, terazosin (as hydrochloride) 2 mg, net price 28-tab pack = £2.17; 5 mg, 28-tab pack = £2.48; 10 mg, 28-tab pack = £7.93. Counselling, initial dose, driving

Hytrin® (AAMCo) (TM)
Tablets, terazosin (as hydrochloride) 2 mg (yellow) net price, 28-tab pack = £2.20; 5 mg (tan), 28-tab pack = £4.13; 10 mg (blue), 28-tab pack = £8.24; starter pack (for benign prostatic hyperplasia) of 7 × 1-mg tab with 14 × 2-mg tab and 7 × 5-mg tab = £10.97. Counselling, initial dose, driving

Parasympathomimetics

The parasympathomimetic bethanechol increases detrusor muscle contraction. However, it has only a limited role in the relief of urinary retention; its use has been superseded by catheterisation.

BETHANECHOL CHLORIDE

Indications
urinary retention, but see notes above

Cautions
autonomic neuropathy (use lower initial dose); Interactions: Appendix 1 (parasympathomimetics)

Contra-indications
peptic ulcer; intestinal or urinary obstruction; conditions where increased motility of the urinary or gastro-intestinal tract could be harmful; cardiovascular disorders (including recent myocardial infarction, bradycardia, and heart block); hypertension; obstructive airways disease; epilepsy; parkinsonism; hyperthyroidism

Pregnancy
manufacturer advises avoid—no information available

Breast-feeding
manufacturer advises avoid; gastrointestinal disturbances in infant reported

Side-effects
nausea, vomiting, diarrhoea, abdominal pain, increased salivation, eructation; flushing, hypotension, bradycardia; bronchoconstriction, rhinorrhoea; headache; increased lacrimation; increased sweating

Dose
• 10–25 mg 3–4 times daily half an hour before food

Mytonotine® (Glenwood) (TM)
Tablets, scored, bethanechol chloride 10 mg, net price 100-tab pack = £18.51; 25 mg, 100-tab pack = £27.26. Label: 22

7.4.2 Drugs for urinary frequency, enuresis, and incontinence

Urinary incontinence

Incontinence in adults which arises from detrusor instability is managed by combining drug therapy with conservative methods for managing urge incontinence such as pelvic floor exercises and bladder training; stress incontinence is generally managed by non-drug methods. Duloxetine, an inhibitor of serotonin and noradrenaline re-uptake can be added and is licensed for the treatment of moderate to severe stress incontinence in women; it may be more effective when used as an adjunct to pelvic floor exercises.

Antimuscarinic drugs reduce symptoms of urgency and urge incontinence and increase bladder capacity. Oxybutynin also has a direct relaxant effect on urinary smooth muscle. Side-effects limit the use of oxybutynin, but they may be reduced by starting at a lower dose. A modified-release preparation of oxybutynin is effective and has fewer side-effects; a transdermal patch is also available. The efficacy and side-effects of tolterodine are comparable to those of modified-release oxybutynin. Flavoxate has less marked side-effects but it is also less effective. Darifenacina, fesoterodina, propiverina, solifenacina, and tropsium are newer antimuscarinic drugs licensed for urinary frequency, urgency, and incontinence. The need for continuing antimuscarinic
drug therapy should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

The Scottish Medicines Consortium (p. 4) has advised (June 2008) that fesoterodine (Toviaz®) is accepted for restricted use within NHS Scotland as a second-line treatment for overactive bladder syndrome.

Purified bovine collagen implant (Contigen®, Bard) is indicated for urinary incontinence caused by intrinsic sphincter deficiency (poor or non-functioning bladder outlet mechanism). The implant should be inserted only by surgeons or physicians trained in the technique for injection of the implant.

**Cautions** Antimuscarinic drugs should be used with caution in the elderly (especially if frail), in those with autonomic neuropathy, and in those susceptible to angle-closure glaucoma. They should also be used with caution in hiatus hernia with reflux oesophagitis. Antimuscarinics can worsen hyperthyroidism, coronary artery disease, congestive heart failure, hypertension, prostatic hyperplasia, arrhythmias, and tachycardia. For interactions, see Appendix 1 (antimuscarinics).

**Contra-indications** Antimuscarinic drugs should be avoided in patients with myasthenia gravis, significant bladder outflow obstruction or urinary retention, severe ulcerative colitis, toxic megacolon, and in gastro-intestinal obstruction or intestinal atony.

**Side-effects** Side-effects of antimuscarinic drugs include dry mouth, gastro-intestinal disturbances including constipation, flatulence, taste disturbances, blurred vision, dry eyes, drowsiness, dizziness, fatigue, difficulty in micturition (less commonly urinary retention), palpitation, and skin reactions (including dry skin, rash, and photosensitivity); also headache, diarrhoea, angioedema, arythmias, and tachycardia. Central nervous system stimulation, such as restlessness, disinhibition, hallucination, and conversion may occur; children are at higher risk of these effects. Antimuscarinic drugs can reduce sweating, leading to heat sensations and fainting in hot environments or in patients with fever, and very rarely may precipitate angle-closure glaucoma.

**DARIFENACIN**

**Indications** urinary frequency, urgency, and incontinence

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** max. 7.5 mg daily in moderate impairment; avoid in severe impairment

**Pregnancy** manufacturer advises avoid—-toxicity in animal studies

**Breast-feeding** present in milk in animal studies—manufacturer advises caution

**Side-effects** see notes above; also less commonly ulcerative stomatitis, oedema, hypertension, dysphagia, cough, rhinitis, weakness, insomnia, impotence, and vaginitis

**Dose**

- **ADULT** over 18 years. 7.5 mg once daily, increased if necessary after 2 weeks to 15 mg once daily

**Emselex®** (Merus) (Pf) Tablets, m/r, darifenacin (as hydrobromide) 7.5 mg (white), net price 28-tab pack = £25.48; 15 mg (peach), 28-tab pack = £25.48. Label: 3, 25

**DULOXETINE**

**Indications** moderate to severe stress urinary incontinence in women; major depressive disorder (section 4.3.4); diabetic neuropathy (section 4.3.4); generalised anxiety disorder (section 4.3.4)

**Cautions** elderly; cardiac disease; hypertension (avoid if uncontrolled); history of mania; history of seizures; raised intra-ocular pressure; susceptibility to angle-closure glaucoma; bleeding disorders or concomitant use of drugs that increase risk of bleeding; interactions: Appendix 1 (duloxetine)

**Withdrawal** Nausea, vomiting, headache, anxiety, dizziness, paraesthesia, sleep disturbances, and tremor are the most common features of abrupt withdrawal or marked reduction of the dose; dose should be reduced over at least 1–2 weeks

**Hepatic impairment** manufacturer advises avoid

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** toxicity in animal studies—avoid in patients with stress urinary incontinence; risk of neonatal withdrawal symptoms if used near term

**Breast-feeding** present in milk—manufacturer advises avoid

**Side-effects** nausea, vomiting, dyspepsia, constipation, diarrhoea, abdominal pain, weight changes, decreased appetite, flatulence, dry mouth, palpitation, hot flush; insomnia, abnormal dreams, paraesthesia, drowsiness, anxiety, headache, dizziness, fatigue, weakness, tremor, nervousness, anorexia; sexual dysfunction; visual disturbances; sweating, pruritus; less commonly gastritis, halitosis, hepatitis, bruxism, dysphagia, tachycardia, hypertension, postural hypotension, syncope, raised cholesterol, vertigo, taste disturbance, cold extremities, impaired temperature regulation, impaired attention, movement disorders, muscle twitching, musculoskeletal pain, thirst, stomatitis, hypothyroidism, urinary disorders, and photosensitivity; rarely mania; very rarely angle-closure glaucoma, also reported supraventricular arrhythmia, chest pain, hallucinations, suicidal behaviour (see Suicidal Behaviour and Antidepressant Therapy, p. 249), seizures, hypersensitivity reactions
including urticaria, angioedema, rash (including Stevens-Johnson syndrome) and anaphylaxis, hyponatraemia (see Hyponatraemia and Antidepressant Therapy, p. 248)

**Dose**

- **ADULT** over 18 years, 40 mg twice daily, assess for benefit and tolerability after 2–4 weeks
- **Note** Initial dose of 20 mg twice daily for 2 weeks can minimise side-effects

**Yentreve**® (Lilly) [FM]

Capsules, duloxetine (as hydrochloride) 20 mg (blue), net price 28-cap pack = £18.48, 56-cap pack = £30.80; 40 mg (orange/blue), 56-cap pack = £36.96. Label: 2

**Cymbalta**® (Lilly) [FM]

Section 4.3.4 (major depressive episode, generalised anxiety disorder, and diabetic neuropathy)

**FESOTERODINE FUMARATE**

**Indications** urinary frequency, urgency, and urge incontinence

**Caution** see notes above

**Hepatic impairment** manufacturer advises increase dose cautiously; max. 4 mg daily in moderate impairment; avoid in severe impairment; consult product literature before concomitant use of cytochrome P450 enzyme inhibitors

**Renal impairment** increase dose cautiously if eGFR 30–80 mL/minute/1.73 m²; max. 4 mg daily if eGFR less than 30 mL/minute/1.73 m²; consult product literature before concomitant use of cytochrome P450 enzyme inhibitors

**Pregnancy** manufacturer advises caution—no information available

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** see notes above; also insomnia; less commonly nasal dryness, pharyngolaryngeal pain, cough, and vertigo

**ADULT** over 18 years, 4 mg once daily, increased if necessary to max. 8 mg once daily

**Note** Max. 4 mg daily with concomitant atazanavir, clarithromycin, indinavir, iraconazole, ritonavir, saquinavir, or telithromycin; in patients with hepatic or renal impairment, consult product literature before concomitant use of amprenavir, aprepitant, atazanavir, clarithromycin, diltiazem, erythromycin, fluconazole, fosamprenavir, indinavir, iraconazole, ritonavir, saquinavir, telithromycin, verapamil, or grapefruit juice

**Toviaz**® (Pfizer) [FM]

Tablets, m/r, f/c, fesoterodine fumarate 4 mg (light blue), net price 28-tab pack = £25.78; 8 mg (blue), 28-tab pack = £25.78. Label: 3, 25

**FLAVOXATE HYDROCHLORIDE**

**Indications** urinary frequency and incontinence, dysuria, urgency; bladder spasms due to catheterisation, cystoscopy, or surgery

**Cautions** see notes above

**Contra-indications** see notes above; gastro-intestinal haemorrhage

**Pregnancy** manufacturer advises avoid unless no safer alternative

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** see notes above; also vertigo, eosinophilia, leucopenia, urticaria, erythema, and pruritus

**Dose**

- **ADULT** and **CHILD** over 12 years, 200 mg 3 times daily

**Urisspas 200®** (Recordati) [FM]

Tablets, f/c, flavoxate hydrochloride 200 mg, net price 90-tab pack = £11.67. Label: 3

**MIRABEGRON**

**Indications** urinary frequency, urgency, and urge incontinence

**Cautions** history of QT-interval prolongation; concomitant use with drugs that prolong the QT interval; interactions: Appendix 1 (mirabegron)

**Contra-indications** severe hypertension

**Hepatic impairment** avoid in severe impairment—no information available; reduce dose to 25 mg once daily in moderate impairment; with concomitant use of strong cytochrome P450 inhibitors such as itraconazole, ritonavir, or clarithromycin reduce dose to 25 mg once daily in mild impairment and avoid in moderate impairment

**Renal impairment** avoid if eGFR less than 15 mL/minute/1.73 m²—no information available; reduce dose to 25 mg once daily if eGFR 15–29 mL/minute/1.73 m²; with concomitant use of strong cytochrome P450 inhibitors such as iraconazole, ritonavir, or clarithromycin reduce dose to 25 mg once daily if eGFR 30–89 mL/minute/1.73 m² and avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** avoid—toxicity in animal studies; contraception advised in women of child-bearing potential

**Breast-feeding** avoid—present in milk in animal studies

**Side-effects** tachycardia, urinary-tract infection; less commonly dyspepsia, gastritis, palpitation, atrial fibrillation, hypertension, vulvovaginal infection and pruritus, joint swelling, rash, pruritus

**Dose**

- **ADULT** over 18 years, 50 mg once daily

**Betmiga®** (Astellas) [FM]

Tablets, m/r, mirabegron 25 mg (brown), net price 90-tab pack = £29.00; mirabegron 50 mg (yellow), 30-tab pack = £29.00. Label: 25

**OXYBUTYNIN HYDROCHLORIDE**

**Indications** urinary frequency, urgency and incontinence, neurogenic bladder instability, and nocturnal enuresis associated with overactive bladder

**Cautions** see notes above; acute porphyria (section 9.8.2)

**Contra-indications** see notes above

**Hepatic impairment** manufacturer advises caution

**Renal impairment** manufacturer advises caution

**Pregnancy** manufacturers advise avoid unless essential—toxicity in animal studies

**Breast-feeding** manufacturers advise avoid—present in milk

**Side-effects** see notes above; also less commonly anorexia, facial flushing, rarely night terrors; application site reactions with patches; also reported cognitive impairment
**Dose**

- **ADULT** and **CHILD** over 12 years, initially 5 mg 2–3 times daily, increased if necessary to max. 5 mg 4 times daily; **ELDERLY** initially 2.5–3 mg twice daily, increased to 5 mg twice daily according to response and tolerance; **CHILD** 5–12 years, neurogenic bladder instability, 2.5–3 mg twice daily, increased to 5 mg 2–3 times daily; **CHILD** under 5 years see **BNF for Children**; **CHILD** 5–18 years, nocturnal enuresis associated with overactive bladder, 2.5–3 mg twice daily increased to 5 mg 2–3 times daily (last dose before bedtime)

**Oxybutynin Hydrochloride (Non-proprietary)**

- **Tablets**, oxybutynin hydrochloride 2.5 mg, net price 56-tab pack = £1.81; 3 mg, 56-tab pack = £14.00; 5 mg, 56-tab pack = £2.71. 84-tab pack = £4.06. Label: 3

**Cystrin®** (Zentiva)

- **Tablets**, oxybutynin hydrochloride 5 mg (scored), net price 84-tab pack = £21.99. Label: 3

**Ditropan**

- **Tablets**, both blue, scored, oxybutynin hydrochloride 2.5 mg, net price 84-tab pack = £1.60; 5 mg, 84-tab pack = £2.95. Label: 3

**Elixir**

- **Oxybutynin hydrochloride 2.5 mg/5 mL, net price 150-mL pack = £6.88. Label: 3**

**Detrunorm**

- **Capsules**, pink, s/c, oxybutynin hydrochloride 5 mg, net price 30-tab pack = £1.81; 3 mg, 56-tab pack = £14.00; 84-tab pack = £4.06. 56-tab pack = £1.81; 3 mg, 56-tab pack = £14.00; 84-tab pack = £4.06. 56-tab pack = £1.81; 3 mg, 56-tab pack = £14.00; 84-tab pack = £4.06. 56-tab pack = £1.81; 3 mg, 56-tab pack = £14.00; 84-tab pack = £4.06.

**Modified release**

- **Lyrinel® XL** (Janssen)
  - **Tablets**, m/r, oxybutynin hydrochloride 5 mg (yellow), net price 30-tab pack = £13.77; 10 mg (pink), 30-tab pack = £27.54. Label: 3, 25
  - **Dose** **ADULT** over 18 years, initially 5 mg once daily, adjusted according to response in steps of 5 mg at weekly intervals; max. 20 mg once daily; **CHILD** 5–18 years see **BNF for Children**
  - **Note** Patients taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of **Lyrinel® XL**

**Transdermal preparations**

- **Kentera®** (Orion)
  - **Patches**, self-adhesive, oxybutynin 36 mg (releasing oxybutynin approx. 3.9 mg/24 hours), net price 8-patch pack = £27.20. Label: 3, counselling, administration
  - **Dose** **ADULT** over 18 years, urinary frequency, urgency and incontinence, apply 1 patch twice weekly to clean, dry, unbroken skin on abdomen, hip or buttock, remove after every 3–4 days and site replacement patch on a different area (avoid using same area for 7 days)
  - **Note** The Scottish Medicines Consortium has advised (July 2005) that **Kentera®** should be restricted for use in patients who benefit from oral oxybutynin but cannot tolerate its side-effects

**Propafenone Hydrochloride**

**Indications**

- urinary frequency, urgency and incontinence; neurogenic bladder instability

**Cautions**

- see notes above

**Contra-indications**

- see notes above

**Hepatic impairment**

- avoid in moderate to severe impairment

**Renal impairment**

- doses above 30 mg daily should be used with caution if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy**

- manufacturer advises avoid (restriction of skeletal development in animals)

**Breast-feeding**

- manufacturer advises avoid—present in milk in animal studies

**Side-effects**

- see notes above

**Dose**

- **ADULT** over 18 years, 15 mg 1–3 times daily, increased if necessary to max. 15 mg 4 times daily

**Detrusorm® (Amco)**

- **Tablets**, pink, s/c, propiverine hydrochloride 15 mg, net price 56-tab pack = £18.00. Label: 3

**Modified release**

- **Detrusorm® XL** (AMCo)
  - **Capsules**, orange/white, m/r, propiverine hydrochloride 30 mg, net price 28-cap pack = £24.45. Label: 3, 25
  - **Dose** **ADULT** over 18 years, urinary frequency, urgency, and incontinence, 30 mg once daily
7 Obstetrics, gynaecology, and urinary-tract disorders

Tolterodine Tartrate

**Indications**
- urinary frequency, urgency, and incontinence

**Cautions**
- see notes above

**Dose**
- **ADULT** over 18 years, 5 mg daily, increased if necessary to 10 mg once daily
- **Note** Max. 5 mg daily (in combination with tamsulosin, max. 1. Voume® tablet daily) with concomitant potent inhibitors of cytochrome P450 enzyme CYP3A4 (such as itraconazole or ritonavir)

**Vesicare®** (Astellas)®
- **Tablets**, f/c, solifenacinc sucinate 5 mg (yellow), net price 30-tab pack = £27.62; 10 mg (pink), 30-tab pack = £35.91. Label: 3

With tamsulosin Section 7.4.1

**TOLERODINE TARTRATE**

**Indications**
- see under Dose

**Cautions**
- see notes above

**Hepatic impairment**
- reduce dose to 1 mg twice daily; avoid modified-release preparations

**Renal impairment**
- reduce dose to 1 mg twice daily and avoid modified-release preparations if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy**
- manufacturer advises avoid—no information available

**Breast-feeding**
- manufacturer advises avoid—no information available

**Side-effects**
- see notes above; also chest pain, peripheral oedema; sinusitis, bronchitis; paraesthesia, fatigue, vertigo, weight gain; less commonly memory impairment; also reported flushing

**Dose**
- **ADULT** over 18 years, 2 mg twice daily; reduce to 1 mg twice daily if necessary to minimise side-effects; **CHILD** 2–18 years see **BNF for Children**
- **Nocturnal enuresis associated with overactive bladder**, **CHILD** 5–18 years see **BNF for Children**

**Tolterodine Tartrate (Non-proprietary) (Pfizer)**
- **Tablets**, tolterodine tartrate 1 mg, net price 56-tab pack = £2.72; 2 mg, 56-tab pack = £2.68. Label: 3

**Detrositol®** (Pfizer)®
- **Tablets**, f/c, tolterodine tartrate 1 mg, net price 56-tab pack = £29.03; 2 mg, 56-tab pack = £30.56. Label: 3

**Modified release**

**Tolterodine Tartrate (Non-proprietary) (Pfizer)**
- **Capsules**, m/r, tolterodine tartrate 4 mg, net price 28-cap pack = £25.78. Label: 3, 25

**Dose**
- urinary frequency, urgency, and incontinence, **ADULT** over 18 years, 4 mg once daily

**Detrositol® XL (Pfizer)®**
- **Capsules**, blue, m/r, tolterodine tartrate 4 mg, net price 28-cap pack = £25.78. Label: 3, 25

**Dose**
- urinary frequency, urgency and incontinence, **ADULT** over 18 years, 4 mg once daily

**TROSPIUM CHLORIDE**

**Indications**
- urinary frequency, urgency and incontinence

**Cautions**
- see notes above

**Contra-indications**
- see notes above

**Hepatic impairment**
- manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

**Renal impairment**
- use with caution; reduce dose to 20 mg once daily or 20 mg on alternate days if eGFR 10–30 mL/minute/1.73 m²; avoid Regurin® XL

**Pregnancy**
- manufacturer advises caution

**Breast-feeding**
- manufacturer advises caution

**Side-effects**
- see notes above; rarely chest pain, dyspnoea, and asthenia; very rarely myalgia and arthralgia

**Dose**
- **ADULT** and **CHILD** over 12 years, 20 mg twice daily before food

**Tropisium Chloride (Non-proprietary)**
- **Tablets**, f/c, tropism chloride 20 mg, net price 60-tab pack = £25.21. Label: 23

**Brands include** Floros®

**Regurin® (Speciality European)**
- **Tablets**, brown-yellow, f/c, tropism chloride 20 mg, net price 60-tab pack = £26.00. Label: 23

**Modified release**

**Regurin® XL (Speciality European)**
- **Capsules**, orange/white, m/r, tropism chloride 60 mg, net price 28-cap pack = £23.05. Label: 23, 25

**Dose**
- **ADULT** over 18 years, 60 mg once daily

**Nocturnal enuresis in children**

**Nocturnal enuresis** is common in young children, but persists in a small proportion by 10 years of age. For children under 5 years, reassurance and advice on the management of nocturnal enuresis can be useful for some families. Treatment may be considered in children over 5 years depending on their maturity and motivation, the frequency of nocturnal enuresis, and the needs of the child and their family.

Initially, advice should be given on fluid intake, diet, toileting behaviour, and reward systems; for children who do not respond to this advice, further treatment may be necessary. An enuresis alarm should be first-line treatment for motivated, well-supported children; alarms have a lower relapse rate than drug treatment when discontinued. Treatment should be reviewed after 4 weeks, and, if there are early signs of response, continued until a minimum of 2 weeks’ uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months, only continue if the condition is still improving and the child remains motivated to use the alarm. If initial alarm treatment is unsuccessful, consider combination treatment with desmopressin (see below), or desmopressin alone if the alarm is no longer appropriate or desirable.

**Desmopressin** (section 6.5.2), an analogue of vasopressin, is given by oral or by sublingual administration; it should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects. Desmopressin alone can be offered to children over 5 years of age if an alarm is inappropriate or undesirable, or when rapid or short-term results are the priority (for example to cover periods away from home); desmopressin alone can also be used if there has been a partial response to a combination of desmopressin and an alarm following initial treatment with an alarm. Treatment should be assessed after 4 weeks and continued for 3 months if there are signs of response. Desmopressin should be
withdrawn at regular intervals (for 1 week every 3 months) for full reassessment. Particular care is needed to avoid fluid overload by restricting fluid intake from 1 hour before taking desmopressin until 8 hours after. When stopping treatment with desmopressin, gradual withdrawal should be considered.

Nocturnal enuresis associated with daytime symptoms (overactive bladder) can be managed with anti-muscarinic drugs (see Urinary incontinence, p. 550) in combination with desmopressin. Treatment should be prescribed only after specialist assessment and should be continued for 3 months; the course can be repeated if necessary.

The tricyclic antidepressant imipramine (section 4.3.1) may be considered for children who have not responded to all other treatments and have undergone specialist assessment, however, behavioural disturbances can occur and relapse is common after withdrawal. Treatment should not normally exceed 3 months unless a combination with desmopressin. Treatment should be prescribed only after specialist assessment and should be continued for 3 months; the course can be repeated if necessary.

Alkalinisation of urine

Alkalinisation of urine can be undertaken with potassium citrate. The alkalinising action may relieve the discomfort of cystitis caused by lower urinary tract infections. Sodium bicarbonate is used as a urinary alkalinising agent in some metabolic and renal disorders (section 9.2.1.3).

Potassium Citrate Mixture BP

(Potassium Citrate Oral Solution)

Oral solution, potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaia tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K⁺/10 mL. Label: 27

Dose

10 mL 3 times daily well diluted with water

Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.

SODIUM BICARBONATE

Indications

Relief of discomfort in mild urinary-tract infections; alkalinisation of urine

Cautions

Cardiac disease; patients on sodium-restricted diet; elderly; avoid prolonged use; interactions: Appendix 1 (antacids)

Hepatic impairment

Section 1.1.1

Renal impairment

Avoid; specialised role in some forms of renal disease, see section 9.2.1.3

Pregnancy

Use with caution

Side-effects

Eruption, alkalosis on prolonged use

Dose

3 g in water every 2 hours until urinary pH exceeds 7; maintenance of alkaline urine 5–10 g daily

Preparations

Section 9.2.1.3

SODIUM CITRATE

Indications

Relief of discomfort in mild urinary-tract infections

Cautions

Cardiac disease; hypertension; patients on a sodium-restricted diet; elderly; interactions: Appendix 1 (sodium citrate)

Renal impairment

Section 1.1.1

Pregnancy

Use with caution

Side-effects

Mild diuresis

Note

Proprietary brands of sodium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.

Other preparations for urinary disorders

A terpene mixture (Rowatinex®) is claimed to be of benefit in urolithiasis for the expulsion of calculi. Rowatinex® (Rowa)

Capsules, yellow, e/c, anethol 4 mg, borneol 10 mg, camphene 15 mg, cineole 3 mg, fenchone 4 mg, pinene 31 mg, net price 50 = £7.35. Label: 25

Dose

1–2 capsules 3–4 times daily before food. CHILD not recommended

Bladder instillations and urological surgery

Bladder infection

Various solutions are available as irrigations or washouts.

Aqueous chlorhexidine (section 13.11.2) can be used in the management of common infections of the bladder but it is ineffective against most Pseudomonas spp. Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile sodium chloride solution 0.9% (physiological saline) is usually adequate and is preferred as a mechanical irritant.
Continuous bladder irrigation with amphotericin 50 micrograms/mL (section 5.2.3) may be of value in mycotic infections.

**Dissolution of blood clots** Clot retention is usually treated by irrigation with sterile sodium chloride solution 0.9% but sterile sodium citrate solution for bladder irrigation 3% may also be helpful.

**Bladder cancer** Bladder instillations of doxorubicin (section 8.1.2) and mitomycin (section 8.1.2) are used for recurrent superficial bladder tumours. Such instillations reduce systemic side-effects; adverse effects on the bladder (e.g. micturition disorders and reduction in bladder capacity) may occur.

Instillation of epirubicin (section 8.1.2) is used for treatment and prophylaxis of certain forms of superficial bladder cancer; instillation of doxorubicin (section 8.1.2) is also used for some papillary tumours.

Instillation of BCG (Bacillus Calmette-Guérin), a live attenuated strain derived from *Mycobacterium bovis* (section 8.2.4), is licensed for the treatment of primary or recurrent bladder carcinoma in-situ and for the prevention of recurrence following transurethral resection.

**Interstitial cystitis** Dimethyl sulfoxide may be used for symptomatic relief in patients with interstitial cystitis (Hunner’s ulcer). 50 mL of a 50% solution (Rimso-50®—available from ‘special-order’ manufacturers or specialist importing companies, p. 1104) is instilled into the bladder, retained for 15 minutes, and voided by the patient. Treatment is repeated at intervals of 2 weeks. Bladder spasm and hypersensitivity reactions may occur and long-term use requires ophthalmic, renal, and hepatic assessment at intervals of 6 months.

**Interactions:** see Appendix 1 (dimethyl sulfoxide).

**Maintenance of indwelling urinary catheters**

The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.

**UROLOGICAL SURGERY**

**Glycine Irrigation Solution** (Non-proprietary) Irrigation solution, glycine 1.5% in water for injections.

**Uses** used for percutaneous renal surgery.

**Interactions:** may be dissolved by the patient. Treatment is repeated at intervals

**SODIUM CITRATE**

**Indications** bladder washouts, see notes above

**Sterile Sodium Citrate Solution for Bladder Irrigation**

sodium citrate 3%, dilute hydrochloric acid 0.2%, in purified water, freshly boiled and cooled, and sterilised

**Urological surgery** There is a high risk of fluid absorption from the irrigant used in endoscopic surgery within the urinary tract; if this occurs in excess, hypervolaemia, haemolysis, and renal failure may result. Glycine irrigation solution 1.5% is the irrigant of choice for transurethral resection of the prostate gland and bladder tumours; sterile sodium chloride solution 0.9% (physiological saline) is used for percutaneous renal surgery.

**GLYCINE**

**Indications** bladder irrigation during urological surgery; see notes above

**Cautions** see notes above

**Side-effects** see notes above

**Glycine Irrigation Solution** (Non-proprietary) Irrigation solution, glycine 1.5% in water for injections.

**Maintenance of indwelling urinary catheters**

The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.

**CATHETER PATENCY SOLUTIONS**

**Chlorhexidine 0.02%**

**Brands include** Uro-Tainer Chlorhexidine®, net price 100-mL sachet = £2.70

**Sodium chloride 0.9%**

**Brands include** OptiFlo S®, net price 50- and 100-mL sachets = £3.30; Uriflex S®, 100-mL sachet = £3.45; Uriflex SP®, with integral drug additive port, 100-mL sachet = £3.45; Uro-Tainer Sodium Chloride®, 50- and 100-mL sachets = £3.45; Uro-Tainer M®, with integral drug additive port, 50- and 100-mL sachets = £2.90

**Solution G**

Citrac acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%. Brands include OptiFlo G®, net price 50- and 100-mL sachets = £3.50; Uriflex G®, 100-mL sachet = £2.40; Uro-Tainer® Twin Baby S, 2 x 30-mL = £4.72

**Solution R**

Citrac acid 6%, gluconolactone 0.8%, magnesium carbonate 2.8%, disodium edetate 0.01%. Brands include OptiFlo R®, net price 50- and 100-mL sachets = £3.50; Uriflex R®, 100-mL sachet = £2.40; Uro-Tainer® Twin Soluto R, 2 x 30-mL = £4.72

**Diluents for bladder instillation**

**SODIUM CHLORIDE**

**Indications** diluent for instillation of drugs to the bladder

**Sodium Chloride 0.9% Solution for Intravesical Use** (Non-proprietary) Intravesical instillation, sodium chloride 0.9%, net price 50-mL bag = £9.66

**7.4.5 Drugs for erectile dysfunction**

**Reasons for failure to produce a satisfactory erection** include psychogenic, vascular, neurogenic, and endocrine abnormalities; impotence can also be drug-induced. Intracavernosal injection or urethral application of vasoactive drugs under careful medical supervision is used for both diagnostic and therapeutic purposes.

Erectile disorders may also be treated with drugs given by mouth which increase the blood flow to the penis. Drugs should be used with caution if the penis is deformed (e.g. in angulation, cavernosal fibrosis, and Peyronie’s disease).

**Priapism** If priapism occurs with alprostadil, treatment should not be delayed more than 6 hours and is as follows:
Drug treatments for erectile dysfunction (including aid to diagnosis)

**Cautions**
- priapism—patients should be instructed to report any erection lasting 4 hours or longer—for management, see section 7.4.5; anatomical deformations of penis (painful erection more likely)—follow up regularly to detect signs of penile fibrosis (consider discontinuation if angulation, cavernosal fibrosis or Peyronie’s disease develop);
- interactions: Appendix 1 (prostaglandins)

**Contra-indications**
- predisposition to prolonged erection (as in sickle cell anaemia, multiple myeloma or leukaemia); not for use with other agents for erectile dysfunction, in patients with penile implants or when sexual activity medically inadvisable; urethral application also contra-indicated in urethral stricture, severe hypospadia, severe curvature, balanitis, urethritis

**Side-effects**
- hypotension, hypertension; dizziness, headache; penile pain, other localised pain (buttocks, leg, testicular, abdominal); influenza-like syndrome; urethral burning, urethral bleeding; injection site reactions including penile fibrosis, penile oedema, penile rash, haematomata, haemosiderin deposits; less commonly nausea, dry mouth, vasodilatation, syncope, supraventricular extrasystole, rapid pulse, asthenia, leg cramps, pelvic pain, scrotal or testicular oedema, scrotal erythema, testicular thickening, micturation difficulties, haematuria, mydriasis, and sweating; local reactions including penile warmth, pruritus, irritation, penile numbness or sensitivity, balanitis, phimosis, priapism (see section 7.4.5 and under Cautions), abnormal ejaculation; urinary-tract infection, and hypersensitivity reactions (including rash, erythema, urticaria, and anaphylaxis)

**Dose**
- See under preparations below

### Intracavernosal injection

**Caverject** (Pharmacia) \( \text{Price} £9.24; 20\text{-microgram vial} = £11.94; 40\text{-microgram vial} = £21.58 \) (all with diluent-filled syringe, needles and swabs)

1. \( \text{Price} \) for treatment of erectile dysfunction except in men who:
   - have diabetes, multiple sclerosis, Parkinson’s disease, poliomyelitis, prostate cancer, severe pelvic injury, single gene neurological disease, spina bifida, or spinal cord injury;
   - are receiving dialysis for renal failure;
   - have had radical pelvic surgery, prostatectomy (including tranurethral resection of the prostate), or kidney transplant;
   - were receiving Caverject\(^\text{®}\), Erecnos\(^\text{®}\), MUSE\(^\text{®}\), Viagra\(^\text{®}\) or Varden\(^\text{®}\) for erectile dysfunction, at the expense of the NHS, on 14 September 1998;
   - are suffering severe distress as a result of impotence (prescribed in specialist centres only, see notes above).

The prescription must be endorsed ‘SLS’.

---

Initial therapy by penile aspiration—using aseptic technique a 19–21 gauge butterfly needle inserted into the corpus cavernosum and sterile physiological saline introduced through the first needle and drained through the second.

If aspiration is unsuccessful a second 19–21 gauge butterfly needle can be inserted into the opposite corpus cavernosum and sterile physiological saline introduced through the first needle and drained through the second.

If aspiration and lavage of corpora are unsuccessful, cautious intracavernosal injection of a sympathomimetic (section 2.7.2) with action on alpha-adrenergic receptors, continuously monitoring blood pressure and pulse (\textit{extreme caution}: coronary heart disease, hypertension, cerebral ischaemia or if taking antidepressant) as follows:

- Intracavernosal injections of phenylephrine 100–200 micrograms (0.5–1 mL of a 200 microgram/mL solution) every 5–10 minutes; max. total dose 1 mg [unlicensed indication] \( \text{i} \): if suitable strength of adrenaline not available may be specially prepared by diluting 0.1 mL of the phenylephrine 1% (10 mg/mL) injection (section 2.7.2) to 5 mL with sodium chloride 0.9%.
  - Alternatively

- Intracavernosal injections of adrenaline 10–20 micrograms (0.5–1 mL of a 20 microgram/mL solution) every 5–10 minutes; max. total dose 100 micrograms [unlicensed indication] \( \text{i} \): if suitable strength of adrenaline not available may be specially prepared by diluting 0.1 mL of the adrenaline 1 in 1000 (1 mg/mL, section 3.4.3) injection to 5 mL with sodium chloride 0.9%.
  - Alternatively

- Intracavernosal injection of metaraminol (\textit{caution}: has been associated with fatal hypertensive crises); metaraminol 1 mg (0.1 mL of 10 mg/mL metaraminol injection, section 2.7.2) is diluted to 50 mL with sodium chloride injection 0.9% and given carefully by slow injection into the corpora in 5-mL injections every 15 minutes [unlicensed indication].

If necessary the sympathomimetic injections can be followed by further aspiration of blood through the same butterfly needle.

If sympathomimetics unsuccessful, urgent surgical referral for management (possibly including shunt procedure).

---

### Prescribing on the NHS

Drug treatments for erectile dysfunction may only be prescribed on the NHS under certain circumstances (see individual preparations below). The Department of Health (England) has recommended that treatment should also be available from specialist services when the condition is causing severe distress; specialist centres should use form HBP in Scotland or form WP10HP in Wales and endorse them ‘SLS’ if the treatment is to be dispensed in the community. The following criteria should be considered when assessing distress:

- significant disruption to normal social and occupational activities;
- a marked effect on mood, behaviour, social and environmental awareness;
- a marked effect on interpersonal relationships.

The Department of Health (England) has recommended that treatment should also be available from specialist services when the condition is causing severe distress; specialist centres should use form HBP in Scotland or form WP10HP in Wales and endorse them ‘SLS’ if the treatment is to be dispensed in the community. The following criteria should be considered when assessing distress:

- significant disruption to normal social and occupational activities;
- a marked effect on mood, behaviour, social and environmental awareness;
- a marked effect on interpersonal relationships.

7 Obstetrics, gynaecology, and urinary-tract disorders

Avanafil, sildenafil, tadalafil, and vardenafil are phosphodiesterase type-5 inhibitors licensed for the treatment of erectile dysfunction; they are not recommended for use with other treatments for erectile dysfunction. The patient should be assessed appropriately before prescribing avanafil, sildenafil, tadalafil or vardenafil. Since these drugs are given by mouth there is a potential for drug interactions.

Cautions
Avanafil, sildenafil, tadalafil, and vardenafil should be used with caution in cardiovascular disease, left ventricular outflow obstruction, anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie’s disease), and in those with a predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia). Concomitant treatment with a phosphodiesterase type-5 inhibitor and an alpha-blocker (section 2.5.4 and section 7.4.1) can increase the risk of postural hypotension—initiate treatment with a phosphodiesterase type-5 inhibitor (at a low dose) only once the patient is stable on the alpha-blocker; see also interactions: Appendix 1 (avanafil, sildenafil, tadalafil, vardenafil).

Contra-indications
Avanafil, sildenafil, tadalafil, and vardenafil are contra-indicated in patients receiving nitrates, in patients in whom vasodilation or sexual activity are inadvisable, or in patients with a previous history of non-arterial anterior ischaemic optic neuropathy. In the absence of information, manufacturers contra-indicate these drugs in hypotension (avoid if systolic blood pressure below 90 mmHg), recent stroke, unstable angina, and myocardial infarction.

Side-effects
The side-effects of avanafil, sildenafil, tadalafil, and vardenafil include dyspepsia, nausea, vomiting, headache (including migraine), flushing, dizziness, myalgia, back pain, visual disturbances (non-arteriolar anterior ischaemic optic neuropathy has been reported—stop drug if sudden visual impairment occurs), and nasal congestion. Less common side-effects include painful red eyes, palpititation, tachycardia, hypotension, hypertension, epistaxis. Other side-effects reported rarely include syncope, hypersensitivity reactions (including rash, facial oedema, and Stevens-Johnson syndrome), and priapism. Serious cardiovascular events (including arrhythmia, unstable angina, and myocardial infarction), seizures, sudden hearing loss (discontinue drug and seek medical advice), and retinal vascular occlusion have also been reported.

Urethral application
Counselling If partner pregnant barrier contraception should be used

Urinary application
The prescription must be endorsed ‘SLS’.

Phosphodiesterase type-5 inhibitors

Avanafil, sildenafil, tadalafil, and vardenafil are phosphodiesterase type-5 inhibitors licensed for the treatment of erectile dysfunction, but are not recommended for use with other treatments for erectile dysfunction. The patient should be assessed appropriately before prescribing avanafil, sildenafil, tadalafil or vardenafil. Since these drugs are given by mouth there is a potential for drug interactions.

Cautions
Avanafil, sildenafil, tadalafil, and vardenafil should be used with caution in cardiovascular disease, left ventricular outflow obstruction, anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie’s disease), and in those with a predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia). Concomitant treatment with a phosphodiesterase type-5 inhibitor and an alpha-blocker (section 2.5.4 and section 7.4.1) can increase the risk of postural hypotension—initiate treatment with a phosphodiesterase type-5 inhibitor (at a low dose) only once the patient is stable on the alpha-blocker; see also interactions: Appendix 1 (avanafil, sildenafil, tadalafil, vardenafil).

Contra-indications
Avanafil, sildenafil, tadalafil, and vardenafil are contra-indicated in patients receiving nitrates, in patients in whom vasodilation or sexual activity are inadvisable, or in patients with a previous history of non-arteriolar anterior ischaemic optic neuropathy. In the absence of information, manufacturers contra-indicate these drugs in hypotension (avoid if systolic blood pressure below 90 mmHg), recent stroke, unstable angina, and myocardial infarction.

Side-effects
The side-effects of avanafil, sildenafil, tadalafil, and vardenafil include dyspepsia, nausea, vomiting, headache (including migraine), flushing, dizziness, myalgia, back pain, visual disturbances (non-arteriolar anterior ischaemic optic neuropathy has been reported—stop drug if sudden visual impairment occurs), and nasal congestion. Less common side-effects include painful red eyes, palpitation, tachycardia, hypotension, hypertension, epistaxis. Other side-effects reported rarely include syncope, hypersensitivity reactions (including rash, facial oedema, and Stevens-Johnson syndrome), and priapism. Serious cardiovascular events (including arrhythmia, unstable angina, and myocardial infarction), seizures, sudden hearing loss (discontinue drug and seek medical advice), and retinal vascular occlusion have also been reported.
**AVANAFIL**

**Indications** erectile dysfunction

**Cautions** see notes above; also bleeding disorders or active peptic ulceration; **interactions:** Appendix 1

**Contra-indications** see notes above; also life-threatening arrhythmia in previous 6 months; blood pressure > 170/100 mmHg; mild to severe heart failure; hereditary degenerative retinal disorders

**Hepatic impairment** use lowest effective initial dose in mild to moderate impairment, adjusted according to response; manufacturer advises avoid in severe impairment—no information available

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m²

**Side-effects** see notes above; also less commonly malaise, drowsiness; rarely dry mouth, gastritis, abdominal pain, diarrhoea, hyperbilirubinaemia, peripheral oedema, hyperactivity, insomnia, weight gain, genital irritation, pollakiuria, increased serum creatinine, gout, muscle spasms, haematuria

**Dose**

- **ADULT** over 18 years, initially 100 mg (patients on alpha-blocker therapy 50 mg) approx. 30 minutes before sexual activity; subsequent doses adjusted according to response to 50–200 mg as a single dose as needed; max. 1 dose in 24 hours (max. single dose 200 mg)

  **Note** Max. 100 mg once every 48 hours with concomitant moderate inhibitors of cytochrome P450 enzyme CYP3A4 e.g. aprepitant, diltiazem, erythromycin, fluconazole, fosamprenavir, or verapamil

  **Note** Onset of effect may be delayed if taken with food

**Spedra** (Menarini) [PNL]

- Tablets, all yellow, avanafil 50 mg, net price 4-tab pack = £10.94, 8-tab pack = £19.70; 100 mg, 4-tab pack = £14.08, 8-tab pack = £26.26; 200 mg, 4-tab pack = £23.50, 8-tab pack = £46.99

**REVATIO**

- Chewable tablets, sildenafil (as citrate), 25 mg, net price 4-tab pack = £16.59, 8-tab pack = £33.19; 50 mg, 4-tab pack = £21.27, 8-tab pack = £42.54; 100 mg, 4-tab pack = £23.50, 8-tab pack = £46.99

**NIVAFILOX®** (AMCo)

- Tablets, all blue, f/c, sildenafil (as citrate), 25 mg, net price 4-tab pack = £16.59, 8-tab pack = £33.19; 50 mg, 4-tab pack = £21.27, 8-tab pack = £42.54; 100 mg, 4-tab pack = £23.50, 8-tab pack = £46.99

**TADALAFIL**

**Indications** benign prostatic hyperplasia; erectile dysfunction; pulmonary hypertension (section 2.5.1)

**Cautions** see notes above; **interactions:** Appendix 1 (tadalafil)

**Contra-indications** see notes above; also mild to severe heart failure, uncontrolled arrhythmias, uncontrolled hypertension

**Hepatic impairment** max. dose 10 mg; manufacturer advises caution in severe impairment and for regular once-daily dosing—no information available

**Renal impairment** max. dose 10 mg if eGFR less than 30 mL/minute/1.73 m² (avoid regular once-daily dosing)

**Side-effects** see notes above; also increased sweating, abdominal pain, and transient amnesia reported

**Dose**

- Erectile dysfunction, **ADULT** over 18 years, initially 10 mg at least 30 minutes before sexual activity, subsequent doses adjusted according to response, up to 20 mg as a single dose; max. 1 dose in 24 hours (but daily dose of 10–20 mg not recommended); for patients who anticipate sexual activity at least twice weekly, 5 mg once daily can be taken, reduced to 2.5 mg once daily according to response

  **Note** Effect of intermittent dosing may persist for longer than 24 hours

- Benign prostatic hyperplasia, **ADULT** over 18 years, 5 mg once daily

1. **For treatment of erectile dysfunction except in men who:**

   - have diabetes, multiple sclerosis, Parkinson’s disease, poliomyelitis, prostate cancer, severe pelvic injury, single gene neurologic disease, spina bifida, or spinal cord injury;
   - are receiving dialysis for renal failure;
   - have had radical pelvic surgery, prostatectomy (including transurethral resection of the prostate), or kidney transplant;
   - were receiving Caverject®, Erecnos®, MUSE®, Viaggra® or Vindalo® for erectile dysfunction, at the expense of the NHS, on 14 September 1998;
   - are suffering severe distress as a result of impotence (prescribed in specialist centres only, see notes above).

The prescription must be endorsed ‘SLS’.

**SILDENAFIL**

**Indications** erectile dysfunction; pulmonary hypertension (section 2.5.1)

**Cautions** see notes above; also bleeding disorders or active peptic ulceration; **interactions:** Appendix 1 (sildenafil)

**Contra-indications** see notes above; also hereditary degenerative retinal disorders

**Hepatic impairment** initial dose 25 mg; manufacturer advises avoid in severe impairment

**Renal impairment** initial dose 25 mg if eGFR less than 30 mL/minute/1.73 m²

**Side-effects** see notes above; also less commonly chest pain, drowsiness, hypoaesthesia, vertigo, tinnitus, dry mouth, fatigue; rarely cerebrovascular accident and atrial fibrillation

**Dose**

- **ADULT** over 18 years initially 50 mg approx. 1 hour before sexual activity; subsequent doses adjusted according to response to 25–100 mg as a single dose as needed; max. 1 dose in 24 hours (max. single dose 100 mg)

  **Note** Onset of effect may be delayed if taken with food

**Revatio®** (Pfizer) [PNL]

- Tablets, all blue, f/c, sildenafil (as citrate), 5 mg once daily according to response; manufacturer advises avoid in severe impairment and for regular once-daily dosing—no information available

**Nipsatra®** (AMCo)

- Tablets, all blue, f/c, sildenafil (as citrate), 5 mg once daily according to response; manufacturer advises avoid in severe impairment and for regular once-daily dosing—no information available

**Viagra®** (Pfizer) [PNL]

- Tablets, all blue, f/c, sildenafil (as citrate), 5 mg once daily according to response; manufacturer advises avoid in severe impairment and for regular once-daily dosing—no information available

**Caverject®**

- (prescribed in specialist centres only, see notes above).

The prescription must be endorsed ‘SLS’.
7 Obstetrics, gynaecology, and urinary-tract disorders

VARDENAFIL

**Indications** erectile dysfunction

**Cautions** see notes above; also elderly; bleeding disorders or active peptic ulceration; susceptibility to prolongation of QT interval (including concomitant use of drugs which prolong QT interval); **interactions:** Appendix 1 (vardenafil)

**Contra-indications** see notes above; also hereditary degenerative retinal disorders

**Hepatic impairment** initial dose 5 mg in mild to moderate impairment, increased subsequently according to response (max. 10 mg in moderate impairment); manufacturer advises avoid in severe impairment

**Renal impairment** initial dose 5 mg if eGFR less than 30 mL/minute/1.73 m²

**Side-effects** see notes above; also less commonly drowsiness, dizziness, increased lacrimation, photosensitivity; rarely anxiety, transient amnesia, hypertension, and raised intra-ocular pressure

**Dose**

- See under preparations

**Levitra** (Bayern) Tablets, all orange, f/c, vardenafil (as hydrochloride trihydrate) 5 mg, net price 4-tab pack = £7.56, 8-tab pack = £15.12; 10 mg, 4-tab pack = £14.08, 8-tab pack = £28.16; 20 mg, 4-tab pack = £23.48, 8-tab pack = £46.96

**Dose ADULT** over 18 years, initially 10 mg (patients on alpha-blocker therapy 5 mg) approx. 25–60 minutes before sexual activity, subsequent doses adjusted according to response up to max. 20 mg as a single dose; max. 1 dose in 24 hours

**Note** Onset of effect may be delayed if taken with high-fat meal

**Orodispersible tablets**, vardenafil (as hydrochloride) 10 mg, net price 4-tab pack = £17.88

**Excipients** include aspartame

**Dose ADULT** over 18 years, 10 mg approx. 25–60 minutes before sexual activity, max. 10 mg in 24 hours (dose form not suitable for patients with moderate hepatic impairment, or for initiation of therapy in patients taking

alpha-blockers, or if eGFR less than 30 mL/minute/1.73 m²)

The Scottish Medicines Consortium (p. 4) has advised (September 2011) that vardenafil orodispersible tablets (Levitra®) are accepted for restricted use within NHS Scotland for men for whom an orodispersible tablet is an appropriate formulation.

Important: Levitra® 10 mg orodispersible tablets and Levitra® 10 mg film coated tablets are not bioequivalent.

**Papaverine and phentolamine**

Although not licensed the smooth muscle relaxant papaverine has also been given by intracavernosal injection for erectile dysfunction. Patients with neurological or psychogenic impotence are more sensitive to the effect of papaverine than those with vascular abnormalities. Phentolamine is added if the response is inadequate [unlicensed indication].

Persistence of the erection for longer than 4 hours is an emergency, see advice in section 7.4.5.

**7.4.6 Drugs for premature ejaculation**

**Dapoxetine** is a short-acting selective serotonin re-uptake inhibitor licensed for use in the treatment of premature ejaculation in men who meet all the following criteria: poor control over ejaculation, a history of premature ejaculation over the past 6 months, marked distress or interpersonal difficulty as a consequence of premature ejaculation, and an intravaginal ejaculatory latency time of less than two minutes.

**DAPOXETINE**

**Indications** premature ejaculation (see notes above)

**Cautions** bleeding disorders; concomitant use of drugs that increase risk of bleeding; epilepsy (avoid if uncontrolled, discontinue if convulsions develop); susceptibility to angle-closure glaucoma; **interactions:** Appendix 1 (dapoxetine)

**Postural hypotension and syncope** Postural hypotension and syncope reported. Test for postural hypotension before starting treatment—avoid dapoxetine if postural hypotension occurs. Patients should be advised to maintain hydration and to sit or lie down until prodromal symptoms such as nausea, dizziness, and sweating abate

**Contra-indications** significant cardiac disease; history of syncope; history of mania, bipolar disorder, or severe depression; discontinue if psychiatric disorder develops

**Hepatic impairment** avoid in moderate to severe impairment

**Renal impairment** use with caution if eGFR 30–80 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²

**Side-effects** nausea, vomiting, diarrhoea, constipation, abdominal pain, abdominal distension, dyspepsia, dry mouth, flushing, sweating, hypertension, malaise, irritability, dizziness, headache, anxiety, agitation, abnormal dreams, sleep disturbances, drowsiness, tremor, paraesthesia, impaired attention, sexual dysfunction, visual disturbances, tinnitus, less commonly syncope, sinus arrest, bradycardia, tachycardia, hypotension (including postural hypotension), restlessness, taste disturbances, depression, mood disturbances (discontinue), confusion, abnormal thoughts, vertigo, bruxism, mydriasis, eye pain, pru-
ritus; rarely defaecation urgency, sudden onset of sleep

**Dose**

- **ADULT** 18–64 years, initially 30 mg approx. 1–3 hours before sexual activity, subsequent doses adjusted according to response to max. 60 mg as a single dose; max. 1 dose in 24 hours; review treatment after 4 weeks (or 6 doses) and at least every 6 months thereafter

  **Note** Max. single dose 30 mg with concomitant aprepitant, clarithromycin, diltiazem, erythromycin, fluconazole, fosamprenavir, and verapamil; use 60-mg dose with caution with concomitant potent inhibitors of cytochrome P450 enzyme CYP2D6.

**Priligy**® (Menarini) ▼ ①③④

Tablets, f/c, dapoxetine (as hydrochloride), 30 mg (light grey), net price 3-tab pack = £14.71, 6-tab pack = £26.48; 60 mg (grey), 3-tab pack = £19.12, 6-tab pack = £34.42. Label: 2, 25, counselling, postural hypotension.
The chemotherapy of cancer is complex and should be confined to specialists in oncology. Cytotoxic drugs have both anti-cancer activity and the potential to damage normal tissue; most cytotoxic drugs are teratogenic. Chemotherapy may be given with a curative intent or it may aim to prolong life or to palliate symptoms. In an increasing number of cases chemotherapy may be combined with radiotherapy or surgery or both as either neoadjuvant treatment (initial chemotherapy aimed at shrinking the primary tumour, thereby rendering local therapy less destructive or more effective) or as adjuvant treatment (which follows definitive treatment of the primary disease, when the risk of subclinical metastatic disease is known to be high). All cytotoxic drugs cause side-effects and a balance has to be struck between likely benefit and acceptable toxicity.

Combinations of cytotoxic drugs, as continuous or pulsed cycles of treatment, are frequently more toxic than single drugs but have the advantage in certain tumours of enhanced response, reduced development of drug resistance and increased survival. However for some tumours, single-agent chemotherapy remains the treatment of choice.

Cytotoxic drugs fall into a number of classes, each with characteristic antitumour activity, sites of action, and toxicity. A knowledge of sites of metabolism and excretion is important because impaired drug handling as a

Guidelines for handling cytotoxic drugs

- Trained personnel should reconstitute cytotoxics;
- Reconstitution should be carried out in designated pharmacy areas;
- Protective clothing (including gloves, gowns, and masks) should be worn;
- The eyes should be protected and means of first aid should be specified;
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard);
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material;
- Staff exposure to cytotoxic drugs should be monitored.
result of disease is not uncommon and may result in enhanced toxicity.

**Intrathecal chemotherapy**

A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance should be available. Support for training programmes is also available. Copies, and further information may be obtained from:

Department of Health
PO Box 777
London SE1 6XH
Fax: 01623 724524

It is also available from the Department of Health website (www.dh.gov.uk).

**Safe systems for cytotoxic medicines**

NHS cancer networks have been established across the UK to bring together all stakeholders in all sectors of care, to work collaboratively to plan and deliver high quality cancer services for a given population. NHS cancer networks have websites containing information on local chemotherapy services and treatment (see www.cancer.nhs.uk/networks.htm).

Safe system requirements:

- cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care coordinated by a multidisciplinary team;
- cytotoxic drugs should be prescribed, dispensed, and administered only in the context of a written protocol or treatment plan;
- injectable cytotoxic drugs should only be dispensed if they are prepared for administration;
- oral cytotoxic medicines should be dispensed with clear directions for use.

**Risks of incorrect dosing of oral anti-cancer medicines**

The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy. Standards to be followed to achieve this include:

- non-specialists who prescribe or administer on-going oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity;
- staff dispensing oral cytotoxic medicines should confirm that the prescribed dose is appropriate for the patient. Patients should have written information that includes details of the intended oral anti-cancer regimen, the treatment plan, and arrangements for monitoring, taken from the original protocol from the initiating hospital. Staff dispensing oral cytotoxic medicines should also have access to this information, and to advice from an experienced cancer pharmacist in the initiating hospital.

**Doses**

Doses of cytotoxic drugs are determined using a variety of different methods including body-surface area or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient’s neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from some of the drug entries in this chapter. However, even where dose statements have been provided, detailed specialist literature, individual hospital chemotherapy protocols, or local cancer networks (www.cancer.nhs.uk/networks.htm) should be consulted before prescribing, dispensing, or administering cytotoxic drugs.

Prescriptions should not be repeated except on the instructions of a specialist.

**Side-effects of cytotoxic drugs**

Side-effects common to most cytotoxic drugs are discussed below whilst side-effects characteristic of a particular drug or class of drugs (e.g. neurotoxicity with vinca alkaloids) are mentioned in the appropriate sections. Manufacturers’ product literature, hospital-trust protocols, and cancer-network protocols should be consulted for full details of side-effects associated with individual drugs and specific chemotherapy regimens.

Many side-effects of cytotoxic drugs often do not occur at the time of administration, but days or weeks later. It is therefore important that patients and healthcare professionals can identify symptoms that cause concern and can contact an expert for advice. Toxicities should be accurately recorded using a recognised scoring system such as the Common Toxicity Criteria for Adverse Events (CTCAE) developed by the National Cancer Institute.

**Extravasation of intravenous drugs**

A number of cytotoxic drugs will cause severe local tissue necrosis if leakage into the extravascular compartment occurs. To reduce the risk of extravasation injury it is recommended that cytotoxic drugs are administered by appropriately trained staff. For information on the prevention and management of extravasation injury, see section 10.3.

**Oral mucositis**

A sore mouth is a common complication of cancer chemotherapy; it is most often associated with fluorouracil, methotrexate, and the anthracyclines. It is best to prevent the complication. Good oral hygiene (rinsing the mouth frequently and effective brushing of the teeth with a soft brush 2–3 times daily) is probably beneficial. For fluorouracil, sucking ice chips during short infusions of the drug is also helpful.

Once a sore mouth has developed, treatment is much less effective. Saline mouthwashes should be used but there is no good evidence to support the use of anti-septic or anti-inflammatory mouthwashes. In general, mucositis is self-limiting but with poor oral hygiene it can be a focus for blood-borne infection.
Tumour lysis syndrome  Tumour lysis syndrome occurs secondary to spontaneous or treatment-related rapid destruction of malignant cells. Patients at risk of tumour lysis syndrome include those with non-Hodgkin's lymphoma (especially if high grade and bulky disease), Burkitt's lymphoma, acute lymphoblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydrogenation, and renal impairment are also predisposing factors. Features include hyperkalaemia, hyperuricaemia (see below), and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow. Early identification of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential.

Hyperuricaemia  Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure. Allopurinol (section 10.1.4) should be started 24 hours before treating such tumours and patients should be adequately hydrated. The dose of mercaptopurine or azathioprine should be reduced if allopurinol needs to be given concomitantly (see Appendix 1).

Rasburicase (section 10.1.4), a recombinant urate oxidase, is licensed for hyperuricaemia in patients with haematological malignancy, for details, see p. 730. It rapidly reduces plasma-uric acid concentration and may be of particular value in preventing complications following treatment of leukaemias or bulky lymphomas.

Nausea and vomiting  Nausea and vomiting cause considerable distress to many patients who receive chemotherapy and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Patients vary in their susceptibility to drug-induced nausea and vomiting; those affected more often include women, patients under 50 years of age, anxious patients, and those who experience motion sickness. Patients taking cytotoxic drugs who have signs or symptoms of infection should be advised to seek prompt medical attention. All patients should initially be investigated and treated under the supervision of the appropriate oncology or haematology specialist.

Symptoms of infection should be advised to seek prompt medical attention. All patients should initially be investigated and treated under the supervision of the appropriate oncology or haematology specialist.

Prevention of acute symptoms  For patients at low risk of emesis, pretreatment with dexamethasone (6–10 mg by mouth) or lorazepam (1–2 mg by mouth) may be used. For patients at high risk of emesis, a SHT₇-receptor antagonist (section 4.6), usually given by mouth in combination with dexamethasone and the neurokinin receptor antagonist aprepitant is effective.

Prevention of delayed symptoms  For delayed symptoms associated with moderately emetogenic chemotherapy, a combination of dexamethasone and SHT₇-receptor antagonist is effective; for highly emetogenic chemotherapy, a combination of dexamethasone and aprepitant is effective. Metoclopramide is also licensed for delayed chemotherapy-induced nausea and vomiting.

Prevention of anticipatory symptoms  Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam can be helpful for its amnesic, sedative, and anxiolytic effects.

Bone-marrow suppression  All cytotoxic drugs except vincristine and bleomycin cause bone-marrow suppression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as Carmustine, lomustine, and melphalan. Peripheral blood counts must be checked before each treatment, and doses should be reduced or therapy delayed if bone-marrow has not recovered.

Cytotoxic drugs may be contra-indicated in patients with acute infection; any infection should be treated before, or when starting, cytotoxic drugs.

Fever in a neutropenic patient (neutrophil count less than 1.0 × 10⁹/litre) requires immediate broad-spectrum antibacterial therapy. Appropriate bacteriological investigations should be conducted as soon as possible. Patients taking cytotoxic drugs who have signs or symptoms of infection should be advised to seek prompt medical attention. All patients should initially be investigated and treated under the supervision of the appropriate oncology or haematology specialist.

In selected patients, the duration and the severity of neutropenia can be reduced by the use of amifostine, p. 567 or recombinant human granulocyte-colony stimulating factors, section 9.1.6.

Symptomatic anaemia is usually treated with red blood cell transfusions. For guidance on the use of erythropoietins in patients with cancer, see MHRA/CHM advice (p. 653) and NICE guidance (p. 653).

For advice on the use of live vaccines in individuals with impaired immune response, see section 14.1.

Alopecia  Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients. No pharmacological methods of preventing this are available.

Pregnancy and reproductive function  Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Exclude pregnancy before treatment with cytotoxic drugs. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Contraceptive advice should be given to men and women before cytotoxic therapy begins (and should cover the duration of contraception required after therapy has ended).

Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry
the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

**Thromboembolism** Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

### Treatment for cytotoxic-induced side-effects

#### Anthracycline side-effects

**Anthracycline-induced cardiotoxicity** The anthracycline cytotoxic drugs are associated with dose-related, cumulative, and potentially life-threatening cardiotoxic side-effects.

**Dexrazoxane**, an iron chelator, is licensed for the prevention of chronic cumulative cardiotoxicity caused by doxorubicin or epirubicin treatment in advanced or metastatic breast cancer patients who have received a prior cumulative dose of 300 mg/m² of doxorubicin or a prior cumulative dose of 540 mg/m² of epirubicin when further anthracycline treatment is required. Patients receiving dexrazoxane should still be monitored for cardiac toxicity. The myelosuppressive effects of dexrazoxane may be additive to those of chemotherapy. The use of dexrazoxane is restricted to adults with advanced or metastatic breast cancer. Dexrazoxane is contra-indicated in children.

**Anthracycline extravasation** Dexrazoxane is licensed for the treatment of anthracycline extravasation. The first dose should be given as soon as possible and within six hours after the injury. For further information on the prevention and management of extravasation injury, see section 10.3.

Local guidelines for the management of extravasation should be followed or specialist advice sought.

### DEXRAZOXANE

**Indications** see notes above and under preparations

**Cautions** see notes above; monitor full blood count

**Hepatic impairment** monitor liver function

**Renal impairment** use with caution—risk of accumulation; manufacturer of Cardioxane® advises reduce dose by 50% if creatinine clearance less than 40 mL/minute

**Pregnancy** avoid unless essential (toxicity in animal studies); ensure effective contraception during and for at least 3 months after treatment in men and women

**Breast-feeding** discontinue breast-feeding

**Side-effects** nausea, vomiting, dyspepsia, abdominal pain, diarrhoea, stomatitis, dry mouth, anorexia; dyspnoea; dizziness, syncope, asthenia, paraesthesia, tremor, fatigue, drowsiness; pyrexia; vaginal haemorrhage; myalgia; blood disorders (including anaemia, leucopenia, neutropenia, thrombocytopenia, and increased myelosuppression); alopecia, pruritus; peripheral oedema, injection-site reactions including phlebitis; also reported secondary malignancies

**Dose**

- See under preparations

**Cardioxane® (Clinigen) (PwC)**

*Intravenous infusion*, powder for reconstitution, dexrazoxane (as hydrochloride), net price 500-mg vial = £156.57

**Dose** prevention of anthracycline-induced cardiotoxicity, ADULT over 18 years, by *intravenous infusion* (30 minutes before anthracycline administration), 10 times the doxorubicin-equivalent dose or 10 times the epirubicin-equivalent dose

**Savene® (Norgine) (PwC)**

*Intravenous infusion*, powder for reconstitution, dexrazoxane (as hydrochloride), net price 10 x 500-mg vials (with diluent) = £675.00

**Dose** anthracycline extravasation, ADULT over 18 years, by *intravenous infusion*, 1 g/m² (max. 2 g) daily for 2 days, then 500 mg/m² for 1 day

**Note** Local coolants such as ice packs should be removed at least 15 minutes before administration

### Chemotherapy-induced mucositis and myelosuppression

**Folinic acid** (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate and thus speed recovery from methotrexate-induced mucositis or myelosuppression (‘folinic acid rescue’).

Folinic acid is also used in the management of methotrexate overdose, together with other measures to maintain fluid and electrolyte balance, and to manage possible renal failure.

Folinic acid does not counteract the antibacterial activity of folate antagonists such as trimethoprim.

When folinic acid and fluorouracil are used together in metastatic colorectal cancer the response-rate improves compared to that with fluorouracil alone.

The calcium salt of levofolinic acid, a single isomer of folinic acid, is also used for rescue therapy following methotrexate administration, for cases of methotrexate overdose, and for use with fluorouracil for colorectal cancer. The dose of calcium levofolinate is generally half that of calcium folinate.

The disodium salts of folinic acid and levofolinic acid are also used for rescue therapy following methotrexate therapy, and for use with fluorouracil for colorectal cancer.

**Palifermin**, a human keratinocyte growth factor, is licensed for the management of oral mucositis in patients with haematological malignancies receiving myeloablative radiochemotherapy with autologous haematopoietic stem-cell support.

### FOLINIC ACID

**Indications** see notes above

**Cautions** avoid simultaneous administration of methotrexate; not indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B₁₂ deficiency; interactions: Appendix 1 (folates)

**Contra-indications** intrathecal injection

**Pregnancy** not known to be harmful; benefit outweighs risk

**Breast-feeding** presence in milk unknown but benefit outweighs risk
**Side-effects** rarely pyrexia after parenteral use; insomnia, agitation, and depression after high doses

**Dose**
- See under preparations

**Calcium folinate**
(Calcium leucovorin)

**Calcium Folinate** (Non-proprietary) *(Motrin)*
Tablets, scored, folinic acid (as calcium salt) 15 mg, net price 10-tab pack = £47.46, 30-tab pack = £85.74

**Brands include** Refolinon®

**Note** Not all strengths and pack sizes are available from all manufacturers

**Injection**, folinic acid (as calcium salt) 3 mg/mL, net price 1-mL amp = £4.00, 10-mL amp = £46.22; 7.5 mg/mL, net price 2-mL amp = £7.80; 10 mg/mL, net price 5-mL vial = £19.41, 10-mL vial = £34.94, 30-mL vial = £89.95; 35-mL vial = £90.98

**Brands include** Refolinon®

**Note** Not all strengths and pack sizes are available from all manufactures

**Injection**, powder for reconstitution, folinic acid (as calcium salt), net price 15-mg vial = £4.46; 30-mg vial = £8.36

**Dose**
- See notes above
- See under preparations

**Calcium levofolinate**

**Calcium Levofolinate** (Non-proprietary) *(Motrin)*
Injection, levofolinic acid (as calcium salt) 10 mg/mL, net price 2.5-mL vial = £11.62, 17.5-mL vial = £81.33

**Dose**
- See notes above
- See under preparations

**Isovorin®** *(Pfizer)* *(Motrin)*

**Injection**, levofolinic acid (as calcium salt) 10 mg/mL, net price 2.5-mL vial = £11.62, 17.5-mL vial = £81.33

**Dose**
- See notes above
- See under preparations

**Levofolinic Acid**

**Levofolinic Acid** *(Non-proprietary)* *(Pfizer)*

**Injection**, levofolinic acid (as disodium salt) 50 mg/mL, net price 1-mL vial = £24.70, 4-mL vial = £80.40

**Dose**
- As an antidote to methotrexate, by intravenous injection or infusion, consult product literature
- Adjust to fluorouracil in colorectal cancer, consult product literature

**Sodium folinate**

**Sodium folinate** *(Medac)* *(Pfizer)*

**Injection**, folinic acid (as disodium salt) 50 mg/mL, net price 2-mL vial = £35.09, 8-mL vial = £126.25

**Dose**
- As an antidote to methotrexate, by intravenous injection or infusion, consult product literature
- Adjunct to fluorouracil in colorectal cancer, consult product literature

**Disodium levofolinate**

**Levofolinic Acid** *(Non-proprietary)* *(Pfizer)*

**Injection**, levofolinic acid (as disodium salt) 50 mg/mL, net price 1-mL vial = £24.70, 4-mL vial = £80.40

**Dose**
- As an antidote to methotrexate, by intravenous injection or infusion, consult product literature
- Adjunct to fluorouracil in colorectal cancer, consult product literature

**PALIFERMIN**

**Indications** see notes above

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—tumour necrosis factor (TNF) levels are increased in animal studies

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk—tumour necrosis factor (TNF) levels are increased in animal studies

**Side-effects** oral paraesthesia, taste disturbance, thickening and discoloration of tongue; fever, oedema; arthralgia; rash, pruritus, erythema, skin hyperpigmentation

**Dose**
- By intravenous injection, 60 micrograms/kg once daily for 3 doses (third dose given 24–48 hours after myeloablative therapy) then 3 further doses at least 24 hours after myeloablative therapy, and more than 4 days after most recent palifermin injection, starting on same day as (but after) stem-cell infusion; CHILD not recommended

**Kepivance®** *(Swedish Orphan)* *(Pfizer)*

**Injection**, powder for reconstitution, palifermin, net price 6.25-mg vial = £54.24

**Chemotherapy-induced neutropenic infection and nephrotoxicity**

**Amifostine** is licensed for the reduction of risk of infection associated with cisplatin- and cyclophosphamide-induced neutropenia in advanced ovarian carcinoma, and for the reduction of nephrotoxicity caused by cisplatin use in advanced solid tumours of non-germ-cell origin. Amifostine is also licensed for protection against xerostomia during radiotherapy for head and neck cancer.

Other drugs for the reduction of risk of infection associated with neutropenia include granulocyte-colony stimulating factors (section 9.1.6).
**AMIFOSTINE**

**Indications** see under Dose

**Cautions** ensure adequate hydration before treatment; infuse with patient supine and monitor arterial blood pressure (interrupt infusion if blood pressure decreases significantly, consult product literature); during chemotherapy interrupt antihypertensive therapy 24 hours before treatment with amifostine and monitor closely; during radiotherapy monitor closely if concomitant antihypertensive therapy; monitor serum-calcium concentration in patients at risk of hypocalcaemia; patients at risk of renal impairment; caution in handling—risk of cutaneous reactions

**Hepatic impairment** avoid—no information available

**Renal impairment** avoid—no information available

**Pregnancy** toxicity in animal studies; avoid

**Breast-feeding** avoid—no information available

**Side-effects** nausea, vomiting, hiccup; hypotension (managed by infusion of sodium chloride 0.9% and postural management), hypertension, flushing, arthralgias (including rarely atrial fibrillation, supraventricular tachycardia); sneezing; drowsiness, dizziness, syncope; hypocalcaemia; rarely chest pain, apnoea, seizures, serious skin reactions (including Stevens-Johnson syndrome, toxic epidermal necrolysis, and very rarely exfoliative and bulous dermatitis, toxicoderma), and renal failure; very rarely myocardial infarction, laryngeal oedema, and respiratory arrest

**Dose**
- Reduction of neutropenia-related risk of infection due to cyclophosphamide and cisplatin treatment in patients with advanced ovarian carcinoma, by intravenous infusion over 15 minutes, **ADULT** under 70 years, 910 mg/m² started within 30 minutes before chemotherapy (reduced to 740 mg/m² for subsequent cycles if full dose could not be given first time due to hypotension lasting more than 5 minutes after interruption, consult product literature)
- Reduction of nephrotoxicity associated with cisplatin in patients with advanced solid tumours of non-germ-cell origin, consult product literature
- Prevention of xerostomia during radiotherapy for head and neck cancer, consult product literature

**Ethyl®**

**Intravenous infusion, powder for reconstitution, amifostine, net price 500-mg vial = £144.00**

**Urothelial toxicity**

Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide and ifosfamide; it is caused by the metabolite acrolein. **Mesna** reacts specifically with this metabolite in the urinary tract, preventing toxicity. Mesna is used routinely (preferably by mouth) in patients receiving ifosfamide, and in patients receiving cyclophosphamide by the intravenous route at a high dose (e.g. more than 2 g) or in those who experienced urothelial toxicity when given cyclophosphamide previously.

**MESNA**

**Indications** see notes above

**Cautions** false positive urinary ketones; false positive or false negative urinary erythrocytes

**Contra-indications** hypersensitivity to thiol-containing compounds

**Dose**
- Calculated according to oxazaphosphorine (cyclophosphamide or ifosfamide) treatment—consult product literature

**Mesna** (Baxter)

- **Tablets**, f/c, mesna 400 mg, net price 10-tab pack = £42.90; 600 mg, 10-tab pack = £61.10
- **Injection**, mesna 100 mg/mL, net price 4-mL amp = £3.95; 10-mL amp = £9.77

**Note** For oral administration contents of ampoule are taken in a flavoured drink such as orange juice or cola which may be stored in a refrigerator for up to 24 hours in a sealed container

---

**BNF 68**

**8.1.1 Alkylating drugs**

**Pregnancy** not known to be harmful; see also Pregnancy and Reproductive Function, p. 564

**Side-effects** nausea, vomiting, colic, diarrhoea, fatigue, headache, limb and joint pains, depression, irritability, rash, hypotension and tachycardia; rarely hypersensitivity reactions (more common in patients with auto-immune disorders)

**Dose**
- Extensive experience is available with these drugs, which are among the most widely used in cancer chemotherapy. They act by damaging DNA, thus interfering with cell replication. In addition to the side-effects common to many cytotoxic drugs (section 8.1), there are two problems associated with prolonged usage. Firstly, gametogenesis is often severely affected (section 8.1). Secondly, prolonged use of these drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

**Cyclophosphamide** is used mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours. It is given by mouth or intravenously; it is inactive until metabolised by the liver. A urinary metabolite of cyclophosphamide, acrolein, can cause haemorrhagic cystitis; this is a rare but serious complication; increased fluid intake for 24–48 hours after intravenous injection, can prevent this complication. When high-dose therapy (e.g. more than 2 g intravenously) is used or when the patient is considered to be at high risk of cystitis (e.g. because of pelvic irradiation), mesna (given intravenously then by mouth) can also help prevent cystitis—see under Urothelial Toxicity (section 8.1).

**Ifosfamide** is related to cyclophosphamide and is given intravenously; mesna (section 8.1) is routinely given with it to reduce urothelial toxicity.

**Chlorambucil** is used either alone or in combination therapy for some lymphomas and chronic leukaemias. It is given by mouth. Side-effects, apart from bone-marrow suppression, are uncommon. However, patients occasionally develop severe widespread rashes which can progress to Stevens-Johnson syndrome or to toxic epidermal necrolysis. If a rash occurs further chlorambucil is contra-indicated and cyclophosphamide is substituted.

**Melphalan** is licensed for the treatment of multiple myeloma, polycythaemia vera, childhood neuroblastoma, advanced ovarian adenocarcinoma, and advanced breast cancer. However, in practice, melphalan is rarely used for ovarian adenocarcinoma; it is no longer used for advanced breast cancer. Melphalan is also licensed...
for regional arterial perfusion in localised malignant melanoma of the extremities and localised soft-tissue sarcoma of the extremities. Interstitial pneumonitis and life-threatening pulmonary fibrosis are rarely associated with melphalan.

**Busulfan** is given by mouth to treat chronic myeloid leukaemia. Busulfan given by mouth or intravenously, followed by cyclophosphamide, is also licensed as an alternative to conventional therapy, malignant melanoma and certain solid tumours. Bone-marrow toxicity is delayed, and the drug is therefore given at intervals of 4 to 6 weeks. Permanent bone-marrow damage can occur with prolonged use. Nausea and vomiting are common and moderately severe.

**Bendamustine** given intravenously is licensed for the treatment of chronic lymphocytic leukaemia, non-Hodgkin’s lymphoma, and for the treatment of multiple myeloma.

The **Scottish Medicines Consortium** (p. 4) has advised (March 2011) that bendamustine *(Levact®)* is accepted for restricted use within NHS Scotland for the treatment of chronic lymphocytic leukaemia in patients for whom fludarabine combination chemotherapy is not appropriate.

**Cautions** see section 8.1; cardiac disorders—monitor serum potassium and ECG; avoid in acute porphyria (but see section 9.8.2); interactions: see Appendix 1 (bendamustine)

**Contra-indications** jaundice; severe bone marrow suppression, low leucocyte or platelet count; major surgery less than 30 days before start of treatment

**Hepatic impairment** consider a 30% dose reduction in moderate impairment; avoid in severe impairment

**Renal impairment** no information available on use in patients with creatinine clearance less than 10 mL/minute

**Pregnancy** avoid (teratogenic and mutagenic in animal studies); effective contraception required during treatment in men or women, and for 6 months after treatment in men; see also Pregnancy and Reproductive function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also anorexia, diarrhoea, constipation, haemorrhage, hypotension, hypertension, palpitation, angina, arrhythmias, respiratory dysfunction, insomnia, pain, chills, malaise, infection, pyrexia, amenorrhea, dehydration, electrolyte disturbances (including hypokalaemia); less commonly pericardial effusion; rarely acute circulatory failure, drowsiness, voice changes, sweating; very rarely taste disturbance, tachycardia, myocardial infarction, cardiac failure, pulmonary fibrosis, paraesthesia, peripheral neuropathy, neurological disorders, ataxia, anticholinergic syndrome, encephalitis, phlebitis, multiple organ failure, haemolysis; also reported secondary tumours, Stevens-Johnson syndrome, toxic epidermal necrolysis

**Dose**

- See Doses, p. 563

**Levact®** *(Napp)*

**Injection**, powder for reconstitution, bendamustine hydrochloride, net price 25-mg vial = £69.45; 100-mg vial = £275.81

**NICE guidance** Bendamustine for the first-line treatment of chronic lymphocytic leukaemia (February 2011)

Bendamustine is recommended as an option for the treatment of chronic lymphocytic leukaemia in patients for whom fludarabine combination chemotherapy is not appropriate.

**NICE guidance** (Bendamustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma)

See p. 590

**Estramustine** is a combination of an oestrogen and chlormethine used predominantly in prostate cancer. It is given by mouth and has both an antimitotic effect and (by reducing testosterone concentration) a hormonal effect.

**Treosulfan** is given by mouth or by intravenous or intraperitoneal administration and is used to treat ovarian cancer. Skin pigmentation is a common side-effect and allergic alveolitis, pulmonary fibrosis and haemorrhagic cystitis occur rarely.

**Thiotepa** is licensed in combination with other chemotherapy as conditioning treatment in adults and children with haematological disease or solid tumours before haematopoietic stem cell transplantation.

**Mitobronitol** is occasionally used to treat chronic myeloid leukaemia; it is available on a named-patient basis from specialist importing companies, see p. 1104.

**BENDAMUSTINE HYDROCHLORIDE**

**Indications** see notes above

**Cautions** see section 8.1; cardiac disorders—monitor serum potassium and ECG; avoid in acute porphyria (but see section 9.8.2); interactions: see Appendix 1 (bendamustine)

**Contra-indications** jaundice; severe bone marrow suppression, low leucocyte or platelet count; major surgery less than 30 days before start of treatment

**Hepatic impairment** consider a 30% dose reduction in moderate impairment; avoid in severe impairment

**Renal impairment** no information available on use in patients with creatinine clearance less than 10 mL/minute

**Pregnancy** avoid (teratogenic and mutagenic in animal studies); effective contraception required during treatment in men or women, and for 6 months after treatment in men; see also Pregnancy and Reproductive function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also anorexia, diarrhoea, constipation, haemorrhage, hypotension, hypertension, palpitation, angina, arrhythmias, respiratory dysfunction, insomnia, pain, chills, malaise, infection, pyrexia, amenorrhea, dehydration, electrolyte disturbances (including hypokalaemia); less commonly pericardial effusion; rarely acute circulatory failure, drowsiness, voice changes, sweating; very rarely taste disturbance, tachycardia, myocardial infarction, cardiac failure, pulmonary fibrosis, paraesthesia, peripheral neuropathy, neurological disorders, ataxia, anticholinergic syndrome, encephalitis, phlebitis, multiple organ failure, haemolysis; also reported secondary tumours, Stevens-Johnson syndrome, toxic epidermal necrolysis

**Dose**

- See Doses, p. 563

**Levact®** *(Napp)*

**Injection**, powder for reconstitution, bendamustine hydrochloride, net price 25-mg vial = £69.45; 100-mg vial = £275.81

**BUSULFAN** (Busulphan)

**Indications** see notes above

**Cautions** see section 8.1 and notes above; monitor cardiac and liver function; ineffective once in blast crisis phase; high dose or history of seizures—anti-epileptic prophylaxis required; previous radiation therapy, three or more cycles of chemotherapy, or previous progenitor cell transplant—increased risk of hepatic veno-occlusive disease; discontinue if lung toxicity develops; risk of second malignancy; avoid in
acute porphyria (but see section 9.8.2); interactions: Appendix 1 (busulfan)

**Hepatic impairment** manufacturer advises caution and regular liver function tests—consult product literature

**Pregnancy** avoid (teratogenic in animals); manufacturers advise effective contraception during and for 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also hepatotoxicity (including hepatic veno-occlusive disease, hyperbilirubinaemia, jaundice and fibrosis); cardiac tamponade in thalassaemia; pneumonia; skin hyperpigmentation; rarely seizures, aplastic anaemia, visual disturbances; very rarely myasthenia gravis, gynaecomastia

**Dose**

- Chronic myeloid leukaemia, induction of remission, by mouth, 60 micrograms/kg daily (max. 4 mg); maintenance, usually 0.5–2 mg daily
- Conditioning treatment before haematopoietic stem-cell transplantation, by mouth or by intravenous infusion, consult product literature

**Myleran® (Alkopharma) Tablets,** f/c, busulfan 2 mg, net price 25-tab pack = £65.22

**Busilvex® (Fabre)** Concentrate for intravenous infusion, busulfan 6 mg/mL, net price 10-mL vial = £201.25

---

**CARMUSTINE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; avoid in acute porphyria (but see section 9.8.2); interactions: Appendix 1 (carmustine)

**Pregnancy** avoid (teratogenic and embryotoxic in animals); manufacturer advises effective contraception during treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; irritant to tissues

**Dose**

- See Doses, p. 563

**Gliadel® (Archimedes) Implant,** carmustine 7.7 mg, net price = £650.38

---

**CHLORAMBUCIL**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; history of epilepsy and children with nephrotic syndrome (increased risk of seizures); avoid in acute porphyria (but see section 9.8.2)

**Hepatic impairment** manufacturer advises consider dose reduction in severe impairment—limited information available

**Pregnancy** avoid; manufacturer advises effective contraception during treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**

- See Doses, p. 563

**Leukeran® (Alkopharma) Tablets,** f/c, brown, chlorambucil 2 mg, net price 25-tab pack = £40.51

---

**CYCLOPHOSPHAMIDE**

**Indications** see notes above; rheumatoid arthritis (section 10.1.3)

**Cautions** see section 8.1 and notes above; previous or concurrent mediastinal irradiation—risk of cardio-toxicity; diabetes mellitus; avoid in acute porphyria (but see section 9.8.2); interactions: Appendix 1 (cyclophosphamide)

**Contra-indications** haemorrhagic cystitis

**Hepatic impairment** reduce dose—consult local treatment protocol for details

**Renal impairment** reduce dose if serum creatinine concentration greater than 120 micromol/litre

**Pregnancy** avoid (manufacturer advises effective contraception during and for at least 3 months after treatment in men or women); see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding during and for 36 hours after stopping treatment

**Side-effects** see section 8.1 and notes above; also anorexia; pancreatitis; cardiotoxicity at high doses; interstitial pulmonary fibrosis; inappropriate secretion of anti-diuretic hormone, disturbances of carbohydrate metabolism; urothelial toxicity; pigmentation of palms, nails, and soles: rarely hepatotoxicity and renal dysfunction

**Dose**

- See Doses, p. 563

**Cyclophosphamide (Non-proprietary) Tablets,** s/c, cyclophosphamide (anhydrous) 50 mg, net price 100 = £70.70. Label: 25, 27

**Injection,** powder for reconstitution, cyclophosphamide, net price 500-mg vial = £9.20; 1-g vial = £17.06

---

**ESTRAMUSTINE PHOSPHATE**

**Indications** prostate cancer

**Cautions** see section 8.1; cerebrovascular or cardiovascular disease; diabetes; hypertension; hypercalcemia; congestive heart failure, epilepsy, migraine or other conditions which might be aggravated by fluid retention; avoid in acute porphyria (but see section 9.8.2); interactions: Appendix 1 (estramustine)

**Contra-indications** peptic ulceration, severe cardiovascular disease, thromboembolic disorders

**Hepatic impairment** manufacturer advises caution and regular liver function tests; avoid in severe impairment

**Renal impairment** manufacturer advises caution

**Pregnancy** men should use effective contraceptive methods during treatment

**Side-effects** see section 8.1; also diarrhoea, conges-tive heart failure, ischaemic heart disease, myocardial infarction, oedema (rarely angioedema) impotence, gynaecomastia; altered liver function, altered endo-crine function
8 Malignant disease and immunosuppression

8.1 Alkylating drugs

**Dose**
- 0.14–1.4 g daily in divided doses (usual initial dose 560–840 mg daily)

**Counselling** Each dose should be taken not less than 1 hour before or 2 hours after meals and should not be taken with products containing calcium, magnesium or aluminium, including dairy products and antacid medication

**Estracyt** (Pharmacia) Powder for reconstitution, estramustine phosphate 140 mg (as disodium salt), net price 100-cap pack = £171.28. Label: 5, 23, counselling, see above

**IFOSFAMIDE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; ensure satisfactory electrolyte balance and renal function before each course (risk of tubular dysfunction, Fanconi’s syndrome or diabetes insipidus if renal toxicity not treated promptly); diabetes mellitus; avoid in acute porphyria (but see section 9.8.2); interactions: Appendix 1 (ifosfamide)

**Contra-indications** urinary-tract obstruction; acute infection (including urinary-tract infection); urothelial damage

**Hepatic impairment** avoid

**Renal impairment** avoid if serum creatinine concentration greater than 120 micromol/litre

**Pregnancy** avoid (teratogenic and carcinogenic in animals); manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**
- See Doses, p. 563

Ifosfamide (Non-proprietary) Injection, powder for reconstitution, ifosfamide, net price 1-g vial = £66.08; 2-g vial = £130.04 (hosp. only)

**LOMUSTINE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; avoid in acute porphyria (but see section 9.8.2); interactions: Appendix 1 (lomustine)

**Contra-indications** coeliac disease

**Renal impairment** avoid in severe impairment

**Pregnancy** avoid (manufacturer advises effective contraception during and for at least 6 months after treatment in men or women); see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**
- Used alone, 120–130 mg/m² body-surface every 6–8 weeks

Lomustine (Medac) Capsules, blue/clear, lomustine 40 mg, net price 20-cap pack = £455.62

**Note** The brand name CCNU® has been used for lomustine capsules

**MELPHALAN**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; avoid in acute porphyria (but see section 9.8.2); interactions: Appendix 1 (melphalan)

**Renal impairment** reduce dose initially (consult product literature)

**Pregnancy** avoid (manufacturer advises adequate contraception during treatment in men or women); see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**
- By mouth, multiple myeloma, dose may vary according to regimen; typical dose 150 micrograms/kg daily for 4 days, repeated every 6 weeks

Polycythaemia vera, initially, 6–10 mg daily reduced after 5–7 days to 2–4 mg daily until satisfactory response then further reduce to 2–6 mg per week
- By intravenous injection or infusion or regional arterial perfusion, consult product literature

Alkeran® (Genopharm) Tablets, melphalan 2 mg, net price 25-tab pack = £42.88

Injection, powder for reconstitution, melphalan 50 mg (as hydrochloride), net price 50-mg vial (with solvent-diluent) = £129.81

**THIOTEPA**

**Indications** see notes above

**Cautions** see section 8.1; avoid in acute porphyria (but see section 9.8.2); interactions: Appendix 1 (thiotepa)

**Pregnancy** avoid (teratogenic and embryotoxic in animals); see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1

**Dose**
- See Doses, p. 563

Tepadina® (Adienne) Injection, powder for reconstitution, thiotepa, net price 15-mg vial = £123.00; 100-mg vial = £736.00

**Note** The Scottish Medicines Consortium (p. 4) has advised (June 2012) that thiotepa (Tepadina®) is not recommended for use within NHS Scotland in combination with other chemotherapy as conditioning treatment in adults or children with haematological diseases, or solid tumours prior to haematopoietic stem cell transplantation.

**TREOSULFAN**

**Indications** see notes above

**Cautions** see section 8.1; avoid in acute porphyria (but see section 9.8.2)

**Pregnancy** avoid; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above
8.1.2 Anthracyclines and other cytotoxic antibiotics

Drugs in this group are widely used. Many cytotoxic antibiotics act as radiomimetics and simultaneous use of radiotherapy should be avoided because it may markedly increase toxicity.

Daunorubicin, doxorubicin, epirubicin and idarubicin are anthracycline antibiotics. Mitoxantrone is an anthracycline derivative.

Doxorubicin is used to treat the acute leukemias, Hodgkin’s and non-Hodgkin’s lymphomas, paediatric malignancies, and some solid tumours including breast cancer. It is given by injection into a fast-running infusion, commonly at 21-day intervals. Extravasation can cause severe tissue necrosis. Doxorubicin is largely excreted in the bile and an elevated bilirubin concentration is an indication for reducing the dose. Diarrhoea, dehydration, and red coloration of the urine can commonly occur, and renal damage has been reported. Supraventricular tachycardia related to drug administration is an uncommon complication. Higher cumulative doses are associated with cardiomyopathy and it is usual to limit total cumulative doses to 450 mg/m² because symptomatic and potentially fatal heart failure is common above this dose. Patients should be assessed before treatment by echocardiography; the elderly, and those with cardiac disease, hypertension, or who have received myocardial irradiation, should be treated cautiously. Cardiac monitoring may assist in determining safe dosage. Caution is necessary with concomitant use of cardiotoxic drugs, or drugs that reduce cardiac contractility. Some evidence suggests that weekly low-dose administration may be less cardiotoxic. Doxorubicin is also given by bladder instillation for the treatment of transitional cell carcinoma, papillary bladder tumours and carcinoma in-situ.

Liposomal formulations of doxorubicin for intravenous use are also available. They may reduce the incidence of cardiotoxicity and lower the potential for local necrosis, but infusion reactions, sometimes severe, may occur. Hand-foot syndrome (painful, macular reddening skin eruptions) occurs commonly with liposomal doxorubicin and may be dose limiting. It can occur after 2–3 treatment cycles and may be prevented by cooling hands and feet and avoiding socks, gloves, or tight-fitting footwear for 4–7 days after treatment.

Epirubicin is structurally related to doxorubicin and clinical trials suggest that it is as effective in the treatment of breast cancer. A maximum cumulative dose of 0.9–1 g/m² is recommended to help avoid cardiotoxicity. Like doxorubicin it is given intravenously and by bladder instillation. Hyperpigmentation of skin, nails, and oral mucosa, and red coloration of the urine, may occur.

Idarubicin has general properties similar to those of doxorubicin; it is mostly used in the treatment of haematological malignancies. Diarrhoea, abdominal pain, haemorrhage, cardiac disorders, rash, and red pigmentation of the urine are commonly reported. Skin and nail hyperpigmentation have been reported less frequently. Idarubicin is given intravenously and it may also be given by mouth.

Daunorubicin also has general properties similar to those of doxorubicin. It should be given by intravenous infusion and is indicated for acute leukemias. A liposomal formulation for intravenous use is licensed for advanced AIDS-related Kaposi’s sarcoma.

Mitoxantrone is structurally related to doxorubicin; it is used for metastatic breast cancer. Mitoxantrone is also licensed for treatment of non-Hodgkin’s lymphoma, adult acute non-lymphocytic leukaemia, and non-resectable primary hepatocellular carcinoma. It is given intravenously and is well tolerated, but myelosuppression and dose-related cardiotoxicity occur; cardiac examinations are recommended after a cumulative dose of 160 mg/m².

Pixantrone is licensed as monotherapy for the treatment of refractory or multiply relapsed aggressive non-Hodgkin B-cell lymphomas, although the benefits of using it as a fifth-line or greater chemotherapy in refractory patients has not been established. Baseline investigations should include a full blood count, assessment of cardiac function measured by left ventricular ejection fraction, and measurement of serum concentrations of total bilirubin and total creatinine. Severe myelosuppression is a common side-effect, and cardiotoxicity may occur during or following treatment; full blood count and cardiac function should be monitored throughout treatment. Patients with cardiac risk factors should have the risks and benefits of treatment carefully assessed. Photosensitivity is a theoretical risk and patients should be advised to follow sun protection strategies.

Pixantrone monotherapy for treating multiply relapsed or refractory aggressive non-Hodgkin’s B-cell lymphoma (February 2014)

Pixantrone monotherapy is recommended as an option for treating adults with multiply relapsed or refractory aggressive non-Hodgkin’s B-cell lymphoma in patients:

- who have previously been treated with rituximab and
- who are receiving third- or fourth-line treatment and
- if the manufacturer provides pixantrone with the discount agreed in the patient access scheme

See p. 594

NICE guidance (paclitaxel, pegylated liposomal doxorubicin and topotecan for second-line or subsequent treatment of advanced ovarian cancer)

Bleomycin is given intravenously or intramuscularly to treat metastatic germ cell cancer and, in some regimens,
non-Hodgkin’s lymphoma. It causes little bone-marrow suppression but dermatological toxicity is common and increased pigmentation particularly affecting the flexures and subcutaneous sclerotic plaques may occur. Mucositis is also relatively common and an association with Raynaud’s phenomenon is reported. Hypersensitivity reactions manifest by chills and fevers commonly occur a few hours after drug administration and may be prevented by simultaneous administration of a corticosteroid, for example hydrocortisone intravenously. The principal problem associated with the use of bleomycin is progressive pulmonary fibrosis. This is dose-related, occurring more commonly at cumulative doses greater than 300,000 units (see Bleomycin, below) and in the elderly. Basal lung crépitations or suspicious chest X-ray changes are an indication to stop therapy with this drug. Patients who have received extensive treatment with bleomycin (e.g. cumulative dose more than 100,000 units—see Bleomycin below) may be at risk of developing respiratory failure if a general anaesthetic is given with high inspired oxygen concentrations. Anaesthetists should be warned of this.

Dactinomycin is principally used to treat paediatric cancers; it is given intravenously. Its side-effects are similar to those of doxorubicin, except that cardiac toxicity is not a problem.

Mitomycin is given intravenously to treat upper gastrointestinal and breast cancers and by bladder instillation for superficial bladder tumours. It causes delayed bone-marrow toxicity and therefore it is usually administered at 6-weekly intervals. Prolonged use may result in permanent bone-marrow damage. It may also cause lung fibrosis and renal damage.

**BLEOMYCIN**

**Indications** squamous cell carcinoma; see also notes above

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues; cardiac monitoring essential

**Renal impairment** reduce dose by half if serum-creatinine 177–354 micromol/litre; reduce dose further if serum-creatinine greater than 354 micromol/litre

**Pregnancy** avoid (teratogenic and carcinogenic in animal studies); see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinues breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**—See Doses, p. 563

**Bleomycin (Non-proprietary) (PN)**

**Injection** powder for reconstitution, bleomycin (as sulfate), net price 15,000-unit vial = £15.56

**Note** To conform to the European Pharmacopeia vials previously labelled as containing ‘15 units’ of bleomycin are now labelled as containing 15,000 units. The amount of bleomycin in the vial has not changed. Brands include Bleo-Kyowa®

**DACTINOMYCIN**

(Actinomycin D)

**Indications** see notes above

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues

**Pregnancy** avoid (teratogenic in animal studies); see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinues breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**—See Doses, p. 563

**Dactinomycin (Non-proprietary) (NM)**

**Injection** powder for reconstitution, dactinomycin

Available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104

**DAUNORUBICIN**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues; cardiac monitoring essential

**Contra-indications** myocardial insufficiency, recent myocardial infarction, severe arrhythmia; previous treatment with maximum cumulative doses of doxorubicin or other anthracycline

**Hepatic impairment** reduce dose according to serum bilirubin concentration—consult local protocol for details; avoid in severe impairment

**Renal impairment** reduce dose by 25% if serum creatinine 105–265 micromol/litre and by 50% if serum creatinine greater than 265 micromol/litre; avoid in severe impairment

**Pregnancy** avoid (teratogenic and carcinogenic in animal studies); see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinues breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**—See Doses, p. 563

**Daunorubicin (Non-proprietary) (PN)**

**Injection** powder for reconstitution, daunorubicin (as hydrochloride), net price 20-mg vial = £55.00

**Note** The brand name Cerubidine® was formerly used

**Lipid formulation**

DaunoXome® (Galén) (PN)

**Concentrate for intravenous infusion**, daunorubicin encapsulated in liposomes. For dilution before use, net price 50-mg vial = £131.75

For advanced AIDS-related Kaposi’s sarcoma

**DOXORUBICIN HYDROCHLORIDE**

**Indications** see notes above and section 7.4.4

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues; interactions: Appendix 1 (doxorubicin)

**Contra-indications** see notes above; severe myocardial insufficiency, recent myocardial infarction, severe arrhythmia; previous treatment with maximum cumulative doses of doxorubicin or other anthracycline; intravascular use in urinary tract infections, bladder inflammation, and in urethral stenosis with catheterisation difficulties

**Hepatic impairment** reduce dose according to bilirubin concentration; avoid in severe impairment

**Pregnancy** avoid (teratogenic and toxic in animal studies); manufacturer of liposomal product advises effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

**DOXORUBICIN HYDROCHLORIDE**

**Indications** see notes above and section 7.4.4

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues; interactions: Appendix 1 (doxorubicin)

**Contra-indications** see notes above; severe myocardial insufficiency, recent myocardial infarction, severe arrhythmia; previous treatment with maximum cumulative doses of doxorubicin or other anthracycline; intravascular use in urinary tract infections, bladder inflammation, and in urethral stenosis with catheterisation difficulties

**Hepatic impairment** reduce dose according to bilirubin concentration; avoid in severe impairment

**Pregnancy** avoid (teratogenic and toxic in animal studies); manufacturer of liposomal product advises effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564
**Pharmorubicin® Solution for Injection**

*Pharmacia* (Pharmacopoeia)

**Injection**, epirubicin hydrochloride 2 mg/mL, net price 5-mL vial = £21.24, 25-mL vial = £106.19, 100-mL vial = £386.16

---

**IDARUBICIN HYDROCHLORIDE**

**Indications**

- acute leukaemias (see notes above);
- advanced breast cancer after failure of first-line chemotherapy (not including anthracyclines);

**Cautions**

- see section 8.1 and notes above; caution in handling—irritant to tissues; **interactions**: Appendix 1 (idarubicin)

**Contra-indications**

- severe myocardial insufficiency;
- recent myocardial infarction; severe arrhythmias;
- previous treatment with maximum cumulative dose of idarubicin or other anthracycline

**Hepatic impairment**

- reduce dose according to serum-bilirubin concentration; avoid in severe impairment

**Renal impairment**

- reduce dose; avoid in severe impairment

**Pregnancy**

- avoid (teratogenic in *animal* studies); see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding**

- discontinue breast-feeding

**Side-effects**

- see section 8.1 and notes above

**Dose**

- **By mouth**, acute non-lymphocytic leukaemia, monotherapy, 30 mg/m² daily for 3 days or in combination therapy, 15–30 mg/m² daily for 3 days
- **Advanced breast cancer**, monotherapy, 45 mg/m² as a single dose or 15 mg/m² daily for 3 consecutive days; repeat every 3–4 weeks

**Note**

- Max. cumulative dose by mouth (for all indications) 400 mg/m²

- **By intravenous administration**, consult product literature

**Zavedos® (Pharmacopoeia)**

**Capsules**, idarubicin hydrochloride, 5 mg (red), net price 1-cap pack = £41.47; 10 mg (red/white), 1-cap pack = £69.12. Label: 25

**Injection**, powder for reconstitution, idarubicin hydrochloride, net price 5-mg vial = £87.36; 10-mg vial = £174.72

---

**EPIRUBICIN HYDROCHLORIDE**

**Indications**

- see notes above and section 7.4.4

**Cautions**

- see section 8.1 and notes above; caution in handling—irritant to tissues; **interactions**: Appendix 1 (epirubicin)

**Contra-indications**

- severe myocardial insufficiency, recent myocardial infarction, severe arrhythmia, unstable angina, myocardopathy; previous treatment with maximum cumulative doses of epirubicin or other anthracycline

**Specific contra-indications for intravesical treatment**

- urinary tract infections, bladder inflammation or contraction, haematuria, invasive tumours penetrating the bladder, catheterisation difficulties

**Hepatic impairment**

- reduce dose according to bilirubin concentration; avoid in severe impairment

**Renal impairment**

- dose reduction may be necessary in severe impairment

**Pregnancy**

- avoid (carcinogenic in *animal* studies); see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding**

- discontinue breast-feeding

**Side-effects**

- see section 8.1 and notes above

**Dose**

- **See Doses, p. 563**

**Epirubicin**

- **Non-proprietary** *Pharmacia*

**Injection**, epirubicin hydrochloride 2 mg/mL, net price 5-mL vial = £17.38, 25-mL vial = £84.85, 50-mL vial = £95.54, 100-mL vial = £306.20

**Injection**, powder for reconstitution, epirubicin hydrochloride, net price 50-mg vial = £91.54

---

**MITOMYCIN C KYOWA®**

*ProStrakan* (Pharmacopoeia)

**Injection**, powder for reconstitution, mitomycin, net price 2-mg vial = £5.88; 10-mg vial = £21.37; 20-mg vial = £39.94; 40-mg vial = £79.88 (hosp. only)

---
Malignant disease and immunosuppression

8 Malignant disease and immunosuppression

8.1 Antimetabolites

MITOXANTRONE
(Mitozantrone)

Indications see notes above
Cautions see section 8.1 and notes above; intrathecal administration not recommended; interactions: Appendix 1 (mitoxantrone)

Hepatic impairment use with caution—consult local treatment protocol

Pregnancy avoid; manufacturer advises effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564
Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; history of, biochemical and electrolyte disturbances, chroma-

turia, proteinuria, haematuria, bone pain, conjunctivitis, skin discoloration, pruritus, nail disorder; less commonly oesophagitis, rectal haemorrhage, arrhythmia, vein disorder, pleural effusion, pneumonitis, rhinorrhea, anxiety, sleep disorder, dizziness, vertigo, spontaneous erection, tumour progression, oliguria, arthralgia, arthritis, musculoskeletal pain and weakness, dry eye, keratitis, night sweats, petechiae, skin ulcer, rash

Dose see section 8.3.4.1.

PIXANTRONE

Indications see notes above
Cautions see section 8.1 and notes above; history of, or active cardiovascular disease, previous therapy with anthracyclines or anthracenediones, previous or concurrent radiotherapy to the mediastinal area, or concurrent use of cardotoxic drugs—increased risk of cardiotoxicity; interactions: Appendix 1 (pixantrone)

Contra-indications immunisation with live virus vaccines; active severe infection or risk factors for severe infection

Hepatic impairment no information available—manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

Renal impairment no information available—manufacturer advises caution

Pregnancy manufacturer advises avoid—toxicity in animal studies; ensure effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564
Breast-feeding manufacturer advises avoid—no information available

Side-effects see section 8.1 and notes above; loss of appetite, weight loss, taste disturbances, diarrhoea, constipation, abdominal pain, dyspepsia, dry mouth, abnormal liver function tests, cardiac toxicity and disorders, tachycardia, hypotension, pallor, vein discoloration, oedema, dyspnoea, cough, drowsiness, malaise, headache, paraesthesia, infection, pyrexia, biochemical and electrolyte disturbances, chroma-

Antimetabolites are incorporated into new nuclear material or combine irreversibly with cellular enzymes, preventing normal cellular division.

Methotrexate inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines. It is given by mouth, intravenously, intramuscularly, or intrathecally.

Methotrexate is used as maintenance therapy for childhood acute lymphoblastic leukaemia. Other uses include choriocarcinoma, non-Hodgkin’s lymphoma, and a number of solid tumours. Intrathecal methotrexate is used in the CNS prophylaxis of childhood acute lymphoblastic leukaemia, and as a therapy for established meningeal cancer or lymphoma.

Methotrexate causes myelosuppression, mucositis, and rarely pneumonitis. It is contra-indicated in significant renal impairment because it is excreted primarily by the kidney. It is also contra-indicated in patients with severe hepatic impairment. It should also be avoided in the presence of significant pleural effusion or ascites because it can accumulate in these fluids, and its subsequent return to the circulation may cause myelosuppression. Systemic toxicity may follow intrathecal administration and blood counts should be carefully monitored.

Folinic acid (section 8.1) following methotrexate administration helps to prevent methotrexate-induced mucositis or myelosuppression.

Capecitabine, which is metabolised to fluorouracil, is given by mouth. It is licensed as monotherapy or combination therapy for adjuvant treatment of advanced colon cancer following surgery, for monotherapy or combination therapy of metastatic colorectal cancer, and for first-line treatment of advanced gastric cancer in combination with a platinum-based regimen. Capecitabine is also licensed for second-line treatment of locally advanced or metastatic breast cancer either in combination with docetaxel (where previous therapy included an anthracycline) or alone (after failure of a taxane and anthracycline regimen or where further anthracycline treatment is not indicated). For the role of capecitabine in the treatment of breast cancer, see section 8.3.4.1.
Cytarabine acts by interfering with pyrimidine synthesis. It is given subcutaneously, intravenously, or intrahecially. Its predominant use is in the induction of remission of acute myeloblastic leukaemia. It is a potent myelosuppressant and requires careful haematological monitoring. A liposomal formulation of cytarabine for intrathecal use is licensed for lymphomatous meningitis.

Fludarabine is licensed for the initial treatment of advanced B-cell chronic lymphocytic leukaemia (CLL) or after first-line treatment in patients with sufficient bone-marrow reserves; it is usually given by mouth, but can be given by intravenous injection or infusion. Fludarabine is well tolerated but it does cause myelosuppression, which may be cumulative. Immunosuppression is also common (see panel on cladribine and fludarabine below), and co-trimoxazole is used to prevent pneumocystis infection. Immune-mediated haemolytic anaemia, thrombocytopenia, and neutropenia are less common side-effects.

The Scottish Medicines Consortium (p. 4) has advised (October 2006) that fludarabine cannot be used for restricted use for the treatment of advanced B-cell chronic lymphocytic leukaemia (CLL) in patients with sufficient bone marrow reserves. First-line treatment should only be initiated in patients with advanced disease, Rai stages III/IV (Binet stage C), or Rai stages I/II (Binet stage A/B) who have disease-related symptoms or evidence of progressive disease.

Fludarabine was recommended for the first-line treatment of chronic lymphocytic leukaemia (September 2001) for the first-time treatment of chronic lymphocytic leukaemia in patients who have either failed, or are intolerant of, first-line chemotherapy, and who would otherwise have received combination chemotherapy of either:
- cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP)
- cyclophosphamide, doxorubicin and prednisolone (CAP) or
- cyclophosphamide, vincristine and prednisolone (CVP)

Intravenous fludarabine should only be used when oral fludarabine is contra-indicated.

www.nice.org.uk/TA29

Fludarabine and fludarabine have a potent and prolonged immunosuppressive effect. Patients treated with fludarabine or fludarabine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

Fludarabine is given by intravenous infusion for the treatment of hairy cell leukaemia. It is also given for chronic lymphocytic leukaemia in patients who have failed to respond to standard regimens containing an alkylating agent. Cladribine produces severe myelosuppression, with neutropenia, anaemia, and thrombocytopenia; haemolytic anaemia has also been reported. High doses of cladribine have been associated with acute renal failure and severe neurotoxicity.

Cladribine is given by intravenous infusion for the treatment of hairy cell leukaemia. It is also given for chronic lymphocytic leukaemia in patients who have failed to respond to standard regimens containing an alkylating agent. Cladribine produces severe myelosuppression, with neutropenia, anaemia, and thrombocytopenia; haemolytic anaemia has also been reported. High doses of cladribine have been associated with acute renal failure and severe neurotoxicity.

Clofarabine is licensed for the treatment of acute lymphoblastic leukaemia in patients aged 1 to 21 years who have relapsed or are refractory after receiving at least two previous regimens. It is given by intravenous infusion.

Nelarabine is licensed for the treatment of T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in patients who have relapsed or who are refractory after receiving at least two previous regimens. It is given by intravenous infusion. Neurotoxicity is common with nelarabine and close monitoring for neurological adverse events is strongly recommended—discontinue if neurotoxicity occurs.

The Spanish Medicines Consortium (p. 4) has advised (March 2008) that the use of nelarabine (Atriance®) within NHS Scotland is restricted to bridging treatment before stem cell transplantation.
Gemcitabine is used intravenously; it is given alone for elderly patients or for palliative treatment, or with cisplatin as first-line treatment for locally advanced or metastatic non-small cell lung cancer. It is also used in the treatment of locally advanced or metastatic pancreatic cancer (see NICE guidance below). Combined with cisplatin, gemcitabine is also licensed for the treatment of advanced bladder cancer. Combined with carboplatin, gemcitabine is licensed for the treatment of locally advanced or metastatic epithelial ovarian cancer which has relapsed after a recurrence-free interval of at least 6 months following previous platinum-based therapy. Combined with paclitaxel, gemcitabine is also licensed for the treatment of metastatic breast cancer which has relapsed after previous chemotherapy including an anthracycline (see NICE guidance below). Gemcitabine is generally well tolerated but it can cause mild gastrointestinal side-effects, musculoskeletal pain, influenza-like symptoms and rashes; renal impairment and pulmonary toxicity have also been reported. Haemolytic uraemic syndrome has been reported rarely and gemcitabine should be discontinued if signs of microangiopathic haemolytic anaemia occur.

The Scottish Medicines Consortium has advised (November 2006) that gemcitabine is accepted for restricted use for the treatment of metastatic breast cancer, which has relapsed following previous chemotherapy including an anthracycline (unless contra-indicated).

NICE guidance
Gemcitabine for the treatment of metastatic breast cancer (January 2007)
Gemcitabine, in combination with paclitaxel, is an option for the treatment of metastatic breast cancer only when docetaxel monotherapy or docetaxel plus capcitabine are also considered appropriate.

www.nice.org.uk/TA116

NICE guidance
Gemcitabine for the treatment of pancreatic cancer (May 2001)
Gemcitabine is an option for first-line chemotherapy for patients with advanced or metastatic adenocarcinoma of the pancreas and a Karnofsky score of at least 50 [Karnofsky score is a measure of the ability to perform ordinary tasks]. Gemcitabine is not recommended for patients who can have potentially curative surgery. There is insufficient evidence about its use for second-line treatment of pancreatic adenocarcinoma.

www.nice.org.uk/TA25

Fluorouracil is used to treat a number of solid tumours, including gastro-intestinal tract cancers and breast cancer. It is commonly used with folic acid in advanced colorectal cancer. It may also be used topically for the treatment of locally advanced or metastatic non-small cell lung cancer. It may also be used for the treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (see NICE guidance, below), and as monotherapy for its second-line treatment (but see NICE guidance, below). It is also licensed as monotherapy for maintenance treatment in locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following platinum-based chemotherapy (but see NICE guidance, below). Pemetrexed is given by intravenous infusion.

The Scottish Medicines Consortium (p. 4) has advised (July 2005) that pemetrexed (Alimta®) in combination with cisplatin is accepted for restricted use within NHS Scotland for previously untreated patients with stage III/IV unresectable malignant pleural mesothelioma.

The Scottish Medicines Consortium (p. 4) has advised (January 2010) that pemetrexed (Alimta®) is accepted for restricted use within NHS Scotland in combination with cisplatin for the first-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology; it is restricted to patients in whom the histology of the tumour has been confirmed as adenocarcinoma or large cell carcinoma.

The Scottish Medicines Consortium (p. 4) has advised (August 2008) that pemetrexed (Alimta®) is accepted for restricted use within NHS Scotland as monotherapy for the second-line treatment of locally advanced or metastatic non-small cell lung cancer without predominantly squamous cell histology; it is restricted for use in patients with good performance status who would otherwise be eligible for docetaxel treatment.

NICE guidance
Aflibercept in combination with irinotecan and fluorouracil-based therapy for treating metastatic colorectal cancer that has progressed following prior oxaliplatin-based chemotherapy
See p. 584

Pemetrexed inhibits thymidylate transferase and other folate-dependent enzymes. It is licensed for use with cisplatin for the treatment of unresectable malignant pleural mesothelioma which has not previously been treated with chemotherapy (see NICE guidance, below). Pemetrexed is also licensed for use with cisplatin for the first-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (see NICE guidance, below), and as monotherapy for its second-line treatment (but see NICE guidance, below). It is also licensed as monotherapy for maintenance treatment in locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following platinum-based chemotherapy (but see NICE guidance, below). Pemetrexed is given by intravenous infusion.

The Scottish Medicines Consortium (p. 4) has advised (July 2005) that pemetrexed (Alimta®) in combination with cisplatin is accepted for restricted use within NHS Scotland for previously untreated patients with stage III/IV unresectable malignant pleural mesothelioma.

NICE guidance
Pemetrexed for the treatment of malignant pleural mesothelioma (January 2008)
Pemetrexed is an option for the treatment of malignant pleural mesothelioma only in patients who have a WHO performance status of 0 or 1 [WHO performance status is a measure of the ability to perform ordinary tasks], who are considered to have advanced disease and for whom surgical resection is considered inappropriate.

www.nice.org.uk/TA135
Raltitrexed, a thymidylate synthase inhibitor, is given intravenously for palliation of advanced colorectal cancer when fluorouracil and folinic acid cannot be used. It is probably of similar efficacy to fluorouracil. Raltitrexed is given at various stages of treatment in short-term cycles. Raltitrexed has a lower incidence of gastrointestinal side-effects than mercaptopurine. Long-term therapy is no longer recommended because of the high risk of liver toxicity; treatment with tioguanine should be discontinued if liver toxicity develops.

Mercaptopurine is used as maintenance therapy for the acute leukaemias and in the management of ulcerative colitis and Crohn’s disease (section 1.5.3). Azathioprine, which is metabolised to mercaptopurine, is generally used as an immunosuppressant (section 8.2.1 and section 10.1.3). The dose of both drugs should be reduced if the patient is receiving allopurinol since it interferes with their metabolism.

Decitabine is a pyrimidine analogue and is licensed for the treatment of newly diagnosed acute myeloid leukaemia in patients over 65 years who are not candidates for standard induction chemotherapy. Decitabine is recommended in adults who are not eligible for haematopoietic stem cell transplantation as an option for the treatment of intermediate-2 and high-risk myelodysplastic syndromes, chronic myelomonocytic leukaemia, and acute myeloid leukaemia, in adults who are not eligible for haematopoietic stem cell transplantation.

AZACITIDINE

Indications see notes above

Cautions see section 8.1; history of severe congestive heart failure, unstable cardiac or pulmonary disease—consider cardiopulmonary assessment before and during treatment; monitor for bleeding; monitor liver function tests, serum creatinine, and serum bicarbonate before initiation of treatment and before each treatment cycle; monitor full blood count before initiation of treatment, before each treatment cycle, and as clinically indicated

Contra-indications advanced malignant hepatic tumour

Hepatic impairment caution in severe impairment

Renal impairment delay next treatment cycle if serum-creatinine or blood urea nitrogen greater than twice baseline value and above the upper level of normal until values return to normal or baseline, and then reduce dose by 50% on the next treatment cycle. Reduce dose by 50% on the next treatment cycle if serum-bicarbonate concentration less than 20 mmol/litre

Pregnancy avoid (toxicity in animal studies); manufacturer advises effective contraception during and for 3 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564
8.1.3 Antimetabolites

Breastfeeding
discontinue breast-feeding

Side-effects see section 8.1; also gastro-intestinal disturbances (including diarrhea, constipation, abdominal pain, and dyspepsia), anorexia; hypertension, hypotension; dyspnoea, pneumonia; anxiety, insomnia, dizziness, headache, drowsiness; haematuria; hypokalaemia; arthralgia, myalgia; injection-site reactions, rash, haematoma; haemorrhage (including cerebral haemorrhage); less commonly hypersensitivity reactions (including anaphylactic reactions); hepatic coma, hepatic failure and renal failure also reported

Dose
- See Doses, p. 563

Vidaza® (Celgene) Injection, powder for reconstitution, azacitidine, net price 100-mg vial = £21.00

CAPECITABINE

Indications see notes above

Cautions see section 8.1; history of significant cardiovascular disease, arrhythmias, angina pectoris; monitor plasma-calcium concentration; diabetes mellitus; electrolyte disturbances; nervous system disease; monitor for symptoms of severe skin reactions (including Stevens-Johnson syndrome and toxic epidermal necrolysis)—permanently discontinue treatment immediately if symptoms occur; monitor for symptoms of hand-foot syndrome—interrupt treatment if significant syndrome occurs and refer to product literature; diarrhoea or dehydration—consult product literature for guidance on dose modification and treatment interruption; monitor for eye disorders (including keratitis and corneal disorders); interactions: Appendix 1 (fluorouracil)

Contra-indications dihydropyrimidine dehydrogenase deficiency

Hepatic impairment manufacturer advises monitor liver function in mild to moderate impairment—consult product literature for guidance on treatment interruption; avoid in severe impairment

Renal impairment reduce starting dose of 1.25 g/m² to 75% if creatinine clearance 30–50 mL/minute; avoid if creatinine clearance less than 30 mL/minute

Pregnancy avoid (teratogenic in animal studies); see also Pregnancy and Reproductive Function, p. 564

Breastfeeding discontinue breast-feeding

Side-effects see section 8.1; also see product literature

Dose
- Stage III colon cancer, adjuvant following surgery, monotherapy, ADULT over 18 years 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval; recommended duration of treatment 6 months
- Stage III colon cancer, adjuvant following surgery, in combination therapy, ADULT over 18 years 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval; recommended duration of treatment 6 months
- Metastatic colorectal cancer, monotherapy, ADULT over 18 years 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval
- Metastatic colorectal cancer, in combination therapy, ADULT over 18 years 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval
- Advanced gastric cancer, in combination with a platinum-based regimen, ADULT over 18 years 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval or 625 mg/m² twice daily given continuously
- Locally advanced or metastatic breast cancer, monotherapy or in combination with docetaxel, ADULT over 18 years 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval

Note Adjust dose according to tolerability—consult product literature

Capecitabine (Non-proprietary) Tablets, capcitabine 150 mg, net price 60-tab pack = £30.00; 500 mg, 120-tab pack = £240.00. Label: 21

Xeloda® (Roche) Tablets, f/c, peach, capcitabine 150 mg, net price 60-tab pack = £40.02; 500 mg, 120-tab pack = £265.55. Label: 21

CLADRIBINE

Indications see notes above and under preparations

Cautions see section 8.1 and notes above; use irradiated blood only; interactions: Appendix 1 (cladribine)

Hepatic impairment regular monitoring recommended

Renal impairment regular monitoring recommended

Pregnancy avoid (teratogenic in animal studies); manufacturer advises that men should not father children during and for 6 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breastfeeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; also constipation, diarrhoea, abdominal pain, flatulence; oedema, tachycardia; cough, dyspnoea; dizziness, insomnia, anxiety, headache; chills, asthenia, malaise; myalgia, arthralgia; sweating, rash, pruritus, and purpura

Dose
- See Doses, p. 563

Leustatin® (Janssen) Concentrate for intravenous infusion, cladribine 1 mg/mL, net price 10-mL vial = £159.70
For hairy cell leukaemia and for B-cell chronic lymphocytic leukaemia in patients who have failed to respond to standard regimens containing an alkylating agent

Lilact® (Lipomed) Injection (for subcutaneous use only—no dilution required), cladribine 2 mg/mL, net price 5-mL vial = £165.00
For hairy cell leukaemia

CLOFARABINE

Indications see notes above

Cautions see section 8.1 and notes above; cardiac disease

Hepatic impairment manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

Renal impairment manufacturer advises caution in mild to moderate impairment; avoid in severe impairment
8.1.3 Antimetabolites

**Breast-feeding**
do not breast-feed

**Side-effects**
see section 8.1; also nausea, double vision, rash, pruritus, hand-foot (desquamative) syndrome, sweating; pancreatitis also reported

**Breast-feeding**
do not breast-feed

**Side-effects**
see section 8.1; also diarrhea, headache, epistaxis; less commonly acute febrile neutrophilic dermatosis

**Dose**
- See Doses, p. 563

**FLUDARABINE PHOSPHATE**

**Indications**
see notes above

**Cautions**
see section 8.1; avoid contact with skin, eyes, or mucous membranes; monitor for signs of haemolysis; monitor for neurological toxicity; worsening of existing and increased susceptibility to infection; patients over 65 years—assess creatinine clearance before treatment initiation; interactions: Appendix 1 (fludarabine)

**Contra-indications**
haemolytic anaemia

**Renal impairment**
dose by up to 50% if creatinine clearance 30–70 mL/minute; avoid if creatinine clearance less than 30 mL/minute

**Pregnancy**
avoid (embralyotic and teratogenic in animal studies); manufacturer advises effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding**
do not breast-feed

**Side-effects**
see section 8.1 and notes above; also diarrhoea, abdominal pain, jaundice, tachycardia, flushing, hypotension, pericardial effusion, oedema, haemorrhage, dyspnoea, cough, anxiety, agitation, dizziness, drowsiness, headache, paraesthesia, peripheral neuropathy, restlessness; haematuria, arthralgia, myalgia, rash, pruritus, hand-foot (desquamative) syndrome, sweating; pancreatitis also reported

**Dose**
- See Doses, p. 563

**FLUDARABINE PHOSPHATE**

**Indications**
see notes above

**Cautions**
see section 8.1 and notes above; monitor for signs of haemolysis; monitor for neurological toxicity; worsening of existing and increased susceptibility to infection; patients over 65 years—assess creatinine clearance before treatment initiation; interactions: Appendix 1 (fludarabine)

**Contra-indications**
haemolytic anaemia

**Renal impairment**
dose by up to 50% if creatinine clearance 30–70 mL/minute; avoid if creatinine clearance less than 30 mL/minute

**Pregnancy**
avoid (embralyotic and teratogenic in animal studies); manufacturer advises effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding**
do not breast-feed

**Side-effects**
see section 8.1 and notes above; also diarrhoea, anorexia, oedema, pneumonia, cough, peripheral neuropathy, chills, fever, malaise, weakness, myelodysplastic syndrome, acute myeloid leukaemia, visual disturbances, rash; less commonly pulmonary toxicity (including pneumonitis and fibrosis), confusion, haemorrhage, autoimmune disorder; rarely heart failure, arrhythmia, coma, seizures, agitation, skin cancer, optic neuropathy, blindness, Stevens-Johnson syndrome, toxic epidermal necrolysis; also reported haemorrhagic cystitis

**Dose**
- By mouth, ADULT 40 mg/m² for 5 days every 28 days usually for 6 cycles
- By intravenous injection or infusion, consult product literature

**FLUDARABINE PHOSPHATE**

**Indications**
see notes above

**Cautions**
see section 8.1 and notes above; avoid contact with skin, eyes, or mucous membranes; monitor for signs of haemolysis; monitor for neurological toxicity; worsening of existing and increased susceptibility to infection; patients over 65 years—assess creatinine clearance before treatment initiation; interactions: Appendix 1 (fludarabine)

**Contra-indications**
haemolytic anaemia

**Renal impairment**
dose by up to 50% if creatinine clearance 30–70 mL/minute; avoid if creatinine clearance less than 30 mL/minute

**Pregnancy**
avoid (embralyotic and teratogenic in animal studies); manufacturer advises effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding**
do not breast-feed

**Side-effects**
see section 8.1 and notes above; also diarrhoea, anorexia, oedema, pneumonia, cough, peripheral neuropathy, chills, fever, malaise, weakness, myelodysplastic syndrome, acute myeloid leukaemia, visual disturbances, rash; less commonly pulmonary toxicity (including pneumonitis and fibrosis), confusion, haemorrhage, autoimmune disorder; rarely heart failure, arrhythmia, coma, seizures, agitation, skin cancer, optic neuropathy, blindness, Stevens-Johnson syndrome, toxic epidermal necrolysis; also reported haemorrhagic cystitis

**Dose**
- By mouth, ADULT 40 mg/m² for 5 days every 28 days usually for 6 cycles
- By intravenous injection or infusion, consult product literature

**FLUDARABINE PHOSPHATE**

**Indications**
see notes above

**Cautions**
see section 8.1 and notes above; avoid contact with skin, eyes, or mucous membranes; monitor for signs of haemolysis; monitor for neurological toxicity; worsening of existing and increased susceptibility to infection; patients over 65 years—assess creatinine clearance before treatment initiation; interactions: Appendix 1 (fludarabine)
8 Malignant disease and immunosuppression

Hepatic impairment manufacturer advises caution

Pregnancy avoid (teratogenic); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; also local irritation with topical preparation

Dose

By intravenous injection or infusion or by intrarterial infusion, consult product literature

Fluorouracil (Non-proprietary) (Non-proprietary)

Injection, fluorouracil (as sodium salt) 25 mg/mL, net price 10-mL vial = £5.20, 20-mL vial = £6.40, 100-mL vial = £32.00, 50 mg/mL, 10-mL vial = £6.40, 20-mL vial = £12.80, 50-mL vial = £32.00, 100-mL vial = £64.00

GEMCITABINE

Indications see notes above

Cautions see section 8.1 and notes above; interactions: Appendix 1 (gemcitabine)

Hepatic impairment manufacturer advises caution

Renal impairment manufacturer advises caution

Pregnancy avoid (teratogenic in animal studies); manufacturer advises effective contraception during treatment; men must avoid fathering a child during and for 6 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

By See Doses, p. 563

Gemcitabine (Non-proprietary)

Injection, powder for reconstitution, gemcitabine (as hydrochloride), net price 200-mg vial = £29.80, 1-g vial = £154.62, 1.5-g vial = £213.93, 2-g vial = £324.00

Gemzar® (Lilly) (Non-proprietary)

Injection, powder for reconstitution, gemcitabine (as hydrochloride), net price 200-mg vial = £32.55, 1-g vial = £162.76

MERCAPTOPURINE (6-Mercaptopurine)

Indications acute leukaemias and chronic myeloid leukaemia; inflammatory bowel disease [unlicensed indication] (section 1.5.3)

Cautions see section 8.1 and notes above; thiopurine methyltransferase status (see section 8.2.1); monitor liver function; interactions: Appendix 1 (mercapto-purine)

Hepatic impairment may need dose reduction

Renal impairment reduce dose

Pregnancy avoid (teratogenic); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; also hepatotoxicity, anorexia; rarely transient oligospermia, pancreatitis; very rarely intestinal ulceration, lymphoma

Dose

See preparations below

Important Pre-Nethol® tablets and Xaluprine® oral suspension are not bioequivalent, haematological monitoring is advised when switching formulations

Fluorouracil

Important Note that the above dose is a weekly dose.

By intravenous injection or infusion, or by intrarterial infusion, or by intramuscular injection, or intrathecal administration, consult product literature

Methotrexate (Non-proprietary)

Injection, methotrexate (as sodium salt) 2.5 mg/mL, net price 2-mL vial = £4.80; 25 mg/mL, 2-mL vial = £2.62, 20-mL vial = £25.07

Injection, methotrexate 100 mg/mL (not for intrathecal use), net price 10-mL vial = £78.00, 50-mL vial = £380.00

Oral preparations

Section 10.1.3

Nelarabine

Indications see notes above

Cautions see section 8.1 and notes above; previous or concurrent intrathecal chemotherapy or craniospinal irradiation (increased risk of neurotoxicity)

Driving May affect performance of skilled tasks (e.g. driving)

Pregnancy avoid (toxicity in animal studies); manufacturer advises effective contraception during and for at least 3 months after treatment in men and women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding
8.1.3 Antimetabolites

Side-effects see section 8.1; also abdominal pain, constipation, taste disturbance, anorexia, diarrhoea; hypotension, oedema; pleural effusion, wheezing, dyspnoea, cough; confusion, seizures, amnesia, drowsiness, peripheral neurological disorders, hypothesia, paraesthesia, ataxia, demyelination, tremor, dizziness, headache, asthenia, fatigue; pyrexia; electrolyte disturbances; blurred vision; muscle weakness, myalgia, arthralgia; benign and malignant tumours also reported.

Dose
- See Doses, p. 563

Alimta® (LSU) \^ intravenous infusion, nelarabine 5 mg/mL, net price 50-mL vial = £222.00

Electrolytes Na⁺ 3.75 mmol/vial

PEMETREXED

Indications see notes above

Cautions see section 8.1 and notes above; history of cardiovascular disease; diabetes; prophylactic folic acid and vitamin B₁₂ supplementation required (consult product literature); concomitant nephrotoxic drugs including non-steroidal anti-inflammatory drugs (consult product literature); interactions: Appendix 1 (pemetrexed)

Renal impairment manufacturer advises avoid if creatinine clearance less than 45 mL/minute—no information available

Pregnancy avoid (toxicity in animal studies); manufacturer advises effective contraception during treatment; men must avoid fathering a child during and for 6 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also gastro-intestinal disturbances; oedema; neuropathy; dehydration; conjunctivitis, increased lacrimation; skin disorders; less commonly colitis, arrhythmias, and interstitial pneumonitis; rarely hepatitis; peripheral ischaemia, acute renal failure, Stevens-Johnson syndrome and toxic epidermal necrolysis also reported

Dose
- See Doses, p. 563

Atriance® (GSK) \^ intravenous, nelarabine 5 mg/mL, net price 50-mL vial = £222.00

Electrolytes Na⁺ 3.75 mmol/vial

RALTITREXED

Indications see notes above

Cautions see section 8.1 and notes above; interactions: Appendix 1 (raltitrexed)

Hepatic impairment caution in mild to moderate impairment; avoid if severe

Renal impairment reduce dose and increase dosing interval if creatinine clearance less than 65 mL/minute (consult product literature); avoid if creatinine clearance less than 25 mL/minute

Pregnancy pregnancy must be excluded before treatment; ensure effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose
- See Doses, p. 563

Tomudex® (Hospira) \^ injection, powder for reconstitution, raltitrexed, net price 2-mg vial = £175.00

TEGFUR WITH GIMERACIL AND OTERACIL

Indications see notes above

Cautions see section 8.1; interactions: Appendix 1 (fluorouracil)

Contra-indications dihydropyrimidine dehydrogenase deficiency

Renal impairment reduce dose if creatinine clearance 30–50 mL/minute—consult product literature; manufacturer advises avoid if creatinine clearance less than 30 mL/minute

Pregnancy avoid; manufacturer advises effective contraception during and for up to 6 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also ocular toxicity and neuropathy

Dose
- See Doses, p. 563

Teysono® (Nordic) \^ capsules, tegafur 15 mg, gimeracil 4.35 mg, oteracil (as potassium salt) 15.8 mg, net price 84-cap pack = £279.72; Label: 23

Capsules, tegafur 20 mg, gimeracil 5.8 mg, oteracil (as potassium salt) 15.8 mg, net price 84-cap pack = £248.40; Label: 23

Note The Scottish Medicines Consortium (p. 4) has advised that tegafur with gimeracil and oteracil (Teysono®) is accepted for restricted use within NHS Scotland for the treatment of advanced gastric cancer, when given in combination with cisplatin, in patients who are unsuitable for an anthracycline, fluorouracil and platinum triplet first-line regimen.

TIOGUANINE

(Thioguanine)

Indications see notes above

Cautions see section 8.1 and notes above; thiopurine methyltransferase status (see section 8.2.1); monitor liver function weekly—discontinue if liver toxicity develops; interactions: Appendix 1 (tioguanine)

Hepatic impairment reduce dose

Renal impairment reduce dose

Pregnancy avoid (teratogenicity reported when men receiving tioguanine have fathered children); ensure effective contraception during treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also stomatitis and diarrhea

Dose
- 100–200 mg/m² daily

Lanvis® (Alkopharma) \^ tablets, yellow, scored, tioguanine 40 mg, net price 25-tab pack = £103.54
Vinca alkaloids and etoposide

The vinca alkaloids, vinblastine, vincristine, and vindesine, are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer). Vinorelbine is a semi-synthetic vinca alkaloid; it is given intravenously or orally for the treatment of advanced breast cancer and for advanced non-small cell lung cancer. For the role of vinorelbine in the treatment of breast cancer, see section 8.3.4.1. Vinflunine is licensed as monotherapy for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract after failure of a platinum-containing regimen.

NICE guidance
Vinflunine for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract (January 2013)
Vinflunine is not recommended for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract that has progressed after treatment with platinum-based chemotherapy.

www.nice.org.uk/TA272

Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a limiting side-effect of vincristine; it occurs less often with vindesine, vinblastine, vinorelbine, and vinflunine. Patients with neuropathy commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; otoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced. Motor weakness can also occur, and increasing motor weakness calls for dose reduction or discontinuation of these drugs. Recovery from neurotoxic effects is usually slow but complete.

Myelosuppression is a dose-limiting side-effect of vinblastine, vindesine, vinorelbine, and vinflunine; vincristine causes negligible myelosuppression. The vinca alkaloids cause severe local irritation and care must be taken to avoid extravasation. Severe bronchospasm has been reported following administration of the vinca alkaloids (more commonly when used in combination with mitomycin-C).

Important
Vinblastine, vincristine, vindesine, vinflunine, and vinorelbine injections are for intravenous administration only. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.
The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers treated in an adult or adolescent unit should receive their vinca alkaloid dose in a syringe.

Etoposide may be given orally or by slow intravenous infusion; the oral dose being double the intravenous dose. A preparation containing etoposide phosphate can be given by intravenous injection or infusion. Etoposide is usually given daily for 3–5 days and courses should not be repeated more frequently than at intervals of 21 days. It has particularly useful activity in small cell carcinoma of the bronchus, the lymphomas, and testicular cancer.

ETOPOSIDE
Indications see notes above
Cautions see section 8.1 and notes above; interactions: Appendix 1 (etoposide)
Contra-indications see section 8.1 and notes above
Hepatic impairment avoid in severe impairment
Renal impairment consider dose reduction—consult local treatment protocol for details
Pregnancy avoid (teratogenic in animal studies); see also Pregnancy and Reproductive Function, p. 564
Breast-feeding discontinue breast-feeding
Side-effects see section 8.1; irritant to tissues
Dose
• By mouth, 120–240 mg/m² daily for 5 days
• By intravenous infusion, consult product literature

Etoposide (Non-proprietary)
Concentrate for intravenous infusion, etoposide 20 mg/mL, net price 5-mL vial = £12.15, 10-mL vial = £29.00, 25-mL vial = £60.75
Brands include Eposin®

Etopophos® (Bristol-Myers Squibb) Injection, powder for reconstitution, etoposide (as phosphate), net price 100-mg vial = £26.17 (hosp. only)

Vepesid® (Bristol-Myers Squibb) Injection, both pink, etoposide 50 mg, net price 20 = £99.82; 100 mg, 10-cap pack = £87.23 (hosp. only), Label: 23

VINCBLASTINE SULFATE
Indications see notes above
Cautions see section 8.1 and notes above; caution in handling; interactions: Appendix 1 (vinblastine)
Contra-indications see section 8.1 and notes above
Important Intrathecal injection contra-indicated
Hepatic impairment dose reduction may be necessary
Pregnancy avoid (limited experience suggests fetal harm; teratogenic in animal studies); see also Pregnancy and Reproductive Function, p. 564
Breast-feeding discontinue breast-feeding
Side-effects see section 8.1 and notes above; irritant to tissues
Dose
• See Doses, p. 563

Vinblastine (Non-proprietary)
Injection, vinblastine sulfate 1 mg/mL, net price 10-mL vial = £13.09
Velbe® (Genus)
Injection, powder for reconstitution, vinblastine sulfate, net price 10-mg amp = £14.15

VINCRIStINE SULFATE
Indications see notes above
Cautions see section 8.1 and notes above; neuromuscular disease; caution in handling; interactions: Appendix 1 (vincristine)
Contra-indications see section 8.1 and notes above
Important Intrathecal injection contra-indicated
8.1.5 Other antineoplastic drugs

**Vindesine Sulfate**

**Indications**
- See notes above

**Cautions**
- See section 8.1 and notes above; neurovascular disease; in handling: interactions: Appendix 1 (vindesine)

**Contra-indications**
- See section 8.1 and notes above

**Hepatic impairment**
- Dose reduction may be necessary

**Pregnancy**
- Avoid (teratogenic in animal studies); see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding**
- Discontinue breast-feeding

**Side-effects**
- See section 8.1 and notes above; also rarely inappropriate secretion of antidiuretic hormone; diarrhoea, intestinal necrosis, paralytic ileus, seizures, urinary retention, muscle wasting, and eye disorders also reported; irritant to tissues

**Dose**
- See Doses, p. 563

**Vindesine** (Non-proprietary) **(Genus)**

**Injection**
- Vindesine sulfate 1 mg/mL, net price 1-mL vial = £10.92; 2-mL vial = £21.17; 5-mL vial = £44.16

**Oncovin** (Genus) **(Genus)**

**Injection**
- Vindesine sulfate 1 mg/mL, net price 1-mL vial = £14.18; 2-mL vial = £28.05

**Vinorelbine**

**Indications**
- See notes above

**Cautions**
- See section 8.1 and notes above; ischaemic heart disease; in handling: interactions: Appendix 1 (vinorelbine)

**Contra-indications**
- See section 8.1 and notes above; with capsules previous significant surgical resection of stomach or small bowel, long-term oxygen therapy, concurrent radiotherapy if treating the liver

**Hepatic impairment**
- Reduce oral dose in moderate impairment, avoid oral use in severe impairment; reduce intravenous dose in severe impairment; consult product literature

**Pregnancy**
- Avoid unless essential (teratogenicity, and fetal loss in animal studies); manufacturer advises effective contraception during and for 3 months after treatment; men must avoid fathering a child during and for at least 3 months after treatment; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding**
- Discontinue breast-feeding

**Side-effects**
- See section 8.1 and notes above; also rarely pancreatitis; hyponatraemia and inappropriate secretion of antidiuretic hormone also reported; irritant to tissues

**Dose**
- **By mouth.** 60 mg/m² once weekly for 3 weeks, increased if tolerated to 80 mg/m² once weekly; max. 160 mg once weekly
- **By intravenous injection or infusion,** consult product literature

**Vinorelbine** (Non-proprietary) **(Genus)**

**Concentrate for intravenous infusion**
- Vinorelbine (as tartrate) 10 mg/mL, net price 1-mL vial = £29.00, 5-mL vial = £139.00

**Navelbine** (Fabre) **(Genus)**

**Concentrate for intravenous infusion**
- Vinorelbine (as tartrate) 10 mg/mL, net price 1-mL vial = £29.00, 5-mL vial = £139.00

**Capsules**
- Vinorelbine (as tartrate) 20 mg (brown), net price 1-cap pack = £43.98; 30 mg (pink), 1-cap pack = £65.98; 80 mg (yellow), 1-cap pack = £175.92. Label: 21, 25

**Vinflunine**

**Indications**
- See notes above

**Cautions**
- See section 8.1 and notes above; cardiovascular disease; QT-interval prolongation (avoid hypokalaemia or concomitant use of drugs that prolong QT-interval); interactions: Appendix 1 (vinflunine)

**Contra-indications**
- See notes above

**Hepatic impairment**
- Reduce dose—consult product literature

**Renal impairment**
- Reduce dose if creatinine clearance less than 60 mL/minute—consult product literature

**Pregnancy**
- Avoid unless essential—teratogenicity and embryotoxicity in animal studies; manufacturer advises effective contraception during and for up to 3 months after treatment; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding**
- Discontinue breast-feeding

**Side-effects**
- See section 8.1 and notes above; also anorexia, diarrhoea, dyspessa; tachycardia, hypertension, hypotension, thrombosis; oedema; insomnia; fatigue; dehydration; cutaneous reactions, sweating; less commonly increased weight, myocardial infarction, renal failure; also reported QT-interval prolongation, inappropriate anti-diuretic hormone secretion, blurred vision

**Hepatic impairment**
- Dose reduction may be necessary

**Pregnancy**
- Avoid (teratogenicity and fetal loss in animal studies); see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding**
- Discontinue breast-feeding

**Side-effects**
- See section 8.1 and notes above; also rarely inappropriate secretion of antidiuretic hormone; diarrhoea, intestinal necrosis, paralytic ileus, seizures, urinary retention, muscle wasting, and eye disorders also reported; irritant to tissues

**Dose**
- See Doses, p. 563

**Javlor** (Fabre) **(Genus)**

**Concentrate for intravenous infusion**
- Vinflunine (as ditatrate) 25 mg/mL, net price 2-mL vial = £212.50, 10-mL vial = £1062.50

**Vinflunine**

**Indications**
- See notes above

**Cautions**
- See section 8.1 and notes above; ischaemic heart disease; in handling: interactions: Appendix 1 (vinflunine)

**Contra-indications**
- See section 8.1 and notes above; with capsules previous significant surgical resection of stomach or small bowel, long-term oxygen therapy, concurrent radiotherapy if treating the liver

**Hepatic impairment**
- Reduce oral dose in moderate impairment, avoid oral use in severe impairment; reduce intravenous dose in severe impairment; consult product literature

**Pregnancy**
- Avoid unless essential (teratogenicity, and fetal loss in animal studies); manufacturer advises effective contraception during and for 3 months after treatment; men must avoid fathering a child during and for at least 3 months after treatment; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding**
- Discontinue breast-feeding

**Side-effects**
- See section 8.1 and notes above; also rarely pancreatitis; hyponatraemia and inappropriate secretion of antidiuretic hormone also reported; irritant to tissues

**Dose**
- **By mouth.** 60 mg/m² once weekly for 3 weeks, increased if tolerated to 80 mg/m² once weekly; max. 160 mg once weekly
- **By intravenous injection or infusion,** consult product literature

**Vinorelbine** (Non-proprietary) **(Genus)**

**Concentrate for intravenous infusion**
- Vinorelbine (as tartrate) 10 mg/mL, net price 1-mL vial = £29.00, 5-mL vial = £139.00

**Navelbine** (Fabre) **(Genus)**

**Concentrate for intravenous infusion**
- Vinorelbine (as tartrate) 10 mg/mL, net price 1-mL vial = £29.75, 5-mL vial = £139.98

**Capsules**
- Vinorelbine (as tartrate) 20 mg (brown), net price 1-cap pack = £43.98; 30 mg (pink), 1-cap pack = £65.98; 80 mg (yellow), 1-cap pack = £175.92. Label: 21, 25

**Vinflunine**

**Indications**
- See notes above

**Cautions**
- See section 8.1 and notes above; ischaemic heart disease; in handling: interactions: Appendix 1 (vinflunine)

**Contra-indications**
- See section 8.1 and notes above; with capsules previous significant surgical resection of stomach or small bowel, long-term oxygen therapy, concurrent radiotherapy if treating the liver

**Hepatic impairment**
- Reduce oral dose in moderate impairment, avoid oral use in severe impairment; reduce intravenous dose in severe impairment; consult product literature

**Pregnancy**
- Avoid unless essential (teratogenicity, and fetal loss in animal studies); manufacturer advises effective contraception during and for 3 months after treatment; men must avoid fathering a child during and for at least 3 months after treatment; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding**
- Discontinue breast-feeding

**Side-effects**
- See section 8.1 and notes above; also rarely pancreatitis; hyponatraemia and inappropriate secretion of antidiuretic hormone also reported; irritant to tissues

**Dose**
- **By mouth.** 60 mg/m² once weekly for 3 weeks, increased if tolerated to 80 mg/m² once weekly; max. 160 mg once weekly
- **By intravenous injection or infusion,** consult product literature

**Vinorelbine** (Non-proprietary) **(Genus)**

**Concentrate for intravenous infusion**
- Vinorelbine (as tartrate) 10 mg/mL, net price 1-mL vial = £29.00, 5-mL vial = £139.00

**Navelbine** (Fabre) **(Genus)**

**Concentrate for intravenous infusion**
- Vinorelbine (as tartrate) 10 mg/mL, net price 1-mL vial = £29.75, 5-mL vial = £139.98

**Capsules**
- Vinorelbine (as tartrate) 20 mg (brown), net price 1-cap pack = £43.98; 30 mg (pink), 1-cap pack = £65.98; 80 mg (yellow), 1-cap pack = £175.92. Label: 21, 25

8.1.5 Other antineoplastic drugs

**Afiblercept**

Afiblercept is a recombinant fusion protein that acts as a soluble decoy receptor and binds to vascular endothelial growth factors A and B (VEGF-A, VEGF-B) and placental growth factor (PIGF). Afiblercept inhibits the activation of VEGF receptors and the proliferation of endothelial cells, thereby inhibiting the growth of new vessels
that supply tumours with oxygen and nutrients. It is licensed in combination with irinotecan, fluorouracil and folic acid (FOLFIRI) chemotherapy, in adults with metastatic colorectal cancer that is resistant to, or has progressed after, an oxaliplatin-containing regimen. An intravitreal preparation is available for the treatment of neovascular age-related macular degeneration, see section 11.8.2.

NICE guidance
Aflibercept in combination with irinotecan and fluorouracil-based therapy for treating metastatic colorectal cancer that has progressed following prior oxaliplatin-based chemotherapy (March 2014)
Aflibercept in combination with irinotecan and fluorouracil-based therapy is not recommended within its marketing authorisation for treating metastatic colorectal cancer that is resistant to or has progressed after an oxaliplatin-containing regimen.

www.nice.org.uk/TA307

**AFLIBERCEPT**

**Indications** see notes above

**Cautions** see section 8.1; increased risk of hypertension; monitor blood pressure at initiation and at least fortnightly during treatment (do not initiate treatment if pre-existing hypertension is uncontrolled)—consult product literature if hypertension develops during treatment; history of cardiovascular disease (may be exacerbated by hypertension); increased risk of haemorrhage (including fatal events); monitor for signs of gastro-intestinal perforation (discontinue if perforation develops); risk of fistula formation (discontinue if fistula develops); risk of thrombocytopenia and neutropenia (including febrile neutropenia and neutropenic infection)—monitor full blood count, including differential count and platelets at baseline and before each treatment cycle; increased risk of thromboembolic events (consult product literature if event occurs); nephrotic syndrome and thrombotic microangiopathy reported—monitor for proteinuria before each treatment administration (consult product literature if symptoms develop); monitor for signs and symptoms of diarrhoea and dehydration, particularly in elderly—consult product literature if severe diarrhoea occurs; may impair wound healing— withhold treatment for at least 4 weeks before elective surgery and for at least 4 weeks after major surgery, or until wound fully healed; monitor for posterior reversible encephalopathy syndrome (unexplained fever, dyspnoea, tachycardia, vasculitis, hypotension, oedema, pulmonary infiltrates, with or without leucocytosis—treat immediately); nephrotic syndrome and thrombotic microangiopathy—monitor for signs and symptoms of proteinuria before each treatment (discontinue if proteinuria develops); risk of proteinuria, thrombocytopenia and neutropenia (including febrile neutropenia), thrombocytopenia, dehydration, proteinuria, hand-foot syndrome, skin hyperpigmentation; less commonly gastro-intestinal perforation, posterior reversible encephalopathy syndrome, nephrotic syndrome, thrombotic microangiopathy, impaired wound healing.

**Dose**
• See Doses, p. 563

**Zaltrap® (Sanofi-Aventis)** (infravitreal)

Concentrate for intravenous infusion, aflibercept 25 mg/mL, net price 4-mL (100-mg) vial = £295.65, 8-mL (200-mg) vial = £591.30

**Arsenic trioxide**

Arsenic trioxide is licensed for acute promyelocytic leukaemia in patients who have relapsed or failed to respond to previous treatment with a retinoid and chemotherapy.

**ARSENIC TRIOXIDE**

**Indications** see notes above

**Cautions** see section 8.1; correct electrolyte abnormalities before treatment; ECG required before and during treatment—consult product literature; avoid concomitant administration with drugs causing QT interval prolongation, hypokalaemia, and hypermagnesaemia; previous treatment with anthracyclines (increased risk of QT interval prolongation); interactions: Appendix 1 (arsenic trioxide)

**Hepatic impairment** manufacturer advises caution—limited information available

**Renal impairment** manufacturer advises caution—limited information available

**Pregnancy** avoid (teratogenic and embryotoxic in animal studies); manufacturer advises effective contraception during treatment in men and women; see also Pregnancy and Reproductive function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** diarrhoea, stomatitis, abdominal pain, decreased appetite, weight loss, fistula, aphthous stomatitis, haemorrhoids, proctalgia, toothache, hypertension, haemorrhage (including nasal, rectal and gastro-intestinal), thromboembolic events (arterial and venous), dyspnoea, ophthalmic pain, rhinorrhoea, nasopharyngitis, dysphonia, headache, malaise, infection, sepsis, urinary tract infection, leucopenia, neutropenia (including febrile neutropenia), thrombocytopenia, dehydration, proteinuria, hand-foot syndrome, skin hyperpigmentation; less commonly gastro-intestinal perforation, posterior reversible encephalopathy syndrome, nephrotic syndrome, thrombotic microangiopathy, impaired wound healing.

**Dose**
• See Doses, p. 563

Trisenox® (TEVA UK)

Concentrate for intravenous infusion, arsenic trioxide 1 mg/mL, net price 10-mL amp = £292.00
Bevacizumab

Bevacizumab is a monoclonal antibody that inhibits vascular endothelial growth factor. It is licensed for the treatment of metastatic colorectal cancer in combination with fluoropyrimidine-based chemotherapy (but see NICE guidance below). It is also licensed for first-line treatment of metastatic breast cancer in combination with paclitaxel, or with capecitabine when treatment with other chemotherapy, including taxanes or anthracyclines is not appropriate; patients who have received adjuvant taxane or anthracycline-containing regimens in the previous 12 months should not be treated with bevacizumab in combination with capecitabine. Bevacizumab is also licensed for advanced or metastatic renal cell carcinoma in combination with interferon alfa-2a (but see NICE Guidance, p. 599).

Bevacizumab, in combination with platinum-based chemotherapy, is licensed for first-line treatment of unresectable advanced, metastatic or recurrent non-small cell lung cancer other than predominantly squamous cell histology. It is also licensed, in combination with carboplatin and paclitaxel, for the first-line treatment of advanced (FIGO stages IIIB, IIIC and IV) epithelial ovarian, fallopian tube, or primary peritoneal cancer and, in combination with carboplatin and gemcitabine, for first recurrence of platinum-sensitive epithelial ovarian, fallopian tube, or primary peritoneal cancer in patients who have not been treated previously with bevacizumab or other drugs that target vascular endothelial growth factor. Bevacizumab is given by intravenous infusion.

MHRA/CHM advice

Bevacizumab and sunitinib: risk of osteonecrosis of the jaw (January 2011)

Treatment with bevacizumab or sunitinib may be a risk factor for the development of osteonecrosis of the jaw.

Patients treated with bevacizumab or sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk.

Dental examination and appropriate preventive dentistry should be considered before treatment with bevacizumab or sunitinib.

If possible, invasive dental procedures should be avoided in patients treated with bevacizumab or sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

NICE guidance

Bevacizumab in combination with cetuximab for the treatment of metastatic colorectal cancer (January 2007)

Bevacizumab in combination with fluorouracil plus folinic acid, with or without irinotecan, is not recommended for the first-line treatment of metastatic colorectal cancer; see also NICE guidance Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy, p. 589.

www.nice.org.uk/TA218

NICE guidance

Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine for the treatment of metastatic colorectal cancer (December 2010)

Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine is not recommended for the treatment of metastatic colorectal cancer.

www.nice.org.uk/TA212

NICE guidance

Bevacizumab in combination with a taxane for the first-line treatment of metastatic breast cancer (February 2011)

Bevacizumab in combination with a taxane is not recommended for the first-line treatment of metastatic breast cancer.

www.nice.org.uk/TA214

NICE guidance

Bevacizumab in combination with capecitabine for the first-line treatment of metastatic breast cancer (August 2012)

Bevacizumab in combinations with capecitabine is not recommended within its marketing authorisation for the first-line treatment of metastatic breast cancer, that is, when treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate, or when taxanes or anthracyclines have been used as part of adjuvant treatment in the previous 12 months.

www.nice.org.uk/TA263

NICE guidance

Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013)

Bevacizumab in combination with paclitaxel and carboplatin is not recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer).

www.nice.org.uk/TA284
Malignant disease and immunosuppression

8.1.5 Other antineoplastic drugs

BEVACIZUMAB

Indications see notes above

Cautions see section 8.1; intra-abdominal inflammation (risk of gastro-intestinal perforation and gall bladder perforation); increased risk of fistulas (discontinue permanently if tracheo-oesophageal or grade 4 fistula develops); withhold treatment for elective surgery and avoid for at least 28 days after major surgery or until wound fully healed; monitor for necrotising fasciitis (usually secondary to wound healing complications, gastro-intestinal perforation or fistula formation)—discontinue and initiate treatment promptly; history of hypertension (increased risk of proteinuria—discontinue if nephrotic syndrome); uncontrolled hypertension; monitor blood pressure; history of arterial thromboembolism; history of cardiovascular disease (increased risk of cardiovascular events especially in the elderly); monitor for congestive heart failure; increased risk of haemorrhage (especially tumour-associated haemorrhage); monitor for posterior reversible encephalopathy syndrome (presenting as seizures, headache, altered mental status, visual disturbance or cortical blindness, with or without hypertension); untreated CNS metastases; consider dental check-up before initiating treatment (risk of osteonecrosis of the jaw, see MHRA/CHM advice, above); interactions: Appendix 1 (bevacizumab)

Pregnancy avoid—toxicity in animal studies; effective contraception required during and for at least 6 months after treatment in women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding manufacturer advises avoid breast-feeding during and for at least 6 months after treatment

Side-effects see section 8.1; gastro-intestinal perforation, gall bladder perforation, intestinal obstruction, abdominal pain, diarrhoea, constipation, taste disturbances; mucocutaneous bleeding, haemorrhage, hypoxia, arterial thromboembolism, congestive heart failure, syncope, supraventricular tachycardia, hypertension (see also Cautions); dyspnoea, rhinitis; anorexia, drowsiness, headache, peripheral neuropathy, asthenia, lethargy, dysarthria, posterior reversible encephalopathy syndrome; pyrexia; infection; proteinuria; dehydation, neutropenia, thrombocytopenia, anaemia; eye disorders; fistulas, pulmonary hypertension, impaired wound healing, necrotising fasciitis (see Cautions) osteonecrosis of the jaw (see MHRA/CHM advice, above), hand-foot syndrome, exfoliative dermatitis, dry skin, skin discoloration, and hypersensitivity reactions (including flushing, rash, hypotension, chest pain, and rigors) also reported

Dose See Doses, p. 563

Avastin® (Roche) Concentrate for intravenous infusion, bevacizumab 25 mg/mL, net price 4-mL (100-mg) vial = £242.66, 16-mL (400-mg) vial = £924.40

BEXAROTENE

Indications skin manifestations of cutaneous T-cell lymphoma refractory to previous systemic treatment

Cautions see section 8.1 and notes above; hyperlipidaemia (avoid if uncontrolled), hypothyroidism (avoid if uncontrolled); hypersensitivity to retinoids; avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (bexarotene)

Contra-indications see section 8.1 and notes above; history of pancreatitis, hypervitaminosis A

Hepatic impairment avoid

Pregnancy avoid; manufacturer advises effective contraception during and for at least 1 month after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose • Initially 300 mg/m² daily as a single dose with a meal; adjust dose according to response

Targetin® (TEVA UK) Capsules, bexarotene 75 mg in a liquid suspension, net price 100-cap pack = £937.50

Bortezomib

Bortezomib, a proteasome inhibitor, is licensed as monotherapy, or in combination with pegylated liposomal doxorubicin or dexamethasone, for the treatment of multiple myeloma that has progressed despite the use of at least one therapy, and where the patient has already had, or is unable to have, haematopoietic stem cell transplantation. It is also licensed for use in combination with melphalan and prednisolone for the treatment of previously untreated multiple myeloma in patients who are not eligible for high-dose chemotherapy with haematopoietic stem cell transplantation. Bortezomib is also licensed in combination with dexamethasone, or with dexamethasone and thalidomide, for the induction treatment of previously untreated multiple myeloma in patients who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation.
with haematopoietic stem cell transplantation. Bortezomib is given by intravenous or subcutaneous injection.

**Important**

Bortezomib injection is for **intravenous or subcutaneous administration** only. Inadvertent intrathecal administration with fatal outcome has been reported.

The Scottish Medicines Consortium, p. 4 has advised (December 2013) that bortezomib (Velcade®) is accepted for restricted use within NHS Scotland in combination with dexamethasone and thalidomide for the induction treatment of adults with previously untreated multiple myeloma who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation.

**NICE guidance**

**Bortezomib monotherapy for relapsed multiple myeloma (October 2007)**

Bortezomib monotherapy is an option for the treatment of progressive multiple myeloma in patients who are at first relapse having received one prior therapy and who have undergone, or are unsuitable for, bone-marrow transplantation, under the following circumstances:

- the response to bortezomib is measured using serum M protein after a maximum of four cycles of treatment, and treatment is continued only in patients who have a reduction in serum M protein of 50% or more (where serum M protein is not measurable, an appropriate alternative biochemical measure of response should be used) and
- the manufacturer rebates the full cost of bortezomib if there is an inadequate response (as defined above) after four cycles of treatment.

www.nice.org.uk/TA129

**NICE guidance**

**Bortezomib and thalidomide for the first-line treatment of multiple myeloma (July 2011)**

Bortezomib in combination with an alkylating drug and a corticosteroid is recommended as an option for the first-line treatment of multiple myeloma if:

- high-dose chemotherapy with stem cell transplantation is considered inappropriate and
- the person is unable to tolerate or has contra-indications to thalidomide.

For thalidomide see under Lenalidomide and thalidomide, p. 631

www.nice.org.uk/TA228

**NICE guidance**

**Bortezomib for induction therapy in multiple myeloma before high-dose chemotherapy and autologous stem cell transplantation (April 2014)**

Bortezomib is recommended as an option within its marketing authorisation, in combination with dexamethasone, or with dexamethasone and thalidomide, for the induction treatment of adults with previously untreated multiple myeloma, who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation.

www.nice.org.uk/TA311

**BORTEZOMIB**

**Indications**

see notes above

**Cautions**

see section 8.1; cardiovascular disease; pulmonary disease (chest X-ray recommended before treatment—discontinue if interstitial lung disease develops); consider antiviral prophylaxis for herpes zoster infection; risk factors for seizures; amyloidosis; history of syncope and concurrent use of medication which may cause hypotension; dehydration; risk of neuropathy—consult product literature; monitor blood-glucose concentration in patients on oral anti-diabetics; monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological signs or symptoms)—discontinue treatment if diagnosed; **Interactions:** Appendix 1 (bortezomib)

**Contra-indications**

acute diffuse infiltrative pulmonary disease; pericardial disease

**Hepatic impairment**

reduce dose in moderate to severe impairment—consult product literature

**Renal impairment**

no information available for creatinine clearance less than 20 mL/minute/1.73 m²

**Pregnancy**

manufacturer advises effective contraception during and for 3 months after treatment in men or women—toxicity in animal studies; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding**

discontinue breast-feeding

**Side-effects**

see section 8.1; also diarrhoea, constipation (cases of ileus reported), hypotension, dyspnoea, fatigue, pyrexia, peripheral neuropathy (including sensory), headache, paraesthesia, decreased appetite, herpes zoster (including reactivation), myalgia, rash; less commonly pulmonary disorders, seizures, posterior reversible encephalopathy syndrome (discontinue treatment); rarely autonomic neuropathy; very rarely progressive multifocal leucoencephalopathy syndrome; also consult product literature

**Dose**

- See Doses, p. 563

**Velcade®** (Janssen)[TM]

Injection, powder for reconstitution, bortezomib (as mannitol boronic ester), net price 3.5-mg vial = £762.38

**Brentuximab vedotin**

**Brentuximab vedotin** is licensed for the treatment of relapsed or refractory CD-30 positive Hodgkin’s disease following autologous stem cell transplant or following at least two prior therapies, when autologous stem cell transplant or multi-agent chemotherapy is not a treatment option. It is also licensed for relapsed or refractory systemic anaplastic large cell lymphoma.

**BRENTUXIMAB VEDOTIN**

**Indications**

see notes above

**Cautions**

see section 8.1; rapidly proliferating tumours and high tumour burden—risk of tumour lysis syndrome; elevated BMI—risk of hyperglycaemia; monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological, cognitive or behavioural signs or symptoms); monitor for new or worsening abdominal pain—investigate and withhold treatment if acute
Cetuximab is licensed for the treatment of wild-type RAS metastatic colorectal cancer in patients with tumours expressing epidermal growth factor receptor, as combination therapy, or as monotherapy if oxaliplatin- and irinotecan-based therapy has failed or if irinotecan is not tolerated (but see NICE guidance below). Evidence of non-mutated (wild-type) RAS status (at exons 2, 3 and 4 of KRAS and NRAS) is required before cetuximab is initiated for the treatment of metastatic colorectal cancer, and should be determined by an experienced laboratory using a validated test method. The combination of cetuximab with oxaliplatin-containing chemotherapy is contra-indicated in patients with metastatic colorectal cancer who have mutant or unknown RAS status. Cetuximab is also licensed, in combination with radiotherapy, for the treatment of locally advanced squamous cell cancer of the head and neck and in combination with platinum-based chemotherapy for recurrent or metastatic squamous cell cancer of the head and neck (see NICE guidance below).

Cetuximab is given by intravenous infusion. Patients must receive an antihistamine and a corticosteroid at least one hour before infusion. Resuscitation facilities should be available and treatment should be initiated by a specialist.

The Scottish Medicines Consortium (p. 4) has advised (January 2010) that cetuximab (Erbitux®) is accepted for restricted use within NHS Scotland, in combination with chemotherapy, for metastatic colorectal cancer in patients with tumours expressing epidermal growth factor; it is restricted to patients with non-resectable metastases confined to the liver, who have not previously received chemotherapy.

Cetuximab in combination with radiotherapy is an option for the treatment of locally advanced squamous cell cancer of the head and neck in patients who have a Karnofsky performance status of 90% or greater and when all forms of platinum-based chemoradiotherapy treatment are contra-indicated.
8.1.5 Other antineoplastic drugs

**Cetuximab**

*Indications*  
see notes above and product literature

*Caution*  
cardiovascular disease, cardiopulmonary disease, pulmonary disease—discontinue if interstitial lung disease; history of, or risk factors for keratitis, ulcerative keratitis (including contact lens use), or severe dry eye (see also MHRA/CHM advice above)

*Contra-indications*  
*RAS* mutated colorectal tumours  
(or if *RAS* tumour status unknown)

*Pregnancy*  
use only if potential benefit outweighs risk—no information available; see also Pregnancy and Reproductive Function, p. 564

*Breast-feeding*  
avoid breast-feeding during and for 2 months after treatment—no information available

*Side-effects*  
infusion-related reactions including dyspnoea, dizziness, chills, fever, and severe (sometimes fatal) hypersensitivity reactions (possibly delayed onset) such as rash, urticaria, bronchospasm, hypotension, hypertension, and shock; nausea, vomiting, diarrhoea, headache, aseptic meningitis, hypomagnesaemia, hypocalcaemia, conjunctivitis, blepharitis, keratitis, skin reactions including acne, pruritus, dry skin, desquamation, hypertrichosis, nail disorders; very rarely Stevens-Johnson syndrome, toxic epidermal necrolysis

*Dose*  
• See Doses, p. 563

**Erbitux** (Merck Serono)  

*Intravenous infusion*, cetuximab 5 mg/mL, net price 20-mL vial = £178.10, 100-mL vial = £890.50

**Crisantaspase**

*Crisantaspase* is the enzyme asparaginase produced by *Erwinia chrysanthemi*. It is given intramuscularly, intravenously, or subcutaneously almost exclusively in acute lymphoblastic leukaemia. Facilities for the management of anaphylaxis should be available.

*Indications*  
see notes above

*Caution*  
see notes above

*Contra-indications*  
history of pancreatitis related to asparaginase therapy

*Pregnancy*  
avoid; see also Pregnancy and Reproductive Function, p. 564

*Breast-feeding*  
discontinue breast-feeding

*Side-effects*  
see section 8.1; also liver dysfunction, coagulation disorders; lethargy, drowsiness, confusion, dizziness, neuropathy, convulsions, headache; less commonly changes in blood lipids, anaphylaxis, hyperglycaemia; rarely CNS depression; very rarely myalgia; abdominal pain and hypertension also reported

*Dose*  
• See Doses, p. 563

**Erwinase®** (EUSA Pharma)  

*Injection*, powder for reconstitution, crisantaspase, net price 10 000-unit vial = £613.00

**Dacarbazine and temozolomide**

Dacarbazine is used to treat metastatic melanoma and, in combination therapy, soft tissue sarcomas. It is also a component of a commonly used combination for...
Hodgkin’s disease (ABVD—doxorubicin [previously Adriamycin\textsuperscript{TM}], bleomycin, vinblastine, and dacarbazine). It is given intravenously. The predominant side-effects are myelosuppression and severe nausea and vomiting.

**Temozolomide** is structurally related to dacarbazine. It is given by mouth and is licensed for the treatment of newly diagnosed glioblastoma multiforme in adults (in combination with radiotherapy) and subsequently as monotherapy. It is also licensed for second-line treatment of malignant glioma in adults and children over 3 years.

**NICE guidance**
*Temozolomide for the treatment of recurrent malignant glioma (brain cancer) (April 2001)*
Temozolomide may be considered for the treatment of recurrent glioma, which has not responded to first-line chemotherapy.

www.nice.org.uk/TA23

**NICE guidance**
*Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007)*
Temozolomide is an option for the treatment of newly diagnosed glioblastoma multiforme in patients with a WHO performance status of 0 or 1. Carmustine implants are an option for the treatment of newly diagnosed high-grade (Grade 3 or 4) glioma only for patients in whom at least 90% of the tumour has been resected. Carmustine implants should only be used within specialist centres.

www.nice.org.uk/TA121

**Dacarbazine**

**Indications** see notes above

**Cautions** see section 8.1; caution in handling; interactions: Appendix 1 (dacarbazine)

**Hepatic impairment** dose reduction may be required in combined renal and hepatic impairment; avoid in severe impairment

**Renal impairment** dose reduction may be required in combined renal and hepatic impairment; avoid in severe impairment

**Pregnancy** avoid (carcinogenic and teratogenic in animal studies); manufacturer advises adequate contraception during treatment; men should avoid fathering a child during and for at least 6 months after treatment; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and consult product literature

**Dose**
• See Doses, p. 563

**Dacarbazine (Non-proprietary)** \(\text{TM}\)

injection, powder for reconstitution, dacarbazine (as citrate), net price 100-mg vial = £5.05; 200-mg vial = £7.50; 500-mg vial = £16.50; 600-mg vial = £22.50; 1-g vial = £31.80

**Temodal\textsuperscript{(R)} (MSD)** \(\text{Pat}\)

Capsules, temozolomide 5 mg, net price 5-cap pack = £16.00; 20 mg, 5-cap pack = £60.30; 100 mg, 5-cap pack = £320.80; 140 mg, 5-cap pack = £451.40; 180 mg, 5-cap pack = £580.37; 250 mg, 5-cap pack = £806.08. Label: 23, 25

Brands include Temodar\textsuperscript{(R)}

**Temozolomide**

**Indications** see notes above

**Cautions** see section 8.1; *Pneumocystis jirovecii pneumonia*—consult product literature for monitoring and prophylaxis requirements; monitor liver function before treatment initiation, after each treatment cycle and midway through 42-day treatment cycles—consider the balance of benefits and risks of treatment if results are abnormal at any point (fatal liver injury reported); monitor for myelodysplastic syndrome and secondary malignancies; **interactions**: Appendix 1 (temozolomide)

**Hepatic impairment** use with caution in severe impairment—no information available

**Renal impairment** manufacturer advises caution—no information available

**Pregnancy** avoid (teratogenic and embryotoxic in animal studies); manufacturer advises adequate contraception during treatment; men should avoid fathering a child during and for at least 6 months after treatment; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and consult product literature

**Dose**
• Consult product literature; **CHILD** under 3 years not recommended

**Temozolomide** (Non-proprietary) \(\text{Pat}\)

Capsules, temozolomide 5 mg, net price 5-cap pack = £16.00; 20 mg, 5-cap pack = £60.30; 100 mg, 5-cap pack = £320.80; 140 mg, 5-cap pack = £451.40; 180 mg, 5-cap pack = £580.37; 250 mg, 5-cap pack = £806.08. Label: 23, 25

Brands include Temodar\textsuperscript{(R)}

**Temodal\textsuperscript{(R)} (MSD)** \(\text{Pat}\)

Capsules, temozolomide 5 mg (green/white), net price 5-cap pack = £10.59; 20 mg (yellow/white), 5-cap pack = £42.35; 100 mg (pink/white), 5-cap pack = £111.77; 140 mg (blue/white), 5-cap pack = £296.48; 180 mg (orange/white), 5-cap pack = £381.19; 250 mg (white), 5-cap pack = £529.43. Label: 23, 25

**Eribulin**

Eribulin is licensed for the treatment of locally advanced or metastatic breast cancer when the disease has progressed after treatment with at least 2 chemotherapy regimens. Previous therapy should have included an anthracycline and a taxane unless patients were unsuitable for these treatments. It is given intravenously on day 1 and day 8 of a 21-day cycle. It can cause myelosuppression, peripheral neuropathy, and QT-interval prolongation.

**NICE guidance**
**Eribulin for the treatment of locally advanced or metastatic breast cancer (April 2012)**
Eribulin is **not** recommended for the treatment of locally advanced or metastatic breast cancer that has progressed after at least two chemotherapy regimens for advanced disease.

www.nice.org.uk/TA250
Hydroxycarbamide

Hydroxycarbamide is an orally active drug used mainly in the treatment of chronic myeloid leukaemia. It is also licensed for the treatment of cancer of the cervix in conjunction with radiotherapy. It is occasionally used for polycythaemia (the usual treatment is venesection); patients receiving long-term therapy with hydroxycarbamide should be advised to protect skin from sun exposure and should be monitored for secondary malignancies. Myelosuppression, nausea, and skin reactions are the most common toxic effects.

Mitotane

Mitotane is licensed for the symptomatic treatment of advanced or inoperable adrenocortical carcinoma. It selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy (section 6.3.1); the dose of glucocorticoid should be increased in case of shock, trauma, or infection. Gastro-intestinal side-effects such as anorexia, nausea, and vomiting, and endocrine side-effects, such as hypogonadism and thyroid disorders, are very common with mitotane; neurotoxicity occurs in many patients.
Malignant disease and immunosuppression

**MITOTANE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; risk of accumulation in overweight patients; monitor plasma-mitotane concentration—consult product literature; avoid in acute porphyria (section 9.5.2).

**Interactions** Appendix 1 (mitotane)

**Driving** CNS effects may affect performance of skilled tasks (e.g. driving)

**Counselling** Warn patient to contact doctor immediately if injury, infection, or illness occurs (because of risk of acute adrenal insufficiency)

**Hepatic impairment** manufacturer advises caution in mild to moderate impairment—monitoring of plasma-mitotane concentration recommended; avoid in severe impairment

**Renal impairment** manufacturer advises caution in mild to moderate impairment—monitoring of plasma-mitotane concentration recommended; avoid in severe impairment

**Pregnancy** manufacturer advises avoid—women of childbearing age should use effective contraception during and after treatment; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above; also gastro-intestinal disturbances (including nausea, vomiting, diarrhoea, epigastric discomfort), anorexia, liver disorders; hypercholesterolaemia, hypertriglyceridaemia; ataxia, confusion, asthenia, myasthenia, paraesthesia, drowsiness, neuropathy, cognitive impairment, movement disorder, dizziness, headache; gynaecomastia; prolonged bleeding time, leucopenia, thrombocytopenia, anaemia; rash; rarely hypersalivation, hypertension, postural hypotension, flushing, pyrexia, haematuria, proteinuria, haemorrhagic cystitis, hypouricaemia, visual disturbances, and ocular disorders

**Dose**

- **ADULT** over 18 years, initially 2–3 g daily, (up to 6 g daily in severe illness) in 2–3 divided doses, adjusted according to plasma-mitotane concentration; reduce dose or interrupt treatment if signs of toxicity; discontinue if inadequate response after 3 months

**Lysodren**® (HRA Pharma) Tablets, scored, mitotane 500 mg, net price 100-tab pack = £590.97. Label: 2, 10, 21, counselling, driving, adrenal suppression

**PANITUMUMAB**

**Panitumumab**

Panitumumab is a monoclonal antibody that binds to the epidermal growth factor receptor (EGFR). It is indicated as combination therapy for the treatment of non-mutated *RAS* metastatic colorectal cancer, or as monotherapy after failure of fluoropyrimidine-, oxaliplatin-, and irinotecan-containing chemotherapy regimens. Evidence of non-mutated *RAS* status (at exons 2, 3 and 4 of *KRAS* and *NRAS*) is required before panitumumab treatment is initiated, and should be determined by an experienced laboratory using a validated test method.

The combination of panitumumab with oxaliplatin-containing chemotherapy is contra-indicated in patients with mutant *RAS* metastatic colorectal cancer or for whom *RAS* status is unknown. Panitumumab is given by intravenous infusion.

**MHRA/CHM advice**

**Severe skin reactions**

Severe skin reactions have been reported very commonly in patients treated with panitumumab. Patients receiving panitumumab who have severe skin reactions or develop worsening skin reactions should be monitored for the development of inflammatory or infectious sequelae (including cellulitis, sepsis, and necrotising fasciitis). Appropriate treatment should be promptly initiated and panitumumab withheld or discontinued.

**NICE guidance**

Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) See p. 589

**Pentostatin**

**Pentostatin** is active in hairy cell leukaemia. It is given intravenously on alternate weeks and can induce prolonged complete remission. It can cause myelosuppres-
sion, immunosuppression, and a number of other side-effects that may be severe. Treatment should be withheld in patients who develop a severe rash, and withheld or discontinued in patients showing signs of neurotoxicity. Its use should be confined to specialist centres.

### Pertuzumab

**Indications**
- see section 8.1 and notes above

**Cautions**
- see section 8.1 and notes above; interactions: Appendix 1 (pentostatin)

**Hepatic impairment**
- manufacturer advises caution—limited information available

**Renal impairment**
- avoid if creatinine clearance less than 60 mL/minute

**Pregnancy**
- avoid (teratogenic in animal studies); manufacturer advises that men should not father children during and for 6 months after treatment; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding**
- discontinue breast-feeding

**Side-effects**
- see section 8.1 and notes above

**Dose**
- See Doses, p. 563

**Perjeta** (Roche) 😱
- Concentrate for intravenous infusion, pertuzumab 30 mg/mL, net price 14-mL vial = £2395.00

### Platinum compounds

**Carboplatin** is widely used in the treatment of advanced ovarian cancer and lung cancer (particularly the small cell type). It is given intravenously. The dose of carboplatin is determined according to renal function rather than body surface area. Carboplatin can be given on an outpatient basis and is better tolerated than cisplatin; nausea and vomiting are reduced in severity and nephrotoxicity, neurotoxicity, and ototoxicity are much less of a problem than with cisplatin. It is, however, more myelosuppressive than cisplatin.

**Cisplatin** is used alone or in combination for the treatment of testicular, lung, cervical, bladder, head and neck, and ovarian cancer (but carboplatin is preferred for ovarian cancer). It is given intravenously. Cisplatin requires intensive intravenous hydration and treatment may be complicated by severe nausea and vomiting. Cisplatin is toxic, causing nephrotoxicity (monitoring of renal function is essential), ototoxicity, peripheral neuropathy, hypomagnesaemia and myelosuppression. It is, however, increasingly given in a day-case setting.

**Oxaliplatin** is licensed in combination with fluorouracil and folic acid, for the treatment of metastatic colorectal cancer and as adjuvant treatment of colon cancer after resection of the primary tumour; it is given intravenously. Neurotoxic side-effects (including sensory peripheral neuropathy) are dose limiting. Other side-effects include gastro-intestinal disturbances, ototoxicity, myelosuppression and transient vision loss (reversible on discontinuation). If unexplained respiratory symptoms occur, oxaliplatin should be discontinued until investigations exclude interstitial lung disease and pulmonary fibrosis. Posterior reversible encephalopathy syndrome has also been reported in patients receiving oxaliplatin combination chemotherapy.

### NICE guidance

**Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005)**

A combination of fluorouracil and folinic acid with either irinotecan or oxaliplatin are options for first-line treatment for advanced colorectal cancer. Irinotecan alone or fluorouracil and folinic acid with oxaliplatin are options for patients who require further treatment subsequently. Raltitrexed is not recommended for the treatment of advanced colorectal cancer. Its use should be confined to clinical studies.

Malignant disease and immunosuppression

8 Malignant disease and immunosuppression

[8 Malignant disease and immunosuppression

[Non-proprietary]

Carboplatin

See Doses, p. 563.

Dose

See section 8.1 and notes above; discontinue breast-feeding.

Breast-feeding

Avoid (teratogenic and embryotoxic in animal studies); see also Pregnancy and Reproductive Function, p. 564.

Breast-feeding

Discontinue breast-feeding.

Indications

See section 8.1 and notes above.

Dose

See Doses, p. 563.

Cisplatin (Non-proprietary)

Injection, cisplatin 1 mg/mL, net price 10-mL vial = £5.90, 50-mL vial = £24.50, 100-mL vial = £50.22.

Injection, powder for reconstitution, cisplatin, net price 50-mg vial = £17.00.

Oxaliplatin

Indications

Metastatic colorectal cancer in combination with fluorouracil and folinic acid; colon cancer—see notes above.

Cautions

See section 8.1 and notes above; interactions: Appendix 1 (platinum compounds).

Contra-indications

See section 8.1; peripheral neuropathy with functional impairment.

Renal impairment

Reduce dose in mild to moderate impairment (consult product literature); avoid if creatinine clearance less than 30 mL/minute.

Pregnancy

Manufacturer advises avoid—toxicity in animal studies; effective contraception required during and for 4 months after treatment in women and 6 months after treatment in men; see also Pregnancy and Reproductive Function, p. 564.

Breast-feeding

Discontinue breast-feeding.

Side-effects

See section 8.1 and notes above.

Dose

See Doses, p. 563.

Oxaliplatin (Non-proprietary)

Injection, powder for reconstitution, oxaliplatin, net price 50-mg vial = £150.00, 100-mg vial = £299.50.

Concentrate for intravenous infusion, oxaliplatin 5 mg/mL, net price 10-mL vial = £155.00, 20-mL vial = £311.00, 40-mL vial = £622.38.

Porfimer sodium and temoporfin

Porfimer sodium and temoporfin are used in the photodynamic treatment of various tumours. The drugs accumulate in malignant tissue and are activated by laser light to produce a cytotoxic effect.

Porfimer sodium is licensed for photodynamic therapy of non-small cell lung cancer and obstructing oesophageal cancer. Temoporfin is licensed for photodynamic therapy of advanced head and neck cancer.

Porfimer sodium

Indications

Non-small cell lung cancer; oesophageal cancer; see notes above.

Cautions

See section 8.1; avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 30 days.

Porfimer SODIUM

Indications

Non-small cell lung cancer; oesophageal cancer; see notes above.

Cautions

See section 8.1; avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 30 days.
Contra-indications  see section 8.1; tracheo-oesophageal or broncho-oesophageal fistula; acute porphyria (section 9.8.2)

Hepatic impairment  avoid in severe impairment

Pregnancy  manufacturer advises avoid unless essential

Breast-feeding  no information available—manufacturer advises avoid

Side-effects  see section 8.1; photosensitivity (see Cautions above—sunscreens offer no protection); constipation

Dose
● See Doses, p. 563

Photofrin® (pinnacle) Inj
Injection, powder for reconstitution, porfimer sodium, net price 15-mg vial = £154.00; 75-mg vial = £770.00

PROCARBAZINE

Indications  see notes above

Cautions  see section 8.1 and notes above; cardiovascular or cerebrovascular disease; phaeochromocytoma; epilepsy; interactions: Appendix 1 (procarbazine)

Contra-indications  pre-existing severe leucopenia or thrombocytopenia

Hepatic impairment  caution in mild to moderate impairment; avoid in severe impairment

Renal impairment  caution in mild to moderate impairment; avoid in severe impairment

Pregnancy  avoid (teratogenic in animal studies and isolated reports in humans); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding  discontinue breast-feeding

Side-effects  see section 8.1 and notes above; loss of appetite; also reported jaundice, hypersensitivity rash (discontinue treatment)

Dose
● See Doses, p. 563

Procarbazine (Non-proprietary) Capsules, procarbazine (as hydrochloride) 50 mg, net price 50-cap pack = £249.50. Label: 4

8.1.5 Other antineoplastic drugs

Protein kinase inhibitors

Afatinib is a protein kinase inhibitor licensed for the treatment of locally advanced or metastatic non-small cell lung cancer with activating epidermal growth factor receptor (EGFR) mutations, in patients who have not previously been treated with an EGFR tyrosine kinase inhibitor.

NICE guidance

Afatinib for treating epidermal growth factor receptor mutation-positive locally advanced or metastatic non-small-cell lung cancer (April 2014)

Afatinib is recommended as an option, within its marketing authorisation, for treating locally advanced or metastatic non-small-cell lung cancer in adults:
● whose tumour tests positive for the epidermal growth factor receptor tyrosine kinase (EGFR-TK) mutation, and
● who have not previously had an EGFR-TK inhibitor, and
● if the manufacturer provides afatinib with the discount agreed in the patient access scheme.

Axitinib, a tyrosine kinase inhibitor, is licensed for the treatment of advanced renal cell carcinoma following failure of previous treatment with sunitinib or a cytokine (aldesleukin or interferon alfa).

Bosutinib is licensed for the treatment of chronic, accelerated and blast phase Philadelphia chromosome-positive chronic myeloid leukemia, in those previously treated with one or more tyrosine kinase inhibitors, and for whom imatinib, nilotinib and dasatinib are not clinically appropriate.
NICE guidance
Bosutinib for previously treated chronic myeloid leukaemia (November 2013)
Bosutinib is not recommended within its marketing authorisation for treating Philadelphia-chromosome-positive chronic myeloid leukaemia.
www.nice.org.uk/TA299

Crizotinib, a tyrosine kinase inhibitor, is licensed for previously treated anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer.

NICE guidance
Crizotinib for previously treated non-small-cell lung cancer associated with an anaplastic lymphoma kinase fusion gene (September 2013)
Crizotinib is not recommended within its marketing authorisation, for treating adults with previously treated anaplastic-lymphoma-kinase-positive advanced non-small-cell lung cancer.
www.nice.org.uk/TA296

Dabrafenib is a BRAF kinase inhibitor licensed as monotherapy for the treatment of unresectable or metastatic melanoma with a BRAF V600 mutation; it should not be used in patients with BRAF wild-type melanoma.

Dasatinib, a tyrosine kinase inhibitor, is licensed for the treatment of chronic myeloid leukaemia in those who have resistance to or intolerance of previous therapy, including imatinib. It is also licensed for newly diagnosed Philadelphia chromosome-positive chronic myeloid leukaemia in the chronic phase and for acute lymphoblastic leukaemia (Philadelphia chromosome positive) in those who have resistance to or intolerance of previous therapy.

The Scottish Medicines Consortium (p. 4) has advised (April 2007) that the use of dasatinib (Sprycel®) in NHS Scotland is restricted to patients in the chronic phase of chronic myeloid leukaemia.

NICE guidance
Dasatinib, nilotinib and standard-dose imatinib for the first-line treatment of chronic myeloid leukaemia (April 2012)
Standard-dose imatinib is recommended as an option for the first-line treatment of adults with chronic phase Philadelphia-chromosome-positive chronic myeloid leukaemia (CML); see also NICE guidance Imatinib for chronic myeloid leukaemia (October 2003), p. 598.
Nilotinib is recommended as an option for the first-line treatment of adults with chronic phase Philadelphia-chromosome-positive CML if the manufacturer makes nilotinib available with the discount agreed as part of the patient access scheme.
Dasatinib is not recommended for the first-line treatment of chronic phase Philadelphia-chromosome-positive CML.
www.nice.org.uk/TA251

Erlotinib, a tyrosine kinase inhibitor, is licensed in combination with gemcitabine for the treatment of metastatic pancreatic cancer. It is also licensed for the treatment of locally advanced or metastatic non-small cell lung cancer after failure of previous chemotherapy and as monotherapy for maintenance treatment of locally advanced or metastatic non-small cell lung cancer with stable disease after four cycles of platinum-based chemotherapy.

The Scottish Medicines Consortium (p. 4) has advised (May 2006) that erlotinib (Tarceva®) is accepted for use within NHS Scotland for the treatment of locally advanced or metastatic non-small cell lung cancer, after failure of at least one chemotherapy regimen. Erlotinib is restricted to use in patients who would otherwise be eligible for treatment with docetaxel monotherapy. The Scottish Medicines Consortium (p. 4) has also advised (December 2011) that erlotinib (Tarceva®) is accepted for use within NHS Scotland for the first-line treatment of patients with locally advanced or metastatic non-small cell lung cancer (NSCLC) with epidermal growth factor receptor (EGFR) activating mutations.

NICE guidance
Erlotinib for non-small-cell lung cancer (November 2008)
Erlotinib is recommended, as an alternative to docetaxel, as second-line treatment for locally advanced or metastatic non-small-cell lung cancer after failure of previous chemotherapy, on the basis that it is provided by the manufacturer at an overall treatment cost equal to that of docetaxel. Erlotinib is not recommended in patients for whom docetaxel is unsuitable or as third-line treatment after docetaxel.
www.nice.org.uk/TA162
Everolimus, a protein kinase inhibitor, is licensed for the treatment of advanced renal cell carcinoma when the disease has progressed despite treatment with vascular endothelial growth factor-targeted therapy (see NICE guidance below), and for the treatment of unresectable or metastatic well- or moderately-differentiated neuroendocrine tumours of pancreatic origin. It is licensed for the treatment of subependymal giant cell astrocytoma associated with tuberous sclerosis complex in patients who require therapeutic intervention but are not amenable to surgery, and for renal angio-myolipoma associated with tuberous sclerosis complex in patients at risk of complications, but who do not require immediate surgery. Everolimus is also licensed for the treatment of hormone-receptor-positive, human epidermal growth factor-2 (HER-2) negative advanced breast cancer, in combination with exemestane, in post-menopausal women without symptomatic visceral disease after recurrence or progression following a non-steroidal aromatase inhibitor.

Imatinib, a tyrosine kinase inhibitor, is licensed for the treatment of newly diagnosed chronic myeloid leukaemia where bone marrow transplantation is not considered first-line treatment, and for chronic myeloid leukaemia in chronic phase after failure of interferon alfa, or in accelerated phase, or in blast crisis (see NICE guidance below). It is also licensed for the treatment of c-kit (CD117)-positive unresectable or metastatic malignant gastro-intestinal stromal tumours (GIST), and as adjuvant treatment following resection of c-kit (CD117)-positive GIST, in patients at significant risk of relapse. Imatinib is licensed for the treatment of newly diagnosed acute lymphoblastic leukaemia in combination with other chemotherapy, and as monotherapy for relapsed or refractory acute lymphoblastic leukaemia. Imatinib is also licensed for the treatment of unresectable dermatofibrosarcoma protuberans and for patients with recurrent or metastatic dermatofibrosarcoma protuberans who cannot have surgery. Imatinib is also licensed for the treatment of myelodysplastic/myeloproliferative diseases associated with platelet-derived growth factor receptor gene rearrangement and for the treatment of advanced hypereosinophilic syndrome and chronic eosinophilic leukaemia.

The Scottish Medicines Consortium (p. 4) has advised (March 2002) that imatinib (Glivec®) should be used for chronic myeloid leukaemia only under specialist supervision in accordance with British Society of Haematology guidelines (November 2001). The Scottish Medicines Consortium (p. 4) has also advised (February 2012) that imatinib (Glivec®) is accepted for restricted use within NHS Scotland for the treatment of adult patients who are at significant risk of relapse following resection of a KIT (CD117) positive gastrointestinal

**NICE guidance**

**Erlotinib monotherapy for maintenance treatment of non-small-cell lung cancer (June 2011)**

Erlotinib monotherapy is not recommended for maintenance treatment in people with locally advanced or metastatic non-small-cell lung cancer who have stable disease after platinum-based first-line chemotherapy.

www.nice.org.uk/TA227

**NICE guidance**

**Erlotinib for the first-line treatment of locally advanced or metastatic EGFR-TK mutation-positive non-small-cell lung cancer (June 2012)**

Erlotinib is recommended as an option for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer if:
- they test positive for the epidermal growth factor tyrosine kinase (EGFR-TK) mutation and
- the manufacturer provides erlotinib at the discounted price agreed under the patient access scheme (as revised in 2012).

www.nice.org.uk/TA258

**Gefitinib**

**Gefitinib for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer (July 2010)**

Gefitinib is recommended as an option for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer if the patient tests positive for the epidermal growth receptor tyrosine kinase (EGFR-TK) mutation and the manufacturer provides gefitinib at the fixed price agreed under the patient access scheme.

www.nice.org.uk/TA192

**Imatinib**

**Imatinib for the second-line treatment of advanced renal cell carcinoma (April 2011)**

Everolimus is not recommended for the second-line treatment of advanced renal cell carcinoma.

www.nice.org.uk/TA219

**NICE guidance**

**Erlotinib in combination with exemestane for treating advanced HER2-negative hormone-receptor-positive breast cancer after endocrine therapy (August 2013)**

Everolimus, in combination with exemestane, is not recommended within its marketing authorisation for treating postmenopausal women with advanced human epidermal growth factor receptor 2 (HER2) negative hormone-receptor-positive breast cancer that has recurred or progressed following treatment with a non-steroidal aromatase inhibitor.

www.nice.org.uk/TA295

**NICE guidance**

**Erlotinib monotherapy for maintenance treatment of non-small-cell lung cancer (June 2011)**

Erlotinib monotherapy is not recommended for maintenance treatment in people with locally advanced or metastatic non-small-cell lung cancer who have stable disease after platinum-based first-line chemotherapy.

www.nice.org.uk/TA227

**Gefitinib**

A tyrosine kinase inhibitor, is licensed for the treatment of locally advanced or metastatic non-small-cell lung cancer, in combination with exemestane, in post-menopausal women without symptomatic visceral disease after recurrence or progression following a non-steroidal aromatase inhibitor.
stromal tumour (GIST) and who are at high risk of recurrence following complete resection (according to the Armed Forces Institute of Pathology (AFIP) risk criteria).

**NICE guidance**
Imatinib for chronic myeloid leukaemia (October 2003)
Imatinib is recommended as first-line treatment for Philadelphia-chromosome-positive chronic myeloid leukaemia in the chronic phase and as an option for patients presenting in the accelerated phase or with blast crisis, provided that imatinib has not been used previously.

See also NICE guidance Dasatinib, nilotinib and standard-dose imatinib for the first-line treatment of chronic myeloid leukaemia (April 2012), p. 596 and NICE guidance Dasatinib, high-dose imatinib and nilotinib for the treatment of imatinib-resistant chronic myeloid leukaemia, and dasatinib and nilotinib for people with CML for whom treatment of imatinib has failed because of intolerance (January 2012), p. 596
www.nice.org.uk/TA70

**NICE guidance**
Imatinib for the adjuvant treatment of gastro-intestinal stromal tumours (August 2010)
Imatinib is not recommended for the adjuvant treatment of gastro-intestinal stromal tumours after surgery.
www.nice.org.uk/TA196

**NICE guidance**
Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (October 2004)
Imatinib 400 mg daily is recommended as first-line management of KIT (CD117)-positive unresectable or metastatic, or both, gastro-intestinal stromal tumours. Continued therapy is recommended only if a response to initial treatment [as defined by Southwest Oncology Group criteria available at www.nice.org.uk/TA86] is achieved within 12 weeks. Patients who have responded should be assessed at 12-week intervals. Discontinue if tumour ceases to respond.
www.nice.org.uk/TA86

**NICE guidance**
Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (November 2010)
Imatinib 600 mg daily or 800 mg daily is not recommended for unresectable or metastatic, or both, gastro-intestinal stromal tumours whose disease has progressed after treatment with imatinib 400 mg daily.
www.nice.org.uk/TA209

Lapatinib, a tyrosine kinase inhibitor, is licensed for the treatment of advanced or metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2). It is indicated, in combination with capecitabine, for patients who have had previous treatment with an anthracycline, a taxane, and trastuzumab, or for postmenopausal women in combination with an aromatase inhibitor section 8.3.4.1.

**NICE guidance**
Lapatinib or trastuzumab in combination with an aromatase inhibitor for the first-line treatment of metastatic hormone-receptor-positive breast cancer that overexpresses HER2 (June 2012)
Lapatinib or trastuzumab in combination with an aromatase inhibitor is not recommended for first-line treatment in postmenopausal women of metastatic hormone-receptor-positive breast cancer that overexpresses human epidermal growth factor receptor 2 (HER2).

Postmenopausal women currently receiving lapatinib or trastuzumab in combination with an aromatase inhibitor for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA257

Nilotinib, a tyrosine kinase inhibitor, is licensed for the treatment of newly diagnosed chronic myeloid leukaemia in the chronic phase, and also for patients with chronic or accelerated phase chronic myeloid leukaemia who have resistance to or intolerance of previous therapy, including imatinib.

The Scottish Medicines Consortium (p. 4) has advised (February 2008) that nilotinib (Tasigna®) is accepted for restricted use within NHS Scotland for the treatment of chronic-phase chronic myeloid leukaemia in adults resistant to or intolerant of at least one previous therapy, including imatinib, and (July 2011) for the treatment of adults with newly diagnosed chronic myeloid leukaemia in the chronic phase.

**NICE guidance**
Dasatinib, nilotinib and standard-dose imatinib for the first-line treatment of chronic myeloid leukaemia (April 2012)
See p. 596

**NICE guidance**
Dasatinib, high-dose imatinib and nilotinib for the treatment of imatinib-resistant chronic myeloid leukaemia (CML), and dasatinib and nilotinib for people with CML for whom treatment with imatinib has failed because of intolerance (January 2012)
See p. 596

Pazopanib, a tyrosine kinase inhibitor, is licensed for advanced renal cell carcinoma, as first-line treatment and for patients who have had previous treatment with cytokine therapy for advanced disease. It is also licensed for the treatment of selective subtypes of advanced soft tissue sarcoma (consult product literature for details).

The Scottish Medicines Consortium (p. 4) has advised (February 2011) that pazopanib (Votrient®) is accepted for restricted use within NHS Scotland for the first-line treatment of advanced renal cell carcinoma and (December 2012) is not recommended for use within NHS Scotland for the treatment of selective subtypes of advanced soft tissue sarcoma in patients who have
received prior chemotherapy for metastatic disease, or who have progressed within 12 months after neoadjuvant therapy.

**NICE guidance**

**Pazopanib for the first-line treatment of advanced renal cell carcinoma (updated August 2013)**

Pazopanib is recommended as a first-line treatment option for people with advanced renal cell carcinoma:
- who have not received prior cytokine therapy and have an Eastern Cooperative Oncology Group performance status of 0 or 1 and
- if the manufacturer provides pazopanib at the discounted price agreed under the patient access scheme.

www.nice.org.uk/TA215

**Ponatinib** is licensed for the treatment of chronic, accelerated, or blast phase chronic myeloid leukaemia in patients who have the T315I mutation or who have resistance to or intolerance of dasatinib or nilotinib, and for whom subsequent treatment with imatinib is not clinically appropriate. It is also licensed for the treatment of Philadelphia chromosome-positive acute lymphoblastic leukaemia in patients who have the T315I mutation or who have resistance to or intolerance of dasatinib, and for whom subsequent treatment with imatinib is not clinically appropriate.

**Regorafenib**, an inhibitor of several protein kinases, is licensed for the treatment of metastatic colorectal cancer in patients who have previously been treated with, or who are unsuitable for, standard treatment including fluoropyrimidine-based chemotherapy, a vascular endothelial growth factor inhibitor, and an epidermal growth factor receptor inhibitor.

**Ruxolitinib** is a selective inhibitor of the Janus-associated tyrosine kinases JAK1 and JAK2 and is licensed for the treatment of disease-related splenomegaly or symptoms in patients with primary myelofibrosis, post-polycythæmia vera myelofibrosis, or post-essential thrombocythaemia myelofibrosis.

**NICE guidance**

**Ruxolitinib for disease-related splenomegaly or symptoms in adults with myelofibrosis (June 2013)**

Ruxolitinib is not recommended for the treatment of disease-related splenomegaly or symptoms in adult patients with primary myelofibrosis (also known as chronic idiopathic myelofibrosis), post-polycythæmia vera myelofibrosis or post essential thrombocythaemia myelofibrosis.

www.nice.org.uk/TA289

**Sorafenib**, an inhibitor of multiple kinases, is licensed for the treatment of advanced renal cell carcinoma when treatment with interferon alfa or interleukin-2 has failed or is contra-indicated (but see NICE Guidance below). It is also licensed for the treatment of hepatocellular carcinoma.

**NICE guidance**

**Sorafenib for the treatment of advanced hepatocellular carcinoma (May 2010)**

Sorafenib is not recommended for the treatment of advanced hepatocellular carcinoma in patients for whom surgical or locoregional therapies have failed or are unsuitable.

www.nice.org.uk/TA189

**Sunitinib**, a tyrosine kinase inhibitor, is licensed for the treatment of advanced or metastatic renal cell carcinoma (but see NICE Guidance, below). It is also licensed for the treatment of unresectable or metastatic malignant gastro-intestinal stromal tumours, after failure of imatinib, and for the treatment of unresectable or metastatic pancreatic neuroendocrine tumours.

The Scottish Medicines Consortium (p. 4) has advised (October 2009 and April 2011) that sunitinib (Sutent®) is accepted for restricted use within NHS Scotland for the treatment of unresectable or metastatic malignant gastro-intestinal stromal tumours after failure of imatinib and for unresectable or metastatic pancreatic neuroendocrine tumours.

**NICE guidance**

**Sunitinib for advanced or metastatic renal cell carcinoma (March 2009)**

Sunitinib is recommended as first-line treatment for advanced or metastatic renal cell carcinoma in patients who are suitable for immunotherapy and have an Eastern Cooperative Oncology Group performance status of 0 or 1.

www.nice.org.uk/TA169

**NICE guidance**

**Sunitinib for the treatment of gastro-intestinal stromal tumours (September 2009)**

Sunitinib is recommended as an option for treatment in patients with unresectable or metastatic gastrointestinal tumours if imatinib treatment has failed because of resistance or intolerance, and the cost of sunitinib for the first treatment cycle is met by the manufacturer.

www.nice.org.uk/TA179

**NICE guidance**

**Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009)**

Bevacizumab, sorafenib, and temsirolimus are not recommended as first-line treatments for people with advanced or metastatic renal cell carcinoma. Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma.

www.nice.org.uk/TA178

**Temsirolimus** is a protein kinase inhibitor licensed for the first-line treatment of advanced renal cell carcinoma (see NICE Guidance above), and for the treatment of relapsed or refractory mantle cell lymphoma. Hypersensitivity reactions, including some life-threatening
and rare fatal reactions, are associated with temsirolimus therapy, usually during administration of the first dose. Symptoms include flushing, chest pain, dyspnoea, apnoea, hypotension, loss of consciousness, and anaphylaxis. Where possible, patients should receive an intravenous dose of antihistamine 30 minutes before starting the temsirolimus infusion. The infusion may have to be stopped temporarily for the treatment of infusion-related effects—consult product literature for appropriate management. If adverse reactions are not managed with dose delays, a dose reduction should be considered—consult product literature.

**Vandetanib**, a tyrosine kinase inhibitor, is licensed for the treatment of aggressive and symptomatic medullary thyroid cancer in patients with unresectable locally advanced or metastatic disease.

**Vemurafenib**, a BRAF kinase inhibitor, is licensed as a monotherapy for the treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma.

The Scottish Medicines Consortium (p. 4) has advised (November 2013) that vemurafenib (Zelboraf®) is accepted for restricted use within NHS Scotland as monotherapy for the first-line treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma.

**NICE guidance**
Vemurafenib for treating locally advanced or metastatic BRAF V600 mutation-positive malignant melanoma (December 2012)

Vemurafenib is recommended as an option for the treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma only if the manufacturer provides vemurafenib with the discount agreed in the patient access scheme.

www.nice.org.uk/TA269

see notes above

**Cautions**

see section 8.1; diarrhoea—proactive management recommended (consult product literature); new or worsening pulmonary symptoms (including dyspnoea, cough, fever)—interrupt treatment until interstitial lung disease is excluded; history of keratitis, ulcerative keratitis, severe dry eyes or use of contact lenses; signs and symptoms of keratitis—promptly refer to ophthalmologist for assessment; cardiac risk factors and conditions which may affect left ventricular ejection fraction—consult cardiac monitoring, including assessment of left ventricular ejection fraction, at baseline and during treatment; protect skin from exposure to sun; signs and symptoms of skin reaction—treat promptly and interrupt afatinib treatment if severe or if Stevens-Johnson syndrome suspected (consult product literature); 

**interactions**: Appendix 1 (afatinib)

**Driving**

Ocular adverse reactions may affect performance of skilled tasks e.g. driving

**Hepatic impairment**

monitor hepatic function regularly and consult product literature for dose adjustment in worsening liver function; manufacturer advises avoid in severe hepatic impairment

**Renal impairment**

manufacturer advises avoid in severe renal impairment

**Pregnancy**

manufacturer advises avoid—ensure effective contraception during and for at least one month after treatment in women of childbearing potential; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding**

manufacturer advises avoid—present in milk in animal studies

**Side-effects**

see section 8.1; also diarrhoea, dehydration, weight loss, decreased appetite, dyspepsia, dysgeusia, pyrexia, paraesthesia, cystitis, renal failure, hypokalaemia, muscle spasms, dry eyes, conjunctivitis, epistaxis, rhinorrhoea, rash (see Cautions), acne, pruritus, dry skin, hand-foot syndrome; less commonly interstitial lung disease, keratitis

**Dose**

- **ADULT** over 18 years, 40 mg once daily; if tolerated may be increased after 3 weeks to 50 mg once daily (but consult product literature); for dose adjustment due to side-effects, consult product literature

**Note**

Gastro® tablets may be dispensed in approximately 100 mL of noncarbonated water by stirring occasionally for up to 15 minutes (must not be crushed). The dispersion should be swallowed immediately, and the glass rinsed with the same volume of water which should also be swallowed. The dispersion can also be administered via a gastric tube
### BOSUTINIB

**Indications**
- see notes above

**Cautions**
- history or risk factors for QT prolongation (including recent cardiac event or concomitant use of drugs that prolong the QT interval) — monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment; cardiac disease; significant gastrointestinal disorder; history of pancreatitis — withhold treatment if lipase elevated and abdominal symptoms occur; monitor liver function before treatment initiation, then monthly for the first 3 months and thereafter as clinically indicated — consult product literature for management of raised transaminases; monitor full blood count weekly for the first month and then monthly thereafter or as clinically indicated; monitor for signs and symptoms of fluid retention (including pericardial effusion, pleural effusion and pulmonary oedema); **interactions**: Appendix 1 (bosutinib)

**Hepatic impairment**
- caution — no information available

**Pregnancy**
- avoid — toxicity in animal studies; effective contraception required during treatment in women; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding**
- manufacturer advises avoid — no information available

**Side-effects**
- see section 8.1; also decreased appetite, diarrhea, constipation, oesophageal-related disorder, dyspepsia, bradycardia, QT-interval prolongation, oedema, pneumonitis, fatigue, neuropathy, dizziness, taste disturbance, decreased appetite, hypophosphataemia, vision disorder; *less commonly* renal cyst; hepatotoxicity also reported

**Dose**
- **ADULT** over 18 years, 250 mg twice daily; for dose adjustment due to side effects, consult product literature

### CRIZOTINIB

**Indications**
- see notes above

**Cautions**
- susceptibility to QT-prolongation (including concomitant use of drugs that prolong QT interval and electrolyte disturbances); monitor liver function twice a month for the first 2 months of treatment, then at least monthly thereafter; pneumonitis reported (monitor patients with pulmonary symptoms and permanently discontinue treatment if treatment-related pneumonitis diagnosed); **interactions**: Appendix 1 (crizotinib)

### DABRAFENIB

**Indications**
- see notes above

**Cautions**
- pyrexia (interrupt treatment if > 38.5°C and assess for signs and symptoms of infection — consult product literature); assess for cutaneous squamous cell carcinoma and new primary melanoma before treatment, monthly during treatment, and for 6 months after discontinuation or until initiation of alternative treatment; assess and monitor for non-cutaneous secondary or recurrent malignancy before, during, and for 6 months after discontinuation or until initiation of alternative treatment — consult product literature; monitor serum creatinine and other signs of renal failure — consult product literature and interrupt dose as appropriate; monitor for ophthalmologic reactions including uveitis and iritis; promptly investigate signs and symptoms of pancreatitis — consult product literature; monitor ECG and electrolytes (including magnesium) before and one month after treatment initiation and after each dose modification — consult product literature if abnormalities occur; **interactions**: Appendix 1 (dabrafenib)

**Driving**
- Ocular adverse reactions and fatigue may affect performance of skilled tasks e.g. driving

**Contra-indications**
- BRAF wild-type melanoma; uncorrectable electrolyte abnormalities (including magnesium); long QT syndrome, or concomitant use of drugs that prolong the QT interval

**Hepatic impairment**
- manufacturer advises caution in moderate to severe impairment; additional monitoring of ECG and electrolytes required — consult product literature

**Renal impairment**
- manufacturer advises caution in severe impairment — no information available

**Pregnancy**
- manufacturer advises avoid unless potential benefit outweighs risk (toxicity in animal studies) — effective non-hormonal contraception required during and for one month after treatment in women of childbearing potential; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding**
- manufacturer advises avoid

**Side-effects**
- see section 8.1; also decreased appetite, diarrhoea, constipation, decrease in left ventricular...
ejection fraction, cough, headache, malaise, pyrexia, chills, influenza-like symptoms, hyperglycaemia, basal cell carcinoma, cutaneous squamous cell carcinoma, hypophosphataemia, arthralgia, myalgia, papilloma, keratitis, hyperkeratosis, acrochordon, rash, hand-foot syndrome, dry skin, pruritus, skin lesions, erythema; less commonly pancreatitis; QT-interval prolongation, new primary melanoma, nephritis, renal failure, uveitis, pancaulinitis

**Dose**

- **ADULT** over 18 years, 150 mg every 12 hours; for dose adjustment due to side-effects, consult product literature.

**Tafinlar**

- **Capsules**, dabrafenib (as mesilate) 50 mg (dark red), net price 28-cap pack = £933.33; 75 mg (dark pink), 28-cap pack = £1400.00. Label: 23, 25, counselling, driving, see Cautions above.

**ERLOTINIB**

**Indications** see notes above

**Cautions** see section 8.1; pre-existing liver disease or concomitant use with hepatotoxic drugs—monitor liver function; dose adjustment may be necessary if smoking started or stopped during treatment; see MHRA/CHM advice Epidermal Growth Factor Receptor (EGFR) Inhibitors: Serious Cases of Keratitis and Ulcerative Keratitis, p. 588; **interactions:** Appendix 1 (erlotinib)

**Hepatic impairment** manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

**Renal impairment** manufacturer advises avoid in severe impairment

**Pregnancy** manufacturer advises avoid—tissue in animal studies; effective contraception required during treatment and for at least 2 weeks after treatment; also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see section 8.1 and notes above; also diarrhoea, abdominal pain, taste disturbance, constipation, dyspepsia, colitis, gastritis; arthralgias, congestive heart failure, hypertension, chest pain, flushing, haemorrhage (including gastro-intestinal and CNS haemorrhage); palpitation; dyspnoea, pulmonary hypertension, cough, oedema (more common in patients over 65 years old), pleural effusion; depression, dizziness, headache, insomnia, neuropathy; influenza-like symptoms; musculoskeletal pain; visual disturbances; tinnitus; acne, dry skin, sweating, pruritus, dermatitis, urticaria; less commonly pancreatitis, hepatitis, cholestasis, cholecystitis, oesophagitis, hypotension, transient ischaemic attack, thrombophlebitis, syncope, asthma, seizures, anemia, tremor, drowsiness, myalgia, arthralgia, anaemia, nephritis, arrhythmia, tachycardia, angina, dyspepsia, constipation, diarrhoea, abdominal pain, taste disturbance; arthralgia, osteoarthritis, myalgia; less frequently rash, hand-foot syndrome, dry skin, pruritus, skin lesions, erythema; less commonly pancreatitis; QT-interval prolongation, new primary melanoma; nephritis, renal failure, uveitis, pancaulinitis.

**Dose**

- Chronic phase chronic myeloid leukaemia, **ADULT** over 18 years 100 mg once daily, increased if necessary to max. 140 mg once daily
- Accelerated and blast phase chronic myeloid leukaemia, acute lymphoblastic leukaemia, **ADULT** over 18 years 140 mg once daily, increased if necessary to max. 180 mg once daily

**Tarceva** (Bristol-Myers Squibb) Tablets, f/c, erlotinib (as hydrochloride) 25 mg, net price 30-tab pack = £378.33; 100 mg, 30-tab pack = £1324.14; 150 mg, 30-tab pack = £1631.53. Label: 23

**EVEROLIMUS**

**Indications** see notes above

**Cautions** see section 8.1; monitor blood-glucose concentration, serum-triglycerides and serum-cholesterol before treatment and periodically thereafter; concomitant use of drugs that increase risk of bleeding; history of bleeding disorders; monitor renal function before treatment and periodically thereafter; reduce dose or discontinue if severe side-effects
occur—consult product literature; interactions: Appendix 1 (everolimus)

Pneumonitis
Non-infectious pneumonitis reported. Patients should be advised to seek urgent medical advice if new or worsening respiratory symptoms occur.

Hepatic impairment
consult product literature

Pregnancy
manufacturer advises avoid (toxicity in animal studies); effective contraception must be used during and for up to 8 weeks after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding
manufacturer advises avoid

Side-effects
see section 8.1; also diarrhoea, dry mouth, abdominal pain, dysphagia, anorexia, taste disturbance, chest pain, hypertension, hyperlipidaemia, hypercholesterolaemia, peripheral oedema, pneumonitis (including interstitial lung disease), asthenia, fatigue, headache, insomnia, convulsions, irritability, increased susceptibility to infections (including pneumonia, aspergillosis, and candidiasis); hyperglycaemia, hypoglycaemia, dehydration, renal failure, electrolyte disturbance, arthralgia, eyelid oedema, epistaxis, skin and nail disorders (including hand-foot syndrome); less commonly congestive heart failure, flushing, agitation, aggression, rhabdomyolysis, and impaired wound healing; hepatitis B reactivation and haemorrhage also reported

Dose
● See under preparations

Afinitor® (Novartis) Tablets, white-yellow, everolimus, 5 mg, net price 30-tab pack = £2250.00; 10 mg, 30-tab pack = £2970.00. Label: 25, counselling, pneumonitis

Dose
renal cell carcinoma, neuroendocrine tumours of pancreatic origin, hormone-receptor-positive breast cancer, ADULT over 18 years, 10 mg once daily.

The Scottish Medicines Consortium (p. 4) has advised (April 2012) that everolimus (Afinitor®) is accepted for restricted use within NHS Scotland for the treatment of unresectable or metastatic, well- or moderately-differentiated neuroendocrine tumours of pancreatic origin (pNET) in adults with progressive disease.

Votubia® (Novartis) Tablets, white-yellow, everolimus, 2.5 mg, net price 30-tab pack = £1200.00; 5 mg, 30-tab pack = £2250.00; 10 mg, 30-tab pack = £2970.00. Label: 25, counselling, pneumonitis

Dose
subependymal giant cell astrocytoma or renal angiomyolipoma associated with tuberous sclerosis complex, consult product literature

Note
Votubia® tablets may be dispersed in approximately 30 mL of water by gently stirring, immediately before drinking. After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed.
8.1.5 Other antineoplastic drugs

**Dose**
- Chronic phase chronic myeloid leukaemia, **ADULT** 400 mg once daily, increased if necessary to max. 800 mg daily (in 2 divided doses); **CHILD** consult product literature
- accelerated phase and blast crisis chronic myeloid leukaemia, **ADULT** 600 mg once daily, increased if necessary to max. 800 mg daily (in 2 divided doses); **CHILD** consult product literature
- Acute lymphoblastic leukaemia, **ADULT** 600 mg once daily; **CHILD** consult product literature
- Gastro-intestinal stromal tumours, **ADULT** 400 mg once daily
- Anaplastic fibrosarcoma protuberans, **ADULT** 800 mg daily in 2 divided doses
- Myelodysplastic/myeloproliferative diseases, **ADULT** 400 mg once daily
- Advanced hypereosinophilic syndrome and chronic eosinophilic leukaemia, **ADULT** 100–400 mg once daily

**Side-effects**
- see section 8.1; anorexia, diarrhoea
- Breast-feeding
- see notes above
- Pregnancy
- manufacturer advises caution
- Hepatic impairment
- manufacturer advises caution
- Renal impairment
- see section 8.1; monitor liver function before treatment and at monthly intervals; **interactions**: Appendix 1 (lapatinib)
- **Cautions**
- see section 8.1; history of pancreatitis; susceptibility to QT-interval prolongation (including electrolyte disturbances, concomitant use of drugs that prolong QT interval); **interactions**: Appendix 3 and 4, and periodically thereafter as clinically indicated

**LAPATINIB**

**Indications**
- see notes above

**Cautions**
- see section 8.1; low gastric pH (reduced absorption); susceptibility to QT-interval prolongation (including concomitant use of drugs that prolong QT-interval and electrolyte disturbances); monitor left ventricular function; monitor for pulmonary toxicity; monitor liver function before treatment and at monthly intervals; **interactions**: Appendix 1 (lapatinib)
- **Hepatic impairment**
- caution in moderate to severe impairment—metabolism reduced
- **Renal impairment**
- caution in severe impairment—no information available
- **Pregnancy**
- avoid unless potential benefit outweighs risk—**toxicity in animal studies**; see also Pregnancy and Reproductive Function, p. 564
- **Breast-feeding**
- discontinue breast-feeding
- **Side-effects**
- see section 8.1; anorexia, weight changes, palpitation, QT-interval prolongation, hypokalaemia, hyperkalaemia, hypocalcaemia, hypophosphataemia, hypoglycaemia, hyperglycaemia, breast pain, gynaecomastia, erectile dysfunction, dysuria, urinary frequency, hypokalaemia, hyperkalaemia, hypocalcaemia, hypoglycaemia, hyperglycaemia, hypophosphataemia, dehydration, decreased visual acuity, conjunctivitis, dry eyes, epistaxis, and ecchymosis

**DOSE**
- In combination with capecitabine, **ADULT** over 18 years, 1.25 g once daily
- In combination with an aromatase inhibitor, **ADULT** over 18 years, 1.5 g once daily
- **Counselling**
- Always take at the same time in relation to food: either one hour before or one hour after food. Patients should report unexpected changes in bowel habit

**Tyverb® (GSK)**

**Tablets**, yellow, f/c, lapatinib 250 mg, net price 84-tab pack = £965.16, 105-tab pack = £1206.45. Counselling, administration
thrombotic events including myocardial infarction, ischaemic stroke or transient ischaemic attack; cardiac disease (monitor for signs or symptoms of congestive heart failure—monitor left ventricular ejection fraction in patients at risk of heart failure before and during treatment); patients at increased risk of haemorrhage; patients at increased risk of gastrointestinal perforation or fistulas; discontinue treatment 7 days before elective surgery and restart only if adequate wound healing; monitor thyroid function; monitor for proteinuria; increased risk of thrombotic microangiopathy—permanently discontinue if symptoms develop; monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including headache, hypertension, seizure, lethargy, confusion, visual and neurological disturbances)—permanently discontinue treatment if symptoms occur.

**Contra-indications:** cerebral or clinically significant gastro-intestinal haemorrhage or haemoptysis in the past 6 months

**Hepatic impairment** use with caution in mild to moderate impairment—reduce dose to 200 mg once daily in moderate impairment; avoid in severe impairment

**Renal impairment** use with caution if creatinine clearance less than 30 mL/minute—no information available

**Pregnancy** avoid unless potential benefit outweighs risk—toxicity in animal studies; effective contraception advised during treatment; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1; also abdominal pain, abdominal distension, dyspepsia, diarrhoea, weight loss, anorexia, dry mouth, taste disturbance, flatulence, hepatic dysfunction, hyperbilirubinaemia, hypertension, flushing, chest pain, oedema, venous thromboembolic events, dyspnoea, cough, pneumothorax, hiccups, epistaxis, voice changes, headache, dizziness, malaise, paraesthesia, insomnia, hypothyroidism, proteinuria (discontinue if grade 4), hyperalbuninaemia, increased amylase, dehydration, muscle spasm, myalgia, blurred vision, sweating, skin reactions, dry skin, hair and skin discoloration, nail disorders; less commonly: hepatic failure, gastro-intestinal perforation, peritonitis, pancreatitis, fistula, cardiac dysfunction, transient ischaemic attack, stroke, myocardial infarction, myocardial ischaemia, bradycardia, haemorrhage, hypertensive crisis, QT-interval prolongation, pulmonary embolism, peripheral neuropathy, menstrual disturbances, hypogammaglobinaemia, arthralgia, oropharyngeal pain, photosensitivity reactions; rarely: thrombotic microangiopathy

**Dose**

- **ADULT** over 18 years, 800 mg once daily; adjust dose in steps of 200 mg according to tolerability (max. 800 mg daily)

---

**PONATINIB**

**Indications** see notes above

**Cautions** history of pancreatitis, alcohol abuse or current severe hypertriglyceridaemia—increased risk of pancreatitis; monitor serum lipase every 2 weeks for the first 2 months and periodically thereafter for all patients— withhold treatment if lipase elevated and abdominal symptoms occur; monitor full blood count every 2 weeks for the first 3 months and then monthly thereafter or as clinically indicated; monitor liver function periodically; history of myocardial infarction or stroke—do not use unless potential benefit outweighs potential risk; assess cardiovascular status before treatment—manage risk factors before and during treatment; hypertension—medically control during treatment and interrupt treatment if uncontrolled; monitor for vascular occlusion or thromboembolism—interrupt treatment immediately if this occurs; interactions: Appendix 1 (ponatinib)

**Hepatic impairment** no information available—manufacturer advises caution

**Renal impairment** no information available—manufacturer advises caution if creatinine clearance less than 50 mL/minute

**Pregnancy** avoid—toxicity in animal studies; ensure effective contraception during treatment in men and women; see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see section 8.1; also abdominal discomfort, gastro-oesophageal reflux disease, constipation, diarrhoea, pancreatitis, dyspepsia, dry mouth, dehydration, decreased appetite, weight loss, hypertension, cardiac disorders, cardiac events, cerebrovascular events, vascular occlusion, thromboembolic events, intermittent claudication, atrial fibrillation, pericardial effusion, oedema, flushing, dyspnoea, cough, pleural effusion, dysphonia, malaise, headache, insomnia, dizziness, peripheral neuropathy, altered sensations, pyrexia, infection, biochemistry and electrolyte disturbances, erectile dysfunction, arthralgia, musculoskeletal pain, muscle spasms, blurred vision, dry eyes, epistaxis, dry skin, rash, pruritus, hyperhidrosis, bruising; less commonly: gastric haemorrhage, atrial flutter, cerebral infarction, cerebral artery stenosis, hepatotoxicity, jaundice, retinal vein thrombosis, retinal vein occlusion, visual impairment, exfoliative dermatitis

**Dose**

- **ADULT** over 18 years, 45 mg once daily; for dose adjustment due to side-effects, consult product literature

**ICULSIG® (ARIAD)**

**Tablets,** ponatinib 15 mg, net price 60-tab pack = £5050.00; 45 mg, 30-tab pack = £5050.00. Label: 3, 25

---

**REGORAFENIB**

**Indications** see notes above

**Cautions** predisposition to bleeding or concomitant treatment with drugs that may increase the risk of bleeding (increased risk of haemorrhagic events)—monitor blood count and coagulation parameters and consider permanent discontinuation in event of severe bleeding; history of ischaemic heart disease—
monitor for signs and symptoms of myocardial ischaemia and interrupt treatment if signs of ischaemia or infarction develop; may impair wound healing—withdraw treatment for major surgical procedures; hypertension—control blood pressure before treatment initiation and monitor as clinically indicated during treatment (review dose and consider treatment interruption if severe or persistent hypertension develops; discontinue treatment if hypertensive crisis occurs); Gilbert’s syndrome—risk of hyperbilirubinemia; monitor hepatic function before treatment, then at least every two weeks for the first 2 months, then at least monthly thereafter and as clinically indicated—consult product literature if changes in liver function observed; monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including seizure, headache, altered mental status, visual disturbances or cortical blindness, with or without hypertension)—discontinue treatment if symptoms occur; monitor biochemical, electrolyte and metabolic parameters during treatment; ensure measures to prevent hand-foot skin reaction—consult product literature if signs or symptoms develop; interactions: Appendix 1 (regorafenib)

Hepatic impairment manufacturer advises caution in moderate impairment; avoid in severe impairment

Renal impairment caution in severe impairment—no information available

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies; women of childbearing potential and men must use effective contraception during treatment and up to 8 weeks after last dose; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding avoid—present in milk in animal studies

Side-effects see section 8.1; also diarrhoea, constipation, dyspnoea, dysphagia, anorexia, hypertension, haemorrhage (including fatal), hypothyroidism, headache, tremor, dyspnoea, malaise, pain, pyrexia, infection, hypothyroidism, biochemical, biochemical and electrolyte disturbances, abnormal international normalised ratio, musculoskeletal stiffness, hand-foot skin reaction, rash, dry skin, nail disorder, mucosal inflammation; less commonly gastro-intestinal perforation and fistula (discontinue treatment), myocardial infarction, myocardial ischaemia, hypertensive crisis, severe (including fatal) liver injury; rarely posterior reversible encephalopathy syndrome, keratoacanthoma, squamous cell carcinoma of the skin, Stevens-Johnson syndrome, toxic epidermal necrolysis

Dose
● ADULT over 18 years, 160 mg once daily for 21 consecutive days of repeated 28-day cycles; for dose adjustment due to side-effects, consult product literature

Stivarga® (Bayer) ▼ (Pkt)
Tablets, f/c, pink, regorafenib 40 mg, net price 84-tab pack = £3744.00. Label: 21, counselling, administration
Counselling Tablets should be taken at the same time each day, swallowed whole with water after a light meal that contains less than 30% fat
Electrolytes Na+ 0.607 mmol/40 mg tablet

RUXOLITINIB

Indications see notes above

Cautions see section 8.1; monitor full blood count (including differential white cell count) before treatment, then every 2–4 weeks until dose stabilised, then as clinically indicated; assess risk of developing infection before treatment—do not initiate until active serious infections are resolved (see also under Tuberculosis below); monitor for infection during treatment; monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological, cognitive or psychiatric signs or symptoms)—withhold treatment if suspected; interactions: Appendix 1 (ruxolitinib)

Tuberculosis Patients should be evaluated for latent and active tuberculosis before starting treatment and monitored for signs and symptoms of tuberculosis during treatment

Hepatic impairment reduce dose (consult product literature)

Renal impairment reduce dose in severe impairment (consult product literature)

Pregnancy avoid—toxicity in animal studies

Breast-feeding avoid—present in milk in animal studies

Side-effects see section 8.1; also flatulence, hypercholesterolaemia, dizziness, headache, weight gain; less commonly tuberculosis; also reported progressive multifocal leucoencephalopathy

Dose
● See Doses, p. 563

Jakavi® (Novartis) ▼ (Pkt)
Tablets, ruxolitinib (as phosphate) 5 mg, net price 56-tab pack = £1680.00; 15 mg, 56-tab pack = £3360.00; 20 mg, 56-tab pack = £3360.00

SORAFENIB

Indications see notes above

Cautions major surgical procedures; cardiac ischaemia; susceptibility to QT-interval prolongation; interactions: Appendix 1 (sorafenib)

Hepatic impairment manufacturer advises caution in severe impairment—no information available

Pregnancy manufacturer advises avoid unless essential—toxicity in animal studies; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also diarrhoea, constipation, dyspnoea, dysphagia, anorexia, hypertension, haemorrhage, flushing, hoarseness, fatigue, asthma, depression, peripheral neuropathy, fever, erectile dysfunction, renal failure, hypophosphataemia, arthralgia, myalgia, tinnitus, rash, pruritus, erythema, dry skin, desquamation, acne, hand-foot skin reaction; less commonly gastro-intestinal perforations, myocardial infarction, congestive heart failure, hypertensive crisis, interstitial lung disease-like events, posterior reversible encephalopathy syndrome, thyroid dysfunction, and Stevens-Johnson syndrome; rarely hepatitis

Dose
● ADULT over 18 years, 400 mg twice daily

 Nexavar® (Bayer) ▼ (Pkt)
Tablets, f/c, red, sorafenib (as tosylate) 200 mg, net price 112-tab pack = £2980.47 Label: 23
SUNITINIB

Indications see notes above

Cautions see section 8.1; cardiovascular disease—discontinue if congestive heart failure develops; susceptibility to QT-interval prolongation; hypertension; increased risk of bleeding; monitor for thyroid dysfunction; consider dental check-up before initiating treatment (risk of osteonecrosis of the jaw, see MHRA/CHM advice, p. 585); interactions: Appendix 1 (sunitinib)

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—effectiveness in animal studies; effective contraception required during treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also abdominal pain, diarrhoea, constipation, anorexia, taste disturbance, dehydration; hypertension, oedema; dyspnkea, cough; fatigue, dizziness, headache, insomnia, peripheral neuropathy, parathesias; hypothyroidism; arthralgia, myalgia; increased lacrimation; epistaxis; skin, hair, and urine discoloration, hand-foot syndrome, dry skin, and rash; gastro-intestinal perforation, fistula formation (interrupt treatment if occurs) pancreatitis, osteonecrosis of the jaw (see MHRA/CHM advice, p. 585), hepatic failure, proteinuria (rarely nephrotic syndrome) and seizures reported

Dose
- Gastro-intestinal stromal tumours and metastatic renal cell carcinoma, 50 mg once daily for 4 weeks, followed by a 2-week treatment-free period to complete 6-week cycle; adjust dose in steps of 12.5 mg according to tolerability; dose range 25–75 mg daily
- Pancreatic neuroendocrine tumours, 37.5 mg once daily, without a treatment-free period; adjust dose in steps of 12.5 mg according to tolerability; max. dose 50 mg daily

Sutent® (Pfizer) Capsules, sunitinib (as maleate) 12.5 mg (orange), net price 28-cap pack = £784.70, 25 mg (caramel), 28-cap pack = £1569.40; 50 mg (caramel), 28-cap pack = £3138.80. Label: 14

TEMSIROLIMUS

Indications see notes above

Cautions see notes above; monitor respiratory function; monitor blood lipids; interactions: Appendix 1 (temsirolimus)

Hepatic impairment use with caution; in renal cell carcinoma, reduce dose in severe impairment (consult product literature); in mantle cell lymphoma, avoid in moderate or severe impairment

Renal impairment manufacturer advises caution in severe impairment—no information available

Pregnancy manufacturer advises avoid (toxicity in animal studies); ensure effective contraception during treatment in men and women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding manufacturer advises discontinue breast-feeding

Side-effects see section 8.1; also abdominal pain, diarrhoea, anorexia, taste disturbance, gastro-intestinal haemorrhage, bowel perforation, dysphagia; hypertension, oedema, thrombosis, thrombophlebitis; cough, dyspnkea, chest pain, interstitial lung disease, hypersensitivity reactions (see notes above); insomnia, anxiety, depression, drowsiness, paraesthesia, dizziness, asthenia; increased susceptibility to infection (including urinary-tract infection and pneumonia), pyrexia; hyperglycaemia; renal failure; hypophosphataemia, hypokalaemia, hypercholerolaemia, hyperlipidaemia; myalgia, arthralgia; eye disorders; rhinitis, epistaxis; skin disorders (including rash and acne), folliculitis, impaired wound healing; less commonly intracerebral bleeding

Dose
- See Doses, p. 563

Torisel® (Pfizer) Infusion, temsirolimus 30 mg concentrate (25 mg/mL), net price 1.2-mL amp (with diluent) = £620.00

Excipients include propylene glycol and ethanol

VANDETANIB

Indications see notes above

Cautions see section 8.1; susceptibility to QT-prolongation (including concomitant use of drugs that prolong QT interval and electrolyte disturbances)—monitor ECG, serum potassium, calcium, magnesium and thyroid stimulating hormone before treatment, then 1, 3, 6 and 12 weeks after starting treatment and following dose adjustment or interruption, then every 3 months for at least 1 year; history of torsades de pointes; phototoxicity reactions reported (wear protective clothing and/or sunscreen); brain metastases (intracranial haemorrhage reported); hypertension; interactions: Appendix 1 (vandetanib)

Contra-indications congenital long QT syndrome; QT interval greater than 480 milliseconds

Hepatic impairment manufacturer advises avoid in severe impairment (serum bilirubin greater than 1.5 times the upper limit of normal)

Renal impairment reduce dose to 200 mg if creatinine clearance 30–49 mL/minute; avoid if creatinine clearance less than 30 mL/minute

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—effective contraception required during and for at least 4 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding avoid—no information available

Side-effects see section 8.1; also abdominal pain, diarrhoea, constipation, dyspepsia, colitis, dry mouth, dysphagia, gastritis, gastrointestinal haemorrhage, cholelithiasis, QT-interval prolongation, hypertension, ischaemic cerebrovascular conditions, oedema, epistaxis, haemoptysis, pneumonitis, headache, paraesthesia, dysaesthesia, dizziness, tremor, lethargy, asthenia, pain, pyrexia, loss of consciousness, balance disorders, taste disturbance, insomnia, depression, anxiety, hypothyroidism, decreased appetite, hyperglycaemia, dehydration, electrolyte disturbances, proteinuria, nephrolithiasis, dysuria, haematuria, polyuria, micturition urgency, blurred vision, corneal changes (including corneal deposits and opacity), halo vision, photopsia, glaucoma, conjunctivitis, dry eye, keratopathy, photosensitivity reactions, hand-foot syndrome, alopecia, less commonly pancreatitis, peritonitis, ileus, intestinal perforation, faecal incontinence, heart failure, cardiac conduction, rate and rhythm disorders, ventricular arrhythmia, cardiac arrest, respiratory failure, aspiration pneumonia, interstitial lung disease (sometimes
VEMURAFENIB

Indications
see notes above

Cautions
see section 8.1; susceptibility to QT-prolongation (including concomitant use of drugs that prolong QT interval and electrolyte disturbances)—monitor ECG and electrolytes before treatment, after one month and following dose adjustment (treatment not recommended if QT interval greater than 500 milliseconds at baseline); monitor for cutaneous and non-cutaneous squamous cell carcinoma and new primary melanoma before, during and for up to 6 months after treatment—consult product literature; monitor liver function before treatment and periodically thereafter; monitor for uveitis, iritis and retinal vein occlusion; prior or concurrent cancer associated with RAS mutation—increased risk of tumour progression;

Interactions:
Appendix 1 (vemurafenib)

Contra-indications
wild-type BRAF malignant melanoma

Hepatic impairment
manufacturer advises more frequent monitoring in moderate to severe impairment (including monthly ECG monitoring during first 3 months of treatment)

Renal impairment
manufacturer advises caution in severe impairment

Pregnancy
manufacturer advises avoid unless potential benefit outweighs risk—effective contraception required during and for at least 6 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding
avoid—no information available

Side-effects
see section 8.1; also diarrhoea, constipation, decreased appetite, cough, peripheral oedema, QT-interval prolongation, fatigue, anaemia, pyrexia, headache, dizziness, taste disturbance, Bell’s palsy, new primary melanoma, arthralgia, myalgia, pain in extremities, musculoskeletal pain, arthritis, urticaria, seborrhoeic keratosis, actinic keratosis, keratinosis pilaris, skin papilloma, cutaneous squamous cell carcinoma, basal cell carcinoma, photosensitivity reactions, hyperkeratosis, erythema, alopecia, folliculitis, dry skin, hand-foot syndrome, erythema nodosum; less commonly vasculitis, peripheral neuropathy, non-cutaneous squamous cell carcinoma, retinal vein occlusion, toxic epidermal necrolysis, Stevens-Johnson syndrome; rarely progression of pre-existing NRAS mutated chronic myelomonocytic leukaemia; also reported hypersensitivity reactions

Drug rash with eosinophilia and systemic symptoms (DRESS syndrome)
DRESS syndrome has been reported in patients taking vemurafenib. DRESS syndrome starts with rash, fever, swollen glands, and increased white cell count, and it can affect the liver, kidneys and lungs; DRESS can also be fatal. Patients should be advised to stop taking vemurafenib and consult their doctor immediately if skin rash develops. Treatment with vemurafenib should not be restarted.

Dose
• ADULT, 300 mg once daily; for dose adjustment due to side effects, consult product literature

Caprelsa® (AstraZeneca) ▼ (pH 10)
Tablets, f/c, vandetanib 100 mg, net price 30-tab pack = £2500.00; 300 mg, 30-tab pack = £5000.00. Alert card
Note Caprelsa® tablets may be dispersed in half a glass of water by stirring until dispersed (approximately 10 minutes), immediately before drinking (do not crush). After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed. The solution can also be administered via nasogastric or gastrostomy tubes

Taxanes
Paclitaxel is a member of the taxane group of drugs. It is given by intravenous infusion, and is available as both conventional and albumin-bound formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable. Conventional paclitaxel given with carboplatin or cisplatin is used for the treatment of ovarian cancer (see NICE guidance p. 594); the combination is also considered appropriate for women whose ovarian cancer is initially considered inoperable; it is also licensed for the secondary treatment of metastatic breast cancer. There is limited evidence to support its use in non-small cell lung cancer. Routine premedication with a corticosteroid, an antihistamine and a histamine H2-receptor antagonist is recommended to prevent severe hypersensitivity reactions; hypersensitivity reactions may occur rarely despite premedication, although more commonly only bradycardia or asymptomatic hypotension occur.

Other side-effects of conventional paclitaxel include myelosuppression, peripheral neuropathy, and cardiac conduction defects with arrhythmias (which are nearly always asymptomatic). It also causes alopecia and muscle pain; nausea and vomiting is mild to moderate.

Albumin-bound paclitaxel is licensed for monotherapy of metastatic breast cancer following failed first-line treatment for metastatic disease and when standard, anthracycline-containing therapy is not indicated. It is also licensed in combination with gemcitabine for the first-line treatment of metastatic adenocarcinoma of the pancreas. It causes myelosuppression (primarily neutropenia) and commonly febrile neutropenia. Other common side-effects include peripheral neuropathy, nausea, vomiting, myalgia, arthralgia and gastrointestinal disorders; bradycardia, cardiac arrest, congestive heart failure, and left ventricular dysfunction are rare but cardiac monitoring should be undertaken, particularly if patients have underlying cardiac disease or
previous exposure to anthracyclines. Patients aged over 75 years with metastatic adenocarcinoma of the pancreas should be treated with caution. Patients should also be monitored for signs and symptoms of pneumonitis and sepsis. Stevens-Johnson syndrome and toxic epidermal necrolysis have also been reported.

**NICE guidance**

**Paclitaxel for the adjuvant treatment of early node-positive breast cancer**

Paclitaxel, within its licensed indication, is not recommended for the adjuvant treatment of women with early node-positive breast cancer. [www.nice.org.uk/TA108](http://www.nice.org.uk/TA108)

Docetaxel is licensed for use in locally advanced or metastatic breast cancer and non-small cell lung cancer resistant to other cytotoxic drugs or for initial chemotherapy in combination with other cytotoxic drugs. It is also licensed for hormone-resistant prostate cancer, for use with other cytotoxic drugs for gastric adenocarcinoma and head and neck cancer, and for adjuvant treatment of operable node-positive and operable node-negative breast cancer. Its side-effects are similar to those of paclitaxel but persistent fluid retention (commonly as leg oedema that worsens during treatment) can be resistant to treatment; hypersensitivity reactions also occur. Pretreatment with dexamethasone by mouth is recommended for reducing fluid retention and hypersensitivity reactions.

For the role of taxanes in the treatment of breast cancer, see section 8.3.4.1.

The Scottish Medicines Consortium (p. 4) has advised that docetaxel (Taxotere®) in combination with cisplatin and fluorouracil is accepted for restricted use within NHS Scotland for the induction treatment of patients with metastatic breast cancer and for adjuvant treatment of operable node-positive and operable node-negative breast cancer. Its side-effects are similar to those of paclitaxel but persistent fluid retention (commonly as leg oedema that worsens during treatment) can be resistant to treatment; hypersensitivity reactions also occur. Pretreatment with dexamethasone by mouth is recommended for reducing fluid retention and hypersensitivity reactions.

**NICE guidance**

**Paclitaxel for the adjuvant treatment of early node-positive breast cancer**

Docetaxel, when given concurrently with doxorubicin and cyclophosphamide (TAC regimen), is recommended as an option for the adjuvant treatment of women with early node-positive breast cancer. [www.nice.org.uk/TA109](http://www.nice.org.uk/TA109)

**Cabazitaxel**, in combination with prednisone or prednisolone, is licensed for the treatment of hormone refractory metastatic prostate cancer in patients who have previously been treated with a docetaxel-containing regimen. Routine premedication with a corticosteroid, an antihistamine, and a histamine H$_2$-receptor antagonist is recommended to prevent severe hypersensitivity reactions. Hypersensitivity reactions are common.

Other side-effects of cabazitaxel include weight changes, diarrhoea, constipation, abdominal pain, dyspepsia, gastroesophageal reflux, haemorrhoids, rectal haemorrhage, taste disturbance, dry mouth, chest pain, atrial fibrillation, tachycardia, hypertension, hypotension, flushing, oedema, dyspnoea, cough, peripheral neuropathy, paraesthesia, hypo-oesthesia, anxiety, confusion, dizziness, headache, malaise, vertigo, chills, hyperglycaemia, urinary retention, urinary incontinence, renal disorders (fatal cases of renal failure reported), dehydration, electrolyte disturbances, sciatica, arthritis, muscle spasm, myalgia, increased lacrimation, tinnitus, dry skin, erythema.

**NICE guidance**

**Cabazitaxel for hormone-refractory metastatic prostate cancer previously treated with a docetaxel-containing regimen**

Cabazitaxel in combination with prednisone or prednisolone is not recommended for the treatment of hormone-refractory metastatic prostate cancer previously treated with a docetaxel-containing regimen. Patients currently receiving cabazitaxel in combination with prednisone or prednisolone for the treatment of hormone-refractory metastatic prostate cancer previously treated with a docetaxel-containing regimen should have the option to continue treatment until they and their clinicians consider it appropriate to stop. [www.nice.org.uk/TA255](http://www.nice.org.uk/TA255)

**CABAZITAXEL**

**Indications** see notes above

**Cautions** see section 8.1; monitor electrolytes—correct dehydration; avoid in acute porphyria (but see section 9.8.2); **interactions**: Appendix 1 (cabazitaxel)

**Hepatic impairment** avoid

**Renal impairment** use with caution if creatinine clearance less than 50 mL/minute

**Pregnancy** ensure effective contraception during treatment (women) and for up to 6 months after treatment (men); see also Pregnancy and Reproductive Function, p. 564

**Breast-feeding** discontinue breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**

- See Doses, p. 563

**Jevtana** (Sanofi-Aventis) ▼

Concentrate for intravenous infusion, cabazitaxel 40 mg/mL, net price 1.5-mL vial (and solvent) = £3696.00

**Note** Incompatible with PVC. Solvent contains ethanol
**DOCETAXEL**

**Indications**  adjutant treatment of operable node-positive and operable node-negative breast cancer, in combination with doxorubicin and cyclophosphamide; with doxorubicin for initial chemotherapy of locally advanced or metastatic breast cancer; monotherapy for locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline or an alkylating drug has failed; with capecitabine for locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline has failed; with trastuzumab for initial chemotherapy of metastatic breast cancer which overexpresses human epidermal growth factor-2; locally advanced or metastatic non-small cell lung cancer where first-line chemotherapy has failed; with cisplatin for unresectable, locally advanced or metastatic non-small cell lung cancer; with prednisolone for hormone-refractory metastatic prostate cancer; with cisplatin and fluorouracil for initial treatment of metastatic gastric adenocarcinoma, including adenocarcinoma of the gastro-oesophageal junction; with cisplatin and fluorouracil for induction treatment of locally advanced squamous cell carcinoma of the head and neck.

**Cautions**  see section 8.1 and notes above; avoid in acute porphyria (but see section 9.8.2); interactions: Appendix 1 (docetaxel).

**Hepatic impairment**  monitor liver function—reduce dose according to liver enzymes; avoid in severe impairment.

**Pregnancy**  avoid (toxicity and reduced fertility in animal studies); manufacturer advises effective contraception during and for at least 3 months after treatment; see also Pregnancy and Reproductive Function, p. 564.

**Breast-feeding**  discontinue breast-feeding.

**Side-effects**  see section 8.1, notes above, and consult product literature.

**Dose**

**Note**  Contains ethanol.

**Electrolytes**  Contains approx. 3.7 mmol Na⁺/vial.

**Topoisomerase I inhibitors**

Irinotecan and topotecan inhibit topoisomerase I, an enzyme involved in DNA replication.

**Irinotecan**  is licensed for metastatic colorectal cancer in combination with fluorouracil and folinic acid or as monotherapy when treatment containing fluorouracil has failed. It is also licensed in combination with cetuximab for the treatment of epidermal growth factor receptor-expressing metastatic colorectal cancer after failure of chemotherapy that has included irinotecan. Irinotecan is also licensed in combination with fluorouracil, folinic acid and bevacizumab for the first-line treatment of metastatic carcinoma of the colon or rectum. Irinotecan is also licensed in combination with capecitabine with or without bevacizumab for the first-line treatment of metastatic colorectal carcinoma. Irinotecan is given by intravenous infusion.

**NICE guidance**

Irinotecan, oxaliplatin and raltitrexed for advanced colorectal cancer (August 2005)

See p. 593.
Topotecan is given by intravenous infusion or orally in relapsed small-cell lung cancer when retreatment with the first-line regimen is considered inappropriate. Topotecan injection is also licensed for metastatic ovarian cancer when first-line or subsequent treatment has failed. Topotecan injection is licensed in combination with cisplatin for treatment of recurrent carcinoma of the cervix, after radiotherapy, and for patients with stage IVB disease.

In addition to dose-limiting myelosuppression, side-effects of irinotecan and topotecan include gastro-intestinal effects (delayed diarrhoea requiring prompt treatment), asthenia, alopecia, and anorexia.

The Scottish Medicines Consortium (p. 4) has advised (November 2007) that topotecan (Hycenthy®) is accepted for restricted use in combination with cisplatin for treatment of recurrent carcinoma of the cervix after radiotherapy and for stage IVB disease; it is restricted to patients who have not previously received cisplatin treatment.

The Scottish Medicines Consortium (p. 4) has advised (March 2009) that use of topotecan capsules within NHS Scotland is restricted to patients in whom standard intravenous chemotherapy is inappropriate and who would otherwise receive best supportive care.

NICE guidance
Topotecan for the treatment of recurrent and stage IVB cervical cancer (October 2009)
Topotecan in combination with cisplatin is recommended as a treatment option for recurrent or stage IVB cervical cancer in patients who have not previously received cisplatin.

www.nice.org.uk/TA183
8 Malignant disease and immunosuppression

Breast-feeding

**Manufacturer advises avoid breast-feeding during and for 3 months after treatment**

**Side-effects**
- see section 8.1; also abdominal pain, constipation, diarrhoea, dyspepsia, taste disturbance, hepatobiliary disorders; hypotension, oedema, flushing; dyspnoea, cough; headache, insomnia, peripheral neuropathy, paraesthesia, dizziness, anorexia, asthena, fatigue; pyrexia, hypokalaemia, dehydration, increased blood creatine kinase; myalgia, arthralgia, back pain

**Dose**
- See Doses, p. 563

**Trabectedin**

Trabectedin is licensed for the treatment of advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed or is contra-indicated and in combination with pegylated liposomal doxorubicin for the treatment of relapsed platinum-sensitive ovarian cancer. Trabectedin is given by intravenous infusion. A corticosteroid, such as dexamethasone by intravenous infusion, should be given 30 minutes before therapy for its antiemetic and hepatoprotective effects.

**NICE guidance**

**Trabectedin for the treatment of advanced soft tissue sarcoma (February 2010)**

Trabectedin is an option for advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed. is inappropriate or is not tolerated. The cost of trabectedin for treatment after the fifth cycle is met by the manufacturer.

[www.nice.org.uk/TA185](http://www.nice.org.uk/TA185)

**Trabectedin for the treatment of relapsed ovarian cancer (April 2011)**

Trabectedin in combination with pegylated liposomal doxorubicin is not recommended for the treatment of relapsed platinum-sensitive ovarian cancer.

[www.nice.org.uk/TA222](http://www.nice.org.uk/TA222)

**TRABECTEDIN**

**Indications**
- see notes above

**Cautions**
- see section 8.1 and notes above; measure creatinine kinase, renal function and hepatic function before starting (consult product literature); monitor haematological and hepatic parameters weekly during first 2 cycles and at least once between treatments in subsequent cycles; concomitant use with hepatotoxic drugs (avoid alcohol)

**Hepatic impairment**
- manufacturer advises caution in impairment—consider dose reduction; avoid in patients with raised bilirubin

**Renal impairment**
- avoid monotherapy if creatinine clearance less than 30 mL/minute; avoid combination regimens if creatinine clearance less than 60 mL/minute

**Pregnancy**
- effective contraception recommended during and for at least 3 months after treatment in women and during and for at least 5 months after treatment in men; see also Pregnancy and Reproductive Function, p. 564

**NICE guidance**

**Trastuzumab**

Trastuzumab is licensed for the treatment of early breast cancer which overexpresses human epidermal growth factor receptor-2 (HER2).

Trastuzumab is also licensed, in combination with paclitaxel or docetaxel, for metastatic breast cancer in patients with HER2-positive tumours who have not received chemotherapy for metastatic breast cancer and in whom anthracycline treatment is inappropriate.

Trastuzumab is also licensed, in combination with an aromatase inhibitor, for metastatic breast cancer in postmenopausal patients with hormone-receptor positive HER2-positive tumours not previously treated with trastuzumab.

Trastuzumab is also licensed as monotherapy for metastatic breast cancer in patients with tumours that overexpress HER2 who have received at least 2 chemotherapy regimens including, where appropriate, an anthracycline and a taxane; women with oestrogen-receptor-positive breast cancer should also have received hormonal therapy.

Trastuzumab is also licensed (by intravenous infusion only), in combination with capecitabine or fluorouracil and cisplatin, for metastatic gastric cancer in patients with HER2-positive tumours who have not received treatment for metastatic gastric cancer.

Resuscitation facilities should be available during administration of trastuzumab and treatment should be initiated by a specialist. Trastuzumab is not interchangeable with trastuzumab emtansine. See section 8.3.4.1 for the role of trastuzumab in the treatment of breast cancer.

**Use with anthracyclines**

Concomitant use of trastuzumab with anthracyclines (section 8.1.2) is associated with cardiotoxicity. The use of anthracyclines even after stopping trastuzumab can increase the risk of cardiotoxicity and if possible should be avoided for up to 24 weeks. If an anthracycline needs to be used, cardiac function should be monitored closely.
Indications

- For the treatment of HER2-positive metastatic gastric cancer (November 2010)

- For the first-line treatment of metastatic hormone-receptor-positive breast cancer that overexpresses HER2 (see p. 598)

Contra-indications

- Severe dyspnoea at rest

Pregnancy

- Manufacturer advises avoid—oligo-hydramnios reported; effective contraception must be used during treatment and for 6 months after stopping; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding

- Avoid breast-feeding during treatment and for 7 months afterwards

Side-effects

- Possibly delayed onset, including chills, fever, hypersensitivity reactions such as anaphylaxis, urticaria, and angioedema
- Gastro-intestinal symptoms, hepatitis, cardiotoxicity (see also above), chest pain, hypertension, hypotension, pulmonary events (possibly delayed onset), headache, taste disturbance, anxiety, malaise, depression, insomnia, drowsiness, dizziness, paraesthesia, tremor, asthma, peripheral neuropathy, hypertonias, paresis, mastitis, infection, ecchymosis, oedema, weight loss, arthralgia, myalgia, arthritis, bone pain, leg cramps, dry eye, increased lacrimation, rash, pruritus, sweating, dry skin, alopecia, acne, nail disorders

Dose

- See Doses, p. 563

Herceptin® (Roche) ▼ Pat

Intravenous infusion, powder for reconstitution, trastuzumab, net price 150-mg vial = £407.40

Injection (for subcutaneous use), trastuzumab 120 mg/mL, net price 5-mL vial = £1222.20

Note

- Subcutaneous preparation not licensed for use in metastatic gastric cancer

Note

- When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab and trastuzumab emtansine are not interchangeable

Note

- The Scottish Medicines Consortium p. 4 has advised (December 2013) that subcutaneous trastuzumab injection (Herceptin®) is accepted for restricted use within NHS Scotland for the treatment of adults with HER2 positive metastatic breast cancer and early breast cancer, when used within licensed indications excluding use in combination with an aromatase inhibitor for the treatment of postmenopausal patients with hormone-receptor positive metastatic breast cancer, not previously treated with trastuzumab

Trastuzumab emtansine

- Trastuzumab emtansine is an antibody-drug conjugate that contains trastuzumab covalently linked to DM1, a cytotoxic microtubule inhibitor. Trastuzumab emtansine and trastuzumab are not interchangeable; trastuzumab emtansine is indicated as monotherapy for the treatment of HER2-positive, untreated, locally advanced or metastatic breast cancer, in adult patients who have previously received trastuzumab and a taxane separately or in combination, or who have developed disease recurrence during or within 6 months of completing adjuvant therapy. Resuscitation facilities should be available during administration of trastuzumab emtansine and treatment should be initiated by a specialist. See section 8.3.4.1 for the role of trastuzumab emtansine in the treatment of breast cancer.
8 Malignant disease and immunosuppression

8.1.5 Other antineoplastic drugs

Tretinoin is the acid form of vitamin A

Tretinoin

Tretinoin is licensed for the induction of remission in acute promyelocytic leukaemia. It is used in previously untreated patients as well as in those who have relapsed after standard chemotherapy or who are refractory to it.

TRETINOIN

Note Tretinoin is the acid form of vitamin A

Indications see notes above; acne (section 13.6.1); photodamage (section 13.8.1)

Cautions exclude pregnancy before starting treatment; monitor haematological and coagulation profile, liver function, serum calcium and plasma lipids before and during treatment; increased risk of thromboembolism during first month of treatment; interactions: Appendix 1 (retinoids)

Hepatic impairment reduce dose to 25 mg/m²

Renal impairment reduce dose to 25 mg/m²

Pregnancy teratogenic; effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progestogen-only contraceptives not considered effective); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding avoid

Side-effects retinoic acid syndrome (fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleucocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure) requires immediate treatment—consult product literature; gastro-intestinal disturbances, pancreatitis; arthralgia, flushing, oedema; headache; benign intracranial hypertension (mainly in children—consider dose reduction if intractable headache in children), shivering, dizziness, confusion, anxiety, depression, insomnia, parasthesia, visual and hearing disturbances; raised liver enzymes, serum creatinine and lipids; bone and chest pain, alopecia, erythema, rash, pruritus, sweating, dry skin and mucous membranes, cheilitis; thromboembolism, hypercalcaemia, and genital ulceration reported

Dose

• ADULT and CHILD 45 mg/m² daily in 2 divided doses, max. duration of treatment 90 days (consult product literature for details of concomitant chemotherapy)

Vesanoid® (intrapharm) Capsules, yellow/brown, tretinoin 10 mg, net price 100-cap pack = £160.63. Label: 21, 25

Vismodegib

Vismodegib is a hedgehog pathway inhibitor used in the treatment of basal cell carcinoma. Vismodegib may cause severe birth defects and embryo-fetal death. For women of child-bearing potential, pregnancy must be terminated before initiation of treatment, and monthly during treatment. Women must use two contraceptive methods (including one highly effective method and one barrier method) during treatment and for 24 months after the final dose of vismodegib; men must use a condom during treatment and for 2 months after the final dose. Prescribers and pharmacists must comply with prescribing and dispensing restrictions as specified in the manufacturer’s Pregnancy Prevention Programme, and ensure that the patient fully acknowledges the programme’s pregnancy prevention measures—consult product literature for further information.
**8.2 Drugs affecting the immune response**

**8.2.1 Antiproliferative immunosuppressants**

**AZATHIOPRINE**

Azathioprine is widely used for transplant recipients and is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced when allopurinol is given concurrently. Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment with azathioprine.

**Triophosphoros methyltransferase**

The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguani). The risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Consider measuring TPMT activity before starting azathioprine, mercaptopurine, or tioguanine therapy. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

**Mycophenolate mofetil** is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine. It is licensed for the prophylaxis of acute rejection in renal, hepatic or cardiac transplant recipients. There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil reduces the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher.

Cases of pure red cell aplasia have been reported with azathioprine and with mycophenolate mofetil; dose reduction or discontinuation should be considered under specialist supervision.

**Cyclophosphamide** (section 8.1.1) is less commonly prescribed as an immunosuppressant.

---

**Immunosuppressant therapy**

Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are maintained on drug regimens, which may include antiproliferative drugs (azathioprine or mycophenolate mofetil), calcineurin inhibitors (cyclosporin or tacrolimus), corticosteroids, or sirolimus. Choice is dependent on the type of organ, time after transplantation, and clinical condition of the patient. Specialist management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

**Impaired immune responsiveness** Modification of tissue reactions caused by corticosteroids and other immunosuppressants may result in the rapid spread of infection. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicemia or tuberculosis to reach an advanced stage before being recognised—important: for advice on measles exposure, see section 14.5.1, and chickenpox (varicella) exposure, see section 14.5.2. For advice on the use of live vaccines in individuals with impaired immune response, see section 14.1. For general comments and warnings relating to corticosteroids and immunosuppressants, see section 6.3.2.

**Pregnancy** Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. Azathioprine is teratogenic in animal studies.

There is less experience of ciclosporin in pregnancy but it does not appear to be any more harmful than azathioprine. The use of these drugs during pregnancy needs to be supervised in specialist units.

---

**8.2.2 Corticosteroids and other immunosuppressants**

**Immunosuppressants** no information available—manufacturer advises caution in severe impairment

**Pregnancy** important: teratogenic risk; see also notes above

**Breast-feeding** avoid during treatment and for 24 months after final dose

**Side-effects** nausea, vomiting, diarrhoea, constipation, abdominal pain, decreased appetite, weight loss, dehydration, dyspepsia, taste disturbances, malaise, amnorrhea, hyponatraemia, arthralgia, muscular-skeletal pain, muscle spasms, alopecia, abnormal hair growth, pruritus, rash

**Dose**

- **ADULT** over 18 years, 150 mg once daily

**Erivedge**® (Roche) ▼ [TAS]

Capsules, pink/grey, vismodegib 150 mg, net price 28-cap pack = £6285.00. Label: 25, counselling, pregnancy and contraception

**Note** Patient, prescriber, and supplying pharmacy must comply with the manufacturer’s pregnancy prevention programme
frequency of monitoring to at least every 3 months; reduce dose in elderly; interactions: Appendix 1 (azathioprine)

Bone marrow suppression Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. inexplicable bruising or bleeding, infection

Contra-indications see notes above; hypersensitivity to mercaptopurine

Hepatic impairment reduce dose; monitor liver function; see also Cautions

Renal impairment reduce dose; see also Cautions

Pregnancy treatment should not generally be initiated during pregnancy; see also p. 615

Breast-feeding present in milk in low concentration; no evidence of harm in small studies—use if potential benefit outweighs risk

Side-effects hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and interstitial nephritis—calling for immediate withdrawal); dose-related bone marrow suppression (see also Cautions); liver impairment, cholestatic jaundice, hair loss and increased susceptibility to infections and colitis in patients also receiving corticosteroids; nausea; rarely pancreatitis, pneumonitis, hepatic veno-occlusive disease, lymphoma, red cell aplasia—see notes above

Dose

• By mouth, or (if oral administration not possible—intravenous solution very irritant, see below) by intravenous injection over at least 1 minute (followed by 50 mL sodium chloride intravenous infusion), or by intravenous infusion

Autoimmune conditions, 1–3 mg/kg daily, adjusted according to response (consider withdrawal if no improvement within 3 months)

Suppression of transplant rejection, 1–2.5 mg/kg daily adjusted according to response

Note Azathioprine doses in BNF may differ from those in product literature

Note Intravenous injection is alkaline and very irritant, intravenous route should therefore be used only if oral route not feasible, see also Appendix 4

Azathioprine (Non-proprietary) Tablets, azathioprine 25 mg, net price 28-tab pack = £3.66; 50 mg, 56-tab pack = £3.42. Label: 21
Brands include Azasone®

Imuran® (Aspen) Tablets, both 1/2 c, azathioprine 25 mg (orange), net price 100-tab pack = £10.99; 50 mg (yellow), 100-tab pack = £7.99. Label: 21

Injection, powder for reconstitution, azathioprine (as sodium salt), net price 50-mg vial = £15.38

(risk of haemorrhage, ulceration and perforation); delayed graft function; increased susceptibility to skin cancer (avoid exposure to strong sunlight); interactions: Appendix 1 (mycophenolate)

Bone marrow suppression Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexplicable bruising or bleeding

Renal impairment no data available in cardiac or hepatic transplant patients with renal impairment

Pregnancy avoid—congenital malformations reported; effective contraception required before treatment, during treatment, and for 6 weeks after discontinuation of treatment; manufacturer of Myfortic® also advise that men should use condoms during treatment and for 13 weeks after last dose

Breast-feeding avoid—present in milk in animal studies

Side-effects taste disturbance, gingival hyperplasia, nausea, constipation, flatulence, anorexia, weight loss, vomiting, abdominal pain, gastro-intestinal inflammation, ulceration, and bleeding, hepatitis, jaundice, pancreatitis, stomatitis, oedema, tachycardia, hypertension, hypotension, vasodilatation, cough, dyspnoea, insomnia, agitation, confusion, depression, anxiety, convulsions, paraesthesia, myasthenic syndrome, tremor, dizziness, headache, influenza-like syndrome, infections, hyperglycaemia, renal impairment, malignancy (particularly of the skin), blood disorders (including leucopenia, anaemia, thrombocytopenia, pancytopenia, and red cell aplasia—see notes above), disturbances of electrolytes and blood lipids, arthralgia, alopecia, acne, skin hypertrophy, and rash; also reported intestinal villous atrophy, progressive multifocal leucencephalopathy, interstitial lung disease, pulmonary fibrosis

Dose

• Renal transplantation, by mouth, 1 g twice daily starting within 72 hours of transplantation or by intravenous infusion, 1 g twice daily starting within 24 hours of transplantation for max. 14 days (then transfer to oral therapy); CHILD and ADOLESCENT 2–18 years, by mouth 600 mg/m² twice daily (max. 2 g daily)

Note Tablets and capsules not appropriate for dose titration in children with body surface area less than 1.25 m²

• Cardiac transplantation, by mouth, ADULT over 18 years, 1.5 g twice daily starting within 5 days of transplantation

• Hepatic transplantation, by intravenous infusion, ADULT over 18 years, 1 g twice daily starting within 24 hours of transplantation for 4 days (up to max. 14 days), then by mouth, 1.5 g twice daily as soon as is tolerated

Mycophenolate Mofetil (Non-proprietary) Capsules, mycophenolate mofetil 250 mg, net price 100-cap pack = £82.26

Tablets, mycophenolate mofetil 500 mg, net price 50-tab pack = £11.82

Brands include Arznei®

CellCept® (Roche) Capsules, blue/brown, mycophenolate mofetil 250 mg, net price 100-cap pack = £82.26

Tablets, lavender, mycophenolate mofetil 500 mg, net price 50-tab pack = £82.26
8.2.2 Corticosteroids and other immunosuppressants

**Prednisolone** (section 6.3.2) is widely used in oncology. It has a marked antitumour effect in acute lymphoblastic leukaemia, Hodgkin’s disease, and the non-Hodgkin lymphomas. It has a role in the palliation of symptomatic end-stage malignant disease when it may enhance appetite and produce a sense of well-being (see also Prescribing in Palliative Care, p. 21).

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

**Ciclosporin** is a calcineurin inhibitor, and is a potent immunosuppressant which is virtually non-myelotoxic but markedly nephrotoxic. It has an important role in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, and for prophylaxis and treatment of graft-versus-host disease.

**Tacrolimus** is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects, but the incidence of neurotoxicity appears to be greater; cardiomyopathy has also been reported. Disturbance of glucose metabolism also appears to be significant.

**Sirolimus** is a non-calcineurin inhibiting immunosuppressant licensed for renal transplantation.

**Basiliximab** is a monoclonal antibody that acts as an interleukin-2 receptor antagonist and prevents T-lymphocyte proliferation; it is used for prophylaxis of acute rejection in allogeneic renal transplantation. It is given with ciclosporin and corticosteroid immunosuppression regimens; its use should be confined to specialist centres.

**Belatacept** is a fusion protein and co-stimulation blocker that prevents T-cell activation; it is licensed for prophylaxis of graft rejection in adults undergoing renal transplantation who are seropositive for the Epstein-Barr virus. It is used with interleukin-2 receptor antagonist induction, in combination with corticosteroids and a mycophenolic acid.

**Antithymocyte immunoglobulin** (rabbit) is licensed for the prophylaxis of organ rejection in renal and heart allograft recipients and for the treatment of corticosteroid-resistant allograft rejection in renal transplantation. Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

**NICE guidance**

**Immunosuppressive therapy for renal transplantation in adults** (September 2004)

**Immunosuppressive therapy for renal transplantation in children and adolescents** (April 2006)

For induction therapy in the prophylaxis of organ rejection, either basiliximab or daclizumab (discontinued) are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects.

Mycophenolate mofetil (mycophenolic acid) also available but not licensed for use in children, see above) is recommended as part of an immunosuppressive regimen only if:

- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney; or
- there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.

Sirolimus is recommended as a component of immunosuppressive regimen only if intolerance necessitates the withdrawal of a calcineurin inhibitor.

These recommendations may not be consistent with the marketing authorisation of some of the products. [www.nice.org.uk/TA85](http://www.nice.org.uk/TA85)
8 Malignant disease and immunosuppression

BASILIXIMAB
Indications  see notes above
Pregnancy  avoid—no information available; adequate contraception must be used during treatment and for 16 weeks after last dose.
Breast-feeding  avoid—no information available
Side-effects  severe hypersensitivity reactions and cytokine release syndrome have been reported

Dose  
- By intravenous injection or by intravenous infusion, 20 mg within 2 hours before transplant surgery and 20 mg 4 days after surgery; withhold second dose if severe hypersensitivity or graft loss occurs; CHILD and ADOLESCENT 1–17 years, body-weight under 35 kg, 10 mg within 2 hours before transplant surgery and 10 mg 4 days after surgery; body-weight over 35 kg, adult dose.

Simulect® (Novartis)  
Injection, powder for reconstitution, basiliximab, net price 10-mg vial = £758.69, 20-mg vial = £842.38 (both with water for injections). For intravenous infusion

BELATACEPT
Indications  see notes above
Cautions  increased risk of infection; risk factors for post-transplant lymphoproliferative disorder; avoid excessive exposure to UV light including sunlight; tapering of corticosteroid, particularly in patients with high immunologic risk—increased risk of acute graft rejection
Tuberculosis  Patients should be evaluated for latent and active tuberculosis before starting treatment, and monitored for signs and symptoms of tuberculous during and after treatment

Pregnancy  use only if essential; adequate contraception must be used during treatment and for up to 8 weeks after last dose

Breast-feeding  avoid—no information available

Side-effects (reported when used in combination with basiliximab, mycophenolate mofetil and corticosteroids) diarrhoea, constipation, nausea, vomiting, hypertension, peripheral oedema, cough, headache, pyrexia, infection, malignancy, anaemia, leucopenia, dehydration, hypophosphataemia; less commonly infusion related reactions, progressive multifocal leukoencephalopathy

Dose  
- Consult product literature

Nulojix® (Bristol-Myers Squibb)  
Intravenous infusion, powder for reconstitution, belatacept, net price 250-mg vial = £354.52

CICLOSPORIN (Cyclosporin)
Indications  see notes above, and under Dose; severe acute ulcerative colitis [unlicensed indication] (section 1.5.3), rheumatoid arthritis (section 10.1.3); atopic dermatitis and psoriasis (section 13.5.3)

Cautions  monitor kidney function—dose dependent increase in serum creatinine and urea during first few weeks may necessitate dose reduction in transplant patients (exclude rejection if kidney transplant) or discontinuation in non-transplant patients; monitor liver function (see Hepatic Impairment below); monitor blood pressure—discontinue if hypertension develops that cannot be controlled by anti-hypertensives; hyperuricaemia; monitor serum potassium especially in renal dysfunction (risk of hyperkalaemia); monitor serum magnesium; measure blood lipids before treatment and after the first month of treatment; use with tacrolimus specifically contraindicated; for patients other than transplant recipients, preferably avoid other immunosuppressants (increased risk of infection and malignancies, including lymphoma and skin cancer); avoid excessive exposure to UV light, including sunlight; interactions: Appendix 1 (ciclosporin)

Additional cautions  Atopic Dermatitis and Psoriasis, section 13.5.3; Rheumatoid Arthritis, section 10.1.3

Hepatic impairment  dosage adjustment based on bilirubin and liver enzymes may be needed

Renal impairment  dose as in normal renal function but see Cautions above; in nephrotic syndrome reduce dose by 25–50% if serum creatinine more than 30% above baseline on more than one measurement; in patients with nephrotic syndrome and renal impairment initially 2.5 mg/kg daily.

Pregnancy  crosses placenta; see Immunosuppressant Therapy, p. 615

Breast-feeding  present in milk—manufacturer advises avoid

Side-effects  anorexia, nausea, vomiting, abdominal pain, diarrhoea, gingival hyperplasia, hepatic dysfunction, hypertension, tremor, headache, paraesthesia, fatigue, renal dysfunction (renal structural changes on long-term administration, see also under Cautions); hyperuricaemia, hyperkalaemia, hypomagnesaemia, hyperlipidaemia, hypercholesterolaemia, muscle cramps, myalgia, hypertrichosis; less commonly oedema, weight gain, signs of encephalopathy, anaemia, thrombocytopenia; rarely pancreatitis, motor polyneuropathy, menstrual disturbances, gynaecomastia, microangiopathic haemolytic anaemia, haemolytic uraemic syndrome, hyperglycaemia, muscle weakness, myopathy, visual disturbances; secondary to benign intracranial hypertension (discontinue); also reported with infusion anaphylaxis

Dose  
- Organ transplantation, used alone, ADULT and CHILD over 3 months 10–15 mg/kg by mouth 4–12 hours before transplantation followed by 10–15 mg/kg daily for 1–2 weeks postoperatively then reduced gradually to 2–6 mg/kg daily for maintenance (dose should be adjusted according to blood-ciclosporin concentration and renal function); dose lower if given concomitantly with other immunosuppressant therapy (e.g. corticosteroids); if necessary one-third corresponding oral dose can be given by intravenous infusion over 2–6 hours

- Bone-marrow transplantation, prevention and treatment of graft-versus-host disease, ADULT and CHILD over 3 months 3–5 mg/kg daily by intravenous infusion over 2–6 hours from day before transplantation to 2 weeks postoperatively (or 12.5–15 mg/kg daily by mouth) then 12.5 mg/kg daily by mouth for 3–6 months then tailed off (may take up to a year after transplantation)

- Nephrotic syndrome, by mouth, 5 mg/kg daily in 2 divided doses; CHILD 6 mg/kg daily in 2 divided doses;
maintenance treatment reduce to lowest effective dose according to proteinuria and serum creatinine measurements; discontinue after 3 months if no improvement in glomerulonephritis or glomerulonephritis (after 6 months in membranous glomerulonephritis)

**Important**

Patients should be stabilised on a particular brand of oral ciclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-ciclosporin concentration. Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch to a different brand of ciclosporin, the patient should be monitored closely for changes in blood-ciclosporin concentration, serum creatinine, blood pressure, and transplant function.

**Cappedo**<sup>®</sup> (Mylan) <sup>®</sup>

**Capsules**, ciclosporin 25 mg (grey), net price 30-cap pack = £13.50; 50 mg (white), 30-cap pack = £25.65; 100 mg (grey), 30-cap pack = £51.30. Counselling, administration

Excipients include propylene glycol (see Excipients, p. 2)

Note Contains ethanol

Counselling Total daily dose should be taken in 2 divided doses

**Capsorin**<sup>®</sup> (Morningside) <sup>®</sup>

**Capsules**, ciclosporin 25 mg (grey), net price 30-cap pack = £13.11; 50 mg (white), 30-cap pack = £26.80; 100 mg (grey), 30-cap pack = £51.90. Counselling, administration

Note Contains ethanol

Counselling Total daily dose should be taken in 2 divided doses

**Deximune**<sup>®</sup> (Dexcel) <sup>®</sup>

**Capsules**, grey, ciclosporin 25 mg, net price 30-cap pack = £13.06; 50 mg 30-cap pack = £26.80; 100 mg 30-cap pack = £51.90. Counselling, administration

Note Contains ethyl lactate which is metabolised to ethanol

Counselling Total daily dose should be taken in 2 divided doses

**Neoral**<sup>®</sup> (Novartis) <sup>®</sup>

**Capsules**, ciclosporin 10 mg (yellow/white), net price 60-cap pack = £19.40; 25 mg (blue/grey), 30-cap pack = £19.52; 50 mg (yellow/white), 30-cap pack = £38.23; 100 mg (blue/grey), 30-cap pack = £72.57. Counselling, administration

Excipients include propylene glycol (see Excipients, p. 2)

Note Contains ethanol

Oral solution, yellow, sugar-free, ciclosporin 100 mg/mL, net price 50 mL = £108.73. Counselling, administration

Excipients include propylene glycol (see Excipients, p. 2)

Note Contains ethanol

Counselling Total daily dose should be taken in 2 divided doses

Mix solution with orange juice (or squash) or apple juice (to improve taste) or with water immediately before taking (and rinse with more to ensure total dose). Do not mix with grapefruit juice. Keep medicine measure away from other liquids (including water)

**Sandimmun**<sup>®</sup> (Novartis) <sup>®</sup>

**Concentrate for intravenous infusion** (oily), ciclosporin 50 mg/mL. To be diluted before use, net price 1-mL amp = £1.94; 5-mL amp = £9.17

Excipients include polysorbate castor oil (risk of anaphylaxis, see Excipients, p. 2)

Note Contains ethanol

Note Observe patients for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter

Note Sandimmun<sup>®</sup> capsules and oral solution are available direct from Novartis for patients who cannot be transferred to a different oral preparation

**SIROLIMUS**

**Indications** prophylaxis of organ rejection in kidney allograft recipients (initially in combination with ciclosporin and corticosteroid, then with corticosteroid only); see also under Dose

**Cautions** monitor kidney function when given with ciclosporin; monitor whole blood-sirolimus trough concentration (Afro-Caribbean patients may require higher doses); hyperlipidaemia (monitor lipids); monitor urine proteins; increased susceptibility to infection (especially urinary-tract infection); increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light); interactions: Appendix 1 (sirolimus)

**Hepatic impairment** monitor whole blood-sirolimus level closely and consult local treatment protocol; clearance reduced in mild to moderate impairment; in severe impairment decrease dose by 50% and monitor whole blood-sirolimus trough concentration every 5–7 days until 3 consecutive measurements have shown stable blood-sirolimus concentration

**Pregnancy** avoid unless essential—(toxicity in animal studies); effective contraception must be used during treatment and for 12 weeks after stopping

**Breast-feeding** discontinue breast-feeding

**Side-effects** abdominal pain, constipation, nausea, diarrhoea, ascites, stomatitis; oedema, tachycardia, hypertension, hypercholesterolaemia, hypertriglyceridaemia, venous thromboembolism; pleural effusion, pneumonitis; headache; pyrexia; proteinuria, haemolytic uraemic syndrome; anaemia, thrombocytopenia, thrombotic thrombocytopenic purpura, leucopenia, neutropenia, hypokalaemia, hypophosphataemia, hyperglycaemia, lymphocele; arthralgia, osteonecrosis; epistaxis; acne, rash, impaired healing; less commonly pancreatitis, pulmonary embolism, pulmonary haemorrhage, pericardial effusion, nephrotic syndrome, pancytopenia; rarely interstitial lung disease, alveolar proteinosis, hepatic necrosis, lymphoedema, and hypersensitivity reactions including anaphylactic reactions, angioedema, exfoliative dermatitis, and hypersensitivity vasculitis; focal segmental glomerulosclerosis and reversible impairment of male fertility also reported

**Dose**

- Initially 6 mg, after surgery (once wound has healed), then 2 mg once daily (dose adjusted according to whole blood-sirolimus trough concentration) in combination with ciclosporin and corticosteroid for 2–3 months (sirolimus given 4 hours after ciclosporin); ciclosporin should then be withdrawn over 4–8 weeks (if not possible, sirolimus should be discontinued and an alternate immunosuppressive regimen used)

Note Manufacturer advises pre-dose (‘tough’) whole blood-sirolimus concentration (using chromatographic
8.2.2 Corticosteroids and other immunosuppressants

**Malignant disease and immunosuppression**

**Side-effects**
nausea, vomiting, diarrhoea, constipation—present in breast milk

**Breast-feeding**
exclude before treatment; avoid unless

**Pregnancy**
Hepatic impairment
dose reduction may be necessary in severe impairment

**Cautions**
monitor blood pressure, ECG (including visual) parameters, electrolytes, hepatic concentration, haematological and neurological parameters, fasting blood-glucose concentration after 1–2 weeks is recommended

**Contra-indications**
hypersensitivity to macrolides; avoid concurrent administration with ciclosporin (care if patient has previously received ciclosporin)

**Hepatic impairment**
dose reduction may be necessary in severe impairment

**Pregnancy**
exclude before treatment; avoid unless potential benefit outweighs risk—risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia

**Breast-feeding**
avoid—present in breast milk

**Side-effects**
nausea, vomiting, diarrhoea, constipation, dyspepsia, flatulence, bloating, weight changes, anorexia, gastro-intestinal inflammation, ulceration, and perforation, hepatic dysfunction, jaundice, cholestasis, ascites, bile-duct abnormalities, oedema, tachycardia, hypertension, haemorrhage, thrombembolic and ischaemic events, dyspnoea, pleural effusion, parenchymal lung disorders, sleep disturbances, tremor, headache, peripheral neuropathy, mood changes, depression, confusion, anxiety, psychosis, seizures, paraesthesia, dizziness, renal impairment, renal failure, renal tubular necrosis, urinary abnormalities, hyperglycaemia, electrolyte disturbances (including hyperkalaemia, hypokalaemia, and hyperuricaemia), blood disorders (including anaemia, leucopenia, pancytopenia, and thrombocytopenia), arthralgia, muscle cramp, visual disturbances, photophobia, tinnitus, impaired hearing, alopecia, sweating, acne; *less commonly* paralytic ileus, gastro-intestinal reflux disease, peritonitis, pancreatitis, heart failure, arrhythmia, cardiac arrest, cerebrovascular accident, cardiomyopathy (important: see Cardiomyopathy below), palpitation, respiratory failure, coma, speech disorder, amnesia, paralysis, influenza-like symptoms, encephalopathy, coagulation disorders, photosensitivity, cataretar, hypoglycaemia, dysmenorrhoea, hypertonia, dermatitis; *rarely* pericardial effusion, respiratory distress syndrome, posterior reversible encephalopathy syndrome, dehydration, thrombotic thrombocytopenic purpura, blindness, toxic epidermal necrolysis, hirsutism; very rarely myasthenia, haemorrhagic cystitis, Stevens-Johnson syndrome; *also reported* pure red cell aplasia, agranulocytosis, haemolytic anaemia

**Cardiomyopathy**
Cardiomyopathy has been reported in children. Patients should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur

**Dose**
See under preparations

**MHRA/CHM advice**
Oral tacrolimus products: prescribe and dispense by brand name only, to minimise the risk of inadvertent switching between products, which has been associated with reports of toxicity and graft rejection (June 2012)

Inadvertent switching between oral tacrolimus products has been associated with reports of toxicity and graft rejection. To ensure maintenance of therapeutic response when a patient is stabilised on a particular brand, oral tacrolimus products should be prescribed and dispensed by brand name only.

- Adoport®
- Prograf®
- Capex®
- Tacni®
- Vivanex®

are immediate-release capsules that are taken twice daily, once in the morning and once in the evening;

- Modigraf®
- Moditrol®

are immediate-release capsules that are taken twice daily, once in the morning and once in the evening;

- Adavagraf®

is a prolonged-release capsule that is taken once daily in the morning.

Switching between tacrolimus brands requires careful supervision and therapeutic monitoring by an appropriate specialist.

**Adoport®** (Sandоз)
Capsules, tacrolimus (as monohydrate) 500 micrograms (white/ivory), net price 50-cap pack = £42.92; 1 mg (white/brown), 50-cap pack = £55.69,
Corticosteroids and other immunosuppressants

8.2.2 Tacrolimus

**Capexion**® (Generics) (BNF 68 p. 413)

**Capsules**, tacrolimus 500 micrograms, (ivory), net price 50-cap pack = £52.50; 1 mg (white), 50-cap pack = £88.20, 100-cap pack = £136.20; 5 mg (red), 50-cap pack = £252.00. Label: 23, counselling, driving

**Note** Tacrolimus is incompatible with PVC

**Dose** liver transplantation, starting 12 hours after transplantation, by mouth, 100–200 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Renal transplantation, starting within 24 hours of transplantation, by mouth, 200–300 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Heart transplantation with antibody induction (starting within 5 days of transplantation) or without antibody induction (starting within 12 hours of transplantation), by mouth, 75 micrograms/kg daily in 2 divided doses; CHILD, with antibody induction (starting within 5 days of transplantation), 100–300 micrograms/kg daily in 2 divided doses, without antibody induction (starting within 12 hours of transplantation), 300 micrograms/kg daily in 2 divided doses as soon as clinically possible (8–12 hours after discontinuing intravenous infusion)

Maintenance treatment, dose adjusted according to response and whole blood concentration

Rejection therapy, seek specialist advice

**Modigraf**® (Astellas) (Modigraf®)

**Granules**, tacrolimus (as monohydrate), 200 micrograms, net price 50-sachet pack = £71.30; 1 mg, 50-sachet pack = £356.65. Label: 13, 23, counselling, driving

**Note** Tacrolimus is incompatible with PVC

**Dose** liver transplantation, starting 12 hours after transplantation, by mouth, 100–200 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Renal transplantation, starting within 24 hours of transplantation, by mouth, 200–300 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Heart transplantation with antibody induction (starting within 5 days of transplantation) or without antibody induction (starting within 12 hours of transplantation), by mouth, 75 micrograms/kg daily in 2 divided doses; CHILD, with antibody induction (starting within 5 days of transplantation), 100–300 micrograms/kg daily in 2 divided doses, without antibody induction (starting within 12 hours of transplantation), 300 micrograms/kg daily in 2 divided doses as soon as clinically possible (8–12 hours after discontinuing intravenous infusion)

Maintenance treatment, dose adjusted according to response and whole blood concentration

Rejection therapy, seek specialist advice

**Tacni**® (TEVA UK) (BNF 68 p. 2)

**Capsules**, tacrolimus 500 micrograms (ivory), net price 50-cap pack = £50.48; 1 mg (white), 50-cap pack = £65.49, 100-cap pack = £130.99; 5 mg (red), 50-cap pack = £252.00. Label: 23, counselling, driving

**Note** Tacrolimus is incompatible with PVC

**Dose** liver transplantation, starting 12 hours after transplantation, by mouth, 100–200 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Renal transplantation, starting within 24 hours of transplantation, by mouth, 200–300 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Heart transplantation with antibody induction (starting within 5 days of transplantation) or without antibody induction (starting within 12 hours of transplantation), by mouth, 75 micrograms/kg daily in 2 divided doses; CHILD, with antibody induction (starting within 5 days of transplantation), 100–300 micrograms/kg daily in 2 divided doses, without antibody induction (starting within 12 hours of transplantation), 300 micrograms/kg daily in 2 divided doses as soon as clinically possible (8–12 hours after discontinuing intravenous infusion)

Maintenance treatment, dose adjusted according to response and whole blood concentration

Rejection therapy, seek specialist advice
Malignant disease and immunosuppression

8 Malignant disease and immunosuppression

Advagraf® (Astellas) (IV)

Capsules, tacrolimus 500 micrograms (ivory), net price 50-cap pack = £66.39; 1 mg (white), 50-cap pack = £60.21; 100-cap pack = £120.41; 5 mg (red), 50-cap pack = £222.44. Label: 23, counselling, driving

Note Tacrolimus is incompatible with PVC

Dose Liver transplantation, starting 12 hours after transplantation, by mouth, 100–200 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Renal transplantation, starting within 24 hours of transplantation, by mouth, 200–300 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Heart transplantation with antibody induction (starting within 5 days of transplantation) or without antibody induction (starting within 12 hours of transplantation), by mouth, 75 micrograms/kg daily in 2 divided doses; CHILD, with antibody induction (starting within 5 days of transplantation), 100–300 micrograms/kg daily in 2 divided doses; without antibody induction (starting within 12 hours of transplantation), 300 micrograms/kg daily in 2 divided doses as soon as clinically possible (8–12 hours after discontinuing intravenous infusion)

Maintenance treatment, dose adjusted according to response and whole blood concentration

Rejection therapy, seek specialist advice

Vivadex® (Dexcel) (IV)

Capsules, tacrolimus 500 micrograms (ivory), net price 50-cap pack = £46.41; 1 mg (white), 50-cap pack = £60.21; 100-cap pack = £120.41; 5 mg (red), 50-cap pack = £222.44. Label: 23, counselling, driving

Note Tacrolimus is incompatible with PVC

Dose Liver transplantation, starting 12 hours after transplantation, by mouth, 100–200 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Renal transplantation, starting within 24 hours of transplantation, by mouth, 200–300 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Heart transplantation with antibody induction (starting within 5 days of transplantation) or without antibody induction (starting within 12 hours of transplantation), by mouth, 75 micrograms/kg daily in 2 divided doses; CHILD, with antibody induction (starting within 5 days of transplantation), 100–300 micrograms/kg daily in 2 divided doses; without antibody induction (starting within 12 hours of transplantation), 300 micrograms/kg daily in 2 divided doses as soon as clinically possible (8–12 hours after discontinuing intravenous infusion)

Maintenance treatment, dose adjusted according to response and whole blood concentration

Rejection therapy, seek specialist advice

Modified release

Advagraf® (Astellas) (IV)

Capsules, m/r, tacrolimus (as monohydrate)

500 micrograms (yellow/orange), net price 50-cap pack = £35.79; 1 mg (white/orange), 50-cap pack = £71.59, 100-cap pack = £143.17; 3 mg (orange), 50-cap pack = £214.76; 5 mg (red/orange), 50-cap pack = £266.92. Label: 23, 25, counselling, driving

Note Tacrolimus is incompatible with PVC

Dose Liver transplantation, starting 12–18 hours after transplantation, by mouth, 100–200 micrograms/kg once daily in the morning

Renal transplantation, starting within 24 hours of transplantation, by mouth, 200–300 micrograms/kg once daily in the morning

Rejection therapy, seek specialist advice

CHILD not recommended

8.2.3 Anti-lymphocyte monoclonal antibodies

Anti-lymphocyte monoclonal antibodies

The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes. Infusion-related side-effects (including cytokine release syndrome) are reported commonly with anti-lymphocyte monoclonal antibodies and occur predominantly during the first infusion; they include fever and chills, nausea and vomiting, allergic reactions (such as rash, pruritus, angioedema, bronchospasm and dyspnoea), flushing and tumour pain. Patients should receive premedication before administration of anti-lymphocyte monoclonal antibodies to reduce these effects—consult product literature for details of individual regimens. The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management. Evidence of pulmonary infiltration and features of tumour lysis syndrome should be sought if infusion-related effects occur.

Fatalities following severe cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of anti-lymphocyte monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored very closely (and a slower rate of infusion considered).

Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking ofatumumab and rituximab. All patients should be screened before treatment. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

Alemtuzumab is licensed for the treatment of adults with relapsing-remitting multiple sclerosis with active disease defined by clinical or imaging features. It is not recommended for inactive or stable disease. Pretreatment before administration is required (consult product literature) and all patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course. Screening patients at high risk of hepatitis B or C is recommended before treatment—patients who are carriers should be treated with caution. HPV screening should be carried out annually in female patients. In patients with active infection, a delay in initiation of alemtuzumab treatment should be considered until the infection is fully controlled, and all patients should be evaluated for active or latent tuberculosis before starting alemtuzumab treatment. The risk of autoimmune mediated conditions may increase during treatment, including immune thrombocytopenic purpura, thyroid disorders, nephropathies, and cytopneas, and should be monitored for throughout the course of treatment (consult product literature). Patients with previous autoimmune conditions other than multiple sclerosis should be treated with caution. Alemtuzumab should be given under the care of a specialist with facilities for the management of hypersensitivity and anaphylactic reactions. Although no longer licensed for oncological and transplant indications, alemtuzumab is also available through a patient access programme for these indications.

NICE guidance

Alemtuzumab for treating relapsing-remitting multiple sclerosis (May 2014)

Alemtuzumab is recommended as an option, within its marketing authorisation, for treating adults with active relapsing-remitting multiple sclerosis

www.nice.org.uk/TA312

Rituximab is licensed for the treatment of chemotherapy-resistant or relapsed stage III–IV follicular non-Hodgkin’s lymphoma and, in combination with other
Rituximab should be used with caution in patients receiving cardiotoxic chemotherapy or with a history of cardiovascular disease because exacerbation of angina, arrhythmia, and heart failure have been reported. The use of rituximab for the treatment of granulomatosis with polyangiitis or microscopic polyangiitis is contra-indicated in patients with severe heart failure or severe, uncontrolled heart disease. Transient hypotension occurs frequently during infusion and anti-hypertensives may need to be withheld for 12 hours before infusion. Progressive multifocal leucoencephalopathy (which is usually fatal or causes severe disability) has been reported in association with rituximab; patients should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal leucoencephalopathy is suspected, suspend treatment until it has been excluded. Severe (including fatal) skin reactions, including toxic epidermal necrolysis and Stevens-Johnson syndrome have been fatal. Skin reactions occur. Rituximab should be used with caution to or unable to receive cyclophosphamide.

The Scottish Medicines Consortium (p. 4) has advised (August 2013) that Rituximab (MabThera®) is accepted for restricted use within NHS Scotland, in combination with glucocorticoids for the induction of remission in adult patients with severe, active granulomatosis with polyangiitis (Wegener’s) and microscopic polyangiitis (see SMC guidance and NICE guidance below). Full resuscitation facilities should be at hand and as with other cytotoxics, treatment should be undertaken under the close supervision of a specialist. See section 10.1.3 for the role of rituximab in rheumatoid arthritis.

NICE guidance

Rituximab in combination with glucocorticoids for treating anti-neutrophil cytoplasmic antibody-associated vasculitis (March 2014)

Rituximab, in combination with glucocorticoids, is recommended as an option for inducing remission in adults with anti-neutrophil cytoplasmic antibody (ANCA)-associated vasculitis (severely active granulomatosis with polyangiitis [Wegener’s] and microscopic polyangiitis), only if:

- further cyclophosphamide treatment would exceed the maximum cumulative cyclophosphamide dose, or
- cyclophosphamide is contraindicated or not tolerated, or
- the patient has not completed their family, and treatment with cyclophosphamide may materially affect their fertility, or
- the disease has remained active or progressed despite a course of cyclophosphamide lasting 3–6 months, or
- the patient has had uroepithelial malignancy.

www.nice.org.uk/TA308

Rituximab for the first-line treatment of stage III-IV follicular lymphoma (January 2012)

Rituximab, in combination with:

- cyclophosphamide, vincristine and prednisolone (CVP);
- cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP);
- mitoxantrone, chlorambucil and prednisolone (MCP);
- cyclophosphamide, doxorubicin, etoposide, prednisolone and interferon-alfa (CHVPi); or
- chlorambucil

is recommended as an option for the treatment of symptomatic stage III and IV follicular lymphoma in previously untreated patients.

www.nice.org.uk/TA243

Rituximab for the treatment of relapsed or refractory stage III or IV follicular non-Hodgkin’s lymphoma (February 2008)

Rituximab, in combination with chemotherapy, is an option for the induction of remission in patients with relapsed stage III or IV follicular non-Hodgkin’s lymphoma.

Rituximab monotherapy as maintenance therapy is an option for the treatment of patients with relapsed stage III or IV follicular non-Hodgkin’s lymphoma in remission induced with chemotherapy (with or without rituximab).

Rituximab monotherapy is an option for the treatment of patients with relapsed or refractory stage III or IV follicular non-Hodgkin’s lymphoma, when all alternative treatment options have been exhausted (that is, if there is resistance to or intolerance of chemotherapy).

Malignant disease and immunosuppression

8 8.2.3 Anti-lymphocyte monoclonal antibodies

**NICE guidance**

**Rituximab for the treatment of relapsed or refractory chronic lymphocytic leukaemia (July 2010)**

Rituximab in combination with fludarabine and cyclophosphamide is recommended as a treatment option for people with relapsed or refractory chronic lymphocytic leukaemia except when the condition:
- is refractory to fludarabine (that is, it has not responded to fludarabine, or has relapsed within 6 months of treatment), or
- has previously been treated with rituximab, unless it was in the context of a clinical trial, at a dose lower than the dose currently licensed for chronic lymphocytic leukaemia or with chemotherapy other than fludarabine and cyclophosphamide.

Rituximab in combination with fludarabine and cyclophosphamide is recommended only in the context of research for patients with relapsed or refractory chronic lymphocytic leukaemia that has previously been treated with rituximab, unless rituximab has been given as specified above.

www.nice.org.uk/TA193

**NICE guidance**

**Rituximab for the first-line maintenance treatment of follicular non-Hodgkin’s lymphoma (June 2011)**

Rituximab maintenance therapy is recommended as an option for the treatment of patients with follicular non-Hodgkin’s lymphoma that has responded to first-line induction therapy with rituximab in combination with chemotherapy.

www.nice.org.uk/TA226

**NICE guidance**

**Rituximab for the first-line treatment of chronic lymphocytic leukaemia (July 2009)**

Rituximab, in combination with fludarabine and cyclophosphamide, is recommended as an option for the first-line treatment of chronic lymphocytic leukaemia.

www.nice.org.uk/TA174

**NICE guidance**

**Rituximab for aggressive non-Hodgkin’s lymphoma (September 2003)**

Rituximab, in combination with cyclophosphamide, doxorubicin, vincristine, and prednisolone, is recommended for first-line treatment of CD20-positive diffuse large-B-cell lymphoma at clinical stage II, III or IV.

The use of rituximab for localised (stage I) disease should be limited to clinical trials.

www.nice.org.uk/TA65

**NICE guidance**

**Ofatumumab for the treatment of chronic lymphocytic leukaemia refractory to fludarabine and alemtuzumab (October 2010)**

Ofatumumab is not recommended for the treatment of chronic lymphocytic leukaemia that is refractory to fludarabine and alemtuzumab.

Patients currently receiving ofatumumab for this condition should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA202

**ALEMTUZUMAB**

**Indications** see notes above

**Cautions** see notes above—for full details consult product literature; **interactions:** Appendix 1 (alemtuzumab)

**Alert card** Patients should be provided with a Patient Alert Card and Patient Guide

**Contra-indications** human immunodeficiency virus

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. Autoimmune thyroid disease during treatment may affect fetus (consult product literature); women of childbearing potential should use effective contraception during and for 4 months after treatment

**Breast-feeding** manufacturer advises avoid during and for 4 months after each treatment course unless potential benefit outweighs risk

**Side-effects** see notes above—for full details (including monitoring and management of side-effects) consult product literature

**Dose**
- Consult product literature
  - Important Patients should receive premedication before administration (consult product literature for details)

**Lemtrada®** (Genzyme) [500] Concentrate for intravenous infusion, alemtuzumab 10 mg/mL, net price 1.2-mL vial = £7045.00

**OFATUMUMAB**

**Indications** see notes above

**Cautions** see notes above—for full details consult product literature

**Contra-indications** consult product literature

**Renal impairment** no information available for creatinine clearance less than 30 mL/minute

**Pregnancy** avoid unless potential benefit outweighs risk; use effective contraception during and for 12 months after treatment

**Breast-feeding** discontinue breast-feeding during and for 12 months after treatment—no information available

**Side-effects** see notes above—for full details (including monitoring and management of side-effects) consult product literature

**Dose**
- See Doses, p. 563
  - Important Patients should receive premedication before each dose (consult product literature for details)
8.2.4 Other immunomodulating drugs

Interferon alfa

Interferon alfa has shown some antitumour effect in certain lymphomas and solid tumours. Interferon alfa preparations are also used in the treatment of chronic hepatitis B, and chronic hepatitis C ideally in combination with ribavirin (see section 5.3.3). Side-effects are dose-related, but commonly include anorexia, nausea, diarrhoea, influenza-like symptoms, and lethargy. Ocular side-effects and depression (including monitoring and management of side-effects) consult product literature.

Dose

- See Doses, p. 563
- Important Patients should receive premedication before each dose (consult product literature for details)

MabThera® (Roche) (Pf)

Concentrate for intravenous infusion, rituximab

10 mg/mL, net price 10-mL vial = £174.63, 50-mL vial = £873.15

PEGINTERFERON ALFA

Indications see under preparations

Cautions consult product literature; interactions: Appendix 1 (interferons)

Contra-indications consult product literature; avoid injections containing benzyl alcohol (see under preparations below)

Hepatic impairment close monitoring in mild to moderate impairment; avoid if severe

Renal impairment close monitoring required; avoid in severe impairment

Pregnancy avoid unless potential benefit outweighs risk (toxicity in animal studies); effective contraception required during treatment—consult product literature

Breast-feeding unlikely to be harmful

Side-effects see notes above and consult product literature

Dose

- Consult product literature

IntronA® (MSD) (Pf)

Injection, interferon alfa-2b (rbe) 10 million units/mL, net price 1-mL vial = £41.55, 2.5-mL vial = £103.94. For subcutaneous injection or intravenous infusion

Injection pen, interferon alfa-2b (rbe), net price 15 million units/mL, 1.5-mL cartridge = £74.83; 25 million units/mL, 1.5-mL cartridge = £124.72; 50 million units/mL, 1.5-mL cartridge = £249.45. For subcutaneous injection

Note Each 1.5-mL multidose cartridge delivers 12 doses of 0.1 mL i.e. a total of 1.2 mL.

For chronic myelogenous leukaemia (as monotherapy or in combination with cytarabine), hairy cell leukaemia, follicular lymphoma, lymph or liver metastases of carcinoid tumour, chronic hepatitis B, chronic hepatitis C, adjunct to surgery in malignant melanoma and maintenance of remission in multiple myeloma

Roferon-A® (Roche) (Pf)

Injection, interferon alfa-2a (rbe), net price 6 million units/mL, 0.5-mL (3 million-unit) prefilled syringe = £14.20; 9 million units/mL, 0.5-mL (4.5 million-unit) prefilled syringe = £21.29; 12 million units/mL, 0.5-mL (6 million-unit) prefilled syringe = £28.37; 18 million units/mL, 0.5-mL (9 million-unit) prefilled syringe = £42.57. For subcutaneous injection

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

For AIDS-related Kaposi’s sarcoma, hairy cell leukaemia, chronic myelogenous leukaemia, advanced renal cell carcinoma, progressive cutaneous T-cell lymphoma, chronic hepatitis B and chronic hepatitis C, follicular non-Hodgkin’s lymphoma, adjunct to surgery in malignant melanoma

 peginterferon alfa-2a and peginterferon alfa-2b are available; pegylation increases the persistence of the interferon in the blood. The peginterferons are licensed for the treatment of chronic hepatitis C, ideally in combination with ribavirin (see section 5.3.3.2). Peginterferon alfa-2a is also licensed for the treatment of chronic hepatitis B. For use of interferon alfa and peginterferon alfa in children see BNF for Children

NICE guidance (peginterferon alfa, interferon alfa, and ribavirin for chronic hepatitis C)

See p. 429
8 Malignant disease and immunosuppression

Side-effects

Side-effects reported most frequently

Contra-indications

Avoid treatment with interferon in severe myelosupression. Patients should be monitored in those with suicidal ideation, seizures, or disorders, depressive disorders (avoid in severe depression, neuropsychiatric disorders, mood and personality changes, suicide attempts, confusion and convulsions; alopecia, hepatitis, nephrotic syndrome, and thyroid dysfunction have been reported rarely with interferon beta-1b.

CAUTIONS

Intra-muscular injection is not recommended for patients with decompensated liver disease.

Provision of disease-modifying therapies for multiple sclerosis

The Department of Health, the National Assembly for Wales, the Scottish Executive, the Northern Ireland Department of Health, Social Services & Public Safety, and the manufacturers have reached agreement on a risk-sharing scheme for the NHS supply of interferon beta and glatiramer acetate for multiple sclerosis. Health Service Circular (HSC 2002/004) explains how patients can participate in the scheme. It is available on the Department of Health website (www.dh.gov.uk).

Parliamentary and public health

Avonex® (Biogen) (MSD)

Injection, interferon beta-1a 60 micrograms (12 million units)/mL, net price 0.5-mL (30-microgram, 6 million-unit) prefilled syringe = £163.50; 0.5-mL (30-microgram, 6 million-unit) prefilled pen = £107.76, 180-microgram prefilled pen = £199.38 (with needles and swabs). For subcutaneous injection Excipients include benzyl alcohol (avoid in neonates, see Excipients, p). Combined with ribavirin for chronic hepatitis C, as monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated (see section 5.3.3.2), as monotherapy for chronic hepatitis B

NICE guidance

Interferon beta and glatiramer for multiple sclerosis (January 2002)

Interferon beta and glatiramer acetate are not recommended for the treatment of multiple sclerosis in the NHS in England and Wales. Patients who are currently receiving interferon beta or glatiramer acetate for multiple sclerosis, whether as routine therapy or as part of a clinical trial, should have the option to continue treatment until they and their consultant consider it appropriate to stop, having regard to the established criteria for withdrawal from treatment.

www.nice.org.uk/TA32

INTERFERON BETA

Indications see notes above and under preparations

Cautions see notes above and consult product literature

Contra-indications see notes above and consult product literature

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy avoid unless potential benefit outweighs risk (toxicity in animal studies), effective contraception required during treatment—consult product literature

Breast-feeding avoid—no information available

Side-effects see notes above and consult product literature

Dose • See under preparations

Avonex® (Biogen) (MSD)

Injection, interferon beta-1a 60 micrograms (12 million units)/mL, net price 0.5-mL (30-microgram, 6 million-unit) prefilled syringe = £163.50; 0.5-mL (30-microgram, 6 million-unit) prefilled pen = £107.76, 180-microgram prefilled pen = £199.38 (with needles and swabs). For subcutaneous injection Excipients include benzyl alcohol (avoid in neonates, see Excipients, p). Combined with ribavirin for chronic hepatitis C, as monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated (see section 5.3.3.2), as monotherapy for chronic hepatitis B

Interferon beta

Interferon beta is licensed for use in patients with relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided. Not all patients respond and a deterioration in the bouts has been observed in some. It is also licensed for use in patients with a single demyelinating event with an active inflammatory process, if it is severe enough to require treatment with an intravenous corticosteroid, and they are at high risk of developing multiple sclerosis. Interferon beta-1b is also licensed for use in patients with secondary progressive multiple sclerosis but its role in this condition has not been confirmed.

Cautions Caution is advised in those with severe hepatic or renal impairment or a history of cardiac disorders, depressive disorders (avoid in severe depression or in those with suicidal ideation), seizures, or severe myelosupression. Patients should be monitored for signs of hepatic injury and nephrotic syndrome.

Contra-indications Avoid treatment with interferon beta in patients with severe depressive illness or those with decompensated liver disease.

Side-effects Side-effects reported most frequently include irritation at injection site (including inflammation, hypersensitivity, necrosis) and influenza-like symp-

toms (fever, chills, myalgia, or malaise) but these decrease over time; nausea and vomiting occur occasionally. Other side-effects include hypersensitivity reactions (including anaphylaxis and urticaria), blood disorders, menstrual disorders, mood and personality changes, suicide attempts, confusion and convulsions; alopecia, hepatitis, nephrotic syndrome, and thyroid dysfunction have been reported rarely with interferon beta-1b.

ViraferonPeg® (MSD) (PegValstar®)

Injection, peginterferon alfa-2b (rbe), net price 50-microgram pen = £66.46, 80-microgram pen = £100.34, 100-microgram pen = £132.92, 120-microgram pen = £159.51, 150-microgram pen = £199.38 (all with needles and swabs). For subcutaneous injection Excipients include benzyl alcohol (avoid in neonates, see Excipients, p). Combined with ribavirin for chronic hepatitis C, as monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated (see section 5.3.3.2), as monotherapy for chronic hepatitis B

Consult product literature

Dose • Consult product literature

Hepatic impairment avoid in severe impairment

Renal impairment close monitoring required—reduce dose in moderate to severe impairment; consult product literature

Pregnancy manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in animal studies); effective contraception required during treatment—consult product literature

Breast-feeding manufacturers advise avoid—no information available

Side-effects see notes above and consult product literature

Dose • Consult product literature

Pegasys® (Roche) (PE)

Injection, peginterferon alfa-2a (rbe), net price 90-microgram prefilled syringe = £76.51, 135-microgram prefilled syringe = £107.76, 180-microgram prefilled syringe = £124.40; 135-microgram prefilled pen = £107.76, 180-microgram prefilled pen = £124.40. For subcutaneous injection

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p). Combined with ribavirin for chronic hepatitis C, as monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated (see section 5.3.3.2), as monotherapy for chronic hepatitis B

Note For intramuscular injection

Note For intramuscular injection
Interferon gamma

Interferon gamma-1b is licensed to reduce the frequency of serious infection in chronic granulomatous disease and in severe malignant osteopetrosis.

**INTERFERON GAMMA-1b** (Immune interferon)

**Indications** see notes above

**Cautions** seizure disorders (including seizures associated with fever); cardiac disease (including ischaemia, congestive heart failure, and arrhythmias); monitor before and during treatment: haematological tests (including full blood count, differential white cell count, and platelet count), blood chemistry tests (including renal and liver function tests) and urinalysis; avoid simultaneous administration of foreign proteins including immunological products (risk of exaggerated immune response); **Interactions:** Appendix 1 (interferons)

**Hepatic impairment** manufacturer advises caution in severe impairment—risk of accumulation

**Renal impairment** manufacturer advises caution in severe impairment—risk of accumulation

**Pregnancy** manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in animal studies); effective contraception required during treatment—consult product literature

**Breast-feeding** manufacturers advise avoid—no information available

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain; headache, fatigue, fever, chills, depression; myalgia, arthralgia; rash, injection-site reactions; rarely confusion and systemic lupus erythematosus; also reported, neutropenia, thrombocytopenia, proteinuria and raised liver enzymes

**Dose**

- See under preparation

Immukin® (Boehringer Ingelheim) **Injection**, recombinant human interferon gamma-1b 200 micrograms/mL, net price 0.5-mL vial = £75.00

**Dose** by subcutaneous injection, 50 micrograms/m² 3 times a week; patients with body surface area of 0.5 m² or less, 1.5 micrograms/kg 3 times a week; not yet recommended for children under 6 months with chronic granulomatous disease

Aldesleukin

Aldesleukin (recombinant interleukin-2) is licensed for metastatic renal cell carcinoma excluding patients in whom all three of the following prognostic factors are present: performance status of Eastern Co-operative Oncology Group of 1 or greater, more than one organ present: performance status of Eastern Co-operative Oncology Group of 1 or greater, renal, thyroid, and CNS toxicity is common. It is for use in specialist units only.
ALDESLLEUKIN

Indications  see notes above
Cautions  consult product literature; interactions: Appendix 1 (aldesleukin)
Contra-indications  consult product literature
Pregnancy  use only if potential benefit outweighs risk (toxicity in animal studies); ensure effective contraception during treatment in men and women; see also Pregnancy and Reproductive Function, p. 564
Breast-feeding  discontinue breast-feeding
Side-effects  see section 8.1, notes above, and consult product literature
Dose  • Consult product literature
Proleukin® (Novartis)  (P61)
Injection, powder for reconstitution, aldesleukin. Net price 18-million unit vial = £12.00. For subcutaneous injection or intravenous infusion (but see notes above)

BCG bladder instillation

BCG (Bacillus Calmette-Guérin) is a live attenuated strain derived from Mycobacterium bovis. It is licensed as a bladder instillation for the treatment of primary or recurrent bladder carcinoma and for the prevention of recurrence following transurethral resection.

BACILLUS CALMETTE-GUÉRIN

Indications  see notes above; BCG immunisation (section 14.4)
Cautions  screen for active tuberculosis (contra-indicated if tuberculosis confirmed); traumatic catheterisation or urethral or bladder injury (delay administration until mucosal damage healed)
Contra-indications  impaired immune response, HIV infection, urinary-tract infection, severe haematuria, tuberculosis, fever of unknown origin
Pregnancy  avoid
Breast-feeding  avoid
Side-effects  cystitis, dysuria, urinary frequency, haematuria, malaise, fever, influenza-like syndrome; also systemic BCG infection (with fatalities)—consult product literature; rarely hypersensitivity reactions (such as arthralgia and rash), orchitis, transient urethral obstruction, bladder contracture, renal abscess; ocular symptoms reported
Dose  • Consult product literature
ImmuCyst® (Alliance)  (P66)
Bladder instillation, freeze-dried powder containing attenuated Mycobacterium bovis prepared from the Connaught strain of bacillus of Calmette and Guérin, net price 81-mg vial = £79.23
OncoTICE® (MSD)  (P66)
Bladder instillation, freeze-dried powder containing attenuated Mycobacterium bovis prepared from the TICE strain of bacillus of Calmette and Guérin, net price 12.5-mg vial = £71.61

Canakinumab

Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding. It is licensed for the treatment of cryopyrin-associated periodic syndrome, including severe forms of familial cold auto-inflammatory syndrome (or familial cold urticaria), Muckle-Wells syndrome, and neonatal-onset multisystem inflammatory disease (also known as chronic infantile neurological cutaneous and articular syndrome). These are rare inherited auto-inflammatory disorders.

Indications  see notes above; acute gout (section 10.1.4)
Cautions  history of recurrent infection or predisposition to infection; monitor full blood count including neutrophil count before starting treatment, 1–2 months after starting treatment, and periodically thereafter; patients should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature and section 14.1 (p. 828) for further information
Hepatic impairment  no information available
Renal impairment  limited information available but manufacturer advises no dose adjustment required
Pregnancy  manufacturer advises avoid unless potential benefit outweighs risk; effective contraception required during treatment and for up to 5 months after last dose
Breast-feeding  consider if benefit outweighs risk—not known if present in human milk
Side-effects  vertigo, malaise, increased susceptibility to infection (including serious infection), injection-site reactions, neutropenia, back pain; less commonly gastro-oesophageal reflux; also reported vomiting, malignancy
Dose  • See Doses, p. 563
Ilaris® (Novartis)  (P61)
Injection, powder for reconstitution, canakinumab, net price 150-mg vial = £9927.80

Dimethyl fumarate

Dimethyl fumarate has immunomodulatory and anti-inflammatory properties, and is licensed for the treatment of adults with relapsing-remitting multiple sclerosis. Treatment should be initiated by a physician experienced in the treatment of multiple sclerosis.
**DIMETHYL FUMARATE**

**Indications** see notes above

**Cautions** reduced lymphocyte count; severe active gastro-intestinal disease; serious infection—do not start treatment until resolved and consider suspending treatment if infection develops during treatment; monitor full blood count before treatment (within 6 months before initiation), after 6 months of treatment, then every 6 to 12 months thereafter, and as clinically indicated; monitor renal and hepatic function before treatment, after 3 and 6 months of treatment, then every 6 to 12 months thereafter, and as clinically indicated

**Hepatic impairment** manufacturer advises caution in severe impairment

**Renal impairment** manufacturer advises caution in severe impairment

**Pregnancy** manufacturer advises avoid unless essential and potential benefit outweighs risk—toxicity in animal studies; contraception required in women of child-bearing potential (consider non-hormonal methods)

**Breast-feeding** manufacturer advises avoid

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain, dyspepsia, gastritis, gastroenteritis, flushing (may be severe and indicate hypersensitivity), burning sensation, lymphopenia, leucopenia, proteinuria, pruritus, rash, erythema

**Dose**

- **ADULT** over 18 years, 120 mg twice daily; increased to 240 mg twice daily after 7 days; for dose adjustment due to side-effects, consult product literature

**Tecfidera®** (Biogen)

Capsules, e/c, dimethyl fumarate 120 mg (green/white), net price 14-cap pack = £343.00; 240 mg (green), 56-cap pack = £1373.00. Label: 21, 25

**Fingolimod**

**Fingolimod** is an immunomodulating drug licensed for use in patients with highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta or in those with rapidly evolving severe relapsing-remitting multiple sclerosis. Treatment with fingolimod should be initiated and supervised by a specialist.

**MHRA/CHM advice**

Fingolimod: not recommended for patients at known risk of cardiovascular events. Advice for extended monitoring for those with significant bradycardia or heart block after the first dose and following treatment interruption (January 2013)

Fingolimod is known to cause transient bradycardias and heart block after the first dose. Fingolimod is not recommended in the following patient groups who are at high risk of cardiovascular events unless the anticipated benefits outweigh the potential risks, and advice from a cardiologist is sought before initiation:

**Patients with the following medical conditions:**

- 2nd degree Mobitz Type II or higher degree atrioventricular block, sick sinus syndrome, or sino-atrial heart block
- significant QT prolongation (QT-interval greater than 470 milliseconds in women, or greater than 450 milliseconds in men)
- history of symptomatic bradycardia or recurrent syncope, known ischaemic heart disease, cerebrovascular disease, history of myocardial infarction, congestive heart failure, history of cardiac arrest, uncontrolled hypertension, or severe sleep apnoea

**Patients receiving the following antiarrhythmic or heart-rate lowering drugs:**

- class la or class III antiarrhythmics
- beta blockers
- heart-rate-lowering calcium channel blockers
- other substances which may decrease heart rate (e.g. digoxin, anticholinesteratic drugs or pilocarpine)

All patients receiving fingolimod should be monitored at treatment initiation, (first dose monitoring), and after treatment interruption (see note below); monitoring should include:

**Pre-treatment**

- a 12-lead ECG and blood pressure measurement before starting

**During the first 6 hours of treatment**

- continuous ECG monitoring for 6 hours
- blood pressure and heart rate measurement every hour

**After 6 hours of treatment**

- a further 12-lead ECG and blood pressure measurement

If heart rate at the end of the 6 hour period is at its lowest since fingolimod was first administered, monitoring should be extended by at least 2 hours and until heart rate increases.

Extended monitoring, (at least overnight), should be performed in patients with evidence of clinically important cardiac effects during first dose monitoring. Monitoring in patients requiring pharmacological intervention for bradyarrhythmia-related symptoms during first dose monitoring should be extended at least overnight, and first dose monitoring should be repeated after the second dose.

**Note**

First dose monitoring as above should be repeated in all patients whose treatment is interrupted for:

- 1 day or more during the first 2 weeks of treatment
- more than 7 days during weeks 3 and 4 of treatment
- more than 2 weeks after one month of treatment

If the treatment interruption is of shorter duration than the above, repeated monitoring is not required and treatment should be continued with the next dose as planned.
The Scottish Medicines Consortium (p. 4) has advised (August 2012) that fingolimod (Gilenya®) is accepted for restricted use within NHS Scotland as single disease modifying therapy in highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta, with an unchanged or increased relapse rate or ongoing severe relapses, as compared to the previous year.

**NICE guidance**

Fingolimod for the treatment of highly active relapsing-remitting multiple sclerosis (April 2012)

Fingolimod is recommended as an option for the treatment of highly active relapsing-remitting multiple sclerosis in adults, only if:

- they have an unchanged or increased relapse rate or ongoing severe relapses compared with the previous year despite treatment with interferon beta, and
- the manufacturer provides fingolimod with the discount agreed as part of the patient access scheme.

Patients currently receiving fingolimod whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA254

**Side-effects**

- diarrhoea, weight loss, AV block, bradycardia, hypertension, cough, dyspnoea, depression, malaise, headache, migraine, dizziness, parasthesia, influenza, herpes, bronchitis, sinusitis, gastroenteritis, tinea, lymphopenia, leucopenia, back pain, blurred vision, eye pain, eczema, alopecia, pruritus; less commonly pneumonia, neutropenia, macular oedema; also reported haemophagocytic syndrome (see Cautions above), lymphoma

**Glatiramer acetate**

Glatiramer is an immunomodulating drug comprising synthetic polypeptides. It is licensed for treating initial symptoms in patients at high risk of developing multiple sclerosis, and also for reducing the frequency of relapses in ambulatory patients with relapsing-remitting multiple sclerosis who have had at least 2 clinical relapses in the past 2 years. Initiation of treatment with glatiramer should be supervised by a specialist.

**NICE guidance (interferon beta and glatiramer for multiple sclerosis)**

See p. 626

**Provision of disease-modifying therapies for multiple sclerosis**

See p. 626

**GLATIRAMER ACETATE**

**Indications** see notes above

**Cautions** cardiac disorders

Renal impairment no information available—manufacturer advises caution

Pregnancy manufacturer advises avoid—no information available

Breast-feeding manufacturer advises caution—no information available

**Side-effects** hypersensitivity reactions; flushing, chest pain, palpitation, tachycardia, and dyspnoea may occur within minutes of injection; nausea, constipation, dyspepsia; syncope, anxiety, asthenia, depression, headache, tremor, sweating; oedema, lymphadenopathy; hypertonia, back pain, arthralgia, influenza-like symptoms; injection-site reactions, rash; rarely seizures

**Dose**

- By subcutaneous injection, ADULT over 18 years, 20 mg daily

Copaxone® (Teva®)

Injection, glatiramer acetate 20 mg/mL, net price 1-ml prefilled syringe = £18.36

**Histamine**

Histamine is licensed for maintenance therapy, in combination with aldesleukin, in patients with acute myeloid leukaemia in first remission.
The Scottish Medicines Consortium (p. 4) has advised (December 2010) that histamine dihydrochloride (Ceplene®) is not recommended for use within NHS Scotland.

**HISTAMINE DIHYDROCHLORIDE**

**Indications** see notes above

**Cautions** consult product literature; **interactions:** Appendix 1 (histamine)

**Contra-indications** consult product literature

**Hepatic impairment** increased risk of tachycardia and hypotension in moderate to severe impairment

**Renal impairment** increased risk of hypotension in severe impairment

**Pregnancy** manufacturer advises avoid—no information available; ensure effective contraception during treatment in men and women

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** consult product literature

**Dose**
- See Doses, p. 563

Ceplene®, histamine dihydrochloride 1 mg/mL, net price 0.5-mL vial = £84.38

---

**Lenalidomide, pomalidomide, and thalidomide**

Lenalidomide is an immunomodulating drug with anti-neoplastic, anti-angiogenic, and pro-erythropoietic properties. It is licensed for the treatment of transfusion-dependent anaemia due to low- or intermediate-1-risk myelodysplastic syndromes (MDS) associated with an isolated deletion 5q cytogenetic abnormality when other treatment options are insufficient or inadequate; it is also licensed in combination with dexamethasone, for the treatment of multiple myeloma in patients who have received at least one previous therapy.

The most serious side-effects of lenalidomide are venous thromboembolism, severe neutropenia, thrombocytopenia, and potentially fatal liver injuries. Lenalidomide is structurally related to thalidomide and there is a risk of peripheral neuropathy and teratogenesis.

The Scottish Medicines Consortium (p. 4) has advised (April 2010) that lenalidomide, in combination with dexamethasone, is accepted for restricted use within NHS Scotland for patients with multiple myeloma who have received at least two prior treatments.

**NICE guidance**

**Lenalidomide for the treatment of multiple myeloma (June 2009)**

Lenalidomide in combination with dexamethasone is an option for the treatment of multiple myeloma in patients who have received two or more prior therapies. The drug cost of lenalidomide will be met by the manufacturer for patients who remain on treatment for more than 26 cycles.

See Doses, p. 563

www.nice.org.uk/TA171

---

Pomalidomide is structurally related to thalidomide and has immunomodulatory properties and direct anti-myeloma tumoricidal activity. It is licensed for use in combination with dexamethasone for the treatment of relapsed and refractory multiple myeloma in patients who have received at least two prior treatment regimens, including both lenalidomide and bortezomib, and who have had disease progression during the last treatment.

Thalidomide is used in combination with melphalan and prednisolone as first-line treatment for untreated multiple myeloma, in patients aged 65 years and over, or for those not eligible for high-dose chemotherapy (for example, patients with significant co-morbidity such as cardiac risk factors). It has immunomodulatory and anti-inflammatory activity. Thalidomide can cause drowsiness, neutropenia, thrombocytopenia, hepatic disorders, and thromboembolism. Patients should also be monitored for signs and symptoms of peripheral neuropathy.

**NICE guidance**

**Bortezomib and thalidomide for the first-line treatment of multiple myeloma (July 2011)**

Thalidomide in combination with an alkylating drug and a corticosteroid is recommended as an option for the first-line treatment of multiple myeloma in people for whom high-dose chemotherapy with stem cell transplantation is considered inappropriate.

For bortezomib, see p. 587

www.nice.org.uk/TA228

---

**LENALIDOMIDE**

**Indications** see notes above

**Cautions** see notes above; monitor full blood count (including differential white cell count, platelet count, haemoglobin, and haematocrit) and liver function before treatment, then every week for the first 8 weeks, then monthly thereafter (reduce dose or interrupt treatment if neutropenia, thrombocytopenia or impaired liver function develop—consult product literature); monitor for arterial or venous thromboembolism (if thromboembolic event occurs, discontinue lenalidomide and treat with standard anticoagulation therapy; lenalidomide may be restarted with continued anticoagulation therapy once thromboembolic event resolved—consult product literature); use caution with concomitant drugs that increase the risk of thromboembolism—see also thromboembolism below; high tumour burden—risk...
of tumour lysis syndrome, see p. 564; monitor thyroid function; monitor for signs and symptoms of peripheral neuropathy; caution in patients with risk factors for myocardial infarction; discontinue permanently if angioedema, exfoliative or bullous rash, or if Stevens-Johnson syndrome or toxic epidermal necrolysis is suspected; interactions: Appendix 1 (lenalidomide) Thromboembolism Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised and thromboprophylaxis should be considered in patients with multiple risk factors. Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb Neutropenia and thrombocytopenia Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop Second primary malignancy Patients should be carefully evaluated before and during treatment with lenalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated Hepatic disorders Liver function should be monitored (see Cautions above), particularly when there is history of, or concurrent viral liver infection, or when lenalidomide is combined with drugs known to be associated with liver dysfunction (e.g. paracetamol) Renal impairment reduce dose in renal impairment—consult product literature Pregnancy important: teratogenic risk; see also notes above Breast-feeding discontinue breast-feeding—no information available Side-effects constipation, nausea, vomiting, diarrhoea, abdominal pain, dry mouth, dysphagia, dyspepsia, decreased appetite, stomatitis, cerebrovascular events, arrhythmias, bradycardia, tachycardia, myocardial infarction, chest pain, hypotension, hypotension, cardiac failure, oedema, pulmonary embolism, deep vein thrombosis, pneumonia, dyspnoea, respiratory tract infections, respiratory distress, tremor, malaise, mood changes, dizziness, syncope, falls, pyrexia, headache, ataxia, taste disturbance, peripheral neuropathy, sinusitis, sepsis, flu-like illness, hyperglycaemia, hypothyroidism, renal failure, urinary retention, urinary incontinence, haematuria, sexual dysfunction, haematuria, haemorrhagic disorders, iron-overload, neutropenia, thrombocytopenia, anaemia, leucopenia, dehydration, electrolyte disturbances, musculoskeletal disorders, visual disturbances, cataract, hearing disturbances, skin disorders, rash (if rash occurs, treatment should be discontinued and only restarted following appropriate clinical evaluation, see also Cautions above), hyperhidrosis, pruritus; less commonly hepatic failure, secondary malignancies; rarely Stevens-Johnson syndrome, toxic epidermal necrolysis, tumour lysis syndrome; also reported toxic hepatitis, cytolytic hepatitis, cholestatic hepatitis, cholestatic hepatitis, pancreatitis, interstitial pneumonitis; also consult product literature Dose ● Multiple myeloma, ADULT over 18 years, 25 mg once daily for 21 consecutive days of repeated 28-day cycles; for doses of dexamethasone, and dose adjustments due to side-effects, consult product literature ● Myelodysplastic syndromes, ADULT over 18 years, 10 mg once daily for 21 consecutive days of repeated 28-day cycles; for dose adjustments due to side-effects, consult product literature Revlimid® (Celgene) (POMALIDOMIDE) Capsules, 25 mg (white), 21-cap pack = £3969.00; 25 mg (white), 21-cap pack = £4368.00. Label: 25, counselling, pregnancy and contraception, symptoms of thromboembolism, neutropenia, and thrombocytopenia Note Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a completed Prescription Authorisation Form POMALIDOMIDE Indications see notes above Cautions monitor full blood count before treatment, then every week for the first 8 weeks, then monthly thereafter (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develop—consult product literature); monitor for arterial or venous thromboembolism; use caution with concomitant drugs that increase the risk of bleeding or thromboembolism; peripheral neuropathy; significant cardiac dysfunction; high tumour burden—risk of tumour lysis syndrome, see p. 564; interactions: Appendix 1 (pomalidomide) Thromboembolism Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised. Thromboprophylaxis should be considered, particularly in patients with additional risk factors. Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb Neutropenia and thrombocytopenia Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop Second primary malignancy Patients should be carefully evaluated before and during treatment with pomalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated Hepatic impairment manufacturer advises caution—no information available Renal impairment manufacturer advises caution—no information available Pregnancy important: teratogenic risk; see also notes above Breast-feeding avoid—present in milk in animal studies Side-effects decreased appetite, diarrhoea, nausea, vomiting, constipation, thromboembolic events, peripheral oedema, nasopharyngitis, dysphonia, cough, impaired consciousness, malaise, confusion, peripheral neuropathy, dizziness, vertigo, tremor, pyrexia, pneumonia, respiratory tract infection, pelvic pain, urinary retention, renal failure, leucopenia, neutropenia (including febrile neutropenia and neutropenic sepsis), thrombocytopenia, anaemia, hyperkalaemia, hyponatraemia, bone pain, muscle spasms, rash, pruritus Dose ● ADULT over 18 years, 4 mg once daily for 21 consecutive days of repeated 28-day cycles; for doses of dexamethasone, and dose adjustments due to side-effects, consult product literature
Imnovid® (Celgene) ▼ (PO)

Capsules, pomalidomide, 1 mg (blue/yellow), net price 21-cap pack = £8884.00; 2 mg (blue/orange), 21-cap pack = £8884.00; 3 mg (blue/green), 21-cap pack = £8884.00; 4 mg (blue), 21-cap pack = £8884.00. Label: 3, 25, counselling, pregnancy and contraception, symptoms of thromboembolism, neutropenia, and thrombocytopenia

**Note** Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a completed Prescription Authorisation Form

**Excipients** include propylene glycol (see Excipients, p. 2)

---

**THALIDOMIDE**

**Indications** see notes above

**Cautions** see notes above; monitor white blood cell count (including differential count) and platelet count (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develop - consult product literature); monitor liver function; high tumour burden — risk of tumour lysis syndrome, see p. 564; monitor for arterial or venous thromboembolism and use caution with concomitant drugs that increase the risk of peripheral neuropathy or thromboembolism — see also Thromboembolism, below

**Thromboembolism** Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised. Thromboprophylaxis is recommended for at least the first 5 months of treatment, especially in patients with additional thrombotic risk factors.

Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb.

**Neutropenia and thrombocytopenia** Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop.

**Second primary malignancy** Patients should be carefully evaluated before and during treatment with thalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated.

**Hepatic disorder** Liver function should be monitored, particularly when there is history of, or concurrent viral liver infection, or when thalidomide is combined with drugs known to be associated with liver dysfunction (e.g. paracetamol).

**Peripheral neuropathy** Monitor patients for signs and symptoms of peripheral neuropathy; patients and their carers should be advised to seek medical advice if symptoms such as paraesthesia, abnormal coordination, or weakness develop. Dose reduction, dose interruption, or treatment discontinuation may be necessary — consult product literature. Patients with pre-existing peripheral neuropathy should not be treated with thalidomide unless the potential clinical benefits outweigh the risk.

**Hepatic impairment** caution in severe impairment — no information available

**Renal impairment** caution in severe impairment — no information available

**Pregnancy** important: teratogenic risk; see also notes above

**Breast-feeding** avoid — present in milk in animal studies

**Side-effects** vomiting, dry mouth, dyspepsia, constipation; bradycardia, cardiac failure, deep vein thrombosis; dyspnoea, interstitial lung disease, pulmonary embolism, peripheral oedema; asthenia, confusion, depression, dizziness, drowsiness, peripheral neuropathy, dysaesthesia, paraesthesia, syncope, tremor; pyrexia; pneumonia; anaemia, leucopenia, neutropenia, lymphopenia, thrombocytopenia; skin reactions including Stevens-Johnson syndrome (if rash occurs, treatment should be discontinued and only restarted following appropriate clinical evaluation); also reported atrial fibrillation, atrioventricular block, toxic epidermal necrolysis, intestinal obstruction, gastro-intestinal perforation and haemorrhage, worsening of Parkinson’s disease symptoms, convulsions, hypothyroidism, sexual dysfunction, menstrual disorders, second primary malignancy, hepatic disorders, renal failure, hearing loss, myocardial infarction, cerebrovascular events

---

**Mifamurtide**

**Mifamurtide** is licensed for high-grade, resectable, non-metastatic osteosarcoma after complete surgical resection, in patients 2 to 30 years of age at initial diagnosis. It is used in combination with chemotherapy.

**NICE guidance Mifamurtide for the treatment of osteosarcoma (October 2011)**

Mifamurtide in combination with postoperative multi-agent chemotherapy is recommended (within its licensed indication), as an option for the treatment of high-grade resectable non-metastatic osteosarcoma after macroscopically complete surgical resection in children, adolescents and young adults and if mifamurtide is made available at a reduced cost to the NHS under the patient access scheme.

[www.nice.org.uk/TA235](http://www.nice.org.uk/TA235)

---

**MIFAMURTIDE**

**Indications** see notes above

**Cautions** asthma and chronic obstructive pulmonary disease — consider prophylactic bronchodilator therapy; history of autoimmune, inflammatory, or collagen disease; monitor renal function, hepatic function and clotting parameters; monitor patients with history of venous thrombosis, vasculitis, or unstable cardiovascular disorders for persistent or worsening symptoms during administration — consult product literature; interactions: Appendix 1 (mifamurtide)

**Hepatic impairment** use with caution — no information available

**Renal impairment** use with caution — no information available

**Pregnancy** avoid; effective contraception required

**Breast-feeding** avoid — no information available
Natalizumab

Natalizumab is a monoclonal antibody that inhibits the migration of leucocytes into the central nervous system, hence reducing inflammation and demyelination. It is licensed for use in patients with highly active relapsing-remitting multiple sclerosis (August 2007) that natalizumab is accepted for restricted use as single disease-modifying therapy in patients with rapidly evolving severe relapsing-remitting multiple sclerosis (RES). RES is defined by 2 or more disabling relapses in 1 year, and 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

NICE guidance
Natalizumab for the treatment of adults with highly active relapsing-remitting multiple sclerosis (August 2007)
Natalizumab is an option for the treatment only of rapidly evolving severe relapsing-remitting multiple sclerosis (RES). RES is defined by 2 or more disabling relapses in 1 year, and 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

www.nice.org.uk/TA127

NATALIZUMAB

Indications see notes above
Cautions see notes above and consult product literature; prior treatment with immunosuppressants (increased risk of progressive multifocal leuкоencephalopathy); monitor liver function (see below)
Liver toxicity Liver dysfunction reported; advise patients to seek immediate medical attention if symptoms such as jaundice or dark urine develop; discontinue treatment if significant liver injury occurs
Progressive multifocal leuкоencephalopathy (PML)
Patients should be informed about the risks of PML before starting treatment with natalizumab and again after 2 years; they should be given an alert card which includes information about the symptoms of PML (see also notes above)
Hypersensitivity reactions Patients should be told the importance of uninterrupted dosing, particularly in the early months of treatment (intermittent therapy may increase risk of sensitisation)
Contra-indications progressive multifocal leuкоencephalopathy; active infection (see notes above); concurrent use of interferon beta or glatiramer acetate; immunosuppression; active malignancies (except cutaneous basal cell carcinoma)
Pregnancy avoid unless essential—toxicity in animal studies
Breast-feeding present in milk in animal studies— avoid
Side-effects see notes above; also urinary-tract infection, naоptoparanygitis, autoantibodies, and arthralgia; less commonly hypersensitivity reactions (see above); liver toxicity also reported

Dose
• By intravenous infusion, ADULT over 18 years, 300 mg once every 4 weeks; discontinue if no response after 6 months

Tysabri® (Biogen) ▼ (Pol) Concentrate for intravenous infusion, natalizumab 20 mg/mL, net price 15-mL vial = £1130.00. Counselling, liver toxicity, progressive multifocal leuкоencephalopathy, and hypersensitivity, patient alert card
Electrolytes Na+ 2.3 mmol/vial

Teriflunomide
Teriflunomide is a metabolite of leflunomide which has immunomodulating and anti-inflammatory properties. It is licensed for the treatment of adults with relapsing-remitting multiple sclerosis. Teriflunomide should be
Pregnancy

Manufacturers advise avoid—seriously toxic in pregnancy. In severe impairment; see also Combined Hormonal Contraceptives (section 7.3.1)

NICE guidance

Teriflunomide for treating relapsing-remitting multiple sclerosis (January 2014)

Teriflunomide is recommended for the treatment of adults with active relapsing-remitting multiple sclerosis (normally defined as 2 clinically significant relapses in the previous 2 years), in adults who
- do not have highly active or rapidly evolving severe relapsing-remitting multiple sclerosis and
- the manufacturer provides teriflunomide with the discount agreed in the patient access scheme.

www.nice.org.uk/TA303

TERIFLUNOMIDE

Note

Teriflunomide is a metabolite of leflunomide

Indications

see notes above

Cautions

adult over 65 years; impaired bone-marrow function (avoid if severe) including anaemia, leucopenia or thrombocytopenia; significant alcohol consumption; latent tuberculosis; hypoproteinaemia (avoid if severe); switching between other immunomodulating drugs; persistent cough or dyspnoea—assess for interstitial lung disease and consider suspending treatment; severe infection—delay or suspend treatment until resolved; signs or symptoms of serious skin reactions (including ulcerative stomatitis, Stevens-Johnson syndrome, and toxic epidermal necrolysis)—discontinue treatment; monitor full blood count (including differential white cell count and platelet count) before treatment and as clinically indicated during treatment; monitor blood pressure and platelet count) before treatment and as clinically indicated thereafter; an accelerated elimination procedure is recommended following discontinuation due to serious adverse effects (consult product literature and see Accelerated Elimination Procedure below); interactions: Appendix 1 (teriflunomide); Hepatic monitoring—Monitor liver function before treatment and every 2 weeks for first 6 months then every 8 weeks thereafter or as clinically indicated (pre-existing liver disease may increase risk). Increase to weekly monitoring if alanine aminotransferase (ALT) is 2–3 times the upper limit of reference range; discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range.

Accelerated elimination procedure

To aid drug elimination in case of serious adverse effect or before conception (see also Pregnancy below), stop treatment and give either colestyramine 8 g (reduce to 4 g if not tolerated) 3 times daily for 11 days or activated powdered charcoal 50 g every 12 hours for 11 days. After the accelerated elimination procedure a plasma concentration of less than 20 micrograms/litre (measured on 2 occasions at least 14 days apart) and a waiting period of one and a half months are necessary before conception (see also Accelerated Elimination Procedure above), stopping treatment until resolved; signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range.

Contra-indications

significantly impaired bone-marrow function (including anaemia, neutropenia, leucopenia, or thrombocytopenia); severe immunodeficiency; severe hypoproteinaemia; serious infection

Hepatic impairment

avoid in severe impairment; see also Hepatic Monitoring above

Pregnancy

avoid—toxicity in animal studies; effective contraception essential for women of child-bearing potential during treatment and for up to 2 years after treatment (see also Accelerated Elimination Procedure above)

Breast-feeding

present in milk in animal studies—manufacturer advises avoid

Side-effects

diarrhoea, nausea, vomiting, gastroenteritis, weight loss, hypertension, respiratory tract infection, laryngitis, anxiety, paraesthesia, peripheral neuropathy, sciatica, carpal tunnel syndrome, hyperaesthesia, neuralgia, menorrhagia, urinary tract infection, cystitis, neutropenia, leucopenia, polyakuria, elevated liver enzymes, musculoskeletal pain, myalgia, oral infection, alopecia, rash, acne, tinea pedis; less commonly anaemia, thrombocytopenia; very rarely interstitial lung disease, pancreatitis; important: accelerated elimination procedure recommended following discontinuation due to serious adverse effects (consult product literature and see Accelerated Elimination Procedure above)

Dose

• ADULT over 18 years, 14 mg once daily

Aubagio® (Genzyme) ▼ red

Tablets, f/c, blue, teriflunomide 14 mg, net price 28-tab pack = £1037.84.

8.3 Sex hormones and hormone antagonists in malignant disease

8.3.1 Oestrogens

Diethylstilbestrol is sometimes used to treat prostate cancer, but it is not usually used first-line because of its side-effects. It is occasionally used in postmenopausal women with breast cancer. Toxicity is common and dose-related side-effects include nausea, fluid retention, and venous and arterial thrombosis. Impotence and gynaecomastia always occur in men, and withdrawal bleeding may be a problem in women. Hypercalcaemia and bone pain may also occur in breast cancer.

Ethinylenstradiol is the most potent oestrogen available; unlike other oestrogens it is only slowly metabolised in the liver. Ethinylenestradiol is licensed for the palliative treatment of prostate cancer.

DIETHYLSILBESTROL

(Stilboestrol)

Indications

see notes above

Cautions cardiovascular disease

Hepatic impairment

avoid; see also Combined Hormonal Contraceptives (section 7.3.1)
8 Malignant disease and immunosuppression

Fluid retention, and weight gain.

Side-effects: sodium retention with oedema, thromboembolism, jaundice, feminising effects in men; see also notes above.

Dose:
- Breast cancer, 10–20 mg daily
- Prostate cancer, 1–3 mg daily

Diethylstilbestrol (Non-proprietary)

Breast-feeding: present in milk—no adverse effects

Pregnancy: avoid; see also oral Progestogen-only Contraceptives (section 7.3.2.1)

Contra-indications: see section 6.4.1.2 and notes above

Cautions: see under Medroxyprogesterone acetate (section 6.4.1.2) and notes above; vomiting, constipation, diarrhoea, carpal tunnel syndrome, adrenal insufficiency. Cushing’s syndrome, urinary frequency, tumour flare (with or without hypercalcaemia), and asthenia.

Dose:
- Breast cancer, 160 mg once daily

Megace® (Bristol-Myers Squibb)

Medroxyprogesterone acetate 100 mg (scored), 5 mg, 30-tab pack = £29.98, 100-tab pack = £49.94; 200 mg (scored), 30-tab pack = £29.65, 400 mg, 30-tab pack = £58.67

Dose: endometrial and renal cell cancer, 200–600 mg daily; breast cancer, 0.4–1.5 g daily

Tablets, medroxyprogesterone acetate 2.5 mg, 5 mg and 10 mg, see section 6.4.1.2

Acetate

Indications: see notes above; other indications (section 6.4.1.1)

Cautions: see section 6.4.1.1; interactions: Appendix 1 (oestrogens)

Contra-indications: see section 6.4.1.1

Hepatic impairment: avoid; see also Combined Hormonal Contraceptives (section 7.3.1)

Side-effects: see section 6.4.1.1

Dose:
- Prostate cancer (palliative), 0.15–1.5 mg daily

Preparations: Section 6.4.1.1

8.3.2 Progestogens

Progestogens have a role in the treatment of endometrial cancer; their use in breast cancer and renal cell cancer has declined. Progestogens are now rarely used to treat prostate cancer. Medroxyprogesterone or megestrol are usually chosen and can be given orally; high-dose or parenteral treatment cannot be recommended. Side-effects are mild but may include nausea, fluid retention, and weight gain.

Ethinylestradiol (Ethinylestradiol)

Indications: see notes above; other indications (section 6.4.1.1)

Cautions: see section 6.4.1.1; interactions: Appendix 1 (progestogens)

Contra-indications: see section 6.4.1.1

Hepatic impairment: avoid; see also Combined Hormonal Contraceptives (section 7.3.1)

Dose:
- Breast cancer, 10–20 mg daily
- Prostate cancer, 1–3 mg daily

Tablets, diethylstilbestrol 1 mg, net price 28 = £101.32; 5 mg, 28 = £192.67

Ethinylestradiol

8.3.2 Progestogens

8.3.2 Progestogens

BNF 68
All women should be considered for hormone-antagonist therapy for steroid hormone-receptor-negative tumours and for younger women.

For operable breast cancer, treatment before surgery (neoadjuvant therapy) reduces the size of the tumour and facilitates breast-conserving surgery. Hormone antagonist therapy (e.g. letrozole) is chosen for steroid hormone-receptor-positive breast cancer and chemotherapeutic agents for steroid hormone-receptor-negative tumours or for younger women.

**Early breast cancer** All women should be considered for adjuvant therapy following surgical removal of the tumour. Adjuvant therapy is used to eradicate the micrometastases that cause relapses. Choice of adjuvant treatment is determined by the risk of recurrence, steroid hormone-receptor status of the primary tumour, and menopausal status.

Adjuvant therapy comprises cytotoxic chemotherapy and hormone-antagonist therapy. Women with steroid hormone-receptor-positive breast cancer are considered for hormone-antagonist therapy (preceded by cytotoxic chemotherapy if necessary) whilst women with steroid hormone-receptor-negative breast cancer should be considered for cytotoxic chemotherapy.

Aromatase inhibitors act predominantly by blocking the conversion of androgens to oestrogens in the peripheral tissues. They do not inhibit ovarian oestrogen synthesis and should not be used in premenopausal women.

**Anastrozole and letrozole** are non-steroidal aromatase inhibitors; exemestane is a steroidal aromatase inhibitor. Aromatase inhibitors are usually prescribed as initial adjuvant therapy in postmenopausal women with oestrogen-receptor-positive tumours; tamoxifen, an oestrogen-receptor antagonist, is used if an aromatase inhibitor is not appropriate. Adjuvant hormone antagonist therapy should generally be continued for 5 years following removal of the tumour. In postmenopausal women considered for extended adjuvant therapy, 5 years of tamoxifen is followed by letrozole for a further 2–3 years.

**Trastuzumab** (section 8.1.5) is licensed for use in early breast cancer which overexpresses human epidermal growth factor-2 (HER2) in women who have received surgery, chemotherapy and radiotherapy (as appropriate).

Premenopausal women with oestrogen-receptor-positive breast cancer who decline chemotherapy may benefit from treatment with goserelin (section 8.3.4.2) or ovarian ablation.

**Advanced breast cancer** Treatment of advanced breast cancer depends on the patient’s drug history and an assessment of disease severity. Aromatase inhibitors, such as anastrozole or letrozole, are the preferred treatment in postmenopausal women with oestrogen-receptor-positive advanced breast cancer, a long disease-free interval following treatment for early breast cancer, and disease limited to bone or soft tissues; tamoxifen can be used if aromatase inhibitors are not suitable. Progestogens, such as medroxyprogesterone acetate (section 8.3.2), may be used after aromatase inhibitors and tamoxifen in postmenopausal women.

Tamoxifen should be considered for pre- and perimenopausal women with oestrogen-receptor-positive breast cancer not previously treated with tamoxifen. Ovarian suppression is used in pre- and perimenopausal women who have had disease progression despite treatment with tamoxifen. The gonadorelin analogue goserelin (section 8.3.4.2) is licensed for advanced breast cancer in pre- and perimenopausal women suitable for hormone manipulation.

**Trastuzumab emtansine** can be used alone for treating HER2-positive, unresectable, locally advanced breast cancer previously treated with trastuzumab and a taxane, or when there is disease recurrence during or following adjuvant therapy (section 8.1.5).

Cytotoxic chemotherapy is indicated for advanced steroid hormone-receptor-negative tumours and for aggressive disease, particularly when metastases involve visceral sites (e.g. the liver) or if the disease-free interval following treatment for early breast cancer is short.

**Cytotoxic drugs used in breast cancer** An anthracycline combined with fluorouracil (section 8.1.3) and cyclophosphamide (section 8.1.1), and sometimes also with methotrexate (section 8.1.3) is effective. Cyclophosphamide, methotrexate, and fluorouracil can be useful if an anthracycline is inappropriate (e.g. in cardiac disease).

**Metastatic disease** The choice of chemotherapy regimen will be influenced by whether the patient has previously received adjuvant treatment and the presence of any co-morbidity.

For women who have not previously received chemotherapy, an anthracycline (such as doxorubicin or epirubicin) alone or in combination with another cytotoxic drug is the standard initial therapy for metastatic breast disease.

Patients with anthracycline-refractory or resistant disease should be considered for treatment with a taxane (section 8.1.5) either alone or in combination with trastuzumab if they have tumours that overexpress HER2. Other cytotoxic drugs with activity against breast cancer include capecitabine (section 8.1.3), mitoxantrone, mitomycin (both section 8.1.2), and vinorelbine (section 8.1.4). Trastuzumab alone (section 8.1.5) is an option for chemotherapy-resistant cancers that overexpress HER2. Trastuzumab emtansine can be used as monotherapy in HER2-positive metastatic breast cancer previously treated with trastuzumab and a taxane, or when there is disease recurrence during or following adjuvant therapy (section 8.1.5). Trastuzumab and trastuzumab emtansine are not interchangeable.

The use of bisphosphonates (section 8.6.2) in patients with metastatic breast cancer may reduce pain and prevent skeletal complications of bone metastases.
**ANASTROZOLE**

**Indications**  
Adjuvant treatment of oestrogen-receptor-positive early invasive breast cancer in postmenopausal women; adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy; advanced breast cancer in postmenopausal women which is oestrogen-receptor-positive or responsive to tamoxifen

**Cautions**  
Laboratory test for menopause if doubt; susceptibility to osteoporosis (assess bone mineral density before treatment and at regular intervals)

**Contra-indications**  
Not for premenopausal women

**Hepatic impairment**  
Avoid in moderate to severe impairment

**Renal impairment**  
Avoid if creatinine clearance less than 20 mL/minute

**Pregnancy**  
Avoid

**Breast-feeding**  
Avoid

**Side-effects**  
Nausea, vomiting, abdominal pain, dyspepsia, constipation, anorexia; dizziness, fatigue, headache, depression, insomnia; hot flushes, sweating, alopecia, rash; less commonly drowsiness, asthenia, and peripheral oedema; rarely thrombocytopenia, leucopenia

**Dose**  
- 1 mg daily

Anastrozole (Non-proprietary) (£)

**Tablets,** anastrozole 1 mg, net price 28-tab pack = £1.80

**Brands include** Nastrose®

Aromasin® (AstraZeneca) (£)

**Tablets,** f/c, anastrozole 1 mg, net price 28-tab pack = £68.56

- The Scottish Medicines Consortium (p. 4) has advised (August 2005 and October 2006) that anastrozole (Arimidex®) is accepted for restricted use within NHS Scotland as an adjuvant treatment in postmenopausal women with oestrogen-receptor-positive invasive early breast cancer, following 2–3 years of initial adjuvant tamoxifen therapy.

**FULVESTRANT**

**Indications**  
Treatment of oestrogen-receptor-positive metastatic or locally advanced breast cancer in postmenopausal women in whom disease progresses or relapses while on, or after, other anti-oestrogen therapy

**Hepatic impairment**  
Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

**Renal impairment**  
Manufacturer advises caution if creatinine clearance less than 30 mL/minute—no information available

**Pregnancy**  
Manufacturer advises avoid—increased incidence of fetal abnormalities and death in animal studies

**Breast-feeding**  
Manufacturer advises avoid—present in milk in animal studies

**Side-effects**  
Nausea, vomiting, diarrhoea; venous thromboembolism; anorexia, headache, asthenia; urinary-tract infections; hot flushes; back pain; rash, injection-site reactions, hypersensitivity reactions; less commonly vaginal haemorrhage, vaginal candidiasis, and leucorrhoea

**Dose**  
- By deep intramuscular injection into buttock, 500 mg every 2 weeks for the first 3 doses, then 500 mg every month

Note 500 mg dose should be administered as one 250-mg injection (slowly over 1–2 minutes) into each buttock

Faslodex® (AstraZeneca) (£)

**Injection** (oily), fulvestrant 50 mg/mL, net price 2 × 5-mL (250-mg) prefilled syringe = £522.41

**EXEMESTANE**

**Indications**  
Adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy; advanced breast cancer in postmenopausal women in whom anti-oestrogen therapy has failed

**Cautions**  
Interactions: Appendix 1 (exemestane)

**Contra-indications**  
Not indicated for premenopausal women

**Hepatic impairment**  
Manufacturer advises caution

**Renal impairment**  
Manufacturer advises caution

**Pregnancy**  
Avoid

**Breast-feeding**  
Avoid

**Side-effects**  
Nausea, vomiting, abdominal pain, dyspepsia, constipation, anorexia; dizziness, fatigue, headache, depression, insomnia; hot flushes, sweating, alopecia, rash; less commonly drowsiness, asthenia, and peripheral oedema; rarely thrombocytopenia, leucopenia

**Dose**  
- 25 mg daily

Aromasin® (Pharmacia) (£)

**Tablets,** s/c, exemestane 25 mg, net price 30-tab pack = £88.80, 90-tab pack = £266.40. Label: 21

The Scottish Medicines Consortium (p. 4) has advised (October 2005) that exemestane (Aromasin®) is accepted for restricted use within NHS Scotland as an adjuvant treatment in postmenopausal women with oestrogen-receptor-positive invasive early breast cancer, following 2–3 years of initial adjuvant tamoxifen therapy.

**LETROZOLE**

**Indications**  
First-line treatment in postmenopausal women with hormone-dependent advanced breast cancer; adjuvant treatment of oestrogen-receptor-positive invasive early breast cancer in postmenopausal women; advanced breast cancer in postmenopausal women (naturally or artificially induced menopause) in whom other anti-oestrogen therapy has failed; extended adjuvant treatment of hormone-dependent invasive breast cancer in postmenopausal women who have received standard adjuvant tamoxifen therapy for 5 years; neo-adjuvant treatment in postmenopausal women with localised hormone-receptor-positive, human epidermal growth factor-2 negative breast cancer where chemotherapy is not suitable and surgery not yet indicated

**Cautions**  
Susceptibility to osteoporosis (assess bone mineral density before treatment and at regular intervals)

**Contra-indications**  
Not indicated for premenopausal women

**Hepatic impairment**  
Manufacturer advises caution in severe impairment

- 1 mg daily

Letrozole (Pharmacia) (£)

**Tablets,** s/c, letrozole 2.5 mg, net price 28-tab pack = £48.40, 90-tab pack = £145.20. Label: 21

The Scottish Medicines Consortium (p. 4) has advised (October 2005) that letrozole is accepted for restricted use within NHS Scotland as an adjuvant treatment in postmenopausal women with hormone receptor-positive, hormone-dependent invasive breast cancer, following 2–3 years of initial adjuvant tamoxifen therapy.
TAMOXIFEN

**Indications**  see under Dose and notes above; mastalgia [unlicensed indication] (section 6.7.2)

**Cautions**  occasional cystic ovarian swellings in premenopausal women; increased risk of thromboembolic events, especially when used with cytotoxics (see also below); endometrial changes (important: see below); porphyria, interactions: Appendix 1 (tamoxifen)

**Endometrial changes**  increased endometrial changes, including hyperplasia, polyps, cancer, and uterine sarcoma reported; prompt investigation required if abnormal vaginal bleeding including menstrual irregularities, vaginal discharge, and pelvic pain or pressure in those receiving (or who have received) tamoxifen. Patients should be informed of the risk of endometrial cancer and told to report relevant symptoms promptly.

**Contra-indications**  treatment of infertility contra-indicated if personal or family history of idiopathic venous thromboembolism or genetic predisposition to thromboembolism

**Pregnancy**  avoid—possible effects on fetal development; effective contraception must be used during treatment and for 2 months after stopping

**Breast-feeding**  suppresses lactation; avoid unless potential benefit outweighs risk

**Side-effects**  nausea, vomiting, abdominal pain, hyperextension, hot flushes, fatigue, dizziness, head-ache, dyspepsia, constipation, diarrhoea, depression, anorexia, appetite increase, weight changes, vaginal bleeding, hypercholesterolaemia, alopecia, increased sweating, rash, dry skin, peripheral oedema, arthralgia, musculoskeletal pain, osteoporosis, bone fracture; less commonly cerebrovascular events, cardiac events, palpitation, tachycardia, dyspnoea, cough, insomnia, anxiety, memory impairment, dysaesthesia, taste disturbance, pruritus, urticaria, thrombophlebitis, urinary frequency, urinary-tract infection, vaginal discharge, breast pain, pyrexia, mucosal dryness, stomatitis, cataract, eye irritation, blurred vision, tumour pain, arthritis, leucopenia, general oedema; rarely pulmonary embolism, arterial thrombosis; also reported hepatitis, toxic epidermal necrolysis

**Dose**

- 2.5 mg daily

**Letrozole** (Non-proprietary)

Tablets, letrozole 2.5 mg, net price 14-tab pack = £1.63, 28-tab pack = £3.26

**Femara** (Novartis)

Tablets, f/c, letrozole 2.5 mg. Net price 14-tab pack = £49.90, 28-tab pack = £84.86

### Toremifene

**Indications**  hormone-dependent metastatic breast cancer in postmenopausal women

**Cautions**  hypercaemia may occur (especially if bone metastases and usually at beginning of treatment); avoid in acute porphyria (but see section 9.8.2); history of severe thromboembolic disease; interactions: Appendix 1 (toremifene)

**Endometrial changes**  increased endometrial changes, including hyperplasia, polyps and cancer reported. Abnormal vaginal bleeding including menstrual irregularities, vaginal discharge and symptoms such as pelvic pain or pressure should be promptly investigated

**Contra-indications**  endometrial hyperplasia, QT prolongation (avoid concomitant administration of drugs that prolong QT interval), electrolyte disturbances (particularly uncorrected hypokalaemia), bradycardia, heart failure with reduced left-ventricular ejection fraction, history of arrhythmias

**Hepatic impairment**  elimination decreased in hepatic impairment—avoid if severe

**Pregnancy**  avoid

**Breast-feeding**  avoid

**Side-effects**  nausea, vomiting; oedema; depression, dizziness, fatigue; sweating, hot flushes, vaginal bleeding or discharge (important: see Cautions); rash; less commonly anorexia, constipation, increased weight, thromboembolic events; dyspnoea, insomnia, headache, endometrial hypertrophy; very rarely jaundice, transient corneal opacity, and alopecia

**Dose**

- 60 mg daily
8 Malignant disease and immunosuppression

Vantas (June 2009) that histrelin (The Scottish Medicines Consortium 8.3.4.1) and other indications (section 6.7.2). Before the gonadorelin analogue. Gonadorelin analogues are as effective as orchidectomy or diethylstilbestrol (section 8.3.1) but are expensive and require parenteral administration, at least initially. They cause initial stimulation then depression of lutetinising hormone release by the pituitary. During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain. When such problems are anticipated, alternative treatments (e.g. orchidectomy) or concomitant use of an anti-androgen such as cyproterone acetate or flutamide (see below) are recommended; anti-androgen treatment should be started before the gonadorelin analogue. Gonadorelin analogues are also used in women for breast cancer (section 8.3.4.1) and other indications (section 6.7.2).

The Scottish Medicines Consortium (p. 4) has advised (June 2009) that histrelin (Vantas®) is accepted for restricted use within NHS Scotland for the palliative treatment of advanced prostate cancer in patients with an anticipated life expectancy of at least one year in whom annual administration will offer advantages.

Cautions Men at risk of tumour ‘flare’ (see above) should be monitored closely during the first month of therapy. Caution is required in patients with metabolic bone disease because reduced bone mineral density can occur. The injection site should be rotated. Men at risk of tumour ‘flare’ (see above) should be monitored closely during the first month of therapy. Caution is required in patients with metabolic bone disease because reduced bone mineral density can occur. The injection site should be rotated.

Side-effects The gonadorelin analogues cause side-effects similar to the menopause in women and orchidectomy in men and include hot flushes and sweating, sexual dysfunction, vaginal dryness or bleeding, and gynaecomastia or changes in breast size. Signs and symptoms of prostate or breast cancer may worsen initially (managed in prostate cancer with anti-androgens, see above). Other side-effects include hypersensitivity reactions (rashes, pruritus, asthma, and rarely anaphylaxis), injection site reactions (see Cautions), headache (rarely migraine), visual disturbances, dizziness, arthralgia and possibly myalgia, hair loss, peripheral oedema, gastro-intestinal disturbances, weight changes, sleep disorders, and mood changes.

## 8.3.4 Hormone antagonists

### Gonadorelin analogues

Gonadorelin analogues are as effective as orchidectomy or diethylstilbestrol (section 8.3.1) but are expensive and require parenteral administration, at least initially. They cause initial stimulation then depression of lutetinising hormone release by the pituitary. During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain. When such problems are anticipated, alternative treatments (e.g. orchidectomy) or concomitant use of an anti-androgen such as cyproterone acetate or flutamide (see below) are recommended; anti-androgen treatment should be started before the gonadorelin analogue. Gonadorelin analogues are also used in women for breast cancer (section 8.3.4.1) and other indications (section 6.7.2).

Cautions Men at risk of tumour ‘flare’ (see above) should be monitored closely during the first month of therapy. Caution is required in patients with metabolic bone disease because reduced bone mineral density can occur. The injection site should be rotated.

Side-effects The gonadorelin analogues cause side-effects similar to the menopause in women and orchidectomy in men and include hot flushes and sweating, sexual dysfunction, vaginal dryness or bleeding, and gynaecomastia or changes in breast size. Signs and symptoms of prostate or breast cancer may worsen initially (managed in prostate cancer with anti-androgens, see above). Other side-effects include hypersensitivity reactions (rashes, pruritus, asthma, and rarely anaphylaxis), injection site reactions (see Cautions), headache (rarely migraine), visual disturbances, dizziness, arthralgia and possibly myalgia, hair loss, peripheral oedema, gastro-intestinal disturbances, weight changes, sleep disorders, and mood changes.

### Gonadorelin analogues and gonadotrophin-releasing hormone antagonists

Metastatic cancer of the prostate usually responds to hormonal treatment aimed at androgen depletion. Standard treatments include bilateral subcapsular orchidectomy or use of a gonadorelin analogue (busrelin, goserelin, histrelin, leuprorelin, or triptorelin). The gonadotrophin-releasing hormone antagonist, degarelix, (p. 643) is also available. Response in most patients lasts for 12 to 18 months. No entirely satisfactory therapy exists for disease progression despite this treatment (hormone-refractory prostate cancer), but occasional patients respond to other hormone manipulation e.g. with an anti-androgen. Bone disease can often be palliated with irradiation or, if widespread, with strontium or prednisolone (section 6.3.2).

### Busrelin

**Indications** advanced prostate cancer; other indications (section 6.7.2)

**Cautions** diabetes, hypertension, depression; see notes above

**Side-effects** see notes above; worsening hypertension, palpitation, glucose intolerance, altered blood lipids, thrombocytopenia, leucopenia, nervousness, fatigue, memory and concentration disturbances, anxiety, increased thirst, hearing disorders, musculoskeletal pain; nasal irritation, nose bleeds and altered sense of taste and smell (spray formulation only)

**Dose**

- By subcutaneous injection, 500 micrograms every 8 hours for 7 days, then intranasally, 1 spray into each nostril 6 times daily (see also notes above)

**Counselling** Avoid use of nasal decongestants before and for at least 30 minutes after treatment.

**Suprefact®** (Sanofi-Aventis) **Injection**, busrelin (as acetate) 1 mg/mL. Net price 2 × 5.5-mL vial = £28.64

**Nasal spray**, busrelin (as acetate) 100 micrograms/ metered spray. Net price treatment pack of 4 × 10-g bottle with spray pump = £101.87. Counselling, see above

### Goserelin

**Indications** locally advanced prostate cancer as an alternative to surgical castration; adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer; neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer; metastatic prostate cancer; advanced breast cancer; oestrogen-receptor-positive early breast cancer (section 8.3.4.1); endometriosis, endometrial thinning, uterine fibroids, assisted reproduction (section 6.7.2)

**Cautions** see notes above; diabetes; hypertension; depression; risk of ureteric obstruction and spinal cord compression in men

**Contra-indications** undiagnosed vaginal bleeding

**Pregnancy** see Goserelin, section 6.7.2

**Breast-feeding** see Goserelin, section 6.7.2

**Side-effects** see notes above; also transient changes in blood pressure, heart failure, myocardial infarction; parasthesia; rarely hypercalcaemia (in patients with metastatic breast cancer)

**Dose**

- See under preparations below

**Zoladex®** (AstraZeneca) **Implant**, goserelin (as acetate) 3.6 mg in SafeSystem® syringe applicator, net price each = £65.00

**Dose** breast cancer and prostate cancer (see indications above) by subcutaneous injection into anterior abdominal wall, 3.6 mg every 28 days

**Zoladex® LA** (AstraZeneca) **Implant**, goserelin (as acetate) 10.8 mg in SafeSystem® syringe applicator, net price each = £235.00

**Dose** prostate cancer (see indications above), by subcutaneous injection into anterior abdominal wall, 10.8 mg every 12 weeks
HISTRELIN

Indications advanced prostate cancer
Cautions see notes above; monitor patients at high risk of metabolic disease (e.g. bone disease, worsening diabetes) or cardiovascular disease before and during treatment; risk of ureteric obstruction and spinal cord compression

Side-effects see notes above; also hepatic disorder, dyspnoea, depression, asthenia, elevated blood glucose-concentration, increased urinary frequency, hypertrichosis; less commonly hypercholesterolaemia, palpitation, ventricular extrasystole, haematoma, tremor, anaemia, renal failure, nephrolithiasis, hypercalcaemia

Dose
• By subcutaneous implantation into upper arm. 1 implant (50 mg) every 12 months; remove after 12 months of treatment

Counselling Avoid wetting arm containing implant for 24 hours and avoid lifting heavy objects or strenuous physical activity for 7 days after implantation

Vantas® (Orion) implant, histrelin (as acetate) 50 mg, net price 1 pack (containing implantation device and implant) = £990.00

LEUPRORELIN ACETATE

Indications locally advanced prostate cancer as an alternative to surgical castration; adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer; metastatic prostate cancer; endometriosis, endometrial thinning, uterine fibroids (section 6.7.2)

Cautions see notes above and section 6.7.2; risk of ureteric obstruction and spinal cord compression in men

Side-effects see notes above and section 6.7.2; also fatigue, muscle weakness, depression, paraesthesia, hypertension, palpitation, alteration of glucose tolerance and of blood lipids; hypotension, jaundice, thrombocytopenia and leucopenia reported

Dose
• See under preparations below

Prostap® SR DCS (Takeda) injection, dual-chamber prefilled syringe containing powder for reconstitution, leuprorelin acetate and solvent, net price 3.75-mg prefilled syringe = £75.24

Dose prostate cancer (see indications), by subcutaneous or by intramuscular injection, 3.75 mg every month

Prostap® 3 DCS (Takeda) injection, dual-chamber prefilled syringe containing powder for reconstitution, leuprorelin acetate and solvent, net price 11.25-mg prefilled syringe = £225.72

Dose prostate cancer (see indications), by subcutaneous injection, 11.25 mg every three months

TRIPTORELIN

Indications prostate cancer; endometriosis, precocious puberty, reduction in size of uterine fibroids; male hypersexuality with severe sexual deviation (section 6.7.2)

Cautions see notes above; risk of ureteric obstruction and spinal cord compression in men; risk factors for osteoporosis

Side-effects see notes above; also dry mouth, transient hypertension, paraesthesia, and increased dysuria

Dose
• See under preparations below

Decapeptyl® SR ( Ipsen) (Pol) injection, triptorelin (as acetate), net price 3-mg vial (with diluent) = £69.00

Dose locally advanced non-metastatic prostate cancer as an alternative to surgical castration, metastatic prostate cancer, as an adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer, as an adjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer, as an adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression, by intramuscular injection, 3 mg every 4 weeks

Note Each vial includes an overage to allow accurate administration of a 3-mg dose

Decapeptyl® (Ferring) (Pol) injection, triptorelin (as acetate), net price 11.25-mg vial (with diluent) = £207.00

Dose locally advanced non-metastatic prostate cancer as an alternative to surgical castration, metastatic prostate cancer, as an adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer, as an adjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer, as an adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression, by intramuscular injection, 11.25 mg every 3 months (see also notes above)

Note Each vial includes an overage to allow accurate administration of an 11.25-mg dose

Decapeptyl® Depot® (Ferring) (Pol) injection, triptorelin (as acetate), net price 22.5-mg vial (with diluent) = £414.00

Dose locally advanced non-metastatic prostate cancer as an alternative to surgical castration, metastatic prostate cancer, as an adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer, as an adjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer, as an adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression, by intramuscular injection, 22.5 mg every 6 months (see also notes above)

Note Each vial includes an overage to allow accurate administration of a 22.5-mg dose

Gonapeptyl Depot® (Ferring) (Pol) injection, triptorelin (as acetate), net price 3-mg vial (with diluent) = £81.69

Dose advanced prostate cancer, by subcutaneous or deep intramuscular injection, 3.75 mg every 4 weeks (see also notes above)

Anti-androgens

Cyproterone acetate, flutamide and bicalutamide are anti-androgens that inhibit the tumour ‘flare’ which may occur after commencing gonadorelin analogue administration. Cyproterone acetate and flutamide are also licensed for use alone in patients with metastatic prostate cancer refractory to gonadorelin analogue therapy. Bicalutamide is used for prostate cancer either alone or as an adjunct to other therapy, according to the clinical circumstances.

Abiraterone (in combination with prednisone or prednisolone) and enzalutamide are licensed for metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with a docetaxel-containing chemotherapy regimen. Abirater-
one is also used to treat metastatic castration-resistant prostate cancer in patients who are asymptomatic or mildly symptomatic after failure of androgen deprivation therapy in whom chemotherapy is not yet clinically indicated. Medical castration with a luteinising hormone-releasing hormone analogue should be continued during treatment with abiraterone in patients not surgically castrated.

The Scottish Medicines Consortium (p. 4) has advised (July 2012) that abiraterone (Zytiga®), in combination with prednisone or prednisolone, is accepted for restricted use within NHS Scotland for the treatment of metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with docetaxel-containing chemotherapy regimen, and have received only one prior chemotheraphy regimen.

**NICE guidance**

Abiraterone for castration-resistant metastatic prostate cancer previously treated with a docetaxel-containing regimen (June 2012)

Abiraterone in combination with prednisone or prednisolone is recommended as an option for the treatment of castration-resistant metastatic prostate cancer only if:

- their disease has progressed on or after one docetaxel-containing chemotherapy regimen, and
- the manufacturer provides abiraterone with the discount agreed in the patient access scheme.

Patients currently receiving abiraterone in combination with prednisone or prednisolone whose disease does not meet the first criteria should be able to continue therapy until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA259](http://www.nice.org.uk/TA259)

**Abiraterone Acetate**

**Indications** see notes above

**Cautions** monitor blood pressure, serum potassium concentration, and fluid balance before treatment, and at least monthly during treatment—consult product literature for management of hypertension, hypokalaemia and oedema; history of cardiovascular disease—correct hypertension and hypokalaemia before treatment (if significant risk of congestive heart failure, such as history of cardiac failure, uncontrolled hypertension or cardiac events, consult product literature for management and increased monitoring); diabetes (increased risk of hyperglycaemia—monitor blood sugar frequently); concurrent chemotherapy—safety and efficacy not established; increased risk of myopathy and rhabdomyolysis with possible renal failure—caution with concomitant use of drugs known to be associated with myopathy or rhabdomyolysis; monitor liver function before treatment, then every 2 weeks for the first 3 months of treatment, then monthly thereafter—interrupt treatment if serum alanine aminotransferase or aspartate aminotransferase greater than 5 times the upper limit (consult product literature for details of restarting treatment at a lower dose) and discontinue permanently if 20 times the upper limit; **interactions**: Appendix 1 (abiraterone)

**Side-effects** diarrhoea, dyspepsia, hepatotoxicity (see under Cautions, above), hypertension, hypertriglyceridaemia, heart failure, angina, arrhythmias, atrial fibrillation, tachycardia, peripheral oedema, urinary tract infection, haematuria, hypokalaemia, fractures, rash; *less commonly* adrenal insufficiency, myopathy, rhabdomyolysis

**Dose**

- 1 g once daily
**Note** Consult product literature for dose of concurrent prednisone or prednisolone

Zytiga® (Janssen) Pod

**Tablets**, abiraterone acetate 250 mg, net price 120-tab pack = £293.00. Label: 23

**Bicalutamide**

**Indications** locally advanced prostate cancer at high risk of disease progression, either alone or as adjuvant treatment to prostatectomy or radiotherapy; locally advanced, non-metastatic prostate cancer when surgical castration or other medical intervention inappropriate; advanced prostate cancer in combination with gonadorelin analogue or surgical castration

**Cautions** consider periodic liver function tests; **interactions**: Appendix 1 (bicalutamide)

**Hepatic impairment** use with caution in moderate impairment and only if benefit clearly outweighs risk; avoid in severe impairment; see also Cautions

**Renal impairment** use with caution in severe impairment—no information available

**Pregnancy** men should use condoms if their partner is pregnant, and use condoms in combination with another effective contraceptive method if their partner is of child-bearing potential—toxicity in animal studies

**Side-effects** nausea, diarrhoea, cholestasis, jaundice; asthenia, weight gain; gynaecomastia, breast tenderness, hot flushes, impotence, decreased libido; anaemia; alopecia, dry skin, hirsutism, pruritus; *less commonly* vomiting, abdominal pain, dyspepsia, interstitial lung disease, pulmonary fibrosis, depression, hypertension, hypertriglyceridaemia, heart failure, angina, arrhythmias, and hepatic failure

**Dose**

- Locally advanced prostate cancer at high risk of disease progression, 150 mg once daily
- Locally advanced, non-metastatic prostate cancer when surgical castration or other medical intervention inappropriate, 150 mg once daily
- Advanced prostate cancer, in combination with gonadorelin analogue or surgical castration, 50 mg once daily (started at the same time as surgical castration or at least 3 days before gonadorelin therapy; see also notes above)

Bicalutamide (Non-proprietary) Pod

**Tablets**, bicalutamide 50 mg, net price 28-tab pack = £7.04; 150 mg, 28-tab pack = £12.77

Casodex® (AstraZeneca) Pod

**Tablets**, 1/4, bicalutamide 50 mg, net price 28-tab pack = £119.79; 150 mg, 28-tab pack = £240.00
CYPROTERONE ACETATE

**Indications** prostate cancer, see under Dose and also notes above; other indications, see section 6.4.2

**Cautions** in prostate cancer, blood counts initially and throughout treatment; monitor hepatic function (liver function tests should be performed before treatment, see also under Side-effects below); monitor adrenocortical function regularly; risk of recurrence of thromboembolic disease; diabetes mellitus, sickle-cell anaemia, severe depression (in other indications some of these are contra-indicated, see section 6.4.2)

**Driving** Fatigue and lassitude may impair performance of skilled tasks (e.g. driving)

**Contra-indications** patients with meningioma or history of meningioma; for contra-indications relating to other indications see section 6.4.2

**Hepatic impairment** dose-related toxicity; see also under cautions (above) and side-effects (below)

**Side-effects** see section 6.4.2

**Hepatotoxicity** Direct hepatic toxicity including jaundice, hepatitis and hepatic failure have been reported (fatalities reported at dosages of 100 mg and above, usually in men treated for advanced prostate cancer). Liver function tests should be performed before and regularly during treatment and whenever symptoms suggestive of hepatotoxicity occur—if confirmed cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as metastatic disease (in which case cyproterone should be continued only if the perceived benefit exceeds the risk)

**Dose**
- Prevention of flare with initial gonadorelin analogue therapy, 200 mg daily in 2–3 divided doses for 5–7 days before initiation of gonadorelin analogue, followed by 200 mg daily in 2–3 divided doses for 3–4 weeks after initiation of gonadorelin analogue; max. 300 mg daily
- Long-term palliative therapy where gonadorelin analogues or orchidectomy contra-indicated, not tolerated, or where oral therapy preferred, 200–300 mg daily in 2–3 divided doses
- Hot flushes with gonadorelin analogue therapy, 50 mg daily in 2–3 divided doses

**Cyproterone Acetate (Non-proprietary)**

ENZALUTAMIDE

**Indications** metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after docetaxel therapy

**Cautions** history or risk of seizure (including brain injury, stroke, brain tumours, brain metastases, alcoholism, concurrent use of medication which may lower seizure threshold); recent cardiovascular disease; bradycardia; uncontrolled hypertension; concurrent chemotherapy—safety and efficacy not established; interactions: Appendix 1 (enzalutamide)

**Hepatic impairment** manufacturer advises caution in moderate impairment, avoid in severe impairment

**Renal impairment** caution in severe impairment—no information available

**Pregnancy** men should use condoms during treatment and for 3 months after stopping treatment if their partner is pregnant, and use condoms in combination with another effective contraceptive method if their partner is of child-bearing potential—toxicity in animal studies

**Side-effects** hot flush, hypertension, headache, visual hallucinations, anxiety, cognitive disorder, memory impairment, falls, neutropenia, fractures, dry skin, pruritus; less commonly seizure, leucopenia

**Dose**
- 160 mg once daily

**Xtandi®** (Astellas)

**FLUTAMIDE**

**Indications** advanced prostate cancer, see also notes above

**Cautions** cardiac disease (oedema reported); also liver function tests, monthly for first 4 months, periodically thereafter and at the first sign or symptom of liver disorder (e.g. pruritus, dark urine, persistent anorexia, jaundice, abdominal pain, unexplained influenza-like symptoms); avoid excessive alcohol consumption; avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (flutamide)

**Hepatic impairment** use with caution (hepatotoxic)

**Side-effects** gynaecomastia (sometimes with galactorrhoea); nausea, vomiting, diarrhoea, increased appetite, insomnia, tiredness; other side-effects reported include decreased libido, increased sweating, increased body temperature, increase in body weight; in severe cases withdrawal or dose reduction may be necessary; in patients with mitral valve prolapse, atrial fibrillation or history of angina, use with caution

**Dose**
- 250 mg 3 times daily (see also notes above)

**Flutamide (Non-proprietary)**

**Gonadotrophin-releasing hormone antagonists**

**Degarelix** is a gonadotrophin-releasing hormone antagonist used to treat advanced hormone-dependent prostate cancer. It does not induce a testosterone surge or tumour ‘flare’, therefore anti-androgen therapy is not required.

**DEGARELIX**

**Indications** see notes above

**Cautions** susceptibility to QT-interval prolongation (avoid concomitant use of drugs that prolong QT interval); monitor bone density; diabetes

**Hepatic impairment** manufacturer advises caution in severe impairment—no information available

**Renal impairment** manufacturer advises caution in severe impairment—no information available
Side-effects nausea; dizziness, headache, drowsiness, insomnia, asthenia; influenza-like symptoms; hot flushes, sweating (including night sweats), weight gain; injection-site reactions; less commonly diarrhoea, vomiting, abdominal discomfort, dry mouth, constipation, anorexia, atro-ventricular block, QT-interval prolongation, fainting, hypotension, hypersensitivity reactions, depression, anxiety, oedema, gynaecomastia, micturition urgency, renal impairment, sexual dysfunction, pelvic pain, prostatitis, testicular pain, anaemia, musculoskeletal pain, tinnitus, urticaria, alopecia, and rash

Dose - By subcutaneous injection into the abdominal region. ADULT over 18 years, initially 240 mg (administered as 2 injections of 120 mg), then 80 mg every 28 days

Firmagon® (Ferring) ™
Injection, powder for reconstitution, degarelix (as acetate), net price 80-mg vial (with diluent) = £129.37; 2 × 120-mg vials (with diluent) = £260.00

8.3.4.3 Somatostatin analogues
Lanreotide, octreotide and pasireotide are analogues of the hypothalamic release-inhibiting hormone somatostatin. Lanreotide and octreotide are indicated for the relief of symptoms associated with neuroendocrine (particularly carcinoid) tumours and acromegaly. Additionally, lanreotide is licensed for the treatment of thyroid tumours and octreotide is also licensed for the prevention of complications following pancreatic surgery. Octreotide long-acting depot injection is licensed for treatment of advanced neuroendocrine tumours of the midgut, or treatment where primary origin is not known but non-midgut sites of origin have been excluded. Octreotide may also be valuable in reducing vomiting in palliative care (see p. 23) and in stopping variceal bleeding [unlicensed indication]—see also vasopressin and terlipressin (section 6.5.2). Pasireotide is licensed for the treatment of Cushings disease when surgery has failed or is inappropriate.

Cautions Growth hormone-secreting pituitary tumours can expand causing serious complications; during treatment with somatostatin analogues patients should be monitored for signs of tumour expansion (e.g. visual field defects). Ultrasound examination of the gallbladder is recommended before treatment and at intervals of 6–12 months during treatment (avoid abrupt withdrawal of short-acting octreotide—see Side-effects below). In insulinoma an increase in the depth and duration of hypoglycaemia may occur (observe patients when initiating treatment and changing doses); in diabetes mellitus, insulin or oral antidiabetic requirements may be reduced. Patients with carcinoid tumours must only receive lanreotide after excluding the presence of an obstructive intestinal tumour.

Side-effects Gastro-intestinal disturbances including anorexia, nausea, vomiting, abdominal pain and bloating, flatulence, diarrhoea, and steatorrhoea may occur (administering non-depot injections of octreotide between meals and at bedtime may reduce gastro-intestinal side-effects). Postprandial glycaemia tolerance may be impaired and rarely persistent hyperglycaemia occurs with chronic administration; hypoglycaemia has also been reported. Gallstones have been reported after long-term treatment (abrupt withdrawal of subcutaneous octreotide is associated with biliary colic and pancreatitis). Pain and irritation may occur at the injection site and sites should be rotated. Rarely, pancreatitis has been reported shortly after administration.

LANREOTIDE
Indications see notes above
Cautions see notes above; cardiac disorders (including bradycardia); interactions: Appendix 1 (lanreotide)
Pregnancy manufacturer advises use only if potential benefit outweighs risk
Breast-feeding manufacturer advises caution—no information available
Side-effects see notes above; also reported constipation, dyspepsia, bradycardia, asthenia, dizziness, fatigue, raised bilirubin, biliary dilatation, alopecia; less commonly skin nodule, hot flushes, leg pain, malaise, headache, insomnia, tenesmus, decreased libido, drowsiness, pruritus, increased sweating; rarely hypothyroidism (monitor as necessary)

Dose - See under preparations

Somatuline® LA (Ipsen) ™
Injection (copolymer microparticles for aqueous suspension), lanreotide (as acetate) 30-mg vial (with vehicle) = £323.00
Dose by intramuscular injection, acromegaly and neuroendocrine (particularly carcinoid) tumours, initially 30 mg every 14 days, frequency increased to every 7–10 days according to response
Thyroid tumours, 30 mg every 14 days, frequency increased to every 19 days according to response

Somatuline Autogel® (Ipsen)
Injection, prefilled syringe, lanreotide (as acetate) 60 mg = £551.00; 90 mg = £736.00; 120 mg = £937.00
Dose by deep subcutaneous injection into the gluteal region, acromegaly (if somatostatin analogue not given previously), initially 60 mg every 28 days, adjusted according to response, for patients treated previously with somatostatin analogue, consult product literature for initial dose
Neuroendocrine (particularly carcinoid) tumours, initially 60–120 mg every 28 days, adjusted according to response

OCTREOTIDE
Indications see under Dose
Cautions see notes above; monitor thyroid function on long-term therapy; monitor liver function; interactions: Appendix 1 (octreotide)

Hepatic impairment adjustment of maintenance dose of non-depot preparations may be necessary in patients with liver cirrhosis
Pregnancy possible effect on fetal growth; manufacturer advises use only if potential benefit outweighs risk and effective contraception required during treatment
Breast-feeding manufacturer advises avoid—present in milk in animal studies
Side-effects see notes above; also arrhythmias, bradycardia, dyspnoea, headache, dizziness, dehydration, alopecia, rash; hepatitis also reported

Dose - Symptoms associated with carcinoid tumours with features of carcinoid syndrome, VIPomas, glucagonomas, by subcutaneous injection, initially 50 micrograms once or twice daily, gradually increased
according to response to 200 micrograms 3 times daily (higher doses required exceptionally); maintenance doses variable; in carcinoid tumours discontinue after 1 week if no effect; if rapid response required, initial dose by intravenous injection (with ECG monitoring and after dilution to a concentration of 10–50% with sodium chloride 0.9% injection)

- Acromegaly, short-term treatment before pituitary surgery or long-term treatment in those inadequately controlled by other treatment or until radiotherapy becomes fully effective by subcutaneous injection, 100–200 micrograms 3 times daily; discontinue if no improvement within 3 months
- Prevention of complications following pancreatic surgery, consult product literature

Octreotide (Non-proprietary)
Injection, octreotide (as acetate) 50 micrograms/mL, net price 1-mL amp = £3.72; 100 micrograms/mL, 1-mL amp = £6.53; 200 micrograms/mL, 5-mL vial = £65.10; 500 micrograms/mL, 1-mL amp = £33.87

Sandostatin® (Novartis)
Injection, octreotide (as acetate) 50 micrograms/mL, net price 1-mL amp = £2.97; 100 micrograms/mL, 1-mL amp = £5.59; 200 micrograms/mL, 5-mL vial = £55.73; 500 micrograms/mL, 1-mL amp = £27.09

Depot preparation
Sandostatin Lar® (Novartis) Injection, (microsphere powder for aqueous suspension), octreotide (as acetate) 10-mg vial = £469.84; 20-mg vial = £776.05; 30-mg vial = £993.44 (all supplied with 2.5-mL diluent-filled syringe)

Dose acromegaly (test dose by subcutaneous injection 50–100 micrograms if subcutaneous octreotide not previously given), neuroendocrine (particularly carcinoid) tumour adequately controlled by subcutaneous octreotide, by deep intramuscular injection into gluteal muscle, initially 20 mg every 4 weeks for 3 months then adjusted according to response; max. 30 mg every 4 weeks

For acromegaly, start depot octreotide 1 day after the last dose of subcutaneous octreotide (for pituitary surgery give last dose of depot octreotide at least 3 weeks before surgery). For neuroendocrine tumours, continue subcutaneous octreotide for 2 weeks after first dose of depot octreotide

Advanced neuroendocrine tumours of the midgut, or tumours of unknown primary origin where non-midgut sites of origin have been excluded, 30 mg every 4 weeks

PASIREOTIDE

Indications see notes above

Cautions see notes above; diabetes mellitus (assess glycaemic status before treatment, weekly for the first 2–3 months of treatment, periodically thereafter, and 3 months after treatment is complete); monitor liver function before treatment and after 1, 2, 4, 8, and 12 weeks of treatment; cardiac disorders (including bradycardia); susceptibility to QT-interval prolongation (including concomitant use of drugs that prolong QT interval and electrolyte disturbances)—monitor ECG and electrolytes before treatment, after one week, and periodically thereafter; Interactions: Appendix 1 (pasireotide)

Hepatic impairment reduce initial dose to 300 micrograms twice daily (increased if necessary after 2 months to max. 600 micrograms twice daily) in moderate impairment; avoid in severe impairment

Pregnancy avoid—toxicity in animal studies

Breast-feeding avoid—present in milk in animal studies

Side-effects see notes above; also bradycardia, QT-interval prolongation, hypotension, headache, fatigue, adrenal insufficiency, hyperglycaemia, decreased appetite, anaemia, alopecia, pruritus, myalgia, arthralgia

Dose
- By subcutaneous injection, ADULT over 18 years, initially 600 micrograms twice daily, increased if necessary after 2 months (according to response) to 900 micrograms twice daily; consider discontinuation if no response within 2 months; for dose adjustment due to side-effects, consult product literature

Signifor® (Novartis) Injection, pasireotide (as diaspurate) 300 micrograms/mL, net price 1-mL amp = £46.67; 600 micrograms/mL, 1-mL amp = £54.00; 900 micrograms/mL, 1-mL amp = £54.00

Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

9.1.1 Iron-deficiency anaemias

9.1.1.1 Oral iron

Iron salts should be given by mouth unless there are good reasons for using another route.

Ferrous salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the speed of response is not critical. Choice of

9.1.1.2 Parenteral iron

Treatment with an iron preparation is justified only in the presence of a demonstrable iron-deficiency state. Before starting treatment, it is important to exclude any serious underlying cause of the anaemia (e.g. gastric erosion, gastro-intestinal cancer).

Prophylaxis with an iron preparation may be appropriate in malabsorption, menorrhagia, pregnancy, after subtotal or total gastrectomy, in haemodialysis patients, and in the management of low birth-weight infants such as preterm neonates.
Improved, but the response is often slow. As atrophic glossitis and koilonychia are usually replenish the iron stores. Epithelial tissue changes such treatment should be continued for a further 3 months to weeks. When the haemoglobin is in the reference range, see BNF for Children.

Some oral preparations contain ascorbic acid to aid absorption of the iron but the therapeutic advantage of such preparations is minimal and cost may be increased. There is no justification for the inclusion of other ingredients, such as the B group of vitamins (except folic acid for pregnant women, see notes above and on p. 651).

Modified-release preparations Modified-release preparations of iron are licensed for once-daily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is carried past the first part of the duodenum into an area of the gut where absorption may be poor.

## 9.1.1 Iron-deficiency anaemias

Some oral preparations contain ascorbic acid to aid absorption of the iron but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the B group of vitamins (except folic acid for pregnant women, see notes above and on p. 651).

Modified-release preparations

Modified-release preparations of iron are licensed for once-daily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is carried past the first part of the duodenum into an area of the gut where absorption may be poor.

#### Ferrous Sulfate

**Indications** iron-deficiency anaemia

**Cautions** interactions: Appendix 1 (iron)

**Side-effects** see notes above

**Dose**

- See under preparations below and notes above

**Iron Sulfate (Non-proprietary)**

- **Tablets**, coated, dried ferrous sulfate 200 mg (65 mg iron), net price 28-tab pack = £97
- **Dose** prophylactic, 1 tablet daily; therapeutic, 1 tablet 2–3 times daily; CHILD, see BNF for Children

**Ironorm® Drops** (Wallace Mfg)

- **Oral drops**, ferrous sulfate 125 mg (25 mg iron)/mL, net price 15-mL = £28.00
- **Dose** ADULT and CHILD over 6 years, prophylactic, 0.6 mL daily; CHILD under 6 years, see BNF for Children

**Modified-release preparations**

Feospan® (Intrapharm)

- **Spansule®** (= capsules m/r), clear/red, enclosing green and brown pellets, dried ferrous sulfate 150 mg (47 mg iron), net price 30-cap pack = £4.65. Label: 25
- **Dose** 1–2 capsules daily; CHILD over 1 year, 1 capsule daily; can be opened and sprinkled on food

Ferrograd® (Teofarma)

- **Tablets**, f/c, m/r, red, dried ferrous sulfate 325 mg (105 mg iron), net price 30-tab pack = £2.58. Label: 25
- **Dose** ADULT and CHILD over 12 years, prophylactic and therapeutic, 1 tablet daily before food

**With folic acid**

For prescribing information on folic acid, see section 9.1.2

Fefol® (Intrapharm)

- **Spansule®** (= capsules m/r), clear/green, enclosing brown, yellow, and white pellets, dried ferrous sulfate 150 mg (47 mg iron), folic acid 500 micrograms, net price 30-cap pack = £1.69. Label: 25
- **Dose** 1 capsule daily

Ferrograd Folic® (Teofarma)

- **Tablets**, f/c, red/yellow, dried ferrous sulfate 325 mg (105 mg iron) for sustained release, folic acid 500 micrograms, net price 30-tab pack = £2.64. Label: 25
- **Dose** ADULT and CHILD over 12 years, 1 tablet daily before food

---

Therapeutic response The haemoglobin concentration should rise by about 100–200 mg/100 mL (1–2 g/litre) per day or 2 g/100 mL (20 g/litre) over 3–4 weeks. When the haemoglobin is in the reference range, treatment should be continued for a further 3 months to replenish the iron stores. Epithelial tissue changes such as atrophic glossitis and koilonychia are usually improved, but the response is often slow.

**Side-effects** Gastro-intestinal irritation can occur with iron salts. Nausea and epigastric pain are dose-related, but the relationship between dose and altered bowel habit (constipation or diarrhoea) is less clear. Oral iron, particularly modified-release preparations, can exacerbate diarrhoea in patients with inflammatory bowel disease; care is also needed in patients with intestinal strictures and diverticular disease.

Iron preparations taken orally can be constipating, particularly in older patients and occasionally lead to faecal impaction.

If side-effects occur, the dose may be reduced; alternatively, another iron salt may be used, but an improvement in tolerance may simply be a result of a lower content of elemental iron. The incidence of side-effects due to ferrous sulfate is no greater than with other iron salts when compared on the basis of equivalent amounts of elemental iron.

Iron preparations are a common cause of accidental overdose in children. For the treatment of iron overdose, see Emergency Treatment of Poisoning, p. 39.

**Counselling** Although iron preparations are best absorbed on an empty stomach they can be taken after food to reduce gastro-intestinal side-effects; they may discolor stools.

**Compound preparations** Preparations containing iron and folic acid are used during pregnancy in women who are at high risk of developing iron and folic acid deficiency; they should be distinguished from those used for the prevention of neural tube defects in women planning a pregnancy (see p. 651).

It is important to note that the small doses of folic acid contained in these preparations are inadequate for the treatment of megaloblastic anaemias.
9.1.1 Iron-deficiency anaemias

**FERROUS FUMARATE**

**Indications** iron-deficiency anaemia

**Cautions** interactions: Appendix 1 (iron)

**Side-effects** see notes above

**Dose**
- See under preparations below and notes above

**Fersaday** (AMCo)

**Tablets**, brown, f/c, ferrous fumarate 322 mg (100 mg iron), net price 28-tab pack = £9.55

**Dose** prophylactic, 1 tablet daily; therapeutic, 1 tablet twice daily

**Ferrograd C** (Teofarma)

**648 9.1.1 Iron-deficiency anaemias BNF 68**

**Dose**
- 1 tablet daily
- 28-tab pack = £1.25
- 100 mg iron, folic acid 350 micrograms, net price

**Tablets**
- Over 1 year, prophylactic, 1 tablet daily; therapeutic, 1 tablet twice daily
- Over 12 years, prophylactic, 5 mL daily; therapeutic, 10 mL twice daily

**Syrup**
- Over 1 year, prophylactic, 2.5 mL daily; therapeutic, 5 mL 1–2 times daily (once daily if required during second and third trimester of pregnancy); PRETERM NEONATE, NEONATE, and INFANT (from dropper bottle) 1 drop (approx. 500 micrograms iron) per 450 g body-weight 3 times daily; CHILD 2–6 years 2.5 mL daily, 6–12 years 5 mL daily

**With ascorbic acid**

For prescribing information on ascorbic acid, see section 9.6.3

**Ferrous Gluconate** (Non-proprietary)

**Tablets**, red, coated, ferrous gluconate 300 mg (35 mg iron), net price 28 = £1.95

**Dose** prophylactic, 2 tablets daily before food; therapeutic, 4–6 tablets daily in divided doses before food; CHILD 6–12 years, prophylactic and therapeutic, 1–3 tablets daily

**POLYSACCHARIDE–IRON COMPLEX**

**Indications** iron-deficiency anaemia

**Cautions** interactions: Appendix 1 (iron)

**Side-effects** see notes above

**Dose**
- See under preparation below and notes above

**Niferex** (Tillomed)

**Elixir**, brown, sugar-free, polysaccharide–iron complex equivalent to 100 mg of iron/5 mL, net price 240-mL pack = £6.06; 10-mL dropper bottle for paediatric use = £2.16. Counselling, use of dropper

**Dose** prophylactic, 2.5 mL daily; therapeutic, 5 mL 1–2 times daily (once daily if required during second and third trimester of pregnancy); PRETERM NEONATE, NEONATE, and INFANT (from dropper bottle) 1 drop (approx. 500 micrograms iron) per 450 g body-weight 3 times daily; CHILD 2–6 years 2.5 mL daily, 6–12 years 5 mL daily

**With folic acid**

For prescribing information on folic acid, see section 9.1.2

**Galfex FA** (Thornton & Ross)

**Capsules**, red/yellow, ferrous fumarate 305 mg (100 mg iron), net price 100 = £2.00

**Dose** ADULT and CHILD over 12 years, prophylactic, 1 capsule daily; therapeutic, 1 capsule twice daily

**Syrop**, brown, sugar-free ferrous fumarate 140 mg (45 mg iron)/5 mL, net price 200 mL = £3.73

**Dose** prophylactic, 5 mL twice daily; therapeutic, 10 mL twice daily; CHILD see BNF for Children

**FERROUS GLUCONATE**

**Indications** iron-deficiency anaemia

**Cautions** interactions: Appendix 1 (iron)

**Side-effects** see notes above

**Dose**
- See under preparation below and notes above

**Syron** (Forum)

**Elixir**, sugar-free, sodium feredetate 190 mg equivalent to 27.5 mg of iron/5 mL, net price 100 mL = £1.07

**Dose** therapeutic, 5 mL increasing gradually to 10 mL 3 times daily; CHILD under 1 year, see BNF for Children; CHILD 1–3 years, therapeutic, 2.5 mL 3 times daily; 6–12 years, therapeutic, 5 mL 3 times daily

**With folinic acid**

For prescribing information on folinic acid, see section 9.1.2

**Galfer®** (Thornton & Ross)

**Capsules**, red/green, ferrous fumarate 305 mg (100 mg iron), net price 84 = £2.30

**Dose** ADULT and CHILD over 12 years, prophylactic, 1 capsule daily; therapeutic, 1 capsule twice daily

**Syrop**, brown, sugar-free ferrous fumarate 140 mg (45 mg iron)/5 mL, net price 300 mL = £5.33

**Dose** ADULT and CHILD over 12 years, prophylactic, 10 mL once daily; therapeutic, 10 mL 1–2 times daily; PRETERM NEONATE and NEONATE, see BNF for Children; CHILD month–12 months, prophylactic and therapeutic, 0.5 mL/kg daily in 2–3 divided doses; max. 20 mL daily

**SODIUM FEREDETATE**

(Sodium feredetate)

**Indications** iron-deficiency anaemia

**Cautions** interactions: Appendix 1 (iron)

**Side-effects** see notes above

**Dose**
- See under preparation below and notes above

**With folic acid**

For prescribing information on folic acid, see section 9.1.2

**Pregaday** (RHPh)

**Tablets**, brown, f/c, ferrous fumarate equivalent to 100 mg iron, folic acid 350 micrograms, net price 28-tab pack = £1.25

**Dose** 1 tablet daily

**FERROUS GLUCONATE**

**Indications** iron-deficiency anaemia

**Cautions** interactions: Appendix 1 (iron)

**Side-effects** see notes above

**Dose**
- See under preparation below and notes above

**Iron can be administered parenterally as iron dextran, iron sucrose, ferric carboxymaltose, iron isomaltoside 1000, or ferumoxytol. Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the patient cannot tolerate oral iron, or does not take it reliably, or if there is continuing blood loss, or in malabsorption. Parenteral iron may also have a role in the management of chemotherapy-induced anaemia, when given with erythropoietins, in specific patient groups (see NICE guidance, p. 653). The Scottish Medicines Consortium (p. 4) has advised (January 2013) that ferumoxytol (Renost®) is accepted for restricted use within NHS Scotland for the treatment of iron deficiency anaemia in non-haemodialysis dependent adults with chronic kidney disease when oral iron preparations are ineffective or cannot be used. Many patients with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route
Side-effects  gastro-intestinal disturbances; headache, dizziness; rash, injection-site reactions; less commonly hypertension, hypotension, flushing, chest pain, peripheral oedema, hypersensitivity reactions (including anaphylaxis), fatigue, paraesthesia, malaise, pyrexia, rigors, myalgia, arthralgia, back pain, pruritus, and urticaria; rarely dyspnoea

Dose  
- By slow intravenous injection or by intravenous infusion, ADULT and CHILD over 14 years, calculated according to body-weight and iron deficit, consult product literature

**Ferinject** *(Vifor)* ▼ (FM)

Injection, iron (as ferric carboxymaltose) 50 mg/mL, net price 2-mL vial = £19.10, 10-mL vial = £95.50, 20-mL vial = £181.45

**Electrolytes**  Na⁺ 0.24 mmol/mL

**Ferric Carboxymaltose**

A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron

Indications  iron-deficiency anaemia, see notes above

Cautions  hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available (see MHRA/CHM advice, p. 648); oral iron should not be given until 5 days after last injection; allergic or immune conditions; infection (discontinue if ongoing bacteremia)

Hepatic impairment  use with caution

Pregnancy  avoid—risk for both mother and fetus

**Iron Dextran**

A complex of ferric hydroxide with dextran containing 5% (50 mg/mL) of iron

Indications  iron-deficiency anaemia, see notes above

Cautions  hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available (see MHRA/CHM advice, p. 648); oral iron should not be given until 5 days after last injection

**MHRA/CHM advice**

### Serious hypersensitivity reactions with intravenous iron (August 2013)

Serious hypersensitivity reactions, including life-threatening and fatal anaphylactic reactions, have been reported in patients receiving intravenous iron. These reactions can occur even when a previous administration has been tolerated (including a negative test dose). Test doses are no longer recommended and caution is needed with every dose of intravenous iron.

Intravenous iron products should only be administered when appropriately trained staff and resuscitation facilities are immediately available; patients should be closely monitored for signs of hypersensitivity during and for at least 30 minutes after every administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

The risk of hypersensitivity is increased in patients with known allergies, immune or inflammatory conditions, or those with a history of severe asthma, eczema, or other atopic allergy; in these patients, intravenous iron should only be used if the benefits outweigh the risks.

Intravenous iron should be avoided in the first trimester of pregnancy and used in the second or third trimesters only if the benefit outweighs the potential risks for both mother and fetus.
**9.1.2 Drugs used in megaloblastic anaemias**

**IRON ISOMALTOSIDE 1000**
A complex of ferric iron and isomaltosides containing 10% (100 mg/mL) of iron

**Indications** iron deficiency anaemia, see notes above

**Contra-indications** history of allergic disorders including asthma and eczema; active rheumatoid arthritis

**Hepatic impairment** avoid in decompensated liver disease and hepatitis

**Pregnancy** avoid in first trimester

**Side-effects** less commonly nausea, vomiting, abdominal pain, flushing, dyspnoea, hypersensitivity reactions (including anaphylaxis), numbness, cramps, blurred vision, pruritus, and rash; rarely diarrhoea, chest pain, hypotension, angioedema, arthralgias, tachycardia, dizziness, restlessless, fatigue, seizures, tremor, impaired consciousness, myalgia, arthralgia, sweating, and injection-site reactions; very rarely hypertension, palpitation, headache, paraesthesia, haemolysis, and transient deafness

**Dose**
- By deep intramuscular injection into the gluteal muscle or by slow intravenous injection or by intravenous infusion, calculated according to body-weight and iron deficit, consult product literature
- CHILD under 14 years, not recommended

**CosmoFer° (Pharmacosmos)**
- **Injection**, iron (as iron dextran) 50 mg/mL, net price 2-mL amp = £7.97, 10-mL amp = £39.85
- CHILD 100 mg/mL, net price 1-mL vial = £16.95, 5-mL vial = £84.75, 10-mL vial = £169.50

**IRON SUCROSE**
A complex of ferric hydroxide with sucrose containing 2% (20 mg/mL) of iron

**Indications** iron-deficiency anaemia, see notes above

**Cautions** hypersensitivity reactions can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available (see MHRA/CHM advice, p. 648); oral iron should not be given until 5 days after last injection; infection (discontinue if ongoing bacteraemia)

**Contra-indications** history of allergic disorders including asthma, eczema, and anaphylaxis

**Hepatic impairment** use with caution; avoid in conditions where iron overload increases risk of impairment

**Pregnancy** avoid in first trimester

**Side-effects** taste disturbances; less commonly nausea, vomiting, abdominal pain, diarrhoea, hypotension, tachycardia, flushing, palpitation, chest pain, bronchospasm, dyspnoea, headache, dizziness, fever, myalgia, pruritus, rash, and injection-site reactions; rarely peripheral oedema, hypertension, hypersensitivity reactions (including anaphylaxis), fatigue, asthenia, and paraesthesia; bradycardia, confusion, arthralgia, and increased sweating also reported

**Dose**
- By slow intravenous injection or by intravenous infusion, calculated according to body-weight and iron deficit, consult product literature; CHILD not recommended but see BNF for Children

**Venoferr° (Vitar)**
- **Injection**, iron (as iron sucrose) 20 mg/mL, net price 5-mL vial = £10.24

**9.1.2 Drugs used in megaloblastic anaemias**

Most megaloblastic anaemias result from a lack of either vitamin B12 or folate, and it is essential to establish in every case which deficiency is present and the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to administer both substances after the bone marrow test while plasma assay results are awaited. Normally, however, appropriate treatment should not be instituted until the results of tests are available.

One cause of megaloblastic anaemia in the UK is pernicious anaemia in which lack of gastric intrinsic factor resulting from an autoimmune gastritis causes malabsorption of vitamin B12.

Vitamin B12 is also needed in the treatment of megaloblastosis caused by prolonged nitrous oxide anaesthesia, which inactivates the vitamin, and in the rare syndrome of congenital transcobalamin II deficiency.

Vitamin B12 should be given prophylactically after total gastrectomy or total ileal resection (or after partial gastrectomy if a vitamin B12 absorption test shows vitamin B12 malabsorption).

Apart from dietary deficiency, all other causes of vitamin B12 deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B12 orally and none for vitamin B12 intrinsic factor com-
plexes given by mouth. Vitamin B$_{12}$ in larger oral doses of 1–2 mg daily [unlicensed] may be effective.

**Hydroxocobalamin** has completely replaced cyanocobalamin as the form of vitamin B$_{12}$ of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B$_{12}$ neuropathy.

**Folic acid** has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B$_{12}$ is administered concurrently otherwise neuropathy may be precipitated (see above).

In *folate-deficient megaloblastic anaemia* (e.g. because of poor nutrition, pregnancy, or antiepileptic drugs), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores.

For prophylaxis in chronic haemolytic states, malabsorption, or in renal dialysis, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

For prophylaxis in pregnancy, see Prevention of Neural Tube Defects below.

Folic acid is also used for the prevention of methotrexate-induced side-effects in severe Crohn’s disease (see section 1.5.3, p. 66), rheumatic disease (see section 10.1.3, p. 716), and severe psoriasis (see section 13.5.3, p. 801).

**Folinic acid** is also effective in the treatment of folate-deficient megaloblastic anaemia but it is generally used in association with cytotoxic drugs (see section 8.4.1); it is given as calcium folinate.

### Prevention of neural tube defects
Folic acid supplements taken before and during pregnancy can reduce the occurrence of neural tube defects. The risk of a neural tube defect occurring in a child should be assessed and folic acid given as follows:

- Women at a low risk of conceiving a child with a neural tube defect should be advised to take folic acid as a medicinal or food supplement at a dose of 400 micrograms daily before conception and until week 12 of pregnancy. Women who have not been taking folic acid and who suspect they are pregnant should start at once and continue until week 12 of pregnancy.
- Couples are at a high risk of conceiving a child with a neural tube defect if either partner has a neural tube defect (or either partner has a family history of neural tube defects), if they have had a previous pregnancy affected by a neural tube defect, or if the woman has coeliac disease (or other malabsorption state), diabetes mellitus, sickle-cell anaemia, or is taking antiepileptic medicines (see also section 4.8.1).

Women in the high-risk group who wish to become pregnant (or who are at risk of becoming pregnant) should be advised to take folic acid 5 mg daily and continue until week 12 of pregnancy (women with sickle-cell disease should continue taking their normal dose of folic acid 5 mg daily or to increase the dose to 5 mg daily) and continue throughout pregnancy).

---

**HYDROXOCOBALAMIN**

**Indications** see under dose below: cyanide poisoning (see Emergency Treatment of Poisoning, p. 41)

**Cautions** should not be given before diagnosis fully established but see also notes above; **interactions**: Appendix 1 (hydroxocobalamin)

**Breast-feeding** present in milk but not known to be harmful

**Side-effects** nausea, headache, dizziness; fever, hypersensitivity reactions (including rash and pruritus); injection-site reactions; hypokalaemia and thrombocytosis during initial treatment; chromatura

**Dose**
- By intramuscular injection, pernicious anaemia and other macrocytic anaemias without neurological involvement, initially 1 mg 3 times a week for 2 weeks then 1 mg every 3 months
- Pernicious anaemia and other macrocytic anaemias with neurological involvement, initially 1 mg on alternate days until no further improvement, then 1 mg every 2 months
- Prophylaxis of macrocytic anaemias associated with vitamin B$_{12}$ deficiency, 1 mg every 2–3 months
- Tobacco amblyopia and Leber’s optic atrophy, initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, thereafter 1 mg every 1–3 months

**CHILD** see BNF for Children

**Hydroxocobalamin (Non-proprietary)**

**Injection**, hydroxocobalamin 1 mg/mL. Net price 1 mL amp = 73p

Note: The BP directs that when vitamin B$_{12}$ injection is prescribed or demanded hydroxocobalamin injection shall be dispensed or supplied

**Brands include** Cobalin-H®, Neo-Cytamen®

**CYANOCOBALAMIN**

**Indications** see notes above

**Dose**
- **By mouth**, vitamin B$_{12}$ deficiency of dietary origin, 50–150 micrograms daily taken between meals; **CHILD** 50–105 micrograms daily in 1–3 divided doses
- **By intramuscular injection**, initially 1 mg repeated 10 times at intervals of 2–3 days, maintenance 1 mg every month, but see notes above

**Cyanocobalamin (Non-proprietary)**

**Tablets**, cyanocobalamin 50 micrograms. Net price 50-tab pack = £6.24

**Brands include** Cytaron®

Note: Currently available brands may not be suitable for vegans

**Liquid**, cyanocobalamin 35 micrograms/5 mL

Net price 200 mL = £2.77

**Brands include** Cytaron®
reactions are common in the first 2 days and profound immunosuppression can occur; antilymphocyte immunoglobulin should be given under specialist supervision with appropriate resuscitation facilities. Alternatively, oxymetholone tablets (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) can be used in aplastic anaemia at a dose of 1–5 mg/kg daily for 3 to 6 months.

It is unlikely that dietary deprivation of pyridoxine (section 9.6.2) produces clinically relevant haematological effects. However, certain forms of sideroblastic anaemia respond to pharmaceutical doses, possibly reflecting its role as a co-enzyme during haemoglobin synthesis. Pyridoxine is indicated in both idiopathic acquired and hereditary sideroblastic anaemias. Although complete cures have not been reported, some increase in haemoglobin can occur; the dose required is usually high, up to 400 mg daily. Reversible sideroblastic anaemias respond to treatment of the underlying cause but in pregnancy, haemolytic anaemias, and alcohol dependence, or during isoniazid treatment, pyridoxine is also indicated.

Corticosteroids (see section 6.3) have an important place in the management of a wide variety of haematological disorders. They include conditions with an immune basis such as autoimmune haemolytic anaemia, immune thrombocytopenias and neutropenias, and major transfusion reactions. They are also used in chemotherapy schedules for many types of lymphoma, lymphoid leukaemias, and paraproteinaemias, including multiple myeloma.

### Erythropoietins

Epoetins (recombinant human erythropoietins) are used to treat symptomatic anaemia associated with erythropoietin deficiency in chronic renal failure, to increase the yield of autologous blood in normal individuals and to shorten the period of symptomatic anaemia in patients receiving cytotoxic chemotherapy. Epoetin beta is also used for the prevention of anaemia in preterm neonates of low birth-weight; only unpreserved formulations should be used in neonates because other preparations may contain benzyl alcohol (seeExcipients, p. 2).

Darbepoetin is a hyperglycosylated derivative of epoetin; it has a longer half-life and can be administered less frequently than epoetin.

### Methoxy polyethylene glycol-epoetin beta

Methoxy polyethylene glycol-epoetin beta is a continuous erythropoietin receptor activator that is licensed for the treatment of symptomatic anaemia associated with chronic kidney disease. It has a longer duration of action than epoetin.

Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients. Aluminium toxicity, concurrent infection, or other inflammatory disease can impair the response to erythropoietin.
MHRA/CHM advice (December 2007)

Erythropoietins—haemoglobin concentration

Overcorrection of haemoglobin concentration in patients with chronic kidney disease may increase the risk of death and serious cardiovascular events, and in patients with cancer may increase the risk of thrombosis and related complications:

- patients should not be treated with erythropoietins for the licensed indications in chronic kidney disease or cancer in patients receiving chemotherapy unless symptoms of anaemia are present;
- the haemoglobin concentration should be maintained within the range 10–12 g/100 mL;
- haemoglobin concentrations higher than 12 g/100 mL should be avoided;
- the aim of treatment is to relieve symptoms of anaemia, and in patients with chronic kidney disease to avoid the need for blood transfusion; the haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia (in some patients, this may be achieved at concentrations lower than the recommended range).

See also MHRA/CHM advice below.

MHRA/CHM advice (December 2007 and July 2008)

Erythropoietins—tumour progression and survival in patients with cancer

Clinical trial data show an unexplained excess mortality and increased risk of tumour progression in patients with anaemia associated with cancer who have been treated with erythropoietins. Many of these trials used erythropoietins outside of the licensed indications (i.e. overcorrected haemoglobin concentration or given to patients who have not received chemotherapy):

- erythropoietins licensed for the treatment of symptomatic anaemia associated with cancer, are licensed only for patients who are receiving chemotherapy;
- the decision to use erythropoietins should be based on an assessment of the benefits and risks for individual patients; blood transfusion may be the preferred treatment for anaemia associated with cancer chemotherapy, particularly in those with a good cancer prognosis.

See also MHRA/CHM advice above.

NICE guidance

Epoetin alfa, beta and darbepoetin alfa for cancer treatment-induced anaemia (May 2008)

Erythropoietin analogues are not recommended for routine use in the management of cancer treatment-induced anaemia, but may be considered, in combination with intravenous iron, for:

- women receiving platinum-based chemotherapy for ovarian cancer who have symptomatic anaemia with a haemoglobin concentration of 6 g/100 mL or lower (the use of erythropoietin analogues does not preclude the use of existing approaches to the management of anaemia, including blood transfusion when necessary);
- patients who cannot be given blood transfusions and who have profound cancer treatment-related anaemia that is likely to have an impact on survival.

Patients currently treated with erythropoietin analogues for the management of cancer treatment-related anaemia who do not fulfil the criteria outlined above can continue therapy until they and their specialists consider it appropriate to stop.

www.nice.org.uk/TA142

DARBEPOETIN ALFA

Indications see under Dose below

Cautions see Epoetin

Contra-indications see Epoetin

Hepatic impairment manufacturer advises caution

Pregnancy no evidence of harm in animal studies—manufacturer advises caution

Breast-feeding manufacturer advises avoid—no information available

Side-effects see Epoetin; also, oedema, injection-site pain; isolated reports of pure red cell aplasia, particularly following subcutaneous administration in patients with chronic renal failure (discontinue therapy)—see also notes above

Dose

- Symptomatic anaemia associated with chronic renal failure in patients on dialysis (see also MHRA/CHM advice, above), ADULT and CHILD over 11 years, by subcutaneous or intravenous injection, initially 450 nanograms/kg once weekly, adjusted according to response by approx. 25% at intervals of at least 4 weeks; maintenance dose, given once weekly or once every 2 weeks
- Symptomatic anaemia associated with chronic renal failure in patients not on dialysis (see also MHRA/CHM advice, above), ADULT and CHILD over 11 years, by subcutaneous or intravenous injection, initially 750 nanograms/kg once every 2 weeks; adjusted according to response by approx. 25% at intervals of at least 4 weeks; maintenance dose, given subcutaneously or intravenously once weekly or subcutaneously once every 2 weeks or subcutaneously once every month

Note Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. When changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements. Adjust

Pure red cell aplasia

There have been very rare reports of pure red cell aplasia in patients treated with erythropoietins. In patients who develop a lack of efficacy with erythropoietin treatment with erythropoietins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should not be switched to another form of erythropoietin.
doses not more frequently than every 2 weeks during maintenance treatment

- Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy (see also MHRA/CHM advice, p. 653), by subcutaneous injection, initially 6.75 micrograms/kg once every 3 weeks or 2.25 micrograms/kg once weekly (if response inadequate after 9 weeks further treatment may not be effective); if adequate response obtained, reduce dose by 25–50%

**Note** Reduce dose by approximately 25–50% if rise in haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

**Aranesp**

**Injection**, prefilled syringe, darbepoetin alfa, 25 micrograms/mL, net price 0.4 mL (10 micrograms) = £14.68; 40 micrograms/mL, 0.375 mL (15 micrograms) = £22.02, 0.5 mL (20 micrograms) = £29.36; 100 micrograms/mL, 0.3 mL (30 micrograms) = £44.04, 0.4 mL (40 micrograms) = £58.73, 0.5 mL (50 micrograms) = £73.41; 200 micrograms/mL, 0.3 mL (60 micrograms) = £88.09, 0.4 mL (80 micrograms) = £117.45, 0.5 mL (100 micrograms) = £146.81, 0.65 mL (130 micrograms) = £190.86; 500 micrograms/mL, 0.3 mL (150 micrograms) = £220.22, 0.6 mL (300 micrograms) = £440.43, 1 mL (500 micrograms) = £734.05

**Injection** (Aranesp®, SureClick), prefilled disposable injection device, darbepoetin alfa, 40 micrograms/mL, net price 0.5 mL (20 micrograms) = £29.36; 100 micrograms/mL, 0.4 mL (40 micrograms) = £58.72; 200 micrograms/mL, 0.3 mL (60 micrograms) = £88.09, 0.4 mL (80 micrograms) = £117.45, 0.5 mL (100 micrograms) = £146.81; 500 micrograms/mL, 0.3 mL (150 micrograms) = £220.22, 0.6 mL (300 micrograms) = £440.43, 1 mL (500 micrograms) = £734.05

**Contra-indications** pure red cell aplasia following erythropoietin therapy (see also notes above); uncontrolled hypertension; patients unable to receive thromboprophylaxis; avoid injections containing benzyl alcohol in neonates (see under preparations, below)

**Hepatic impairment** manufacturers advise caution in chronic hepatic failure

**Pregnancy** no evidence of harm; benefits probably outweigh risk of anaemia and of transfusion in pregnancy

**Breast-feeding** unlikely to be present in milk; minimal effect on infant

**Side-effects** diarrhoea, nausea, vomiting; dose-dependent increase in blood pressure or aggravation of hypertension; in isolated patients with normal or low blood pressure, hypertensive crisis with encephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention; headache; dose-dependent increase in platelet count (but thrombocytosis rare) regressing during treatment; influenza-like symptoms (may be reduced if intravenous injection given over 5 minutes); cardiovascular events; shunt thrombosis especially if tendency to hypotension or arteriovenous shunt complications; very rarely sudden loss of efficacy because of pure red cell aplasia, particularly following subcutaneous administration in patients with chronic renal failure (discontinue erythropoietin therapy)—see also notes above, hyperkalaemia, hypersensitivity reactions (including anaphylaxis and angioedema), skin reactions, injection-site reactions, and peripheral oedema also reported

**Dose**

- See under preparations, below

**Epoetin alfa**

**Binocrit®** (Sandoz) **Injection**, prefilled syringe, epoetin alfa, net price 1000 units = £4.33; 2000 units = £8.65; 3000 units = £12.98; 4000 units = £17.31; 5000 units = £21.64; 6000 units = £25.96; 8000 units = £40.73; 10 000 units = £43.27

**Note** Biosimilar medicine, p. 1

Dose symptomatic anaemia associated with chronic renal failure in patients on haemodialysis (see also MHRA/CHM advice, p. 653), by intravenous injection over 1–5 minutes, initially 50 units/kg 3 times weekly adjusted according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose, usually 25–100 units/kg 3 times weekly.

**CHILD by intravenous injection** initially as for adults; maintenance dose, body-weight under 10 kg usually 75–150 units/kg 3 times weekly, body-weight 10–30 kg usually 60–150 units/kg 3 times weekly, body-weight over 30 kg usually 30–100 units/kg 3 times weekly.

Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis (see also MHRA/CHM advice, p. 653), by intravenous injection over 1–5 minutes, initially 50 units/kg twice weekly, maintenance dose 25–50 units/kg twice weekly

Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis (see also MHRA/CHM advice, p. 653), by intravenous injection over 1–5 minutes, initially 50 units/kg 3 times weekly increased according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose 17–33 units/kg 3 times weekly, max. 200 units/kg 3 times weekly

**Note** Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration continues to rise, despite dose

**EPOETIN ALFA, BETA, THETA, and ZETA**

(Recombinant human erythropoietins)

**Note** The prescriber must specify which epoetin is required, see also Biosimilar medicines, p. 1

**Indications** see under preparations, below

**Cautions** see notes above; also inadequately treated or poorly controlled blood pressure (monitor closely blood pressure, reticulocyte counts, haemoglobin, and electrolytes), interrupt treatment if blood pressure uncontrolled; sudden stabbing migraine-like pain is warning of a hypertensive crisis; sickle-cell disease (lower target haemoglobin concentration may be appropriate); ischaemic vascular disease; thrombocytosis (monitor platelet count for first 8 weeks); epilepsy; malignant disease; increase in unfractonated or low molecular weight heparin dose may be needed during dialysis; risk of thrombosis may be increased when used for anaemia in adults receiving cancer chemotherapy; risk of thrombosis may be increased when used for anaemia before orthopaedic surgery—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident.
Nutrition and blood

9.1.3 Drugs used in hypoplastic, haemolytic, and renal anaemias

reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Symptomatic anaemia in adults receiving cancer chemotherapy (see also MHRA/CHM advice, p. 653), by subcutaneous injection (max. 1 mL per injection site), initially 150 units/kg 3 times weekly (or 450 units/kg once weekly), increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks to 300 units/kg 3 times weekly; if haemoglobin concentration exceeds 12 g/100 mL if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Note Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL, if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Symptomatic anaemia in adults receiving cancer chemotherapy (see also MHRA/CHM advice, p. 653), by subcutaneous injection (max. 1 mL per injection site), initially reduce dose by approximately 25–50% lower than the previous dose.

reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Note Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL, if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Symptomatic anaemia in adults receiving cancer chemotherapy (see also MHRA/CHM advice, p. 653), by subcutaneous injection (max. 1 mL per injection site), initially 150 units/kg 3 times weekly (or 450 units/kg once weekly), increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks to 300 units/kg 3 times weekly; if haemoglobin concentration exceeds 12 g/100 mL if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Discontinue approximately 4 weeks after ending chemotherapy.

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery, by intravenous injection over 1–5 minutes, 600 units/kg every week for 3 weeks before surgery, consult product literature for details and advice on ensuring high iron stores.

Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective major surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable, by subcutaneous injection (max. 1 mL per injection site), 600 units/kg every week for 3 weeks before surgery and on day of surgery or 300 units/kg daily for 15 days starting 10 days before surgery, consult product literature for details.

Eprex® (Janssen) Prefilled syringe, epoetin alfa, net price

Injection, prefilled syringe, epoetin alfa, net price 1000 units = £5.53; 2000 units = £11.06; 3000 units = £16.59; 4000 units = £22.12; 5000 units = £27.65; 6000 units = £33.19, 6000 units = £44.25; 10 000 units = £55.31; 20 000 units = £110.62; 30 000 units = £199.11, 40 000 units = £265.48. An auto-injector device is available for use with pre-filled syringes.

Dose symptomatic anaemia associated with chronic renal failure in patients on haemodialysis (see also MHRA/CHM advice, p. 653), by intravenous injection over 1–5 minutes or by subcutaneous injection (max. 1 mL per injection site), initially 50 units/kg 3 times weekly adjusted according to response at intervals of 25 units/kg 3 times weekly in steps of at least 4 weeks; maintenance dose, usually a total of 75–300 units/kg weekly (as a single dose or in divided doses); CHILD by intravenous injection initially as for adults; maintenance dose, body-weight under 10 kg usually 75–150 units/kg 3 times weekly, body-weight 10–30 kg usually 60–150 units/kg 3 times weekly, body-weight over 30 kg usually 30–100 units/kg 3 times weekly.

Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis (see also MHRA/CHM advice, p. 653), by intravenous injection (max. 1 mL per injection site), initially 50 units/kg 3 times weekly; maintenance dose 25–50 units/kg twice weekly.

Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis (see also MHRA/CHM advice, p. 653), by intravenous injection over 1–5 minutes or by subcutaneous injection (max. 1 mL per injection site), initially 50 units/kg 3 times weekly; increased according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose 100–150 units/kg 3 times weekly, max. 200 units/kg 3 times weekly.

Note Intravenous route preferred; reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration increases 12 g/100 mL if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy (see also MHRA/CHM advice, p. 653), by subcutaneous injection 10–13 g/100 mL to maintain adequate haemoglobin concentration and continued for 6 weeks.

Note Subcutaneous route preferred in patients on not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration increases 12 g/100 mL if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Prevention of anaemia of prematurity in neonates with birth-weight of 0.75–1.5 kg and corrected gestational age of less than 34 weeks, by subcutaneous injection, 250 units/kg 3 times weekly preferably starting within 3 days of birth and continued for 6 weeks.

Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy (see also MHRA/CHM advice, p. 653), by subcutaneous injection (max. 1 mL per injection site), initially 30 units/kg 3 times weekly increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks to 90 units/kg 3 times weekly; if haemoglobin concentration exceeds 12 g/100 mL if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Discontinue approximately 4 weeks after ending chemotherapy.

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery, by intravenous injection over 1–5 minutes, 600 units/kg every week for 3 weeks before surgery, consult product literature for details and advice on ensuring high iron stores.

Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective major surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable, by subcutaneous injection (max. 1 mL per injection site), 600 units/kg every week for 3 weeks before surgery and on day of surgery or 300 units/kg daily for 15 days starting 10 days before surgery, consult product literature for details.

Epoetin beta

NeoRecormon® (Roche) Prefilled syringe, epoetin beta, net price

Injection, prefilled syringe, epoetin beta, net price 500 units = £3.51; 2000 units = £14.03; 3000 units = £21.04; 4000 units = £28.06; 5000 units = £35.07; 6000 units = £42.08; 10 000 units = £70.14; 20 000 units = £140.29; 30 000 units = £210.43.

Excipients include phenylalanine up to 300 micrograms/syringe (section 9.4.1).

Dose symptomatic anaemia associated with chronic renal failure (see also MHRA/CHM advice, p. 653), by subcutaneous injection, ADULT and CHILD, initially 20 units/kg 3 times weekly for 4 weeks, increased according to response at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses; max. 720 units/kg weekly.

By intravenous injection over 2 minutes, ADULT and CHILD, initially 40 units/kg 3 times weekly for 4 weeks, increased according to response to 80 units/kg 3 times weekly after 4 weeks, with further increases if needed at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; max. 720 units/kg weekly.

Note Subcutaneous route preferred in patients on not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration increases 12 g/100 mL if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.
9 Nutrition and Blood

9.1.3 Drugs used in hypoplastic, haemolytic, and renal anaemias

BNF 68

CHM advice, p. 653), by subcutaneous injection, initially 450 units/kg weekly (as a single dose or in 3–7 divided doses), increased if necessary after 4 weeks (if a rise in haemoglobin of at least 1 g/100 mL not achieved) to 900 units/kg weekly (as a single dose or in 3–7 divided doses), if adequate response obtained reduce dose by 25–50%; max. 60 000 units weekly

Note Discontinue treatment if haemoglobin concentration does not increase by at least 1 g/100 mL after 8 weeks of therapy (response unlikely). Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL, if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia when blood-conserving procedures are insufficient or unavailable, consult product literature

Note Avoid contact of reconstituted injection with glass; use only plastic materials

Dose symptomatic anaemia associated with chronic renal failure (see also MHRA/CHM advice, p. 653), by subcutaneous injection, ADULT and CHILD over 3 years, initially 20 units/kg 3 times weekly for 4 weeks, increased according to response at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses; max. 720 units/kg weekly

By intravenous injection over 2 minutes, ADULT and CHILD over 3 years, initially 40 units/kg 3 times weekly for 4 weeks, increased according to response to 80 units/kg 3 times weekly after 4 weeks, with further increases if needed at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; max. 720 units/kg weekly

Note Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL, if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Symptomatic anaemia in adults on non-myeloid malignancies receiving chemotherapy (see also MHRA/CHM advice, p. 653), by subcutaneous injection, initially 20 000 units once weekly, increased if necessary after 4 weeks (if a rise in haemoglobin of at least 1 g/100 mL not achieved) to 40 000 units once weekly, with further increase if needed after 4 weeks to max. 60 000 units once weekly

Note Discontinue treatment if haemoglobin concentration does not increase by at least 1 g/100 mL after 12 weeks of therapy (response unlikely). Reduce dose by 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL, if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Discontinue approximately 4 weeks after ending chemotherapy

Epoetin zeta

Retacrit® (Hospital) ® (Ratiopharm UK)

Injection, prefilled syringe, epoetin zeta, net price 1000 units = £5.66; 2000 units = £11.31; 3000 units = £16.97; 4000 units = £22.63; 5000 units = £28.28; 6000 units = £33.94; 8000 units = £45.25; 10 000 units = £56.57; 20 000 units = £113.13; 30 000 units = £169.70; 40 000 units = £226.26

Excipients include phenylethanaline up to 5 mg/vial (section 9.4.1), benzyl alcohol (avoid in neonates, see Excipients p. 2)

Note Biostimulant medicine, p. 1

Dose symptomatic anaemia associated with chronic renal failure in patients on haemodialysis (see also MHRA/CHM advice, p. 653), by intravenous injection over 1–5 minutes or by subcutaneous injection (max. 1 mL per injection site), initially 50 units/kg 3 times weekly adjusted according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose, usually 25–100 units/kg 3 times weekly; CHILD by intravenous injection initially as for adults; maintenance dose, body-weight under 10 kg usually 75–150 units/kg 3 times weekly, body-weight 10–30 kg usually 60–150 units/kg 3 times weekly; body-weight over 30 kg usually 30–100 units/kg 3 times weekly

Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis (see also MHRA/CHM
Symptomatic anaemia associated with chronic kidney disease in adults currently treated with erythropoietins (see also MHRA/CHM advice, p. 653), ADULT over 18 years, by subcutaneous injection, initially 1.2 micrograms/kg once every 4 weeks, alternatively by subcutaneous or intravenous injection, initially 600 nanograms/kg once every 2 weeks; dose adjusted according to response to intervals of at least 4 weeks; patients treated once every 2 weeks may be given a maintenance dose of double the previous fortnightly dose every 4 weeks.

Methoxy Polyethylene Glycol-Epoetin Beta

Indications see under Dose below

Contra-indications see Epoetin

Pregnancy no evidence of harm in animal studies—manufacturer advises caution

Breast-feeding manufacturer advises use only if potential benefit outweighs risk—present in milk in animal studies

Dose

- Symptomatic anaemia associated with chronic kidney disease in patients on dialysis and not currently treated with erythropoietins (see also MHRA/CHM advice, p. 653), ADULT over 18 years, by intravenous injection over 1–5 minutes or by subcutaneous injection (max. 1 ml per injection site), initially 50 units/kg twice weekly, maintenance dose 25–50 units/kg twice weekly.
- Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis (see also MHRA/CHM advice, p. 653), by intravenous injection over 1–5 minutes or by subcutaneous injection (max. 1 ml per injection site), initially 50 units/kg 3 times weekly increased according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose 17–33 units/kg 3 times weekly; max. 200 units/kg 3 times weekly.

Note

- Avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks.
- Symptomatic anaemia in adults receiving cancer chemotherapy (see also MHRA/CHM advice, p. 653), by subcutaneous injection (max. 1 ml per injection site), initially 150 units/kg 3 times weekly (or 450 units/kg once weekly), increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks to 300 units/kg 3 times weekly;-discontinue if inadequate response after 4 weeks.

Note

- Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL, if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Note

- Reduce dose by approximately 50–70% if rise in haemoglobin concentration exceeds 2 g/100 mL when sufficient blood cannot be saved for elective major surgery. By intravenous injection over 1–5 minutes, 600 units/kg twice weekly for 3 weeks before surgery; consult product literature for details and advice on ensuring high iron stores.

Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood or if autologous transfusion unavailable, by subcutaneous injection (max. 1 ml per injection site), 600 units/kg every week for 3 weeks before surgery and on day of surgery or 300 units/kg daily for 15 days starting 10 days before surgery, consult product literature for details.

Sickle-cell disease

Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe forms include sickle-cell crisis, where infarction of the microvasculature and blood supply to organs results in severe pain. Sickle-cell crisis requires hospitalisation, intravenous fluids, analgesia (section 4.7), and treatment of any concurrent infection. Chronic complications include skin ulceration, renal failure, and increased susceptibility to infection. Pneumococcal vaccine (section 14.4), a annual influenza vaccine (section 14.4) and prophylactic penicillin (Table 2, section 5.1) reduce the risk of infection. Hepatitis B vaccine (section 14.4) should be considered if the patient is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present accompanied by increased erythropoiesis; this may increase folate requirements and folate supplementation may be necessary (section 9.1.2).

Hydroxyurea can reduce the frequency of crises and the need for blood transfusions in sickle-cell disease; it should be considered in consultation with a specialist centre. The beneficial effects of hydroxyurea may not become evident for several months. Myelosuppression and skin reactions are the most common side-effects.

Hydroxyurea (Hydroxyurea)

Indications sickle-cell disease (see notes above); chronic myeloid leukaemia, cancer of the cervix (section 8.1.5)

Cautions see section 8.1 and notes above; also monitor renal and hepatic function before and during
Iron overload

Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory anaemias with hyperplastic bone marrow, especially thalassaemia major, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, the long-term administration of the iron chelating compound desferrioxamine mesilate is useful. Subcutaneous infusions of desferrioxamine are given over 8–12 hours, 3–7 times a week. The dose should reflect the degree of iron overload. For children starting therapy (and who have low iron overload) the dose should not exceed 30 mg/kg. For established overload the dose is usually between 20 and 50 mg/kg daily. Desferrioxamine (up to 2 g per unit of body weight) may also be given at the time of blood trans- 

Hepatic impairment

The majority of patients given desferrioxamine have normal hepatic function; however, hepatic impairment is a contraindication to therapy as desferrioxamine can increase the severity of liver disease. Liver function tests should be measured monthly; if abnormalities occur, treatment should be interrupted if unexplained cytopenia occurs; not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes). Liver enzymes are usually normal in children.

Renal impairment

In patients with normal cardiovascular function, desferrioxamine is not a contraindication to therapy. In patients with cardiovascular disease, the dose should be reduced by 50% if eGFR is less than 60 mL/minute/1.73 m². For patients with severe renal impairment, desferrioxamine binds with 4.1 mg of aluminium.

Desferrioxamine infusion can be used to treat aluminium overload in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

Deferasirox, an oral iron chelator, is licensed for the treatment of chronic iron overload in adults and children over 6 years with thalassaemia major who receive frequent blood transfusions (more than 7 mL/kg/month of packed red blood cells). It is also licensed for transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in children aged 2–5 years with thalassaemia major who receive frequent blood transfusions, adults and children over 2 years with thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells), and in adults and children over 2 years with other anaemias. Deferasirox is also licensed for the treatment of chronic iron overload when desferrioxamine is contra-indicated or inadequate in adults and children over 10 years with non-transfusion-dependent thalassaemia syndromes.

Deferasirox is also licensed for the treatment of iron overload in patients with thalassaemia major in whom desferrioxamine is contra-indicated or is inadequate. Blood dyscrasias, particularly agranulocytosis, have been reported with deferiprone.

**DEFERASIROX**

**Indications** see notes above

**Cautions** eye and ear examinations required before treatment and annually during treatment; monitor body-weight, height, and sexual development in children annually; monitor serum-ferritin concentration monthly; elderly (increased risk of side-effects); risk of gastrointestinal ulceration and haemorrhage; platelet count less than 50 × 10⁹/litre; consider treatment interruption if unexplained cytopenia occurs; not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes); history of liver cirrhosis; test liver function before treatment, then every 2 weeks during the first month, and then monthly; measure baseline serum creatinine and monitor renal function weekly during the first month of treatment and monthly thereafter; test for proteinuria monthly; **interactions:** Appendix 1 (deferasirox)

**Hepatic impairment** use with caution in moderate impairment, reduce dose considerably then gradually increase to max. 50% of normal dose; avoid in severe impairment

**Renal impairment** reduce dose by 10 mg/kg if eGFR < 60–90 mL/minute/1.73 m² and if serum creatinine increased by more than 35% of baseline measurement on 2 consecutive occasions—interrupt treatment if deterioration in renal function persists after dose reduction; avoid if eGFR less than 60 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid unless essential—toxicity in animal studies
**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** gastro-intestinal disturbances (including ulceration and fatal haemorrhage); headache; proteinuria; pruritus, rash; *less commonly* hepatitis, cholelithiasis, oedema, fatigue, anxiety, sleep disorder, dizziness, pyrexia, pharyngitis, glucosuria, renal tubulopathy, disturbances of hearing and vision (including lens opacity and maculopathy), and skin pigmentation; hepatic failure, acute renal failure, tubulointerstitial nephritis, blood disorders (including anaemia, agranulocytosis, neutropenia, pancytopenia, and thrombocytopenia), hypersensitivity reactions (including anaphylaxis and angioedema), alopecia also reported

**Dose**
- Transfusion-related chronic iron overload, **ADULT** and **CHILD** over 2 years initially 10–30 mg/kg once daily according to serum-ferritin concentration and amount of transfused blood (consult product literature); maintenance, adjust dose every 3–6 months in steps of 5–10 mg/kg according to serum-ferritin concentration; usual max. 30 mg/kg daily, but may be increased to max. 40 mg/kg/day and reduced in steps of 5–10 mg/kg once control achieved
- Chronic iron overload in non-transfusion-dependent thalassaemia syndromes, **ADULT** over 18 years initially 10 mg/kg once daily; maintenance, adjust dose every 3–6 months in steps of 5–10 mg/kg once daily to serum-ferritin concentration and liver-iron concentration (consult product literature); max. 20 mg/kg daily; **CHILD** under 18 years see BNF for Children

**Exjade**® (Novartis) ▼(Ph) Dispersible tablets, deferasirox 125 mg, net price 28-tab pack = £117.60; 250 mg, 28-tab pack = £235.20; 500 mg, 28-tab pack = £470.40. Label: 13, 22, counselling, administration. **Counselling** Tablets should be dispersed in water, orange juice, or apple juice; if necessary resuspend residue

**DEFERIPRONE**

**Indications** see notes above

**Cautions** monitor neutrophil count weekly and discontinue treatment if neutropenia develops; monitor plasma-zinc concentration; **interactions**: Appendix 1 (deferiprone)

**Blood disorders** Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop

**Contra-indications** history of agranulocytosis or recurrent neutropenia

**Hepatic impairment** manufacturer advises monitor liver function—interrupt treatment if persistent elevation in serum alanine aminotransferase

**Renal impairment** manufacturer advises caution—no information available

**Pregnancy** manufacturer advises avoid before intended conception and during pregnancy—teratogenic and embryotoxic in *animal* studies; contra-indicated in women of child-bearing potential

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** gastro-intestinal disturbances (reducing dose and increasing gradually may improve tolerance), increased appetite; headache; red-brown urine discoloration; neutropenia, agranulocytosis; zinc deficiency; arthropathy

**Dose**
- **ADULT** and **CHILD** over 6 years 25 mg/kg 3 times daily (max. 100 mg/kg daily)

**Ferriprox**® (Swedish Orphan) ▼(Ph)

**Tablets**, f/c, scored, deferiprone 500 mg, net price 100-tab pack = £152.39; 1 g, 50-tab pack = £175.25. Label: 14, counselling, blood disorders

**Oral solution**, red, deferiprone 100 mg/mL, net price 500 mL = £152.39. Label: 14, counselling, blood disorders

**DESFERROXAMINE MESILATE**

(Deferoxamine Mesilate)

**Indications** see notes above; iron poisoning, see Emergency Treatment of Poisoning, p. 39

**Cautions** eye and ear examinations before treatment and at 3-month intervals during treatment; monitor body-weight and height in children at 3-month intervals—risk of growth retardation with excessive doses; aluminium-related encephalopathy (may exacerbate neurological dysfunction); **interactions**: Appendix 1 (deferoxamine)

**Renal impairment** use with caution

**Pregnancy** teratogenic in *animal* studies; manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk—no information available

**Side-effects** nausea, vomiting, abdominal pain; headache; pyrexia; growth retardation and bone disorders (see Cautions); arthralgia, myalgia; hearing disturbances; injection-site reactions; rarely diarrhoea, hepatic impairment, hypotension (especially when given too rapidly by intravenous injection), anaphylaxis, Vasculitis and mucormycosis infections, blood dyscrasias (including thrombocytopenia and leucopenia), leg cramps, bone pain, visual disturbances (including lens opacity and retinopathy), rash; very rarely acute respiratory distress, neurological disturbances (including dizziness, neuropathy, convulsions, and paraesthesia), renal impairment; muscle spasms also reported

**Dose**
- See notes above; iron poisoning, see Emergency Treatment of Poisoning, p. 39

**Note** For full details and warnings relating to administration, consult product literature

**Desferoxamine mesilate** (Non-proprietary) ▼(Ph)

**Injection**, powder for reconstitution, desferoxamine mesilate, net price 500-mg vial = £4.26; 2-g vial = £17.65

**Desferal**® (Novartis) ▼(Ph)

**Injection**, powder for reconstitution, desferoxamine mesilate, net price 500-mg vial = £4.67; 2-g vial = £18.66

**Paroxysmal nocturnal haemoglobinuria and atypical haemolytic uraemic syndrome** Eculizumab, a recombinant monoclonal antibody, inhibits terminal complement activation at the C5 protein
and thereby reduces haemolysis and thrombotic microangiopathy. It is used to reduce haemolysis in paroxysmal nocturnal haemoglobinuria (PNH), a severe and disabling form of haemolytic anaemia. Eculizumab is also used to reduce thrombotic microangiopathy in atypical haemolytic uraemic syndrome (aHUS).

### ECULIZUMAB

**Indications** paroxysmal nocturnal haemoglobinuria, in those with a history of blood transfusions (under specialist supervision); atypical haemolytic uraemic syndrome (under specialist supervision)

**Cautions** active systemic infection; monitor for 1 hour after infusion; for *paroxysmal nocturnal haemoglobinuria*, monitor for intravascular haemolysis (including serum-lactate dehydrogenase concentration) during treatment and for at least 8 weeks after discontinuation; for *atypical haemolytic uraemic syndrome*, monitor for thrombotic microangiopathy (measure platelet count, serum-lactate dehydrogenase concentration, and serum creatinine) during treatment and for at least 12 weeks after discontinuation

**Meningococcal infection** Vaccinate against *Neisseria meningitidis* at least 2 weeks before treatment (tetravalent vaccine against serotypes A, C, W135 and Y recommended); revaccinate according to current medical guidelines. Patients receiving eculizumab less than 2 weeks after receiving meningococcal vaccine must be given prophylactic antibiotics until 2 weeks after vaccination. Advise patient to report promptly any signs of meningococcal infection. Other immunisations should also be up to date (section 14.1)

**Contra-indications** unresolved *Neisseria meningitidis* infection; patients unvaccinated against *Neisseria meningitidis* (see also Cautions above)

**Pregnancy** no information available—use only if potential benefit outweighs risk; human IgG antibodies known to cross placenta; manufacturer advises effective contraception during and for 5 months after treatment

**Breast-feeding** no information available—manufacturer advises avoid breast-feeding during and for 5 months after treatment

**Side-effects** gastro-intestinal disturbances; oedema; cough, nasopharyngitis; headache, dizziness, vertigo, fatigue, dysgeusia, paraesthesia; infection (including meningococcal infection); spontaneous erection; dysuria; arthralgia, myalgia; blood disorders (including thrombocytopenia, leucopenia); alopecia, pruritus, rash; influenza-like symptoms; infusion-related reactions; less commonly anorexia, gingival pain, jaundice, palpitation, haematoxa, hypotension, chest pain, syncope, tremor, hot flushing, epistaxis, anxiety, depression, mood changes, sleep disturbances, Graves’ disease, menstrual disorders, renal impairment, malignant melanoma, muscle spasms, myelodysplastic syndrome, visual disturbances, tinnitus, hyperhidrosis, petechiae, and skin depigmentation

**Dose**
- Paroxysmal nocturnal haemoglobinuria, by intravenous infusion, ADULT over 18 years, initially 600 mg once a week for 4 weeks, then 900 mg on week 5; maintenance, 900 mg once a week for 4 weeks, then 1200 mg on week 5; CHILD see BNF for Children
- Atypical haemolytic uraemic syndrome, by intravenous infusion, ADULT over 18 years, initially 900 mg once a week for 4 weeks, then 1200 mg once every 12–16 days; CHILD see BNF for Children

**Note** Consult product literature for details of supplemental doses with concomitant plasmapheresis, plasma exchange, or plasma infusion

**Soliris®** Concentrate for intravenous infusion, eculizumab 10 mg/mL, net price 30-mL vial = £3150.00. Counselling, meningococcal infection, patient information card

**Electrolytes** Na⁺ 5 mmol/vial

### 9.1.4 Drugs used in platelet disorders

#### Idiopathic thrombocytopenic purpura

Acute idiopathic thrombocytopenic purpura is usually self-limiting in children. In adults, idiopathic thrombocytopenic purpura can be treated with a corticosteroid, e.g. prednisolone 1 mg/kg daily, gradually reducing the dose over several weeks. Splenectomy is considered if a satisfactory platelet count is not achieved or if there is a relapse on reducing the dose of corticosteroid or withdrawing it.

Immunoglobulin preparations (section 14.5.1), are also used in idiopathic thrombocytopenic purpura or where a temporary rapid rise in platelets is needed, as in pregnancy or pre-operatively; they are also used for children often in preference to a corticosteroid. Anti-D (RhD) immunoglobulin (section 14.5.3) is effective in raising the platelet count in about 80% of unspentecotomised rhesus-positive individuals; its effects may last longer than normal immunoglobulin for intravenous use, but further doses are usually required.

Other therapy that has been tried in refractory idiopathic thrombocytopenic purpura includes azathioprine (section 8.2.1), cyclophosphamide (section 8.1.1), vincristine (section 8.1.4), cyclosporin (section 8.2.2), and danazol (section 6.7.2). Rituximab (section 8.2.3) may also be effective and in some cases induces prolonged remission. For patients with chronic severe thrombocytopenia refractory to other therapy, tranexamic acid (section 2.11) may be given to reduce the severity of haemorrhage.

**Eltrombopag** and **romiplostim** are thrombopoietin receptor agonists licensed for the treatment of chronic idiopathic thrombocytopenic purpura in splenectomised patients refractory to other treatments, such as corticosteroids or immunoglobulins, or as a second-line treatment in non-splenectomised patients when surgery is contra-indicated (see also NICE guidance below). Eltrombopag is an oral preparation and romiplostim is an injection which is made biosynthetically by recombinant DNA technology; they should both be used under the supervision of a specialist.

The Scottish Medicines Consortium (p. 4) has advised (July 2010) that eltrombopag (**Revolade**) is accepted for restricted use within NHS Scotland for the treatment of both splenectomised and non-splenectomised patients with severe symptomatic immune (idiopathic) thrombocytopenic purpura or a high risk of bleeding.
Eltrombopag is recommended for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in splenectomised adults refractory to other treatments, or as a second-line treatment in non-splenectomised adults when surgery is contraindicated, only if:

- the manufacturer provides eltomopag at the agreed discount as part of the patient access scheme and their condition is refractory to standard active treatments and rescue therapies or
- they have severe disease and a high risk of bleeding that needs frequent courses of rescue therapies.

Patients receiving eltomopag whose disease does not meet these criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA221

Eltrombopag is also used, under specialist supervision, to treat thrombocytopenia in patients with chronic hepatitis C infection, where the degree of thrombocytopenia is the main factor preventing the initiation or limiting the ability to maintain interferon-based therapy. For the treatment of chronic hepatitis C, see section 5.3.3.2, p. 429.

### NICE guidance

**Eltrombopag for treating chronic immune (idiopathic) thrombocytopenic purpura (July 2013)**

Eltrombopag is recommended for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in patients who have severe disease and a high risk of bleeding.

### NICE guidance

**Romiplostim for the treatment of chronic immune (idiopathic) thrombocytopenic purpura (April 2011)**

Romiplostim is recommended for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in adults:

- if the manufacturer provides romiplostim at the agreed discount as part of the patient access scheme and
- whose condition is refractory to standard active treatments and rescue therapies or
- who have severe disease and a high risk of bleeding that needs frequent courses of rescue therapies.

www.nice.org.uk/TA221

Romiplostim is also accepted for restricted use within NHS Scotland for patients of East Asian origin (see under Dose and rescue therapies).

### ELTROMBOPAG

**Indications** see notes above

**Cautions** patients of East Asian origin (see under Dose for idiopathic thrombocytopenic purpura); risk factors for thromboembolism; monitor liver function before treatment, every two weeks when adjusting the dose, and monthly thereafter; regular ophthalmological examinations for cataract formation recommended; for idiopathic thrombocytopenic purpura, monitor full blood count including platelet count and peripheral blood smears every week during treatment until a stable platelet count is reached (50–75 $\times$ 10$^9$/litre) or more for at least 6 weeks, then monthly thereafter; for thrombocytopenia associated with chronic hepatitis C infection, monitor platelet count every week before and during antiviral treatment until a stable platelet count is reached (50–75 $\times$ 10$^9$/litre), then monitor full blood count including platelet count and peripheral blood smears monthly thereafter; **interactions**: Appendix 1 (eltrombopag)

**Hepatic impairment** for idiopathic thrombocytopenic purpura, avoid unless potential benefit outweighs risk—reduce initial dose to 25 mg once daily; for thrombocytopenia associated with chronic hepatitis C infection, in severe hepatic impairment use only if potential benefit outweighs risk and monitor closely—increased risk of hepatic decompensation and thromboembolic events

**Renal impairment** use with caution

**Pregnancy** avoid—toxicity in animal studies; ensure effective contraception during treatment

**Breast-feeding** manufacturer advises avoid

**Side-effects** gastro-intestinal disturbances (including nausea, diarrhoea, abdominal pain, and constipation), peripheral oedema, headache, insomnia, paraesthesia, fatigue, arthralgia, bone pain, myalgia, cataaract, dry eye, pruritus, rash, alopecia; less commonly dry mouth, gingival bleeding, haemorrhoids, taste disturbances, cholestasis, hepatitis, anorexia, changes in appetite, weight gain, flushing, palpitation, QT-interval prolongation, hypertension, tachycardia, thromboembolic events (including deep vein thrombosis, pulmonary embolism, and acute myocardial infarction), cough, sleep disorders, mood changes, depression, anxiety, dizziness, migraine, hemiparesis, tremor, peripheral neuropathy, respiratory and urinary tract infections, renal failure, nocturia, rectosigmoid cancer, blood disorders (including anaemia, haemoysis, eosinophilia, myelocytosis), gout, eye disorders, vertigo, epistaxis, skin reactions including ecchymosis, sweating

**Dose**

- Idiopathic thrombocytopenic purpura, ADULT over 18 years, initially 50 mg once daily (patients of EAST ASIAN origin such as Chinese, Japanese, Taiwanese, or Korean, initially 25 mg once daily), adjusted to achieve a platelet count of 50 $\times$ 10$^9$/litre or more (consult product literature for dose adjustments); max. 75 mg once daily; discontinue if inadequate response after 4 weeks at maximum dose
- Thrombocytopenia associated with chronic hepatitis C infection (see also notes above), ADULT over 18 years, initially 25 mg once daily, adjusted to achieve a platelet count sufficient to initiate antiviral therapy then a platelet count of 50–75 $\times$ 10$^9$/litre during antiviral therapy (consult product literature for dose adjustments); max. 100 mg once daily; discontinue if inadequate response after 2 weeks at maximum dose

**Counselling** Each dose should be taken at least 4 hours before or after any dairy products (or foods containing calcium), indigestion remedies, or medicines containing aluminium, calcium, iron, magnesium, zinc, or selenium to reduce possible interference with absorption

**Revolade® (GSK) TV 6118**

Tablets, f/c. eltomopag (as olamine) 25 mg (white), net price 28-tab pack = £770.00; 50 mg (brown), 28-tab pack = £1540.00. Counselling, see above

**ROMIPLOSTIM**

**Indications** see notes above

**Cautions** monitor full blood count and peripheral blood smears for morphological abnormalities before...
and during treatment; monitor platelet count weekly until $50 \times 10^9$/litre or more for at least 4 weeks without dose adjustment, then monthly thereafter.

**Driving** Dizziness may affect performance of skilled tasks (e.g. driving)

**Hepatic impairment** avoid in moderate or severe impairment unless potential benefit outweighs risk (e.g. of portal vein thrombosis)

**Renal impairment** manufacturer advises use only if essential—tocol, diuresis; contrast dye, analgesics, other drugs. Anagrelide should be initiated under specialist supervision.

It is licensed for essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs. Anagrelide should be initiated under specialist supervision.

**Essential thrombocythaemia**

Anagrelide inhibits platelet formation. It is licensed for essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs. Anagrelide should be initiated under specialist supervision.

**ANAGRELIDE**

**Indications** see notes above

**Cautions** cardiovascular disease—assess cardiac function before and during treatment; concomitant aspirin in patients at risk of haemorrhage; monitor full blood count (monitor platelet count every 2 days for 1 week, then weekly until maintenance dose established), liver function, serum creatinine and urea; interactions: Appendix 1 (anagrelide)

**Driving** Dizziness may affect performance of skilled tasks (e.g. driving)

**Hepatic impairment** manufacturer advises caution in mild impairment; avoid in moderate to severe impairment

**Renal impairment** manufacturer advises avoid if eGFR < 50 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid (toxicity in animal studies)

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** gastro-intestinal disturbances, palpititation, tachycardia, fluid retention, headache, dizziness, fatigue, anaemia, rash; less commonly pancreatitis, gastro-intestinal haemorrhage, congestive heart fail-

ure, hypertension, arrhythmias, syncope, chest pain, dyspnoea, sleep disturbances, paraesthesia, hypoaesthesia, depression, nervousness, confusion, amnesia, fever, weight changes, impotence, blood disorders, myalgia, arthralgia, epistaxis, dry mouth, alopecia, skin discoloration, pruritus; rarely gastritis, colitis, postural hypotension, angina, myocardial infarction, vasodilation, pulmonary hypertension, pulmonary infiltrates, migraine, drowsiness, impaired coordination, dysarthria, asthenia, tinnitus, renal failure, nocturia, visual disturbances, gingival bleeding; also reported allergic alveolitis, interstitial lung disease, pneumonitis, hepatitis, tubulointerstitial nephritis

**Dose**

- Initially 500 micrograms twice daily adjusted according to response in steps of 500 micrograms daily at weekly intervals to max. 10 mg daily (max. single dose 2.5 mg); usual dose range 1–3 mg daily in divided doses; **CHILD** under 18 years see **BNF for Children**

**Capsules,** anagrelide (as hydrochloride), 500 micrograms, net price 100-cap pack = £404.57. Counseling, driving, see above

**9.1.5 G6PD deficiency**

Glucose 6-phosphate dehydrogenase (G6PD) deficiency is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than it is in females.

Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they take a number of common drugs. They are also susceptible to developing acute haemolytic anaemia when they eat fava beans (broad beans, *Vicia faba*); this is termed favism and can be more severe in children or when the fresh fava beans are eaten raw.

When prescribing drugs for patients with G6PD deficiency, the following three points should be kept in mind:

- G6PD deficiency is genetically heterogeneous; susceptibility to the haemolytic risk from drugs varies; thus, a drug found to be safe in some G6PD-deficient individuals may not be equally safe in others;
- manufacturers do not routinely test drugs for their effects in G6PD-deficient individuals;
- the risk and severity of haemolysis is almost always dose-related.

The lists below should be read with these points in mind. Ideally, information about G6PD deficiency should be available before prescribing a drug listed below. However, in the absence of this information, the possibility of haemolysis should be considered, especially if the patient belongs to a group in which G6PD deficiency is common.

A very few G6PD-deficient individuals with chronic non-spherocytic haemolytic anaemia have haemolysis even in the absence of an exogenous trigger. These patients must be regarded as being at high risk of severe exacerbation of haemolysis following administration of any of the drugs listed below.
9.1.6 Drugs used in neutropenia

Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival. *Filgrastim* (unglycosylated rhG-CSF) and *lenograstim* (glycosylated rhG-CSF) have similar effects; both have been used in a variety of clinical settings, but they do not have any clear-cut routine indications. In congenital neutropenia *filgrastim* usually increases the neutrophil count with an appropriate clinical response. Prolonged use may be associated with an increased risk of myeloid malignancy. *Pegfilgrastim* is a polyethylene glycol-conjugated (pegylated) derivative of *filgrastim*; pegylation increases the duration of *filgrastim* activity. Granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.

**Cautions** Granulocyte-colony stimulating factors should be used with caution in patients with pre-malignant or malignant myeloid conditions. Full blood counts including differential white cell and platelet counts should be monitored. Treatment should be withdrawn in patients who develop signs of pulmonary infiltration. There have been reports of pulmonary infiltrates leading to acute respiratory distress syndrome—patients with a recent history of pulmonary infiltrates or pneumonia may be at higher risk. Granulocyte-colony stimulating factors should be used with caution in patients with sickle-cell disease. Spleen size should be monitored during treatment because there is a risk of splenomegaly and rupture.

**Pregnancy** There have been reports of toxicity in animal studies and manufacturers advise not to use granulocyte-colony stimulating factors during pregnancy unless the potential benefit outweighs the risk.

**Breast-feeding** There is no evidence for the use of granulocyte-colony stimulating factors during breast-feeding and manufacturers advise avoiding their use.

**Side-effects** Side-effects of granulocyte-colony stimulating factors include gastrointestinal disturbances, anorexia, headache, arthralgia, fever, musculoskeletal pain, bone pain, rash, alopecia, injection-site reactions, thrombocytopenia, and leucocytosis. *Less commonly* chest pain can occur. Pulmonary side-effects, particularly interstitial pneumonia (see Cautions above), cutaneous vasculitis and acute febrile neutrophilic dermatosis have rarely been reported.

### 9.1.6.1 Drugs used in neutropenia

**Drugs with definite risk of haemolysis in most G6PD-deficient individuals**

- Dapsone and other sulphones (higher doses for dermatitis herpetiformis more likely to cause problems)
- Methtithioninium chloride
- Niridazole [not on UK market]
- Nitrofurantoin
- Pamaquin [not on UK market]
- Primaxine (30 mg weekly for 8 weeks has been found to be without undue harmful effects in African and Asian people, see section 5.4.1)

**Quinolones** (including ciprofloxacin, moxifloxacin, nalidixic acid, norfloxacin, and ofloxacin)
- Rauburcase
- Sulfonamides (including co-trimoxazole; some sulfonamides, e.g. sulfadiazine, have been tested and found not to be haemolytic in many G6PD-deficient individuals)

**Drugs with possible risk of haemolysis in some G6PD-deficient individuals**

- Aspirin (acceptable up to a dose of at least 1 g daily in most G6PD-deficient individuals)
- Chloroquine (acceptable in acute malaria and malaria chemoprophylaxis)
- Menadione, water-soluble derivatives (e.g. menadiol sodium phosphate)
- Probenecid [not on UK market]
- Quinidine (acceptable in acute malaria) [not on UK market]
- Quinine (acceptable in acute malaria)
- Sulfonlurea

**Note** Naphthalene in mothballs also causes haemolysis in individuals with G6PD deficiency.
apy, continued until neutrophil count in normal range, usually for up to 14 days (up to 38 days in acute myeloid leukaemia)

- Myeloblastic therapy followed by bone-marrow transplantation, by intravenous infusion over 30 minutes or over 24 hours or by subcutaneous infusion over 24 hours, 1 million units/kg daily, started at least 24 hours following cytotoxic chemotherapy (and within 24 hours of bone-marrow infusion), then adjusted according to neutrophil count (consult product literature)

- Mobilisation of peripheral blood progenitor cells for autologous infusion, used alone, by subcutaneous injection or by subcutaneous infusion over 24 hours, 1 million units/kg daily for 5–7 days; used following adjunctive myelosuppressive chemotherapy (to improve yield), by subcutaneous injection, 500 000 units/kg daily, started the day after completing chemotherapy and continued until neutrophil count in normal range; for timing of leucopheresis consult product literature

- Mobilisation of peripheral blood progenitor cells in normal donors for allogeneic transplantation, by subcutaneous injection, ADULT under 60 years and CHILD over 16 years, 1 million units/kg daily for 4–5 days; for timing of leucopheresis consult product literature

- Severe chronic neutropenia, by subcutaneous injection, ADULT and CHILD in severe congenital neutropenia, initially 1.2 million units/kg daily in single or divided doses (initially 500 000 units/kg daily in idopathic or cyclic neutropenia), adjusted according to response (consult product literature)

- Persistent neutropenia in HIV infection, by subcutaneous injection, initially 100 000 units/kg daily, increased as necessary until neutrophil count in normal range (usual max. 400 000 units/kg daily), then adjusted to maintain neutrophil count in normal range (consult product literature)

### Neupogen® (Amgen) [BNF]

**Injection**
- Filgrastim 30 million-units (300 micrograms)/mL, net price 1-mL vial = £52.70
- Filgrastim 60 million-units (600 micrograms)/mL, net price 0.5-mL prefilled syringe = £52.70; 96 million-units (960 micrograms)/mL, 0.5-mL prefilled syringe = £84.06

**Note**
Biosimilar medicine, p. 1

### Nivestim® (Hospira) [BNF]

**Injection**
- Prefilled syringe, filgrastim, net price 12 million-units (120 micrograms)/0.2 mL = £52.70
- Prefilled syringe, filgrastim, net price 30 million-units (300 micrograms)/0.5 mL = £58.00
- Prefilled syringe, filgrastim, net price 48 million-units (480 micrograms)/0.5 mL = £79.90

**Note**
Biosimilar medicine, p. 1

### Ratiograstim® (Ratiopharm UK) [BNF]

**Injection**
- Prefilled syringe, filgrastim, net price 30 million-units (300 micrograms)/0.5 mL = £62.25
- Prefilled syringe, filgrastim, net price 48 million-units (480 micrograms)/0.8 mL = £99.29

**Note**
Biosimilar medicine, p. 1

### Zarzo® (Sandoz) [BNF]

**Injection**
- Prefilled syringe, filgrastim, net price 30 million-units (300 micrograms)/0.5 mL = £50.15
- Prefilled syringe, filgrastim, net price 48 million-units (480 micrograms)/0.5 mL = £79.90

**Note**
Biosimilar medicine, p. 1

### LENOGRASTIM

**(Recombinant human granulocyte-colony stimulating factor, rHuG-CSF)**

**Indications**
(specialist use only) reduction in the duration of neutropenia and associated complications following peripheral stem cells or bone-marrow transplantation for non-myeloid malignancy, or following treatment with cytotoxic chemotherapy associated with a significant incidence of febrile neutropenia; mobilisation of peripheral blood progenitor cells for harvesting and subsequent infusion

**Cautions**
see notes above

**Pregnancy**
see notes above

**Breast-feeding**
see notes above

**Side-effects**
see notes above; also maculosis, splenic rupture, and toxic epidermal necrolysis

**Dose**
- Following bone-marrow transplantation, by intravenous infusion or subcutaneous injection, ADULT and CHILD over 2 years 19.2 million units/m² daily started the day after transplantation, continued until neutrophil count stable in acceptable range (max. 28 days)
- Following peripheral stem cells transplantation, by intravenous infusion or subcutaneous injection, ADULT 19.2 million units/m² daily started the day after transplantation, continued until neutrophil count stable in acceptable range (max. 28 days); CHILD see BNF for Children
- Cytotoxic-induced neutropenia, by subcutaneous injection, ADULT 19.2 million units/m² daily started the day after completion of chemotherapy, continued until neutrophil count stable in acceptable range (max. 28 days); CHILD see BNF for Children
- Mobilisation of peripheral blood progenitor cells, used alone, by subcutaneous injection, ADULT 1.28 million units/kg daily for 4–6 days (5–6 days in healthy donors); used following adjunctive myelosuppressive chemotherapy (to improve yield), by subcutaneous injection, 19.2 million units/m² daily, started 1–5 days after completion of chemotherapy and continued until neutrophil count in acceptable range; for timing of leucopheresis consult product literature; CHILD see BNF for Children

### Granocyte® (Chugai) [BNF]

**Injection**
- Powder for reconstitution, lenograstim, net price 13.4 million-unit (105-microgram) vial = £40.11; 33.6 million-unit (263-microgram) vial = £62.54 (both with 1-mL prefilled syringe water for injections)

**Excipients**
include phenylalanine (section 9.4.1)

### PEGFILGRASTIM

**(Pegylated recombinant methionyl human granulocyte-colony stimulating factor)**

**Indications**
(specialist use only) reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes)

**Cautions**
see notes above; also acute leukaemia and myelosuppressive chemotherapy; interactions: Appendix 1 (filgrastim)

**Pregnancy**
see notes above

**Breast-feeding**
see notes above
Side-effects see notes above; also rarely capillary leak syndrome (including fatal cases); very rarely splenic rupture.

Dose

Note Dose expressed as filgrastim.

- By subcutaneous injection, ADULT over 18 years, 6 mg (0.6 mL) for each chemotherapy cycle, starting 24 hours after chemotherapy.

Neulasta® (Amgen) Injection, filgrastim (expressed as filgrastim) 10 mg/mL, net price 0.6-mL (6-mg) prefilled syringe = £686.38

9.1.7 Drugs used to mobilise stem cells

Plerixafor is a chemokine receptor antagonist licensed to mobilise haematopoietic stem cells to peripheral blood for collection and subsequent autologous transplantation in patients with lymphoma or multiple myeloma. Plerixafor should be given under specialist supervision following 4 days treatment with a granulocyte-colony stimulating factor (section 9.1.6).

Plerixafor

Indications see notes above.

Cautions monitor platelet and white blood cell count.

Renal impairment reduce dose to 160 micrograms/kg daily if creatinine clearance 20–50 mL/minute; no information available if creatinine clearance less than 20 mL/minute.

Pregnancy manufacturer advises avoid unless essential and use effective contraception during treatment—teratogenic in animal studies.

Breast-feeding manufacturer advises avoid—no information available.

Side-effects gastro-intestinal disturbances, dry mouth, oral hypoesthesia; dizziness, headache, insomnia, fatigue; arthralgia, musculoskeletal pain; erythema, sweating; injection-site reactions; less commonly hypersensitivity reactions including dyspnoea and periorbital swelling.

Dose

- By subcutaneous injection, ADULT over 18 years, 240 micrograms/kg daily 6–11 hours before initiation of apheresis; usual duration 2–4 days (max. 7 days).

Mozobil® (Genzyme) Injection, plerixafor 20 mg/mL, net price 1.2 mL-vial = £4882.77

Faeces, vomit, or aspiration should be saved and analysed where possible if abnormal losses are suspected; where this is impracticable the approximations above may be helpful in planning replacement therapy.

9.2 Fluids and electrolytes

9.2.1 Oral preparations for fluid and electrolyte imbalance

9.2.1.1 Oral potassium

9.2.1.2 Oral sodium and water

9.2.1.3 Oral bicarbonate

Sodium and potassium salts, which may be given by mouth to prevent deficiencies or to treat established deficiencies of mild or moderate degree, are discussed in this section. Oral preparations for removing excess potassium and preparations for oral rehydration therapy are also included here. Oral bicarbonate, for metabolic acidosis, is also described in this section.

For reference to calcium, magnesium, and phosphate, see section 9.5.
Compensation for potassium loss is especially necessary:

- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias;
- in patients in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, cirrhosis of the liver, the nephrotic syndrome, and severe heart failure;
- in patients with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse.

Measures to compensate for potassium loss may also be required in the elderly since they frequently take inadequate amounts of potassium in the diet (but see below for warning on renal insufficiency). Measures may also be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are seldom required with the small doses of diuretics given to treat hypertension; potassium-sparing diuretics (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide or the thiazides when these are given to eliminate oedema.

**Dosage**

If potassium salts are used for the prevention of hypokalaemia, then doses of potassium chloride 2 to 4 g (approx. 25 to 50 mmol) daily (in divided doses) by mouth are suitable in patients taking a normal diet. Smaller doses must be used if there is renal insufficiency (common in the elderly) to reduce the risk of hyperkalaemia. Potassium salts cause nausea and vomiting and poor compliance is a major limitation to their effectiveness; when appropriate, potassium-sparing diuretics are preferable (see also above). Regular monitoring of plasma-potassium concentration is essential in those taking potassium supplements. When there is established potassium depletion larger doses may be necessary, the quantity depending on the severity of any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with chloride depletion and with metabolic alkalosis, and these disorders require correction.

**Administration**

Potassium salts are preferably given as a liquid (or effervescent) preparation, rather than modified-release tablets; they should be given as the chloride (the use of effervescent potassium tablets BPC 1968 should be restricted to hyperchloraemic states, section 9.2.1.3). Salt substitutes. A number of salt substitutes which contain significant amounts of potassium chloride are readily available as health food products (e.g. LoSalt® and Ruthmo®). These should not be used by patients with renal failure as potassium intoxication may result.

**Renal impairment** close monitoring required—risk of hyperkalaemia; avoid in severe impairment

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, flatulence; with modified-release preparations, gastrointestinal obstruction, ulceration and bleeding also reported

**Dose**

See notes above

**Note** Do not confuse Effervescent Potassium Tablets BPC 1968 (section 9.2.1.3) with effervescent potassium chloride tablets. Effervescent Potassium Tablets BPC 1968 do not contain chloride ions and their use should be restricted to hyperchloraemic states (section 9.2.1.3)

**Management of hyperkalaemia**

Acute severe hyperkalaemia (plasma-potassium concentration above 6.5 mmol/litre or in the presence of ECG changes) calls for urgent treatment with 10–20 mL of calcium gluconate 10% by slow intravenous injection, titrated and adjusted to ECG improvement, to temporarily protect against myocardial excitability. An intravenous injection of soluble insulin (5–10 units) with 50 mL glucose 50% given over 5–15 minutes, reduces serum-potassium concentration; this is repeated if necessary or a continuous infusion instituted. Salbutamol [unlicensed indication], by nebulisation or slow intravenous injection may also reduce plasma-potassium concentration; it should be used with caution in patients with cardiovascular disease. The correction of causal or compensating acidosis with sodium bicarbonate infusion (section 9.2.2) should be considered (important: preparations of sodium bicarbonate and calcium salts should not be administered in the same line—risk of precipitation). Drugs exacerbating hyperkalaemia should be reviewed and stopped as appropriate; occasionally haemodialysis is needed.

Ion-exchange resins may be used to remove excess potassium in mild hyperkalaemia or in moderate hyperkalaemia when there are no ECG changes.

**POLYSTYRENE SULFONATE RESINS**

**Indications** hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

**Cautions** children (impaction of resin with excessive dosage or inadequate dilution); monitor for electrolyte disturbances (stop if plasma-potassium concentration
below 5 mmol/litre); sodium-containing resin in con-
gestive heart failure, hypertension, and oedema;
interactions: Appendix I (polystyrene sulfonate
resins)

Contra-indications
obstructive bowel disease; neo-

nates with reduced gut motility; calcium-containing
resin in hyperparathyroidism, multiple myeloma, sar-
coidosis, or metastatic carcinoma

Renal impairment
use sodium-containing resin with
cautions

Pregnancy
manufacturers advise use only if potential
benefit outweighs risk—no information available

Breast-feeding
manufacturers advise use only if potential
benefit outweighs risk—no information available

Side-effects
faecal impaction following rectal
administration, gastro-intestinal concretions follow-
ing oral administration, intestinal necrosis reported
with concomitant use of sorbitol, gastric irritation,
oanxia, nausea, vomiting, constipation (discontinue
treatment—avoid magnesium-containing laxatives),
diarrhoea, hypomagnesaemia; gastro-intestinal
obstruction, ulceration, necrosis, and ischaemic colitis
also reported; with calcium-containing resin, hypercal-
caemia (including in dialysed patients and occasion-
ally in those with renal impairment); with sodium-
containing resin, sodium retention, hypocalcaemia

Dose
• See under preparations

Calcium Resonium® (Sanofi-Aventis)
Powder, buff, calcium polystyrene sulfonate. Net
price 300 g = £68.47. Label: 13

Dose By mouth, 15 g 3–4 times daily in a small amount of
water or syrup (not fruit juice which has a high potassium
content); CHILD under 18 years see BNF for Children

By rectum, as an enema, 30 g in 150 mL of water or 10%
glucose, retained for 9 hours followed by irrigation to
remove resin from colon; NEONATE and CHILD under 18
years see BNF for Children

Resonium A® (Sanofi-Aventis)
Powder, buff, sodium polystyrene sulfonate. Net
price 454 g = £67.50. Label: 13

Dose By mouth, 15 g 3–4 times daily in a small amount of
water or syrup (not fruit juice which has a high potassium
content); CHILD under 18 years see BNF for Children

By rectum, as an enema, 30 g in 150 mL of water or 10% 
glucose, retained for 9 hours followed by irrigation to
remove resin from colon; NEONATE and CHILD under 18
years see BNF for Children

Sorbitoster® (Stanningley) (Tolv)
Powder, buff, calcium polystyrene sulfonate 759–
949 mg/g, net price 500 g = £49.95. Label: 13

Excipients include sucrose 51–241 mg per 1 g of powder

Dose By mouth, 20 g 1–3 times daily in 150 mL of water or
soft drink (not fruit juice which has a high potassium
content); CHILD under 18 years see BNF for Children

By rectum, as a enema, 40 g in 150 mL of 5% glucose 1–3
times daily, retained for 6 hours followed by irrigation to
remove resin from colon; NEONATE and CHILD under 18
years see BNF for Children

SODIUM CHLORIDE

Indications
sodium depletion—see also 9.2.2.1;
nebuliser diluent (section 3.1.5); eye (section 11.8.1);
oral hygiene (section 12.3.4); wound irrigation (sec-
tion 13.11.1)

Slow Sodium® (HK Pharma)
Tablets, m/r, sodium chloride 600 mg (approx.
10 mmol each of Na+ and Cl–). Net price 100-tab
pack = £6.05. Label: 25

Dose prophylaxis of sodium chloride deficiency 4–8
tablets daily with water (in severe depletion up to max. 20
tablets daily)

Chronic renal salt wasting, up to 20 tablets daily with
appropriate fluid intake

CHILD see BNF for Children

Oral rehydration therapy (ORT)
As a worldwide problem diarrhoea is by far the most
important indication for fluid and electrolyte replace-
ment. Intestinal absorption of sodium and water is
enhanced by glucose (and other carbohydrates). Replac-
ement of fluid and electrolytes lost through diarrhoea
can therefore be achieved by giving solutions containing
sodium, potassium, and glucose or another carbohy-
drate such as rice starch.

Oral rehydration solutions should:
• enhance the absorption of water and electrolytes;
• replace the electrolyte deficit adequately and safely;
• contain an alkalinising agent to counter acidosis;
• be slightly hypo-osmolar (about 250 mmol/litre) to
prevent the possible induction of osmotic diarr-
hoea;
• be simple to use in hospital and at home;
• be palatable and acceptable, especially to children;
• be readily available.

It is the policy of the World Health Organization (WHO)
to promote a single oral rehydration solution but to use
it flexibly (e.g. by giving extra water between drinks of
oral rehydration solution to moderately dehydrated
infants).

Oral rehydration solutions used in the UK are lower in
sodium (50–60 mmol/litre) than the WHO formulation
since, in general, patients suffer less severe sodium loss.

Rehydration should be rapid over 3 to 4 hours (except in
hypernatraemic dehydration in which case rehydration
should occur more slowly over 12 hours). The patient
should be reassessed after initial rehydration and if still
dehydrated rapid fluid replacement should continue.

Once rehydration is complete further dehydration is
prevented by encouraging the patient to drink normal
volumes of an appropriate fluid and by replacing con-
tinuing losses with an oral rehydration solution; in
infants, breast-feeding or formula feeds should be
offered between oral rehydration drinks.

For intravenous rehydration see section 9.2.2.
**9.2.2 Parenteral preparations for fluid and electrolyte imbalance**

**BNF 68**

---

**ORAL REHYDRATION SALTS (ORS)**

**Indications** fluid and electrolyte loss in diarrhoea, see notes above

**Dose**
- According to fluid loss, usually 200–400 mL solution after every loose motion: **INFANT** 1–1½ times usual feed volume; **CHILD** 200 mL after every loose motion

**UK formulations**

**Note** After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours

**Dioralyte® (Sanofi-Aventis)**

- **Oral powder**, sodium chloride 470 mg, potassium chloride 300 mg, disodium hydrogen citrate 530 mg, glucose 3.56 g/sachet, net price 6-sachet pack = £2.25, 20-sachet pack (blackcurrant- or citrus-flavoured) = £8.72

**Note** Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets reconstituted with 1 litre of water provide Na⁺ 60 mmol, K⁺ 20 mmol, Cl⁻ 60 mmol, citrate 10 mmol, and glucose 90 mmol

**Dioralyte® Relief** (Sanofi-Aventis)

- **Oral powder**, sodium chloride 350 mg, potassium chloride 300 mg, sodium citrate 580 mg, cooked rice powder 6 g/sachet, net price 6-sachet pack (apricot-, blackcurrant- or raspberry-flavoured) = £2.50, 20-sachet pack (apricot-flavoured) = £7.13

**Note** Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na⁺ 60 mmol, K⁺ 20 mmol, Cl⁻ 60 mmol and citrate 10 mmol; contains aspartame (see section 9.4.1)

**Electrolade® (Actavis)**

- **Oral powder**, sodium chloride 236 mg, potassium chloride 300 mg, sodium bicarbonate 500 mg, anhydrous glucose 4 g/sachet (banana-, blackcurrant-, lemon and lime-, or orange-flavoured). Net price 6-sachet (plain or multiflavoured) pack = £1.53, 20-sachet pack (single-or multiflavoured) pack = £4.99

**Note** Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na⁺ 50 mmol, K⁺ 20 mmol, Cl⁻ 40 mmol, HCO₃⁻ 30 mmol, and glucose 111 mmol

**WHO formulation**

**Oral Rehydration Salts (Non-proprietary)**

- **Oral powder**, sodium chloride 2.6 g, potassium chloride 1.5 g, sodium citrate 2.9 g, anhydrous glucose 13.5 g. To be dissolved in sufficient water to produce 1 litre (providing Na⁺ 75 mmol, K⁺ 20 mmol, Cl⁻ 65 mmol, citrate 10 mmol, glucose 75 mmol/litre)

**Note** Recommended by the WHO and the United Nations Children’s Fund but not commonly used in the UK

**9.2.2.1 Oral bicarbonate**

Sodium bicarbonate is given by mouth for chronic acidotic states such as uraemic acidosis or renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed; sodium bicarbonate 4.8 g daily (57 mmol each of Na⁺ and HCO₃⁻) or more may be required. For severe metabolic acidosis, sodium bicarbonate can be given intravenously (section 9.2.2).

Sodium bicarbonate may also be used to increase the pH of the urine (see section 7.4.3); for use in dyspepsia see section 1.1.1.

**9.2.2.2 Oral solutions**

Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses, when the patient is nauseated or vomiting and is unable to take adequate amounts by mouth. When intravenous administration is not possible, fluid (as sodium chloride...
Intravenous sodium

Sodium chloride in isotonic solution provides the most important extracellular ions in normal physiological concentrations and is indicated in sodium depletion, which can arise from such conditions as gastro-enteritis, diabetic ketoacidosis, ileus, and ascites. In a severe deficit of 4 to 8 litres, 2 to 3 litres of isotonic sodium chloride may be given over 2 to 3 hours; thereafter the infusion can usually be at a slower rate. Excessive administration should be avoided; the jugular venous pressure should be assessed, the bases of the lungs should be examined for crepitations, and in elderly or seriously ill patients it is often helpful to monitor the right atrial (central) venous pressure.

Chronic hyponatraemia arising from inappropriate secretion of antidiuretic hormone should ideally be corrected by fluid restriction. However, if sodium chloride is required for acute or chronic hyponatraemia, regardless of the cause, the deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome and the rise in plasma-sodium concentration should not exceed 10 mmol/litre in 24 hours. In severe hyponatraemia, sodium chloride 1.8% may be used cautiously.

Compound sodium lactate (Hartmann’s solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded; it may reduce the risk of hyperchloremic acidosis.

Sodium chloride and glucose solutions are indicated when there is combined water and sodium depletion. A 1:1 mixture of isotonic sodium chloride and 5% glucose allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the sodium salt with a volume of water determined by the normal plasma Na⁺ remains extracellular. Maintenance fluid should accurately reflect daily requirements and close monitoring is required to avoid fluid and electrolyte imbalance. Illness or injury increase the secretion of anti-diuretic hormone and therefore the ability to excrete excess water may be impaired. Inappropriate use of hypotonic solutions such as sodium chloride 0.16% and glucose 4% may also cause dilutional hyponatraemia especially in children (see **BNF for Children** and the elderly; if necessary, guidance should be sought from a clinician experienced in the management of fluid and electrolytes.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium chloride intravenous infusion 0.9% and glucose intravenous infusion 5% with potassium as appropriate.

**SODIUM CHLORIDE**

**Indications**

Electrolyte imbalance—see also section 9.2.1.2; nebuliser diluent (section 3.1.5); eye (section 11.6.1); oral hygiene (section 12.3.4); wound irrigation (section 13.11.1)

**Cautions**

Restrict intake in impaired renal function, cardiac failure, hypertension, peripheral and pulmonary oedema, toxemia of pregnancy

**Side-effects**

Administration of large doses may give rise to sodium accumulation, oedema, and hyperchloremic acidosis

**Dose**

- See notes above

**Sodium Chloride Intravenous Infusion (Non-proprietary)**

**Intravenous infusion**, usual strength sodium chloride 0.9% (9 g, 150 mmol each of Na⁺ and Cl⁻/litre), this strength being supplied when normal saline for injection is requested. Net price 2-mL amp = 21p; 5-mL amp = 28p; 10-mL amp = 34p; 20-mL amp = £1.04; 50-mL amp = £4.27

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

Note: The term ‘normal saline’ should not be used to describe sodium chloride intravenous infusion 0.9%; the term ‘physiological saline’ is acceptable but it is preferable to give the composition (i.e. sodium chloride intravenous infusion 0.9%).

**With other ingredients**

**Sodium Chloride and Glucose Intravenous Infusion**

**(Non-proprietary)**

**Intravenous infusion**, sodium chloride 0.18% (Na⁺ and Cl⁻ each 30 mmol/litre), glucose 4%

In hospitals, usually 500-mL packs and sometimes other sizes are available

**Intravenous infusion**, sodium chloride 0.45% (Na⁺ and Cl⁻ each 75 mmol/litre), glucose 2.5%

In hospitals, usually 500-mL packs and sometimes other sizes are available

**Intravenous infusion**, sodium chloride 0.45% (Na⁺ and Cl⁻ each 75 mmol/litre), glucose 5%

In hospitals, usually 500-mL packs and sometimes other sizes are available

**Intravenous infusion**, sodium chloride 0.9% (Na⁺ and Cl⁻ each 150 mmol/litre), glucose 5%

In hospitals, usually 500-mL packs and sometimes other sizes are available

Note: See above for warning on hyponatraemia especially in children and elderly

**Ringer’s Solution for Injection**

Calcium chloride (dihydrate) 322 micrograms, potassium chloride 300 micrograms, sodium chloride 8.6 mg/mL, providing the following ions (in mmol/litre), Ca²⁺ 2.2, K⁺ 4, Na⁺ 147, Cl⁻ 156

In hospitals, usually 500- and 1000-mL packs, and sometimes other sizes are available

**Sodium Lactate Intravenous Infusion, Compound**

**(Non-proprietary)**

**(Hartmann’s Solution for Injection; Ringer-Lactate Solution for Injection)**

**Intravenous infusion**, sodium chloride 0.6%, sodium lactate 0.32%, potassium chloride 0.04%, calcium chloride 0.027% (containing Na⁺ 131 mmol, K⁺ 5 mmol, Ca²⁺ 2 mmol, HCO₃⁻ (as lactate) 28 mmol, Cl⁻ 111 mmol/litre)

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available
9 Nutrition and blood

Intravenous glucose

Glucose solutions (5%) are used mainly to replace water deficit and should not be given alone except when there is no significant loss of electrolytes; prolonged administration of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances. Average water requirements in a healthy adult are 1.5 to 2.5 litres daily and this is needed to balance unavoidable losses of water through the skin and lungs and to provide sufficient for urinary excretion. Water depletion (dehydration) tends to occur when these losses are not matched by a comparable intake, as may occur in coma or dysphagia or in the elderly or apathetic who may not drink enough water on their own initiative.

Excessive loss of water without loss of electrolytes is uncommon, occurring in fevers, hyperthyroidism, and in uncommon water-losing renal states such as diabetes insipidus or hypercalcaemia. The volume of glucose solution needed to replace deficits varies with the severity of the disorder, but usually lies within the range of 2 to 6 litres.

Glucose solutions are also used to correct and prevent hypoglycaemia and to provide a source of energy in those too ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition (section 9.3).

Glucose solutions are given in regimens with calcium (section 9.3). Glucose solutions are also used to correct and prevent hyperkalaemia, which is especially likely in renal impairment.

Initial potassium replacement therapy should not involve glucose infusions, because glucose may cause a further decrease in the plasma-potassium concentration.

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available; also available as Potassium Chloride and Sodium Chloride Intravenous Infusion (Non-proprietary). In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

Potassium chloride and sodium chloride intravenous infusion is the initial treatment for the correction of severe hypokalaemia and when sufficient potassium cannot be taken by mouth. Ready-mixed infusion solutions should be used where possible; alternatively, potassium chloride concentrate, as ampoules containing 1.5 g (K⁺ 20 mmol) in 10 mL is thoroughly mixed with 500 mL of sodium chloride 0.9% intravenous infusion and given slowly over 2 to 3 hours, with specialist advice and ECG monitoring in difficult cases. Higher concentrations of potassium chloride may be given in very severe depletion, but require specialist advice.

Repeated measurement of plasma-potassium concentration is necessary to determine whether further infusions are required and to avoid the development of hyperkalaemia, which is especially likely in renal impairment.

Potassium Chloride and Glucose Intravenous Infusion (Non-proprietary)

Intravenous infusion, usual strength potassium chloride 0.3% (3 g, 40 mmol each of K⁺ and Cl⁻/litre) or 0.15% (1.5 g, 20 mmol each of K⁺ and Cl⁻/litre) with 5% of anhydrous glucose

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

Potassium Chloride and Sodium Chloride Intravenous Infusion (Non-proprietary)

Intravenous infusion, usual strength potassium chloride 0.15% (1.5 g/litre) with sodium chloride 0.9% (9 g/litre), containing K⁺ 20 mmol, Na⁺ 150 mmol, and Cl⁻ 170 mmol/litre or potassium chloride 0.3% (3 g/litre) with sodium chloride 0.9% (9 g/litre), containing K⁺ 40 mmol, Na⁺ 150 mmol, and Cl⁻ 190 mmol/litre

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

Note

Glucose BP is the monohydrate but Glucose Intravenous Infusion BP is a sterile solution of anhydrous glucose or glucose monohydrate, potency being expressed in terms of anhydrous glucose

Indications fluid replacement (see notes above), provision of energy (section 9.3); hypoglycaemia (section 6.1.4)

Side-effects glucose injections especially if hypertonic may have a low pH and may cause venous irritation and thrombophlebitis

Dose

- Water replacement, see notes above; energy source, 1–3 litres daily of 20–50% solution

Glucose Intravenous Infusion (Non-proprietary) 7MM

Intravenous infusion, glucose or anhydrous glucose (potency expressed in terms of anhydrous glucose), usual strength 5% (50 mg/mL), 10% (100 mg/mL), and 20% (200 mg/mL); 20% solution, net price 20-mL amp = £2.04; 50% solution,¹ 20-mL amp = £1.00, 50-mL vial = £2.01

In hospitals, 500- and 1000-mL packs, and sometimes other sizes and strengths, are available; also available as Minijet Glucose, 50% in 50-mL disposable syringe²

¹ 7MM restriction does not apply where administration is for saving life in emergency

² Appendix 1 (potassium salts)
Potassium Chloride, Sodium Chloride, and Glucose Intravenous Infusion (Non-proprietary) (W)

Intravenous infusion, sodium chloride 0.45% (4.5 g, Na+ 75 mmol/litre) with 5% of anhydrous glucose and usually sufficient potassium chloride to provide K+ 10–40 mmol/litre (to be specified by the prescriber).

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available.

Intravenous infusion, sodium chloride 0.18% (1.8 g, Na+ 30 mmol/litre) with 4% of anhydrous glucose and usually sufficient potassium chloride to provide K+ 10–40 mmol/litre (to be specified by the prescriber).

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available.

Sodium Bicarbonate Intravenous Infusion (Non-proprietary) (UCB Pharma)

Intravenous injection, sodium bicarbonate 0.45% (12.6 g, 150 mmol each of Na+, K+ and HCO3−/litre); various other strengths available.

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available.

Potassium Chloride Concentrate, Sterile (Non-proprietary) (W)

Sterile concentrate, potassium chloride 15% (150 mg, approximately 2 mmol each of K+ and Cl−/mL). Net price 10-mL amp = 48p

Important Must be diluted with not less than 50 times its volume of sodium chloride intravenous infusion 0.9% or other suitable diluent and mixed well.

Solutions containing 10 and 20% of potassium chloride are also available in both 5- and 10-mL ampoules.

SODIUM BICARBONATE

Indications metabolic acidosis, see also notes above

Dose

• By slow intravenous injection, a strong solution (up to 8.4%), or by continuous intravenous infusion, a weaker solution (usually 1.26%), an amount appropriate to the body base deficit (see notes above)

Sodium Bicarbonate Intravenous Infusion (UCB Pharma)

Usual strength sodium bicarbonate 1.26% (12.6 g, 150 mmol each of Na+ and HCO3−/litre); various other strengths available.

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available.

Minijet® Sodium Bicarbonate (UCB Pharma) (W)

Intravenous injection, sodium bicarbonate in disposable syringe, net price 4.2%, 10 mL = £11.03; 8.4%, 10 mL = £11.10, 50 mL = £12.15

SODIUM LACTATE

Indications see notes above

Sodium Lactate (Non-proprietary) (W)

Intravenous infusion, sodium lactate M/6, contains the following ions (in mmol/litre), Na+ 167, HCO3− (as lactate) 167

Water

Water for Injections (W)

Net price 1-mL amp = 18p; 2-mL amp = 13p; 5-mL amp = 24p; 10-mL amp = 25p, 10-mL vial = £1.40; 20-mL amp = 39p; 50-mL amp = £1.91; 100-mL vial = £2.96

Note Water for Injections can be sold or supplied by a pharmacist for a purpose other than parenteral administration, or when dry powder for parenteral administration has been prescribed without the Water for Injections that is needed as a diluent.

Bicarbonate and lactate

Sodium bicarbonate is used to control severe metabolic acidosis (pH < 7.1) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anoxia or hypovolaemia, sodium bicarbonate (1.26%) can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In severe shock (section 2.7.1), for example in cardiac arrest, metabolic acidosis can develop without sodium or volume depletion; in these circumstances sodium bicarbonate is best given as a small volume of hypertonic solution, such as 50 mL of 8.4% solution intravenously; plasma-pH and electrolytes should be monitored.

Sodium lactate intravenous infusion is no longer used in metabolic acidosis because of the risk of producing lactic acidosis, particularly in seriously ill patients with poor tissue perfusion or impaired hepatic function.

For chronic acidotic states, sodium bicarbonate can be given by mouth (section 9.2.1.3).

9.2.2.2 Plasma and plasma substitutes

Plasma and plasma substitutes (‘colloids’) contain large molecules that do not readily leave the intravascular space where they exert osmotic pressure to maintain circulatory volume. Compared to fluids containing electrolytes such as sodium chloride and glucose (‘crystalloids’), a smaller volume of colloid is required to produce the same expansion of blood volume, thereby shifting salt and water from the extravascular space. If resuscitation requires a volume of fluid that exceeds the maximum dose of the colloid then crystalloids can be given; packed red cells may also be required.

Albumin solutions, prepared from whole blood, contain soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma cholesterides; they may be given without regard to the recipient’s blood group.

Albumin is usually used after the acute phase of illness, to correct a plasma-volume deficit; hypoalbuninaemia itself is not an appropriate indication. The use of albumin solutions in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solutions (20%) can be used under specialist supervision in patients with an intravascular fluid deficit and oedema because of interstitial fluid overload, to restore intravascular plasma volume with less exacerbation of the salt and water overload than isotonic solutions. Concentrated albumin solutions may also be used to obtain a diuresis in hypoalbuminaemic patients (e.g. in hepatic cirrhosis).

Recent evidence does not support the previous view that the use of albumin increases mortality.
Nutrition and blood

repletion; see also section 2.7.1 for the management of instances, the shock responds to water and electrolyte sodium and water depletion because, in these circum-

table. They are rarely needed when shock is due to term measure to treat haemorrhage until blood is avail-

Plasma substitutes may be used as an immediate short-

arising from conditions such as burns or septicaemia.

Plasma substitutes are macromolecular substances

containing 15–25% protein).

Isotonic solutions

Indications: acute or sub-acute loss of plasma volume e.g. in burns, pancreatitis, trauma, and complications of surgery; plasma exchange

Available as: Human Albumin Solution 4.5% (50-, 100-, 250- and 400-mL bottles—Baxter); Human Albumin Solution 5% (250- and 500-mL bottles—Baxter); Albunorm® 5% (100-, 250-, and 500-mL bottles—Octapharm); Zenalb® 4.5% (50-, 100-, 250-, and 500-

mL bottles—BPL)

Concentrated solutions (20%)

Indications: severe hypoalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required; adjunct in the treatment of hyperbilirubinaemia by exchange transfusion in the newborn; paracentesis of large volume ascites associ-

ciated with portal hypertension

Available as: Human Albumin Solution 20% (50- and 100-mL vials—Baxter); Albunorm® 20% (50- and 100-

mL bottles—Octapharm); Flexbumin® 20% (50- and 100-mL bags—Baxter); Zenalb® 20% (50- and 100-mL bottles—BPL)

Plasma substitutes

Dextran, gelatin, and the etherified starches (beta-

starch and pentastarch) are macromolecular substances which are metabolised slowly; they may be used at the outset to expand and maintain blood volume in shock arising from conditions such as burns or septicemia. Plasma substitutes may be used as an immediate short-
term measure to treat haemorrhage until blood is avail-

able. They are rarely needed when shock is due to sodium and water depletion because, in these circum-

stances, the shock responds to water and electrolyte repletion; see also section 2.7.1 for the management of shock.

MHRA/CHM advice

MHRA suspends use of hydroxyethyl starch (HES) infusions (June 2013)

The use of hydroxyethyl starch infusions to treat critically ill patients and those undergoing surgery has been suspended in the UK because their benefits no longer outweigh the risk of using them. Studies have suggested an increased risk of renal injury and death in patients treated with these products compared with crystalloids (simple salt solutions). Tetraspan®, Venofundin®, Volulyte®, and Voluven® have all been withdrawn by the manufacturers.

Plasma substitutes should not be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Large volumes of some plasma substitutes can increase the risk of bleeding through depletion of coagulation factors.

Dextran 70 by intravenous infusion is used for volume expansion. Dextran may interfere with blood group cross-matching or biochemical measurements, and these should be carried out before infusion is begun.

Cautions Plasma substitutes should be used with caution in patients with cardiac disease, severe liver disease, or renal impairment; urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reac-
tions.

Side-effects Hypersensitivity reactions may occur including, rarely, severe anaphylactic reactions. Transi-

tent increase in bleeding time may occur.

DEXTRAN 70

Dextrans of weight average molecular weight about ’70 000’

Indications short-term blood volume expansion

Cautions see notes above; can interfere with some laboratory tests (see also above); where possible, monitor central venous pressure.

Hepatic impairment use with caution in severe impairment

Pregnancy avoid—reports of anaphylaxis in mother causing fetal anoxia, neurological damage and death

Side-effects see notes above

Dose

● See under preparation below
9.3 Intravenous nutrition

When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion. This may be in addition to ordinary oral or tube feeding—supplemental parenteral nutrition, or may be the sole source of nutrition—total parenteral nutrition (TPN). Indications for this method include preparation of undernourished patients for surgery, chemotherapy, or radiation therapy; severe or prolonged disorders of the gastro-intestinal tract; major surgery, trauma, or burns; prolonged coma or refusal to eat; and some patients with renal or hepatic failure. The composition of proprietary preparations available is given under Parenteral Infusion Fluids for Parenteral Feeding, p. 675.

Parenteral nutrition requires the use of a solution containing amino acids, glucose, fat, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of a 3-litre bag. A single dose of vitamin B₁₂, as hydroxocobalamin, is provided under Proprietary Infusion Fluids for Parenteral Feeding, p. 675.

Note The gelatin is partially degraded

Indications low blood volume (but see notes above)

Cautions see notes above

Hepatic impairment use with caution in severe impairment

Pregnancy manufacturer of Geloplasma® advises avoid at the end of pregnancy

Side-effects see notes above

Dose

By intravenous infusion, initially 500–1000 mL of a 3.5–4% solution (see notes above)

Gelaspian (B. Braun)®

Intravenous infusion, succinylated gelatin (modified fluid gelatin, average molecular weight 26 500) 40 g, Na⁺ 151 mmol, K⁺ 4 mmol, Mg²⁺ 1 mmol, Cl⁻ 103 mmol, Ca²⁺ 1 mmol, acetate 24 mmol/litre, net price 500-mL bag = £6.80, 1-litre bag = £13.60

Gelofusine® (B. Braun)®

Intravenous infusion, succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 154 mmol, Cl⁻ 120 mmol/litre, net price 500-mL EcoBag® = £4.83, 1-litre EcoBag® = £9.04

Geloplasma® (Fresenius Kabi)®

Intravenous infusion, partially hydrolysed and succinylated gelatin (modified liquid gelatin) (as amylopectin) 30 g (3%), Na⁺ 150 mmol, K⁺ 5 mmol, Mg²⁺ 1.5 mmol, Cl⁻ 100 mmol, lactate 30 mmol/litre, net price 500-mL bag = £5.05

Isoplex® (Beacon)®

Intravenous infusion, succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 145 mmol, K⁺ 4 mmol, Mg²⁺ 0.9 mmol, Cl⁻ 105 mmol, lactate 25 mmol/litre, net price 500-mL bag = £7.53, 1-litre bag = £14.54

Volplex® (Beacon)®

Intravenous infusion, succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 154 mmol, Cl⁻ 125 mmol/litre, net price 500-mL bag = £4.70, 1-litre bag = £9.09
The nutrition solution is infused through a central venous catheter inserted under full surgical precautions. Alternatively, infusion through a peripheral vein may be used for supplementary as well as total parenteral nutrition for periods of up to a month, depending on the availability of peripheral veins; factors prolonging cannula life and preventing thrombophlebitis include the use of soft polyurethane paediatric cannulas and use of feeds of low osmolality and neutral pH. Only nutritional fluids should be given by the dedicated intravenous line.

Before starting, the patient should be well oxygenated with a near normal circulating blood volume and attention should be given to renal function and acid-base status. Appropriate biochemical tests should have been carried out beforehand and serious deficits corrected. Nutritional and electrolyte status must be monitored throughout treatment.

Complications of long-term parenteral nutrition include gall bladder sludging, gall stones, cholestasis and abnormal liver function tests. For details of the prevention and management of parenteral nutrition complications, specialist literature should be consulted.

Protein is given as mixtures of essential and non-essential synthetic L-amino acids. Ideally, all essential amino acids should be included with a wide variety of non-essential ones to provide sufficient nitrogen together with electrolytes (see also section 9.2.2). Solutions vary in their composition of amino acids; they often contain an energy source (usually glucose) and electrolytes.

Energy is provided in a ratio of 0.6 to 1.1 megajoules (150–250 kcal) per gram of protein nitrogen. Energy requirements must be met if amino acids are to be utilised for tissue maintenance. A mixture of carbohydrate and fat energy sources (usually 30–50% as fat) gives better utilisation of amino acids than glucose alone.

Glucose is the preferred source of carbohydrate, but if more than 180 g is given per day frequent monitoring of blood glucose is required, and insulin may be necessary. Glucose in various strengths from 10 to 50% must be infused through a central venous catheter to avoid thrombosis.

In parenteral nutrition regimens, it is necessary to provide adequate phosphate in order to allow phosphorylation of glucose and to prevent hypophosphataemia; between 20 and 30 mmol of phosphate is required daily.

Fructose and sorbitol have been used in an attempt to avoid the problem of hyperosmolar hyperglycaemic non-ketotic coma but other metabolic problems may occur, as with xylitol and ethanol which are now rarely used.

Fat emulsions have the advantages of a high energy to fluid volume ratio, neutral pH, and iso-osmolarity with plasma, and provide essential fatty acids. Several days of adaptation may be required to attain maximal utilisation. Reactions include occasional febrile episodes (usually only with 20% emulsions) and rare anaphylactic responses. Interference with biochemical measurements such as those for blood gases and calcium may occur if samples are taken before fat has been cleared. Daily checks are necessary to ensure complete clearance from the plasma in conditions where fat metabolism may be disturbed. Additives should not be mixed with fat emulsions unless compatibility is known.

Administration
Because of the complex requirements relating to parenteral nutrition full details relating to administration have been omitted. In all cases product literature and other specialist literature should be consulted.

Supplementary preparations
Compatibility with the infusion solution must be ascertained before adding supplementary preparations.

Addiphos® (Fresenius Kabi)
Solution, sterile, phosphate 40 mmol, K⁺ 30 mmol, Na⁺ 30 mmol/20 mL. For addition to Vamin® solutions and glucose intravenous infusions. Net price 20-mL vial = £1.30

Additrace® (Fresenius Kabi)
Solution, trace elements for addition to Vamin® solutions and glucose intravenous infusions, traces of Fe²⁺, Zn²⁺, Mn²⁺, Cu²⁺, Cr³⁺, Se⁴⁺, Mo⁶⁺, F⁻, I⁻. For adults and children over 40 kg. Net price 10-mL amp = £1.96

Cernevit® (Baxter)
Solution, dl-alpha tocopheryl 11.2 units, ascorbic acid 125 mg, biotin 69 micrograms, colecaciderol 220 units, cyanocobalamin 6 micrograms, folic acid 414 micrograms, glycine 250 mg, nicotinamide 46 mg, pantethenic acid (as dexpantethanol) 17.25 mg, pyridoxine hydrochloride 5.5 mg, retinol (as palmitate) 3500 units, riboflavin (as dihydrated sodium phosphate) 4.14 mg, thiamine (as cocarboxylase tetrahydrate) 3.51 mg. Dissolve in 5 mL water for injection. Net price per vial = £4.64

Decan® (Baxter)
Solution, trace elements for addition to infusion solutions, Fe²⁺, Zn²⁺, Cu²⁺, Mn²⁺, F⁻, Co³⁺, I⁻, Se⁴⁺, Mo⁶⁺, Cr³⁺. For adults over 40 kg. Net price 40-mL vial = £2.00

Dipeptiven® (Fresenius Kabi)
Solution, N(2)-L-alanyl-L-glutamine 200 mg/mL (providing L-alanine 82 mg, L-glutamine 134.8 mg). For addition to infusion solutions containing amino acids. Net price 50 mL = £13.94, 100 mL = £25.93

Dose
amino acid supplement for hypercatabolic or hypermetabolic states, 300–400 mg/kg daily; max 400 mg/kg daily, dose not to exceed 20% of total amino acid intake

Glycophos® Sterile Concentrate (Fresenius Kabi)
Solution, sterile, phosphate 20 mmol, Na⁺ 40 mmol/20 mL. For addition to Vamin® and Vaminolact® solutions, and glucose intravenous infusions. Net price 20-mL vial = £3.91

678  9.3 Intravenous nutrition  BNF 68
9.4 Oral nutrition

9.4.1 Foods for special diets

These are preparations that have been modified to eliminate a particular constituent from a food or that are nutrient mixtures formulated as food substitutes for patients who either cannot tolerate or cannot metabolise certain common constituents of food. In certain clinical conditions, some food preparations are regarded as drugs and can be prescribed within the NHS if they have been approved by the Advisory Committee on Borderline Substances (ACBS)—see Appendix 2.

Phenylketonuria
Phenylketonuria (hyperphenylalaninaemia, PKU), which results from the inability to metabolise phenylalanine, is managed by restricting dietary intake of phenylalanine to a small amount sufficient for tissue building and repair.

Sapropterin, a synthetic form of tetrahydrobiopterin, is licensed as an adjunct to dietary restriction of phenylalanine in the management of patients with phenylketonuria and tetrahydrobiopterin deficiency.

Aspartame (used as a sweetener in some foods and medicines) contributes to the phenylalanine intake and may affect control of phenylketonuria. Where the presence of aspartame is specified in the product literature this is indicated in the BNF against the preparation; the patient should be informed of this.

Coeliac disease
Intolerance to gluten in coeliac disease is managed by completely eliminating gluten from the diet. A range of gluten-free products is available for prescription—see Appendix 2, p. 1022.

9.4.2 Enteral nutrition

Veminolact
Veminolact (Fresenius Kabi) is indicated for use in neonates (when kidney function established, usually second day of life), infants, and children. Net price 100 mL = £4.35; 500 mL = £10.00.

Vaminolact
Vaminolact (Fresenius Kabi) is a solution, trace elements for addition to Vaminolact®, Vamin®, 14 Electrolyte-Free solutions and glucose intravenous infusions, traces of Zn²⁺, Cu²⁺, Mn²⁺, Se⁴⁺, F⁻, I⁻. For use in neonates (when kidney function established, usually second day of life), infants, and children. Net price 10 mL vial = £3.55.

Cautions reduced biliary excretion especially in cholestatic liver disease or in markedly reduced urinary excretion (careful biochemical monitoring required); total parenteral nutrition exceeding 1 month (measure serum manganese concentration and check liver function before commencing treatment and regularly during treatment)—discontinue if manganese concentration raised or if cholestasis develops.

Sapropterin Dihydrochloride

Note Sapropterin is a synthetic form of tetrahydrobiopterin. See under dose below.

Cautions monitor blood-phenylalanine concentration before and after first week of treatment—if unsatisfactory response increase dose at weekly intervals to max. dose and monitor blood-phenylalanine concentration weekly; discontinue treatment if unsatisfactory response after 1 month; monitor blood-phenylalanine concentration...
9.4.2 Enteral nutrition

The body’s reserves of protein rapidly become exhausted in severely ill patients, especially during chronic illness or in those with severe burns, extensive trauma, pancreatitis, or intestinal fistula. Much can be achieved by frequent meals and by persuading the patient to take supplementary snacks of ordinary food between the meals.

However, extra calories, protein, other nutrients, and vitamins are often best given by supplementing ordinary meals with enteral sip or tube feeds (preparations, see Appendix 2).

When patients cannot feed normally, for example, patients with severe facial injury, oesophageal obstruction, or coma, a nutritionally complete diet of enteral feeds must be given. The advice of a dietitian should be sought to determine the protein and total energy requirement of the patient and the form and relative contribution of carbohydrate and fat to the energy requirements.

Most enteral feeds contain protein derived from cows’ milk or soya. Elemental feeds containing protein hydrolysates or free amino acids can be used for patients who have diminished ability to break down protein, for example in inflammatory bowel disease or pancreatic insufficiency.

Even when nutritionally complete feeds are given, water and electrolyte balance should be monitored. Haematological and biochemical parameters should also be monitored, particularly in clinically unstable patients.

Extra minerals (e.g. magnesium and zinc) may be needed in patients where gastro-intestinal secretions are being lost. Additional vitamins may also be needed. Feeds containing vitamin K may affect the INR in patients receiving warfarin—see interactions: Appendix 1 (vitamins).

Children  Children have special requirements and in most situations liquid feeds prepared for adults are totally unsuitable—the advice of a paediatric dietitian should be sought; see also BNF for Children, section 9.4.2.

Preparations
See Borderline Substances, Appendix 2.

9.5 Minerals

9.5.1 Calcium and magnesium

9.5.1.1 Calcium supplements

9.5.1.2 Hypercalcaemia and hypercalciuria

9.5.1.3 Magnesium

Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand, and in old age, due to impaired absorption. In osteoporosis, a calcium intake which is double the recommended amount reduces the rate of bone loss. If the actual dietary intake is less than the recommended amount, a supplement of as much as 40 mmol is appropriate, see also Osteoporosis, p. 510 and Vitamin D, p. 689.

In severe acute hypocalcaemia or hypocalcaemic tetany, an initial slow intravenous injection of 10–20 mL of calcium gluconate injection 10% (providing approximately 2.25–4.5 mmol of calcium) should be given, with plasma-calcium and ECG monitoring (risk of arrhythmias if given too rapidly), and either repeated as required or, if only temporary improvement, followed by a continuous intravenous infusion to prevent recurrence. For infusion, dilute 100 mL of calcium gluconate 10% in 1 litre of glucose 5% or sodium chloride 0.9% and give at an initial rate of 50 mL/hour adjusted according to response. Calcium chloride injection is also available, but is more irritant; care should be taken to prevent extravasation. Oral supplements of calcium and vitamin D may also be required in persistent hypocalcaemia (see also section 9.6.4). Concurrent hypomagnesaemia should be corrected with magnesium sulphate (section 9.5.1.3).

For the role of calcium gluconate in temporarily reducing the toxic effects of hyperkalaemia, see p. 666.
CALCIUM SALTS

Indications see notes above; calcium deficiency

Cautions sarcooidosis; history of nephrolithiasis; avoid calcium chloride in respiratory acidosis or respiratory failure; interactions: Appendix 1 (antacids, calcium salts)

Contra-indications conditions associated with hypercalcaemia and hypercalcuria (e.g. some forms of malignant disease)

Renal impairment use with caution (but see also Calcium Gluconate injection, below)

Side-effects rarely gastro-intestinal disturbances; with injection, bradycardia, arrhythmias, peripheral vasodilatation, fall in blood pressure, sweating, injection-site reactions, severe tissue damage with extravasation.

Dose

• By mouth, daily in divided doses, see notes above

• By slow intravenous injection, acute hypercalcaemia, see notes above; CHILD see BNF for Children

• By continuous intravenous infusion, acute hypercalcaemia, see notes above

Oral preparations

Calcium Gluconate (Non-proprietary) Effervescent tablets, calcium gluconate 1 g (calcium 89 mg or Ca 2+ 2.23 mmol), net price 28-tab pack = £14.82. Label: 13 Note Each tablet usually contains 4.46 mmol Na+

Calcium Lactate (Non-proprietary) Tablets, calcium lactate 300 mg (calcium 39 mg or Ca 2+ 1 mmol), net price £4 = £4.57

Adcal® (ProStrakan) Chewable tablets, fruit flavour, calcium carbonate 1.5 g (calcium 600 mg or Ca 2+ 15 mmol), net price 100-tab pack = £8.70. Label: 24

Cacit® (Warner Chilcott) Tablets, effervescent, pink, calcium carbonate 1.25 g, providing calcium citrate when dispersed in water (calcium 500 mg or Ca 2+ 12.5 mmol), net price 76-tab pack = £11.81. Label: 13

Calcichew® (fakeda) Tablets (chewable), orange flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca 2+ 12.5 mmol), net price 100-tab pack = £9.33. Label: 24

Forte tablets (chewable), orange flavour, scored, calcium carbonate 2.5 g (calcium 1 g or Ca 2+ 25 mmol), net price 60-tab pack = £13.16. Label: 24

Excipients include aspartame (section 9.4.1)

Calcium-500 (Martindale) Tablets, pink, eff/c, calcium carbonate 1.25 g (calcium 500 mg or Ca 2+ 12.5 mmol), net price 100-tab pack = £9.46. Label: 25

Calcium-Sandoz® (Alliance) Syrup, orange flavour, calcium gluconate 1.09 g, calcium lactokionate 727 mg (calcium 108.3 mg or Ca 2+ 2.7 mmol)/5mL, net price 300 mL = £4.07

Sandocal® (Novartis Consumer Health) Sandocal 1000 tablets, effervescent, orange flavour, calcium lactate gluconate 2.263 g, calcium carbonate 1.75 g, providing 1 g calcium (Ca 2+ 25 mmol), net price 3 x 10-tab pack = £6.91. Label: 13

Excipients include aspartame (section 9.4.1)
CINACALCET

Indications  see under Dose and notes above

Cautions  measure serum-calcium concentration before initiation of treatment and within 1 week after starting treatment or adjusting dose, then monthly for secondary hyperparathyroidism and every 2–3 months for primary hyperparathyroidism and parathyroid carcinoma; treatment should not be initiated in patients with hypocalcaemia; in secondary hyperparathyroidism measure parathyroid hormone concentration 1–4 weeks after starting treatment or adjusting dose, then every 1–3 months; dose adjustment may be necessary if smoking started or stopped during treatment; interactions: Appendix 1 (cinacalcet)

Hepatic impairment  manufacturer advises caution in moderate to severe impairment—monitor closely especially when increasing dose

Pregnancy  manufacturer advises use only if potential benefit outweighs risks—no information available

Breast-feeding  manufacturer advises avoid—present in milk in animal studies

Side-effects  nausea, vomiting, anorexia; dizziness, paraesthesia, asthenia; reduced testosterone concentrations; myalgia; rash; less commonly dyspepsia, diarrhoea, and seizures; hypotension, heart failure, and allergic reactions (including angioedema) also reported

Dose

• Secondary hyperparathyroidism in patients with end-stage renal disease on dialysis (but see notes above), ADULT over 18 years, initially 30 mg once daily, adjusted every 2–4 weeks to max. 180 mg daily

• Hypercalcaemia of primary hyperparathyroidism or parathyroid carcinoma, ADULT over 18 years, initially 30 mg twice daily, adjusted every 2–4 weeks according to response up to max. 90 mg 4 times daily

Mimpara® (Amgen) Tablets, green, 1/c. cinacalcet (as hydrochloride) 30 mg, net price 28-tab pack = £125.75; 60 mg, 28-tab pack = £231.97; 90 mg, 28-tab pack = £347.96. Label: 21

9.5.1.3 Magnesium

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton.

Magnesium salts are not well absorbed from the gastro-intestinal tract, which explains the use of magnesium sulfate (section 1.6.4) as an osmotic laxative. Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant hypermagnesaemia (causing muscle weakness and arrhythmias) is rare.

Hypomagnesaemia  Since magnesium is secreted in large amounts in the gastro-intestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of hypomagnesaemia; deficiency may also occur in alcoholism or as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hyperparathyroidism, and also hypokalaemia and hypophosphataemia. Symptomatic hypomagnesaemia is associated with a deficit of 0.5–1 mmol/kg; up to 160 mmol Mg2+ over up to 5 days may be required to replace the deficit (allowing for urinary losses). Magnesium is given initially by intravenous infusion or by intramuscular injection of magnesium sulfate; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate and duration of infusion and the dose should be reduced in renal impairment. To prevent recurrence of the deficit, magnesium may be given by mouth in a dose of 24 mmol Mg2+ daily in divided doses, but there is limited evidence of benefit; magnesium glycerophosphate tablets and liquid (unlicensed) are available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104. For maintenance (e.g. in intravenous nutrition), parenteral doses of magnesium are of the order of 10–20 mmol Mg2+ daily (often about 12 mmol Mg2+ daily).

Arrhythmias  Magnesium sulfate injection has also been recommended for the emergency treatment of serious arrhythmias, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as torsade de pointes (see also section 2.3.1). The usual intravenous dose of magnesium sulfate injection is 8 mmol Mg2+ (2 g) over 10–15 minutes (repeated once if necessary).

Myocardial infarction  Limited evidence that magnesium sulfate prevents arrhythmias and reperfusion injury in patients with suspected myocardial infarction has not been confirmed by large studies. Routine
use of magnesium sulfate for this purpose is not recommended. For the management of myocardial infarction, see section 2.10.1.

**Eclampsia and pre-eclampsia** Magnesium sulfate injection is the drug of choice for the treatment of seizures and the prevention of recurrent seizures in women with eclampsia. Regimens may vary between hospitals. Calcium gluconate injection is used for the management of magnesium toxicity.

Magnesium sulfate injection is also of benefit in women with pre-eclampsia in whom there is concern about developing eclampsia. The patient should be monitored carefully (see under Magnesium Sulfate).

### Magnesium Sulfate

**Note** Magnesium Sulfate Injection BP is a sterile solution of Magnesium Sulfate Heptahydrate.

**Indications** see notes above; constipation (section 1.6.4); severe acute asthma (section 3.1); paste for boils (section 13.10.5)

**Cautions** see notes above; in severe hypomagnesemia administer initially via controlled infusion device (preferably syringe pump); monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech); interactions: Appendix 1 (magnesium, parenteral)

**Hepatic impairment** avoid in hepatic coma if risk of renal failure

**Renal impairment** avoid or reduce dose; increased risk of toxicity

**Pregnancy** not known to be harmful for short-term intravenous administration in eclampsia, but excessive doses in third trimester cause neonatal respiratory depression

**Side-effects** generally associated with hypermagnesaemia, nausea, vomiting, thirst, flushing of skin, hypotension, arrhythmias, coma, respiratory depression, drowsiness, confusion, loss of tendon reflexes, muscle weakness; colic and diarrhoea following oral administration

**Dose**
- Hypomagnesaemia, see notes above
- Arrhythmias, see notes above
- Prevention of seizures in pre-eclampsia [unlicensed indication], initially by intravenous injection over 5–15 minutes, 4 g (16 mmol Mg²⁺) followed by intravenous infusion, 1 g/hour (4 mmol/hour Mg²⁺) for 24 hours; if seizure occurs, additional dose by intravenous injection, 2 g (8 mmol Mg²⁺)
- Treatment of seizures and prevention of seizure recurrence in eclampsia, initially by intravenous injection over 5–15 minutes, 4 g (16 mmol Mg²⁺), followed by intravenous infusion, 1 g/hour (4 mmol/hour Mg²⁺) for 24 hours after seizure or delivery, whichever is later; if seizure recurs, increase the infusion rate to 1.5–2 g/hour (6–8 mmol/hour Mg²⁺) or give an additional dose by intravenous injection, 2 g (8 mmol Mg²⁺)

**Intravenous administration** For intravenous injection, concentration of magnesium sulfate heptahydrate should not exceed 20% (200 mg/mL or 0.8 mmol/mL Mg²⁺). Dilute 1 part of magnesium sulfate injection 50% with at least 1.5 parts of water for injections

**Note** Magnesium sulfate heptahydrate 1 g equivalent to Mg²⁺ approx. 4 mmol

### 9.5.2 Phosphorus

**9.5.2.1 Phosphate supplements**

Ampoules of phosphates (providing PO₄³⁻) may be infused at a rate of 9 mmol every 12 hours. In critically ill patients, the dose of phosphate can be increased up to 500 micromol/kg (approx. 30 mmol in adults, max. 50 mmol), infused over 6–12 hours, according to severity. Excessive doses of phosphates may cause hypocalcaemia and metastatic calcification; it is essential to monitor closely plasma concentrations of calcium, phosphate, potassium, and other electrolytes.

For phosphate requirements in total parenteral nutrition regimens, see section 9.3.

**Phosphates** (Fresenius Kabi)

- **intravenous infusion**: phosphates (providing PO₄³⁻), 100 mmol, K⁺ 19 mmol, Na⁺ 162 mmol/litre), net price 500 mL (Polyfusor®) = £53.40.
- For the treatment of moderate to severe hypophosphataemia

**Phosphate-Sandoz® (HK Pharma)**

- Tablets, effervescent, anthyroid sodium acid phosphate 1.936 g, sodium bicarbonate 350 mg, potassium bicarbonate 315 mg, equivalent to phosphorus 500 mg (phosphate 16.1 mmol), sodium 468.8 mg (Na⁺ 20.4 mmol), potassium 123 mg (K⁺ 3.1 mmol). Net price 20 = £3.29. Label: 13
- **Dose** vitamin D-resistant hypophosphataemic osteomalacia, 4–6 tablets daily, CHILD under 5 years 2–3 tablets daily

**9.5.2.2 Phosphate-binding agents**

Calcium-containing preparations are used as phosphate-binding agents in the management of hyperphosphataemia complicating renal failure. Aluminium-
containing preparations are rarely used as phosphate-binding agents and can cause aluminium accumulation.

Sevelamer hydrochloride and sevelamer carbonate are both licensed for the treatment of hyperphosphataemia in patients on haemodialysis or peritoneal dialysis. Sevelamer carbonate is also licensed for the treatment of patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more.

Lanthanum is licensed for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD), and in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more that cannot be controlled by a low-phosphate diet.

The Scottish Medicines Consortium (p. 4) has advised (March 2007) that lanthanum (Fosrenol®) is accepted for restricted use within NHS Scotland for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis, as a second-line agent, where a non-aluminium, non-calcium phosphate binder is required.

Colestilan is licensed for the treatment of hyperphosphataemia in patients with chronic kidney disease receiving haemodialysis or peritoneal dialysis.

The Scottish Medicines Consortium (p. 4) has advised (January 2014) that colestilan (BindRen®) is not recommended for use within NHS Scotland.

### ALUMINIUM HYDROXIDE

**Indications** hyperphosphataemia; dyspepsia (section 1.1)

**Cautions** see notes above; **interactions:** Appendix 1 (antacids)

**Side-effects** constipation; hyperaluminaemia

**Alu-Cap®** (Meda)

**Capsules**
475 mg (low Na +), net price 120-cap pack = £14.00. Label: 25, counselling, with meals

**Dose**
According to serum-phosphate concentration (usual dose 4–20 capsules daily in divided doses with meals)

### CALCIUM SALTS

**Indications** hyperphosphataemia

**Cautions** sarcoidosis; history of nephro lithiasis; interactions: Appendix 1 (antacids, calcium salts)

**Contra-indications** hypercalcaemia, hypercalciuria

**Side-effects** hypercalcaemia

**Adcal®** section 9.5.1.1

**Calcichew®** section 9.5.1.1

**Calcium-500** section 9.5.1.1

**PhosLo®** (Fresenius Medical Care) (Pharmacosmos)

**Capsules**
calcium acetate (anhydrous) 667 mg (calcium 169 mg or Ca 2+ 4.2 mmol), net price 200-cap pack = £14.40. Counselling, with meals

**Excipients** include propylene glycol (see Excipients, p. 2)

**Dose**
initially 2 capsules with each meal, adjusted according to serum-phosphate concentration (usual dose 3 or 4 capsules with each meal)

**Renacet®** (KoRa)

**Tablets**
1, 2, calcium acetate 475 mg (calcium 120.25 mg or Ca 2+ 3 mmol), net price 100-tab pack = £5.38, 200-tab pack = £9.71; 950 mg (calcium 240.5 mg or Ca 2+ 6 mmol), scored, net price 100-tab pack = £10.25, 200-tab pack = £18.45. Label: 25, counselling, with meals, avoid other drugs at same time (see below)

**Dose ADULT** over 18 years, 475–950 mg with breakfast and with snacks, 0.95–2.85 g with main meals, 0.95–1.9 g with supper, adjusted according to serum-phosphate concentration; max. 6.65 g daily

**Counselling**
Manufacturer advises that other drugs should be taken 1 to 2 hours before or after Renacet® to reduce possible interference with absorption of other drugs

### With magnesium carbonate

**Osvaren®** (Fresenius Medical Care) (Pharmacosmos)

**Tablets**
1, 2, scored, calcium acetate 435 mg (calcium 110 mg or Ca 2+ 2.7 mmol), heavy magnesium carbonate 235 mg (magnesium 60 mg), net price 180-tab pack = £24.00. Label: 25, counselling, with meals, avoid other drugs at same time (see below)

**Contra-indications** hypercalcaemia, hypermagnesaemia; third-degree AV block; myasthenia gravis

**Dose ADULT** over 18 years, initially 1 tablet 3 times daily with meals, adjusted according to serum-phosphate concentration (usual dose 3–10 tablets daily); max. 12 tablets daily

**Counselling**
Manufacturer advises that other drugs should be taken at least 2 hours before or 3 hours after Osvaren® to reduce possible interference with absorption of other drugs

### COLESTILAN

**Indications** hyperphosphataemia in patients with chronic kidney disease on haemodialysis or peritoneal dialysis

**Cautions** constipation; predisposition to gastrointestinal haemorrhage; malabsorption syndromes; interactions: Appendix 1 (colestilan)

**Contra-indications** bowel obstruction; dysphagia; severe gastrointestinal disorders; biliary obstruction; seizure disorders; recent history of peritonitis in peritoneal dialysis patients; serum albumin less than 30 g/L

**Hepatic impairment**
manufacturer advises avoid in severe impairment—no information available

**Pregnancy**
no information available; not absorbed but supplements of fat-soluble vitamins and folic acid may be required

**Breast-feeding**
no information available; not absorbed but supplements of fat-soluble vitamins and folic acid may be required

**Side-effects** constipation, diarrhoea, flatulence, nausea, vomiting, dyspepsia, gastritis, abdominal pain, decreased appetite; *less commonly* oesophagitis, gastrointestinal haemorrhage, taste disturbances; rarely intestinal obstruction

**Dose**
- **ADULT** over 18 years, initially 2–3 g 3 times daily with or immediately after meals, increased according to serum-phosphate concentration in steps of 3 g daily (in divided doses) every 2–3 weeks; max. 5 g 3 times daily
**BindRen** (Mitsubishi) Tablets, f/c, colestilan 1 g, net price 198-tab pack = £143.00. Label: 21, counselling, avoid other drugs at same time (see below)

Granules, f/c, colestilan 2 g/sachet, net price 90-sachet pack = £130.00; 3 g/sachet, net price 90-sachet pack = £195.00. Label: 21, counselling, avoid other drugs at same time (see below)

Counselling: Manufacturer advises that other drugs should be taken at least 1 hour before or 3 hours after BindRen to reduce possible interference with absorption of other drugs.

**LANTHANUM**

**Indications** see notes above

**Cautions** acute peptic ulcer; ulcerative colitis; Crohn’s disease; bowel obstruction; interactions: Appendix 1 (lanthanum)

**Hepatic impairment** lanthanum excreted in bile—possible accumulation in obstructive jaundice

**Pregnancy** manufacturer advises avoid—toxicity in haemodialysis or peritoneal dialysis, and patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more

Cautions gastro-intestinal disorders; interactions: Appendix 1 (lanseveler)

**Contra-indications** bowel obstruction

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** unlikely to be present in milk (however, manufacturer advises avoid)

**Side-effects** nausea, vomiting, abdominal pain, constipation, diarrhoea, dyspepsia, flatulence; also reported intestinal obstruction and perforation, ileus, pruritus, rash

**Dose**

- ADULT over 18 years, initially 2.4–4.8 g daily in 3 divided doses with meals, adjusted according to serum-phosphate concentration (usual dose range 2.4–12 g daily in 3 divided doses); CHILD see BNF for Children

**Renagel** (Genzyme) Tablets, f/c, sevelamer hydrochloride 800 mg, net price 180-tab pack = £167.04. Label: 25, counselling, with meals

Excipients include propylene glycol (see Excipients, p. 2)

**SEVELAMER CARBONATE**

**Indications** hyperphosphataemia in patients on haemodialysis or peritoneal dialysis, and patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more

Cautions gastro-intestinal disorders; interactions: Appendix 1 (sevelamer)

**Contra-indications** bowel obstruction

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** unlikely to be present in milk (however, manufacturer advises avoid)

**Side-effects** nausea, vomiting, abdominal pain, constipation, diarrhoea, dyspepsia, flatulence; also reported intestinal obstruction and perforation, ileus, pruritus, rash

**Dose**

- ADULT over 18 years, initially 2.4–4.8 g daily in 3 divided doses with meals, adjusted according to serum-phosphate concentration every 2–4 weeks (usual dose approx. 6 g daily in 3 divided doses)

**Renvela** (Genzyme) Tablets, f/c, sevelamer carbonate 800 mg, net price 180-tab pack = £167.04. Label: 25, counselling, with meals

Excipients include propylene glycol (see Excipients, p. 2)

Powder for oral suspension, pale yellow, sevelamer carbonate 2.4 g, net price 90-sachet pack (citrus-flavoured) = £167.04. Label: 13, counselling, with meals

**Note** Each sachet to be dispersed in 60 mL water

**SEVELAMER HYDROCHLORIDE**

**Indications** hyperphosphataemia in patients on haemodialysis or peritoneal dialysis

**Cautions** gastro-intestinal disorders; interactions: Appendix 1 (sevelamer)

**Contra-indications** bowel obstruction

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk

**Side-effects** nausea, vomiting, abdominal pain, constipation, diarrhoea, dyspepsia, flatulence; very rarely reported intestinal obstruction; also reported intestinal perforation, ileus, diverticulitis, pruritus, rash

**Dose**

- ADULT over 18 years, initially 2.4–4.8 g daily in 3 divided doses with meals, adjusted according to serum-phosphate concentration (usual dose range 2.4–12 g daily in 3 divided doses); CHILD see BNF for Children

Availability of adequate fluoride confers significant resistance to dental caries. It is now considered that the topical action of fluoride on enamel and plaque is more important than the systemic effect.

When the fluoride content of drinking water is less than 0.7 parts per million, daily administration of fluoride tablets or drops provides suitable supplementation. Systemic fluoride supplements should not be prescribed without reference to the fluoride content of the local water supply. Infants need not receive fluoride supplements until the age of 6 months.

Dentifrices which incorporate sodium fluoride or monofluorophosphate are also a convenient source of fluoride.

Individuals who are either particularly caries prone or medically compromised may be given additional protection by use of fluoride rinses or by application of fluoride gels. Rinses may be used daily or weekly; daily use of a less concentrated rinse is more effective than...
weekly use of a more concentrated one. High-strength
gels must be applied regularly under professional super-
vision; extreme caution is necessary to prevent children
from swallowing any excess. Less concentrated gels are available for home use. Varnishes are also available and
are particularly valuable for young or disabled children
since they adhere to the teeth and set in the presence of
moisture.

Fluoride mouthwash, oral drops, tablets and tooth-
paste are prescribable on form FP10D (GP14 in Scotland, WP10D in Wales; for details see prepara-
tions, below).

There are also arrangements for health authorities to
supply fluoride tablets in the course of pre-school
dental schemes, and they may also be supplied in
school dental schemes.

Fluoride gels are not prescribable on form FP10D
(GP14 in Scotland, WP10D in Wales).

**FLUORIDES**

**Note** Sodium fluoride 2.2 mg provides approx. 1 mg fluoride
ion

**Indications** prophylaxis of dental caries—see notes
above

**Contra-indications** not for areas where drinking
water is fluoridated

**Side-effects** occasional white flecks on teeth with
recommended doses; rarely yellowish-brown discol-
oration if recommended doses are exceeded

**Dose**

**Note** Dose expressed as fluoride ion (F−)

• Water content less than F− 300 micrograms/litre (0.3
parts per million), CHILD up to 6 months none; 6
months–3 years F− 250 micrograms daily, 3–6 years
F− 300 micrograms daily, over 6 years F− 1 mg daily

• Water content between F− 300 and 700 micrograms/
litre (0.3–0.7 parts per million), CHILD up to 3 years
none, 3–6 years F− 250 micrograms daily, over 6 years
F− 300 micrograms daily

• Water content above F− 700 micrograms/litre (0.7
parts per million), supplements not advised

**Note** These doses reflect the recommendations of the British
Dental Association, the British Society of Paediatric Dentistry and the British
Association for the Study of Community Dentistry (Br Dent J 1997; 182: 6–7)

**Tablets**

**Counselling** Tablets should be sucked or dissolved in the
mouth and taken preferably in the evening

**En-De-Kay** (Manx)

Fluotabs 3–6 years, orange-flavoured, scored, sodium
fluoride 1.1 mg (F− 500 micrograms), net price
200-tab pack = £2.38

**Dental prescribing on NHS** May be prescribed as Sodium
Fluoride Tablets

Fluotabs 6+ years, orange-flavoured, scored, sodium
fluoride 2.2 mg (F− 1 mg), net price 200-tab pack = £2.38

**Dental prescribing on NHS** May be prescribed as Sodium
Fluoride Tablets

- **Fluor-a-day** (Dental Health)

Tablets, buff, sodium fluoride 1.1 mg (F− 500 micro-
grams), net price 200-tab pack = £2.79; 2.2 mg (F−
1 mg), 200-tab pack = £2.79

**Dental prescribing on NHS** May be prescribed as Sodium
Fluoride Tablets

**Oral drops**

**Note** Fluoride supplements not considered necessary below
6 months of age (see notes above)

**En-De-Kay** (Manx)

Fluodrops® (= paediatric drops), sugar-free, sodium
fluoride 550 micrograms (F− 250 micrograms)/
0.15 mL. Net price 60 mL = £2.38

**Dental prescribing on NHS** May be prescribed as Sodium
Fluoride Oral Drops

**Mouthwashes**

Rinse mouth for 1 minute and spit out

**Counselling** Avoid eating, drinking, or rinsing mouth for 15
minutes after use

**En-De-Kay** (Manx)

**Daily fluoride mouthrinse** (= mouthwash), blue, sod-
ium fluoride 0.05%. Net price 250 mL = £1.50

**Dose** CHILD 6 years and over, for daily use, rinse with
10 mL

**Dental prescribing on NHS** May be prescribed as Sodium
Fluoride Mouthwash 0.05%

**Fluorinse** (= mouthwash), red, sodium fluoride 2%. Net
price 100 mL = £4.97. Counselling, see above

**Dose** CHILD 8 years and over, for daily use, dilute 5 drops
to 10 mL of water; for weekly use, dilute 20 drops to 10 mL

**Dental prescribing on NHS** May be prescribed as Sodium
Fluoride Mouthwash 2%

**FluorGard** (Colgate-Palmolive)

**Daily dental rinse** (= mouthwash), blue, sodium fluo-
ride 0.05%. Net price 400 mL = £2.99. Counselling,
see above

**Dose** CHILD 6 years and over, for daily use, rinse with
10 mL

**Dental prescribing on NHS** May be prescribed as Sodium
Fluoride Mouthwash 0.05%

**Toothpastes**

**Duraphat** (Colgate-Palmolive) (Pol)

**Duraphat® '2800 ppm' toothpaste**, sodium fluoride
0.619%. Net price 75 mL = £3.26, dual pack
(2 x 75 ml) = £5.54. Counselling, see below

**Dose** ADULT and CHILD over 10 years, apply 1 cm twice
daily using a toothbrush

**Counselling** Brush teeth for 1 minute before spitting out.
Avoid drinking or rinsing mouth for 30 minutes after use

**Dental prescribing on NHS** May be prescribed as Sodium
Fluoride Toothpaste 0.619%

**Duraphat® '5000 ppm' toothpaste**, sodium fluoride
1.1%. Net price 51 g = £6.50. Counselling, see below

**Dose** ADULT and ADOLESCENT over 16 years, apply 2 cm 3
times daily after meals using a toothbrush

**Counselling** Brush teeth for 3 minutes before spitting out

**Dental prescribing on NHS** May be prescribed as Sodium
Fluoride Toothpaste 1%

**9.5.4 Zinc**

Zinc supplements should not be given unless there is
good evidence of deficiency (hypoproteinaemia spuri-
ously lowers plasma-zinc concentration) or in zinc-
losing conditions. Zinc deficiency can occur as a result of
inadequate diet or malabsorption; excessive loss of
zinc can occur in trauma, burns, and protein-losing
conditions. A zinc supplement is given until clinical
improvement occurs, but it may need to be continued
in severe malabsorption, metabolic disease (section
9.8.1), or in zinc-losing states.

Parenteral nutrition regimens usually include trace
amounts of zinc (section 9.3). If necessary, further zinc
can be added to intravenous feeding regimens. A sug-
Selenium deficiency can occur as a result of inadequate diet or prolonged parenteral nutrition. A selenium supplement should not be given unless there is good evidence of deficiency.

### Selenium

**Indications** selenium deficiency

**Cautions** interactions: Appendix 1 (selenium)

**Dose**

- **By mouth** or **by intramuscular injection** or **by intravenous injection**, 100–500 micrograms daily

**Selenase®** (Galen)

**Oral solution**, selenium (as sodium selenite pentahydrate) 50 micrograms/mL, net price 2-mL amp = £1.03, 10-mL bottle = £4.05

**Injection**, selenium (as sodium selenite pentahydrate) 50 micrograms/mL, net price 2-mL amp = £1.50, 10-mL vial = £4.25

**Note** May be difficult to obtain

### Vitamins

#### 9.6.1 Vitamin A

Deficiency of vitamin A (retinol) is associated with ocular defects (particularly xerophthalmia) and an increased susceptibility to infections, but deficiency is rare in the UK (even in disorders of fat absorption). Massive overdose can cause rough skin, dry hair, an enlarged liver, and a raised erythrocyte sedimentation rate and raised serum calcium and serum alkaline phosphatase concentrations.

**Pregnancy** In view of evidence suggesting that high levels of vitamin A may cause birth defects, women who are (or may become) pregnant are advised not to take vitamin A supplements (including tablets and fish-liver oil drops), except on the advice of a doctor or an antenatal clinic; nor should they eat liver or products such as liver pâté or liver sausage.

#### 9.6.2 Vitamin B group

- **Vitamin B group**

#### 9.6.3 Vitamin C

#### 9.6.4 Vitamin D

#### 9.6.5 Vitamin E

#### 9.6.6 Vitamin K

#### 9.6.7 Multivitamin preparations

Vitamins are used for the prevention and treatment of specific deficiency states or where the diet is known to be inadequate; they may be prescribed in the NHS to prevent or treat deficiency but not as dietary supplements.

Their use as general ‘pick-me-ups’ is of unproven value and, in the case of preparations containing vitamin A or D, may actually be harmful if patients take more than the prescribed dose. The ‘fad’ for mega-vitamin therapy with water-soluble vitamins, such as ascorbic acid and pyridoxine, is unscientific and can be harmful.

Dietary reference values for vitamins are available in the Department of Health publication:

**Dental patients** It is unjustifiable to treat stomatitis or glossitis with mixtures of vitamin preparations; this delays diagnosis and correct treatment. Most patients who develop a nutritional deficiency despite an adequate intake of vitamins have malabsorption and if this is suspected the patient should be referred to a medical practitioner.
9 Nutrition and Blood

Deficiency of the B vitamins, other than vitamin B12 (section 9.1.2), is rare in the UK and is usually treated by preparations containing thiamine (B1), riboflavin (B2), and nicotinamide, which is used in preference to nicotinic acid, as it does not cause vasodilatation. Other members (or substances traditionally classified as members) of the vitamin B complex such as aminobenzoic acid, biotin, choline, inositol, and pantothenic acid or panthenol may be included in vitamin B preparations but there is no evidence of their value.

The severe deficiency states Wernicke’s encephalopathy and Korsakoff’s psychosis, especially as seen in chronic alcoholism (section 4.10.1), are best treated initially by the parenteral administration of B vitamins (Pabrinex®), followed by oral administration of thiamine in the longer term. Anaphylaxis has been reported with parenteral B vitamins (see MHRA/CHM advice, below).

As with other vitamins of the B group, pyridoxine (B6) deficiency is rare, but it may occur during isoniazid therapy (section 5.1.9) or penicillamine treatment in Wilson’s disease (section 9.8.1) and is characterised by peripheral neuritis. High doses of pyridoxine are given in some metabolic disorders, such as hyperoxaluria, and it is also used in sideroblastic anaemia (section 9.1.3). There is evidence to suggest that pyridoxine in a dose not exceeding 100 mg daily may provide some benefit in premenstrual syndrome. It has been tried for a wide variety of other disorders, but there is little sound evidence to support the claims of efficacy, and overdosage induces toxic effects.

Nicotinic acid inhibits the synthesis of cholesterol and triglyceride (see section 2.12). Folic acid and vitamin B12 are used in the treatment of megaloblastic anaemia (section 9.1.2). Folic acid (available as calcium folinate) is used in association with cytotoxic therapy (section 8.1).

Breast-feeding severely thiamine-deficient mothers should avoid breast-feeding as toxic methyl-glyoxal present in milk

Dose
• Mild deficiency, by mouth, 25–100 mg daily; severe deficiency, 200–300 mg daily in divided doses

Thiamine (Non-proprietary)
Tablets, thiamine hydrochloride 50 mg, net price 100 = £3.49; 100 mg, 100 = £5.38
Brands include Beneforal®

Pabrinex® (Archimedes) (POM)
I/M High Potency injection, for intramuscular use only, ascorbic acid 500 mg, nicotinamide 160 mg, pyridoxine hydrochloride 50 mg, riboflavin 4 mg, thiamine hydrochloride 250 mg/7 mL. Net price 7 mL (in 2 amps) = £2.25
Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

I/V High Potency injection, for intravenous use only, ascorbic acid 500 mg, anhydrous glucose 1 g, nicotinamide 160 mg, pyridoxine hydrochloride 50 mg, riboflavin 4 mg, thiamine hydrochloride 250 mg/10 mL. Net price 10 mL (in 2 × 5 mL amps) = £2.25
Parenteral vitamins B and C for rapid correction of severe depletion or malabsorption (e.g. in alcoholism, after acute infections, postoperatively, or in psychiatric states), maintenance of vitamins B and C in chronic intermittent haemodialysis

Dose see MHRA/CHM advice above

Treatment of Wernicke’s encephalopathy, by intravenous infusion of I/V High Potency, 2–3 pairs 1 times daily for 2 days; if no response, discontinue; if symptoms respond after 2 days, give by intravenous infusion of I/V High Potency or by deep intramuscular injection into the gluteal muscle of IM High Potency, 1 pair once daily for 5 days or for as long as improvement continues

Prophylaxis of Wernicke’s encephalopathy in alcohol
dependence, by intravenous infusion of I/V High Potency or by deep intramuscular injection into the gluteal muscle of I/M High Potency, 1 pair once daily for at least 3–5 days.

Psychosis following narcosis or electroconvulsive therapy, toxicity from acute infections, by intravenous infusion of I/V High Potency or by deep intramuscular injection into the gluteal muscle of I/M High Potency, 1 pair twice daily for up to 7 days.

Haemodilution, by intravenous infusion of I/V High Potency (in sodium chloride intravenous infusion 0.9%), 1 pair every 2 weeks.

Note: Pybemine® doses in BNF may differ from those in product literature.

### Oral vitamin B complex preparations

Note: Other multivitamin preparations are in section 9.6.7.

### PYRIDOXINE HYDROCHLORIDE (Vitamin B6)

#### Indications

See under Dose.

#### Cautions

Interactions: Appendix 1 (vitamins).

#### Side-effects

Sensory neuropathy reported with high doses given for extended periods.

#### Dose

- Deficiency states, 20–50 mg up to 3 times daily.
- Isoniazid-induced neuropathy, prophylaxis 10 mg daily or 20 mg daily if suitable product not available; treatment, 50 mg three times daily; CHILD under 18 years see BNF for Children.
- Idiopathic sideroblastic anaemia, 100–400 mg daily in divided doses.
- Penicillamine-induced neuropathy, prophylaxis in Wilson’s disease [unlicensed use] (see also notes above), 20 mg daily; CHILD under 18 years see BNF for Children.
- Premenstrual syndrome [unlicensed use], 50–100 mg daily (see notes above).

Prolonged use of pyridoxine in a dose of 10 mg daily is considered safe but the long-term use of pyridoxine in a dose of 200 mg or more daily has been associated with neuropathy. The safety of long-term pyridoxine supplementation with doses above 10 mg daily has not been established.

#### Pyridoxine (Non-proprietary)

Tablets, pyridoxine hydrochloride 10 mg, net price 500 = £8.48; 20 mg, 500 = £8.53; 50 mg, 28 = £3.19.

#### Injections of vitamins B and C

See under Thiamine.

### NICOTINAMIDE

#### Indications

See notes above; acne vulgaris, see section 13.6.1.

#### Injections of vitamins B and C

See under Thiamine.

### Oral vitamin B complex preparations

Note: Other multivitamin preparations are in section 9.6.7.

### Vitamin B Tablets, Compound, Strong

Tablets, brown, f/c or s/c, nicotinamide 20 mg, pyridoxine hydrochloride 2 mg, riboflavin 2 mg, thiamine hydrochloride 5 mg. Net price 28-tab pack = £2.03.

Dose: treatment of vitamin-B deficiency, 1–2 tablets 3 times daily.

### Vigranon B® (Wallace Mfg)

Syrup, thiamine hydrochloride 5 mg, riboflavin 2 mg, nicotinamide 20 mg, pyridoxine hydrochloride 2 mg, panthenol 3 mg/5 mL. Net price 150 mL = £2.41.

### Other compounds

Potassium aminobenzoate has been used in the treatment of various disorders associated with excessive fibrosis such as scleroderma and Peyronie’s disease. In Peyronie’s disease there is some evidence to support efficacy in reducing progression when given early in the disease; however, there is no evidence for reversal of the condition. The therapeutic value of potassium aminobenzoate in scleroderma is doubtful.

Potaba® (Glenwood)

Capsules, potassium aminobenzoate 500 mg, net price 240 = £44.75. Label: 21.

Envelopes® (= powder in sachets), potassium aminobenzoate 3 g, net price 40 sachets = £34.31. Label: 13, 21.

Dose: Peyronie’s disease, scleroderma, 12 g daily in divided doses after food.

### Vitamin C (Ascorbic acid)

Vitamin C therapy is essential in scurvy, but less florid manifestations of vitamin C deficiency are commonly found, especially in the elderly. It is rarely necessary to prescribe more than 100 mg daily except early in the treatment of scurvy.

Severe scurvy causes gingival swelling and bleeding margins as well as petechiae on the skin. This is, however, exceedingly rare and a patient with these signs is more likely to have leukaemia. Investigation should not be delayed by a trial period of vitamin treatment.

Claims that vitamin C ameliorates colds or promotes wound healing have not been proved.

### ASCORBIC ACID

#### Indications

Prevention and treatment of scurvy.

#### Cautions

Interactions: Appendix 1 (vitamins).

#### Dose

- Prophylactic, 25–75 mg daily; therapeutic, not less than 250 mg daily in divided doses.

Ascorbic Acid (Non-proprietary)

Tablets, ascorbic acid 50 mg, net price 28 = £2.11; 100 mg, 28 = £2.39; 200 mg, 28 = £3.10; 500 mg (label: 24), 28 = £4.50.

Brands Include: Redox®

Injection, ascorbic acid 100 mg/mL. Net price 5-mL amp = £4.39.

Available from UCB Pharma.

### Vitamin D

Note: The term Vitamin D is used for a range of compounds which possess the property of preventing or curing rickets.
They include ergocalciferol (calciferol, vitamin D$_2$), colecalciferol (vitamin D$_3$), dihydrotachysterol, alfacalcidol (1α,25-dihydroxycholecalciferol), and calcitriol (1,25-dihydroxycholecalciferol).

Simple vitamin D deficiency can be prevented by taking an oral supplement of only 10 micrograms (400 units) of ergocalciferol (calciferol, vitamin D$_2$) or colecalciferol (vitamin D$_3$) daily. Vitamin D deficiency can occur in people whose exposure to sunlight is limited and in those whose diet is deficient in vitamin D. In these individuals, ergocalciferol or colecalciferol in a dose of 20 micrograms (800 units) daily by mouth may be given to treat vitamin D deficiency; higher doses may be necessary for severe deficiency. Patients who do not respond should be referred to a specialist.

Preparations containing calcium with colecalciferol are available for the management of combined calcium and vitamin D deficiency, or for those at high risk of deficiency (see also Osteoporosis, p. 510 and Calcium Supplements, p. 680).

Vitamin D deficiency caused by intestinal malabsorption or chronic liver disease usually requires vitamin D in pharmacological doses, such as ergocalciferol tablets up to 1 mg (4000 units) daily; the hypocalcaemia of hypoparathyroidism often requires doses of up to 2.5 mg (100 000 units) daily in order to achieve normocalcaemia.

Vitamin D requires hydroxylation by the kidney to its active form, therefore the hydroxylated derivatives alfacalcidol or calcitriol should be prescribed if patients with severe renal impairment require vitamin D therapy. Calcitriol is also licensed for the management of post-menopausal osteoporosis.

Paricalcitol, a synthetic vitamin D analogue, is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure (section 9.5.1.2).

Important. All patients receiving pharmacological doses of vitamin D should have their plasma-calcium concentration checked at intervals (initially once or twice weekly) and whenever nausea or vomiting occurs.

**ERGOCALCIFEROL**
(Calciferol, Vitamin D$_2$)

**Indications** see notes above

**Cautions** take care to ensure correct dose in infants; monitor plasma-calcium concentration in patients receiving high doses and in renal impairment (see notes above); interactions: Appendix 1 (vitamins)

**Contra-indications** hypercalcaemia; metastatic calcification

**Pregnancy** high doses teratogenic in animals but therapeutic doses unlikely to be harmful

**Breast-feeding** caution with high doses; may cause hypercalcemia in infant—monitor serum-calcium concentration

**Side-effects** symptoms of overdosage include anorexia, lassitude, nausea and vomiting, diarrhoea, constipation, weight loss, polyuria, sweating, headache, thirst, vertigo, and raised concentrations of calcium and phosphate in plasma and urine

**Dose**
- See notes above

**Daily supplements**
- There is no plain vitamin D tablet available for treating simple deficiency (see notes above). Alternatives include vitamins capsules (section 9.6.7), preparations of vitamins A and D (section 9.6.1), and calcium and ergocalciferol tablets (see below) (although the calcium and other vitamins in supplements are unnecessary).

For prescribing information on calcium, see section 9.5.1.1

**Calcium and Ergocalciferol (Non-proprietary)**
(Calcium and Vitamin D)

**Tablets**, ergocalciferol 250 micrograms (10 000 units), net price 100 = £21.99; 1.25 mg (50 000 units), 100 = £30.34

**Note** May be difficult to obtain

**Important** When the strength of the tablets ordered or prescribed is not clear, the intention of the prescriber with respect to the strength (expressed in micrograms or milligrams per tablet) should be ascertained.

**Injection**, for intramuscular use only, ergocalciferol, 7.5 mg (300 000 units)/mL in oil, net price 1-mL amp = £9.35, 2-mL amp = £10.84

**Note** Other formulations of ergocalciferol are available from 'special-order' manufacturers or specialist importing companies, see p. 1104

**ALFACALCIDOL**
(1α,25-Dihydroxycholecalciferol)

**Indications** see notes above

**Cautions** see under Ergocalciferol; also nephrolithiasis

**Contra-indications** see under Ergocalciferol

**Pregnancy** see under Ergocalciferol

**Breast-feeding** see under Ergocalciferol

**Side-effects** see under Ergocalciferol; also rarely nephrolithiasis, pruritus, rash, and urticaria

**Dose**
- By mouth or by intravenous injection over 30 seconds, ADULT and CHILD over 20 kg, initially 1 microgram daily (elderly 500 nanograms), adjusted to avoid hypercalcaemia; maintenance, usually 0.25–1 microgram daily; NEONATE and PRETERM NEONATE initially 50–100 nanograms/kg daily, CHILD under 20 kg initially 50 nanograms/kg daily

**Alfacalcidol (Non-proprietary)**

**Capsules**, alfacalcidol 250 nanograms, net price 30-cap pack = £2.62; 500 nanograms 30-cap pack = £5.77; 1 microgram 30-cap pack = £5.89

**One-Alpha® (LEO)**

**Capsules**, alfacalcidol 250 nanograms (white), net price 30-cap pack = £3.37; 500 nanograms (red), 30-cap pack = £6.27; 1 microgram (brown), 30-cap pack = £8.75

**Excipients** include sesame oil

**Oral drops**, sugar-free, alfacalcidol 2 micrograms/mL (1 drop contains approx. 100 nanograms), net price 10 mL = £21.30

**Excipients** include alcohol

**Note** The concentration of alfacalcidol in One-Alpha® drops is 10 times greater than that of the former preparation One-Alpha® solution.
Injection, alfalcacidol 2 micrograms/mL, net price 0.5-mL amp = £2.16, 1-mL amp = £4.11

Excipients include alcohol, propylene glycol (caution in neonates, see Excipients, p. 2)

Note: Shake ampoule for at least 5 seconds before use

CALCITRIOL
(1,25-Dihydroxycholecalciferol)

Indications see notes above

Cautions see under Ergocalciferol; monitor plasma calcium, phosphate, and creatinine during dosage titration

Contra-indications see under Ergocalciferol

Pregnancy see under Ergocalciferol

Breast-feeding see under Ergocalciferol

Side-effects see under Ergocalciferol

Dose
• By mouth, renal osteodystrophy, initially 250 nanograms daily, or on alternate days (in patients with normal or only slightly reduced plasma-calcium concentration), increased if necessary in steps of 250 nanograms at intervals of 2–4 weeks; usual dose 0.5–1 microgram daily; CHILD not established

Established postmenopausal osteoporosis, 250 nanograms twice daily (monitor plasma-calcium concentration and creatinine, consult product literature)

Calcitriol (Non-proprietary) (Takeda)

Capsules, calcitriol 250 nanograms, net price 30-cap pack = £5.41, 100-cap pack = £19.15; 500 nanograms, 30-cap pack = £9.68, 100-cap pack = £25.76

Rocaltril® (Roche) (Roche)

Capsules, calcitriol 250 nanograms (red/white), net price 100 = £18.04; 500 nanograms (red), 100 = £32.25

COLECALCIFEROL
(Cholecalciferol, vitamin D3)

Indications see notes above

Cautions see under Ergocalciferol

Contra-indications see under Ergocalciferol

Pregnancy see under Ergocalciferol

Breast-feeding see under Ergocalciferol

Side-effects see under Ergocalciferol

Dose
• See notes above

Desunin® (Meda) (Meda)

Tablets, colecalciferol 20 micrograms (800 units), net price 30-cap pack = £3.60

Fultiun-D3® (Intensia) (ProStrakan)

Capsules, colecalciferol 20 micrograms (800 units) (blue), net price 30-cap pack = £3.60, 90-cap pack = £10.80; 80 micrograms (3200 units) (green), 30-cap pack = £13.32. Label: 25

Excipients include arachis (peanut) oil

Colecalciferol

Various formulations available from ‘special-order’ manufacturers or specialist importing companies, see p. 1124

With calcium

For prescribing information on calcium, see section 9.5.1.1

Accrete D3® (Intensia)

Tablets, f/c, calcium carbonate 1.5 g (calcium 600 mg or Ca2+ 15 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £2.95

Adcal-D3® (ProStrakan)

Tablets (chewable) (lemon or tutti-frutti flavour), calcium carbonate 1.5 g (calcium 600 mg or Ca2+ 15 mmol), colecalciferol 10 micrograms (400 units), net price 56-tab pack = £3.65, 112-tab pack = £7.49. Label: 24

Dissolve (effervescent tablets), lemon flavour, calcium carbonate 1.5 g (calcium 600 mg or Ca2+ 15 mmol), colecalciferol 10 micrograms (400 units), net price 56-tab pack = £5.99. Label: 13

Capslets (= tablets), f/c, calcium carbonate 750 mg (calcium 300 mg or Ca2+ 7.5 mmol), colecalciferol 5 micrograms (200 units), net price 112-tab pack = £3.65

CalcioD® D3 (Warner Chilcott)

Granules, effervescent, lemon flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca2+ 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £3.58. Label: 24

Calcichew-D3® (Takeda)

Calcichew-D3 Tablets (chewable), orange flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca2+ 12.5 mmol), colecalciferol 5 micrograms (200 units), net price 100-tab pack = £7.68. Label: 24

Excipients include aspartame (section 9.4.1)

Calcichew-D3® Forte Tablets (chewable), lemon flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca2+ 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £4.24, 100-tab pack = £7.08. Label: 24

Excipients include aspartame (section 9.4.1)

Calcichew-D3® 500 mg/400 unit caplets, f/c, lemon flavour, calcium carbonate providing calcium 500 mg (Ca2+ 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 100-tab pack = £7.43

Excipients include propylene glycol, see Excipients, p. 2

Calvolit D3® (Menarini)

Powder, lemon flavour, calcium phosphate 3.1 g (calcium 1.2 g or Ca2+ 30 mmol), colecalciferol 20 micrograms (800 units), net price 30-sachet pack = £4.32. Label: 13, 21

Kalcipos-D® (Meda) (Takeda)

Tablets (chewable), calcium carbonate providing calcium 500 mg (Ca2+ 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £4.21. Label: 24

Natecal D3® (Chiesi)

Tablets (chewable), (aniseed, peppermint, and molasses flavour), calcium carbonate 1.5 g (calcium 600 mg or Ca2+ 15 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £3.63. Label: 24

Excipients include aspartame (section 9.4.1)

With alendronic acid

Section 6.6.2

With risedronate sodium and calcium

Section 6.6.2

DIHYDROTACHYSTEROL

Indications see notes above

Cautions see under Ergocalciferol

Contra-indications see under Ergocalciferol
**9.6.5 Vitamin E**  
(Tocopherols)

The daily requirement of vitamin E has not been well defined but is probably about 3 to 15 mg daily. There is little evidence that oral supplements of vitamin E are necessary in adults, even where there is fat malabsorption or disease, may become deficient.

Vitamin E is necessary for the production of blood clotting factors and proteins necessary for the normal calcification of bone.

Because vitamin K is fat soluble, patients with fat malabsorption, especially in biliary obstruction or hepatic disease, may become deficient. Menadione sodium phosphinate is a water-soluble synthetic vitamin K derivative that can be given orally to prevent vitamin K deficiency in malabsorption syndromes.

Oral coumarin anticoagulants act by interfering with vitamin K metabolism in the hepatic cells and their effects can be antagonised by giving vitamin K. For advice on the use of vitamin K in haemorrhage, see section 2.8.2.

**Vitamin K deficiency bleeding** Neonates are relatively deficient in vitamin K and those who do not receive supplements of vitamin K are at risk of serious bleeding including intracranial bleeding. The Chief Medical Officer and the Chief Nursing Officer have recommended that all newborn babies should receive vitamin
K to prevent vitamin K deficiency bleeding (previously termed haemorrhagic disease of the newborn). An appropriate regimen should be selected after discussion with parents in the antenatal period. Vitamin K (as phytomenadione) 1 mg may be given by a single intramuscular injection at birth; this prevents vitamin K deficiency bleeding in virtually all babies. For preterm neonates, see BNF for Children.

Alternatively, in healthy babies who are not at particular risk of bleeding disorders, vitamin K may be given by mouth, and arrangements must be in place to ensure the appropriate regimen is followed. Two doses of a colloidal (mixed micelle) preparation of phytomenadione 2 mg should be given by mouth in the first week, the first dose being given at birth and the second dose at 4–7 days. For exclusively breast-fed babies, a third dose of colloidal phytomenadione 2 mg is given by mouth at 1 month of age; the third dose is omitted in formula-fed babies because formula feeds contain adequate vitamin K. An alternative regimen is to give one dose of phytomenadione 1 mg by mouth at birth (using the contents of a phytomenadione capsule, see preparation below) to protect from the risk of vitamin K deficiency bleeding in virtually all babies. For healthy babies who are not at particular risk of bleeding disorders, vitamin K may be given by mouth, and arrangements must be in place to ensure the appropriate regimen is followed. Two doses of a colloidal (mixed micelle) preparation of phytomenadione 2 mg should be given by mouth in the first week, the first dose being given at birth and the second dose at 4–7 days. For exclusively breast-fed babies, a third dose of colloidal phytomenadione 2 mg is given by mouth at 1 month of age; the third dose is omitted in formula-fed babies because formula feeds contain adequate vitamin K.

### MENADIOL SODIUM PHOSPHATE

**Indications** see notes above  
**Cautions** G6PD deficiency (section 9.1.5) and vitamin E deficiency (risk of haemolysis); interactions: Appendix 1 (vitamins)  
**Contra-indications** neonates and infants  
**Pregnancy** avoid in late pregnancy and labour unless benefit outweighs risk of neonatal haemolytic anaemia, hyperbilirubinaemia, and kernicterus in neonate

**Dose**  
- 10–40 mg daily, adjusted as necessary; CHILD under 18 years see BNF for Children

**Menadil Phosphate** (Non-proprietary)  
- Tablets, menadil sodium phosphate equivalent to 10 mg of menadil phosphate, net price 100-tab pack = £12.48

### PHYTOMENADIONE

(Vitamin K₃)  
**Indications** see notes above  
**Cautions** intravenous injections should be given very slowly (see also below); interactions: Appendix 1 (vitamins)  
**Pregnancy** use if potential benefit outweighs risk  
**Breast-feeding** present in milk, but see notes above  
**Dose**  
- See notes above and section 2.8.2

**Neokay** (Neocuticals)  
- Capsules, brown, phytomenadione 1 mg in an oily basis, net price 12-cap pack = £3.95; 100-cap pack = £34.00  
**Note** The contents of one capsule should be administered by cutting the narrow tubular tip off and squeezing the liquid contents into the mouth; if the baby spits out the dose or is sick within three hours of administration a replacement dose should be given

### Vitamin and mineral supplements and adjuncts to synthetic diets

**Forcerval** (Alliance)  
- Capsules, brown/red, vitamins (ascorbic acid 60 mg, biotin 100 micrograms, cyanocobalamin 3 micrograms, folic acid 400 micrograms, nicotinamide 18 mg, pantothenic acid 4 mg, pyridoxine 2 mg, riboflavin 1.6 mg, thiamine 1.2 mg, vitamin A 2500 units, vitamin D 2500 units, vitamin D 300 units, net price 28-cap pack = £1.50  
**Abidec** (Chefaro UK)  
- Drops, vitamins A, B group, C, and D, net price 25 mL (with dropper) = £3.33  
**Dalivit** (LPC)  
- Oral drops, vitamins A, B group, C, and D, net price 25 mL = £3.28, 50 mL = £5.58  
**Ketovite** (Essential)  
- Tablets, yellow, ascorbic acid 16.6 mg, riboflavin 1 mg, thiamine hydrochloride 1 mg, pyridoxine hydrochloride 330 micrograms, nicotinamide 3.3 mg, calcium pantothenate 1.16 mg, alpha tocopheryl acetate 5 mg, inositol 50 mg, biotin 170 micrograms, folic acid 250 micrograms, acetylaminophenone 500 micrograms, net price 100-tab pack = £9.21  
**Dose** prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism and adjunct in restricted, specialised, or synthetic diets, 1 tablet 3 times daily, use with Ketovite® Liquid for complete vitamin supplementation
Nutrition and blood maximal effect. be co-administered for 2–3 weeks until zinc produces its action. When transferring from chelating treatment to with a chelating agent because zinc has a slow onset of disease. Symptomatic patients should be treated initially prevents the absorption of copper in Wilson’s erythematosus may not resolve on transfer to trientine. Cystinuria. Penicillamine-induced systemic lupus alternative to penicillamine for rheumatoid arthritis or not only in patients intolerant of penicillamine; it is used for the treatment of Wilson’s disease (hepatolenticular degeneration) to aid the elimination of copper ions. See below for other indications. Trientine is used for the treatment of Wilson’s disease only in patients intolerant of penicillamine; it is not an alternative to penicillamine for rheumatoid arthritis or cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine. Zinc prevents the absorption of copper in Wilson’s disease. Symptomatic patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

**PENICILLAMINE**

**Indications** see under Dose below

**Cautions** section 10.1.3; also neurological involvement in Wilson’s disease

**Contra-indications** section 10.1.3

**Renal impairment** section 10.1.3

**Pregnancy** section 10.1.3

**Breast-feeding** section 10.1.3

**Side-effects** section 10.1.3; also neuropathy (especially if previous neurological involvement in Wilson’s disease—prophylactic pyridoxine recommended, see section 9.8.2)

**Dose**

- Wilson’s disease, 1.5–2 g daily in divided doses before food; max. 2 g daily for 1 year; maintenance 0.75–1 g daily; **ELDERLY** 20 mg/kg daily in divided doses, adjusted according to response; **CHILD** see BNF for Children • Autoimmune hepatitis (used rarely; after disease controlled with corticosteroids), initially 500 mg daily in divided doses increased slowly over 3 months; usual maintenance dose 1.25 g daily; **ELDERLY** not recommended • Cystinuria, therapeutic, 1–3 g daily in divided doses before food, adjusted to maintain urinary cystine below 200 mg/litre; prophylactic (maintain urinary cystine below 300 mg/litre) 0.5–1 g at bedtime; maintain adequate fluid intake (at least 3 litres daily); **ELDERLY** minimum dose to maintain urinary cystine below 200 mg/litre; **CHILD** see BNF for Children • Severe active rheumatoid arthritis, section 10.1.3

**Preparations** Section 10.1.3

**TRIENTINE DIHYDROCHLORIDE**

**Indications** Wilson’s disease in patients intolerant of penicillamine

**Cautions** see notes above; **interactions**: Appendix 1 (trientine)

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk; monitor maternal and neonatal serum-copper concentration; teratogenic in animal studies

**Side-effects** nausea, rash; very rarely anaemia; denuitenis and colitis also reported

**Dose**

- **ADULT** and **CHILD** over 12 years, 1.2–2.4 g daily in 2–4 divided doses before food; **CHILD** 2–12 years, initially 0.6–1.5 g daily in 2–4 divided doses before food, adjusted according to response

**Trientine Dihydrochloride** (Univar)

Capsules, trientine dihydrochloride 300 mg. Label: 6, 22

**ZINC ACETATE**

**Indications** Wilson’s disease (initiated under specialist supervision)

**Cautions** portal hypertension (risk of hepatic decompensation when switching from chelating agent); monitor full blood count and serum cholesterol; **interactions**: Appendix 1 (zinc)

**Pregnancy** reduce dose to 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion

**Breast-feeding** manufacturer advises avoid; present in milk—may cause zinc-induced copper deficiency in infant

**Side-effects** gastric irritation (usually transient; may be reduced if first dose taken mid-morning or with a little protein); less commonly sideroblastic anaemia and leucopenia

**Dose**

- **Note** Dose expressed as elemental zinc

- Wilson’s disease, 50 mg 3 times daily (max. 50 mg 5 times daily), adjusted according to response; **CHILD** 1–6 years, 25 mg twice daily; 6–16 years, body-weight under 57 kg, 25 mg 3 times daily, body-weight over 57 kg, 50 mg 3 times daily; **ADOLESCENT** 16–18 years, 50 mg 3 times daily

**Wilzin** (Orphan Europe)

Capsules, zinc (as acetate) 25 mg (blue), net price 250-cap pack = £132.00; 50 mg (orange), 250-cap pack = £242.00. Label: 23
**Carnitine deficiency**

Levocarnitine is available for the management of primary carnitine deficiency due to inborn errors of metabolism or of secondary deficiency in haemodialysis patients.

### LEVOCARNITINE

(Carnitine)

**Indications** primary and secondary carnitine deficiency

**Cautions** diabetes mellitus; monitoring of free and acyl carnitine in blood and urine recommended

**Renal impairment** accumulation of metabolites may occur with chronic oral administration in severe impairment

**Pregnancy** appropriate to use; no evidence of teratogenicity in animal studies

**Side-effects** nausea, vomiting, abdominal pain, diarrhoea, body odour; side-effects may be dose-related—monitor tolerance during first week and after any dose increase

**Dose**

- Primary deficiency, by mouth, up to 200 mg/kg daily in 2–4 divided doses; usual max. 3 g daily; by intravenous injection over 2–3 minutes, up to 100 mg/kg daily in 2–4 divided doses
- Secondary deficiency, by intravenous injection over 2–3 minutes, 20 mg/kg after each dialysis session (dosage adjusted according to plasma-carnitine concentration); maintenance (if benefit gained from first intravenous course), by mouth, 1 g daily

Levocarnitine (Non-proprietary)  

**Paediatric oral solution**, levocarnitine 300 mg/mL (30%), net price 20 mL = £55.55

**Carnitor** (Sigma-Tau)  

**Tablets**, levocarnitine 330 mg, net price 90-tab pack = £103.95

**Chewable tablets**, levocarnitine 1 g, net price 10-tab pack = £35.00

**Oral liquid**, levocarnitine 100 mg/mL (10%), net price 10 × 10-mL (1-g) single-dose bottle = £35.00

**Injection**, levocarnitine 200 mg/mL, net price 5-mL amp = £11.90

**Fabry’s disease**

Agalsidase alfa and agalsidase beta, enzymes produced by recombinant DNA technology, are licensed for long-term enzyme replacement therapy in Fabry’s disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

### AGALSIDASE ALFA AND BETA

**Indications** Fabry’s disease (specialist use only)

**Cautions** interactions: Appendix 1 (agalsidase alfa and beta)

**Infusion-related reactions** Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature

**Pregnancy** use with caution

**Breast-feeding** use with caution—no information available

**Side-effects** gastro-intestinal disturbances, taste disturbances; tachycardia, bradycardia, palpitation, hypertension, hypotension, chest pain, oedema, flushing, dyspnoea, cough, rhinorrhea; headache, fatigue, dizziness, asthenia, paraesthesia, syncope, neuropathic pain, tremor, sleep disturbances; influenza-like symptoms, nasopharyngitis; muscle spasms, myalgia, arthralgia; eye irritation; tinnitus; hyper-sensitivity reactions, angioedema, pruritis, urticaria, rash, acne; less commonly cold extremities, parosmia, ear pain and swelling, skin discoloration, and injection-site reactions

Fabrazyme® (Genzyme)  

**Intravenous infusion**, powder for reconstitution, agalsidase beta, net price 5-mg vial = £315.08; 35-mg vial = £2196.59

**Dose**  

- **By intravenous infusion**, ADULT and CHILD over 8 years 1 mg/kg every 2 weeks

Replagal® (Shire HGT)  

**Concentrate for intravenous infusion**, agalsidase alfa 1 mg/mL, net price 3.5-mL vial = £1088.64

**Dose**  

- **By intravenous infusion**, ADULT and CHILD over 7 years 200 micrograms/kg every 2 weeks

**Gaucher’s disease**

Imiglucerase, an enzyme produced by recombinant DNA technology, is administered as enzyme replacement therapy for non-neurological manifestations of type 1 or type III Gaucher’s disease, a familial disorder affecting principally the liver, spleen, bone marrow, and lymph nodes.

Velaglucerase alfa, an enzyme produced by recombinant DNA technology, is administered as enzyme replacement therapy for the treatment of type 1 Gaucher’s disease.

Miglustat, an inhibitor of glucosylceramide synthase, is licensed for the treatment of mild to moderate type 1 Gaucher’s disease in patients for whom enzyme replacement therapy is unsuitable; it is given by mouth; see p. 698.

**IMIGLUCERASE**

**Indications** (specialist use only) non-neurological manifestations of type 1 or type III Gaucher’s disease

**Cautions** monitor immunoglobulin G (IgG) antibody concentration; when stabilised, monitor all parameters and response to treatment at intervals of 6–12 months

**Pregnancy** manufacturer advises use with caution—limited information available

**Breast-feeding** no information available

**Side-effects** hypersensitivity reactions (including urticaria, angioedema, cyanosis, hypotension, flushing, tachycardia, paraesthesia, backache); less commonly nausea, vomiting, diarrhoea, abdominal cramps, headache, dizziness, fatigue, fever, arthralgia, and injection-site reactions

**Dose**

- **By intravenous infusion**, initially 60 units/kg once every 2 weeks (doses as low as 15 units/kg once every 2 weeks may improve haematological parameters and organomegaly); maintenance, adjust dose according to response; CHILD under 18 years see BNF for Children
**Cerezyme® (Genzyme)**

_Intravenous infusion_, powder for reconstitution, imiglucerase, net price 200-unit vial = £535.65; 400-unit vial = £1071.29

_Electrolytes_ Na⁺ 0.62 mmol/200-unit vial, 1.24 mmol/400-unit vial

**VELAGLUCERASE ALFA**

**Indications** (specialist use only) type I Gaucher’s disease

**Cautions** monitor immunoglobulin G (IgG) antibody concentration in severe infusion-related reactions or if there is a lack or loss of effect with velaglucerase alfa

**Infusion-related reactions** Infusion-related reactions very common; manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature

**Pregnancy** manufacturer advises use with caution—limited information available

**Breast-feeding** manufacturer advises use with caution—limited information available

**Side-effects** nausea, abdominal pain, tachycardia, hypertension, hypotension, flushing, headache, dizziness, malaise, pyrexia, arthralgia, bone pain, back pain, hypersensitivity reactions, rash, urticaria

**Dose**

- By _intravenous infusion_, 60 units/kg once every 2 weeks; adjusted according to response to 15–60 units/kg once every 2 weeks; _CHILD_ under 18 years see BNF for Children

**VPRIV® (Shire HGT)** ▼ _Full_

_Intravenous infusion_, powder for reconstitution, velaglucerase alfa, net price 400-unit vial = £1410.20

_Electrolytes_ Na⁺ 0.53 mmol/400-unit vial

**IDURSULFASE**

**Indications** (specialist use only) mucopolysaccharidosis II

**Cautions** severe respiratory disease; acute febrile respiratory illness (consider delaying treatment)

**Infusion-related reactions** See notes above

**Contra-indications** women of child-bearing potential

**Pregnancy** manufacturer advises avoid

**Breast-feeding** manufacturer advises avoid—present in milk in _animal_ studies

**Side-effects** gastro-intestinal disturbances, swollen tongue; arrhythmia, tachycardia, chest pain, cyanosis, peripheral oedema, hypertension, hypotension, flushing; bronchospasm, hypoxia, cough, wheezing, tachypnoea, dyspnoea; headache, dizziness, tremor, pyrexia; arthralgia; facial oedema, urticaria, pruritus, rash, infusion-site swelling, erythema; pulmonary embolism and anaphylaxis also reported

**Dose**

- By _intravenous infusion_, _ADULT_ and _CHILD_ over 5 years, 1 mg/kg once weekly

**Elaprase® (Shire HGT)** ▼ _Full_

_Concentrate for intravenous infusion_, idursulfase 2 mg/mL, net price 3-mL vial = £1985.00

**LARONIDASE**

**Indications** (specialist use only) non-neurological manifestations of mucopolysaccharidosis I

**Cautions** monitor immunoglobulin G (IgG) antibody concentration; _interactions:_ Appendix 1 (laronidase)

**Infusion-related reactions** See notes above

**Pregnancy** manufacturer advises avoid unless essential—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain; cold extremities, pallor, flushing, tachycardia, blood pressure changes; dyspnoea, cough, angio-oedema, anaphylaxis; headache, paraesthesia, dizziness, fatigue, restlessless; influenza-like symptoms; musculoskeletal pain, pain in extremities; rash, pruritus, urticaria, alopecia, infusion-site reactions; bronchospasm and respiratory arrest also reported

**Dose**

- By _intravenous infusion_, 100 units/kg once weekly; _CHILD_ see BNF for Children

**Mucopolysaccharidosis**

**Laronidase**, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in the treatment of non-neurological manifestations of mucopolysaccharidosis I, a lysosomal storage disorder caused by deficiency of alpha-L-iduronidase.

**Idursulfase**, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder caused by deficiency of alpha-L-iduronidase.

**Galsulfase**, a recombinant form of human N-acetylgalactosamine-4-sulfate, is licensed for long-term replacement therapy in mucopolysaccharidosis VI (Maroteaux-Lamy syndrome).

**Infusion-related reactions** Infusion-related reactions often occur with administration of laronidase, idursulfase, and galsulfase; they can be managed by pre-treatment with an anti-histamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

**GALSULFASE**

**Indications** (specialist use only) mucopolysaccharidosis VI

**Cautions** respiratory disease; acute febrile or respiratory illness (consider delaying treatment)

**Infusion-related reactions** See notes above

**Pregnancy** manufacturer advises avoid unless essential

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** abdominal pain, umbilical hernia, gastroenteritis; chest pain, hypertension; dyspnoea, apnoea, nasal congestion; rigors, malaise, arreflexia; pharyngitis, conjunctivitis, corneal opacity; ear pain; facial oedema

**Dose**

- By _intravenous infusion_, _ADULT_ and _CHILD_ over 5 years, 1 mg/kg once weekly

**Naglazyme® (BioMarin)** ▼ _Full_

_Concentrate for intravenous infusion_, galsulfase 1 mg/mL, net price 5-mL vial = £982.00

**Appendix 1 (laronidase)**
Aldurazyme® (Genzyme) [POM]
Concentrate for intravenous infusion, laronidase
100 units/mL, net price 5-mL vial = £444.70
Electrolytes Na+ 1.29 mmol/5-mL vial

Nephropathic cystinosis
Mercaptamine is available for the treatment of nephropathic cystinosis.

**MERCAPTAMINE**
(Cysteamine)

**Indications** (specialist use only) nephropathic cystinosis

**Cautions** leucocyte-cystine concentration and haematological monitoring required—consult product literature; dose of phosphate supplement may need to be adjusted if transferring from phosphocysteamine to mercaptamine

**Contra-indications** hypersensitivity to penicillamine

**Pregnancy** avoid—teratogenic and toxic in animal studies

**Breast-feeding** avoid

**Side-effects** breath and body odour, nausea, vomiting, diarrhoea; flushing, malaise, fever, rash; less commonly gastro-intestinal ulcer, seizures, hallucinations, drowsiness, nervousness, leucopenia, nephrotic syndrome

**Dose**
- Initial doses should be one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks
- Maintenance, ADULT and CHILD over 50 kg body-weight, 2 g daily in 4 divided doses
- CHILD up to 12 years, 1.3 g/m² (approx. 50 mg/kg) daily in 4 divided doses

**Cystagon**® (Orphan Europe) [POM]
Capsules, mercaptamine (as bitartrate) 50 mg, net price 100-cap pack = £70.00; 150 mg, 100-cap pack = £110.00. Label: 21

**Note** CHILD under 6 years at risk of aspiration, capsules can be opened and contents sprinkled on food (at a temperature suitable for eating); avoid adding to acidic drinks (e.g. orange juice)

**Pompe disease**
Alglucosidase alfa, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.

**ALGLUCOSIDASE ALFA**

**Indications** (specialist use only) Pompe disease

**Cautions** cardiac and respiratory dysfunction—monitor closely; monitor immunoglobulin G (IgG) antibody concentration

**Infusion-related reactions** Infusion-related reactions very common, calling for use of antihistamine, antipyretic, or corticosteroid, consult product literature for details

**Pregnancy** toxicity in animal studies, but treatment should not be withheld

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** nausea, vomiting, diarrhoea; flushing, tachycardia, blood pressure changes, cold extremities, cyanosis, facial oedema, chest discomfort; cough, tachypnoea, bronchospasm; headache, agitation, tremor, irritability, restlessness, paraesthesia, dizziness, fatigue; pyrexia; antibody formation; myalgia, muscle spasm; sweating, rash, pruritus, urticaria, injection-site reactions; hypersensitivity reactions (including anaphylaxis); severe skin reactions (including ulcerative and necrotising skin lesions) also reported

**Dose**
- By intravenous infusion, ADULT and CHILD 20 mg/kg every 2 weeks

**Myozyme® (Genzyme) [POM]**
Intravenous infusion, powder for reconstitution, alglucosidase alfa, net price 50-mg vial = £356.06

**Tyrosinaemia type I**
Nitisinone is licensed for the treatment of hereditary tyrosinaemia type I in combination with dietary restriction of tyrosine and phenylalanine.

**NITISINONE**
(NTBC)

**Indications** hereditary tyrosinaemia type I (specialist use only)

**Cautions** slit-lamp examination of eyes recommended before treatment; monitor liver function regularly; monitor platelet and white blood cell count every 6 months

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies

**Breast-feeding** manufacturer advises avoid—adverse effects in animal studies

**Side-effects** thrombocytopenia, leucopenia, granulocytopenia; conjunctivitis, photophobia, corneal opacity, keratitis, eye pain; less commonly leucocytosis, blepharitis, pruritus, exfoliative dermatitis, and erythematous rash

**Dose**
- ADULT and CHILD initially 500 micrograms/kg twice daily, adjusted according to response; max. 2 mg/kg daily
- **Note** Capsules can be opened and the contents suspended in a small amount of water or formula milk and taken immediately

**Orfadin® (Swedish Orphan) [POM]**
Capsules, nitisinone 2 mg, net price 60-cap pack = £564.00; 5 mg, 60-cap pack = £1127.00; 10 mg, 60-cap pack = £2062.00

**Urea cycle disorders**
Sodium phenylbutyrate is used in the management of urea cycle disorders. It is indicated as adjunctive therapy in all patients with neonatal-onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy.

Carglumic acid is licensed for the treatment of hyperammonaemia due to N-acetylglutamate synthase deficiency and organic acidemia.

**Emergency management**
For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdgd.org.uk.
**Homocystinuria**

Betaine is licensed for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylenetetrahydrofolate reductase, or cobalamin cofactor metabolism.

Betaine should be used in conjunction with dietary restrictions and may be given with supplements of Vitamin B₁₂, pyridoxine, and folate under specialist advice.

*The Scottish Medicines Consortium (p. 4)* has advised (July 2010) that betaine anhydrous (*Cystadane®*) is accepted for restricted use within NHS Scotland for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylenetetrahydrofolate reductase, or cobalamin cofactor metabolism in patients who are not responsive to pyridoxine treatment.

**BETaine**

**Indications** (specialist use only) adjunctive treatment of homocystinuria

**Cautions** monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur

**Pregnancy** manufacturer advises avoid unless essential—limited information available

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** less commonly gastro-intestinal disorders, anorexia, reversible cerebral oedema (see Cautions), agitation, depression, personality disorder, sleep disturbances, urinary incontinence, alopecia, and urticaria

**Dose**

- **ADULT** and **CHILD over 10 years**, 3 g twice daily, adjusted according to response; max. 20 g/day; **CHILD under 10 years** 50 mg/kg twice daily; dose and frequency adjusted according to response; max. 75 mg/kg twice daily

**Cystadane® (Orphan Europe)**

**Powder** betaine (anhydrous), net price 180 g = £347.00

**Note** Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of powder

**Other metabolic disorders**

Miglustat is available for the treatment of progressive neurological manifestations of Niemann-Pick type C disease, a neurodegenerative disorder characterised by impaired intracellular lipid trafficking; it is also licensed for the treatment of mild to moderate type 1 Gaucher’s disease for whom imiglucerase is unsuitable, see also p. 695.

**MIGLUSTAT**

**Indications** mild to moderate type 1 Gaucher’s disease (specialist supervision only); Niemann-Pick type C disease (specialist supervision only)

**Cautions** monitor cognitive and neurological function; monitor growth and platelet count in Niemann-Pick type C disease

**Hepatic impairment** no information available—manufacturer advises caution

---

**CARGLUMIC ACID**

**Indications** hyperammonaemia due to *N*-acetylaspartate synthase deficiency and organic acidosis

**Under specialist supervision**; see also notes above

**Pregnancy** manufacturer advises avoid unless essential—no information available

**Breast-feeding** manufacturer advises avoid—present in milk in *animal* studies

**Side-effects** sweating; *less commonly* diarrhoea, vomiting, bradycardia, pyrexia

**Dose**

- **ADULT** and **CHILD initially** 100–250 mg/kg daily in 2–4 divided doses immediately before food, adjusted according to plasma-ammonia concentration; maintenance 10–100 mg/kg daily in 2–4 divided doses

- **Hyperammonaemia due to organic acidemia**, **ADULT** and **CHILD initially** 100–250 mg/kg daily in 2–4 divided doses immediately before food, adjusted according to plasma-ammonia concentration

**Carbaglu® (Orphan Europe)**

**Dispersible tablets**, carbgumic acid 200 mg, net price 5-tab pack = £299.00, 60-tab pack = £3499.00.

**Label:** 13

**Note** Must be dispersed in at least 5–10 mL of water and taken orally immediately, or administered via a nasogastric tube

---

**SODIUM PHENYLButYRATE**

**Indications** adjunct in long-term treatment of urea cycle disorders (under specialist supervision); see also notes above

**Cautions** congestive heart failure; **interactions**: Appendix 1, (sodium phenylbutyrate)

**Hepatic impairment** manufacturer advises caution

**Renal impairment** manufacturer advises caution

**Pregnancy** avoid—*toxicity in animal* studies; manufacturer advises adequate contraception during administration

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** *gastro-intestinal disturbances*, weight gain, *taste disturbance*, decreased appetite; *syncope*, *oedema*; headache, depression, irritability; renal tubular acidosis, menstrual disorders; *gastrointestinal disorders*, metabolic acidosis, alopecia, rash, body odour; *less commonly* rectal bleeding, peptic ulcer, pancreatitis, and arrhythmias

**Dose**

- **ADULT** 9.9–13 g/m² daily in divided doses with meals (max. 20 g daily); **CHILD** see *BNF for Children*

**Ammonaps® (Swedish Orphan)**

**Tablets**, sodium phenylbutyrate 500 mg. Contains Na⁺ 2.7 mmol/tablet. Net price 250-tab pack = £493.00

**Granules**, sodium phenylbutyrate 940 mg/g. Contains Na⁺ 5.4 mmol/g of sodium phenylbutyrate. Net price 266-g pack = £860.00

**Note** Granules should be mixed with food before taking

**Pheburane® (Lucane)**

**Granules**, sodium phenylbutyrate 483 mg/g. Contains Na⁺ 5.4 mmol/g of sodium phenylbutyrate, net price 174-g pack = £331.00

**Note** Granules should be mixed with food before taking orally and must not be administered by nasogastric or gastrostomy tubes

---

**Nutrition and Blood**

**9.8.1 Drugs used in metabolic disorders**

**BNF 68**
9.8.2 Acute porphyrias

**The acute porphyrias** (acute intermittent porphyria, variegate porphyria, hereditary coproporphyria, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 10,000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyrinogenic crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs.

Treatment of serious or life-threatening conditions should not be withheld from patients with acute porphyria. When there is no safe alternative, treatment should be started and urinary porphobilinogen excretion should be measured regularly; if it increases or symptoms occur, the drug can be withdrawn and the acute attack treated. If an acute attack of porphyria occurs during pregnancy, contact an expert porphyria service for further advice.

**Haem arginate** is administered by short intravenous infusion as haem replacement in moderate, severe, or unrelenting acute porphyria crises.

The National Acute Porphyria Service (NAPS) provides clinical support and treatment with haem arginate from three centres (University Hospital of Wales, Addenbrooke’s Hospital, and King’s College Hospital). To access the service telephone (029) 2074 7747 and ask for the Acute Porphyria Service.

---

**HAEM ARGINATE**

(Human hemin)

**Indications**

acute porphyrias (acute intermittent porphyria, porphyria variegate, hereditary coproporphyria)

**Pregnancy**

manufacturer advises avoid unless essential

**Breast-feeding**

manufacturer advises avoid unless essential—no information available

**Side-effects**

pain and thrombophlebitis at injection site; rarely hypersensitivity reactions and fever; also reported headache

**Dose**

- By intravenous infusion, ADULT and CHILD 3 mg/kg once daily (max. 250 mg daily) for 4 days; if response inadequate, repeat 4-day course with close biochemical monitoring

**Normosang**

Orphan Europe

Concentrate for intravenous infusion, haem arginate 25 mg/mL, net price 10-mL amp = £434.25

---

**Drugs unsafe for use in acute porphyrias**

The following list contains drugs on the UK market that have been classified as ‘unsafe’ in porphyria because they have been shown to be porphyrinogenic in animals or *in vitro*, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available.

An up-to-date list of drugs considered safe in acute porphyrias is available at [www.wmic.wales.nhs.uk/porphyria_info.php](http://www.wmic.wales.nhs.uk/porphyria_info.php)

Further information may be obtained from:

www.porphyria-europe.org

and also from:

Welsh Medicines Information Centre
University Hospital of Wales
Cardiff, CF14 4XW
Tel: (029) 2074 2979/3877

**Note**

Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

</table>

1. Contact Welsh Medicines Information Centre for further advice.
2. Includes tricyclic (and related) antidepressants and MAOIs, fluoxetine, duloxetine, venlafaxine, and trazodone thought to be safe.
3. Alimemazine, chlorphenamine, desloratadine, fexofenadine, ketotifen, loratadine, and promethazine thought to be safe.
4. Includes primidone and thiopental.
5. Amiodarone, felifopine, and ifeofidine thought to be safe.
6. Progestogent is more porphyrogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogents should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in women who have had a previous attack or are aged under 30 years. Long-acting progestogen preparations should never be used in those at risk of acute porphyria.
7. Includes ergometrine (oxytocin probably safe) and pergolide.
8. Applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure.
9. Includes co-trimoxazole and sulfasalazine.
10. Glipizide and glimepiride are thought to be safe.
11. Although evidence of hazard is uncertain, manufacturer advises avoid.
12. Small amounts in medicines probably safe.
13. Safety uncertain, contact Welsh Medicines Information Centre for further advice.
14. May be used with caution if safer alternative not available.
10 Musculoskeletal and joint diseases

10.1 Drugs used in rheumatic diseases and gout

10.1.1 Non-steroidal anti-inflammatory drugs

10.1.2 Corticosteroids

10.1.2.1 Systemic corticosteroids

10.1.2.2 Local corticosteroid injections

10.1.3 Drugs that suppress the rheumatic disease process

10.1.4 Gout and cytotoxic-induced hyperuricaemia

10.1.5 Other drugs for rheumatic diseases

10.2 Drugs used in neuromuscular disorders

10.2.1 Drugs that enhance neuromuscular transmission

10.2.2 Skeletal muscle relaxants

10.3 Drugs for the treatment of soft-tissue disorders and topical pain relief

10.3.1 Enzymes

10.3.2 Rubefacients, topical NSAIDs, capsaicin, and poultices

Rheumatoid arthritis and other inflammatory disorders

A non-steroidal anti-inflammatory drug (NSAID) is indicated for pain and stiffness resulting from inflammatory rheumatic disease; analgesics such as paracetamol or codeine can also be used. For advice on the prophylaxis and treatment of NSAID-associated gastrointestinal ulcers, see p. 51.

Drugs are also used to influence the rheumatic disease process itself (section 10.1.3). For rheumatoid arthritis these disease-modifying antirheumatic drugs (DMARDs) include methotrexate, cytokine modulators, azathioprine, ciclosporin, cyclophosphamide, leflunomide, penicillamine, gold, antimalarials (chloroquine and hydroxychloroquine), and sulfasalazine. Corticosteroids also have a significant role in the management of rheumatoid arthritis (section 10.1.2.1).

Drugs which may affect the disease process in psoriatic arthritis include sulfasalazine, gold, azathioprine, methotrexate, leflunomide, and cytokine modulators (section 10.1.3).

For long-term control of gout, xanthine-oxidase inhibitors or uricosuric drugs (section 10.1.4) can be used.

Osteoarthritis and soft-tissue disorders

For pain relief in osteoarthritis and soft-tissue disorders, paracetamol (section 4.7.1) should be used first and may need to be taken regularly. A topical NSAID (section 10.3.2) or topical capsaicin 0.025% (section 10.3.2) should also be considered, particularly in knee or hand osteoarthritis. An oral NSAID (section 10.1.1) can be substituted for, or used in addition to, paracetamol. If further pain relief is required in osteoarthritis, then the addition of an opioid analgesic (section 4.7.2) may be considered, but with a substantial risk of adverse effects; however, an opioid analgesic should be considered...
**10.1.1 Non-steroidal anti-inflammatory drugs**

In **single doses** non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of paracetamol (section 4.7.1), but paracetamol is preferred, particularly in the elderly (see also Prescribing for the Elderly, p. 25).

In regular **full dosage** NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation. Therefore, although paracetamol often gives adequate pain control in osteoarthritis, NSAIDs are more appropriate than paracetamol or the opioid analgesics for the relief of pain and optimisation of recovery following ankle sprain, and for the relief of chronic pain and disability associated with tennis elbow.

**Choice** Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance to these drugs. About 10% of patients will respond to any NSAID; of the others, those who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect should normally be obtained within a week, whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. If appropriate responses are not obtained within these times, another NSAID should be tried.

NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 is associated with less gastro-intestinal intolerance. Several other factors also influence susceptibility to gastro-intestinal effects, and a NSAID should be chosen on the basis of the incidence of gastro-intestinal and other side-effects.

Ibuprofen is a propionic acid derivative with anti-inflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other non-selective NSAIDs but its anti-inflammatory properties are weaker. Doses of 1.6 to 2.4 g daily are needed for rheumatoid arthritis and it is unsuitable for conditions where inflammation is prominent, such as acute gout. Dextibuprofen is the active enantiomer of ibuprofen. It has similar properties to ibuprofen and is licensed for the relief of mild to moderate pain and inflammation.

Other propionic acid derivatives:

**Naproxen** is one of the first choices because it combines good efficacy with a low incidence of side-effects (but more than ibuprofen, see NSAIDs and Gastro-intestinal Events, below).

**Fenoprofen** is as effective as naproxen, and flurbiprofen may be slightly more effective. Both are associated with slightly more gastro-intestinal side-effects than ibuprofen.

**Ketoprofen** has anti-inflammatory properties similar to ibuprofen and has more side-effects (see also NSAIDs and Gastro-Intestinal Events, below).

**Dextibuprofen**, an isomer of ketoprofen, has been introduced for the short-term relief of mild to moderate pain.

**Tiaprofenic acid** is as effective as naproxen; it has more side-effects than ibuprofen (important: reports of severe cystitis, see CSM advice on p. 712).

Drugs with properties similar to those of propionic acid derivatives:

**Diclofenac** and aceclofenac are similar in efficacy to naproxen.

**Etodolac** is comparable in efficacy to naproxen; it is licensed for symptomatic relief of osteoarthritis and rheumatoid arthritis.

**Indomethacin** has an action equal to or superior to that of naproxen, but with a high incidence of side-effects including headache, dizziness, and gastro-intestinal disturbances (see also NSAIDs and Gastro-Intestinal Events, below).

**Mefenamic acid** has minor anti-inflammatory properties. It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment.

**Meloxicam** is licensed for the short-term relief of pain in osteoarthritis and for long-term treatment of rheumatoid arthritis and ankylosing spondylitis.

**Nabumetone** is comparable in effect to naproxen.

**Phenylbutazone** is licensed for ankylosing spondylitis, but is not recommended because it is associated with serious side-effects, in particular haematological reactions; it should be used only by a specialist in severe cases where other treatments have been found unsuitable.

**Piroxicam** is as effective as naproxen and has a long duration of action which permits once-daily administration. However, it has more gastro-intestinal side-effects than most other NSAIDs, and is associated with more frequent serious skin reactions (important: see CHMP advice, p. 711).
Sulindac is similar in tolerance to naproxen.

Tenoxicam is similar in activity and tolerance to naproxen. Its long duration of action allows once-daily administration.

Tolfoxamic acid is licensed for the treatment of migraine (section 4.7.4.1).

Ketorolac and the selective inhibitor of cyclo-oxygenase-2, parecoxib, are licensed for the short-term management of postoperative pain (section 15.1.4.2).

The selective inhibitors of cyclo-oxygenase-2, etoricoxib and celecoxib, are as effective as non-selective NSAIDs such as diclofenac and naproxen. Although selective inhibitors can cause serious gastro-intestinal events, available evidence appears to indicate that the risk of serious upper gastro-intestinal events is lower with selective inhibitors compared to non-selective NSAIDs; this advantage may be lost in patients who require concomitant low-dose aspirin.

Celecoxib and etoricoxib are licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; etoricoxib is also licensed for the relief of pain from acute gout.

**Dental and orofacial pain** Most mild to moderate dental pain and inflammation is effectively relieved by NSAIDs. Those used for dental pain include ibuprofen and diclofenac.

For information on the risks of serious gastro-intestinal side-effects of NSAIDs, see p. 704.

For further information on the management of dental and orofacial pain, see p. 274.

**Cautions and contra-indications** NSAIDs should be used with caution in the elderly (risk of serious side-effects and fatalities, see also Prescribing for the Elderly p. 25), in allergic disorders (they are contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID), and in coagulation defects. Long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment. Caution is also required in patients with connective-tissue disorders, see Side-effects below.

In patients with cardiac impairment, caution is required since NSAIDs may impair renal function (see also Side-effects, below). All NSAIDs are contra-indicated in severe heart failure. Diclofenac and the selective inhibitors of cyclo-oxygenase-2 (celecoxib, etoricoxib, and parecoxib) are contra-indicated in ischaemic heart disease, cerebrovascular disease, peripheral arterial disease, and mild to severe heart failure. They should be used with caution in patients with a history of cardiac failure, left ventricular dysfunction, hypertension, in patients with oedema for any other reason, and in patients with other risk factors for cardiovascular events. Other non-selective NSAIDs should be used with caution in uncontrolled hypertension, heart failure, ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, and when used long term in patients with risk factors for cardiovascular events.

**NPSIDs and cardiovascular events** All NSAID use (including cyclo-oxygenase-2 selective inhibitors) can, to varying degrees, be associated with a small increased risk of thrombotic events (e.g. myocardial infarction and stroke) independent of baseline cardiovascular risk factors or duration of NSAID use; however, the greatest risk may be in those receiving high doses long term.

Cyclo-oxygenase-2 selective inhibitors, diclofenac (150 mg daily) and ibuprofen (2.4 g daily) are associated with an increased risk of thrombotic events. The increased risk for diclofenac is similar to that of licensed doses of etoricoxib. Naproxen (1 g daily) is associated with a lower thrombotic risk, and low doses of ibuprofen (1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID should be prescribed for the shortest period of time to control symptoms and the need for long-term treatment should be reviewed periodically.

All NSAIDs (including cyclo-oxygenase-2 selective inhibitors) are contra-indicated in patients with active gastro-intestinal ulceration or bleeding. Piroxicam, ketoprofen, and ketorolac are contra-indicated in patients with any history of gastro-intestinal bleeding, ulceration, or perforation. Other non-selective NSAIDs are contra-indicated in patients with a history of recurrent gastro-intestinal ulceration or haemorrhage (two or more distinct episodes), and in patients with a history of gastro-intestinal bleeding or perforation related to previous NSAID therapy (see also, p. 704). While it is preferable to avoid NSAIDs in patients with active or previous gastro-intestinal ulceration or bleeding, and to withdraw them if gastro-intestinal lesions develop, nevertheless patients with serious rheumatic diseases (e.g. rheumatoid arthritis) are usually dependent on NSAIDs for effective relief of pain and stiffness. Patients at risk of gastro-intestinal ulceration (including the elderly), who need NSAID treatment should receive gastroprotective treatment; for advice on the prophylaxis and treatment of NSAID-associated gastro-intestinal ulcers, see section 1.3. NSAIDs should also be used with caution in Crohn’s disease or ulcerative colitis, as these conditions may be exacerbated.

For interactions of NSAIDs, see Appendix 1 (NSAIDs).

**Hepatic impairment** NSAIDs should be used with caution in patients with hepatic impairment; there is an increased risk of gastro-intestinal bleeding and fluid retention. NSAIDs should be avoided in severe liver disease; see also individual drugs.

**Renal impairment** NSAIDs should be avoided if possible or used with caution in patients with renal impairment; the **lowest effective dose** should be used for the **shortest possible duration**, and renal function should be monitored. Sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure; deterioration in renal function has also been reported after topical use; see also individual drugs.

**Pregnancy** Most manufacturers advise avoiding the use of NSAIDs during pregnancy or avoiding them unless the potential benefit outweighs the risk. NSAIDs should be avoided during the third trimester because use is associated with a risk of closure of fetal ductus...
arteriosus in utero and possibly persistent pulmonary hypertension of the newborn. In addition, the onset of labour may be delayed and its duration may be increased. See also individual monographs for celecoxib and etoricoxib.

**Breast-feeding** NSAIDs should be used with caution during breast-feeding; see also individual drugs.

**Side-effects** Gastro-intestinal disturbances including discomfort, nausea, diarrhoea, and occasionally bleeding and ulceration occur (see also NSAIDs and Gastro-intestinal Events, below and Cautions above). Systemic as well as local effects of NSAIDs contribute to gastrointestinal damage; taking oral formulations with milk or food, or using enteric-coated formulations, or changing the route of administration may only partially reduce symptoms such as dyspepsia.

**NSAIDs and gastro-intestinal events**
All NSAIDs are associated with serious gastro-intestinal toxicity; the risk is higher in the elderly. Evidence on the relative safety of non-selective NSAIDs indicates differences in the risks of serious upper gastrointestinal side-effects—piroxicam (see also CHMP advice, p. 711), ketoprofen, and ketorolac are associated with the highest risk; indometacin, diclofenac, and naproxen are associated with intermediate risk, and ibuprofen with the lowest risk (although high doses of ibuprofen have been associated with intermediate risk). **Selective inhibitors of cyclo-oxygenase-2** are associated with a lower risk of serious upper gastrointestinal side-effects than non-selective NSAIDs. Recommendations are that NSAIDs associated with a low risk e.g. ibuprofen are generally preferred, to start at the lowest recommended dose and not to use more than one oral NSAID at a time. See also Cautions and Contra-indications, p. 703. The combination of a NSAID and low-dose aspirin can increase the risk of gastro-intestinal side-effects; this combination should be used only if absolutely necessary and the patient should be monitored closely.

Other side-effects include hypersensitivity reactions (particularly rashes, angioedema, and bronchospasm—see below), headache, dizziness, nervousness, depression, drowsiness, insomnia, vertigo, hearing disturbances such as tinnitus, photosensitivity, and haematuria. Blood disorders have also occurred. Fluid retention may occur (rarely precipitating congestive heart failure); blood pressure may be raised.

**Asthma**
Any degree of worsening of asthma may be related to the ingestion of NSAIDs, either prescribed or (in the case of ibuprofen and others) purchased over the counter.

Renal failure may be provoked by NSAIDs, especially in patients with pre-existing renal impairment (important, see Renal impairment, above). Rarely, papillary necrosis or interstitial fibrosis associated with NSAIDs can lead to renal failure. Hepatic damage, alveolitis, pulmonary eosinophilia, pancreatitis, visual disturbances, Stevens-Johnson syndrome, and toxic epidermal necrolysis are other rare side-effects. Induction of or exacerbation of colitis or Crohn’s disease has been reported. Aseptic meningitis has been reported rarely with NSAIDs—patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible.

**Overdosage:** see Emergency Treatment of Poisoning, p. 35.

### ACELOFENAC

**Indications** pain and inflammation in rheumatoid arthritis, osteoarthritis and ankylosing spondylitis

**Cautions** see notes above; avoid in acute porphyria (section 9.8.2)

**Contra-indications** see notes above

**Hepatic impairment** initially 100 mg daily; see also notes above

**Renal impairment** avoid in moderate to severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** manufacturer advises avoid; see also notes above

**Side-effects** see notes above

**Dose**
- 100 mg twice daily; CHILD not recommended

Acelofenac (Non-proprietary) (PM)
Tablets, acelofenac 100 mg, net price 60-tab pack = £9.63. Label: 21

Preservex® (Almirall) (PM)
Tablets, f/c, acelofenac 100 mg, net price 60-tab pack = £9.63. Label: 21

### ACEMETACIN

(Glycolic acid ester of indometacin)

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders; postoperative analgesia

**Cautions** see under Indometacin and notes above

**Driving** Dizziness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** see notes above

**Pregnancy** see notes above

**Breast-feeding** manufacturer advises avoid; see also notes above

**Side-effects** see under Indometacin and notes above

**Dose**
- 120 mg daily in divided doses with food, increased if necessary to 180 mg daily; CHILD not recommended

Emflex® (Merck Serono) (PM)
Capsules, yellow/orange, acemetacin 60 mg, net price 90-cap pack = £28.20. Label: 21, counselling, driving

### CELECOXIB

**Indications** pain and inflammation in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis

**Cautions** see notes above; monitor blood pressure before and during treatment

**Contra-indications** see notes above; sulfonamide sensitivity; inflammatory bowel disease

**Hepatic impairment** halve initial dose in moderate impairment; see also notes above
Renal impairment avoid if eGFR less than 30 mL/minute/1.73 m²; see also notes above

Pregnancy avoid (teratogenic in animal studies); see also notes above

Breast-feeding avoid—in present in milk in animal studies; see also notes above

Side-effects see notes above; dyspnoea, influenza-like symptoms; less commonly stomatitis, palpitiation, cerebral infarction, fatigue, paraesthesia, muscle cramps; rarely taste disturbance, alopecia; very rarely seizures; also reported chest pain

Dose

- Osteoarthritis, 200 mg daily in 1–2 divided doses, increased if necessary to max. 200 mg twice daily; CHILD not recommended
- Rheumatoid arthritis, 100 mg twice daily, increased if necessary to 200 mg twice daily; CHILD not recommended
- Ankylosing spondylitis, 200 mg daily in 1–2 divided doses, increased if necessary to max. 400 mg daily in 1–2 divided doses; CHILD not recommended

Note Discontinue if no improvement after 2 weeks on max. dose

Celebrex® (Pharmacia) Capsules, celecoxib 100 mg (white/blue), net price 60-cap pack = £21.55; 200 mg (white/gold), 30-cap pack = £21.55

DEXIBUPROFEN

Indications pain and inflammation associated with osteoarthritis and other musculoskeletal disorders; mild to moderate pain and inflammation including dysmenorrhoea and dental pain

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment reduce initial dose; avoid if eGFR less than 30 mL/minute/1.73 m²; see also notes above

Pregnancy see notes above

Breast-feeding present in milk—but risk to infant minimal; see also notes above

Side-effects see notes above

Dose

- 600–900 mg daily in up to 3 divided doses; increased if necessary to max. 1.2 g daily (900 mg daily for dysmenorrhoea); max. single dose 400 mg (300 mg for dysmenorrhea); CHILD not recommended

Seractil® (Genus) Tablets, f/c, dexibuprofen 300 mg, net price 60-tab pack = £9.47; 400 mg (scored) 60–tab pack = £11.55

DEXKETOPROFEN

Indications short-term treatment of mild to moderate pain including dysmenorrhoea

Cautions see notes above

Contra-indications see notes above

Hepatic impairment reduce initial dose to max. 50 mg daily in mild to moderate impairment; see also notes above

Renal impairment reduce initial dose to 50 mg daily; avoid in moderate to severe impairment; see also notes above

Pregnancy see notes above

Breast-feeding manufacturer advises avoid—no information available; see also notes above

Side-effects see notes above

Dose

- 12.5 mg every 4–6 hours or 25 mg every 8 hours; max. 75 mg daily; ELDERLY initially max. 50 mg daily; CHILD not recommended

Keral® (Menarini) Tablets, f/c, scored, dexketoprofen (as trometamol) 25 mg, net price 20-tab pack = £3.67, 50-tab pack = £9.18. Label: 22

DICLOFENAC POTASSIUM

Indications pain and inflammation in rheumatic disease and other musculoskeletal disorders; acute gout; postoperative pain; migraine; fever in ear, nose, or throat infection in children

Cautions see notes above

Contra-indications see notes above

Renal impairment avoid in severe impairment; see also notes above

Hepatic impairment see notes above

Pregnancy see notes above

Breast-feeding amount in milk too small to be harmful; see also notes above

Side-effects see notes above

Dose

- Rheumatic disease, musculoskeletal disorders, acute gout, 75–150 mg daily in 2–3 divided doses; CHILD over 14 years, 75–100 mg daily in 2–3 divided doses
- Postoperative pain, 75–150 mg daily in 2–3 divided doses; CHILD 9–14 years (body-weight 35 kg and over), up to 2 mg/kg (max. 100 mg) daily in 3 divided doses; CHILD over 14 years, 75–100 mg daily in 2–3 divided doses
- Migraine, 50 mg at onset, repeated after 2 hours if necessary then after 4–6 hours; max. 200 mg in 24 hours; CHILD not recommended
- Fever in ear, nose, or throat infection, CHILD over 9 years (body-weight 35 kg and over), up to 2 mg/kg (max. 100 mg) daily in 3 divided doses

Diclofenac Potassium (Non-proprietary) Tablets, diclofenac potassium 25 mg, net price 28-tab pack = £3.23; 50 mg, 28-tab pack = £6.18. Label: 21

Voltarol® Rapid (Novartis) Tablets, s/c, diclofenac potassium 25 mg (red), net price 30-tab pack = £3.46; 50 mg (brown), 30-tab pack = £6.62. Label: 21

DICLOFENAC SODIUM

Indications pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders; acute gout; postoperative pain

Cautions see notes above

1. 12.5 mg tablets can be sold to the public for the treatment of headache, dental pain, period pain, rheumatic and muscular pain, backache and the symptoms of cold and flu (including fever), in patients aged over 14 years subject to max. single dose of 25 mg, max. daily dose of 75 mg for max. 3 days, and max. pack size of 18 × 12.5 mg
Contra-indications see notes above; avoid suppositories in pruritus; avoid injections containing benzyl alcohol in neonates (see preparations below) Intravenous use Additional contra-indications include concomitant NSAID or anticoagulant use (including low-dose heparins), history of haemorrhagic diathesis, history of confirmed or suspected cerebrovascular bleeding, operations with high risk of haemorrhage, history of asthma, moderate or severe renal impairment (see also Renal impairment below), hypovolaemia, dehydration; Hepatic impairment see notes above Renal impairment avoid in severe impairment; avoid intravenous use if serum creatinine greater than 160 micromol/litre; see also notes above Pregnancy see notes above Breast-feeding amount in milk too small to be harmful; see also notes above Side-effects see notes above; suppositories may cause rectal irritation; injection site reactions Dose • By mouth, 75–150 mg daily in 2–3 divided doses • By rectum in suppositories, 75–150 mg daily in divided doses • Juvenile idiopathic arthritis, CHILD 6 months–18 years, by mouth, see BNF for Children • Postoperative pain, CHILD 6 months–18 years, by rectum, see BNF for Children Diclofenac Sodium (Non-proprietary) Tablets, e/c, diclofenac sodium 25 mg, net price 84-tab pack = £1.25; 50 mg, 84-tab pack = £1.10. Label: 5, 25 Brands include Defenac®, Dicloflex®, Dichaip®, Fenactol®, Flamraw® Dental prescribing on NHS Diclofenac Sodium Tablets may be prescribed Suppositories, diclofenac sodium 100 mg, net price 10 = £3.03 Brands include Ecomac® Dyloject® (Therabel) Injection, diclofenac sodium 37.5 mg/mL, net price 2-mL vial = £4.80 Note May be difficult to obtain Dose • by deep intramuscular injection into the gluteal muscle, acute exacerbations of pain and postoperative pain, 75 mg once daily (twice daily in severe cases) for max. 2 days Ureretic colic, 75 mg then a further 75 mg after 30 minutes if necessary • by intravenous injection (in supervised settings), acute postoperative pain, 75 mg repeated after 4–6 hours if necessary; max. 150 mg in 24 hours for 2 days Prevention of postoperative pain, initially after surgery 25–50 mg over 15–60 minutes then 5 mg/hour; max. 150 mg in 24 hours for 2 days Suppositories, diclofenac sodium 12.5 mg, net price 10 = 58p; 25 mg, 10 = £1.03; 50 mg, 10 = £1.70; 100 mg, 10 = £3.03 ▲ Modified release Diclomax® (Galeni) Capsules, m/r, yellow, diclofenac sodium 75 mg, net price 56-cap pack = £9.69. Label: 21, 25 Dose ADULT over 18 years, 1 capsule 1–2 times daily or 2 capsules once daily. CHILD 12–18 years see BNF for Children Diclomax Retard® (Galeni) Capsules, m/r, diclofenac sodium 100 mg, net price 28-cap pack = £6.97. Label: 21, 25 Dose ADULT over 18 years, 1 capsule once daily. CHILD 12–18 years see BNF for Children Motifene® 75 mg (Daichi Sankyo) Capsules, e/c, m/r, diclofenac sodium 75 mg (enclosing e/c pellets containing diclofenac sodium 25 mg and m/r pellets containing diclofenac sodium 50 mg), net price 56-cap pack = £8.00. Label: 25 Exipients include propylene glycol (see Excipients, p. 2) Dose ADULT over 18 years, 1 capsule 1–2 times daily. CHILD 12–18 years see BNF for Children Voltarol® 75 mg SR (Novartis) Tablets, m/r, f/c, pink, diclofenac sodium 75 mg, net price 28-tab pack = £6.46; 56-tab pack = £12.92. Label: 21, 25 Dose ADULT over 18 years, 1 tablet 1–2 times daily. CHILD 12–18 years see BNF for Children Note Other brands of modified-release tablets containing diclofenac sodium 75 mg include Defenac® SR, Dexomox® 75 SR, Dicloflex® 75 SR, Fenactol® 75 mg SR, Flammax® 75 MR, Flamraw® SR, Flexrad® MR 75, Rheumatac® Retard 75, Rhumalgan® CR, Slofenac® SR, Volsauf® Retard 75 Voltarol® Retard (Novartis) Tablets, m/r, f/c, red, diclofenac sodium 100 mg. Net price 28-tab pack = £9.47. Label: 21, 25 Dose ADULT over 18 years, 1 tablet once daily. CHILD 12–18 years see BNF for Children Note Other brands of modified-release tablets containing diclofenac sodium 100 mg include Defenac® Retard, Dexomox® Retard 100, Dicloflex® Retard, Fenactol® Retard 100 mg, Flammax® 100 MR, Slofenac® SR, Volsauf® Retard 100 ▲ With misoprostol For prescribing information on misoprostol, see section 1.3.4 Arthrotec® (Pharmacia) Arthrotec® 50 tablets, diclofenac sodium (in e/c core) 50 mg, misoprostol 200 micrograms, net price 60-tab pack = £11.98. Label: 21, 25 Dose prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid...
arthritis or osteoarthritis, 1 tablet 2–3 times daily with food; 
CHILD not recommended

Arthroto\textsuperscript{®} 75 tablets, diacerein sodium (in e/c core) 75 mg, misoprostol 200 micrograms, net price 60-tab pack = £15.83. Label: 21, 25

Dose prophyaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis, 1 tablet twice daily with food; 
CHILD not recommended

Note The BNF recommends a higher starting dose of misoprostol for prophyaxis against NSAID-induced gastroduodenal ulceration than that provided by Arthroto\textsuperscript{®} (see section 1.3.4)

Misofen\textsuperscript{®} (Morningside) \textsuperscript{®}

Tablets, diacerein sodium (in e/c core) 50 mg, misoprostol 200 micrograms, net price 60-tab pack = £11.98. Label: 21, 25

Dose prophyaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis, 1 tablet 2–3 times daily with food; 
CHILD not recommended

Tablets, diacerein sodium (in e/c core) 75 mg, misoprostol 200 micrograms, net price 60-tab pack = £15.83. Label: 21, 25

Dose prophyaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis, 1 tablet twice daily with food; 
CHILD not recommended

Note The BNF recommends a higher starting dose of misoprostol for prophyaxis against NSAID-induced gastroduodenal ulceration than that provided by Misofen\textsuperscript{®} (see section 1.3.4)
FLURBIPROFEN

**Indications**  pain and inflammation in rheumatic disease and other musculoskeletal disorders; mild to moderate pain including dysmenorrhoea; migraine; postoperative analgesia; sore throat (section 12.3.1)

**Cautions**  see notes above

**Contra-indications**  see notes above

**Hepatic impairment**  see notes above

**Renal impairment**  avoid in severe impairment; see also notes above

**Pregnancy**  see notes above

**Breast-feeding**  small amount present in milk—manufacturer advises avoid; see also notes above

**Side-effects**  see notes above; also stomatitis; less commonly paraesthesia, confusion, hallucinations, and fatigue

**Dose**
- **ADULT** and **CHILD** over 12 years, 150–200 mg daily in 2–4 divided doses, increased in acute conditions to 300 mg daily
- **Dysmenorrhoea,** **ADULT** and **CHILD** over 12 years, initially 100 mg, then 50–100 mg every 4–6 hours; max. 300 mg daily

**Flurbiprofen (Non-proprietary)**

**Tablets,** flurbiprofen 50 mg, net price 100 = £0.10; 100 mg, 100 = £0.19. Label: 21

**Froben®** (Abbott Healthcare)

**Tablets,** yellow, s/c, flurbiprofen 50 mg, net price 100 = £0.10; 100 mg, 100 = £0.19. Label: 21

**Ibuprofen (Non-proprietary)**

**Tablets,** coated, ibuprofen 200 mg, net price 84-tab pack = £3.08; 400 mg, 84-tab pack = £3.15; 600 mg, 84-tab pack = £3.93. Label: 21

**Brands include**  Antrophen®, Ebubac®, Rimafen®

**Dental prescribing on NHS**  Ibuprofen Tablets may be prescribed

**Oral suspension,** ibuprofen 100 mg/5 mL, net price 100 mL = £1.37, 150 mL = £2.11, 500 mL = £8.88. Label: 21

**Note**  Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription

**Brands include**  Calprofen®, Feverfen®, Nurofen® for Children, Orfiben® for Children

**Dental prescribing on NHS**  Ibuprofen Oral Suspension Sugar-free may be prescribed

**Brufen®** (Abbott Healthcare)

**Tablets,** I/c, ibuprofen 200 mg, net price 100-tab pack = £3.92; 400 mg, 100-tab pack = £8.16; 600 mg, 100-tab pack = £12.24. Label: 21

**Syrup,** orange, ibuprofen 100 mg/5 mL, net price 500 mL (orange-flavoured) = £8.88. Label: 21

**Granules,** effervescent, ibuprofen 600 mg/sachet, net price 20-sachet pack = £8.80. Label: 13, 21

**Electrolytes**  Na+ approx. 6.5 mmol/sachet

**Modified release**

**Brufen Retard®** (Abbott Healthcare)

**Tablets,** m/r, ibuprofen 800 mg, net price 56-tab pack = £7.74. Label: 25, 27

**Dose**  **ADULT** and **CHILD** over 12 years, 2 tablets daily as a single dose, preferably in the early evening, increased in severe cases to 3 tablets daily in 2 divided doses

**Topical preparations**  Section 10.3.2

**INDOMETACIN** (Indomethacin)

**Indications**  pain and moderate to severe inflammation in rheumatic disease and other acute musculoskeletal disorders; acute gout; dysmenorrhoea; premature labour (section 7.1.3)

**Cautions**  see notes above; also epilepsy, parkinsonism, psychiatric disturbances; during prolonged therapy ophthalmic and blood examinations particularly advisable; avoid rectal administration in proctitis and haemorrhoids

**Driving**  Dizziness may affect performance of skilled tasks (e.g. driving)

**Contra-indications**  see notes above

**Hepatic impairment**  see notes above

**Renal impairment**  avoid in severe impairment; see also notes above

**Pregnancy**  see notes above

**Breast-feeding**  amount probably too small to be harmful—manufacturers advise avoid; see also notes above

**Side-effects**  see notes above; rarely confusion, convulsions, psychiatric disturbances, syncope, blood

1. Can be sold to the public in certain circumstances.
disorders (particularly thrombocytopenia), hyperglycaemia, peripheral neuropathy, intestinal strictures; also reported hyperkalaemia; suppositories may cause rectal irritation and occasional bleeding

**Dose**

- **By mouth**, rheumatic disease, 50–200 mg daily in divided doses; **CHILD** see BNF for Children
- Acute gout, 150–200 mg daily in divided doses
- Dysmenorrhoea, up to 75 mg daily
- **By rectum** in suppositories, 100 mg at night and in the morning if required; **CHILD** not recommended
- Combined oral and rectal treatment, max. total daily dose 150–200 mg

**Indomethacin** (Non-proprietary)

- **Capsules**, indometacin 25 mg, net price 28-cap pack = £1.17; 50 mg, 28-cap pack = £1.22. Label: 21, counselling, driving, see above
- **Suppositories**, indometacin 100 mg, net price 10 = £17.61. Counselling, driving, see above

**Modified release**

- **Indomethacin m/r preparations**
- **Capsules**, m/r, indometacin 75 mg. Label: 21, 25, counselling, driving, see above
- **Brands include Indolar SR**, Pardelprin CR
- **Dose** 75 mg 1–2 times daily (once daily in dysmenorrhoea). **CHILD** not recommended

**Modified release**

- **Oruvail** (Sanofi-Aventis)®
- **Capsules**, m/r, enclosing white pellets, ketoprofen 100 mg (pink/purple), net price 56-cap pack = £23.93; 150 mg (pink), 28-cap pack = £13.60; 200 mg (pink/white), 28-cap pack = £23.85. Label: 21, 25
- **Dose** 100–200 mg once daily with food. **CHILD** not recommended

**Note** Other brands of modified-release capsules containing ketoprofen 100 mg and 200 mg include Ketocid 200 mg, Ketovail 200 mg, Tiloket CR

**With omeprazole**

For prescribing information on omeprazole, see section 1.3.5

- **Axorid** (Meda)®
- **Capsules**, m/r, ketoprofen 100 mg, omeprazole 20 mg (yellow/white), net price 30-cap pack = £13.80; ketoprofen 200 mg, omeprazole 20 mg (white), 30-cap pack = £13.80. Label: 21, 25
- **Excipients** include propylene glycol (see Excipients, p. 2)

**Note** Capsules enclose microgranules containing modified-release ketoprofen and gastro-resistant omeprazole

**Dose** (expressed as ketoprofen) patients requiring ketoprofen for osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis, who are at risk of NSAID-associated duodenal or gastric ulcer or gastrointestinal erosions, **ADULT** and **CHILD** over 15 years. 100 mg (with omeprazole 20 mg) once daily increased to 200 mg (with omeprazole 20 mg) once daily depending on severity of symptoms

**Topical preparations**

Section 10.3.2

---

**KETOPROFEN**

**Indications** pain and mild inflammation in rheumatic disease and other musculoskeletal disorders, and after orthopaedic surgery; acute gout; dysmenorrhoea

**Cautions** see notes above

**Contra-indications** see notes above

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount probably too small to be harmful but manufacturers advise avoid; see also notes above

**Side-effects** see notes above; suppositories may cause rectal irritation

**Dose**

- **By mouth**, rheumatic disease, 100–200 mg daily in 2–4 divided doses; **CHILD** not recommended
- Pain and dysmenorrhoea, 50 mg up to 3 times daily; **CHILD** not recommended
- **By rectum** in suppositories, rheumatic disease, 100 mg at bedtime; **CHILD** not recommended
- Combined oral and rectal treatment, max. total daily dose 200 mg

**Ketoprofen** (Non-proprietary)

- **Capsules**, ketoprofen 50 mg, net price 28-cap pack = £9.32; 100 mg, 56-cap pack = £6.66. Label: 21

**Orudis** (Sanofi-Aventis)®

- **Capsules**, ketoprofen 50 mg (green/purple), net price 112-cap pack = £15.14; 100 mg (pink), 56-cap pack = £15.49. Label: 21
- **Suppositories**, ketoprofen 100 mg. Net price 10 = £6.65

**MEFENAMIC ACID**

**Indications** pain and inflammation in rheumatoid arthritis and osteoarthritis; postoperative pain; mild to moderate pain; dysmenorrhoea and menorrhagia

**Cautions** see notes above; epilepsy; acute porphyria (section 9.8.2)

**Contra-indications** see notes above; inflammatory bowel disease

**Hepatic impairment** see notes above

**Renal impairment** avoid in severe impairment; see also notes above

**Pregnancy** see notes above

**Breast-feeding** amount too small to be harmful but manufacturer advises avoid; see also notes above

**Side-effects** see notes above; also diarrhoea or rashes (withdraw treatment), stomatitis; less commonly paraesthesia and fatigue; rarely hypotension, palpitation, glucose intolerance, thrombocytopenia, haemolytic anaemia (positive Coombs’ test), and aplastic anaemia

**Dose**

- **ADULT** over 18 years, 500 mg 3 times daily
- **CHILD** 12–18 years, acute pain including dysmenorrhoea, menorrhagia, 500 mg 3 times daily

**Mefenamic Acid** (Non-proprietary)

- **Capsules**, mefenamic acid 250 mg, net price 100-cap pack = £2.17. Label: 21
- **Tablets**, mefenamic acid 500 mg, net price 28-tab pack = £1.66. Label: 21
- **Suspension**, mefenamic acid 50 mg/5 mL, net price 125 mL = £79.98. Label: 21
- **Excipients** include ethanol
Ponstan® (Chemidex) ( Proprietary)
Capsules, blue/ivory, mefenamic acid 250 mg, net price 100-cap pack = £8.17. Label: 21
Forte tablets, yellow, mefenamic acid 500 mg, net price 100-tab pack = £15.72. Label: 21

MELOXICAM

Indications  pain and inflammation in rheumatic disease; exacerbation of osteoarthritis (short-term); ankylosing spondylitis
Cautions  see notes above
Contra-indications  see notes above
Hepatic impairment  see notes above
Renal impairment  avoid if eGFR less than 25 mL/minute/1.73m²; see also notes above
Pregnancy  see notes above
Breast-feeding  present in milk in animal studies — manufacturer advises avoid; see also notes above

Side-effects  see notes above
Dose  • By mouth, osteoarthritis, ADULT and CHILD over 16 years, 7.5 mg once daily, increased if necessary to max. 15 mg once daily
Rheumatoid arthritis, ankylosing spondylitis, ADULT and CHILD over 16 years, 15 mg once daily, may be reduced to 7.5 mg once daily; ELDERLY 7.5 mg daily
• CHILD over 12 years, see BNF for Children

Meloxicam (Non-proprietary) ( Proprietary)
Tablets, meloxicam 7.5 mg, net price 30-tab pack = £1.03; 15 mg, 30-tab pack = £1.13. Label: 21

NABUMETONE

Indications  pain and inflammation in rheumatoid arthritis and rheumatoid arthritis
Cautions  see notes above
Contra-indications  see notes above
Hepatic impairment  see notes above
Renal impairment  avoid in severe impairment; see also notes above
Pregnancy  see notes above
Breast-feeding  manufacturer advises avoid; see also notes above

Side-effects  see notes above
Dose  • By mouth, osteoarthritis, ADULT and CHILD over 16 years, 7.5 mg once daily, increased if necessary to max. 15 mg once daily
Rheumatoid arthritis, ankylosing spondylitis, ADULT and CHILD over 16 years, 15 mg once daily, may be reduced to 7.5 mg once daily; ELDERLY 7.5 mg daily
• CHILD over 12 years, see BNF for Children

Naprosyn® (Roche) ( Proprietary)
Tablets, yellow, scored, naproxen 250 mg, net price 56-tab pack = £4.29; 500 mg, 56-tab pack = £8.56. Label: 21
Tablets, e/c, naproxen 250 mg, net price 56-tab pack = £4.29; 375 mg, 56-tab pack = £6.42; 500 mg, 56-tab pack = £5.02. Label: 5, 25

NAPROXEN

Indications  pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders; dysmenorrhoea; acute gout
Cautions  see notes above

Contra-indications  see notes above
Hepatic impairment  see notes above
Renal impairment  avoid if eGFR less than 30 mL/minute/1.73m²; see also notes above
Pregnancy  see notes above
Breast-feeding  amount too small to be harmful but manufacturer advises avoid; see also notes above

Side-effects  see notes above
Dose  • Rheumatic disease, 0.5–1 g daily in 1–2 divided doses; CHILD 2–18 years, juvenile idiopathic arthritis, see BNF for Children
• Acute musculoskeletal disorders and dysmenorrhoea, 500 mg initially, then 250 mg every 6–8 hours as required; max. dose after first day 1.25 g daily; CHILD under 18 years, see BNF for Children
• Acute gout, 750 mg initially, then 250 mg every 8 hours until attack has passed; CHILD under 16 years not recommended

1 Naproxen (Non-proprietary) ( Proprietary)
Tablets, naproxen 250 mg, net price 28-tab pack = £1.15; 500 mg, 28-tab pack = £1.82. Label: 21
Brands include
Anthrox® Tablets, e/c, naproxen 250 mg, net price 56-tab pack = £2.71; 375 mg, 56-tab pack = £6.42; 500 mg, 56-tab pack = £5.02. Label: 5, 25

Naprosyn® (Roche) ( Proprietary)
Tablets, yellow, scored, naproxen 250 mg, net price 56-tab pack = £4.29; 500 mg, 56-tab pack = £8.56. Label: 21
Tablets, e/c, (Naprosyn EC®), naproxen 250 mg, net price 56-tab pack = £4.29; 375 mg, 56-tab pack = £6.42; 500 mg, 56-tab pack = £8.56. Label: 5, 25

With esomeprazole
For prescribing information on esomeprazole, see section 1.3.5

Vimovo® (AstraZeneca) ( Proprietary)
Tablets, 1, 2, 3, m/r, naproxen 500 mg, esomeprazole (as magnesium trihydrate) 20 mg, net price 60-tab pack = £14.95. Label: 22, 25
Note Naproxen component is gastro-resistant
Dose patients requiring naproxen for osteoarthritis, rheumatoid arthritis, or ankylosing spondylitis, who are at risk of NSAID-associated duodenal or gastric ulcer and when treatment with lower doses of naproxen or other NSAIDs is ineffective, ADULT over 18 years, 1 tablet twice daily

With misoprostol
For prescribing information on misoprostol, see section 1.3.4

Napratec® (Pharmacia) ( Proprietary)
Combination pack, 56 yellow scored tablets, naproxen 500 mg; 56 white scored tablets, misoprostol 200 micrograms. Net price = £23.76. Label: 21
Dose patients requiring naproxen for rheumatoid arthritis, osteoarthritis, or ankylosing spondylitis, with prophylaxis against NSAID-induced gastroduodenal ulceration, 1 naproxen 500-mg tablet and 1 misoprostol 200-microgram tablet taken together twice daily with food; CHILD not recommended
Note The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by Napratec® (see section 1.3.4)

1. Can be sold to the public for the treatment of primary dysmenorrhoea in women aged 15–50 years subject to max. single dose of 500 mg, max. daily dose of 750 mg for max. 3 days, and a max. pack size of 9 × 250 mg tablets
### PIROXICAM

**Indications**  
Rheumatoid arthritis, osteoarthritis, and ankylosing spondylitis (see also CHMP advice below)

**Cautions**  
See notes above and CHMP advice below

**Contra-indications**  
Inflammatory bowel disease; see also notes above and CHMP advice below

**Hepatic impairment**  
See notes above

**Renal impairment**  
See notes above

**Breast-feeding**  
Amount too small to be harmful; see also notes above

**Pregnancy**  
See notes above

**Side-effects**  
Amount too small to be harmful; see also notes above

**Dose**  
By mouth, max. 20 mg once daily (see also CHMP advice below); CHILD 6–18 years, juvenile idiopathic arthritis; see BNF for Children

#### CHMP advice

**Piroxicam (June 2007)**

The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastro-intestinal side effects and serious skin reactions. The CHMP has advised that:

- Piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases.
- Piroxicam should not be used as first-line treatment in adults.
- Use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis.
- Piroxicam dose should not exceed 20 mg daily.
- Piroxicam should no longer be used for the treatment of acute painful and inflammatory conditions.
- Treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter.
- Concomitant administration of a gastro-protective agent (section 1.3) should be considered.

#### Note

Topical preparations containing piroxicam are not affected by these restrictions.

---

### SULINDAC

**Indications**  
Pain and inflammation in rheumatic disease and other musculoskeletal disorders; acute gout

**Cautions**  
See notes above; also history of renal stones and ensure adequate hydration

**Contra-indications**  
See notes above

**Hepatic impairment**  
See notes above

**Renal impairment**  
Avoid in severe impairment; see also notes above

**Breast-feeding**  
See notes above

**Side-effects**  
See notes above; jaundice with fever, cholestasis, hepatitis, hepatic failure; also urine discoloration occasionally reported

**Dose**  
200 mg twice daily (may be reduced according to response); max. 400 mg daily; acute gout should respond within 7 days; limit treatment of peri-articular disorders to 7–10 days; CHILD not recommended

---

### TENOXICAM

**Indications**  
Pain and inflammation in rheumatic disease and other musculoskeletal disorders

**Cautions**  
See notes above

**Contra-indications**  
See notes above

**Hepatic impairment**  
See notes above

**Renal impairment**  
Avoid in severe impairment; see also notes above

**Breast-feeding**  
Present in milk in animal studies; see also notes above

**Side-effects**  
See notes above

**Dose**  
By mouth, rheumatic disease, ADULT over 18 years, 20 mg daily. Acute musculoskeletal disorders, ADULT over 18 years, 20 mg daily for 7 days; max. duration of treatment 14 days (including treatment by intravenous or intramuscular injection).

**By intravenous or intramuscular injection**  
ADULT over 18 years, initial treatment for 1–2 days if oral administration not possible, 20 mg once daily

#### Tenoxicam (Non-proprietary)

**Tablets**  
20 mg, net price 30-tab pack = £13.82. Label: 21

**Injection**  
20 mg, net price 28-mg vial = £3.98. Label: 21

#### Mobilflex®

**Tablets**  
Yellow, f/c, tenoxicam 20 mg, net price 30-tab pack = £15.42. Label: 21

---

### TIAPROFENIC ACID

**Indications**  
Pain and inflammation in rheumatic disease and other musculoskeletal disorders

**Cautions**  
See notes above

**Contra-indications**  
See notes above

---

**Topical preparations**  
Section 10.3.2
Musculoskeletal and joint diseases

10 Musculoskeletal and joint diseases

10.1.2 Corticosteroids

10.1.2.1 Systemic corticosteroids

10.1.2.2 Local corticosteroid injections

CSM advice

Following reports of severe cystitis the CSM has recommended that tiaprofenic acid should not be given to patients with urinary-tract disorders and should be stopped if urinary symptoms develop. Patients should be advised to stop taking tiaprofenic acid and to report to their doctor promptly if they develop urinary-tract symptoms (such as increased frequency, nocturia, urgency, pain on urinating, or blood in urine).

Hepatic impairment reduce dose in mild or moderate impairment; see also notes above

Renal impairment reduce dose in mild or moderate impairment; avoid in severe impairment; see also notes above

Pregnancy see notes above

Breast-feeding amount too small to be harmful; see also notes above

Side-effects see notes above

Dose ● ADULT over 18 years, 300 mg twice daily

Surgam® (Sanofi-Aventis) FLR

Tablets, tiaprofenic acid 300 mg, net price 56-tab pack = £14.95. Label: 21

Aspirin

Aspirin (section 4.7.1) has been used in high doses to treat rheumatoid arthritis, but other NSAIDs are now preferred.

10.1.2.2 Local corticosteroid injections

The general actions, uses, and cautions of corticosteroids are described in section 6.3. Short-term treatment with corticosteroids can help to rapidly improve symptoms of rheumatoid arthritis. Long-term treatment in rheumatoid arthritis should be considered only after evaluating the risks and all other treatment options have been considered. Corticosteroids can induce osteoporosis, and prophylaxis should be considered on long-term treatment (section 6.6).

In severe, possibly life-threatening, situations a high initial dose of corticosteroid is given to induce remission and the dose is then reduced gradually and discontinued altogether. Relapse may occur as the dose of corticosteroid is reduced, particularly if the reduction is too rapid. The tendency is therefore to increase the maintenance dose and consequently the patient becomes dependent on corticosteroids. For this reason pulse doses of corticosteroids (e.g. methylprednisolone up to 1 g intravenously on 3 consecutive days) are used to suppress highly active inflammatory disease while long-term treatment with a disease-modifying drug is commenced.

Prednisolone 7.5 mg daily may reduce the rate of joint destruction in moderate to severe rheumatoid arthritis of less than 2 years’ duration. The reduction in joint destruction must be distinguished from mere symptomatic improvement (which lasts only 6 to 12 months at this dose) and care should be taken to avoid increasing the dose above 7.5 mg daily. Evidence supports maintenance of this anti-erosive dose for 2–4 years only after which treatment should be tapered off to reduce long-term adverse effects.

A modified-release preparation of prednisone (section 6.3.2) is also available for the treatment of moderate to severe rheumatoid arthritis.

Polymyalgia rheumatica and giant cell (temporal) arteritis are always treated with corticosteroids. The usual initial dose of prednisolone in polymyalgia rheumatica is 10–15 mg daily and in giant cell arteritis 40–60 mg daily (the higher dose being used if visual symptoms occur). Treatment should be continued until remission of disease activity and doses are then reduced gradually to about 7.5–10 mg daily for maintenance. Relapse is common if therapy is stopped prematurely. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long-term low-dose corticosteroid treatment.

Polyarteritis nodosa and polymyositis are usually treated with corticosteroids. An initial dose of 60 mg of prednisolone daily is often used and reduced to a maintenance dose of 10–15 mg daily.

Systemic lupus erythematosus is treated with corticosteroids when necessary using a similar dosage regimen to that for polyarteritis nodosa and polymyositis (above). Patients with pleurisy, pericarditis, or other systemic manifestations will respond to corticosteroids. It may then be possible to reduce the dosage; alternate-day treatment is sometimes adequate, and the drug may be gradually withdrawn. In some mild cases corticosteroid treatment may be stopped after a few months. Many mild cases of systemic lupus erythematosus do not require corticosteroid treatment. Alternative treatment with anti-inflammatory analgesics, and possibly chloroquine or hydroxychloroquine, should be considered.

Ankylosing spondylitis should not be treated with long-term corticosteroids; rarely, pulse doses may be needed and may be useful in extremely active disease that does not respond to conventional treatment.

Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, particularly in rheumatoid arthritis, they are given by intra-articular injection to relieve pain, increase mobility, and reduce deformity in one or a few joints; they can also provide symptomatic relief while waiting for DMARDs to take effect. Full aseptic precautions are essential; infected areas should be avoided. Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Smaller amounts of corticosteroids may also be injected directly into soft tissues for the relief of inflammation in conditions such as tennis or golfer’s elbow or compression neurpathies. In tendinitis, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath and a high risk of rupture, the Achilles tendon should not be injected).
Hydrocortisone acetate or one of the synthetic analogues is generally used for local injection. Intra-articular corticosteroid injections can cause flushing and may affect the hyaline cartilage. Each joint should not usually be treated more than 4 times in one year.

Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions (see section 13.4).

**LOCAL CORTICOSTEROID INJECTIONS**

**Indications** local inflammation of joints and soft tissues (for details, consult product literature)

**Caution** see notes above and consult product literature; see also section 6.3.2

**Contra-indications** see notes above and consult product literature; avoid injections containing benzyl alcohol in neonates (see preparations below)

**Side-effects** see notes above and consult product literature

**Dose**
- See under preparations

### Betamethasone

**Betnesol®** *(RoH)* *(Ph)*

**Injection**, betamethasone (as sodium phosphate) 4 mg/mL, net price 1-mL amp = £1.22.

### Dexamethasone

**Dexamethasone** *(Non-proprietary)* *(Ph)*

**Injection**, dexamethasone (as sodium phosphate) 4 mg/mL, net price 1-mL amp = 91p, 2-mL vial = £1.27

**Dose** by intra-articular injection (for details consult product literature), 0.33–3.3 mg according to size, where appropriate may be repeated at intervals of 3–21 days according to response

**Injection**, dexamethasone (as sodium phosphate) 3.3 mg/mL, net price 1-mL amp = £1.14, 2-mL vial = £4.80

**Dose** by intra-articular injection (for details consult product literature), 0.33–3.3 mg according to size (by soft-tissue infiltration 1.7–5 mg), where appropriate may be repeated at intervals of 3–21 days

### Hydrocortisone acetate

**Hydrocortisone acetate** *(AMCo)* *(Ph)*

**Injection** (aqueous suspension), hydrocortisone acetate 25 mg/mL, net price 1-mL amp = £0.87

**Dose** by intra-articular injection (for details consult product literature), 0.5–25 mg according to size, where appropriate may be repeated at intervals of 21 days; not more than 3 joints should be treated on any one day; *CHILD* 3–50 mg (divided)

### Methylprednisolone acetate

**Depo-Medrone®** *(Pharmacia)* *(Ph)*

**Injection** (aqueous suspension), methylprednisolone acetate 40 mg/mL, net price 1-mL vial = £3.44; 2-mL vial = £6.18; 3-mL vial = £8.96

**Dose** by intra-articular injection (for details consult product literature), 4–80 mg, according to size, where appropriate may be repeated at intervals of 7–35 days

**Depo-Medrone®** *with Lidocaine* *(Pharmacia)* *(Ph)*

**Injection** (aqueous suspension), methylprednisolone acetate 40 mg, lidocaine hydrochloride 10 mg/mL, net price 1-mL vial = £3.94; 2-mL vial = £7.06

**Dose** by intra-articular injection (for details consult product literature), 4–80 mg, according to size, where appropriate may be repeated at intervals of 7–35 days

### Prednisolone acetate

**DeltaSTab®** *(AMCo)* *(Ph)*

**Injection** (aqueous suspension), prednisolone acetate 25 mg/mL, net price 1-mL amp = £6.87

**Dose** by intra-articular injection (for details consult product literature), 2.5–25 mg according to size, not more than 3 joints should be treated on any one day, where appropriate may be repeated when relapse occurs

For intramuscular injection, see section 6.3.2

### Triamcinolone acetonide

**Adcortyl® Intra-articular/Intradermal** *(Squibb)* *(Ph)*

**Injection** (aqueous suspension), triamcinolone acetonide 10 mg/mL, net price 1-mL amp = 89p; 5-mL vial = £3.83

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

**Dose** by intra-articular injection (for details consult product literature), 2.5–15 mg according to size (for larger doses use Kenalog®, where appropriate may be repeated when relapse occurs; *CHILD* under 18 years see BNF for Children

**By intradermal injection, (for details consult product literature) 2–3 mg; max. 5 mg at any one site (total max. 30 mg); appropriate may be repeated at intervals of 1–2 weeks; *CHILD* under 6 years not recommended

**Kenalog® Intra-articular/Intramuscular** *(Squibb)* *(Ph)*

**Injection** (aqueous suspension), triamcinolone acetonide 40 mg/mL, net price 1-mL vial = £1.49

**Dose** by intra-articular injection (for details consult product literature), 5–40 mg according to size; total max. 80 mg (for doses below 5 mg use Adcortyl® Intra-articular/Intradermal), where appropriate may be repeated when relapse occurs; *CHILD* under 18 years see BNF for Children

For intramuscular injection, see section 6.3.2

### Drugs that suppress the rheumatic disease process

Certain drugs such as those affecting the immune response can suppress the disease process in *rheumatoid arthritis* and *psoriatic arthritis*, gold, penicillamine, hydroxychloroquine, chloroquine, and sulfasalazine can also suppress the disease process in *rheumatoid arthritis* while sulfasalazine and possibly gold can suppress the disease process in *psoriatic arthritis*. Unlike NSAIDs, which are used only for symptom control, disease-modifying anti-rheumatic drugs (DMARDs) can affect the progression of disease but may require 2–6 months of treatment for a full therapeutic response. Response to DMARDs may allow the NSAID dose to be reduced or withdrawn. All patients with suspected inflammatory joint disease should be referred to a specialist as soon as possible to confirm diagnosis and evaluate disease activity; early initiation of DMARDs is recommended to control the signs and symptoms, and to limit joint damage.

**Choice** The choice of a disease-modifying anti-rheumatic drug should take into account co-morbidity and patient preference. Methotrexate, sulfasalazine, intramuscular gold, and penicillamine are similar in efficacy. However, methotrexate or sulfasalazine may be better tolerated.

A combination of DMARDs (including methotrexate and at least one other DMARD) and a short-term corticosteroid (section 10.1.2), should be given to patients with newly diagnosed active rheumatoid arthritis, ideally within 3 months of the onset of persistent symptoms. If the use of particular DMARDs is contra-
indicated and combination therapy is not possible, monotherapy with a suitable DMARD should be given and the dose rapidly increased until clinically effective. In patients with established and stable rheumatoid arthritis, cautiously reduce drug doses to the lowest that are clinically effective. Response to drug treatment often produces a reduction in requirements of both corticosteroids and other drugs.

**Gold and penicillamine** are effective in *polymyositis rheumatism*. Systemic and discoid lupus erythematosus are sometimes treated with chloroquine or hydroxychloroquine.

If a disease-modifying anti-rheumatic drug does not lead to an objective benefit within 6 months, it should be replaced by a different one.

**Juvenile idiopathic arthritis** Many children with juvenile idiopathic arthritis (juvenile chronic arthritis) do not require disease-modifying antirheumatic drugs. Methotrexate is effective (see BNF for Children); sulphasalazine is an alternative (unlicensed indication) but it should be avoided in *systemic-onset juvenile idiopathic arthritis* (see BNF for Children). Gold and penicillamine are no longer used. For the role of cytokine modulators in *juvenile idiopathic arthritis*, see BNF for Children.

**Gold**

Gold can be given as *sodium aurothiomalate* for active progressive rheumatoid arthritis; it must be given by deep intramuscular injection and the area gently massaged. A test dose of 10 mg must be given followed by doses of 50 mg at weekly intervals until there is definite evidence of remission. Benefit is not to be expected until about 300–500 mg has been given; it should be discontinued if there is no remission after 1 g has been given. In patients who do respond, the interval between injections is then gradually increased to 4 weeks and treatment is continued for up to 5 years after complete remission. If relapse occurs the dosage frequency may be immediately increased to 50 mg weekly and only once control has been obtained again should the dosage frequency be decreased; if no response is seen within 2 months, alternative treatment should be sought. It is important to avoid complete relapse since second courses of gold are not usually effective.

Sodium aurothiomalate should be discontinued in the presence of blood disorders, gastro-intestinal bleeding (associated with ulcerative enterocolitis), or unexplained proteinuria (associated with immune complex nephritis) which is repeatedly above 300 mg/litre. Urine tests and full blood counts (including total and differential white cell and platelet counts) must therefore be performed before starting treatment and before each intramuscular injection. Rashes with pruritus often occur after 2 to 6 months of treatment and may necessitate discontinuation.

**SODIUM AUROTHIOMALATE**

**Indications** active progressive rheumatoid arthritis  
**Cautions** see notes above; elderly, history of urticaria, eczema, colitis; monitor for pulmonary fibrosis with annual chest X-ray; **Interactions** Appendix 1 (sodium aurothiomalate)  
**Counselling** Patients should be advised to seek prompt medical attention if diarrhoea, sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, metallic taste, rash, breathlessness, or cough develop

**Contra-indications** history of blood disorders or bone marrow aplasia, exfoliative dermatitis, systemic lupus erythematosus, necrotising enterocolitis, pulmonary fibrosis  
**Hepatic impairment** caution in mild to moderate impairment, avoid in severe impairment  
**Renal impairment** caution in mild to moderate impairment; avoid in severe impairment  
**Pregnancy** manufacturer advises avoid but limited data suggests usually not necessary to withdraw if condition well controlled—consider reducing dose and frequency  
**Breast-feeding** manufacturer advises avoid—present in milk; theoretical possibility of rashes and idiosyncratic reactions

**Side-effects** see notes above; also severe anaphylactic reactions; stomatitis, taste disturbances, colitis, hepatotoxicity with cholestatic jaundice, pulmonary fibrosis, peripheral neuropathy, mouth ulcers, proteinuria, blood disorders (sometimes sudden and fatal), nephrotic syndrome, gold deposits in eye, alopecia, and skin reactions (including, on prolonged parenteral treatment, irreversible pigmentation in sun-exposed areas)

**Dose**  
- By deep intramuscular injection, administered on expert advice, see notes above

**Penicillamine**

Penicillamine has a similar action to gold. More patients are able to continue treatment than with gold but side-effects are common.

Patients should be warned not to expect improvement for at least 6 to 12 weeks after treatment is initiated. Penicillamine should be discontinued if there is no improvement within 1 year. Blood counts, including platelets, and urine examinations should be carried out before starting treatment and then every 1 or 2 weeks for the first 2 months then every 4 weeks to detect blood disorders and proteinuria (they should also be carried out in the week after any dose increase). A reduction in platelet count calls for discontinuation with subsequent re-introduction at a lower dosage and then, if possible, gradual increase. Proteinuria, associated with immune complex nephritis, occurs in up to 30% of patients, but may resolve despite continuation of treatment; treatment may be continued provided that renal function tests remain normal, oedema is absent, and the 24-hour urinary excretion of protein does not exceed 2 g.

Nausea may occur but is usually a problem provided that penicillamine is taken before food or on retiring and that low initial doses are used and only gradually increased. Loss of taste can occur about 6 weeks after treatment is started but usually returns 6 weeks later irrespective of whether treatment is discontinued; mineral supplements are not recommended. Rashes are a common side-effect. Those that occur in the first few months of treatment disappear when the drug is stopped and treatment may then be re-introduced at a lower dose level and gradually increased.

Patients who are hypersensitive to penicillin may react rarely to penicillamine.
### PENICILLAMINE

**Indications** see notes above and under Dose  

**Cautions** see notes above; concomitant nephrotoxic drugs (increased risk of toxicity); gold treatment (avoid concomitant use if adverse reactions to gold); interactions: Appendix 1 (penicillamine)  

**Blood counts and urine tests** See notes above. Longer intervals may be adequate in cystinuria and Wilson’s disease. Consider withdrawal if platelet count falls below 120,000/mm³ or white blood cells below 2000/mm³ or if 3 successive falls within reference range (can restart at reduced dose when counts return to within reference range but permanent withdrawal necessary if recurrence of leucopenia or thrombocytopenia)  

**Counselling** Warn patient to tell doctor promptly if sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, or rashes develop  

**Contra-indications** lupus erythematosus  

**Renal impairment** reduce dose and monitor renal function or avoid (consult product literature)  

**Pregnancy** fetal abnormalities reported rarely; avoid if possible  

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk—no information available  

**Side-effects** (see also notes above) initially nausea, anorexia, fever; proteinuria, thrombocytopenia; rarely mouth ulceration, stomatitis, male and female breast enlargement, haematuria (withdraw immediately if cause unknown), alopecia, pseudoxanthoma elasticum, elastosis perforans, skin laxity; also reported pancreatitis, vomiting, cholestatic jaundice, pulmonary haemorrhage, bronchiolitis, pneumonitis, blood disorders including neutropenia, agranulocytosis, aplastic anaemia, haemolytic anaemia and leucopenia, nephrotic syndrome, glomerulonephritis, Goodpasture’s syndrome, septic arthritis in patients with rheumatoid arthritis, lupus erythematosus, myasthenia gravis, polymyositis, rheumatoid arthritis, urticaria, dermatomyositis, pemphigus, Stevens-Johnson syndrome, late rashes (consider dose reduction)  

**Dose**  

- Severe active rheumatoid arthritis, administered on expert advice, ADULT over 18 years, initially 125–250 mg daily for 1 month increased by similar amounts at intervals of not less than 4 weeks to usual maintenance of 500–750 mg daily in divided doses; max. 1.5 g daily; if remission sustained for 6 months, reduction of daily dose by 125–250 mg every 12 weeks may be attempted; ELDERLY initially up to 125 mg daily for 1 month increased by similar amounts at intervals of not less than 4 weeks; max. 1 g daily  

- Wilson’s disease, autoimmune hepatitis, and cystinuria, section 9.8.1  

**Penicillamine** (Non-proprietary)  

**Tablets**, penicillamine 125 mg, net price 56-tab pack = £11.20; 250 mg, 56-tab pack = £21.89. Label: 6, 22, counselling, blood disorder symptoms (see above)  

**Distamine®** (Alliance)  

**Tablets**, 1/1c. penicillamine 125 mg, net price 100-tab pack = £10.34; 250 mg, 100-tab pack= £17.78. Label: 6, 22, counselling, blood disorder symptoms (see above)  

### Antimalarials

The antimalarial hydroxychloroquine is used to treat rheumatoid arthritis of moderate inflammatory activity; chloroquine is also licensed for treating inflammatory disorders but is used much less frequently and is generally reserved for use if other drugs have failed. Chloroquine and hydroxychloroquine are effective for mild systemic lupus erythematosus, particularly involving the skin and joints. These drugs should not be used for psoriatic arthropathies. Chloroquine and hydroxychloroquine are better tolerated than gold or penicillamine. Retinopathy (see below) rarely occurs provided that the recommended doses are not exceeded; in the elderly it is difficult to distinguish drug-induced retinopathy from changes of ageing. Mepacrine (section 5.4.4) is sometimes used in discoid lupus erythematosus [unlicensed].  

**Cautions** Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory (see advice of the Royal College of Ophthalmologists, below). Chloroquine and hydroxychloroquine should be used with caution in neurological disorders (especially in those with a history of epilepsy), in severe gastro-intestinal disorders, in G6PD deficiency (section 9.1.5), in acute porphyria, and in the elderly (see also above). Chloroquine and hydroxychloroquine may exacerbate psoriasis and aggravate myasthenia gravis. Concurrent use of hepatoxic drugs should be avoided; other interactions: Appendix 1 (chloroquine and hydroxychloroquine).  

**Screening for ocular toxicity** A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening to prevent ocular toxicity on long-term treatment with chloroquine and hydroxychloroquine (Hydroxychloroquine and Ocular Toxicity: Recommendations on Screening 2009). Chloroquine should be considered (for treating chronic inflammatory conditions) only if other drugs have failed. All patients taking chloroquine should receive ophthalmic examination according to a protocol arranged locally between the prescriber and the ophthalmologist. The following recommendations relate to hydroxychloroquine, which is only rarely associated with toxicity.  

**Before treatment:**  

- Assess renal and liver function (adjust dose if impaired)  

- Ask patient about visual impairment (not corrected by glasses). If impairment or eye disease present, assessment by an optometrist is advised and any abnormality should be referred to an ophthalmologist  

- Record near visual acuity of each eye (with glasses where appropriate) using a standard reading chart  

- Initiate hydroxychloroquine treatment if no abnormality detected (at a dose not exceeding hydroxychloroquine sulfate 6.5 mg/kg daily)  

**During treatment:**  

- Ask patient about visual symptoms and monitor visual acuity annually using the standard reading chart  

- Refer to ophthalmologist if visual acuity changes or if vision blurred and warn patient to seek prescribing doctor’s advice about stopping treatment
### CHLOROQUINE

**Indications**  
Active rheumatoid arthritis, systemic and discoid lupus erythematosus; malaria (section 5.4.1)

**Cautions**  
See notes above

**Hepatic impairment**  
See notes above

**Renal impairment**  
Manufacturer advises caution; reducing dose

**Pregnancy**  
See notes above

**Breast-feeding**  
See notes above

**Side-effects**  
See notes above

**Dose**  
Administered on expert advice, by mouth, adult over 18 years, chloroquine (base) 150 mg daily; max. 2.5 mg/kg daily based on ideal body-weight, see also recommendations above

**Note**  
Chloroquine base 150 mg = chloroquine sulfate 200 mg = chloroquine phosphate 250 mg (approx.)

### HYDROXYCHLOROQUINE SULFATE

**Indications**  
Active rheumatoid arthritis (including juvenile idiopathic arthritis), systemic and discoid lupus erythematosus; dermatological conditions caused or aggravated by sunlight

**Cautions**  
See notes above

**Hepatic impairment**  
See notes above

**Renal impairment**  
Manufacturer advises caution and monitoring of plasma-hydroxychloroquine concentration in severe impairment

**Pregnancy**  
See notes above

**Breast-feeding**  
Avoid—risk of toxicity in infant; see also notes above

**Side-effects**  
See notes above; also reported bronchospasm

**Dose**  
Administered on expert advice, 200–400 mg daily (but not exceeding 6.5 mg/kg daily based on ideal body-weight, see also recommendations above); CHILD 1 month–18 years see BNF for Children

**Hydroxychloroquine**  
(Non-proprietary) 
Tablets, hydroxychloroquine sulfate 200 mg, net price 60-tab pack = £4.96. Label: 21, counselling, see below

**Brands include**  
Quinoric®

**Counselling**  
Do not take antacids for at least 4 hours before or after hydroxychloroquine to reduce possible interference with hydroxychloroquine absorption

**Plaquenil®**  
(Sanofi-Aventis) 
Tablets, H/c, hydroxychloroquine sulfate 200 mg, net price 60-tab pack = £5.15. Label: 21, counselling, see below

**Counselling**  
Do not take antacids for at least 4 hours before or after hydroxychloroquine to reduce possible interference with hydroxychloroquine absorption

### Drugs affecting the immune response

**Methotrexate** is a disease-modifying antirheumatic drug suitable for moderate to severe rheumatoid arthritis. *Azathioprine, ciclosporin, cyclophosphamide, leflunomide,* and the *cytokine modulators* are considered more toxic and they are used in cases that have not responded to other disease-modifying drugs.

**Methotrexate** is usually given in an initial dose of 7.5 mg by mouth once a week, adjusted according to response to a maximum of 15 mg once a week (occasionally 20 mg once a week). Regular full blood counts (including differential white cell count and platelet count), renal and liver function tests are required. In patients who experience mucosal or gastro-intestinal side-effects with methotrexate, folic acid 5 mg every week [unlicensed indication], on a different day from the methotrexate, may help to reduce the frequency of such side-effects.

**Azathioprine** is usually given in a dose of up to 2.5 mg/kg daily in divided doses. Blood counts are needed to detect possible neutropenia or thrombocytopenia (usually resolved by reducing the dose). Nausea, vomiting, and diarrhoea may occur, usually starting early during the course of treatment, and may necessitate withdrawal of the drug; herpes zoster infection may also occur.

**Leflunomide** acts on the immune system as a disease-modifying antirheumatic drug. Its therapeutic effect starts after 4–6 weeks and improvement may continue for a further 4–6 months. Leflunomide, which is similar
in efficacy to sulfasalazine and methotrexate, may be chosen when these drugs cannot be used. The active metabolite of leflunomide persists for a long period; active procedures to wash the drug out are required in case of serious adverse effects, or before starting treatment with another disease-modifying antirheumatic drug, or, in men or women, before conception. Side-effects of leflunomide include bone-marrow toxicity; its immunosuppressive effects increase the risk of infection and malignancy.

Ciclosporin is licensed for severe active rheumatoid arthritis when conventional second-line therapy is inappropriate or ineffective. There is some evidence that ciclosporin may retard the rate of erosive progression and improve symptom control in those who respond only partially to methotrexate.

Cyclophosphamide (section 8.1.1) may be used at a dose of 1 to 1.5 mg/kg daily by mouth for rheumatoid arthritis with severe systemic manifestations [unlicensed indication]; it is toxic and regular blood counts (including platelet counts) should be carried out. Cyclophosphamide can also be given intravenously in a dose of 0.5 to 1 g (with prophylactic mesna) for severe systemic rheumatoid arthritis and for other connective tissue diseases (especially with active vasculitis), repeated initially at fortnightly then at monthly intervals (according to clinical response and haematological monitoring).

Drugs that affect the immune response are also used in the management of severe cases of systemic lupus erythematosus and other connective tissue disorders. They are often given in conjunction with corticosteroids for patients with severe or progressive renal disease. They may be used in cases of polymyositis that are resistant to corticosteroids. They are used for their corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive. Azathioprine is usually used.

In the specialist management of psoriatic arthritis affecting peripheral joints, leflunomide, methotrexate, or azathioprine [unlicensed indication] may be used.

**AZATHIOPRINE**

Indications see notes above; inflammatory bowel disease (section 1.5.3); autoimmune conditions and prophylaxis of transplantation rejection (section 8.2.1); severe refractory eczema [unlicensed indication] (section 13.5.3)

Cautions section 8.2.1

Hepatic impairment section 8.2.1

Renal impairment section 8.2.1

Pregnancy see section 8.2.1

Breast-feeding section 8.2.2

Side-effects section 8.2.1

Dose

- By mouth, initially, rarely more than 3 mg/kg daily, reduced according to response; maintenance 1–3 mg/kg daily; consider withdrawal if no improvement within 3 months

Preparations Section 8.2.1

**LEFLUNOMIDE**

Indications (specialist use only) moderate to severe active rheumatoid arthritis; active psoriatic arthritis

Cautions impaired bone-marrow function including anaemia, leucopenia or thrombocytopenia (avoid if significant and due to causes other than rheumatoid arthritis); recent treatment with other hepatotoxic or myelotoxic disease-modifying antirheumatic drugs; washout procedures recommended for serious adverse effects or before switching to other disease-modifying antirheumatic drugs (consult product literature and see Washout Procedure, below); history of tuberculosis; exclude pregnancy before treatment; effective contraception essential during treatment and for at least 2 years after treatment in women and at least 3 months after treatment in men (plasma concentration monitoring required; waiting time before conception may be reduced with washout procedure consult product literature and see Washout Procedure, below); monitor full blood count (including differential white cell count and platelet count) before treatment and every 2 weeks for 6 months then every 8 weeks; monitor liver function—see Hepatotoxicity, below; monitor blood pressure; interactions: Appendix 1 [leflunomide]

Hepatotoxicity—potentially life-threatening hepatotoxicity reported usually in the first 6 months; monitor liver function before treatment and every 2 weeks for first 6 months then
every 8 weeks. Discontinue treatment (and institute washout procedure—consult product literature and see Washout Procedure below) or reduce dose according to liver-function abnormality; if liver-function abnormality persists after dose reduction, discontinue treatment and institute washout procedure.

Washout procedure To aid drug elimination in case of serious adverse effect, or before starting another disease-modifying anti-rheumatic drug, or before conception (see also Pregnancy below), stop treatment and give either colestyramine 8 g 3 times daily for 11 days or activated charcoal 50 g 4 times daily for 11 days; the concentration of the active metabolite after washout should be less than 20 micrograms/litre (measured on 2 occasions 14 days apart) in men or women before conception—consult product literature. Procedure may be repeated as necessary

Contra-indications severe immunodeficiency; severe hypoproteinaemia; severe infection

Hepatic impairment avoid—active metabolite may accumulate; see also Cautions above

Renal impairment manufacturer advises avoid in moderate or severe impairment—no information available

Pregnancy avoid—active metabolite teratogenic in animal studies; effective contraception essential during treatment and for at least 2 years after treatment in women and at least 3 months after treatment in men (see also Cautions above)

Breast-feeding present in milk in animal studies—manufacturer advises avoid

Side-effects diarrhoea, nausea, vomiting, anorexia, oral mucosal disorders, abdominal pain; increased blood pressure; headache, dizziness, asthma, parasthesia; leucopenia; alopecia, rash, dry skin, pruritus; less commonly taste disturbance, anxiety, hyperlipidaemia, hypokalaemia, hypophosphataemia, anaemia, thrombocytopenia, and tendon rupture; rarely hepatic, jaundice (see Hepatotoxicity, above), peripheral neuropathy, vasculitis, progressive multifocal leucoencephalopathy, Stevens-Johnson syndrome, and toxic epidermal necrolysis; hypouricaemia, reduced sperm count, and renal failure also reported; important: discontinue treatment and institute washout procedure (see Washout Procedure under Cautions) in case of serious side-effect

Dose Rheumatoid arthritis, ADULT over 18 years, initially 100 mg once daily for 3 days, then 10–20 mg once daily

Psoriatic arthritis, ADULT over 18 years, initially 100 mg once daily for 3 days, then 20 mg once daily

Leflunomide (Non-proprietary) Ref

Tablets, leflunomide, 10 mg: net price 30-tab pack = £15.92, 20 mg, 30-tab pack = £16.76. Label: 4

Arava® (Sanofi-Aventis) Ref

Tablets, f/c, leflunomide 10 mg (white), net price 30-tab pack = £51.13; 20 mg (yellow), 30-tab pack = £61.56; 100 mg (white), 3-tab pack = £30.67. Label: 4

METHOTREXATE

Indications see under dose; Crohn’s disease [unlicensed indication] (section 1.5.3); malignant disease (section 8.1.3); psoriasis (section 13.5.3)

Cautions section 8.1; see Monitoring, Blood Count, Liver Toxicity, and Pulmonary Toxicity below; extreme caution in blood disorders (avoid if severe); peptic ulceration, ulcerative colitis, diarrhoea and ulcerative stomatitis (withdraw if stomatitis develops)—may be first sign of gastrointestinal toxicity; risk of accumulation in pleural effusion or ascites—drain before treatment; acute porphyria (section 9.8.2); interactions: see below and Appendix 1 (methotrexate)

Monitoring In view of reports of blood dyscrasias (including fatalities) and liver cirrhosis with low-dose methotrexate patients should:

• have full blood count and renal and liver function tests before starting treatment and repeated every 1–2 weeks until therapy stabilised, thereafter patients should be monitored every 2–3 months
• be advised to report all symptoms and signs suggestive of infection, especially sore throat

Treatment with folic acid (as calcium folinate, section 8.1) may be required in acute toxicity

Blood count Bone marrow suppression can occur abruptly; factors likely to increase toxicity include advanced age, renal impairment, and concomitant use with another anti-folate drug (e.g. trimethoprim). A clinically significant drop in white cell count or platelet count calls for immediate withdrawal of methotrexate and introduction of supportive therapy

Liver toxicity Liver cirrhosis reported. Treatment should not be started or should be discontinued if any abnormality of liver function tests or liver biopsy is present or develops during therapy. Abnormalities can return to normal within 2 weeks after which treatment may be recommenced if judged appropriate

Pulmonary toxicity Pulmonary toxicity may be a special problem in rheumatoid arthritis (patient to seek medical attention if dyspnoea, cough or fever; monitor for symptoms at each visit—discontinue if pneumonitis suspected)

Aspirin and NSAIDs If aspirin or other NSAIDs are given concurrently the dose of methotrexate should be carefully monitored. Patients should be advised to avoid self-medication with over-the-counter aspirin or ibuprofen

Contra-indications see Cautions above; active infection and immunodeficiency syndromes

Hepatic impairment avoid—dose-related toxicity; see also Cautions above

Renal impairment reduce dose; risk of nephrotoxicity at high doses; avoid in severe impairment

Pregnancy avoid (teratogenic; fertility may be reduced during therapy but this may be reversible); effective contraception required during and for at least 3 months after treatment in men or women; see also section 8.1

Breast-feeding discontinue breast-feeding: present in milk

Side-effects section 8.1; also anorexia, abdominal discomfort, dyspepsia, gastro-intestinal ulceration and bleeding, diarrhoea, toxic megaloclon, hepatotoxicity (see Cautions above); hypotension, pericarditis, pericardial tamponade; pulmonary oedema, pleuritic pain, pulmonary fibrosis, interstitial pneumonitis (see also Pulmonary Toxicity above); anaaphylactic reactions, urticaria, dizziness, chills, fever, drowsiness, insomnia, malaise, headache, mood changes, neurotoxicity, confusion, paraesthesia; precipitation of diabetes; menstrual disturbances, vaginitis, cystitis, reduced libido, impotence; blood disorders; haematuria, dysuria, renal failure; osteoporosis, arthralgia, myalgia, vasculitis; conjunctivitis, visual disturbance; rash, pruritus, Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity, changes in nail and skin pigmentation, telen-
Methotrexate

Dose

- Moderate to severe active rheumatoid arthritis, by mouth, ADULT over 18 years, 7.5 mg once weekly, increased according to response; max. weekly dose 20 mg
- Severe active rheumatoid arthritis, by subcutaneous or by intramuscular or by intravenous injection, ADULT over 18 years, 7.5 mg once weekly, increased according to response by 2.5 mg weekly; max. weekly dose 25 mg
- CHILD under 18 years see BNF for Children

Important

Note that the above dose is a weekly dose. To avoid error with low-dose methotrexate, it is recommended that:

- the patient is carefully advised of the dose and frequency and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the patient is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

Methotrexate treatment booklets

Methotrexate treatment booklets should be issued where appropriate.

In England, Wales, and Northern Ireland, they are available for purchase from:

3M Security Print and Systems Limited
Gorse Street, Chadderton
Oldham
OL9 9QH
Tel: 0845 610 1112
GP practices can obtain supplies through their Local Area Team stores.
NHS Hospitals can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mm.com.
In Scotland, treatment booklets can be obtained by emailing stockorders.dppas@apsgroup.co.uk

These booklets include advice for adults taking oral methotrexate for inflammatory conditions, and a section for recording results of blood tests and dosage information.

Methotrexate (Non-proprietary) [*Pharmaceutical Service Guidance*]

Tablets, yellow, methotrexate 2.5 mg, net price 24-tab pack = £2.22, 28-tab pack = £2.60. Counselling, dose, treatment booklet, NSAIDs

Brands include Maxtrex®

Tablets, yellow, methotrexate 10 mg, net price 100-tab pack = £37.06. Counselling, dose, treatment booklet, NSAIDs

Parenteral preparations

See also section 8.1.3

Metoject® (Medac) [*Pharmaceutical Service Guidance*]

Injection, prefilled syringe, methotrexate (as disodium salt) 50 mg/mL, net price 0.15 mL (7.5 mg) = £14.85, 0.2 mL (10 mg) = £15.29, 0.25 mL (12.5 mg) = £16.50, 0.3 mL (15 mg) = £16.57, 0.35 mL (17.5 mg) = £17.50, 0.4 mL (20 mg) = £17.84, 0.45 mL (22.5 mg) = £18.45, 0.5 mL (25 mg) = £18.48, 0.55 mL (27.5 mg) = £18.89, 0.6 mL (30 mg) = £18.95

Cytokine modulators

Cytokine modulators should be used under specialist supervision.

Adalimumab, certolizumab pegol, etanercept, golimumab, and infliximab inhibit the activity of tumour necrosis factor alpha (TNF-α).

Adalimumab is licensed for moderate to severe active rheumatoid arthritis when response to other disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (see also NICE guidance October 2007, p. 721 and August 2010, p. 721); it is also licensed for severe, active, and progressive disease in adults not previously treated with methotrexate. In the treatment of rheumatoid arthritis, adalimumab should be used in combination with methotrexate, but it can be given alone if methotrexate is inappropriate. Adalimumab is also licensed for the treatment of active and progressive psoriatic arthritis (see also NICE guidance, p. 721) and severe active ankylosing spondylitis (see also NICE guidance, p. 721) that have not responded adequately to other disease-modifying antirheumatic drugs. It is also licensed for the treatment of severe axial spondyloarthritis without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs. For the role of adalimumab in inflammatory bowel disease, see section 1.5.3. For the role of adalimumab in plaque psoriasis, see section 13.5.3. For the role of adalimumab in juvenile idiopathic arthritis see BNF for Children.

Certolizumab pegol is licensed for use in patients with moderate to severe active rheumatoid arthritis when response to disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (see also NICE guidance, below). Certolizumab pegol can be used in combination with methotrexate, or as a monotherapy if methotrexate is not tolerated or is contra-indicated. Certolizumab pegol is also licensed for the treatment of severe active ankylosing spondylitis in patients who have had an inadequate response to, or are intolerant of NSAIDs. It is also licensed for the treatment of severe active axial spondyloarthritis, without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs.

NICE guidance

Certolizumab pegol for the treatment of rheumatoid arthritis (February 2010)

Certolizumab pegol is an option for the treatment of patients with rheumatoid arthritis only if:

- certolizumab pegol is used as described in the NICE guidance (October 2007) for other tumour necrosis factor (TNF) inhibitors, (see Adalimumab, Etanercept and Infliximab for the treatment of Rheumatoid Arthritis, below) and
- the manufacturer provides the first 12 weeks of certolizumab pegol (10 prefilled 200-mg syringes) free of charge to all patients starting treatment.

www.nice.org.uk/TA186

Etanercept is licensed for the treatment of moderate to severe active rheumatoid arthritis either alone or in combination with methotrexate. It is also licensed for the treatment of severe active ankylosing spondylitis and psoriatic arthritis and for the treatment of psoriasis vulgaris.

NICE guidance

Etanercept for the treatment of rheumatoid arthritis (August 2010)

Etanercept is licensed for moderate to severe active rheumatoid arthritis when response to other disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (see also NICE guidance, p. 721 and August 2010, p. 721); it is also licensed for severe, active, and progressive disease in adults not previously treated with methotrexate. In the treatment of rheumatoid arthritis, etanercept should be used in combination with methotrexate, but it can be given alone if methotrexate is inappropriate. Etanercept is also licensed for the treatment of active and progressive psoriatic arthritis (see also NICE guidance, p. 721) and severe active ankylosing spondylitis (see also NICE guidance, p. 721) that have not responded adequately to other disease-modifying antirheumatic drugs. It is also licensed for the treatment of severe axial spondyloarthritis without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs. For the role of etanercept in inflammatory bowel disease, see section 1.5.3. For the role of etanercept in plaque psoriasis, see section 13.5.3. For the role of etanercept in juvenile idiopathic arthritis see BNF for Children.

NICE guidance

Etanercept for the treatment of ankylosing spondylitis (September 2010)

Etanercept is licensed for the treatment of severe active ankylosing spondylitis when response to other disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (see also NICE guidance, below). Etanercept can be used in combination with methotrexate, or as a monotherapy if methotrexate is not tolerated or is contra-indicated. Etanercept is also licensed for the treatment of severe active ankylosing spondylitis in patients who have had an inadequate response to, or are intolerant of NSAIDs. Etanercept is also licensed for the treatment of severe active axial spondyloarthritis, without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs.

NICE guidance

Etanercept for the treatment of plaque psoriasis (February 2010)

Etanercept is licensed for the treatment of moderate to severe plaque psoriasis when response to other disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (see also NICE guidance, below). Etanercept can be used in combination with methotrexate, or as a monotherapy if methotrexate is not tolerated or is contra-indicated. Etanercept is also licensed for the treatment of severe plaque psoriasis when response to other disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (see also NICE guidance, below). Etanercept is also licensed for the treatment of severe plaque psoriasis in patients who have had an inadequate response to, or are intolerant of NSAIDs. Etanercept is also licensed for the treatment of severe active ankylosing spondylitis and psoriatic arthritis and for the treatment of psoriasis vulgaris.

NICE guidance

Etanercept for the treatment of psoriatic arthritis (September 2010)

Etanercept is licensed for the treatment of severe active psoriatic arthritis when response to other disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (see also NICE guidance, below). Etanercept can be used in combination with methotrexate, or as a monotherapy if methotrexate is not tolerated or is contra-indicated. Etanercept is also licensed for the treatment of severe active psoriatic arthritis when response to other disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (see also NICE guidance, below). Etanercept is also licensed for the treatment of severe active ankylosing spondylitis and psoriatic arthritis and for the treatment of psoriasis vulgaris.
combination with methotrexate when the response to other disease-modifying antirheumatic drugs is inadequate and in severe, active and progressive \textit{rheumatoid arthritis} in patients not previously treated with methotrexate (see also NICE guidance October 2007, p. 721 and August 2010, p. 721). It is also licensed for the treatment of active and progressive \textit{psoriatic arthritis} inadequately responsive to other disease-modifying antirheumatic drugs (see also NICE guidance, p. 721), and for severe \textit{ankylosing spondylitis} inadequately responsive to conventional therapy (see also NICE guidance, p. 721). For the role of etanercept in plaque psoriasis, see section 13.5.3.

\textbf{Golimumab} is licensed in combination with methotrexate for the treatment of moderate to severe active \textit{rheumatoid arthritis} when response to disease-modifying antirheumatic drug (DMARD) therapy (including methotrexate) has been inadequate (see also NICE guidance below); it is also licensed in combination with methotrexate for patients with severe, active, and progressive \textit{rheumatoid arthritis} not previously treated with methotrexate. Golimumab is also licensed for the treatment of active and progressive \textit{psoriatic arthritis}, as monotherapy or in combination with methotrexate, when response to DMARD therapy has been inadequate (see also NICE guidance below), it is also licensed for the treatment of severe active \textit{ankylosing spondylitis} when there is an inadequate response to conventional treatment (see also NICE guidance below).

The Scottish Medicines Consortium (p. 4) has advised (June 2012) that golimumab (Simponi®) is accepted for restricted use within NHS Scotland at a dose of 50 mg, alone or in combination with methotrexate, for the treatment of active and progressive psoriatic arthritis in adults whose disease has not responded to adequate trials of at least two standard DMARDs, administered either individually or in combination.

\textbf{NICE guidance}

\textbf{Golimumab for the treatment of rheumatoid arthritis after the failure of previous disease-modifying antirheumatic drugs (June 2011)}

Golimumab, in combination with methotrexate, is an option for the treatment of rheumatoid arthritis in adults who have had an inadequate response to conventional disease-modifying antirheumatic drugs (DMARDs) only, including methotrexate, if:

\begin{itemize}
  \item golimumab is used as described in the NICE guidance (October 2007) for other tumour necrosis factor (TNF) inhibitors (see Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis, p. 721), and
  \item the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose
\end{itemize}

Alternatively, golimumab, in combination with methotrexate, is an option for the treatment of rheumatoid arthritis in adults who have had an inadequate response to DMARDs including a TNF inhibitor, if:

\begin{itemize}
  \item golimumab is used as described in the NICE guidance (August 2010) for other TNF inhibitors (see Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor, p. 721), and
  \item the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose
\end{itemize}

www.nice.org.uk/TA225

\textbf{NICE guidance}

\textbf{Golimumab for the treatment of psoriatic arthritis (April 2011)}

Golimumab is an option for the treatment of active and progressive psoriatic arthritis in adults only if:

\begin{itemize}
  \item golimumab is used as described in the NICE guidance (August 2010) for other tumour necrosis factor (TNF) inhibitors (see Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis, p. 721), and
  \item the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose
\end{itemize}

www.nice.org.uk/TA220

\textbf{Infliximab} is licensed for the treatment of active \textit{rheumatoid arthritis} in combination with methotrexate when the response to other disease-modifying antirheumatic drugs, including methotrexate, is inadequate (see also NICE guidance October 2007, p. 721 and August 2010, p. 721); it is also licensed in combination with methotrexate for patients not previously treated with methotrexate or other DMARDs who have severe, active, and progressive \textit{rheumatoid arthritis}. Infliximab is also licensed for the treatment of \textit{ankylosing spondylitis}, in patients with severe axial symptoms who have not responded adequately to conventional therapy (but see also NICE guidance, p. 721) and in combination with methotrexate (or alone if methotrexate is not tolerated or is contra-indicated) for the treatment of active and progressive \textit{psoriatic arthritis} which has not responded adequately to disease-modifying antirheumatic drugs (see also NICE guidance, p. 721).

\textbf{Rituximab} is licensed in combination with methotrexate for the treatment of severe active \textit{rheumatoid arthritis} in patients whose condition has not responded adequately to other disease-modifying antirheumatic drugs (including one or more tumour necrosis factor inhibitors) or who are intolerant of them (see also NICE guidance, p. 721). For the role of rituximab in malignant disease, see section 8.2.3.
NICE guidance
Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis (October 2007)
The tumour necrosis factor alpha (TNF-α) inhibitors adalimumab, etanercept, and infliximab are options for the treatment of adults with active rheumatoid arthritis who have failed to respond to at least 2 disease-modifying antirheumatic drugs (DMARDs), including methotrexate (unless contra-indicated). TNF-α inhibitors should be given in combination with methotrexate; however, when methotrexate cannot be used because of intolerance or contra-indications, adalimumab or etanercept can be given as monotherapy.

Adalimumab, etanercept, and infliximab should be withdrawn if response is not adequate within 6 months. Response to treatment should be monitored at least every 6 months in patients who respond initially; treatment should be withdrawn if response is not maintained. An alternative TNF-α inhibitor may be considered for patients in whom treatment is withdrawn because of intolerance before the initial 6-month assessment of efficacy.

Use of TNF-α inhibitors for the treatment of severe, active, and progressive rheumatoid arthritis in adults not previously treated with methotrexate or other DMARDs is not recommended.

www.nice.org.uk/TA130

NICE guidance
Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010)
Rituximab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or are intolerant of, other disease-modifying antirheumatic drugs (DMARDs), including at least 1 tumour necrosis factor (TNF) inhibitor. Repeat courses of rituximab should be given no more frequently than every 6 months, and should only be continued if an adequate response is achieved and maintained.

Adalimumab, etanercept, infliximab, or abatacept, in combination with methotrexate, are options for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other DMARDs including at least 1 TNF inhibitor, and who cannot use rituximab because of contra-indications or intolerance. In patients who cannot use methotrexate because of intolerance or contra-indications, adalimumab or etanercept can be given as monotherapy. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months.

www.nice.org.uk/TA195

NICE guidance
Adalimumab, etanercept, and infliximab for the treatment of ankylosing spondylitis (May 2008)
Adalimumab or etanercept are treatment options for adults with severe active ankylosing spondylitis whose disease satisfies specific criteria for diagnosis where there is confirmation of sustained active spinal disease, and where treatment with two or more NSAIDs taken sequentially at maximum tolerated or recommended doses for 4 weeks has failed to control symptoms.

Response to adalimumab or etanercept treatment should be assessed at 12-week intervals and continued only if response is adequate. If response to treatment is not maintained, a repeat assessment should be made after a further 6 weeks and treatment discontinued if there is an inadequate response. Patients who are intolerant of adalimumab or etanercept during the initial 12 weeks may receive the alternative TNF-α inhibitor (adalimumab or etanercept). However an alternative TNF-α inhibitor is not recommended in patients who fail to respond initially or fail to maintain an adequate response.

Infliximab is not recommended for the treatment of ankylosing spondylitis. Patients who are already receiving infliximab for the treatment of ankylosing spondylitis can continue treatment until they and their specialist consider it appropriate to stop.

See full NICE guidance for specific criteria to diagnose severe active ankylosing spondylitis, confirm sustained active spinal disease, and assess response to treatment.

www.nice.org.uk/TA143

NICE guidance
Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010)
Etanercept, infliximab, or adalimumab are recommended for the treatment of active and progressive psoriatic arthritis in adults who have peripheral arthritis with at least 3 tender joints and at least 3 swollen joints, and who have not responded adequately to at least 2 standard disease-modifying antirheumatic drugs (used alone or in combination).

Etanercept, infliximab, and adalimumab should be discontinued if there is an inadequate response at 12 weeks.

www.nice.org.uk/TA199

Side-effects
Adalimumab, certolizumab pegol, etanercept, golimumab, infliximab, and rituximab have been associated with infections, sometimes severe, including tuberculosis, sepsicaemia, and hepatitis B reactivation. Other side-effects include nausea, abdominal pain, worsening heart failure, hypersensitivity reactions, fever, headache, depression, antibody formation (including lupus erythematosus-like syndrome), pruritus, injection-site reactions, and blood disorders (including anaemia, leucopenia, thrombocytopenia, pancytopenia, and aplastic anaemia).

Abatacept prevents the full activation of T-lymphocytes. It is licensed for moderate to severe active rheumatoid arthritis in combination with methotrexate, in...
10 Musculoskeletal and joint diseases

patients unresponsive to other disease-modifying anti-rheumatic drugs (including methotrexate or a tumour necrosis factor (TNF) inhibitor); see also NICE guidance (August 2010), p. 721 and (April 2013), below. For the role of abatacept in juvenile idiopathic arthritis see BNF for Children. Abatacept is not recommended for use in combination with TNF inhibitors. The Scottish Medicines Consortium (p. 4) has advised (July 2013) that abatacept (Orencia®) is accepted for restricted use within NHS Scotland for adults with severe active rheumatoid arthritis, confirmed on at least two occasions, one month apart. This advice is contingent upon continuing availability of abatacept at the price agreed in the patient access scheme.

**NICE guidance**
**Abatacept for the treatment of rheumatoid arthritis after the failure of conventional disease-modifying anti-rheumatic drugs (April 2013)**

Abatacept, in combination with methotrexate, is an option for the treatment of highly active rheumatoid arthritis in adults who have had an inadequate response to at least two conventional disease-modifying anti-rheumatic drugs, including methotrexate. If:

- abatacept is used as described in the NICE guidance (October 2007) for other tumour necrosis factor (TNF) inhibitors (see Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis, and the manufacturer provides abatacept with the discount agreed in the patient access scheme

Patients already receiving abatacept for this indication, who do not fulfil the criteria for treatment should continue treatment until they and their specialist consider it appropriate to stop. www.nice.org.uk/TA280

**Anakinra** inhibits the activity of interleukin-1. Anakinra (in combination with methotrexate) is licensed for the treatment of *rheumatoid arthritis* which has not responded to methotrexate alone; it is not, however, recommended for routine management of *rheumatoid arthritis*, see NICE guidance below.

The Scottish Medicines Consortium (p. 4) has advised (July 2002) that anakinra is not recommended for the treatment of rheumatoid arthritis within NHS Scotland.

**NICE guidance**
**Anakinra for the treatment of rheumatoid arthritis (February 2009)**

Anakinra is not recommended for the treatment of rheumatoid arthritis except when used in a controlled long-term clinical study. Patients who are already receiving anakinra for rheumatoid arthritis should continue treatment until they and their specialist consider it appropriate to stop.

**Belimumab** inhibits the activity of B-lymphocyte stimulator. Belimumab is licensed as adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy. Infusion-related side-effects are reported commonly with belimumab, including severe or life-threatening hypersensitivity and infusion reactions. These occur predominantly during the first 2 infusions. Delay in the onset of acute hypersensitivity reactions has been observed; patients should remain under clinical supervision for several hours following at least the first 2 infusions. Premedication with an antihistamine, with or without an antipyretic, may be considered.

**Tocilizumab** antagonises the actions of interleukin-6. Tocilizumab is licensed for use in patients with moderate to severe active *rheumatoid arthritis* when response to at least one disease-modifying antirheumatic drug or tumour necrosis factor inhibitor has been inadequate, or in those who are intolerant of these drugs. Tocilizumab can be used in combination with methotrexate, or as monotherapy if methotrexate is not tolerated or is contra-indicated (see also NICE guidance below). For the role of tocilizumab in juvenile idiopathic arthritis see BNF for Children.

The Scottish Medicines Consortium (p. 4) has advised (August 2012) that tocilizumab (RoActemra®) is accepted for restricted use within NHS Scotland as monotherapy in patients who are intolerant to methotrexate or where continued treatment with methotrexate is inappropriate, for the treatment of moderate to severe active rheumatoid arthritis in adults who have either responded inadequately to, or who were intolerant to, previous therapy with one or more disease-modifying anti-rheumatic drugs or tumour necrosis factor inhibitors, in accordance with the British Society for Rheumatology guidance on prescribing TNF-α blockers in adults with rheumatoid arthritis (2005).

**Ustekinumab** inhibits the activity of interleukins 12 and 23. It is licensed for the treatment of *active psoriatic arthritis* (in combination with methotrexate or alone) in patients who have had an inadequate response to one or more disease-modifying antirheumatic drugs.

The Scottish Medicines Consortium (p. 4) has advised (February 2014) that ustekinumab (Stelara®) is accepted for restricted use within NHS Scotland either alone or in combination with methotrexate, for the treatment of active psoriatic arthritis in adults who have responded
inadequately to previous therapy with a non-biological disease-modifying anti-rheumatic drug, and failed on, or are unsuitable for, treatment with a TNF inhibitor.

**ABATACEPT**

**Indications** see under Cytokine Modulators, above

**Cautions** predisposition to infection (screen for latent tuberculosis and viral hepatitis); do not initiate until active infections are controlled; children should be brought up to date with current immunisation schedule (section 14.1) before initiating therapy; progressive multifocal leucoencephalopathy—discontinue treatment if neurological symptoms present; elderly (increased risk of side-effects); **Interactions:** Appendix 1 (abatacept)

**Contra-indications** severe infection (see also Cautions)

**Pregnancy** manufacturer advises avoid unless essential—effective contraception required during treatment and for 4 weeks after last dose

**Breast-feeding** present in milk in animal studies—manufacturer advises avoid breast-feeding during treatment and for 14 weeks after last dose

**Side-effects** abdominal pain, diarrhoea, dyspepsia, nausea, vomiting, stomatitis, flushing, hypertension, cough, dizziness, fatigue, headache, paraesthesia, infection, leukopenia, pain in extremities, conjunctivitis; **less commonly** gastritis, tachycardia, bradycardia, palpitation, hypotension, bronchospasm, dysphonia, hyperhidrosis, weight gain, depression, anxiety, sleep disorder, menstrual disturbances, basal and squamous cell carcinoma, skin papilloma, thrombocytopenia, arthralgia, visual disturbance, dry eye, bruising, alopecia, dry skin, psoriasis; **also reported** lymphoma, lung cancer

**Dose**

- Rheumatoid arthritis (see notes above), by **intravenous infusion**, *ADULT* over 18 years, body-weight less than 60 kg, 500 mg, repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks; body-weight 60–100 kg, 750 mg repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks; body-weight over 100 kg, 1 g repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks; by **subcutaneous injection** (following intravenous infusion loading dose), *ADULT* over 18 years, 125 mg given within a day of the loading dose, then 125 mg weekly

**Note** Patients who are unable to receive an infusion may initiate subcutaneous abatacept without receiving an intravenous loading dose

**Polycystic juvenile idiopathic arthritis** *CHILD* 6–17 years, see BNF for Children

**Note** Review treatment if no response within 6 months

**Orecnia** (Bristol-Myers Squibb)

**Intravenous infusion**, powder for reconstitution, abatacept, net price 250 mg vial = £302.40

**Electrolytes** Na⁺ < 0.5 mmol/vial

**Injection**, abatacept, net price 125-mg pre-filled syringe = £302.40

**ADALIMUMAB**

**Indications** see under Cytokine Modulators above; inflammatory bowel disease (section 1.5.3); psoriasis (section 13.5.3)

**Cautions** predisposition to infection; monitor for infection before, during, and for 4 months after treatment (see also Tuberculosis below); do not initiate until active infections are controlled; discontinue if new serious infection develops; hepatitis B virus—monitor for active infection; children should be brought up to date with current immunisation schedule (section 14.1) before initiating therapy; mild heart failure (discontinue if symptoms develop or worsen—avoid in moderate or severe heart failure); demyelinating disorders (risk of exacerbation); history or development of malignancy; monitor for non-melanoma skin cancer before and during treatment, especially in patients with a history of PUVA treatment for psoriasis or extensive immunosuppressant therapy; **Interactions:** Appendix 1 (adalimumab)

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting adalimumab. Patients who have previously received adequate treatment for tuberculosis can start adalimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting adalimumab. Patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with adalimumab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

**Blood disorders** Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop

**Contra-indications** severe infection (see also Cautions)

**Pregnancy** avoid; manufacturer advises effective contraception required during treatment and for at least 5 months after last dose

**Breast-feeding** avoid; manufacturer advises avoid for at least 5 months after last dose

**Side-effects** see under Cytokine Modulators (p. 721) and Cautions above; also vomiting, dyspepsia, gastrointestinal haemorrhage, dizziness, hyperlipidaemia, hypertension, oedema, flushing, chest pain, tachycardia, cough, dysphonia, mood changes, sleep disturbances, anxiety, paraesthesia, haematuria, renal impairment, benign tumours, skin cancer, electrolyte disturbances, hyperuricaemia, dehydration, musculoskeletal pain, eye disorders, rash, dermatitis, onycholysis, impaired healing; **less commonly** gastritis, tachycardia, cough, dysphonia, mood changes, sleep disturbances, anxiety, paraesthesia, haematuria, renal impairment, benign tumours, skin cancer, electrolyte disturbances, hyperuricaemia, dehydration, musculoskeletal pain, eye disorders, rash, dermatitis, onycholysis, impaired healing; **less commonly** dysphagia, pancreatitis, cholelithiasis, hepatitis steatohepatitis, cholecystitis, arthritidias, vascular occlusion, aortic aneurysm, interstitial lung disease, pneumonitis, tremor, neuropathy, erectile dysfunction, nocturia, malignancy (including solid tumours, lymphoma, and leukemia), rhabdomyolysis, hearing loss, tinnitus; rarely autoimmune hepatitis, myocardial infarction, demyelinating disorders; **also reported** pulmonary embolism, pleural effusion, sarcoidosis, Stevens-Johnson syndrome, cutaneous vasculitis, new onset or worsening psoriasis

**Dose**

- By **subcutaneous injection**, rheumatoid arthritis, *ADULT* over 18 years, 40 mg on alternate weeks; if necessary increased to 40 mg weekly in patients receiving adalimumab alone; review treatment if no response within 12 weeks

Psoriatic arthritis, ankylosing spondylitis, severe axial spondyloarthritis, *ADULT* over 18 years, 40 mg on alternate weeks; discontinue treatment if no response within 12 weeks

**Polycystic juvenile idiopathic arthritis**, *CHILD* 2–18 years, see BNF for Children
BELLIMUMAB

Indications  see under Cytokine Modulators above
Cautions  predisposition to infection; do not initiate until active infections controlled; history of malignancy; Contra-indications  see under Cytokine Modulators above
Renal impairment  caution in severe impairment—no information available
Pregnancy  avoid; manufacturer advises adequate contraception during treatment and for at least 4 months after last dose
Breast-feeding  avoid—present in milk in animal studies
Side-effects  see notes above; also diarrhea, nausea, hypersensitivity reactions, vomiting, depression, insomnia, migraine, infections, pyrexia, leucopenia, pain in extremities
Dose  By intravenous infusion, ADULT over 18 years, 10 mg/kg, repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks; review treatment if no response within 6 months
Benlysta® (GSK)  Intravenous infusion, powder for reconstitution, belimumab, net price 120-mg vial = £121.50; 400-mg vial = £405.00

CERTOLIZUMAB PEGOL

Indications  see under Cytokine Modulators above
Cautions  predisposition to infection; monitor for infection before, during, and for 5 months after treatment (see also Tuberculosis below); do not initiate until active infections are controlled; discontinue if new serious infection develops until infection controlled; hepatitis B virus—monitor for active infection; mild heart failure (discontinue if symptoms develop or worsen)—avoid in moderate to severe heart failure; demyelinating CNS disorders (risk of exacerbation); history or development of malignancy; Contra-indications  see under Cytokine Modulators above
Renal impairment  caution if eGFR 30–50 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²
Pregnancy  avoid; manufacturer advises adequate contraception during treatment and for at least 5 months after last dose
Breast-feeding  avoid; manufacturer advises adequate contraception during treatment and for at least 5 months after last dose
Side-effects  see under Cytokine Modulators (p. 721) and Cautions above; hypertension, sensory abnor- malities, rash; less commonly ascites, cholestasis, gastro-intestinal disorders (including perforation and ulcer), hepatic disorders, appetite disorders, cardiomyopa-thies (including heart failure), dyslipidaemia, syncope, oedema, dizziness, ischaemic coronary artery disor-ders, arrhythmias, asthma, pleural effusion, cough, peripheral neuropathy, tremor, anxiety, mood disor-ders, influenza-like illness, menstrual disorders, renal impairment, haematuria, malignancy (including solid tumours, lymphoma, and leukaemia), skin cancer, benign tumours, haemorrhage, electrolyte disorders, muscle disorders, visual disturbance, ocular inflam-mation, tinnitus, eczema, impaired healing, alopec-ia, photosensitivity, acne, skin discoloration, nail disorders, new onset or worsening psoriasis, dermatitis, rarely cholelithiasis, splenomegaly, atrio-ventricular block, cerebrovascular accident, Raynaud’s phenomenon, interstitial lung disease, impaired coordination, trigeminal neuralgia, seizures, thyroid disorders, sexual dysfunction, nephropathy; also reported multiple sclerosis
Dose  By subcutaneous injection, ADULT over 18 years, 200 mg once daily, repeated every 2 weeks for 2 weeks after initial injection, then every 4 weeks; review treatment if no response within 12 weeks
Severe ankylosing spondylitis, severe axial spondyloarthropathy, ADULT over 18 years, 400 mg, repeated 2 weeks and 4 weeks after initial injection, then 200 mg every 2 weeks; review treatment if no response within 12 weeks

ANAKINRA

Indications  see under Cytokine Modulators above
Cautions  see under Cytokine Modulators above
Renal impairment  caution if eGFR 30–50 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m²
Pregnancy  avoid; manufacturer advises adequate contraception during treatment and for at least 5 months after last dose
Breast-feeding  avoid; manufacturer advises adequate contraception during treatment and for at least 5 months after last dose
Side-effects  injection-site reactions; headache; infections, neutropenia (see also Cautions), and anti-body formation; also reported malignancy
Dose  By subcutaneous injection, ADULT over 18 years, 100 mg once daily
Kinerefr® (Swedish Orphan)  Intravenous infusion, adalimumab, net price 40-mg prefilled pen or prefilled syringe = £352.14; 40 mg/0.8 mL vial = £352.14. Label: 10, alert card, counselling, tuber-culosis and blood disorders

HumiraTR (AbbVie)  Intravenous infusion, adalimumab, net price 40-mg prefilled pen or prefilled syringe = £352.14; 40 mg/0.8 mL vial = £352.14. Label: 10, alert card, counselling, tuber-culosis and blood disorders
ETANERCEPT

Indications see under Cytokine Modulators above

Cautions predisposition to infection (avoid if predisposition to septicaemia); significant exposure to herpes zoster virus—interrupt treatment and consider varicella–zoster immunoglobulin; hepatitis B virus—monitor for active infection; monitor for worsening hepatitis C infection; children should be brought up to date with current immunisation schedule (section 14.1) before initiating therapy; heart failure (risk of exacerbation); history or increased risk of demyelinating disorders; history or development of malignancy; monitor for skin cancer before and during treatment, particularly in those at risk (including patients with psoriasis or a history of PUVA treatment); history of blood disorders; diabetes mellitus; interactions: Appendix 1 (etanercept)

Tuberculosis Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting etanercept. Patients who have previously received adequate treatment for tuberculosis can start etanercept but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting etanercept. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with etanercept. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

Blood disorders Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

Contra-indications active infection; avoid injections containing benzyl alcohol in neonates (see preparations below)

Hepatic impairment use with caution in moderate to severe alcoholic hepatitis

Pregnancy avoid—limited information available; manufacturer advises effective contraception required during treatment and for 3 weeks after last dose

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects see under Cytokine Modulators (p. 721); also less commonly interstitial lung disease, skin cancer, uveitis, rash, new onset or worsening psoriasis; rarely demyelinating disorders, seizures, lymphoma, Stevens-Johnson syndrome, vasculitis; very rarely toxic epidermal necrolysis; also reported appendicitis, gastritis, oesophagitis, inflammatory bowel disease, vomiting, diabetes mellitus, malignancy (including solid tumours and leukaemia), macrophage activation syndrome, and cutaneous ulcer

Dose By subcutaneous injection, rheumatoid arthritis, psoriatic arthritis, ankylosing spondylitis, ADULT over 18 years, 25 mg twice weekly or 50 mg once weekly Juvenile idiopathic arthritis, CHILD 2–17 years, see BNF for Children

GOLIMUMAB

Indications see under Cytokine Modulators above; ulcerative colitis (section 1.5.3)

Cautions predisposition to infection; monitor for infection before, during, and for 5 months after treatment (see also Tuberculosis below); do not initiate until active infections are controlled; discontinue if new serious infection develops until infection controlled; hepatitis B virus—monitor for active infection; severe heart failure (discontinue if symptoms develop or worsen); demyelinating disorders (risk of exacerbation); history or development of malignancy; interactions: Appendix 1 (golimumab)

Tuberculosis Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting golimumab. Patients who have previously received adequate treatment for tuberculosis can start golimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting golimumab. Patients who have tested negative for latent tuberculosis, and those who are receiving or who have completed treatment for latent tuberculosis, should be monitored closely for symptoms of active infection. All patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

Blood disorders Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

Contra-indications severe active infection (see also Cautions); moderate or severe heart failure

Hepatic impairment manufacturer advises caution—no information available

Pregnancy use only if essential; manufacturer advises adequate contraception during treatment and for at least 6 months after last dose

Breast-feeding manufacturer advises avoid during and for at least 6 months after treatment—present in milk in animal studies

Side-effects see under Cytokine Modulators (p. 721) and under Cautions above; also dyspepsia, hypertension, dizziness, asthma; less commonly constipation, taste disturbance, gastritis, colitis, stomatitis, gastro-oesophageal reflux disease, cholelithiasis, hepatic disorders, hyperlipidaemia, arrhythmia, ischaemic coronary artery disorders, Raynaud’s syndrome, heart failure, thrombosis, flushing, bronchospasm, interstitial lung disease, demyelinating disorders, insomnia, paraesthesia, hyperglycaemia,
thoracic, pulmonary oedema, amnesia, agitation, confusion, nervousness, neuropathy, seizures, vaginitis, eye disorders, bullous ulceration, cheilitis, seborrhoea, impaired healing, rosacea, hyperkeratosis, abnormal skin pigmentation; rarely pericardial effusion, vasospasm, interstitial lung disease, leukaemia, lymphoma, demyelinating disorders, Stevens-Johnson syndrome, toxic epidermal necrolysis; also reported hepatic failure.

Dose
- By intravenous infusion, rheumatoid arthritis (in combination with methotrexate), ADULT over 18 years, 3 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 8 weeks; if response inadequate after 12 weeks, dose may be increased in steps of 1.5 mg/kg every 8 weeks, up to max. 7.5 mg/kg every 8 weeks; alternatively, 3 mg/kg may be given every 4 weeks; discontinue if no response by 12 weeks of initial infusion or after dose adjustment.

Ankylosing spondylitis, ADULT over 18 years, 5 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 6–8 weeks; discontinue if no response by 6 weeks of initial infusion.

Psoriatic arthritis (in combination with methotrexate), ADULT over 18 years, 5 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 8 weeks.

Remicade® (MSD) (Rhu) Intravenous infusion, powder for reconstitution, infliximab, net price 100-mg vial = £419.62. Label: 10, alert card, counselling, tuberculosis, blood disorders.

**INFLIXIMAB**

**Indications** see under Cytokine Modulators above; inflammatory bowel disease (section 1.5.3); psoriasis (section 13.5.3).

**Caution** predisposition to infection; monitor for infection before, during, and for 6 months after treatment (see also Tuberculosis below); discontinue if new serious infection develops; hepatitis B virus—monitor for active infection; mild heart failure (discontinue if symptoms develop or worsen); demyelinating disorders (risk of exacerbation); history or development of malignancy; history of prolonged immunosuppressant or PUVA treatment in patients with psoriasis; interactions: Appendix 1 (infliximab).

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting infliximab. Patients who have previously received adequate treatment for tuberculosis can start infliximab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting infliximab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with infliximab.

Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

**Blood disorders** Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

**Hypersensitivity reactions** Hyperreactivity reactions Hypersensitivity reactions (including fever, chest pain, hypotension, hypertension, dyspnoea, transient visual loss, pruritus, urticaria, serum sickness-like reactions, angioedema, anaphylaxis) reported during or within 1–2 hours after infusion (risk greatest during first or second infusion in patients who discontinue other immunosuppressants). All patients should be observed carefully for 1–2 hours after infusion and resuscitation equipment should be available for immediate use. Prophylactic antipyretics, antihistamines, or hydrocortisone may be administered. Monitor for symptoms of delayed hypersensitivity if readministered after a prolonged period. Patients should be advised to keep Alert card with them at all times and seek medical advice if symptoms of delayed hypersensitivity develop.

**Contra-indications** severe infections (see also under Cautions); moderate or severe heart failure.

**Pregnancy** use only if essential; manufacturer advises adequate contraception during and for at least 6 months after last dose.

**Breast-feeding** amount probably too small to be harmful.

**Side-effects** see under Cytokine Modulators (p. 721) and under Cautions above; also constipation, diarrhoea, dyspepsia, gastro-intestinal hamorrhage, gastro-oesophageal reflux, flushing, hypotension, hypertension, palpitation, tachycardia, sleep disturbances, dizziness, paraesthesia, hypothesia, arthralgia, myalgia, epistaxis, alopecia, rash, ecchymosis, hyperhidrosis, new onset or worsening psoriasis, dry skin; less commonly hepatitis, cholecystitis, intestinal perforation, pancreatitis, heart failure, arrhythmia, Bradycardia, syncope, peripheral ischaemia, pleurisy, pulmonary oedema, anaemia, agitation, confusion, hypothermia, mechanism, seizures, vaginitis, eye disorders, bullous ulceration, cheilitis, seborrhoea, impaired healing, rosacea, hyperkeratosis, abnormal skin pigmentation; rarely pericardial effusion, vasospasm, interstitial lung disease, leukaemia, lymphoma, demyelinating disorders, Stevens-Johnson syndrome, toxic epidermal necrolysis; also reported hepatic failure.

**Dose**—By intravenous infusion, rheumatoid arthritis (in combination with methotrexate), ADULT over 18 years, 3 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 8 weeks; if response inadequate after 12 weeks, dose may be increased in steps of 1.5 mg/kg every 8 weeks, up to max. 7.5 mg/kg every 8 weeks; alternatively, 3 mg/kg may be given every 4 weeks; discontinue if no response by 12 weeks of initial infusion or after dose adjustment.

Ankylosing spondylitis, ADULT over 18 years, 5 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 6–8 weeks; discontinue if no response by 6 weeks of initial infusion.

Psoriatic arthritis (in combination with methotrexate), ADULT over 18 years, 5 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 8 weeks.

Remicade® (MSD) (Rhu) Intravenous infusion, powder for reconstitution, infliximab, net price 100-mg vial = £419.62. Label: 10, alert card, counselling, tuberculosis, blood disorders.

**RITUXIMAB**

**Indications** see under Cytokine Modulators above; malignant disease (section 8.2.3).

**Caution** section 8.2.3, p. 623; predisposition to infection.

**Alert card** Patients with rheumatoid arthritis should be provided with the patient alert card before administration.

**Contra-indications** section 8.2.3, p. 622; severe infection.

**Pregnancy** section 8.2.3, p. 625.

**Breast-feeding** section 8.2.3, p. 625.

**Side-effects** section 8.2.3, p. 624 and under Cytokine Modulators (p. 721); also dyspepsia; hypertension, hypotension; rhinitis, sore throat; asthma, paraesthesia, migraine; arthralgia, muscle spasm; urticaria.

**Dose**—By intravenous infusion, ADULT, rheumatoid arthritis (in combination with methotrexate), 1 g, repeated 2 weeks after initial infusion.

**Important** Patients should receive premedication before each infusion (consult product literature for details) and be provided with a patient alert card.

**Preparations** Section 8.2.3.
Tocilizumab

**Indications** see under Cytokine Modulators above

**Cautions** predisposition to infection or history of recurrent or chronic infection; interrupt treatment if serious infection occurs; history of intestinal ulceration or diverticulitis; monitor hepatic transaminases every 4–8 weeks for first 6 months, then every 12 weeks; monitor neutrophil and platelet counts 4–8 weeks after starting treatment and then as indicated; low platelet or absolute neutrophil count (discontinue if absolute neutrophil count less than 0.5 × 10^9/litre or platelet count less than 50 × 10^9/microlitre); monitor lipid profile 4–8 weeks after starting treatment and then as indicated; monitor for demyelinating disorders; **interactions**: Appendix 1 (tocilizumab)

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Patients with latent tuberculosis should be treated with standard therapy (section 5.1.9) before starting tocilizumab

**Counselling** Patients should be advised to seek immediate medical attention if symptoms of infection occur, or if symptoms of diverticular perforation such as abdominal pain, haemorrhage, or fever accompanying change in bowel habits occur

**Contra-indications** severe active infection (see also Cautions); do not initiate if absolute neutrophil count less than 2 × 10^9/litre (see also Cautions)

**Hepatic Impairment** manufacturer advises caution

**Renal impairment** manufacturer advises monitor renal function closely in moderate or severe impairment

**Pregnancy** manufacturer advises avoid unless essential (toxicity in animal studies); effective contraception required during and for 3 months after treatment

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk — no information available

**Side-effects** abdominal pain, mouth ulceration, gastritis, raised hepatic transaminases; dizziness, peripheral oedema, hypertension, hypercholesteraemia; headache; infection (including upper respiratory tract infection); antibody formation, hypersensitivity, leucopenia, neutropenia; rash, pruritus; less commonly gastric ulcer, gastro-intestinal perforation, hypertriglyceridaemia, hypothyroidism, nephrolithiasis, infusion related reactions, anaphylaxis, and thrombocytopenia also reported

**Dose**

- Rheumatoid arthritis, by intravenous infusion, **ADULT** over 18 years, 8 mg/kg (max. 800 mg) once every 4 weeks; for details of dose adjustment in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count, consult product literature
- Juvenile idiopathic arthritis, **CHILD** 2–18 years, see BNF for Children

**RoActemra®** (Roche)

Concentrate for intravenous infusion, tocilizumab
20 mg/mL, net price 4 mL (80-mg) vial = £102.40, 10 mL (200-mg) vial = £256.00, 20 mL (400-mg) vial = £512.00. Alert card, counselling, see above

**USTEKINUMAB**

**Indications** see under Cytokine Modulators above; plaque psoriasis (section 13.5.3)

**Cautions** See section 13.5.3, p. 804 for information on tuberculosis

**Sulfasalazine** has a beneficial effect in suppressing the inflammatory activity of rheumatoid arthritis. Sulfasalazine may also be used by specialists, in the management of psoriatic arthritis affecting peripheral joints (unlicensed indication). Side-effects include rashes, gastrointestinal intolerance and, especially in patients with rheumatoid arthritis, occasional leucopenia, neutropenia, and thrombocytopenia. These haematological abnormalities occur usually in the first 3 to 6 months of treatment and are reversible on cessation of treatment. Close monitoring of full blood counts (including differential white cell count and platelet count) is necessary initially, and at monthly intervals during the first 3 months (liver function tests also being performed at monthly intervals for the first 3 months). Although the manufacturer recommends renal function tests, evidence of practical value is unsatisfactory.

**SULFASALAZINE** (Sulphasalazine)

**Indications** active rheumatoid arthritis; inflammatory bowel disease, see section 1.5.1 and notes above

**Cautions** see section 1.5.1 and notes above

**Blood disorders** Patients should be advised to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise. A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.

**Contra-indications** see section 1.5.1 and notes above

**Hepatic impairment** section 1.5.1

**Renal impairment** section 1.5.1

**Pregnancy** section 1.5.1

**Breast-feeding** section 1.5.1

**Side-effects** see section 1.5.1 and notes above

**Dose**

- By mouth, administered on expert advice, as entericoated tablets, initially 500 mg daily, increased by 500 mg at intervals of 1 week to a max. of 2–3 g daily in divided doses

**Sulfasalazine** (Proprietary)

**Tablets**, e/c, sulfasalazine 500 mg, net price 112-tab pack = £8.07 Label: 5, 14, 25, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

**Brands include** Sulazine EC®

**Salazopyrin EN- Tabs®** (Pharmacia)

**Tablets**, e/c, yellow, 1/2 c, sulfasalazine 500 mg, net price 112-tab pack = £8.43 Label: 5, 14, 25, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained
10.1.4 Gout and cytotoxic-induced hyperuricaemia

It is important to distinguish drugs used for the treatment of acute attacks of gout from those used in the long-term control of the disease. The latter exacerbate and prolong the acute manifestations if started during an attack.

**Acute attacks of gout**

Acute attacks of gout are usually treated with high doses of NSAIDs such as diclofenac, etoricoxib, indomethacin, ketoprofen, naproxen, or sulindac (section 10.1.1). Colchicine is an alternative in patients in whom NSAIDs are contra-indicated. Aspirin is not indicated in gout. Allopurinol, febuxostat, and uricosurics are not effective in treating an acute attack and may prolong it indefinitely if started during the acute episode.

The use of colchicine is limited by the development of toxicity at higher doses, but it is of value in patients with heart failure since, unlike NSAIDs, it does not induce fluid retention; moreover, it can be given to patients receiving anticoagulants.

Oral or parenteral corticosteroids are an effective alternative in those who cannot tolerate NSAIDs or who are resistant to other treatments. Intra-articular injection of a corticosteroid can be used in acute mono-articular gout [unlicensed indication]. A corticosteroid by intramuscular injection can be effective in podagra.

Canakinumab, a recombinant monoclonal antibody, can be used for the symptomatic treatment of frequent gouty arthritis attacks (at least 3 in the previous 12 months). It is licensed for use in patients whose condition has not responded adequately to treatment with NSAIDs or colchicine, or who are intolerant of them.

### COLCHICINE

**Indications**

acute gout; short-term prophylaxis during initial therapy with allopurinol and uricosuric drugs; prophylaxis of familial Mediterranean fever (recurrent polyserositis)

**Cautions**

see notes above; also elderly; gastro-intestinal disease; cardiac disease; interactions: Appendix 1 (colchicine)

**Contra-indications**

blood disorders

**Hepatic impairment**

use with caution

**Renal impairment**

reduce dose or increase dosage interval if eGFR 10–50 mL/minute/1.73 m$^2$; avoid if eGFR less than 10 mL/minute/1.73 m$^2$

**Pregnancy**

avoid—teratogenicity in animal studies

**Breast-feeding**

present in milk but no adverse effects reported; manufacturers advise caution

**Side-effects**

nausea, vomiting, and abdominal pain; excessive doses may cause profuse diarrhoea, gastrointestinal haemorrhage, rash, renal and hepatic damage; rarely peripheral neuritis, inhibition of spermatogenesis, myopathy, alopecia, and with prolonged treatment blood disorders

**Dose**

- Acute gout, 500 micrograms 2–4 times daily until symptoms relieved, max. 6 mg per course; course not to be repeated within 3 days

- Prevention of gout attacks during initial treatment with allopurinol or uricosuric drugs, 500 micrograms twice daily

- Prophylaxis of familial Mediterranean fever [unlicensed], 0.5–2 mg once daily

**Note**

BNF doses may differ from those in the product literature

**Colchicine (Non-proprietary)**

Tablets, colchicine 500 micrograms, net price 100 = £36.23

### CANAKINUMAB

**Indications**

acute gout; malignant disease (section 8.2.4)

**Cautions**

section 8.2.4

**Contra-indications**

section 8.2.4

**Hepatic impairment**

section 8.2.4

**Renal impairment**

section 8.2.4

**Pregnancy**

section 8.2.4

**Breast-feeding**

section 8.2.4

**Side-effects**

section 8.2.4

**Dose**

- By subcutaneous injection, ADULT over 18 years, 150 mg as a single dose; may be repeated at least 12 weeks after initial response if symptoms recur

**Note**

Patients who do not respond to initial dose should not be retreated

### Preparations

Section 8.2.4

### Long-term control of gout

Frequent recurrence of acute attacks of gout, the presence of tophi, or signs of chronic gouty arthritis may call for the initiation of long-term [‘interval’] treatment. For long-term control of gout the formation of uric acid from purines may be reduced with the xanthine-oxidase inhibitors allopurinol or febuxostat; alternatively the uricosuric drug sulfinpyrazone may be used to increase the excretion of uric acid in the urine. Treatment should be continued indefinitely to prevent further attacks of gout by correcting the hyperuricaemia. These drugs should never be started during an acute attack; they are usually started 1–2 weeks after the attack has settled. The initiation of treatment may precipitate an acute attack, and therefore an anti-inflammatory analgesic or colchicine should be used as a prophylactic and continued for at least one month after the hyperuricaemia has been corrected. However, if an acute attack develops during treatment, then the treatment should continue at the same dosage and the acute attack treated in its own right.

Allopurinol is widely used and is especially useful in patients with renal impairment or urate stones when uricosuric drugs cannot be used; it is not indicated for the treatment of asymptomatic hyperuricaemia. It can cause rashes.

Febuxostat is licensed for the treatment of chronic hyperuricaemia where urate deposition has already occurred; it is not indicated for patients in whom the rate of urate formation is greatly increased, such as in malignant disease or in Lesch-Nyhan syndrome.
Side-effects
rashes (withdraw therapy; if rash mild re-introduce cautiously but discontinue promptly if recurrence—hypersensitivity reactions occur rarely and include exfoliation, fever, lymphadenopathy, arthralgia, and eosinophilia resembling Steven-Johnson syndrome or toxic epidermal necrolysis, vasculitis, hepatitis, renal impairment, and very rarely seizures); gastro-intestinal disorders; rarely malaise, headache, vertigo, drowsiness, visual and taste disturbances, hypertension, alopecia, hepatotoxicity, paraesthesia and neuropathy, gynaecomastia, blood disorders (including leucopenia, thrombocytopenia, haemolytic anaemia and aplastic anaemia)

Dose
• Initially 100 mg daily, preferably after food, then adjusted according to plasma or uric acid concentration; usual maintenance dose in mild conditions 100–200 mg daily, in moderately severe conditions 300–600 mg daily, in severe conditions 700–900 mg daily; doses over 300 mg daily given in divided doses; CHILD under 15 years, (in neoplastic conditions, enzyme disorders) 10–20 mg/kg daily (max. 400 mg daily)

Allopurinol (Non-proprietary)
Febuxostat (max. 400 mg daily)
Allopurinol, allopurinol 100 mg, net price 28-tab pack = £9.70; 300 mg, 28-tab pack = £1.00. Label: 8, 21, 27
Brands include Coplen®, Cosuric®, Rimapurin®
Zyloprim® (Aspen) Tablets, allopurinol 100 mg, net price 100-tab pack = £10.19; 300 mg, 28-tab pack = £7.31. Label: 8, 21, 27

ALLOPURINOL

Indications prophylaxis of gout and of uric acid and calcium oxalate renal stones; prophylaxis of hyperuricaemia associated with cancer chemotherapy

Cautions administer prophylactic NSAID (not aspirin or salicylates) or colchicine until at least 1 month after hyperuricaemia corrected (usually for first 3 months) to avoid precipitating an acute attack; ensure adequate fluid intake (2–3 litres/day); for hyperuricaemia associated with cancer therapy, allopurinol treatment should be started before cancer therapy; interactions: Appendix 1 (allopurinol)

Contra-indications not a treatment for acute gout but continue if attack develops when already receiving allopurinol, and treat attack separately (see notes above)

Hepatic impairment reduce dose
Renal impairment max. 100 mg daily, increased only if response inadequate; in severe impairment, reduce daily dose below 100 mg, or increase dose interval; if facilities available, adjust dose to maintain plasma oxipurinol concentration below 100 micromol/litre

Pregnancy toxicity not reported; manufacturer advises use only if no safer alternative and disease carries risk for mother or child

Breast-feeding present in milk—not known to be harmful

1. The Scottish Medicines Consortium issued similar advice in August 2010

www.nice.org.uk/TA164

Sulfinpyrazone can be used instead of allopurinol, or in conjunction with it in cases that are resistant to treatment.

Probenecid (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) is a uricosuric drug used to prevent nephrotoxicity associated with cidofovir (section 5.3.2.2).

Benzbromarone (available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104) is a uricosuric drug that can be used in patients with mild renal impairment.

Crystallisation of urate in the urine can occur with the uricosuric drugs and it is important to ensure an adequate urine output especially in the first few weeks of treatment. As an additional precaution the urine may be rendered alkaline.

Aspirin and other salicylates antagonise the uricosuric drugs; they do not antagonise allopurinol but are nevertheless not indicated in gout.

Nicotinamide does not antagonise allopurinol but is never-these-phylactic in combination with it in cases that are resistant to treatment. As an additional precaution the urine may be rendered alkaline.

Febuxostat is recommended as an option for the management of chronic hyperuricaemia in gout only for patients who are intolerant of allopurinol or for whom allopurinol is contra-indicated.

For the purposes of this guidance, intolerance of allopurinol is indicated in gout.

Febuxostat for the management of hyperuricaemia associated with cancer chemotherapy carries risk for mother or child

ALLOPURINOL

Indications prophylaxis of gout and of uric acid and calcium oxalate renal stones; prophylaxis of hyperuricaemia associated with cancer chemotherapy

Cautions administer prophylactic NSAID (not aspirin or salicylates) or colchicine until at least 6 months after starting febuxostat to avoid precipitating an acute attack; transplant recipients; monitor liver function tests before and periodically during treatment as indicated; thyroid disorders; ischaemic heart disease; congestive heart failure; interactions: Appendix 1 (febuxostat)

Contra-indications not a treatment for acute gout but continue if attack develops when already receiving febuxostat, and treat attack separately (see notes above)

Hepatic impairment max. 80 mg daily in mild impairment; no dose information available in moderate or severe impairment

Renal impairment use with caution if eGFR less than 30 mL/minute/1.73 m²—no information available

Pregnancy manufacturer advises avoid—limited information available

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects gastro-intestinal disturbances, abnormal liver function tests, oedema, headache, rash; less commonly cholelithiasis, hyperlipidaemia, taste and smell disturbances, hypertension, chest pain, flushing, atrial fibrillation, ECG abnormalities, palpitation, dyspnoea, bronchitis, upper respiratory tract infection, cough, dizziness, paraesthesia, hypoaeosinophilia, hemiparesis, drowsiness, insomnia, appetite and weight change, diabetes mellitus, increased thyroid stimulating hormone, decreased libido, erectile dysfunction, haematuria, nephrolithiasis, increased
urinary frequency, renal failure, proteinuria, myalgia, arthralgia, arthritis, muscle weakness, muscle spasm, bursitis, dermatitis; rarely pancreatitis, hepatitis, jaundice, thirst, asthenia, nervousness, tubulointerstitial nephritis, pancytopenia, thrombocytopenia, rhabdomyolysis, blurred vision, mouth ulceration, tinnitus

**PROBENECID**

**Indications** prevention of nephrotoxicity associated with cidofovir (section 5.3.2.2)

**Cautions** ensure adequate fluid intake (about 2–3 litres daily) and render urine alkaline if uric acid overload is high; peptic ulceration; transient false-positive Benedict’s test; G6PD-deficiency (section 9.1.5); interactions: Appendix 1 (probencid)

**Contra-indications** history of blood disorders, nephrolithiasis, acute gout attack; avoid aspirin and salicylates

**Renal impairment** avoid if eGFR less than 30 mL/min/1.73m²

**Breast-feeding** present in milk

**Side-effects** gastro-intestinal disturbances; less commonly sore gums, flushing, headache, dizziness, urinary frequency, anaemia, alopecia; hepatic necrosis, hypersensitivity reactions (including anaphylaxis, pruritus, urticaria, fever, and Stevens-Johnson syndrome), nephrotic syndrome, haemolytic anaemia, leucopenia, and aplastic anaemia also reported

**Dose**

- **ADULT** over 18 years, 80 mg once daily, if after 2–4 weeks serum uric acid greater than 6 mg/100 mL, increase to 120 mg once daily

**Adenuric** (Menarini) Tablets, both yellow, f/c, febuxostat 80 mg, net price 28-tab pack = £24.36; 120 mg 28-tab pack = £24.36

---

### SULFINPYRAZONE

(Sulphinpyrazone)

**Indications** gout prophylaxis, hyperuricaemia

**Cautions** see under Probenecid; regular blood counts advisable; cardiac disease (may cause salt and water retention); interactions: Appendix 1 (sulfinpyrazone)

**Contra-indications** see under Probenecid; avoid in hypersensitivity to NSAIDs

**Hepatic impairment** avoid in severe impairment

**Renal impairment** reduce dose; avoid in severe impairment

**Pregnancy** manufacturer advises caution—no information available

**Breast-feeding** no information available

**Side-effects** gastro-intestinal disturbances, occasionally allergic skin reactions, salt and water retention; rarely blood disorders, gastro-intestinal ulceration and bleeding, acute renal failure, raised liver enzymes, jaundice and hepatitis

**Dose**

- Initially 100–200 mg daily with food (or milk) increasing over 2–3 weeks to 600 mg daily (rarely 800 mg daily), continued until serum uric acid concentration normal then reduced for maintenance (maintenance dose may be as low as 200 mg daily)

**Sulfinpyrazone** (Non-proprietary)

Tablets, sulfinpyrazone 100 mg, net price 84-tab pack = £41.25; 200 mg, 84-tab pack = £79.00. Label: 12, 21

---

### Hyperuricaemia associated with cytotoxic drugs

Allopurinol is used to prevent hyperuricaemia associated with cytotoxic drugs—see section 8.1 (Hyperuricaemia) and Allopurinol above.

**Rasburicase** is licensed for the prophylaxis and treatment of acute hyperuricaemia, before and during initiation of chemotherapy, in patients with haematological malignancy and a high tumour burden at risk of rapid lysis.

---

### RASBURICASE

**Indications** prophylaxis and treatment of acute hyperuricaemia with initial chemotherapy for haematological malignancy

**Cautions** monitor closely for hypersensitivity; atopic allergies; may interfere with test for uric acid—consult product literature

**Contra-indications** G6PD deficiency (section 9.1.5)

**Pregnancy** manufacturer advises avoid—no information available

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** fever; less commonly nausea, vomiting, diarrhoea, headache, hypersensitivity reactions (including rash, bronchospasm and anaphylaxis); haemolytic anaemia, methaemoglobinemia

**Dose**

- By intravenous infusion, 200 micrograms/kg once daily for up to 7 days according to plasma-uric acid concentration

---

### PROBENECID

**Indications** prevention of nephrotoxicity associated with cidofovir (section 5.3.2.2)

**Cautions** ensure adequate fluid intake (about 2–3 litres daily) and render urine alkaline if uric acid overload is high; peptic ulceration; transient false-positive Benedict’s test; G6PD-deficiency (section 9.1.5); interactions: Appendix 1 (probencid)

**Contra-indications** history of blood disorders, nephrotic syndrome, acute gout attack; avoid aspirin and salicylates

**Renal impairment** avoid in severe impairment

**Hepatic impairment** avoid in severe impairment

**Breast-feeding** no information available

**Side-effects** gastro-intestinal disturbances; less commonly sore gums, flushing, headache, dizziness, urinary frequency, anaemia, alopecia; hepatic necrosis, hypersensitivity reactions (including anaphylaxis, pruritus, urticaria, fever, and Stevens-Johnson syndrome), nephrotic syndrome, haemolytic anaemia, leucopenia, and aplastic anaemia also reported

**Dose**

- **ADULT** over 18 years, 80 mg once daily, if after 2–4 weeks serum uric acid greater than 6 mg/100 mL, increase to 120 mg once daily

**Adenuric** (Menarini) Tablets, both yellow, f/c, febuxostat 80 mg, net price 28-tab pack = £24.36; 120 mg 28-tab pack = £24.36

---

10.2 Drugs used in neuromuscular disorders

10.2.1 Drugs that enhance neuromuscular transmission

Anticholinesterases are used as first-line treatment in ocular myasthenia gravis and as an adjunct to immunosuppressant therapy for generalised myasthenia gravis. Corticosteroids are used when anticholinesterases do not control symptoms completely. A second-line immunosuppressant such as azathioprine is frequently used to reduce the dose of corticosteroid.

Plasmapheresis or infusion of intravenous immunoglobulin (unlicensed indication) may induce temporary remission in severe relapses, particularly where bulbar or respiratory function is compromised or before thymectomy.

Anticholinesterases

Anticholinesterase drugs enhance neuromuscular transmission in voluntary and involuntary muscle in myasthenia gravis. They prolong the action of acetylcholine by inhibiting the action of the enzyme acetylcholinesterase. Excessive dosage of these drugs can impair neuromuscular transmission and precipitate cholinergic crises by causing a depolarising block. This may be difficult to distinguish from a worsening myasthenic state.

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secretions, increased gastro-intestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine.

Neostigmine produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an antimuscarinic drug such as atropine or propantheline may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. The maximum that most patients can tolerate is 180 mg daily.

Pyridostigmine is less powerful and slower in action than neostigmine but it has a longer duration of action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastro-intestinal effect but an antimuscarinic drug may still be required. It is inadvisable to exceed a total daily dose of 450 mg in order to avoid acetylcholine receptor down-regulation; patients requiring doses exceeding 450 mg daily will usually require input from a specialised neuromuscular service. Immunosuppressant therapy is usually considered if the dose of pyridostigmine exceeds 360 mg daily.

Neostigmine is also used to reverse the actions of the non-depolarising neuromuscular blocking drugs (see section 15.1.6).

10.1.5 Other drugs for rheumatic diseases

Glucosamine

Glucosamine is a natural substance found in mucopolysaccharides, mucoproteins, and chitin. It is licensed for symptomatic relief of mild to moderate osteoarthritis of the knee, but is not recommended. The mechanism of action is not understood and there is limited evidence to show it is effective.

The Scottish Medicines Consortium (p. 4) has advised (May 2000) that glucosamine (Alateris®) and (July 2011) glucosamine (Glusartel®) are not recommended for use within NHS Scotland for the symptomatic relief of mild to moderate osteoarthritis of the knee.

GLUCOSAMINE

Indications symptomatoc relief of mild to moderate osteoarthritis of the knee

Cautions impaired glucose tolerance (monitor blood-glucose concentration before treatment and periodically thereafter); predisposition to cardiovascular disease (monitor cholesterol); asthma; interactions: Appendix 1 (glucosamine)

Contra-indications shellfish allergy

Pregnancy manufacturers advise avoid—no information available

Breast-feeding manufacturers advise avoid—no information available

Side-effects nausea, abdominal pain, dyspepsia, flatulence, diarrhoea, constipation, drowsiness, headache, fatigue; less commonly flushing, rash, pruritus; also reported visual disturbances, hair loss

Dose

• See under preparations

Alateris® (Dee) Oral

Tablets, scored, glucosamine (as hydrochloride) 625 mg, net price 60-tab pack = £18.40

Dose ADULT over 18 years, 2 tablets once daily; review treatment if no benefit after 2–3 months

Dolenio® (Alissa) Oral

Tablets, 100 mg, net price 30-tab pack = £18.40

Dose ADULT over 18 years, 1 tablet once daily; review treatment if no benefit after 2–3 months

Glusartel® (HFA Healthcare) Oral

Powder, sugar-free, glucosamine sulfate (as sodium chloride) 1.5 g sachet, net price 30-sachet pack = £18.40. Label: 13

Electrolytes Na+ 6.52 mmol/tablet

Dose ADULT over 18 years, 1 sachet (dissolved in at least 250 ml of water) once daily; review treatment if no benefit after 2–3 months

10.1.5 Other drugs for rheumatic diseases

Fasturtec® (Sanoﬁ-Aventis) Oral

Intravenous infusion, powder for reconstitution, rasburicase, net price 1.5-mg vial (with solvent) = £69.46; 7.5-mg vial (with solvent) = £289.44

Dose ADULT over 18 years, 2 tablets once daily; review treatment if no benefit after 2–3 months

Over 18 years, 1 sachet (dissolved in at least 250 ml of water) once daily; review treatment if no benefit after 2–3 months

Oral powder, 360 mg daily.

Lyrica (Novartis) Oral

Dose ADULT over 18 years, 1 capsule every 2 hours. The maximum that most patients can tolerate is 180 mg daily.

Fasturtec is also used to reverse the actions of the non-depolarising neuromuscular blocking drugs (see section 15.1.6).

10.2 Drugs used in neuromuscular disorders

10.2.1 Drugs that enhance neuromuscular transmission

Anticholinesterases

Anticholinesterase drugs enhance neuromuscular transmission in voluntary and involuntary muscle in myasthenia gravis. They prolong the action of acetylcholine by inhibiting the action of the enzyme acetylcholinesterase. Excessive dosage of these drugs can impair neuromuscular transmission and precipitate cholinergic crises by causing a depolarising block. This may be difficult to distinguish from a worsening myasthenic state.

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secretions, increased gastro-intestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine.

Neostigmine produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an antimuscarinic drug such as atropine or propantheline may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. The maximum that most patients can tolerate is 180 mg daily.

Pyridostigmine is less powerful and slower in action than neostigmine but it has a longer duration of action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastro-intestinal effect but an antimuscarinic drug may still be required. It is inadvisable to exceed a total daily dose of 450 mg in order to avoid acetylcholine receptor down-regulation; patients requiring doses exceeding 450 mg daily will usually require input from a specialised neuromuscular service. Immunosuppressant therapy is usually considered if the dose of pyridostigmine exceeds 360 mg daily.

Neostigmine is also used to reverse the actions of the non-depolarising neuromuscular blocking drugs (see section 15.1.6).
Neostigmine

Indications myasthenia gravis; other indications (section 15.1.6)

Cautions asthma (extreme caution), bradycardia, arrhythmias, recent myocardial infarction, epilepsy, hypotension, parkinsonism, vagotonia, peptic ulceration, hyperthyroidism; atropine or other antide to muscarinic effects may be necessary (particularly when neostigmine is given by injection), but not given routinely because it may mask signs of overdosage; interactions: Appendix 1 (parasympathomimetics)

Contra-indications intestinal or urinary obstruction

Renal impairment may need dose reduction

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding see under Neostigmine

Pregnancy reduce dose; excreted by kidney

Contra-indications see under Neostigmine; weaker muscarinic action

Cautions

Side-effects nausea, vomiting, increased salivation, diarrhoea, abdominal cramps (more marked with higher doses); signs of overdosage include bronchoconstriction, increased bronchial secretions, lacrimation, excessive sweating, involuntary defaecation and micturition, miosis, nystagmus, bradycardia, heart block, arrhythmias, hypotension, agitation, excessive dreaming, and weakness eventually leading to fasciculation and paralysis

Dose

- By mouth, neostigmine bromide 15–30 mg at suitable intervals throughout day, total daily dose 75–300 mg (but see also notes above); NEONATE 1–5 mg every 4 hours, half an hour before feeds; CHILD up to 6 years initially 7.5 mg, 6–12 years initially 15 mg, usual total daily dose 15–90 mg

- By subcutaneous or intramuscular injection, ADULT and CHILD over 12 years, neostigmine methylsulphate 1–2.5 mg at suitable intervals throughout day (usual total daily dose 5–20 mg); NEONATE 150 micrograms/kg every 6–8 hours 30 minutes before feeds, increased to max. 300 micrograms/kg every 4 hours, if necessary (unlicensed); CHILD 1 month–12 years 200–500 micrograms as required

Neostigmine (Non-proprietary) tablets, scored, neostigmine bromide 15 mg, net price 140 = £68.31

Injection Section 15.1.6

Pyridostigmine bromide

Indications myasthenia gravis

Cautions see under Neostigmine; weaker muscarinic action

Contra-indications see under Neostigmine

Renal impairment reduce dose; excreted by kidney

Pregnancy see under Neostigmine

Breast-feeding see under Neostigmine

Side-effects see under Neostigmine

Dose

- By mouth, 30–120 mg at suitable intervals throughout day, total daily dose 0.3–1.2 g (but see also notes above); CHILD under 18 years, see BNF for Children

Mestinon® (Meda) tablets, scored, pyridostigmine bromide 60 mg, net price 200 = £45.57

Injection Section 15.1.6

Immunosuppressant therapy

Corticosteroids (section 6.3) are established as treatment for myasthenia gravis; although they are commonly given on alternate days there is little evidence of benefit over daily administration. Corticosteroid treatment is usually initiated under in-patient supervision and all patients should receive osteoporosis prophylaxis (section 6.6).

In generalised myasthenia gravis small initial doses of prednisolone (10 mg on alternate days) are increased in steps of 10 mg on alternate days to 1–1.5 mg/kg (max. 100 mg) on alternate days. When given daily, prednisolone is started at 5 mg daily and then increased in steps of 5 mg daily to 60 mg daily or occasionally up to 80 mg daily (0.75–1 mg/kg daily). About 10% of patients experience a transient but very serious worsening of symptoms in the first 2–3 weeks, especially if the corticosteroid is started at a high dose. However, ventilated patients may be started on 1.5 mg/kg (max. 100 mg) on alternate days. Smaller doses of corticosteroid are usually required in oculomotor myasthenia. Once clinical remission has occurred (usually after 2–6 months), the dose of prednisolone should be reduced slowly to the minimum effective dose (usually 10–40 mg on alternate days).

In generalised myasthenia gravis azathioprine (section 8.2.1) is usually started at the same time as the corticosteroid and it allows a lower maintenance dose of the corticosteroid to be used; azathioprine is initiated at a dose of 0.5–1 mg/kg daily, which is increased over 3–4 weeks to 2–2.5 mg/kg daily. Ciclosporin (section 8.2.2), methotrexate (section 8.1.3), or mycophenolate mofetil (section 8.2.1) can be used in patients unresponsive or intolerant to other treatments [unlicensed indications].

Acetylcholine-release enhancers

Amifampridine is licensed for the symptomatic treatment of Lambert-Eaton myasthenic syndrome (LEMS), a rare disorder of neuromuscular transmission.

The Scottish Medicines Consortium (p. 4) has advised (July 2012) that amifampridine phosphate (Firdapse®) is not recommended for use within NHS Scotland for the symptomatic treatment of Lambert-Eaton myasthenic syndrome (LEMS).

Fampridine is licensed for the improvement of walking in patients with multiple sclerosis who have a walking disability.

Amifampridine

Indications (specialist use only) symptomatic treatment of Lambert-Eaton myasthenic syndrome

Cautions concomitant use of drugs that lower convulsive threshold; non-paraneoplastic form of Lambert-Eaton myasthenic syndrome; clinical and ECG monitoring required at treatment initiation and yearly thereafter

Contra-indications epilepsy; uncontrolled asthma; congenital QT syndrome; avoid concomitant use of drugs that prolong QT interval; avoid concomitant use of drugs with a narrow therapeutic index

Hepatic impairment use with caution; in mild impairment reduce initial dose to 10 mg daily in divided doses, increased in steps of 5 mg every 7 days; in moderate or severe impairment reduce initial dose to 5 mg daily in divided doses, increased in steps of 5 mg every 7 days
Renal impairment use with caution; in mild impairment reduce initial dose to 10 mg every 7 days; in moderate or severe impairment reduce initial dose to 5 mg daily in divided doses, increased in steps of 5 mg every 7 days; in moderate or severe impairment reduce initial dose to 5 mg daily in divided doses, increased in steps of 5 mg every 7 days

Pregnancy manufacturer advises avoid—ensure effective contraception during treatment in men and women

Breast-feeding manufacturer advises avoid—no information available

Side-effects gastro-intestinal disorders; parasthesia; palpitations, arrhythmias, Raynaud’s syndrome, cough, bronchial hypersecretion, exacerbation or precipitation of asthma, sleep disturbances, convulsions, anxiety, drowsiness, dizziness, weakness, headache, chorea, myoclonia, and blurred vision also reported

Dose

• ADULT over 18 years, initially 15 mg daily in 3 divided doses, increased in steps of 5 mg every 4–5 days, to max. 60 mg daily in 3–4 divided doses; max. single dose 20 mg

Firdapse® (BioMarin) Tablets, scored, amifampridine (as phosphate) 10 mg, net price 100-tab pack = £1815.00. Label: 3, 21

FAMPYRIDINE

Indications (specialist use only) improvement of walking disability in multiple sclerosis

Cautions predisposition to seizures including concomitant use of drugs that lower seizure threshold; symptomatic cardiac rhythm disorders, sinoatrial or atrioventricular conduction disorders; interactions: Appendix 1 (fampridine)

Contra-indications history of seizures (discontinue treatment if seizures occur)

Renal impairment avoid if eGFR less than 80 mL/minute/1.73 m²

Pregnancy avoid—toxicity in animal studies

Breast-feeding avoid—no information available

Side-effects nausea, vomiting, constipation, dyspepsia, dyspnoea, pharyngolaryngeal pain, dizziness, headache, paraesthesia, tremor, malaise, insomnia, anxiety, urinary tract infection, back pain; less commonly seizures

Dose

• ADULT over 18 years, 10 mg every 12 hours; discontinue treatment if no improvement within 2 weeks

Fampridine® (Biogen) Tablets, 10 mg, net price 28-tab pack (2 × 14) = £362.00. Label: 23, 25

BACLOFEN

Indications chronic severe spasticity resulting from disorders such as multiple sclerosis or traumatic partial section of spinal cord

Cautions psychiatric illness, Parkinson’s disease, cerebrovascular disease, elderly; respiratory impairment; epilepsy; history of peptic ulcer (avoid oral route in active peptic ulceration); diabetes; hypertonic bladder sphincter; avoid abrupt withdrawal (risk of hyperactive state, may exacerbate spasticity, and precipitate autonomic dysfunction including hyperthermia, psychiatric reactions and convulsions, see also under Withdrawal below); interactions: Appendix 1 (muscle relaxants)

Withdrawal Serious side-effects can occur on abrupt withdrawal; to minimise risk, discontinue gradual dose reduction over at least 1–2 weeks (longer if symptoms occur)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Specific cautions for intrathecal treatment coagulation disorders; previous spinal fusion procedure; malnutrition (increased risk of post-surgical complications)

Contra-indications Specific contra-indications for intrathecal treatment local or systemic infection

Hepatic impairment manufacturer advises use by mouth with caution

10.2.2 Skeletal muscle relaxants

The drugs described below are used for the relief of chronic muscle spasm or spasticity associated with multiple sclerosis or other neurological damage; they are not indicated for spasm associated with minor injuries. Baclofen, diazepam, and tizanidine act principally on the central nervous system. Dantrolene, has a peripheral site of action; cannabis extract has both a central and a peripheral action. Skeletal muscle relaxants differ in action from the muscle relaxants used in anaesthesia (section 15.1.5), which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection) remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of treatment with these drugs is that reduction in muscle tone can cause a loss of splitting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

Baclofen inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of sedation and muscular hypotonia (other adverse events are uncommon).

A cannabis extract containing dromabinol (delta-9-tetrahydrocannabinol) and cannabidiol is licensed as an adjunct treatment for moderate to severe spasticity associated with multiple sclerosis in patients who have not responded adequately to other skeletal muscle relaxants. The dose should be titrated over 2 weeks; response to treatment should be reviewed after 4 weeks and treatment stopped if an adequate response is not achieved.

Dantrolene acts directly on skeletal muscle and produces fewer central adverse effects making it a drug of choice. The dose should be increased slowly.

Diazepam can also be used. Sedation and occasionally extensor hypotonus are disadvantages. Other benzodiazepines also have muscle-relaxant properties. Muscle-relaxant doses of benzodiazepines are similar to anxiolytic doses (section 4.1.2).

Tizanidine is an alpha₂-adrenoceptor agonist indicated for spasticity associated with multiple sclerosis or spinal cord injury.
10.2.2 Skeletal muscle relaxants

**Renal impairment** risk of toxicity—use smaller doses (e.g. 5 mg daily by mouth) and if necessary increase dosage interval; if eGFR less than 15 mL/minute/1.73m² manufacturer advises use by mouth only if potential benefit outweighs risk, excreted by kidney

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk (toxicity in animals studies)

**Side-effects** gastro-intestinal disturbances, dry mouth; hypotension, respiratory or cardiovascular depression; sedation, drowsiness, confusion, dizzi-

**Dose**
- **By mouth, ADULT** over 18 years, initially 5 mg 3 times daily, gradually increased; usual maintenance dose up to 60 mg daily in divided doses (max. 100 mg daily); **CHILD** under 18 years, initially 300 micrograms/kg daily in 4 divided doses, increased at weekly intervals until satisfactory response; usual maintenance dose 0.75–2 mg/kg daily in divided doses; **CHILD** up to 8 years, max. total daily dose 40 mg/day; **CHILD** 8–18 years, max. total daily dose 60 mg/day

**Note** Review treatment if no benefit within 6 weeks of achieving maximum dose

- **By intrathecal injection, specialist use only, severe chronic spasticity unresponsive to oral antispastic drugs (or where side-effects of oral therapy unacceptable)** or as alternative to ablative neurosurgical procedures, **ADULT** over 18 years, initial test dose 25–50 micrograms over at least 1 minute via catheter or lumbar puncture, increased in 25-microgram steps (not more often than every 24 hours) to max. 100 micrograms to determine appropriate dose, then dose-titration phase, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish maintenance dose (ranging from 12 micrograms to 2 mg daily for spasticity of spinal origin or 22 micrograms to 1.4 mg daily for spasticity of cerebral origin) retaining some spasticity to avoid sensory paralysis; **CHILD** 4–18 years (spasticity of cerebral or spinal origin only), initial test dose 25–50 micrograms then titrated as for **ADULT**, initial maintenance dose 25–200 micrograms daily, adjusted according to response

**Important** Consult product literature for details on test dose and titration—important to monitor patients closely in appropriately equipped and staffed environment during screening and immediately after pump implantation. Resuscitation equipment must be available for immediate use. Treatment with continuous pump-administered intrathecal baclofen should be initiated within 3 months of a satisfactory response to intrathecal baclofen testing.

**Baclofen** (Non-proprietary) Tablets, scored, baclofen 10 mg, net price 100-tab pack = £12.38. Label: 2, 8, 21

**Oral solution**, baclofen 5 mg/5 mL, net price 300 mL = £4.48. Label: 2, 8, 21

**Brands include Lyflex® (sugar-free)**

**Intrathecal injection**, baclofen 50 micrograms/mL, net price 1-mL amp (for test dose) = £2.19; 500 micrograms/mL, 20-mL amp (for use with implantable pump) = £48.62; 2 mg/mL, 5-mL amp (for use with implantable pump) = £48.62

---

**CANNABIS EXTRACT**

**Indications** adjunct in moderate to severe spasticity in multiple sclerosis (specialist use only)

**Cautions** significant cardiovascular disease; history of epilepsy; monitor oral mucosa—interrupt treatment if lesions or persistent soreness; **interactions**: Appendix 1 (cannabis extract)

**Driving** May affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced

**Contra-indications** personal or family history of psychosis; history of other severe psychiatric disorder

**Hepatic impairment** manufacturer advises more frequent monitoring in significant impairment—possible risk of prolonged or enhanced effect

**Renal impairment** manufacturer advises more frequent monitoring in significant impairment—possible risk of prolonged or enhanced effect

**Pregnancy** manufacturer advises use only if potential benefit outweighs risks and recommends effective contraception during and for 2 months after treatment in men and women

**Breast-feeding** avoid—present in milk

**Side-effects** increased or decreased appetite, taste disturbance, constipation, diarrhoea, nausea, vomiting, dry mouth, mouth ulcers, oral pain, dizziness, vertigo, malaise, depression, disorientation, dissociation, mood disturbance, amnesia, impaired attention, drowsiness, dysarthria, blurred vision; less commonly abdominal pain, oromucosal and tooth discoloration, stomatitis, palpitation, tachycardia, hypertension, pharyngitis, syncope, hallucinations, paranoia, delusions, suicidal thoughts; also reported anxiety, seizures

**Dose** Consult product literature

**Sativex** (Bayer) 1-Cannabinoids: Appendix 1 (cannabis extract)

**Oromucosal spray**, Cannabis sativa extract (containing dronabinol (delta-9-tetrahydrocannabinol) 27 mg and cannabidiol 25 mg/mL), net price 3 × 10-mL units = £375.00. Counselling, driving see above

**Excipients** include propylene glycol

**DANTROLENE SODIUM**

**Indications** chronic severe spasticity of voluntary muscle; malignant hyperthermia (section 15.1.8)

**Cautions** impaired cardiac and pulmonary function; therapeutic effect may take a few weeks to develop—discontinue if no response within 6–8 weeks; **interactions**: Appendix 1 (muscle relaxants)

**Hepatotoxicity** Potentially life-threatening hepatotoxicity reported, usually if doses greater than 400 mg daily used, in females, patients over 30 years, if history of liver disorders, or concomitant use of hepatotoxic drugs; test liver function before and at intervals during therapy—discontinue if abnormal liver function tests or symptoms of liver disorder
Dose section 4.1.2; also hypotonia

Side-effects Breast-feeding present in milk—manufacturer advises avoid (present in milk in section 4.1.2)

Hepatic impairment avoid—may cause severe liver damage; injection may be used in an emergency for malignant hyperthermia

Pregnancy avoid use in chronic spasticity—embryotoxic in animal studies

Breast-feeding present in milk—manufacturer advises avoid use in chronic spasticity

Side-effects diarhoea (withdraw if severe, discontinue treatment if recurs on re-introduction), nausea, vomiting, anorexia, hepatotoxicity (see above), abdominal pain; pericarditis; pleural effusion, respiratory depression; headache, drowsiness, dizziness, asthenia, fatigue, seizures, fever, chills; speech and visual disturbances; rash; less commonly dysphoria, constipation, exacerbation of cardiac insufficiency; tachycardia, erratic blood pressure, dyspnoea, depression, confusion, nervousness, insomnia, increased urinary frequency, urinary incontinence or retention, haematuria, crystalluria, and increased sweating

Dose

- Initially 25 mg daily, may be increased at weekly intervals to max. 100 mg 4 times daily; usual dose 75 mg 3 times daily; CHILD 5–18 years see BNF for Children.

Dantrolium® (Spepharm) 

Capsules, orange/brown, dantrolene sodium 25 mg, net price 100 = £16.87; 100 mg, 100 = £43.07. Label: 2, counselling, driving, hepatotoxicity

DIAZEPAM

Indications muscle spasm of varied aetiology, including tetanus; other indications (section 4.1.2, section 4.8, section 15.1.4.1)

Cautions section 4.1.2; special precautions for intravenous injection (section 4.8.2)

Contra-indications section 4.1.2

Hepatic impairment section 4.1.2

Renal impairment section 4.1.2

Pregnancy section 4.1.2

Breast-feeding section 4.1.2

Side-effects section 4.1.2; also hypotonia

Dose

- Muscle spasm, by mouth, 2–15 mg daily in divided doses, increased if necessary in spastic conditions to 60 mg daily according to response
- Cerebral spasticity in selected cases, CHILD 2–40 mg daily in divided doses
- By intramuscular or by slow intravenous injection (into a large vein at a rate of not more than 5 mg/minute), in acute muscle spasm, 10 mg repeated if necessary after 4 hours

Note Only use intramuscular route when oral and intravenous routes not possible; emulsion formulation preferred for intravenous injection; special precautions for intravenous injection, see section 4.8.2

TIZANIDINE

Indications spasticity associated with multiple sclerosis or spinal cord injury or disease

Cautions elderly; monitor liver function monthly for first 4 months and in those who develop unexplained nausea, anorexia or fatigue; concomitant administration of drugs that prolong QT interval; avoid abrupt withdrawal (risk of rebound hypertension and tachycardia, see under Withdrawal, below); interactions: Appendix 1 (muscle relaxants)

Withdrawal Rebound hypertension and tachycardia can occur on abrupt withdrawal; to minimise risk, discontinue gradually and monitor blood pressure

Driving Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Hepatic impairment avoid use in severe impairment; use in moderate impairment only if potential benefit outweighs risk

Renal impairment manufacturer advises caution

Pregnancy avoid (toxicity in animal studies)

Breast-feeding avoid (present in milk in animal studies)

Side-effects dry mouth, nausea, gastro-intestinal disturbance, altered liver enzymes (discontinue if persistently raised—consult product literature), hypotension, drowsiness, fatigue, dizziness; less commonly bradycardia; also reported hepatitis, liver failure, insomnia, hallucinations, confusion, convulsions, syncope, asthenia, blurred vision

Dose

- ADULT over 18 years, initially 2 mg daily as a single dose increased according to response at intervals of at least 3–4 days in steps of 2 mg daily and given in divided doses usually up to 24 mg daily in 3–4 divided doses; max. 36 mg daily

Tizanidine (Non-proprietary) 

Tablets, tizanidine (as hydrochloride) 2 mg net price £17.25; 4 mg, 120-tab pack = £24.07. Label: 2, 8

Zanaflex® (TEVA UK) 

Tablets, scored, tizanidine (as hydrochloride) 2 mg, net price 120-tab pack = £30.41; 4 mg, 120-tab pack = £42.18. Label: 2, 8

Other muscle relaxants

The clinical efficacy of methocarbamol and meprobamate (section 4.1.2) as muscle relaxants is not well established, although they have been included in compound analgesic preparations.

METHOCARBAMOL

Indications short-term symptomatic relief of muscle spasm (but see notes above)

Cautions interactions: Appendix 1 (muscle relaxants)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced
Quinine salts (section 5.4.1), such as quinine sulfate 200–300mg at bedtime, are effective in reducing the frequency of nocturnal leg cramps by about 25% in ambulatory patients; however, because of potential toxicity, quinine is not recommended for routine treatment and should not be used unless cramps cause regular disruption to sleep. Quinine should only be considered when cramps are very painful or frequent; when other treatable causes of cramp have been excluded; and when non-pharmacological treatments have not worked (e.g. passive stretching exercises). It may take up to 4 weeks for improvement to become apparent; if there is benefit, quinine treatment can be continued. Patients should be monitored closely during the early stages for adverse effects as well as for benefit. Treatment should be interrupted at intervals of approximately 3 months to assess the need for further quinine treatment. In patients taking quinine long term, a trial discontinuation may be considered. Quinine is toxic in overdosage and accidental fatalities have occurred (see also below).

**QUININE**

**Indications** see notes above; malaria (section 5.4.1)

**Cautions** see section 5.4.1 and notes above

**Contra-indications** section 5.4.1

**Pregnancy** section 5.4.1

**Breast-feeding** section 5.4.1

**Side-effects** section 5.4.1; important: very toxic in overdosage—immediate advice from poison centres essential (see also p. 39)

**Dose**

- See notes above

**Preparations**

Section 5.4.1

---

**Extravasation**

Local guidelines for the management of extravasation should be followed where they exist or specialist advice sought.

Extravasation injury follows leakage of drugs or intravenous fluids from the veins or inadvertent administration into the subcutaneous or subdermal tissue. It must be dealt with promptly to prevent tissue necrosis. Acidic or alkaline preparations and those with an osmolality greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. In addition, certain patients such as the very young and the elderly are at increased risk. Those receiving anticoagulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or analgesics may not notice the early signs or symptoms of extravasation.

**Prevention of extravasation** Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and patients receiving repeated doses of hazardous drugs peripherally should have the cannula rested at regular intervals. Attention should be paid to the manufacturers’ recommendations for administration. Placing a glyceryl trinitrate patch (section 2.6.1) distal to the cannula may improve the patency of the vessel in patients with small veins or in those whose veins are prone to collapse.

Patients should be asked to report any pain or burning at the site of injection immediately.

**Management of extravasation** If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) in order to remove as much of the drug as possible. Aspiration is sometimes possible if the extravasation presents with a raised bleb or blister at the injection site and is surrounded by hardened tissue, but it is often unsuccessful if the tissue is soft or soggy. Corticosteroids are usually given to treat inflammation, although there is little evidence to support their use in extravasation. Hydrocortisone or dexamethasone (section 6.3.2) can be given either locally by subcutaneous injection or intravenously at a site distant from the injury. **Antihistamines** (section 3.4.1) and **analgesics** (section 4.7) may be required for symptom relief.

The management of extravasation beyond these measures is not well standardised and calls for specialist advice. Treatment depends on the nature of the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it.
Collagenases

Collagenases are proteolytic enzymes that are derived from the fermentation of *Clostridium histolyticum* and have the ability to break down collagen. A preparation containing a mixture of two collagenases is licensed for the treatment of Dupuytren’s contracture; the preparation should be injected into a palpable cord with a contracture of a metacarpophalangeal joint or proximal interphalangeal joint.

The Scottish Medicines Consortium (p. 4) has advised (April 2012) that collagenase *Clostridium histolyticum* (Xiapex®) is accepted for restricted use within NHS Scotland as an alternative to limited fasciectomy, for the treatment of Dupuytren’s contracture of moderate severity (as defined by the British Society for Surgery of the Hand) in patients with a palpable cord and up to two affected joints per hand, who are suitable for limited fasciectomy, but for whom percutaneous needle fasciectomy is not considered a suitable treatment option.

**Indications**

Dupuytren’s contracture in patients with a palpable cord

**Cautions**

Coagulation disorders or use of anticoagulants

**Contra-indications**

Avoid injecting into other structures containing collagen (e.g. tendons, nerves, and blood vessels)—risk of tendon rupture or ligament damage

**Pregnancy**

Manufacturer advises avoid

**Breast-feeding**

Systemic absorption by mother negligible

**Side-effects**

Paraesthesia, hypoesthesia, burning sensation, lymphadenopathy, arthralgia, myalgia, joint swelling, injection site reactions, ecchymosis, hyperhidrosis; less commonly complex regional pain syndrome, monoplegia, tremor, crepitus, muscle spasm and weakness, tendon rupture, ligament injury, wound dehiscence

**Dose**

- By intraleisional injection into palpable cord, **ADULT** over 18 years, 580 micrograms; if necessary repeat at intervals of approx. 4 weeks; max. 3 injections per cord; max. 8 injections in total; only one cord may be treated at a time

**Note**

Reconstitution and injected volumes vary with site of injection—consult product literature

**Xiapex®** (Auxilium) ▼

Injection, powder for reconstitution, collagenase *Clostridium histolyticum*, net price 900-microgram vial (with solvent) = £650.00

**Hyaluronidase**

Hyaluronidase is used to render the tissues more readily permeable to injected fluids, e.g. for introduction of fluids by subcutaneous infusion (termed hypodermoclysis).

**Indications**

Enhance permeation of subcutaneous or intramuscular injections, local anaesthetics and subcutaneous infusions; promote resorption of excess fluids and blood

**Cautions**

Infants or elderly (control speed and total volume and avoid overhydration especially in renal impairment)

**Contra-indications**

Do not apply direct to cornea; avoid sites where infection or malignancy; not for anaesthesia in unexplained premature labour; not to be used to reduce swelling of bites or stings; not for intravenous administration; not to be used to enhance the absorption and dispersion of dopamine and/or alpha-adrenoceptor agonists

**Side-effects**

Oedema; rarely local irritation, infection, bleeding, bruising; occasional severe allergy (including anaphylaxis)

**Dose**

- With subcutaneous or intramuscular injection, 1500 units dissolved directly in solution to be injected (ensure compatibility)
- With local anaesthetics, 1500 units mixed with local anaesthetic solution (ophthalmology, 15 units/mL)
- Hypodermoclysis, 1500 units dissolved in 1 mL water for injections or 0.9% sodium chloride injection, administered before start of 500–1000 mL infusion fluid
- Extravasation (see notes above) or haematoma, 1500 units dissolved in 1 mL water for injections or 0.9% sodium chloride injection, infiltrated into affected area (as soon as possible after extravasation)

**Hyalase®** (Wockhardt) ▼

Injection, powder for reconstitution, hyaluronidase (ovine). Net price 1500-unit amp = £7.60

**Rhubafacients, topical NSAIDs, capsaicin, and poultices**

Rhubafacients act by counter-irritation. Pain, whether superficial or deep-seated, is relieved by any method that itself produces irritation of the skin. Topical rhubafacent preparations may contain nicotinate and salicylate compounds, essential oils, capsaicin, and camphor. The evidence available does not support the use of topical rhubafacients in acute or chronic musculoskeletal pain.
Topical NSAIDs

The use of a NSAID by mouth is effective for relieving musculoskeletal pain. Topical NSAIDs (e.g. felbinac, ibuprofen, ketoprofen, and piroxicam) may provide some relief of pain in musculoskeletal conditions; they can be considered as an adjunctive treatment in knee or hand osteoarthritis (see section 10.1).

Cautions Apply with gentle massage only. Avoid contact with eyes, mucous membranes, and inflamed or broken skin; discontinue if rash develops. Hands should be washed immediately after use. Not for use with occlusive dressings. Topical application of large amounts can result in systemic effects (see section 10.1.1), including hypersensitivity and asthma (renal disease has also been reported). Not generally suitable for children. Patient packs carry a warning to avoid during pregnancy or breast-feeding.

Hypersensitivity For NSAID hypersensitivity and asthma warning, see p. 703 and p. 704

Photosensitivity Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity. Patients using preparations containing ketoprofen should be advised not to expose area treated to sunbeds or sunlight (even on a bright but cloudy day) during, and for two weeks after stopping treatment; treated areas should be protected with clothing.

Non-proprietary preparations

Ibufrofen (Non-proprietary)

Gel, ibuprofen 5%, net price 30 g = £1.28, 50 g = £2.11, 100 g = £4.22. Counselling, photosensitivity, see above

Dose apply up to 3 times daily

Ketoprofen (Non-proprietary) Gel, ketoprofen 2.5%, net price 50 g = £4.47, 50 g = £1.64, 100 g = £3.28. Counselling, photosensitivity, see above

Dose apply 2–4 times daily for up to 7 days (usual max 15 g daily)

Piroxicam (Non-proprietary)

Gel, piroxicam 0.5%, net price 60 g = £2.83; 112 g = £5.28. Counselling, photosensitivity, see above

Dose apply 3–4 times daily

Proprietary preparations

Feldene® (Pfizer) Gel, piroxicam 0.5%, net price 60 g = £6.00; 112 g = £9.41 (also 7.5 g starter pack, hosp. only). Counselling, photosensitivity, see above

Excipients include benzyl alcohol, propylene glycol

Dose apply 3–4 times daily; therapy should be reviewed after 4 weeks

Fenbid® Forte Gel (AMCo) Gel, ibuprofen 10%, net price 100 g = £4.00. Counselling, photosensitivity, see above

Excipients include benzyl alcohol

Dose apply up to 4 times daily; therapy should be reviewed after 14 days

Ibuigel® Forte (Dermal) Gel, ibuprofen 10%, net price 100 g = £5.79. Counselling, photosensitivity, see above

Excipients none as listed in section 13.1.3

Dose apply up to 3 times daily

1 Smaller pack sizes available on sale to the public

Orotuvil® (Sanofi-Aventis) Gel, ketoprofen 2.5%, net price 100 g = £6.84. Counselling, photosensitivity, see above

Excipients include fragrance

Dose apply 2–4 times daily for up to 7 days (usual recommended dose 15 g daily)

Powergel® (Menarini) Gel, ketoprofen 2.5%, net price 50 g = £3.06; 100 g = £5.89. Counselling, photosensitivity, see above

Excipients include fragrance

Dose apply 2–3 times daily for up to max. 10 days

Traxam® (AMCo) Foam, diclofenac diethylammonium salt 1.16% (equivalent to diclofenac sodium 1%), net price 20 g (hosp. only) = £1.55; 100 g = £5.63. Counselling, photosensitivity, see above

Excipients include hydroxybenzoates (parabens), propylene glycol

Dose apply 3–4 times daily; therapy should be reviewed after 14 days (or after 28 days for osteoarthritis)

Voltarol Emugel® (Novartis) Gel, diclofenac epolamine (equivalent to diclofenac sodium per patch), net price 10-patch pack = £14.09. Counselling, photosensitivity, see above

Excipients include propylene glycol, fragrance

Dose apply 3–4 times daily

Voltarol Gel Patch® (Novartis) Gel patch, diclofenac epolamine (equivalent to 140 mg diclofenac sodium per patch), net price 10-patch pack = £14.09. Counselling, photosensitivity, see above

Excipients include hydroxybenzoates (parabens), propylene glycol

Dose ADULT and CHILD over 15 years, ankle sprain, apply 1 patch daily for up to 3 days; epicondylitis, apply 1 patch twice daily for up to 14 days

Capsaicin

A preparation containing capsaicin 0.025% can be considered as an adjunct in hand or knee osteoarthritis (see section 10.1). It may need to be used for 1–2 weeks before pain is relieved.

A capsaicin 0.075% cream is licensed for the symptomatic relief of postherpetic neuralgia (section 4.7.3) after lesions have healed, and for the relief of painful diabetic neuropathy (section 6.1.5).

A self-adhesive patch containing capsaicin 0.025% can be considered as an adjunct in hand or knee osteoarthritis (see section 10.1). It may need to be used for 1–2 weeks before pain is relieved.

The Scottish Medicines Consortium (p. 4) has advised (January 2011) that capsaicin 179 mg (8%) patch (Quenteza®) is accepted for restricted use within NHS Scotland for the treatment of postherpetic neuralgia in patients who have not achieved adequate pain relief from, or who have not tolerated conventional first and second-line treatments. Treatment should be under the supervision of a specialist in pain management.

1 Various pack sizes available on sale to the public
Zacin® (TEVA UK)
Cream, capsaicin 0.025%, net price 45 g = £17.71.
Excipients include benzyl alcohol, cetyl alcohol
Cautions avoid contact with eyes, inflamed or broken skin; wash hands immediately after use (or wash hands 30 minutes after application if hands treated); not to be used under tight bandages; avoid hot shower or bath just before or after application (burning sensation enhanced); avoid inhalation of vapours
Side-effects transient burning sensation during initial treatment (particularly if too much used or if administered less than 4 times daily); rarely cough, sneezing, eye irritation; dyspnoea and exacerbation of asthma also reported
Dose symptomatic relief in osteoarthritis, apply sparingly 4 times daily (not more often than every 4 hours)

Axsain® (TEVA UK)
Cream, capsaicin 0.075%, net price 45 g = £14.58.
Excipients include benzyl alcohol, cetyl alcohol
Cautions avoid contact with eyes, inflamed or broken skin; wash hands immediately after use (or wash hands 30 minutes after application if hands treated); not to be used under tight bandages; avoid hot shower or bath just before or after application (burning sensation enhanced); avoid inhalation of vapours
Side-effects transient burning sensation during initial treatment (particularly if too much used or if administered less than 3–4 times daily); rarely cough, sneezing, eye irritation; dyspnoea and exacerbation of asthma also reported
Dose post-herpetic neuralgia (important: after lesions have healed), apply sparingly up to 3–4 times daily (not more often than every 4 hours)
Post-hypertensive neuralgia, under specialist supervision, apply sparingly 3–4 times daily (not more often than every 4 hours) for 8 weeks then review

Qutenza® (Astellas)
Patches, self-adhesive, capsaicin 179 mg (8%), net price 16280 cm² patch (with cleansing gel) = £210.00.
Excipients include butylated hydroxyanisole in cleansing gel (see section 13.1.3)
Cautions avoid holding near eyes or mucous membranes; avoid contact with inflamed or broken skin, the face, scalp or in proximity to mucous membranes; monitor blood pressure during treatment procedure; uncontrolled hypertension; recent cardiovascular events
Side-effects application site reactions including transient burning, erythema, pruritus; less commonly nausea; peripheral oedema, first degree AV block, tachycardia, palpitations, hypertension; cough, throat irritation; hypoaesthesia, burning sensation, dysgeusia, pain in extremities, muscle spasm; eye irritation; pruritus
Dose peripheral neuropathic pain in non-diabetic patients, applied under supervision of a physician, consult product literature
Note Nitrile gloves to be worn while handling patches and cleaning treatment areas (latex gloves do not provide adequate protection)

Poultices
Kaolin Poultice
Poultice, heavy kaolin 52.7%, thymol 0.05%, boric acid 4.5%, peppermint oil 0.05%, methyl salicylate 0.2%, glycerol 42.5%. Net price 200 g = £2.76
Dose warm and apply directly or between layers of muslin; avoid application of overheated poultice

Kaolin Poultice K/L Pack® (K/L)
Kaolin poultice Net price 4 × 100-g pouches = £6.40
11.1 Administration of drugs to the eye

Drugs are most commonly administered to the eye by topical application as eye drops or eye ointments. When a higher drug concentration is required within the eye, a local injection may be necessary, see Other Preparations, below.

Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles and some are prescribable on the NHS (consult Drug Tariff—see Appliances and Reagents, p. 1092 for links to online Drug Tariffs). Product-specific devices may be supplied by manufacturers—consult individual manufacturers for information. They are particularly useful for the elderly, visually impaired, arthritic, or otherwise physically limited patients.

Eye drops and eye ointments Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid and keeping the eye closed for as long as possible after application; one drop is all that is needed. Instillation of more than one drop should be discouraged because it may increase systemic side-effects. A small amount of eye ointment is applied similarly; the ointment melts rapidly and blinking helps to spread it.

When two different eye-drop preparations are used at the same time of day, dilution and overflow may occur when one immediately follows the other. The patient should therefore leave an interval of at least 5 minutes between the two; the interval should be extended when eye drops with a prolonged contact time, such as gels and suspensions, are used. Eye ointment should be applied after drops.

Systemic effects may arise from absorption of drugs into the general circulation from conjunctival vessels or from the nasal mucosa after the excess preparation has drained down through the tear ducts. The extent of systemic absorption following ocular administration is highly variable; nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Pressure on the lacrimal punctum for at least a minute after applying eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

After using eye drops or eye ointments, patients should be warned not to drive or perform other skilled tasks until vision is clear.

For warnings relating to eye drops and contact lenses, see section 11.9.

Eye lotions These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign bodies as a first-aid treatment. Sterile sodium chloride 0.9% solution (section 11.8.1) is usually used. Clean water will suffice in an emergency.

Ophthalmic Specials The Royal College of Ophthalmologists and the UK Ophthalmic Pharmacy Group have produced the Ophthalmic Specials Gui-
dance to help prescribers and pharmacists manage and restrict the use of unlicensed eye preparations. ‘Specials’ should only be prescribed in situations where a licensed product is not suitable for a patient’s needs. The Ophthalmic Specials Guidance can be accessed on the Royal College of Ophthalmologists website (www.rcophth.ac.uk). The guidance will be reviewed every six months to ensure the most accurate and up-to-date information is available.

Other preparations Subconjunctival injection may be used to administer anti-infective drugs, mydriatics, or corticosteroids for conditions not responding to topical therapy; intracameral and intravitreal routes can also be used to administer certain drugs, for example antibacterials. These injections should only be used under specialist supervision.

Drugs such as antimicrobials and corticosteroids may be administered systemically to treat susceptible eye conditions.

Preservatives and sensitisers Information on preservatives and on substances identified as skin sensitisers (see section 13.1.3) is provided under Excipients statements in preparation entries. Very rarely, cases of corneal calcification have been reported with the use of phosphate-containing eye drops in patients with significantly damaged corneas—consult product literature for further information.

Control of microbial contamination

Preparations for the eye should be sterile when issued. Care should be taken to avoid contamination of the contents during use.

Eye drops in multiple-application containers for domiciliary use should not be used for more than 4 weeks after first opening (unless otherwise stated by the manufacturer).

Multiple application eye drops for use in hospital wards are normally discarded 1 week after first opening—local practice may vary. Individual containers should be provided for each patient. A separate container should be supplied for each eye only if there are special concerns about contamination. Containers used before an eye operation should be discarded at the time of the operation and fresh containers supplied postoperatively. A fresh supply should also be provided upon discharge from hospital; in specialist ophthalmology units, it may be acceptable to issue containers that have been dispensed to the patient on the day of discharge.

In out-patient departments single-application containers should be used; if multiple-application containers are used, they should be discarded after single patient use within one clinical session.

In eye surgery single-application containers should be used if possible; if a multiple-application container is used, it should be discarded after single use. Preparations used during intra-ocular procedures and others that may penetrate into the anterior chamber must be isotonic and without preservatives and buffered if necessary to a neutral pH. Specially formulated fluids should be used for intra-ocular surgery; intravenous infusion preparations are not usually suitable for this purpose (Hartmann’s solution may be used in some ocular surgery). For all surgical procedures, a previously unopened container is used for each patient.

11.3 Anti-infective eye preparations

11.3.1 Antibacterials

Bacterial eye infections are generally treated topically with eye drops and eye ointments. Systemic administration is sometimes appropriate in blepharitis.

**Chloramphenicol** has a broad spectrum of activity and is the drug of choice for superficial eye infections. Chloramphenicol eye drops are well tolerated and the recommendation that chloramphenicol eye drops should be avoided because of an increased risk of aplastic anaemia is not well founded.

Other antibacterials with a broad spectrum of activity include the quinolones, **ciprofloxacin**, **levofoxacin**, **moxifloxacin**, and **ofloxacin**; the aminoglycosides, **gentamicin**, **tobramycin**, quinolones (except moxifloxacin), and **polyoxymycin B** are effective for infections caused by **Pseudomonas aeruginosa**.

**Ciprofloxacin** eye drops are licensed for **corneal ulcers**, intensive application (especially in the first 2 days) is required throughout the day and night. **Azithromycin** eye drops are licensed for **trachomatous conjunctivitis** caused by **Chlamydia trachomatis** and for **purulent bacterial conjunctivitis**. **Trachoma** which results from chronic infection with **Chlamydia trachomatis** can be treated with azithromycin by mouth [unlicensed indication].

**Fusidic acid** is useful for staphylococcal infections. **Propamidine isetionate** is of little value in bacterial infections but is used by specialists to treat the rare, but
potentially sight-threatening, condition of *acanthamoeba keratitis* [unlicensed indication] (see also section 11.9).

Cefuroxime can be administered by intracameral injection for the prophylaxis of endophthalmitis following cataract surgery, see section 11.8.2.

**With corticosteroids** Many antibacterial preparations also incorporate a corticosteroid but such mixtures should not be used unless a patient is under close specialist supervision. In particular they should not be prescribed for undiagnosed ‘red eye’ which is sometimes caused by the herpes simplex virus and may be difficult to diagnose (section 11.4).

**Administration** Frequency of application depends on the severity of the infection and the potential for irreversible ocular damage; antibacterial eye preparations are usually administered as follows:

- **Eye drops** apply 1 drop at least every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing;
- **Eye ointment** apply either at night (if eye drops used during the day) or 3–4 times daily (if eye ointment used alone).

### AZITHROMYCIN DIHYDRATE

**Indications** see notes above

**Side-effects** ocular discomfort (including pruritus, burning), blurred vision; *less commonly* eyelid eczema, eyelid erythema, eyelid oedema, conjunctival hyperaemia, keratitis

**Dose**

- Apply twice daily for 3 days; review if no improvement after 3 days

### Single use

**Azeter** (Spectrum Thea) (Pmi)

*Eye drops* azithromycin dihydrate 1.5%, net price 6 × 0.25 g = £6.99

### CHLORAMPHENICOL

**Indications** see notes above

**Pregnancy** avoid unless essential—no information on *topical* use but risk of ‘neonatal grey-baby syndrome’ with oral use in third trimester

**Breast-feeding** avoid unless essential—*theoretical* risk of bone-marrow toxicity

**Side-effects** transient stinging; see also notes above

**Dose**

- See Administration in notes above

**Chloramphenicol** (Non-proprietary) (Pmi)

*Eye drops*, chloramphenicol 0.5%. Net price 10 mL = £1.44

*Eye ointment*, chloramphenicol 1%. Net price 4 g = £1.63

**Note** Chloramphenicol 0.5% eye drops (in max. pack size 10 mL) and 1% eye ointment (in max. pack size 4 g) can be sold to the public for treatment of acute bacterial conjunctivitis in adults and children over 2 years; max. duration of treatment 5 days

**Chloromycetin** (AMCo) (Pmi)

*Redidrops* (= eye drops), chloramphenicol 0.5%. Net price 5 mL = £1.65; 10 mL = 90p

**Excipients** include phenylmercuric acetate

*Ophthalmic ointment* (= eye ointment), chloramphenicol 1%. Net price 4 g = £1.08

#### Single use

**Minims** (Bausch & Lomb) (Pmi)

*Eye drops*, chloramphenicol 0.5%. Net price 20 × 0.5 mL = £10.53

### CIPROFLOXACIN

**Indications** superficial bacterial infections, see notes above; corneal ulcers

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises caution

**Side-effects** taste disturbance, ocular discomfort, ocular hyperaemia, corneal deposits (reversible after completion of treatment); *less commonly* nausea, headache, keratopathy, corneal infiltrates, corneal staining, photophobia, blurred vision, eyelid disorders (including oedema, exfoliation, erythema), eye irritation (including pain, swelling, pruritus, dryness), increased lacrimation, conjunctival hyperaemia; rarely diarrhoea, abdominal pain, dizziness, keratitis, corneal disorders including corneal epithelium defect, eye hypoaesthesia, asthenopia, diplopia, ear pain, paranasal sinus hypersecretion, rhinitis, dermatis

**Dose**

- Superficial bacterial infection, **ADULT** and **CHILD** apply *eye drops* 4 times daily; in severe infection apply every 2 hours during waking hours for 2 days, then 4 times daily; max. duration of treatment 21 days

  **ADULT** and **CHILD** over 1 year, apply 1.25 cm *eye ointment* 3 times daily for 2 days, then twice daily for 5 days

- Corneal ulcer, **ADULT** and **CHILD** apply *eye drops* throughout day and night, day 1 apply every 15 minutes for 6 hours then every 30 minutes, day 2 apply every hour, days 3–14 apply every 4 hours; max. duration of treatment 21 days

  **ADULT** and **CHILD** over 1 year, apply *eye ointment* throughout day and night; apply 1.25 cm ointment every 1–2 hours for 2 days, then every 4 hours for next 12 days

**Ciloxan** (Alcon) (Pmi)

*Ophthalmic solution* (= eye drops), ciprofloxacin (as hydrochloride) 0.3%. Net price 5 mL = £4.70

**Excipients** include benzalkonium chloride

*Eye ointment*, ciprofloxacin (as hydrochloride) 0.3%, Net price 3.5 g = £5.22

### FUSIDIC ACID

**Indications** see notes above

**Dose**

- See under preparation below

**Fucithalmic** (LEO) (Pmi)

*Eye drops*, m/r, fusidic acid 1% in gel basis (liquifies on contact with eye). Net price 5 g = £2.69

**Excipients** include benzalkonium chloride

*Eye ointment*, ciprofloxacin (as hydrochloride) 0.3%, Net price 5 mL = £4.70

### GENTAMICIN

**Indications** see notes above

**Dose**

- See Administration in notes above

**Gentamicin** (AMCo) (Pmi)

*Drops* (for ear or eye), gentamicin (as sulfate) 0.3%. Net price 10 mL = £2.13

**Excipients** include benzalkonium chloride
### LEVOFLOXACIN

**Indications**  see notes above

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk

**Side-effects** ocular burning, visual disturbances; **less commonly** headache, ocular discomfort (including itching, pain, and dryness), conjunctival follicles, lid oedema, lid erythema, photophobia, rhinitis

**Dose**
- **ADULT** and **CHILD** over 1 year, apply every 2 hours (max. 8 times daily) for the first 2 days, then 4 times daily for 3 days

**Oftaquix®** (Kestrel Ophthalmics)  
**Eye drops**, levofloxacin 0.5%, net price 5 mL = £6.95
**Excipients** include benzalkonium chloride
**Unit dose** **eye drops**, levofloxacin 0.5%, net price 30 × 0.5-mL single use units = £17.95

### MOXIFLOXACIN

**Indications** see notes above

**Cautions** not recommended for neonates

**Side-effects** taste disturbances, ocular discomfort (including pain, irritation and dryness), hyperaemia; **less commonly** vomiting, headache, paraesthesia, corneal disorders (including keratitis, erosion, and staining), conjunctival haemorrhage, eyelid erythema, visual disturbances, nasal discomfort, pharyngolaryngeal pain; **also reported** nausea, palpitation, dyspnoea, dizziness, raised intra-ocular pressure, photophobia, rash, pruritus

**Dose**
- **ADULT** and **CHILD** over 1 year, apply 1–2 times daily (continue treatment for 2–3 days after infection improves; review if no improvement within 5 days)

**Tobravisc®** (Alcon)  
**Eye drops**, moxifloxacin (as hydrochloride) 0.5%, net price 5 mL = £9.80

### OFLOXACIN

**Indications** see notes above

**Cautions** corneal ulcer or epithelial defect (risk of corneal perforation)

**Pregnancy** manufacturer advises use only if benefit outweighs risk; systemic quinolones have caused arthropathy in animal studies

**Breast-feeding** manufacturer advises avoid

**Side-effects** ocular discomfort and irritation; **also reported** facial oedema, keratitis, visual disturbances, photophobia, increased lacrimation, ocular oedema, dry eyes, ocular hyperaemia

**Dose**
- **ADULT** and **CHILD** over 1 year, apply every 2–4 hours for the first 2 days, then reduce frequency to 4 times daily (max. 10 days treatment)

**Exocin®** (Allergan)  
**Ophthalmic solution** (= eye drops), ofloxacin 0.3%. Net price 5 mL = £2.17
**Excipients** include benzalkonium chloride

### PROPAMIDINE ISETIONATE

**Indications** local treatment of infections (but see notes above)

**Pregnancy** manufacturer advises avoid unless essential—no information available

**Breast-feeding** manufacturer advises avoid unless essential—no information available

**Side-effects** eye pain and irritation

**Dose**
- **See preparations**

**Brolene®** (Sanofi-Aventis)  
**Eye drops**, propamidine isetionate 0.1%. Net price 10 mL = £2.80
**Excipients** include benzalkonium chloride
**Dose** apply up to 4 times daily
**Eye ointment**, dibrompropamidine isetionate 0.15%. Net price 5 g = £2.92
**Dose** apply 1–2 times daily

**Golden Eye®** (Typharm)  
**Eye drops**, propamidine isetionate 0.1%, net price 10 mL = £3.26
**Excipients** include benzalkonium chloride
**Dose** apply up to 4 times daily
**Eye ointment**, dibrompropamidine isetionate 0.15%, net price 5 g = £3.49
**Dose** apply 1–2 times daily

### TOBRAMYCIN

**Indications** see notes above

**Dose**
- **ADULT** and **CHILD** over 1 year, apply twice daily for 6–8 days; in severe infection, apply 4 times daily on the first day, then twice daily for 5–7 days

**Tobravisc®** (Alcon)  
**Eye drops**, tobramycin 0.3%, net price 5 mL = £4.74
**Excipients** include benzododecinium bromide

### 11.3.2 Antifungals

Fungal infections of the cornea are rare but can occur after agricultural injuries, especially in hot and humid climates. Orbital mycosis is rarer, and when it occurs it is usually because of direct spread of infection from the paranasal sinuses. Increasing age, debility, or immuno-suppression can encourage fungal proliferation. The spread of infection through blood occasionally produces metastatic endophthalmitis.

Many different fungi are capable of producing ocular infection; they can be identified by appropriate laboratory procedures.

Antifungal preparations for the eye are not generally available. Treatment will normally be carried out at specialist centres, but requests for information about supplies of preparations not available commercially should be addressed to the Strategic Health Authority (or equivalent), or to the nearest hospital ophthalmology unit, or to Moorfields Eye Hospital, 162 City Road, London EC1V 2PD (tel. (020) 7253 3411) or www.moorfields.nhs.uk
11.3.3 Antivirals

Herpes simplex infections producing, for example, dendritic corneal ulcers can be treated with aciclovir or ganciclovir. Aciclovir eye ointment is used in combination with systemic treatment for ophthalmic zoster (section 5.3.2.1).

Slow-release ocular implants containing ganciclovir (available on a named-patient basis from specialist importing companies, see p. 1104) may be inserted surgically to treat immediate sight-threatening CMV retinitis. Local treatments do not protect against systemic infection or infection in the other eye. For systemic treatment of CMV retinitis, see section 5.3.2.2.

ACICLOVIR
(Acyclovir)

Indications
local treatment of herpes simplex infections

Side-effects
local irritation and inflammation, superficial punctate keratopathy; rarely blepharitis; very rarely hypersensitivity reactions including angioedema

Dose
● Apply 1 cm ointment 5 times daily (continue for at least 3 days after complete healing)

Zovirax® (GSK)
Eye ointment, aciclovir 3%, net price 4.5 g = £9.34

GANCICLOVIR

Indications
local treatment of herpes simplex infections

Side-effects
burning sensation, tingling, superficial punctate keratitis

Dose
● Apply 5 times daily until healing complete, then apply 3 times daily for a further 7 days

Virgan® (Spectrum Thea) (For)
Ophthalmic gel, ganciclovir 0.15%, net price 5 g = £19.99
Excipients include benzalkonium chloride

11.4 Corticosteroids and other anti-inflammatory preparations

11.4.1 Corticosteroids

Corticosteroids administered locally to the eye or given by mouth are effective for treating anterior segment inflammation, including that which results from surgery. Topical corticosteroids are applied frequently for the first 24–48 hours; once inflammation is controlled, the frequency of application is reduced. They should normally only be used under expert supervision; three main dangers are associated with their use:

● a ‘red eye’, when the diagnosis is unconfirmed, may be due to herpes simplex virus, and a corticosteroid may aggravate the condition, leading to corneal ulceration, with possible damage to vision and even loss of the eye. Bacterial, fungal, and amoebic infections pose a similar hazard;

● ‘steroid glaucoma’ can follow the use of corticosteroid eye preparations in susceptible individuals;

● a ‘steroid cataract’ can follow prolonged use.

Other side-effects of ocular corticosteroids include thinning of the cornea and sclera.

Combination products containing a corticosteroid with an anti-infective drug are sometimes used after ocular surgery to reduce inflammation and prevent infection; use of combination products is otherwise rarely justified.

Systemic corticosteroids (section 6.3.2) may be useful for ocular conditions. The risk of producing a ‘steroid cataract’ increases with the dose and duration of corticosteroid use.

BETAMETHASONE

Indications
local treatment of inflammation (short-term)

Cautions
see notes above

Side-effects
see notes above

Dose
● Apply eye drops every 1–2 hours until controlled then reduce frequency; apply eye ointment 2–4 times daily or at night when used with eye drops

Betnesol® (Focus)
A
Drops (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, net price 10 mL = £2.32
Excipients include benzalkonium chloride, disodium edetate
Eye ointment, betamethasone sodium phosphate 0.1%, net price 3 g = £19.99
Excipients include benzalkonium chloride

With neomycin
Betnesol-N® (RPH)
A
Drops (for ear, eye, or nose), see section 12.1.1
Dose apply up to 6 times daily

DEXAMETHASONE

Indications
local treatment of inflammation (short-term)

Cautions
see notes above

Side-effects
see notes above

Dose
● Apply eye drops every 30–60 minutes until controlled then reduce frequency to 4–6 times daily

Maxidex® (Alcon)
A
Eye drops, dexamethasone 0.1%, net price 5 mL = £1.42; 10 mL = £2.80
Excipients include benzalkonium chloride, disodium edetate, polysorbate 80
### Prednisolone

**Indications**  
Local treatment of inflammation (short-term)

**Cautions**  
See notes above

**Side-effects**  
See notes above

**Dose**  
- Apply every 1–2 hours until controlled then reduce frequency

**Predsol**<sup>®</sup> (Focus)<sup>®</sup>  
Eye drops, prednisolone sodium phosphate 0.5%, net price 10 mL = £2.00

**Excipients**  
- Include benzalkonium chloride, dexamethasone, disodium edetate

**Single use**  
Minims<sup>®</sup> Prednisolone Sodium Phosphate (Bausch & Lomb)<sup>®</sup>  
Eye drops, prednisolone sodium phosphate 0.5%, net price 20 × 0.5 mL = £11.28

**Excipients**  
- Include dexamethasone, disodium edetate

### Rimexolone

**Indications**  
Local treatment of inflammation (short-term)

**Cautions**  
See notes above

**Side-effects**  
See notes above

**Dose**  
- Postoperative inflammation, apply 4 times daily for 2 weeks, beginning 24 hours after surgery
- Steroid-responsive inflammation, apply at least 4 times daily for up to 4 weeks
- Uveitis, apply every hour during daytime in week 1, then every 2 hours in week 2, then 4 times daily in week 3, then twice daily for first 4 days of week 4, then once daily for remaining 3 days of week 4

**Excipients**  
- Include benzalkonium chloride, disodium edetate, polyvinyl alcohol

### Intravitreal corticosteroids

An intravitreal implant containing dexamethasone (Ozurdex<sup>®</sup>) is licensed for the treatment of adults with macular oedema following either branch retinal vein occlusion or central retinal vein occlusion; it is also licensed for the treatment of adult patients with inflammation of the posterior segment of the eye presenting as non-infectious uveitis. It should be administered by specialists experienced in the use of intravitreal injections.

The Scottish Medicines Consortium, (p. 4) has advised (May 2012) that dexamethasone intravitreal implant (Ozurdex<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of adults with macular oedema (i) following central retinal vein occlusion, and (ii) with branch retinal vein occlusion who are not clinically suitable for laser treatment, including patients with dense macular haemorrhage, or patients who have received and failed on previous laser treatment.
**NICE guidance**

**Dexamethasone intravitreal implant for the treatment of macular oedema secondary to retinal vein occlusion** (July 2011)

Dexamethasone intravitreal implant is recommended as an option for the treatment of macular oedema following central retinal vein occlusion.

Dexamethasone intravitreal implant is also recommended as an option for the treatment of macular oedema following branch retinal vein occlusion when:

- treatment with laser photoacoagulation has not been beneficial, or
- treatment with laser photoacoagulation is not considered suitable because of the extent of macular haemorrhage.

www.nice.org.uk/TA229

An intravitreal implant containing fluocinolone acetonide (fluocinolone acetonide) is licensed for the treatment of visual impairment associated with chronic diabetic macular oedema which is insufficiently responsive to available therapies. It should be administered by specialists experienced in the use of intravitreal injections.

The *Scottish Medicines Consortium*, (p. 4) has advised (February 2014) that fluocinolone acetonide intravitreal implant (*Iluvien®*) is recommended for restricted use within NHS Scotland for the treatment of vision impairment associated with chronic diabetic macular oedema, considered insufficiently responsive to available therapies, only in patients in whom the affected eye is pseudophakic (has an artificial lens after cataract surgery), and retreatment would take place only if the patient had previously responded to treatment with fluocinolone acetonide and subsequently best corrected visual acuity had deteriorated to less than 20/32.

**NICE guidance**

**Fluocinolone acetonide intravitreal implant for treating chronic diabetic macular oedema after an inadequate response to prior therapy** (November 2013)

Fluocinolone acetonide intravitreal implant is recommended as an option for treating chronic diabetic macular oedema that is insufficiently responsive to available therapies only if:

- the implant is to be used in an eye with an intra-ocular (pseudophakic lens) and
- the manufacturer provides fluocinolone acetonide intravitreal implant with the discount agreed in the patient access scheme.

www.nice.org.uk/TA301

**FLUCINOLONE ACETONIDE**

**Indications** see notes above—specialist use only

**Cautions**

- raised baseline intra-ocular pressure (monitor intra-ocular pressure closely); monitor for raised intra-ocular pressure, retinal detachment, endophthalmitis, vitreous haemorrhage or detachment within 2–7 days following the procedure; monitor intra-ocular pressure at least every 3 months thereafter (for approximately 36 months); concomitant administration of anticoagulant or antiplatelet drugs (higher incidence of conjunctival haemorrhage)

**Contra-indications** pre-existing glaucoma; active or suspected ocular or peri-ocular infection

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Side-effects** headache, raised intra-ocular pressure, vitreous detachment, retinal detachment, blepharitis, eyelid pruritus, cataract, visual disturbance; also reported glaucoma, ocular infection (including endophthalmitis), corneal oedema

**Dose**

- **By intravitreal injection**, 700 micrograms into the affected eye

**Note** Concurrent administration to both eyes not recommended. For further information on administration and repeat dosing, consult product literature

**Ozurdex®** (Allergan) ®

Intravitreal implant, dexamethasone 700 micrograms in disposable applicator, net price = £870.00

**DEXAMETHASONE**

**Indications** see notes above—specialist use only

**Cautions** monitor intra-ocular pressure and for signs of ocular infection; history of ocular herpes simplex; posterior capsule tear or iris defect (risk of implant migration into the anterior chamber); retinal vein occlusion with significant retinal ischaemia; concomitant administration of anticoagulant or antiplatelet drugs

**Contra-indications** active or suspected ocular or peri-ocular infection; uncontrolled advanced glaucoma; rupture of the posterior lens capsule in patients with aphakia or anterior chamber intra-ocular lens

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Side-effects** headache, raised intra-ocular pressure, vitreous detachment, retinal detachment, blepharitis, eyelid pruritus, cataract, visual disturbance; also reported glaucoma, ocular infection (including endophthalmitis), corneal oedema

**Dose**

- **By intravitreal injection**, 190 micrograms into the affected eye

**Note** Concurrent administration to both eyes not recommended. For further information on administration and repeat dosing, consult product literature

**Iluvien®** (Alimera) ®

Intravitreal implant, fluocinolone acetonide 190 micrograms in a disposable applicator, net price = £5500.00

**11.4.2 Other anti-inflammatory preparations**

Other preparations used for the topical treatment of inflammation and allergic conjunctivitis include antihistamines, lodoxamide, and sodium cromoglicate.

Eye drops containing antihistamines, such as antazoline (with xylometazoline as Otrivine-Antistin®),
azelastine, epinastine, ketotifen, and olopatadine, can be used for allergic conjunctivitis.

**Sodium cromoglicate** (sodium cromoglycate) and nedocromil sodium eye drops can be useful for vernal keratoconjunctivitis and other allergic forms of conjunctivitis.

Lodoxamide eye drops are used for allergic conjunctival conditions including seasonal allergic conjunctivitis.

Diclofenac eye drops (section 11.8.2) and emedastine eye drops are also licensed for seasonal allergic conjunctivitis.

Non-steroidal anti-inflammatory eye drops (section 11.8.2) are used for the prophylaxis and treatment of inflammation of the eye following surgery or laser treatment.

11.5 Mydriatics and cycloplegics

**OLOPATADINE**

**Indications** seasonal allergic conjunctivitis

**Side-effects** local irritation; less commonly keratitis, dry eye, local oedema, photophobia, headache, asthma, dizziness; dry nose also reported

**Dose**
- **ADULT** and **CHILD** over 3 years, apply twice daily; maximum duration of treatment 4 months

**Opatanol** (Alcon) (PO)

*Eye drops*, olopatadine (as hydrochloride) 1 mg/mL, net price 5 mL = £4.68

*Excipients* include benzalkonium chloride

**SODIUM CROMOGLICATE**

*(Sodium cromoglycate)*

**Indications** allergic conjunctivitis; seasonal keratoconjunctivitis

**Side-effects** burning and stinging

**Dose**
- **ADULT** and **CHILD** apply eye drops 4 times daily

**Sodium Cromoglicate (Non-proprietary) (PO)**

*Eye drops*, sodium cromoglicate 2%. Net price 15.5 mL = £1.67

Brands include Hay-Crom®, Opticrom®, Aquous, Vivistim®

**Note** Sodium cromoglicate 2% eye drops can be sold to the public (in max. pack size of 10 mL) for treatment of acute seasonal and perennial allergic conjunctivitis

**Single use**

**Catacom®** (Moorfields)

*Eye drops*, sodium cromoglicate 2%, net price 30 × 0.3 mL = £8.99

**Antimuscarinics**

**ATROPINE SULFATE**

**Indications** see notes above

**Cautions** risk of systemic effects in infants under 3 months; see also notes above

**Side-effects** see notes above

Atropine (Non-proprietary) (PO)

*Eye drops*, atropine sulfate 0.5%, net price 10 mL = £19.00; 1%, 10 mL = £13.25

**Single use**

Minims® Atropine Sulphate (Bausch & Lomb) (PO)

*Eye drops*, atropine sulfate 1%. Net price 20 × 0.5 mL = £14.46

**CYCLOPENTOLATE HYDROCHLORIDE**

**Indications** see notes above

**Cautions** see notes above

**Side-effects** see notes above

**Mydriacyl®** (Intrapharm) (PO)

*Eye drops*, cyclopentolate hydrochloride 0.5%, net price 5 mL = £6.73; 1%, 5 mL = £6.73

*Excipients* include benzalkonium chloride

**Single use**

Minims® Cyclopentolate Hydrochloride (Bausch & Lomb) (PO)

*Eye drops*, cyclopentolate hydrochloride 0.5% and 1%. Net price 20 × 0.5 mL (both) = £9.95

**HOMATROPINE HYDROBROMIDE**

**Indications** see notes above

**Cautions** see notes above

**Side-effects** see notes above

Homatropine (Non-proprietary) (PO)

*Eye drops*, homatropine hydrobromide, available from ‘special-order’ manufacturers, p. 1104

**TROPICAMIDE**

**Indications** see notes above

**Cautions** see notes above

**Side-effects** see notes above

Mydriacyl® (Alcon) (PO)

*Eye drops*, tropicamide 0.5%, net price 5 mL = £1.29; 1%, 5 mL = £1.60

*Excipients* include benzalkonium chloride, disodium edetate
The most common form of glaucoma is primary open-angle glaucoma (chronic open-angle glaucoma), where drainage of the aqueous humour through the trabecular meshwork is restricted. The condition is often asymptomatic, but the patient may present with significant loss of visual field. Patients with ocular hypertension are at high risk of developing primary open-angle glaucoma.

Drugs that reduce intra-ocular pressure by different mechanisms are available for managing ocular hypertension and glaucoma. A topical beta-blocker or a prostaglandin analogue is usually the drug of first choice for the treatment of ocular hypertension. A prostaglandin analogue should be used to manage patients with early or moderate primary open-angle glaucoma. After checking compliance and eye drop instillation technique, it may be necessary to combine these drugs or add others, such as sympathomimetics, carbonic anhydrase inhibitors, or miotics to control intra-ocular pressure.

### Acute angle-closure glaucoma

Acute angle-closure glaucoma occurs when the outflow of aqueous humour from the eye is obstructed by bowing of the iris against the trabecular meshwork; it is a medical emergency that requires urgent reduction of intra-ocular pressure to prevent loss of vision. Patients with acute angle-closure glaucoma should be referred immediately for specialist ophthalmology assessment and treatment. Standard antiglaucoma therapy is used if supplementary treatment is required after iridotomy, iridectomy, laser treatment, or drainage surgery in either primary open-angle or acute angle-closure glaucoma.

### Beta-blockers

Topical application of a beta-blocker to the eye reduces intra-ocular pressure effectively in primary open-angle glaucoma, probably by reducing the rate of production of aqueous humour. Administration by mouth also reduces intra-ocular pressure but this route is not used since side-effects may be troublesome.

Beta-blockers used as eye drops include betaxolol, carteolol, levobunolol, and timolol.

### Cautions, contra-indications, and side-effects

Systemic absorption can follow topical application to the eyes; therefore, eye drops containing a beta-blocker are contra-indicated in patients with bradycardia, heart block, or uncontrolled heart failure. Important: for a warning to avoid in asthma see below. Beta-blocker eye drops should be used with caution in patients with corneal diseases. Consider also other cautions, contra-indications, and side-effects of beta-blockers (p. 102). Local side-effects of eye drops include ocular stinging, burning, pain, itching, erythema, dry eyes and allergic reactions including anaphylaxis and blepharoconjunctivitis; occasionally corneal disorders have been reported. Important: Beta-blockers, even those with apparent cardioselectivity, should not be used in patients with asthma or a history of obstructive airways disease, unless no alternative treatment is available. In such cases the risk of inducing bronchospasm should be appreciated and appropriate precautions taken.

### Interactions

Since systemic absorption may follow topical application the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind. See also Appendix 1 (beta-blockers).
**BETAXOLOL**

**Indications** see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Apply twice daily

Betaxolol (Non-proprietary)  
Eye drops, solution, betaxolol (as hydrochloride) 0.5%, net price 5 mL = £1.90  
Excipients may include benzalkonium chloride, disodium edetate

Betoptic® (Alcon)  
Ophthalmic solution (= eye drops), betaxolol (as hydrochloride) 0.5%, net price 5 mL = £1.90  
Excipients include benzalkonium chloride, disodium edetate

Ophthalmic suspension (= eye drops), betaxolol (as hydrochloride) 0.25%, net price 5 mL = £2.66  
Excipients include benzalkonium chloride, disodium edetate

Unit dose eye drop suspension, betaxolol (as hydrochloride) 0.25%, net price 50 x 0.25 mL = £13.77

**CARTEOLOL HYDROCHLORIDE**

**Indications** see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Apply twice daily

Teoptic® (Spectrum Thea)  
Eye drops, carteolol hydrochloride 1%, net price 5 mL = £7.60; 2%, 5 mL = £8.40  
Excipients include benzalkonium chloride

Timoptol® (MSD)  
Eye drops, in Ocumeter® metered-dose unit, timolol (as maleate) 0.25%, net price 5 mL = £3.12; 0.5%, 5 mL = £3.12  
Excipients include benzalkonium chloride

Unit dose eye drops, timolol (as maleate) 0.25%, net price 30 x 0.2 mL = £8.45; 0.5%, 30 x 0.2 mL = £9.65

**LEVOBUNOLOL HYDROCHLORIDE**

**Indications** see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above; anterior uveitis occasionally reported

**Dose**
- Apply once or twice daily

Levobunolol (Non-proprietary)  
Eye drops, levobunolol hydrochloride 0.5%. Net price 5 mL = £1.85  
Excipients may include benzalkonium chloride, disodium edetate, sodium metabsulphite

Betagan® (Allergan)  
Eye drops, levobunolol hydrochloride 0.5%, polyvinyl alcohol (Liquifilm®) 1.4%. Net price 5-mL = £1.85  
Excipients include benzalkonium chloride, disodium edetate, sodium metabsulphite

Unit dose eye drops, levobunolol hydrochloride 0.5%, polyvinyl alcohol (Liquifilm®) 1.4%. Net price 30 x 0.4 mL = £9.98  
Excipients include disodium edetate

**Prostaglandin analogues and prostamides**

The prostaglandin analogues latanoprost, tafluprost, and travoprost, and the synthetic prostamide, bimatoprost, increase uveoscleral outflow and subsequently reduce intra-ocular pressure. They are used to reduce intra-ocular pressure in ocular hypertension or open-angle glaucoma.

**Cautions** Use with caution in patients with aphakia, pseudophakia with torn posterior lens capsule or ante-
Bimatoprost

Indications
Raised intra-ocular pressure in open-angle glaucoma; ocular hypertension

Cautions
See notes above; also predisposition to hypotension or bradycardia

Hepatic impairment
Use with caution to severe impairment—no information available

Renal impairment
Use with caution—no information available

Pregnancy
Manufacturer advises use only if potential benefit outweighs risk

Breast-feeding
Manufacturer advises avoid—present in milk in animal studies

Side-effects
See notes above; also nausea, bradycardia, malaise, retinal haemorrhage, blepharospasm, eyelid retraction, reactivation of previous corneal infiltrates or ocular infection

Dose
- ADULT over 18 years, apply once daily, preferably in the evening

Lumigan® (Allergan) £37.29
Eye drops, bimatoprost 300 micrograms/mL, net price £13.75. Counselling, see Prostaglandin Analogues and Prostamides, above

Note
The Scottish Medicines Consortium (p. 4) has advised (March 2013) that bimatoprost 300 micrograms/mL preservative-free eye drops (Lumigan® single-dose eye drops) are accepted for restricted use within NHS Scotland for the reduction of increased intra-ocular pressure in chronic open-angle glaucoma and ocular hypertension as monotherapy or as adjunctive therapy to beta-blockers) in adults who have proven sensitivity to benzoalkonium chloride.

With timolol
For prescribing information on timolol, see section 11.6, Beta-blockers

Ganfort® (Allergan) £12.48
Eye drops, bimatoprost 50 micrograms/mL, net price £17.50. Counselling, see Prostaglandin Analogues and Prostamides, above

Dose
For raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate, ADULT over 18 years, apply once daily

Bimatoprost

Indications
Raised intra-ocular pressure in open-angle glaucoma; ocular hypertension

Cautions
See notes above; also predisposition to hypotension or bradycardia

Hepatic impairment
Use with caution to severe impairment—no information available

Renal impairment
Use with caution—no information available

Pregnancy
Manufacturer advises use only if potential benefit outweighs risk

Breast-feeding
Manufacturer advises avoid—present in milk in animal studies

Side-effects
See notes above; also nausea, bradycardia, malaise, retinal haemorrhage, blepharospasm, eyelid retraction, reactivation of previous corneal infiltrates or ocular infection

Dose
- ADULT over 18 years, apply once daily, preferably in the evening

Lumigan® (Allergan) £37.29
Eye drops, bimatoprost 100 micrograms/mL, net price £12.43, triple pack (3 x 3 mL) = £37.29; 300 micrograms/mL, 3 mL = £10.30, triple pack (3 x 3 mL) = £30.90. Counselling, see Prostaglandin Analogues and Prostamides, above

Excipients include benzoalkonium chloride

Note
The Scottish Medicines Consortium (p. 4) has advised (October 2013) that Ganfort® unit dose eye drops are accepted for restricted use within NHS Scotland for the reduction of increased intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension insufficiently responsive to topical beta-blockers or prostaglandin analogues who have proven sensitivity to preservatives

Latanoprost

Indications
Raised intra-ocular pressure in open-angle glaucoma; ocular hypertension

Cautions
See notes above; peri-operative period of cataract surgery; do not use within 5 minutes of thiomersal-containing preparations

Contra-indications
Active herpes simplex keratitis; history of recurrent herpetic keratitis associated with prostaglandin analogues

Pregnancy
Manufacturer advises avoid

Breast-feeding
May be present in milk—manufacturer advises avoid

Side-effects
See notes above; also reported nasopharyngitis, pyrexia, (both in children), iris cyst

Dose
- Apply once daily, preferably in the evening

Latanoprost (Non-proprietary) £37.59
Eye drops, latanoprost 50 micrograms/mL, net price 3 mL = £13.95, tripe pack (3 x 3 mL) = £37.59. Counselling, see Prostaglandin Analogues and Prostamides, above

Excipients may include benzoalkonium chloride

Note
The Scottish Medicines Consortium (p. 4) has advised (October 2013) that Xalatan® unit dose eye drops are accepted for restricted use within NHS Scotland for the reduction of increased intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension as monotherapy or as adjunctive therapy to beta-blockers) in adults who have proven sensitivity to preservatives

Xalatan® (Pfizer) £30.90
Eye drops, latanoprost 50 micrograms/mL, net price 3 mL = £12.48. Counselling, see Prostaglandin Analogues and Prostamides, above

Excipients include benzoalkonium chloride
11.6 Treatment of glaucoma

**Single use**

**Monopost®** (Spectrum Thea)  
Eye drops, latanoprost 50 micrograms/mL, net price 30 x 0.2 mL = £8.49, 90 x 0.2 mL = £25.47. Counselling, see Prostaglandin Analogues and Prostamides, p. 751  
**Note** The Scottish Medicines Consortium, p. 4 has advised (June 2013) that Monopost® is accepted for restricted use within NHS Scotland for the reduction of elevated intraocular pressure in patients with open-angle glaucoma and ocular hypertension who have shown sensitivity to benzalkonium chloride.

**With timolol**  
For prescribing information on timolol, see section 11.6, Beta-blockers.

**Latanoprost with Timolol** (Non-proprietary).  
Eye drops, latanoprost 50 micrograms, timolol (as maleate) 5 mg/mL, net price 2.5 mL = £4.28. Counselling, see Prostaglandin Analogues and Prostamides, p. 751  
**Excipients** may include benzalkonium chloride  
**Dose** for raised intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension who have shown sensitivity to timolol or propranolol alone (not adequate), **ADULT** over 18 years, apply once daily  
**Xalacom®** (Pharmacia).  
Eye drops, latanoprost 25 micrograms, timolol (as maleate) 5 mg/mL, net price 2.5 mL = £14.32. Counselling, see Prostaglandin Analogues and Prostamides, p. 751  
**Excipients** may include benzalkonium chloride  
**Dose** for raised intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension who have shown sensitivity to timolol or propranolol alone (not adequate), **ADULT** over 18 years, apply once daily

**Side-effects** see notes above; also dry mouth, dysgeusia, peptic ulcer reactivation, gastro-intestinal disorders, constipation, bradycardia, oropharyngeal pain, cough, dysphonia, nasal congestion, throat irritation, malaise, herpes simplex, photopsia, mydriasis, cataract; also reported vertigo, tinnitus  
**Dose**  
- **ADULT** over 18 years, apply once daily, preferably in the evening

**Travatan®** (Alcon).  
Eye drops, travoprost 40 micrograms/mL, net price 2.5 mL = £10.95. Counselling, see Prostaglandin Analogues and Prostamides, p. 751  
**Excipients** include propylene glycol

**With timolol**  
For prescribing information on timolol, see section 11.6, Beta-blockers.

**Tafluprost**  
**Indications** raised intra-ocular pressure in open-angle glaucoma, ocular hypertension  
**Cautions** use with caution—no information available  
**Renal impairment** use with caution—no information available  
**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—**toxicity in animal studies**  
**Breast-feeding** manufacturer advises avoid—present in milk in animal studies; manufacturer advises avoid  
**Side-effects** see notes above  
**Dose**  
- **ADULT** over 18 years, apply once daily, preferably in the evening

**Safilutan®** (MSD).  
**Unit dose eye drops**, tafluprost 15 micrograms/mL, net price 30 x 0.3 mL = £17.41. Counselling, see Prostaglandin Analogues and Prostamides, p. 751  
**Excipients** include disodium edetate

**Travoprost**  
**Indications** raised intra-ocular pressure in open-angle glaucoma; ocular hypertension  
**Cautions** use with caution—no information available  
**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—**toxicity in animal studies**  
**Breast-feeding** present in milk in animal studies; manufacturer advises avoid  
**Side-effects** see notes above; also dry mouth, dysgeusia, peptic ulcer reactivation, gastro-intestinal disorders, constipation, bradycardia, oropharyngeal pain, cough, dysphonia, nasal congestion, throat irritation, malaise, herpes simplex, photopsia, mydriasis, cataract; also reported vertigo, tinnitus  
**Dose**  
- **ADULT** over 18 years, apply once daily, preferably in the evening

**Sympathomimetics**

**Brimonidine**, a selective alpha₂-adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow. It is licensed for the reduction of intra-ocular pressure in open-angle glaucoma or ocular hypertension in patients for whom beta-blockers are inappropriate; it may also be used as adjunctive therapy when intra-ocular pressure is inadequately controlled by other antiglaucoma therapy.

**Apraclonidine** (section 11.8.2) is another alpha₂-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. Eye drops containing apraclonidine 0.5% are used short-term to delay laser treatment or surgery in patients with glaucoma not adequately controlled by another drug; eye drops containing 1% are used for control of intra-ocular pressure after anterior segment laser surgery.

**Brimonidine Tartrate**  
**Indications** raised intra-ocular pressure, see notes above  
**Cautions** severe cardiovascular disease; cerebral or coronary insufficiency, Raynaud’s syndrome, thromboangiitis obliterans, postural hypotension, depression; children 2–12 years (increased risk of drowsiness); **interactions:** Appendix 1 (brimonidine)  
**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving)  
**Contra-indications** neonate or child under 2 years  
**Hepatic impairment** manufacturer advises use with caution  
**Renal impairment** manufacturer advises use with caution  
**Pregnancy** manufacturer advises use only if benefit outweighs risk  
**Breast-feeding** manufacturer advises avoid
Side-effects dry mouth, gastro-intestinal disturbances, taste disturbances, upper respiratory symptoms, headache, drowsiness, dizziness, malaise, ocular disturbances (including hyperaemia, burning, stinging, pruritus, pain and dryness), visual disturbances, eyelid inflammation, photophobia, corneal erosion and staining, conjunctival disturbances (including blanching, follicles, and infection); less commonly palpitation, arrhythmia, bradycardia, tachycardia, depression, nasal dryness; rarely dyspnoea; very rarely hypertension, hypotension, syncope, insomnia, iritis, miosis

Dose

● Apply twice daily

Brimonidine Tartrate (Non-proprietary) (£PM)

Eye drops, brimonidine tartrate 0.2%, net price 5 mL = £2.00

Brands include Brimex®

Excipients may include benzalkonium chloride

Alphagan® (Allergan) (£PM)

Eye drops, brimonidine tartrate 0.2%, net price 5 mL = £6.85

Excipients include benzalkonium chloride

With timolol

For prescribing information on timolol, see section 11.6, Beta-blockers

Combigan® (Allergan) (£PM)

Eye drops, brimonidine tartrate 0.2%, timolol (as maleate) 0.5%, net price 5 mL = £10.00

Excipients include benzalkonium chloride

Dose for raised intra-ocular pressure in open-angle glaucoma and for ocular hypertension when beta-blocker alone not adequate, apply twice daily

Carbonic anhydrase inhibitors and systemic drugs

The carbonic anhydrase inhibitors, acetazolamide, brinzolamide, and dorzolamide, reduce intra-ocular pressure by reducing aqueous humour production. Systemic use also produces weak diuresis.

Acetazolamide is given by mouth or by intravenous injection (intramuscular injections are painful because of the alkaline pH of the solution). It is used as an adjunct to other treatment for reducing intra-ocular pressure. Acetazolamide is a sulfonamide derivative; blood disorders, rashes, and other sulfonamide-related side-effects occur occasionally—patients should be told to report any unusual skin rash. It is not generally recommended for long-term use; if electrolyte disturbances and metabolic acidosis occur, these can be corrected by administering potassium bicarbonate (as effervescent potassium tablets, section 9.2.1.3).

Dorzolamide and brinzolamide are topical carbonic anhydride inhibitors. They are licensed for use in patients resistant to beta-blockers or those in whom beta-blockers are contra-indicated. They are used alone or as an adjunct to a topical beta-blocker. Brinzolamide can also be used as an adjunct to a prostaglandin analogue. Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

The osmotic diuretics, intravenous hypertonic mannitol (section 2.2.5) or glycerol by mouth are useful short-term ocular hypotensive drugs.

11.6 Treatment of glaucoma

ACETAZOLAMIDE

Indications reduction of intra-ocular pressure in open-angle glaucoma, secondary glaucoma, and peri-operatively in angle-closure glaucoma; diuresis (section 2.2.7); epilepsy

Cautions not generally recommended for prolonged use, but if given, monitor blood count and plasma-electrolyte concentrations; pulmonary obstruction and impaired alveolar ventilation (risk of acidosis); elderly; diabetes mellitus; renal calculi; avoid extravasation at injection site (risk of necrosis); interactions: Appendix 1 (diuretics)

Contra-indications hypokalaemia, hyponatraemia, hyperchloraeemic acidosis; adrenocortical insufficiency; long-term administration in chronic angle-closure glaucoma; sulfonamide hypersensitivity

Hepatic impairment manufacturer advises avoid

Renal impairment avoid—risk of metabolic acidosis

Pregnancy manufacturer advises avoid, especially in first trimester (toxicity in animal studies)

Breast-feeding amount too small to be harmful

Side-effects see notes above; also nausea, vomiting, diarrhoea, taste disturbance, loss of appetite, parasthesia, flushing, headache, dizziness, fatigue, irritability, excitement, ataxia, depression, thirst, polyuria, reduced libido; less commonly melaena, drowsiness, confusion, hearing disturbances, fever, glycosuria, metabolic acidosis and electrolyte disturbances on long-term therapy, haematuria, crystalluria, renal and ureteric colic, renal lesions or calculi, renal failure, blood disorders, bone marrow suppression, rash (including Stevens-Johnson syndrome and toxic epidermal necrosis); rarely fulminant hepatic necrosis, hepatitis, cholestatic jaundice, flaccid paralysis, convulsions, photosensitivity; also reported transient myopia

Dose

● Glaucopa, by mouth or by intravenous injection, 0.25–1 g daily in divided doses

● Epilepsy, by mouth or by intravenous injection, 0.25–1 g daily in divided doses; CHILD 8–30 mg/kg/day, max. 750 mg/day

Note: Dose by Intramuscular injection, as for intravenous injection but preferably avoided because of alkalinity

Diamox® (AMCo) (£PM)

Tablets, acetazolamide 250 mg. Net price 112-tab pack = £15.22. Label: 3

Injection, powder for reconstitution, acetazolamide (as sodium salt). Net price 500-mg vial = £14.76

Modified release

Diamox® SR (AMCo) (£PM)

Capsules, m/r, orange, enclosing orange f/c pellets, acetazolamide 250 mg. Net price 30-cap pack = £16.66 Label: 3, 25

Dose glaucoma, 1–2 capsules daily

BRINZOLAMIDE

Indications reduction of intra-ocular pressure in open-angle hypertension and open-angle glaucoma either as adjunct to beta-blockers or prostaglandin analogues or used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated

Cautions systemic absorption follows topical application; renal tubular immaturity or abnormality; interactions: Appendix 1 (brinzolamide)
**Contra-indications** hyperchloraemic acidosis; sulphonamide hypersensitivity

**Hepatic impairment** manufacturer advises avoid

**Renal impairment** see Cautions above; also avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** avoid—tobacco in animal studies

**Breast-feeding** use only if benefit outweighs risk

**Side-effects** see notes above; also taste disturbances, dry mouth, headache, ocular disturbances (including corneal erosion, corneal oedema, photophobia, and reduced visual acuity); less commonly nausea, vomiting, diarrhoea, dyspepsia, oesophagitis, flatulence, oral hypoaesthesia and paraesthesia, chest pain, bradycardia, palpitation, dyspnoea, cough, upper respiratory tract congestion, pharyngitis, depression, sleep disturbances, nervousness, malaise, drowsiness, amnesia, dizziness, paraesthesia, sinusitis, decreased libido, erectile dysfunction, renal pain, epistaxis, nasal dryness, throat irritation, dermatitis, erythema

**Dose**
- Apply twice daily increased to max. 3 times daily if necessary

**Azopt**® (Alcon) ®

*Eye drops,* brinzolamide 10 mg/mL, net price 5 mL = £6.92

*Excipients* include benzalkonium chloride, disodium edetate

**With timolol**

For prescribing information on timolol, see section 11.6, Beta-blockers

**Azarga**® (Alcon) ®

*Ophthalmic suspension* (= eye drops), brinzolamide 10 mg, timolol (as maleate) 5 mg/mL, net price 5 mL = £11.05

*Excipients* include benzalkonium chloride, disodium edetate

**Dose** for raised intra-ocular pressure in open-angle glaucoma or ocular hypertension when beta-blocker alone not adequate, ADULT over 18 years apply twice daily

**DORZOLAMIDE**

**Indications** raised intra-ocular pressure in ocular hypertension, open-angle glaucoma, pseudo-exfoliative glaucoma either as adjunct to beta-blocker or used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated

**Cautions** systemic absorption follows topical application; history of renal calculi; chronic corneal defects, low endothelial cell count, history of intra-ocular surgery; *interactions*: Appendix 1 (dorzolamide)

**Contra-indications** hyperchloraemic acidosis, sulphonamide hypersensitivity

**Hepatic impairment** manufacturer advises caution—no information available

**Renal impairment** avoid if eGFR less than 30 mL/minute/1.73 m²

**Pregnancy** manufacturer advises avoid—tobacco in animal studies

**Breast-feeding** manufacturer advises avoid—no information available

**Side-effects** see notes above; also nausea, bitter taste, headache, anemia, ocular irritation, blurred vision, lacrimation, conjunctivitis, superficial punctuate keratitis, eyelid inflammation; less commonly iridocyclitis; rarely dry mouth, dizziness, paraesthesia, urolithiasis, eyelid crusting, transient myopia, corneal oedema, epistaxis, throat irritation, contact dermatitis, Stevens-Johnson syndrome, topical epidermal necrolysis

**Dose**
- Used alone, apply 3 times daily
- With topical beta-blocker, apply twice daily

**Dorzolamide** (Non-proprietary) ®

*Eye drops,* dorzolamide (as hydrochloride) 2%, net price 5 mL = £1.99

*Excipients* may include benzalkonium chloride

**Brands include** Dorzant®

**Trusopt® (MSD)** ®

*Ophthalmic solution* (= eye drops), in Ocumeter® Plus metered-dose unit, dorzolamide (as hydrochloride) 2%, net price 5 mL = £6.33

*Excipients* include benzalkonium chloride

**Unit dose eye drops,** dorzolamide (as hydrochloride) 2%, net price 60 × 0.2 mL = £24.18

**With timolol**

For prescribing information on timolol, see section 11.6, Beta-blockers

**Dorzolamide with Timolol** (Non-proprietary) ®

*Eye drops,* dorzolamide (as hydrochloride) 2%, timolol (as maleate) 0.5%, net price 5 mL = £2.90

*Excipients* may include benzalkonium chloride

**Cosopt® (MSD)** ®

*Ophthalmic solution* (= eye drops), in Ocumeter® Plus metered-dose unit, dorzolamide (as hydrochloride) 2%, timolol (as maleate) 0.5%, net price 5 mL = £10.05

*Excipients* include benzalkonium chloride

**Unit dose eye drops,** dorzolamide (as hydrochloride) 2%, timolol (as maleate) 0.5%, net price 60 × 0.2 mL = £28.59

**Miotics**

Miotics act by opening the inefficient drainage channels in the trabecular meshwork.

**Pilocarpine**, a miotic, is not commonly used for the treatment of primary open-angle glaucoma because side-effects, such as pupil miosis, are poorly tolerated. It is used mainly in the treatment of primary angle-closure glaucoma and in some secondary glaucomas.

**Cautions** A darkly pigmented iris may require a higher concentration of the miotic or more frequent administration and care should be taken to avoid overdose. Retinal detachment has occurred in susceptible individuals and those with retinal disease; therefore fundus examination is advised before starting treatment with a miotic. Care is also required in conjunctival or corneal damage. Intra-ocular pressure and visual fields should be monitored in those with chronic simple glaucoma and those receiving long-term treatment with a miotic. Miotics should be used with caution in patients with peptic ulceration, gastro-intestinal spasm, cardiac disease, hypertension, hypotension, marked vasomotor
instability, asthma, epilepsy, Parkinson’s disease, hyperthyroidism, and urinary-tract obstruction.

Contra-indications Miotics are contra-indicated in conditions where pupillary constriction is undesirable such as acute iritis, anterior uveitis and some forms of secondary glaucoma. They should be avoided in acute inflammatory disease of the anterior segment.

Pregnancy Miotics should be avoided during pregnancy unless the potential benefit outweighs risk—limited information available.

Breast-feeding Miotics should be avoided during breast-feeding unless the potential benefit outweighs risk—no information available.

Side-effects Ciliary spasm leads to headache and browache which may be more severe in the initial 2–4 weeks of treatment (a particular disadvantage in patients under 40 years of age). Ocular side-effects include burning, itching, smarting, blurred vision, with chronic use, vitreous haemorrhage, and pupillary block. Systemic side-effects (see under Parasympathomimetics, section 7.4.1) are rare following application to the eye.

PILOCARPINE

Indications see notes above; dry mouth (section 12.3.5).

Cautions see notes above.

Contra-indications see notes above.

Side-effects see notes above.

Dose

• Apply up to 4 times daily; long-acting preparations, see under preparations below.

Pilocarpine Hydrochloride (Non-proprietary) Eye drops, pilocarpine hydrochloride 1%, net price 10 mL = £2.28; 2%, 10 mL = £2.63; 4%, 10 mL = £3.35.

Excipients may include benzalkonium chloride.

Single use

Minims® Pilocarpine Nitrate (Bausch & Lomb) Eye drops, pilocarpine nitrate 2%, net price 20 × 0.5 mL = £11.48.

11.7 Local anaesthetics

Oxybuprocaine and tetracaine are widely used topical local anaesthetics. Proxymetacaine causes less initial stinging and is useful for children. Oxybuprocaine or a combined preparation of lidocaine and fluorescein is used for tonometry. Tetracaine produces a more profound anaesthesia and is suitable for use before minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. Lidocaine (section 15.2), with or without adrenaline (epinephrine), is injected into the eyelids for minor surgery. Local anaesthetics should never be used for the management of ocular symptoms. Local anaesthetic eye drops should be avoided in preterm neonates because of the immaturity of the metabolising enzyme system.

LIDOCAINE HYDROCHLORIDE

(Lignocaine hydrochloride)

Indications local anaesthetic.

Minims® Lidocaine and Fluorescein (Bausch & Lomb) Eye drops, lidocaine hydrochloride 4%, fluorescein sodium 0.25%. Net price 20 × 0.5 mL = £11.24.

OXYBUPROCAINE HYDROCHLORIDE

(Benoxinate hydrochloride)

Indications local anaesthetic.

Minims® Oxybuprocaine Hydrochloride (Bausch & Lomb) Eye drops, oxybuprocaine hydrochloride 0.4%. Net price 20 × 0.5 mL = £9.72.

PROXYMETACAINE HYDROCHLORIDE

Indications local anaesthetic.

Minims® Proxymetacaine Hydrochloride (Bausch & Lomb) Eye drops, proxymetacaine hydrochloride 0.5%. Net price 20 × 0.5 mL = £11.05.

TETRACAINE HYDROCHLORIDE

(Amethocaine hydrochloride)

Indications local anaesthetic.

Minims® Tetracaine Hydrochloride (Bausch & Lomb) Eye drops, tetracaine hydrochloride 0.5% and 1%. Net price 20 × 0.5 mL (both) = £9.73.

11.8 Miscellaneous ophthalmic preparations

11.8.1 Tear deficiency, ocular lubricants, and astringents

Certain eye drops, e.g. amphotericin, cefazidime, cefuroxime, colistimethate sodium, desferrioxamine, dexamethasone, gentamicin, and vancomycin can be prepared aseptically from material supplied for injection. Botulinum toxin type A preparations are licensed for the treatment of blepharospasm (Botox®, Dysport®, and Xeomin®) and for the temporary improvement of moderate to severe wrinkles between the eyebrows in adults under 65 years (Azzalure®, Bocouture®, Botox®, and Vistabel®), see section 4.9.3: preparations are not interchangeable and should be used under specialist supervision.

11.8.2 Ocular diagnostic and peri-operative preparations and photodynamic treatment

Chronic soreness of the eyes associated with reduced or abnormal tear secretion (e.g. in Sjogren’s syndrome) often responds to tear replacement therapy or pilocarpine given by mouth (section 12.3.5). The severity...
of the condition and patient preference will often guide the choice of preparation.

**Hypromellose** is the traditional choice of treatment for tear deficiency. It may need to be instilled frequently (e.g. hourly) for adequate relief. Ocular surface mucin is often abnormal in tear deficiency and the combination of hypromellose with a mucolytic such as **acetylcysteine** can be helpful.

The ability of **carbomers** to cling to the eye surface may help reduce frequency of application to 4 times daily.

**Polyvinyl alcohol** increases the persistence of the tear film and is useful when the ocular surface mucin is reduced.

**Sodium hyaluronate** eye drops are also used in the management of tear deficiency.

**Sodium chloride** 0.9% drops are sometimes useful in tear deficiency, and can be used as ‘comfort drops’ by contact lens wearers, and to facilitate lens removal. They are also used to irrigate the eye. Special presentations of sodium chloride 0.9% and other irrigation solutions are used routinely for intra-ocular surgery. **Sodium chloride** 5% eye drops are used for the short-term treatment of corneal oedema.

Eye ointments containing a **paraffin** can be used to lubricate the eye surface, especially in cases of recurrent corneal epithelial erosion. They may cause temporary visual disturbance and are best suited for application before sleep. Ointments should not be used during contact lens wear.

### ACETYL CYSTEINE

**Indications** tear deficiency, impaired or abnormal mucus production

**Dose**
- Apply 3–4 times daily

**Ilube®** (Moorfields) (Non-proprietary)

Eye drops, acetylcysteine 5%, hypromellose 0.35%. Net price 10 mL = £10.09

**Excipients** include benzalkonium chloride, disodium edetate

**Note** Synthetic high molecular weight polymers of acrylic acid cross-linked with either allyl ethers of sucrose or allyl ethers of pentaerythritol

**Indications** dry eyes including keratoconjunctivitis sicca, unstable tear film

**Dose**
- Apply 3–4 times daily or as required

**Carbomer Gel** (Non-proprietary)

Gel (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £2.80

**Excipients** include disodium edetate

**Artelac® Nighttime Gel** (Bausch & Lomb)

Gel (= eye drops), carbomer 2 mg, net price 10 g = £2.96

**Clinitas Gel®** (Altacor)

Gel (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £1.49

**GelTears®** (Bausch & Lomb)

Gel (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £2.80

**Excipients** include benzalkonium chloride

**Liquivisc®** (Spectrum Thea)

Gel (= eye drops), carbomer 974P (polyacrylic acid) 0.25%, net price 10 g = £4.50

**Excipients** include benzalkonium chloride

**Lumecare® Carbomer Gel** (Medicom)

Gel (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £2.10

**Excipients** include cetrimide

**Viscotears®** (Alcon)

Liquid gel (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 30 × 0.6 mL single-dose units = £5.42

### CARBOMERS

**(Polyacrylic acid)**

**Indications** dry eye conditions

**Dose**
- Apply as required

**Carmellose (Non-proprietary)**

Eye drops, carmellose sodium 0.5%, net price 10 mL = £7.49

**Carmize®** (Aspire)

Eye drops, carmellose sodium 0.5%, net price 10 mL = £7.49

**Optive®** (Allergan)

Eye drops, carmellose sodium 0.5%, glycerol, net price 10 mL = £7.49

**Optive® Plus** (Allergan)

Eye drops, carmellose sodium 0.5%, glycerol 1%, castor oil 0.25%, net price 10 mL = £7.49

**Celluvisc®** (Allergan)

Eye drops, carmellose sodium 0.5%, net price 30 × 0.4 mL = £5.75; 1%, 30 × 0.4 mL = £3.00

**Carmize®** (Aspire)

Eye drops, carmellose sodium 0.5%, net price 30 × 0.4 mL = £5.75, 90 × 0.4 mL = £15.53; 1%, 30 × 0.4 mL = £3.00, 60 × 0.4 mL = £6.00

**Celluvisc®** (Allergan)

Eye drops, carmellose sodium 0.5%, net price 30 × 0.4 mL = £4.80, 90 × 0.4 mL = £15.53; 1%, 30 × 0.4 mL = £3.00, 60 × 0.4 mL = £6.00

**Melophtal®** (Martindale)

Eye drops, carmellose sodium 0.5%, net price 30 × 0.4 mL = £5.75; 1%, 30 × 0.4 mL = £3.00

**Note** Each unit is resealable and may be used for up to 12 hours

### HYDROXYETHYLCELLULOSE

**Indications** tear deficiency

**Minims® Artificial Tears** (Bausch & Lomb)

Eye drops, hydroxyethylcellulose 0.44%, sodium chloride 0.35%. Net price 20 × 0.5 mL = £8.97
**HYPROMELLOSE**

**Indications**  
Tear deficiency

**Note**  
The Royal Pharmaceutical Society has stated that where it is not possible to ascertain the strength of hypromellose prescribed, the prescriber should be contacted to clarify the strength intended.

**Hypermellose (Non-proprietary)**  
Eye drops, hypromellose 0.3%, net price 10 mL = £1.05

**Excipients**  
may include benzalkonium chloride  
**Brands include** Lumecare®, Hypermellose, Mandalan®

**Artelac** (Bausch & Lomb)  
Eye drops, hypromellose 0.32%, net price 10 mL = £4.99

**Excipients**  
include cetrimide, disodium edetate

**Isopto Alkaline** (Alcon)  
Eye drops, hypromellose 1%, net price 10 mL = 94p

**Excipients**  
include benzalkonium chloride

**Isopto Plain** (Alcon)  
Eye drops, hypromellose 0.5%, net price 10 mL = 81p

**Excipients**  
include benzalkonium chloride

**Tear-Lac** (Scope Ophthalmics)  
Eye drops, hypromellose 0.3%, net price 10 mL = £5.75

**Tears Naturale** (Alcon)  
Eye drops, hypromellose 0.3%, dextran ’70’ 0.1%, net price 15 mL = £1.89

**Excipients**  
include benzalkonium chloride, disodium edetate

**Single use**

**Artelac** SDU (Bausch & Lomb)  
Eye drops, hypromellose 0.32%, net price 30 x 0.5 mL = £16.95, 60 x 0.5 mL = £32.85

**Hydromoor** (Moorfields)  
Eye drops, hypromellose 0.3%, net price 30 x 0.4 mL = £5.75

**Lumecare® Preservative Free Tear Drops** (Medicom)  
Eye drops, hypromellose 0.3%, net price 30 x 0.5 mL = £5.72

**Tears Naturale® Single Dose** (Alcon)  
Eye drops, hypromellose 0.3%, dextran ’70’ 0.1%, net price 28 x 0.4 mL = £13.26

**LIQUID PARAFFIN**

**Indications**  
Dry eye conditions

**Lacri-Lube** (Allergan)  
Eye ointment, white soft paraffin 57.3%, liquid paraffin 42.5%, wool alcohols 0.2%. Net price 3.5 g = £2.51, 5 g = £3.32

**Vita-POS** (Scope Ophthalmics)  
Eye ointment, retinol palmitate 250 units/g, white soft paraffin, light liquid paraffin, liquid paraffin, wool fat, net price 5 g = £2.75

**MACROGOLS**  
(Polyethylene glycols)

**Indications**  
Dry eye conditions

**Dose**  
Apply as required

**SODIUM CHLORIDE**

**Indications**  
See notes above

**Sodium Chloride 0.9% Solutions**  
See section 13.11.1

**Balanced Salt Solution**  
Solution (sterile), sodium chloride 0.64%, sodium acetate 0.39%, sodium citrate 0.17%, calcium chloride 0.048%, magnesium chloride 0.03%, potassium chloride 0.075%

For intra-ocular or topical irrigation during surgical procedures

**Single use**

**Minims® Saline** (Bausch & Lomb)  
Eye drops, sodium chloride 0.9%. Net price 20 x 0.5 mL = £7.14
11.8.2 Ocular diagnostic and peri-operative preparations

**SODIUM HYALURONATE**

**Indications**
- dry eye conditions

**Dose**
- Apply as required

**Artelac Rebalance®** (Bausch & Lomb)
- **Eye drops**, sodium hyaluronate 0.15%, net price 10 mL = £10.30

**Blink® Intensive Tears (AMO)**
- **Eye drops**, sodium hyaluronate 0.2%, polyethylene glycol 400 0.25%, net price 10 mL = £2.97

**Hyabak®** (Spectrum Thea)
- **Eye drops**, sodium hyaluronate 0.15%, net price 10 mL = £7.99

**Hylo-Care®** (Scope Ophthalmics)
- **Eye drops**, sodium hyaluronate 0.1%, dexamethasone sodium 0.5%, glycerol 0.9%, net price 10 mL = £7.49

**Hylo-Forte®** (Scope Ophthalmics)
- **Eye drops**, sodium hyaluronate 0.2%, net price 10 mL = £9.50

**Hylo-Tear®** (Scope Ophthalmics)
- **Eye drops**, sodium hyaluronate 0.1%, net price 10 mL = £8.50

**Lumecare® Sodium Hyaluronate (Medicon)**
- **Eye drops**, sodium hyaluronate 0.15%, net price 10 mL = £3.97

**Optive® Fusion** (Allergan)
- **Eye drops**, Sodium hyaluronate 0.1%, carramose sodium 0.5%, glycerol 0.9%, net price 10 mL = £7.49

**Oxyal®** (Kestrel Ophthalmics)
- **Eye drops**, sodium hyaluronate 0.15%, net price 10 mL = £4.15

**Vismed® Gel Multi** (TRB Chemedica)
- **Eye drops**, sodium hyaluronate 0.3%, net price 10 mL = £7.95

**Vismed® Multi** (TRB Chemedica)
- **Eye drops**, sodium hyaluronate 0.18%, net price 10 mL = £6.81

**Single use**

**Artelac® Splash** (Bausch & Lomb)
- **Eye drops**, sodium hyaluronate 0.2%, net price 30 × 0.5 mL = £7.00, 60 × 0.5 mL = £11.20

**Blink® Intensive Tears (AMO)**
- **Eye drops**, sodium hyaluronate 0.2%, polyethylene glycol 400, net price 20 × 0.4 mL = £2.97

**Clinitas®** (Altacor)
- **Eye drops**, sodium hyaluronate 0.4%, net price 30 × 0.5 mL = £5.70

**Note** Each unit is resealable and may be used for up to 12 hours

**Lubristil®** (Moorfields)
- **Eye drops**, sodium hyaluronate 0.15%, net price 20 × 0.3 mL = £4.99

**Lubristil® Gel** (Moorfields)
- **Eye drops**, sodium hyaluronate 0.15%, xanthan gum 1%, net price 20 × 0.4 mL = £6.49

**Ocsan®** (Agepha)
- **Eye drops**, sodium hyaluronate 0.2%, net price 20 × 0.5 mL = £5.31

**Vismed®** (TRB Chemedica)
- **Eye drops**, sodium hyaluronate 0.18%, net price 20 × 0.3 mL = £5.10

**Vismed® Gel** (TRB Chemedica)
- **Eye drops**, sodium hyaluronate 0.3%, net price 20 × 0.45 mL = £5.98

**SOYBEAN OIL**

**Indications**
- dry eye conditions

**Dose**
- Apply up to 4 times daily

**Emustil®** (Moorfields)
- **Eye drops**, soybean oil 7%, natural phospholipids 3%, net price 20 × 0.3 mL = £6.22

11.8.2 Ocular diagnostic and peri-operative preparations and photodynamic treatment

**Ocular diagnostic preparations**

Fluorescein sodium is used in diagnostic procedures and for locating damaged areas of the cornea due to injury or disease.

**FLUORESCEIN SODIUM**

**Indications**
- detection of lesions and foreign bodies

**Minims® Fluorescein Sodium** (Bausch & Lomb)
- **Eye drops**, fluorescein sodium 1% or 2%. Net price 20 × 0.5 mL (both) = £8.52

**With local anaesthetic**

Section 11.7

**Ocular peri-operative drugs**

Drugs used to prepare the eye for surgery, drugs that are injected into the anterior chamber at the time of surgery, and those used after eye surgery, are included here.

**Cefuroxime**, administered by intra-ocular injection into the anterior chamber of the eye (intracameral use), is used for the prophylaxis of endophthalmitis after cataract surgery.

Non-steroidal anti-inflammatory eye drops such as diclofenac, flurbiprofen, ketorolac, and naprofenac, are used for the prophylaxis and treatment of inflammation, pain, and other symptoms associated with ocular surgery or laser treatment of the eye. **Bromfenac** is used for the treatment of postoperative inflammation following cataract surgery. Diclofenac and flurbiprofen are also used to prevent miosis during ocular surgery.

**Apraclonidine**, an alpha-2 adrenoreceptor agonist, reduces intra-ocular pressure possibly by reducing the production of aqueous humour. It is used to control increases in intra-ocular pressure associated with ocular surgery and as short-term treatment to reduce intra-ocular pressure prior to surgery.

**Acetylcholine**, administered into the anterior chamber of the eye during surgery, rapidly produces miosis which...
lacks approximately 20 minutes. If prolonged miosis is required, it can be applied again.

Intra-ocular sodium hyaluronate and balanced salt solution (section 11.8.1) are used during surgical procedures on the eye.

Povidone-iodine is used for peri-ocular and conjunctival antisepsis before ocular surgery to support post-operative infection control.

**ACETYLCHOLINE CHLORIDE**

**Indications**
- Cataract surgery, penetrating keratoplasty, iridectomy, and other anterior segment surgery requiring rapid complete miosis

**Cautions**
- Gastro-intestinal spasm, peptic ulcer, heart failure; asthma; hyperthyroidism; urinary-tract obstruction; parkinsonism

**Pregnancy**
- Avoid unless potential benefit outweighs risk—no information available

**Breast-feeding**
- Avoid unless potential benefit outweighs risk—no information available

**Side-effects**
- Rarely bradycardia, hypotension, breathing difficulty, sweating, flushing

**Miochol-® (Bausch & Lomb)**

- **Intra-ocular irrigation**, powder for reconstitution, acetylcholine chloride 10 mg/mL (1%) when reconstituted, net price 20-mg vial (with solvent) = £7.28

**Miphet® (SD Healthcare)**

- **Intra-ocular irrigation**, powder for reconstitution, acetylcholine chloride 10 mg/mL (1%) when reconstituted, net price 20-mg vial (with solvent) = £7.28

**APRACLONIDINE**

**Note**
- Apraclonidine is a derivative of clonidine

**Indications**
- Control of intra-ocular pressure

**Cautions**
- History of angina, severe coronary insufficiency, recent myocardial infarction, heart failure, cerebrovascular disease, vasovagal attack, hypertension; Parkinson’s syndrome; Raynaud’s syndrome; thrombocytopenia; obliterans; depression; monitor intra-ocular pressure and visual fields; loss of effect may occur over time; suspend treatment if reduction in intra-ocular pressure and visual fields; loss of effect may occur over time; suspend treatment if reduction in vision occurs in end-stage glaucoma; monitor for excessive reduction in intra-ocular pressure following peri-operative use; interactions: Appendix 1 (apraclonidine)

**Driving**
- Drowsiness may affect performance of skilled tasks (e.g. driving)

**Contra-indications**
- History of severe or unstable and uncontrolled cardiovascular disease

**Hepatic impairment**
- Manufacturer advises caution

**Renal impairment**
- Use with caution in chronic renal failure

**Pregnancy**
- Manufacturer advises avoid—no information available

**Breast-feeding**
- Manufacturer advises avoid—no information available

**Side-effects**
- Taste disturbance, conjunctivitis, dry eye, ocular intolerance (withdraw if eye pruritus, ocular hyperaemia, increased lacrimation, or oedema of the eyelids and conjunctiva occur), rhinitis, less commonly chest pain, asthma, dyspnoea, throat irritation, nervousness, irritability, impaired co-ordination, myalgia, mydriasis, keratitis, keratopathy, photophobia, visual impairment, corneal erosion and infiltrates, blepharo-spasms, blepharitis, eyelid ptosis or retraction, conjunctival vascular disorders, rhinorrhea, parosmia; since absorption may follow topical application, systemic effects (see Clonidine, section 2.5.2) may occur

**Dose**
- See under preparations below

**Iopidine® (Alcon)**

- **Ophthalmic solution** (= eye drops), apraclonidine 1% (as hydrochloride), net price 12 × 2 single use 0.25-ml units = £77.81

**Dose**
- Control or prevention of postoperative elevation of intra-ocular pressure after anterior segment laser surgery, apply 1 drop 1 hour before laser procedure then 1 drop immediately after completion of procedure; **CHILD** not recommended

**Lopidine 0.5% ophthalmic solution (= eye drops), apraclonidine 0.5% (as hydrochloride), net price 5 mL = £10.88

**Excipients**
- Include benzalkonium chloride

**Dose**
- Short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug (see note below), apply 1 drop 3 times daily usually for max. 1 month; **CHILD** not recommended

**Note**
- May not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour

---

**BROMFENAC**

**Indications**
- Postoperative inflammation following cataract surgery

**YelloX® (Bausch & Lomb)**

- **Eye drops**, bromfenac (as sodium sesquisalicylate) 0.09%, net price 5 mL = £8.50

**Excipients**
- Include benzalkonium chloride, disodium edetate, sulfates

---

**CEFUROXIME**

**Indications**
- Prophylaxis of endophthalmitis after cataract surgery

**Cautions**
- Severe risk of infection; complicated cataracts or combined operations with cataract surgery; severe thyroid disease; reduced corneal endothelial cells (less than 2000)

**Dose**
- By intracameral injection, **ADULT** over 18 years, 1 mg into the anterior chamber of the eye at the end of cataract surgery

**Note**
- For information on administration, consult product literature

**Aprokam® (Spectrum Thea)**

- **Injection for intracameral use**, powder for reconstitution, cefuroxime (as sodium) 10 mg/mL when reconstituted with 5 mL sodium chloride 0.9%, net price 50-mg vial = £7.95

---

**DICLOFENAC SODIUM**

**Indications**
- Inhibition of intra-operative miosis during cataract surgery (but does not possess intrinsic mydriatic properties); postoperative inflammation in cataract surgery; strabismus surgery or argon laser trabecuoplasty; pain in corneal epithelial defects after photorefractive keratectomy, radial keratotomy or accidental trauma; seasonal allergic conjunctivitis (section 11.4.2)
Voltarol® Ophtha Multidose (Spectrum Thea) (POM)
Eye drops, diclofenac sodium 0.1%, net price 5 mL = £6.68
Excipients include benzalkonium chloride, disodium edetate, propylene glycol

Single use
Voltarol® Ophtha (Spectrum Thea) (POM)
Eye drops, diclofenac sodium 0.1%, net price pack of 5 single-dose units = £4.00, 40 single-dose units = £32.00

FLURBIPROFEN SODIUM

Indications inhibition of intra-operative miosis (but does not possess intrinsic mydriatic properties); anterior segment inflammation following postoperative and post-laser trabeculoplasty when corticosteroids contra-indicated

Ocufen® (Allergan) (POH)
Ophthalmic solution (= eye drops), flurbiprofen sodium 0.03%, polyvinyl alcohol (Liquifilm®) 1.4%, net price 40 × 0.4 mL = £37.15

KETOROLAC TROMETAMOL

Indications prophylaxis and reduction of inflammation and associated symptoms following ocular surgery

Acular® (Allergan) (POH)
Eye drops, ketorolac trometamol 0.5%, net price 5 mL = £3.00
Excipients include benzalkonium chloride, disodium edetate

NEPAFENAC

Indications prophylaxis and treatment of postoperative pain and inflammation associated with cataract surgery; reduction in the risk of postoperative macular oedema associated with cataract surgery in diabetic patients

Cautions avoid sunlight; discontinue immediately if evidence of corneal epithelial breakdown

Side-effects punctuate keratitis; less commonly nausea, headache, corneal epithelium defect, tritis, keratitis, corneal deposits, choroidal effusion, ocular discomfort, blurred vision, dry eye, allergic conjunctivitis, eye pruritus, increased lacrimation, photophobia, conjunctival hyperaemia; also reported dizziness, impaired corneal healing, corneal opacity, reduced visual acuity, eye swelling, dermatochalasis

Nevanac® (Alcon) (POH)
Ophthalmic suspension (= eye drops), nepafenac 1 mg/mL, net price 5 mL = £14.92
Excipients include benzalkonium chloride, disodium edetate

POVIDONE-IODINE

Indications cutaneous peri-ocular and conjunctival antisepsis before ocular surgery

Contra-indications concomitant use with ocular antimicrobial drugs, and ocular formulations containing mercury-based preservatives; preterm neonates

Side-effects rarely conjunctival hyperaemia, superficial punctuate keratitis; also reported residual yellow coloration of the conjunctiva, cytotoxicity on mucous membranes and deep tissue, hypothyroidism in neonates

Dose
• Apply eye drops, leave for 2 minutes, then irrigate thoroughly with sodium chloride 0.9%

Minims® Povidone Iodine (Bausch & Lomb) (POH)
Eye drops, povidone-iodine 5%, net price 20 × 0.4 mL = £16.00

Subfoveal choroidal neovascularisation

Aflibercept, pegaptanib and ranibizumab are vascular endothelial growth factor inhibitors licensed for the treatment of neovascular (wet) age-related macular degeneration. Aflibercept is also licensed for the treatment of macular oedema secondary to central retinal vein occlusion; ranibizumab is also licensed for the treatment of visual impairment due to diabetic macular oedema, macular oedema secondary to branch or central retinal vein occlusion, and choroidal neovascularisation secondary to pathologic myopia. Ranibizumab can be administered concomitantly with laser photocoagulation for the treatment of diabetic macular oedema and for macular oedema secondary to branch retinal vein occlusion. They are given by intravitreal injection by specialists experienced in the management of this condition. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections—patients should be advised to report any signs of infection immediately.

Aflibercept for the treatment of neovascular (wet) age-related macular degeneration (July 2013) and ranibizumab for the treatment of neovascular (wet) age-related macular degeneration (October 2011 and April 2013) are vascular endothelial growth factor inhibitors licensed for the treatment of neovascular (wet) age-related macular degeneration. The Scottish Medicines Consortium (p. 4) has also advised (May 2011 and April 2013) that ranibizumab (Lancet®) is accepted for use within NHS Scotland for the treatment of neovascular (wet) age-related macular degeneration. The Scottish Medicines Consortium (p. 4) has also advised (October 2011 and April 2013) that ranibizumab (Lancet®) is accepted for use within NHS Scotland for the treatment of macular oedema secondary to branch or central retinal vein occlusion, and (November 2012) for restricted use for the treatment of visual impairment due to diabetic macular oedema in adults with best corrected visual acuity 75 Early Treatment Diabetic Retinopathy Study letters or less at baseline, and (October 2013) for the treatment of visual impairment due to choroidal neovascularisation secondary to pathologic myopia in adults; SMC advice is contingent upon the continuing availability of ranibizumab at the price agreed in the patient access scheme.

www.nice.org.uk/TA294
NICE guidance

Ranibizumab for the treatment of visual impairment caused by macular oedema secondary to central retinal vein occlusion (February 2013)

Ranibizumab is recommended as an option for treating visual impairment caused by macular oedema secondary to central retinal vein occlusion only if the manufacturer provides ranibizumab with the discount agreed in the patient access scheme.

www.nice.org.uk/TA274

Ranibizumab and pegaptanib for the treatment of age-related macular degeneration (updated May 2012)

Ranibizumab is recommended for the treatment of wet age-related macular degeneration if all of the following apply:

- the best corrected visual acuity is between 6/12 and 6/96;
- there is no permanent structural damage to the central fovea;
- the lesion size is less than or equal to 12 disc areas in greatest linear dimension;
- there is evidence of recent disease progression;
- the manufacturer provides ranibizumab with the discount agreed in the patient access scheme (as revised in 2012).

Ranibizumab should only be continued in patients who maintain adequate response to therapy. Pegaptanib is not recommended for the treatment of wet age-related macular degeneration; patients currently receiving pegaptanib for any lesion type can continue therapy until they and their specialist consider it appropriate to stop.

www.nice.org.uk/TA305

Aflibercept for treating visual impairment caused by macular oedema secondary to central retinal vein occlusion (February 2014)

Aflibercept solution for injection is recommended as an option for treating visual impairment caused by macular oedema secondary to central retinal vein occlusion only if the manufacturer provides aflibercept solution for injection with the discount agreed in the patient access scheme.

www.nice.org.uk/TA305

NICE guidance

Ranibizumab for the treatment of choroidal neovascularisation associated with pathological myopia (November 2013)

Ranibizumab is recommended as an option for treating visual impairment due to choroidal neovascularisation secondary to pathological myopia when the manufacturer provides ranibizumab with the discount agreed in the patient access scheme.

www.nice.org.uk/TA283

Verteporfin is licensed for use in the photodynamic treatment of age-related macular degeneration associated with predominantly classic subfoveal choroidal neovascularisation or with pathological myopia (see NICE guidance below). Following intravenous infusion, verteporfin is activated by local irradiation using non-thermal red light to produce cytotoxic derivatives. Only specialists experienced in the management of these conditions should use it.

NICE guidance

Verteporfin photodynamic therapy for wet age-related macular degeneration (September 2003)

Photodynamic therapy is recommended for wet age-related macular degeneration with a confirmed diagnosis of classic (no occult) subfoveal choroidal neovascularisation and best-corrected visual acuity of 6/60 or better.

Photodynamic therapy is not recommended for wet age-related macular degeneration with predominantly classic but partly occult subfoveal choroidal neovascularisation except in clinical studies.

www.nice.org.uk/TA68

AFLIBERCEPT

Indications see notes above—specialist use only

Cautions see notes above; also monitor intra-ocular pressure following injection; patients at risk of retinal pigment epithelial tear

Contra-indications ocular or periorcular infection; severe intra-ocular inflammation; clinical signs of irreversible ischaemic visual function loss

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk and recommends women use effective contraception during and for at least 3 months after treatment
11.8.2 Ocular diagnostic and peri-operative preparations

**Dose**
- Neovascular (wet) age-related macular degeneration, by intravitreal injection, ADULT over 18 years, 2 mg into the affected eye once a month for 3 months, then every 2 months thereafter; review treatment frequency after 12 months
- Macular oedema secondary to central retinal vein occlusion, by intravitreal injection, ADULT over 18 years, 2 mg into the affected eye once a month; monitor visual and anatomic outcomes monthly; continue treatment until visual and anatomic outcomes are stable for 3 monthly assessments (discontinue treatment if no improvement in visual and anatomic outcomes after initial 3 injections); if necessary subsequent doses may be given at least 1 month apart

**Breast-feeding**
- manufacturer advises avoid—no information available

**Side-effects**
- see notes above; also conjunctival haemorrhage, vitreous haemorrhage, corneal erosion, eye pain, retinal pigment epithelium tear, retinal degeneration, cataract formation, corneal abrasion or oedema, raised intraocular pressure, blurred vision, vitreous floaters, vitreous detachment, foreign body sensation in eye, increased lacrimation, eyelid oedema, ocular hypertension; less commonly retinal tear, retinal detachment, lenticular opacities, corneal epithelium defect, eyelid irritation, iritis, iridocyclitis, anterior chamber flare; rarely vitritis, uveitis

**Dose**
- By intravitreal injection, ADULT over 18 years, 300 micrograms once every 6 weeks into the affected eye

**Note**
- For further information on administration, consult product literature. Review treatment if no benefit after 2 consecutive injections

**Macugen® (Pfizer)**
- Solution for intravitreal injection, pegaptanib (as sodium salt), net price 300-microgram prefilled syringe = £514.00

**PEGAPTANIB SODIUM**

**Indications**
- see notes above—specialist use only

**Cautions**
- see notes above; also history of stroke or transient ischaemic attack; patients at risk of retinal pigment epithelial tear; monitor intraocular pressure, perfusion of the optic nerve head, and for signs of ocular infection following injection; retinal detachment or macular hole—discontinue treatment and rhegmatogenous retinal detachment or stage 3 or 4 macular hole develops; diabetic macular oedema due to type 1 diabetes (limited information available); previous intravitreal injections; active systemic infection; proliferative diabetic retinopathy; uncontrolled hypertension; diabetic patients with HbA1c over 12%

**Contra-indications**
- ocular or periocular infection; severe intraocular inflammation; signs of irreversible ischaemic visual function loss in patients with retinal vein occlusion

**Pregnancy**
- manufacturer advises avoid unless potential benefit outweighs risk and recommends women use effective contraception during and for at least 3 months after treatment

**Breast-feeding**
- manufacturer advises avoid—no information available

**Side-effects**
- see notes above; also rhinorrhea; headache; eye pain, anterior chamber inflammation, raised intraocular pressure, punctate keratitis, vitreous floaters, cataract, conjunctival and retinal haemorrhage, local oedema, conjunctivitis, corneal dystrophy, dry eye, eye discharge, eye irritation, macular degeneration, mydriasis, peribulbar haemotoma, photophobia, flashing lights, vitreous disorders; less commonly vomiting, dyspepsia, palpitation, chest pain, hypertension, aortic aneurysm, influenza-like symptoms, nightmares, depression, back pain, asthenopia, blepharitis, corneal deposits, vitreous haemorrhage, chalazion, retinal exudates, eyelid ptosis, decreased intraocular pressure, injection-site reactions, retinal detachment, occlusion of retinal blood vessels, ectropion, eye movement disorder, pupillary disorder, iritis, optic nerve cupping, nasopharyngitis, deafness, vertigo, eczema, changes in hair colour, rash, pruritus, night sweats

**Dose**
- Neovascular (wet) age-related macular degeneration, by intravitreal injection, ADULT over 18 years, 500 micrograms once a month into the affected eye; monitor visual acuity monthly; continue treatment until visual acuity is stable for 3 consecutive months; thereafter monitor visual acuity monthly; if necessary subsequent doses may be given at least 1 month apart
- Diabetic macular oedema, macular oedema secondary to retinal vein occlusion, by intravitreal injection, ADULT over 18 years, 300 micrograms once a month into the affected eye; monitor visual acuity monthly; continue treatment until visual acuity is stable for 3 consecutive months (discontinue treatment if no improvement in visual acuity after initial 3 injections); thereafter monitor visual acuity monthly; if necessary subsequent doses may be given at least 1 month apart
- Choroidal neovascularisation secondary to pathologic myopia, by intravitreal injection, ADULT over 18 years,
initially 500 micrograms as a single injection into the affected eye; monitor for disease activity monthly for first 2 months, then at least every 3 months thereafter during the first year, then as required; if necessary subsequent doses may be given at least 1 month apart.

Concomitant treatment of diabetic macular oedema, or macular oedema secondary to branch retinal vein occlusion, with laser photocoagulation, by intravitreal injection, ADULT, 500 micrograms at least 30 minutes after laser photocoagulation.

**Note** For further information on administration, consult product literature.

Lucentis® (Novartis) ▼ [PAH]
Solution for intravitreal injection, ranibizumab 10 mg/mL, net price 0.23-mL vial = £742.17

**VERTEPORFIN**

**Indications** see notes above—specialist use only

**Cautions** photosensitivity—avoid exposure of unprotected skin and eyes to bright light during infusion and for 48 hours afterwards; concomitant use with other photosensitising drugs; biliary obstruction; avoid extravasation.

**Contra-indications** acute porphyria

**Hepatic impairment** use with caution in moderate impairment; avoid in severe impairment.

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk (teratogenic in animal studies)

**Breast-feeding** no information available—manufacturer advises avoid breast-feeding for 48 hours after administration.

**Side-effects** nausea, hypercholesterolaemia, malaise, back pain, photosensitivity, visual disturbances (including reduced visual acuity, flashing lights, visual-field defects), less commonly hypertension, hyperaesthesia, pyrexia, retinal detachment, subretinal, retinal or vitreous haemorrhage, rarely retinal or choroidal vessel non-perfusion; also reported chest pain, myocardial infarction, vasovagal reactions, macular oedema, metamorphopsia, eyelid oedema, anterior chamber cell or flare,iritis, photopsia, ocular hypertension, abnormal retinograph, ocular discomfort, photophobia, chromatopsia, retinal pigment epitheliopathy; less commonly transient blindness, lens subluxation, scotoma, visual field defect, diplopia, hyphaema, miosis, unequal pupils, corneal abrasion, anterior chamber inflammation, eye inflammation.

**Dose**

- By intravenous infusion over 10 minutes, 6 mg/m²

**Note** For information on administration and light activation, consult product literature.

Visudyne® (Novartis) ▼ [PAH]
Injection, powder for reconstitution, verteporfin, net price 15-mg vial = £850.00

**Excipients** include butylated hydroxytoluene

**Contraindications** active or suspected ocular or periocular infection; large diameter macular hole (>400 microns); high myopia; aphakia; history of rhegmatogenous retinal detachment; lens zonule instability; recent ocular surgery or intra-ocular injection (including laser therapy); proliferative diabetic retinopathy; ischaemic retinopathies; retinal vein occlusions; exudative age-related macular degeneration; vitreous haemorrhage.

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk—no information available

**Side-effects** conjunctival, retinal, and vitreous disorders, reduced visual acuity, raised intra-ocular pressure, macular hole, macular degeneration, macular oedema, metamorphopsia, eyelid oedema, anterior chamber cell or flare, iritis, photopsia, ocular hypertension, abnormal retinograph, ocular discomfort, photophobia, chromatopsia, retinal pigment epitheliopathy; less commonly transient blindness, lens subluxation, scotoma, visual field defect, diplopia, hyphaema, miosis, unequal pupils, corneal abrasion, anterior chamber inflammation, eye inflammation.

**Dose**

- By intravitreal injection, ADULT over 18 years, 125 micrograms as a single dose into the affected eye.

**Note** Concurrent administration to both eyes not recommended. For further information on administration, consult product literature.

Jetrea® (Alcon) ▼ [PAH]
Concentrate for solution for intravitreal injection, ocriplasmin 2.5 mg/mL, net price 0.2-mL vial = £2500.00

**11.9 Contact lenses**

For cosmetic reasons many people prefer to wear contact lenses rather than spectacles; contact lenses are also sometimes required for medical indications. Visual defects are corrected by either rigid (‘hard’ or gas permeable) lenses or soft (hydrogel or silicone hydrogel) lenses; soft lenses are the most popular type, because they are initially the most comfortable, but they may not give the best vision. Lenses should usually be worn for a specified number of hours each day and removed for sleeping. The risk of infectious and non-infectious keratitis is increased by extended continuous contact lens wear, which is not recommended, except when medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, can result in complications including ulcerative keratitis or conjunctivitis. One-day disposable lenses, which are worn only once and therefore require no disinfection or cleaning, are becoming increasingly popular.

**NICE guidance**

Ocriplasmin for treating vitreomacular traction (October 2013)

Ocriplasmin is recommended as an option for treating vitreomacular traction in adults, only if:

- a epiretinal membrane is not present
- they have a stage II full-thickness macular hole with a diameter of 408 microns or less and/or
- they have severe symptoms.

www.nice.org.uk/TA297

**OCRIPLASMIN**

**Indications** see notes above—specialist use only

**Cautions** monitor intra-ocular pressure, visual acuity, and for signs of intra-ocular inflammation or infection following injection; non-proliferative diabetic retinopathy, history of uveitis (including severe active inflammation); significant eye trauma.

**Contra-indications** active or suspected ocular or periocular infection; large diameter macular hole (>400 microns); high myopia; aphakia; history of rhegmatogenous retinal detachment; lens zonule instability; recent ocular surgery or intra-ocular injection (including laser therapy); proliferative diabetic retinopathy; ischaemic retinopathies; retinal vein occlusions; exudative age-related macular degeneration; vitreous haemorrhage.

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk—no information available

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk—no information available

**Side-effects** conjunctival, retinal, and vitreous disorders, reduced visual acuity, raised intra-ocular pressure, macular hole, macular degeneration, macular oedema, metamorphopsia, eyelid oedema, anterior chamber cell or flare, iritis, photopsia, ocular hypertension, abnormal retinograph, ocular discomfort, photophobia, chromatopsia, retinal pigment epitheliopathy; less commonly transient blindness, lens subluxation, scotoma, visual field defect, diplopia, hyphaema, miosis, unequal pupils, corneal abrasion, anterior chamber inflammation, eye inflammation.

**Dose**

- By intravitreal injection, ADULT over 18 years, 125 micrograms as a single dose into the affected eye.

**Note** Concurrent administration to both eyes not recommended. For further information on administration, consult product literature.

Jetrea® (Alcon) ▼ [PAH]
Concentrate for solution for intravitreal injection, ocriplasmin 2.5 mg/mL, net price 0.2-mL vial = £2500.00

**11.9 Contact lenses**

For cosmetic reasons many people prefer to wear contact lenses rather than spectacles; contact lenses are also sometimes required for medical indications. Visual defects are corrected by either rigid (‘hard’ or gas permeable) lenses or soft (hydrogel or silicone hydrogel) lenses; soft lenses are the most popular type, because they are initially the most comfortable, but they may not give the best vision. Lenses should usually be worn for a specified number of hours each day and removed for sleeping. The risk of infectious and non-infectious keratitis is increased by extended continuous contact lens wear, which is not recommended, except when medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, can result in complications including ulcerative keratitis or conjunctivitis. One-day disposable lenses, which are worn only once and therefore require no disinfection or cleaning, are becoming increasingly popular.
Acanthamoeba keratitis, a painful and sight-threatening condition, is associated with ineffective lens cleaning and disinfection, the use of contaminated lens cases, or tap water coming into contact with the lenses. The condition is especially associated with the use of soft lenses (including frequently replaced lenses) and should be treated by specialists.

**Contact lenses and drug treatment**  Special care is required in prescribing eye preparations for contact lens users. Some drugs and preservatives in eye preparations can accumulate in hydrogel lenses and may induce toxic reactions. Therefore, unless medically indicated, the lenses should be removed before instillation of the eye preparation and not worn during the period of treatment. Alternatively, unpreserved drops can be used. Eye drops may, however, be instilled while patients are wearing rigid corneal contact lenses. Ointment preparations should never be used in conjunction with contact lens wear; oily eye drops should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include oral contraceptives (particularly those with a higher oestrogen content), drugs which reduce blink rate (e.g. anxiolytics, hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. antihistamines, antimuscarinics, phenothiazines and related drugs, some beta-blockers, diuretics, and tricyclic antidepressants), and drugs which increase lacrimation (including epinephrine and hydralazine). Other drugs that may affect contact lens wear are isotretinoin (can cause conjunctival inflammation), aspirin (salicylic acid appears in tears and can be absorbed by contact lenses—leading to irritation), and rifampicin and sulfasalazine (can discolour lenses).

This chapter also includes advice on the drug management of the following:
- allergic rhinitis, p. 769
- nasal polyps, p. 769
- oropharyngeal infections, p. 775
- periodontitis, p. 773

12.1.1 Otitis externa

Otitis externa is an inflammatory reaction of the meatal skin. It is important to exclude an underlying chronic otitis media before treatment is commenced. Many cases recover after thorough cleansing of the external ear canal by suction or dry mopping. A frequent problem in resistant cases is the difficulty in applying lotions and ointments satisfactorily to the relatively inaccessible affected skin. The most effective method is to introduce a ribbon gauze dressing or sponge wick soaked with corticosteroid ear drops or with an astringent such as aluminium acetate solution. When this is not practical, the ear should be gently cleansed with a probe covered in cotton wool and the patient encouraged to lie with the affected ear uppermost for ten minutes after the canal has been filled with a liberal quantity of the appropriate solution.

If infection is present, a topical anti-infective which is not used systemically (such as neomycin or clioquinol) may be used, but for only about a week as excessive use may result in fungal infections; these may be difficult to treat and require expert advice. Sensitivity to the anti-infective or solvent may occur and resistance to antibacterials is a possibility with prolonged use. Aluminium acetate ear drops are also effective against bacterial infection and inflammation of the ear.

In view of reports of ototoxicity, manufacturers contraindicate treatment with topical aminoglycosides or polymyxins in patients with a perforated tympanic membrane (eardrum) or patent grommet. However, some specialists do use these drops cautiously in the presence of a perforation or patent grommet in patients with chronic suppurative otitis media (section 12.1.2) and when other measures have failed for otitis externa; treatment should be considered only by specialists in the following circumstance:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.
Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances.

A solution of acetic acid 2% acts as an antifungal and antibacterial in the external canal. It may be used to treat mild otitis externa but in severe cases an anti-inflammatory preparation with or without an anti-inflammatory drug is required. A proprietary preparation containing acetic acid 2% (EarCalm® spray) is on sale to the public.

For severe pain associated with otitis externa, a simple analgesic, such as paracetamol (section 4.7.1) or ibuprofen (section 10.1.1), can be used. A systemic antibacterial (Table 1, section 5.1) can be used if there is spreading cellulitis or if the patient is systemically unwell. When a resistant staphylococcal infection (a boil) is present in the external auditory meatus, flucloxacillin is the drug of choice; ciprofloxacin (or an aminoglycoside) may be needed in pseudomonal infection. If infection is present, the corticosteroid should be avoided in the presence of an untreated ear infection. If infection is present, the corticosteroid should be used in combination with a suitable anti-infective (see notes above).

The skin of the pinna adjacent to the ear canal is often affected by eczema. Topical corticosteroid creams and ointments (section 13.4) are then required, but prolonged use should be avoided.

### Astringent preparations

#### ALUMINIUM ACETATE

**Indications** inflammation in otitis externa (see notes above)

**Dose**
- Insert into meatus or apply on a ribbon gauze dressing or sponge wick which should be kept saturated with the ear drops

**Aluminium Acetate (Non-proprietary)**

**Ear drops 13%**
- aluminium sulfate 2.25 g, calcium carbonate 1 g, tartaric acid 450 mg, acetic acid (33%) 2.5 mL, purified water 7.5 mL
- Available from manufacturers of ‘special order’ products

**Ear drops 8%**
- dilute 8 parts aluminium acetate ear drops (13%) with 5 parts purified water. Must be freshly prepared

### Anti-inflammatory preparations

#### Corticosteroids

Topical corticosteroids are used to treat inflammation and eczema in otitis externa.

**Cautions** Prolonged use of topical corticosteroid ear preparations should be avoided.

**Contra-indications** Corticosteroid ear preparations should be avoided in the presence of an untreated ear infection. If infection is present, the corticosteroid should be used in combination with a suitable anti-infective (see notes above).

**Side-effects** Local sensitivity reactions may occur.

#### BETAMETHASONE SODIUM PHOSPHATE

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Betnesol**® (RPH) **Paracetamol**

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 10 mL = £2.32

**Excipients** include benzyl alcohol, dextrose, disodium edetate

**Dose**
- ear, apply 2–3 drops every 2–3 hours; reduce frequency when relief obtained, eye, section 11.4.1, nose, section 12.2.1

**Vistamethasone**® (MartinDale) **Paracetamol**

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 5 mL = £1.02; 10 mL = £1.16

**Excipients** include benzyl alcohol, sodium chloride, disodium edetate

**Dose**
- ear, apply 2–3 drops every 3–4 hours; reduce frequency when relief obtained, eye, section 11.4.1, nose, section 12.2.1

With antibacterial

#### Betnesol-N**® (RPH) **Paracetamol**

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, neomycin sulfate 0.5%. Net price 10 mL = £2.39

**Excipients** include benzyl alcohol, sodium chloride, disodium edetate

**Dose**
- ear, apply 2–3 drops 3–4 times daily, eye, section 11.4.1, nose, section 12.2.3

### DEXAMETHASONE

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

With antibacterial

**Otomize**® (Forest) **Paracetamol**

**Ear spray**, dexamethasone 0.1%, neomycin sulfate 3250 units/mL, glacial acetic acid 2%. Net price 5 mL pump-action aerosol unit = £3.50

**Excipients** include hydroxybenzoates (parabens)

**Dose**
- ADULT and CHILD over 2 years, apply 1 metered spray 3 times daily

**Sofradex**® (Sanofi-Aventis) **Paracetamol**

**Drops** (for ear or eye), dexamethasone (as sodium metasulphobenzoate) 0.05%, framycetin sulfate 0.5%, gramicidin 0.005%. Net price 5 mL = £0.48; 10 mL = £0.96

**Excipients** include polysorbate 80

**Dose**
- ear, apply 2–3 drops every 2–3 hours; reduce frequency when relief obtained, eye, section 11.4.1, nose, section 11.4.1

#### FLUMETASONE PIVALATE

(Flumethasone Pivalate)

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

With antibacterial

**Locorten-Vioform**® (AMCo) **Paracetamol**

**Ear drops**, flumetasone pivalate 0.02%, clobetasol propionate 0.005%, clobetasol propionate 0.01%, paracetamol 1%. Net price 7.5 mL = £1.76

**Contra-indications** iodine sensitivity

**Dose**
- ADULT and CHILD over 2 years apply 2–3 drops into the ear twice daily for 7–10 days

**Note** Clobetasol propionate stains skin and clothing
**12.1.2 Otitis media**

**Acute otitis media**  
Acute otitis media is the commonest cause of severe aural pain in small children. Many infections, especially those accompanying coryza, are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment and a simple analgesic, such as paracetamol, may be sufficient. In children without systemic features, a systemic antibacterial (Table 1, section 5.1) may be started after 72 hours if there is no improvement, or earlier if there is deterioration, if the patient is systemically unwell, if the patient is at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis is present, or in children under 2 years of age with bilateral otitis media. Perforation of the tympanic membrane in patients with acute otitis media usually heals spontaneously without treatment; if there is no improvement, e.g. pain or discharge persists, a systemic antibacterial (Table 1, section 5.1) can be given. Topical treatment of acute otitis media is ineffective and there is no place for drops containing a local anaesthetic.

**Hydrocortisone**

**Indications**  
eczematous inflammation in otitis externa (see notes above)

**Cautions**  
see notes above

**Contra-indications**  
see notes above

**Side-effects**  
see notes above

**With antibacterial**

**Gentisone**

**Indications**  
mild bacterial or fungal infections in otitis externa (but see notes above)

**Cautions**  
avoid prolonged use (see notes above)

**Contra-indications**  
perforated tympanic membrane (but see also p. 765 and section 12.1.2)

**Side-effects**  
local sensitivity

**With corticosteroid**

**Sofradex**

**Indications**  
bacterial infection in otitis externa (see notes above)

**Cautions**  
avoid prolonged use (see notes above)

**Contra-indications**  
perforated tympanic membrane (see p. 765)

**Side-effects**  
local sensitivity

**Gentamicin**

**Indications**  
bacterial infection in otitis externa (see notes above)

**Cautions**  
avoid prolonged use (see notes above)

**Contra-indications**  
perforated tympanic membrane

**Side-effects**  
local sensitivity

**With corticosteroid**

**Gentisone HC**

**Indications**  
eczematous inflammation in otitis externa

**Cautions**  
see notes above

**Contra-indications**  
see notes above

**Side-effects**  
see notes above

**Prednisolone sodium phosphate**

**Indications**  
eczematous inflammation in otitis externa (see notes above)

**Cautions**  
see notes above

**Contra-indications**  
see notes above

**Side-effects**  
see notes above

**With antibacterial**

**Genticin**

**Indications**  
eczematous inflammation in otitis externa

**Cautions**  
see notes above

**Contra-indications**  
perforated tympanic membrane

**Side-effects**  
local sensitivity

**With corticosteroid**

**Sofradex**

**Indications**  
bacterial infection in otitis externa (see notes above)

**Cautions**  
avoid prolonged use (see notes above)

**Contra-indications**  
perforated tympanic membrane

**Side-effects**  
local sensitivity

**Gentamicin**

**Indications**  
bacterial infection in otitis externa (see notes above)

**Cautions**  
avoid prolonged use (see notes above)

**Contra-indications**  
perforated tympanic membrane (but see also p. 765 and section 12.1.2)

**Side-effects**  
local sensitivity

**With corticosteroid**

**Gentisone HC**  
see Hydrocortisone, above

**Chloramphenicol**

**Indications**  
bacterial infection in otitis externa (but see notes above)

**Cautions**  
avoid prolonged use (see notes above)

**Side-effects**  
high incidence of sensitivity reactions to vehicle

**Chloramphenicol (Non-proprietary)**

**Indications**  
bacterial infection in otitis externa

**Cautions**  
avoid prolonged use (see notes above)

**Side-effects**  
local sensitivity; stains skin and clothing

**With corticosteroid**

**Locorten-Vioform**

**Indications**  
mild bacterial or fungal infections in otitis externa (see notes above)

**Cautions**  
avoid prolonged use (see notes above); manufacturer advises avoid in perforated tympanic membrane (but used by specialists for short periods)

**Side-effects**  
local sensitivity; stains skin and clothing

**Clioquinol**

**Indications**  
mild bacterial or fungal infections in otitis externa (see notes above)

**Cautions**  
avoid prolonged use (see notes above)

**Side-effects**  
see Hydrocortisone, above

**Clofazimine**

**Indications**  
fungal infection in otitis externa (see notes above)

**Side-effects**  
occasional local irritation or sensitivity

**Canesten**

**Indications**  
bacterial infection in otitis externa (see notes above)

**Cautions**  
avoid prolonged use (see notes above)

**Contra-indications**  
perforated tympanic membrane

**Side-effects**  
local sensitivity

**FRAMYCETIN SULFATE**

**Indications**  
bacterial infection in otitis externa (see notes above)

**Cautions**  
avoid prolonged use (see notes above)

**Contra-indications**  
perforated tympanic membrane

**Side-effects**  
local sensitivity

**With corticosteroid**

**Betnesol-N**

**Indications**  
bacterial infection in otitis externa (see notes above)

**Cautions**  
avoid prolonged use (see notes above)

**Contra-indications**  
perforated tympanic membrane

**Side-effects**  
local sensitivity

**With corticosteroid**

**Betnesol-N**

**NEOMYCIN SULFATE**

**Indications**  
bacterial infection in otitis externa (see notes above)

**Cautions**  
avoid prolonged use (see notes above)

**Contra-indications**  
perforated tympanic membrane (see p. 765)

**Side-effects**  
local sensitivity

**With corticosteroid**

**Betnesol-N**

**12 Ear, nose, and oropharynx**
**Otitis media with effusion**  Otitis media with effusion (glue ear) occurs in about 10% of children and in 90% of children with cleft palates. Systemic antibiotics are not usually required. If glue ear persists for more than a month or two, the child should be referred for assessment and follow up because of the risk of long-term hearing impairment which can delay language development. Untreated or resistant glue ear may be responsible for some types of chronic otitis media.

**Chronic otitis media**  Opportunistic organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in patients with chronic otitis media. The mainstay of treatment is thorough cleansing with aural microsuction which may completely resolve long-standing infection. Local cleansing of the meatal and middle ear may be followed by treatment with a sponge wick or ribbon gauze dressing soaked with corticosteroid ear drops or with an astringent such as aluminium acetate solution; this is particularly beneficial for discharging ears or infections of the mastoid cavity. An antibiotic ear ointment may also be used. Acute exacerbations of chronic infection may also require systemic treatment with amoxicillin (or erythromycin if penicillin-allergic); treatment is adjusted according to the results of sensitivity testing.

In view of reports of ototoxicity, manufacturers contra-indicate topical treatment with ototoxic antibacterials in the presence of a tympanic perforation or patent grommet. Ciprofloxacin or ofloxacin eye drops used in the ear [unlicensed use] or ear drops [both unlicensed; available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104] are an effective alternative to such ototoxic ear drops for chronic otitis media in patients with perforation of the tympanic membrane. However, some specialists do use ear drops containing aminoglycosides or polymyxins [unlicensed indications] cautiously in patients with chronic supplicative otitis media and a perforation of the tympanic membrane, if the otitis media has failed to settle with systemic antibacterials; treatment should be considered only by specialists in the following circumstance:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances. It is considered that the pus in the middle ear associated with otitis media also carries a risk of ototoxicity.

### 12.1.3 Removal of ear wax

Wax is a normal bodily secretion which provides a protective film on the meatal skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum.

Wax can be softened using simple remedies such as olive oil ear drops or almond oil ear drops; sodium bicarbonate ear drops are also effective, but may cause dryness of the ear canal. If the wax is hard and impacted, the drops can be used twice daily for several days and this may reduce the need for mechanical removal of the wax. The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Some proprietary preparations containing organic solvents can irritate the meatal skin, and in most cases the simple remedies indicated above are just as effective and less likely to cause irritation. Docusate sodium or urea–hydrogen peroxide are ingredients in a number of proprietary preparations for softening ear wax.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in young children, in patients unable to co-operate with the procedure, in those with otitis media in the last six weeks, in otitis externa, in patients with cleft palate, a history of ear drum perforation, or previous ear surgery. A person who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage is unacceptable in this situation.

**Almond Oil**  (Non-proprietary)

- **Ear drops**, almond oil in a suitable container
  - Allow to warm to room temperature before use

**Olive Oil**  (Non-proprietary)

- **Ear drops**, olive oil in a suitable container
  - Allow to warm to room temperature before use

**Sodium Bicarbonate**  (Non-proprietary)

- **Ear drops**, sodium bicarbonate 5%, net price 10 mL = £1.25

**Cerumol®**  (Thornton & Ross)

- **Ear drops**, chlorobutanol 5%, arachis (peanut) oil 57.3%. Net price 11 mL = £2.05

**Exterior®**  (Dermal)

- **Ear drops**, urea–hydrogen peroxide complex 5% in glycerol. Net price 8 mL = £1.75

**Molcer®**  (Wallace Mfg)

- **Ear drops**, docusate sodium 5%. Net price 15 mL = £8.08
  - **Excipients** include propylene glycol

**Otex®**  (DDD)

- **Ear drops**, urea–hydrogen peroxide 5%. Net price 8 mL = £2.89

**Waxsol®**  (Meda)

- **Ear drops**, docusate sodium 0.5%. Net price 10 mL = £1.95

### 12.2 Drugs acting on the nose

**12.2.1 Drugs used in nasal allergy**

**12.2.2 Topical nasal decongestants**

**12.2.3 Nasal preparations for infection**

Rhinitis is often self-limiting but bacterial sinusitis may require treatment with antibacterials (Table 1, section 5.1). There are few indications for nasal sprays and drops except in allergic rhinitis and perennial rhinitis (section 12.2.1). Many nasal preparations contain sympathomimetic drugs which may damage the nasal cilia (section 12.2.2). Sodium chloride 0.9% solution may be used as a douche or ‘sniff’ following endonasal surgery.
12.2.1 Drugs used in nasal allergy

Mild allergic rhinitis is controlled by antihistamines (see also section 3.4.1) or topical nasal corticosteroids; systemic nasal decongestants are of doubtful value (section 3.10). Topical nasal decongestants can be used for a short period to relieve congestion and allow penetration of a topical nasal corticosteroid.

More persistent symptoms and nasal congestion can be relieved by topical nasal corticosteroids; sodium cromoglicate is an alternative, but may be less effective. The topical antihistamine azelastine is useful for controlling breakthrough symptoms in allergic rhinitis. Topical antihistamines are considered less effective than topical corticosteroids but probably more effective than cromoglicate. In seasonal allergic rhinitis (e.g. hay fever), treatment should begin 2 to 3 weeks before the season commences and may have to be continued for several months; continuous treatment may be required for years in perennial rhinitis.

Montelukast (section 3.3.2) is less effective than topical nasal corticosteroids; montelukast can be used in patients with seasonal allergic rhinitis and concomitant asthma.

Sometimes allergic rhinitis is accompanied by vasomotor rhinitis. In this situation, the addition of topical nasal ipratropium bromide (section 12.2.2) can reduce watery rhinorrhea.

Very disabling symptoms occasionally justify the use of systemic corticosteroids for short periods (section 6.3), for example, in students taking important examinations. They may also be used at the beginning of a course of treatment with a corticosteroid spray to relieve severe mucosal oedema and allow the spray to penetrate the nasal cavity.

Pregnancy If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment with nasal beclometasone, budesonide, fluticasone, or sodium cromoglicate may be considered.

Antihistamines

**AZELASTINE HYDROCHLORIDE**

**Indications** allergic rhinitis

**Side-effects** irritation of nasal mucosa; bitter taste (if applied incorrectly); very rarely hypersensitivity reactions including rash, pruritus, and urticaria

**Rhinolast** (Meda) Nasal spray, azelastine hydrochloride 140 micrograms (0.14 mL)/metered spray. Net price 22 mL (157-spray unit with metered pump) = £10.46

**Excipients** include sodium edetate

**Dose** ADULT and CHILD over 5 years, 140 micrograms (1 spray) into each nostril twice daily

**Note** Preparations of azelastine hydrochloride can be sold to the public for nasal administration in aqueous form (other than by aerosol) if supplied for the treatment of seasonal allergic rhinitis or perennial allergic rhinitis in adults and children over 5 years, subject to max. single dose of 140 micrograms per nostril, max. daily dose of 280 micrograms per nostril, and a pack size limit of 36 doses

Corticosteroids

Nasal preparations containing corticosteroids (beclometasone, betamethasone, budesonide, fluticasone, mometasone, and triamcinolone) have a useful role in the prophylaxis and treatment of allergic rhinitis (see notes above).

**Cautions** Corticosteroid nasal preparations should be avoided in the presence of untreated nasal infections, and also after nasal surgery (until healing has occurred); they should also be avoided in pulmonary tuberculosis. Patients transferred from systemic corticosteroids may experience exacerbation of some symptoms. Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; for cautions and side-effects of systemic corticosteroids, see section 6.3.2. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays.

The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

**Side-effects** Local side-effects include dryness, irritation of nose and throat, and epistaxis. Nasal ulceration has been reported, but occurs commonly with nasal preparations containing fluticasone furoate or mometasone furoate. Nasal septal perforation (usually following nasal surgery) occurs very rarely. Raised intra-ocular pressure or glaucoma may occur rarely. Headache, smell and taste disturbances may also occur. Hyperactivity, sleep disturbances, anxiety, depression, and aggression have been reported in children. Hypersensitivity reactions, including bronchospasm, have been reported.

BECLOMETASONE DIPROPIONATE

(Beclometasone Dipropionate)

**Indications** prophylaxis and treatment of allergic and vasomotor rhinitis

**Cautions** see notes above

**Side-effects** see notes above

**Dose**

- ADULT and CHILD over 6 years, 100 micrograms (2 sprays) into each nostril twice daily; max. total 400 micrograms (8 sprays) daily; when symptoms controlled, dose reduced to 50 micrograms (1 spray) into each nostril twice daily

**Beclometasone (Non-proprietary)** Nasal spray, beclometasone dipropionate 50 micrograms/metered spray. Net price 200-spray unit = £2.12

**Brands include** Nasotec Aqueous

**Note** Preparations of beclometasone dipropionate can be sold to the public for nasal administration as a nasal spray if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 20 mg.
Betnesol® (RPH) (Pom)
Drops (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, net price 1 mL = £1.16
Excipients include benzalkonium chloride, polysorbate 80

Indications non-infected inflammatory conditions of ear, nose
Cautions see notes above; interactions: Appendix 1 (corticosteroids)

Dose
See preparations
Budesonide (Non-proprietary) (Pom)
Nasal spray, budesonide 100 micrograms/metered spray, net price 100-spray unit = £5.90
Dosage: ADULT and CHILD over 12 years, 200 micrograms (2 sprays) into each nostril once daily; when control achieved reduce to 100 micrograms (1 spray) into each nostril once daily, ADULT and CHILD over 12 years, 1 spray into each nostril twice daily
Note: Preparations of budesonide can be sold to the public for nasal administration (other than by pressurised aerosol) if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years, subject to maximum single dose of 200 micrograms per nostril, maximum daily dose of 200 micrograms per nostril for maximum 3 months, and a pack size of 3 mg

Flixonase® (A&H) (Pom)
Aqueous nasal spray, fluticasone propionate 50 micrograms/metered spray. Net price 150-spray unit with applicator = £11.01
Excipients include benzalkonium chloride, polysorbate 80
Note: Preparations of fluticasone propionate can be sold to the public for nasal administration (other than by pressurised aerosol) if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years, subject to maximum single dose of 100 micrograms per nostril, maximum daily dose of 200 micrograms per nostril for maximum 3 months, and a pack size of 3 mg

Flixonase Nasule® (A&H) (Pom)
Nasal drops, fluticasone propionate 400 micrograms/unit dose, net price 28 × 0.4-mL units = £12.99
Excipients include polysorbate 20
Dose: nasal polyps, ADULT and ADOLESCENT over 16 years, 200 micrograms (approx. 6 drops) into each nostril once daily; ADULT and CHILD over 12 years 1 spray into each nostril twice daily; consider alternative treatment if no improvement after 4–6 weeks

Flixonase® (A&H) (Pom)
Aqueous nasal spray, fluticasone propionate 50 micrograms/metered spray. Net price 150-spray unit = £8.04
Excipients include benzalkonium chloride, polysorbate 80

With azelastine hydrochloride
Dymista® (Meda) (Pom)
Nasal spray, fluticasone propionate 50 micrograms, azelastine hydrochloride 137 micrograms/metered spray, net price 120-spray unit = £18.91
Excipients include benzalkonium chloride, polysorbate 80
Dose: moderate to severe seasonal and perennial allergic rhinitis, if monotherapy with antihistamine or corticosteroid is inadequate, ADULT and CHILD over 12 years, 1 spray into each nostril twice daily

Fluticasone furoate
Avamys® (GSK) (Pom)
Nasal spray, fluticasone furoate 27.5 micrograms/metered spray, net price 120-spray unit = £6.44
Excipients include benzalkonium chloride, disodium edetate, polysorbate 80
Dose: prophylaxis and treatment of allergic rhinitis, ADULT and CHILD over 12 years, 55 micrograms (2 sprays) into each nostril once daily; control achieved reduces to 27.5 micrograms (1 spray) into each nostril once daily, 1 spray into each nostril twice daily, when control achieved reduce to 27.5 micrograms (1 spray) into each nostril once daily

Betnesol® (RPH) (Pom)
Drops (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, net price 10 mL = £2.19
Excipients: include ben Zachalkonium chloride, poly sorbate 80

Indications prophylaxis and treatment of allergic rhinitis and perennial rhinitis, nasal polyps
Cautions: see notes above; interactions: Appendix 1 (corticosteroids)

Dose
See notes above
Budesonide (Non-proprietary) (Pom)
Nasal spray, budesonide 100 micrograms/metered spray, net price 100-spray unit = £5.90
Dosage: ADULT and CHILD over 12 years, 200 micrograms (2 sprays) into each nostril once daily in the morning or 100 micrograms (1 spray) into each nostril twice daily; when control achieved reduce to 100 micrograms (1 spray) into each nostril once daily
Dosage: ADULT and CHILD over 12 years, 1 spray into each nostril twice daily for up to 3 months
Note: Preparations of budesonide can be sold to the public for nasal administration as a nasal spray if supplied for the prevention and treatment of seasonal allergic rhinitis in adults over 18 years subject to maximum single dose of 200 micrograms per nostril, maximum daily dose of 200 micrograms per nostril for maximum period of 3 months, and a pack size of 10 mg

Rhinocort Aqua® (AstraZeneca) (Pom)
Nasal spray, budesonide 64 micrograms/metered spray. Net price 120-spray unit = £3.49
Excipients include disodium edetate, polysorbate 80, potassium sorbate
Dosage: ADULT and CHILD over 12 years, 128 micrograms (2 sprays) into each nostril once daily in the morning or 64 micrograms (1 spray) into each nostril twice daily; when control achieved reduce to 64 micrograms (1 spray) into each nostril once daily, maximum duration of treatment 3 months
Dosage: ADULT and CHILD over 12 years, 64 micrograms (1 spray) into each nostril twice daily for up to 3 months

**MOMETASONE FUROATE**

**Indications** prophylaxis and treatment of allergic rhinitis; nasal polyps

**Cautions** see notes above

**Side-effects** see notes above

**Dose**
- Rhinitis, ADULT and CHILD over 12 years, 100 micrograms (2 sprays) into each nostril once daily, increased if necessary to max. 200 micrograms (4 sprays) into each nostril once daily; when control achieved reduce to 50 micrograms (1 spray) into each nostril once daily; CHILD 6–12 years, 50 micrograms (1 spray) into each nostril once daily
- Nasal polyps, ADULT over 18 years, 100 micrograms (2 sprays) into each nostril once daily, increased if necessary after 5–6 weeks to 100 micrograms (2 sprays) into each nostril twice daily (consider alternative treatment if no improvement after further 5–6 weeks); reduce to the lowest effective dose when control achieved

Mometasone (Non-proprietary) Nasal spray, mometasone furoate 50 micrograms/metered spray, net price 140-spray unit = £7.60

**Excipients** include benzalkonium chloride, polysorbate 80

Nasonex® (MSD) Nasal spray, mometasone furoate 50 micrograms/metered spray, net price 140-spray unit = £7.68

**Excipients** include benzalkonium chloride, polysorbate 80

**TRIAMCINOLONE ACETONIDE**

**Indications** prophylaxis and treatment of allergic rhinitis

**Cautions** see notes above

**Side-effects** see notes above

Nasacort® (Sanofi-Aventis) Aqueous nasal spray, triamcinolone acetonide 55 micrograms/metered spray. Net price 120-spray unit = £7.39

**Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

**Dose** ADULT and CHILD over 12 years, 110 micrograms (2 sprays) into each nostril once daily; CHILD 6–12 years, 55 micrograms (1 spray) into each nostril once daily, increased if necessary to 110 micrograms (2 sprays) into each nostril once daily; when control achieved, reduce to 55 micrograms (1 spray) into each nostril once daily; max. duration of treatment 3 months; CHILD 2–6 years see BNF for Children

**Note** Preparations of triamcinolone acetonide can be sold to the public for nasal administration as a non-presurised nasal spray if supplied for the symptomatic treatment of seasonal allergic rhinitis in adults over 18 years, subject to the same conditions as above. The nasal mucosa is sensitive to changes in atmospheric temperature and humidity and these alone may cause slight nasal congestion. The nose and nasal sinuses produce a litre of mucus in 24 hours and much of this finds its way silently into the stomach via the nasopharynx. Slight changes in the nasal airway, accompanied by an awareness of mucus passing along the nasopharynx causes some patients to be inaccurately diagnosed as suffering from chronic sinusitis. These symptoms are particularly noticeable at the start of the cool months. Sodium chloride 0.9% given as nasal drops or spray may relieve nasal congestion by helping to liquefy mucous secretions.

Inhalation of warm moist air is useful in the treatment of symptoms of acute infective conditions. The addition of volatile substances such as menthol and eucalyptus may encourage the use of warm moist air (section 3.8). Symptoms of nasal congestion associated with vasomotor rhinitis and the common cold can be relieved by the short-term use (usually not longer than 7 days) of decongestant nasal drops and sprays. These all contain sympathomimetic drugs which exert their effect by vasoconstriction of the mucosal blood vessels which in turn reduces oedema of the nasal mucosa. They are of limited value because they can give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events. Ephedrine nasal drops is the safest sympathomimetic preparation and can give relief for several hours. The more potent sympathomimetic drugs oxymetazoline and xylometazoline are more likely to cause a rebound effect. Sympathomimetics may cause a hypertensive crisis if used during treatment with a monoamine-oxidase inhibitor including moclobemide. The CHM/MHRA has stated that non-prescription cough and cold medicines containing ephedrine, oxymetazoline, or xylometazoline can be considered for up to 5 days in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age (section 3.9.1).

Non-allergic watery rhinorrhoea often responds well to treatment with the antimuscarinic ipratropium bromide.

Systemic nasal decongestants—see section 3.10.

**Sinusitis and oral pain** Sinusitis affecting the maxillary antrum can cause pain in the upper jaw. Where this is associated with blockage of the opening from the sinus into the nasal cavity, it may be helpful to relieve the congestion with inhalation of warm moist air (section 3.8) or with ephedrine nasal drops (see above). For antibacterial treatment of sinusitis, see Table 1, section 5.1.
12.2.3 Nasal preparations for infection

**EPHEDRINE HYDROCHLORIDE**

**Indications** nasal congestion

**Cautions** see section 3.1.1.2 and notes above; also avoid excessive or prolonged use; **interactions:** Appendix 1 (sympathomimetics)

**Pregnancy** see section 3.1.1.2

**Breast-feeding** see section 3.1.1.2

**Side-effects** local irritation, nausea, headache; after excessive use tolerance with diminished effect, rebound congestion; cardiovascular effects also reported

**Dose**

- **Ephedrine** (Non-proprietary)
  - **Nasal drops**, ephedrine hydrochloride 0.5%, net price 10 mL = £1.49; 1%, 10 mL = £1.54
  - **Note** the BP directs that if no strength is specified 0.5%

**Side-effects** see under Ephedrine Hydrochloride section 3.1.1.2 and notes above; also reported transient visual disturbances; in small children, also restlessness, sleep disturbances, and hallucinations (discontinue treatment)

**Dose**

- **Ephedrine** (Non-proprietary)
  - **Nasal drops**, ephedrine hydrochloride 0.5%, net price 10 mL = £1.49; 1%, 10 mL = £1.54

**Note** the BP directs that if no strength is specified 0.5%

**Drops** should be supplied

- **Dose** **ADULT** and **CHILD** over 12 years, 1–2 drops into each nostril up to 4 times daily when required, max. duration 7 days

**Dental prescribing on NHS** Ephedrine nasal drops may be prescribed

**XYLOMETAZOLINE HYDROCHLORIDE**

**Indications** nasal congestion

**Cautions** see under Ephedrine Hydrochloride section 3.1.1.2 and notes above; also angle-closure glaucoma; avoid excessive or prolonged use

**Pregnancy** manufacturer advises avoid

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** see under Ephedrine Hydrochloride and notes above; also reported transient visual disturbances; in small children; also restless, sleep disturbances, and hallucinations (discontinue treatment)

**Dose**

- **Xylometazoline** (Non-proprietary)
  - **Nasal drops**, xylometazoline hydrochloride 0.1%, net price 10 mL = £2.10
  - **Brands include** Otradin®, Otrivine®, Otrivine® Allergy Relief
  - **Dose** 1 spray into each nostril 1–3 times daily when required; max. duration 7 days; not recommended for children under 12 years

**Paediatric nasal drops**, xylometazoline hydrochloride 0.05%, net price 10 mL = £1.91

**Brands include** Otradin®, Otrivine®, Otrivine® Allergy Relief

**Dose** **CHILD** 6–12 years 1–2 drops into each nostril 1–2 times daily when required; max. duration 5 days

**Nasal spray**, xylometazoline hydrochloride 0.1%, net price 10 mL = £2.10

**Brands include** Otrivine®, Otrivine® Allergy Relief

**Dose** 1–2 drops into each nostril up to 4 times daily when required, max. duration 7 days; not recommended for children under 12 years

1. Can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition)

**Antimuscarinic**

**IPRATROPIUM BROMIDE**

**Indications** rhinorrhea associated with allergic and non-allergic rhinitis

**Cautions** see section 3.1.2; avoid spraying near eyes

**Side-effects** epistaxis, nasal dryness, and irritation; less frequently nausea, headache, and pharyngitis; very rarely antimuscarinic effects such as gastrointestinal motility disturbances, palpitations, and urinary retention

**Dose**

- **ADULT** and **CHILD** over 12 years, 42 micrograms (2 sprays) into each nostril 2–3 times daily

**Rinastec** (Boehringer Ingelheim)

- **Nasal spray** 0.03%, ipratropium bromide 21 micrograms/metered spray. Net price 180-dose unit = £6.54

- **Excipients** include benzalkonium chloride, disodium edetate

**Betnesol-N** (RPH)

- **Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, neomycin sulfate 0.5%. Net price 10 mL = £2.39

- **Excipients** include benzalkonium chloride, disodium edetate

**Dose**

- **Nose** 2–3 drops into each nostril 2–3 times daily

**12.2.3 Nasal preparations for infection**

There is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis; for elimination of nasal staphylococci, see below.

Systemic treatment of sinusitis—see Table 1 section 5.1

**Nasal staphylococci**

Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of a cream containing chlorhexidine and neomycin (Naseptin®), but re-colonisation frequently occurs. Coagulase-positive staphylococci are present in the noses of 40% of the population. A nasal ointment containing mupirocin is also available; it should probably be held in reserve for resistant cases. In hospital or in care establishments, mupirocin nasal ointment should be reserved for the eradication (in both patients and staff) of nasal carriage of meticillin-resistant Staphylococcus aureus (MRSA). The ointment should be applied 3 times daily for 5 days and a sample taken 2 days after treatment to confirm eradication. The course may be repeated if the sample is positive (and the throat is not colonised). To avoid the development of resistance, the treatment course should not exceed 7 days and the course should not be repeated on more than one occasion. If the MRSA strain is mupirocin-resistant or does not respond after 2 courses, consider alternative products such as chlorhexidine and neomycin cream.
Bactroban Nasal® (GSK) (pH 2.5)
Nasal ointment, mupirocin 2% (as calcium salt) in white soft paraffin basis. Net price 3 g = £3.54
Dose for eradication of nasal carriage of staphylococci, including meticillin-resistant Staphylococcus aureus (MRSA), apply 2–3 times daily to the inner surface of each nostril.

Naseptin® (Alliance) (pH 7.0)
Cream, chlorhexidine hydrochloride 0.1%, neomycin sulfate 0.5%, net price 15 g = £1.90
Excipients include arachis (peanut) oil, cetostearyl alcohol
Dose for eradication of nasal carriage of staphylococci, apply to nostrils 4 times daily for 10 days; for preventing nasal carriage of staphylococci, apply to nostrils twice daily.

12.3 Drugs acting on the oropharynx

12.3.1 Drugs for oral ulceration and inflammation

12.3.2 Oropharyngeal anti-infective drugs

12.3.3 Lozenges and sprays

12.3.4 Mouthwashes, gargles, and dentifrices

12.3.5 Treatment of dry mouth

12.3.1 Drugs for oral ulceration and inflammation

Ulceration of the oral mucosa may be caused by trauma (physical or chemical), recurrent aphthae, infections, carcinoma, dermatological disorders, nutritional deficiencies, gastro-intestinal disease, haematopoietic disorders, and drug therapy (see also Chemotherapy-induced mucositis and myelosuppression, section 8.1).

It is important to establish the diagnosis in each case as the majority of these lesions require specific management in addition to local treatment. Local treatment aims to protect the ulcerated area, to relieve pain, to reduce inflammation, or to control secondary infection. Patients with an unexplained mouth ulcer of more than 3 weeks’ duration require urgent referral to hospital to exclude oral cancer.

Simple mouthwashes A saline mouthwash (section 12.3.4) may relieve the pain of traumatic ulceration. The mouthwash is made up with warm water and used at frequent intervals until the discomfort and swelling subsides.

Antiseptic mouthwashes Secondary bacterial infection may be a feature of any mucosal ulceration; it can increase discomfort and delay healing. Use of chlorhexidine mouthwash (section 12.3.4) is often beneficial and may accelerate healing of recurrent aphthae.

Corticosteroids Topical corticosteroid therapy may be used for some forms of oral ulceration. In the case of aphthous ulcers it is most effective if applied in the ‘prodromal’ phase. Thrush or other types of candidiasis are recognised complications of corticosteroid treatment.

Hydrocortisone oromucosal tablets are allowed to dissolve next to an ulcer and are useful in recurrent aphthae and erosive lichenoid lesions.

Beclometasone dipropionate inhaler 50–100 micrograms sprayed twice daily on the oral mucosa is used to manage oral ulceration [unlicensed indication]. Alternatively, betamethasone soluble tablets dissolved in water can be used as a mouthwash to treat oral ulceration [unlicensed indication].

Systemic corticosteroid therapy (section 6.3.2) is reserved for severe conditions such as pemphigus vulgaris.

Local analgesics Local analgesics have a limited role in the management of oral ulceration. When applied topically their action is of a relatively short duration so that analgesia cannot be maintained continuously throughout the day. The main indication for a topical local analgesic is to relieve the pain of otherwise intractable oral ulceration particularly when it is due to major aphthae. For this purpose lidocaine 5% ointment or lozenges containing a local anaesthetic are applied to the ulcer. Lidocaine 10% solution as spray (section 15.2) can be applied thinly to the ulcer [unlicensed indication] using a cotton bud. When local anaesthetics are used in the mouth care must be taken not to produce anaesthesia of the pharynx before meals as this might lead to choking.

Benzydamine and Flurbiprofen are non-steroidal anti-inflammatory drugs (NSAIDs). Benzydamine mouthwash or spray may be useful in reducing the discomfort associated with a variety of ulcerative conditions. It has also been found to be effective in reducing the discomfort of post-irradiation mucositis. Some patients find the full-strength mouthwash causes some stinging and, for them, it should be diluted with an equal volume of water. Flurbiprofen lozenges are licensed for the relief of sore throat.

Choline salicylate is a derivative of salicylic acid and has some analgesic action. The dental gel may provide relief for recurrent aphthae, but excessive application or confinement under a denture irritates the mucosa and can itself cause ulceration.

Other preparations Doxycycline rinsed in the mouth may be of value for recurrent aphthous ulceration.

Periodontitis Low-dose doxycycline (Periostat®) is licensed as an adjunct to scaling and root planing for the treatment of periodontitis; a low dose of doxycycline reduces collagenase activity without inhibiting bacteria associated with periodontitis. For anti-infectives used in the treatment of destructive (refractory) forms of periodontal disease, see section 12.3.2 and Table 1, section 5.1. For mouthwashes used for oral hygiene and plaque inhibition, see section 12.3.4.

BENZYDAMINE HYDROCHLORIDE

Indications painful inflammatory conditions of oropharynx
Side-effects occasional numbness or stinging; rarely hypersensitivity reactions
Dose
• As a mouthwash (benzydamine hydrochloride 0.15%), ADULT and CHILD over 13 years, rinse or gargle, using 15 mL (dilute with an equal volume of water if stinging occurs) every 1½–3 hours as required, usually for not more than 7 days
• As an oromucosal spray (benzydamine hydrochloride 0.15%), ADULT and CHILD over 12 years,
**Corticosteroids**

**Indications** oral and perioral lesions  
**Contra-indications** untreated oral infection  
**Side-effects** occasional exacerbation of local infection; thrush or other candidal infections

**Betamethasone** (Non-proprietary)  
*Soluble tablets,* betamethasone 500 micrograms (as sodium phosphate), net price 100-tab pack = £19.52. Label: 10, 13, counselling, administration.  
*Dose oral ulceration,* [unlicensed indication] ADULT and CHILD over 12 years, 500 micrograms dissolved in 20 mL water and rinsed around the mouth 4 times daily; not to be swallowed  
*Dental prescribing on NHS* May be prescribed as Betamethasone Mouthwash 0.15%  
*Oromucosal spray,* benzydamine hydrochloride 0.15%, net price 30-mL unit = £4.24

**Hydrocortisone** (Non-proprietary)  
*Mucoadhesive buccal tablets,* hydrocortisone 2.5 mg (as sodium succinate), Net price 20 = £4.24  
*Dose* ADULT and CHILD over 12 years, 1 lozenge 4 times daily; allowed to dissolve slowly in the mouth in contact with the ulcer; CHILD under 12 years, only on medical advice  
*Dental prescribing on NHS* May be prescribed as Hydrocortisone Oromucosal Tablets

**Doxycycline**

**Indications** see preparations; other indications (section 5.1.3)  
**Cautions** section 5.1.3; monitor for superficial fungal infection, particularly if predisposition to oral candidiasis  
**Contra-indications** section 5.1.3  
**Hepatic impairment** section 5.1.3  
**Renal impairment** section 5.1.3  
**Pregnancy** section 5.1.3  
**Breast-feeding** section 5.1.3  
**Side-effects** section 5.1.3; fungal superinfection  
**Dose**  
- See preparations  
- **Note** Doxycycline stains teeth, avoid in children under 12 years of age

**Flurbiprofen**

**Indications** relief of sore throat  
**Cautions** section 10.1.1  
**Contra-indications** section 10.1.1  
**Hepatic impairment** section 10.1.1  
**Renal impairment** section 10.1.1  
**Pregnancy** section 10.1.1  
**Breast-feeding** section 10.1.1  
**Side-effects** taste disturbance, mouth ulcers (move lozenge around mouth); see also section 10.1.1

**Streifen** (Reckitt Benckiser)  
*Lozenges,* flurbiprofen 8.75 mg, net price 16 = £2.58  
*Dose* ADULT and CHILD over 12 years, allow 1 lozenge to dissolve slowly in the mouth every 3–6 hours, max. 5 lozenges in 24 hours, for max. 3 days

**Local anaesthetics**

**Indications** relief of pain in oral lesions  
**Cautions** avoid prolonged use; hypersensitivity; avoid anaesthesia of the pharynx before meals—risk of choking  
**Hepatic impairment** see Lidocaine section 2.3.2  
**Renal impairment** see Lidocaine section 2.3.2  
**Pregnancy** see Lidocaine section 15.2  
**Breast-feeding** see Lidocaine section 2.3.2  
**Lidocaine** (Non-proprietary)  
*Ointment,* lidocaine 5% in a water-miscible basis, net price 15 g = £6.18  
*Dose* rub sparingly and gently on affected areas  
*Dental prescribing on NHS* Lidocaine 5% Ointment may be prescribed

**Xylocaine** (AstraZeneca)  
*Spray,* lidocaine 10% (100 mg/g) supplying 10 mg lidocaine/spray; 500 spray doses per container. Net price 50-mL bottle = £6.29  
*Dose* apply thinly to the ulcer [unlicensed indication] using a cotton bud  
*Dental prescribing on NHS* May be prescribed as Lidocaine Spray 10%

**Preparations on sale to the public**

Many mouth ulcer preparations, throat lozenges, and throat sprays on sale to the public contain a local anaesthetic. To identify the active ingredients in such preparations, consult the product literature of the manufacturer.

**Note** The correct proprietary name should be ascertained—many products have very similar names but different active ingredients
The most common cause of a sore throat is a viral infection which does not benefit from anti-infective treatment. Streptococcal sore throat requires systemic penicillin therapy (Table 1, section 5.1). Acute ulcerative gingivitis (Vincent’s infection) responds to systemic metronidazole (section 5.1.11). Preparations administered in the dental surgery for the local treatment of periodontal disease include gels of metronidazole (Elyzol®) and those of minocycline (Dentomycin®, Blackwell).

### Oropharyngeal fungal infections

Fungal infections of the mouth are usually caused by Candida spp. (candidiasis or candidosis). Different types of oropharyngeal candidiasis are managed as follows:

**Thrush**  
Acute pseudomembranous candidiasis (thrush), is usually an acute infection but it may persist for months in patients receiving inhaled corticosteroids, cytotoxic or broad-spectrum antibacterials. Thrush also occurs in patients with serious systemic disease associated with reduced immunity such as leukaemia, other malignancies, and HIV infection. Any predisposing condition should be managed appropriately. When thrush is associated with corticosteroid inhalers, rinsing the mouth with water (or cleaning a child’s teeth) immediately after using the inhaler may avoid the problem. Treatment with nystatin or miconazole may be needed. Fluconazole (section 5.2.1) is effective for unresponsive infections or if a topical antifungal drug cannot be used or if the patient has dry mouth. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred (section 5.2.1).

**Acute erythematous candidiasis**  
Acute erythematous (atrophic) candidiasis is a relatively uncommon condition associated with corticosteroid and broad-spectrum antibacterial use and with HIV disease. It is usually treated with fluconazole (section 5.2.1).

**Denture stomatitis**  
Patients with denture stomatitis (chronic atrophic candidiasis), should cleanse their dentures thoroughly and leave them out as often as possible during the treatment period. To prevent recurrence of the problem, dentures should not normally be worn at night. New dentures may be required if these measures fail despite good compliance.

**Miconazole**  
oral gel can be applied to the fitting surface of the denture before insertion (for short periods only). Denture stomatitis is not always associated with candidiasis and other factors such as mechanical or chemical irritation, bacterial infection, or rarely allergy to the dental base material, may be the cause.

**Chronic hyperplastic candidiasis**  
Chronic hyperplastic candidiasis (candidal leukoplakia) carries an increased risk of malignancy; biopsy is essential—this type of candidiasis may be associated with varying degrees of dysplasia, with oral cancer present in a high proportion of cases. Chronic hyperplastic candidiasis is treated with a systemic antifungal such as fluconazole (section 5.2.1) to eliminate candidal overgrowth. Patients should avoid the use of tobacco.

**Angular cheilitis**  
Angular cheilitis (angular stomatitis) is characterised by soreness, erythema and fissuring at the angles of the mouth. It is commonly associated with denture stomatitis but may represent a nutritional deficiency or it may be related to orofacial granulomatosis or HIV infection. Both yeasts (Candida spp.) and bacteria (Staphylococcus aureus and beta-haemolytic streptococci) are commonly involved as interacting, infective factors. A reduction in facial height related to ageing and tooth loss with maceration in the deep occlusive folds that may subsequently arise, predisposes to such infection. While the underlying cause is being identified and treated, it is often helpful to apply miconazole cream (see p. 819) or sodium fusidate ointment (see p. 817); if the angular cheilitis is unresponsive to treatment, miconazole and hydrocortisone cream or ointment (see p. 788) can be used.

**Immunocompromised patients**  
For advice on prevention of fungal infections in immunocompromised patients see p. 403.

**Drugs used in oropharyngeal candidiasis**  
Nystatin is not absorbed from the gastro-intestinal tract and is applied locally (as a suspension) to the mouth for treating local fungal infections. Miconazole is applied locally (as an oral gel) in the mouth but it is absorbed to the extent that potential interactions need to be considered. Miconazole also has some activity against Gram-positive bacteria including streptococci and staphylococci. Fluconazole (section 5.2.1) is given by mouth for infections that do not respond to topical therapy or when topical therapy cannot be used. It is reliably absorbed and effective. Itraconazole (section 5.2.1) can be used for fluconazole-resistant infections.

If candidial infection fails to respond to 1 to 2 weeks of treatment with antifungal drugs the patient should be sent for investigation to eliminate the possibility of...
underlying disease. Persistent infection may also be caused by reinfection from the genito-urinary or gastro-intestinal tract. Infection can be eliminated from these sources by appropriate antifungal therapy; the patient’s partner may also require treatment to prevent reinfection.

For the role of antiseptic mouthwashes in the prevention of oral candidiasis in immunocompromised patients and treatment of denture stomatitis, see section 12.3.4.

### Miconazole

**Indications** see preparations

**Cautions** avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (antifungals, imidazole)

**Contra-indications** with oral gel, impaired swallowing reflex in infants, first 5–6 months of life of an infant born preterm

**Hepatic impairment** avoid

**Pregnancy** manufacturer advises avoid if possible— toxicity at high doses in animal studies

**Breast-feeding** manufacturer advises caution—no information available

**Side-effects** nausea, vomiting; rash; with **buccal tablets**, abdominal pain, taste disturbance, burning sensation at application site, pruritus, and oedema; with **oral gel**, very rarely diarrhoea (usually on long-term treatment), hepatitis, toxic epidermal necrolysis, and Stevens-Johnson syndrome

**Dose**

- See preparations

**Daktarin** (Janssen) Oral gel, sugar-free, orange-flavoured, miconazole 24 mg/mL (20 mg/g). Net price 15-g tube = £2.97. 80-g tube = £4.38. Label: 9, counselling, hold in mouth, after food

**Dose** prevention and treatment of oral candidiasis, by **mouth**, ADULT and **CHILD** over 2 years, 2.5 mL 4 times daily after meals, retain near oral lesions before swallowing (dental prostheses should be removed at night and brushed with gel). **CHILD** under 2 years see BNF for Children

Prevention and treatment of intestinal candidiasis, by **mouth**, ADULT and **CHILD** over 4 months, 5 mg/kg 4 times daily; max. 250 mg (10 mL) 4 times daily

**Note** Treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared

**Dental prescribing on NHS** May be prescribed as Miconazole Oromucosal Gel

**Buccal preparation**

**Loramyc** (Therabel) Mucoadhesive buccal tablets, white-yellow, miconazole 50 mg, net price 14-tab pack = £52.12. Label: 10, counselling, administration

**Dose** oropharyngeal candidiasis in immunocompromised ADULT, 50 mg daily preferably taken in the morning for 7 days; if no improvement, continue treatment for a further 7 days

**Counselling** Place rounded side of tablet on upper gum above an incisor tooth and hold upper lip firmly over the gum for 30 seconds using a finger. If tablet detaches within 6 hours, replace with a new tablet. With each dose, use alternate sides of the gum

**Note** The Scottish Medicines Consortium (p. 4) has advised (January 2011) that miconazole mucoadhesive buccal tablets (Loramyc®) are not recommended for use within NHS Scotland.

1. 15-g tube can be sold to the public

### Nystatin

**Indications** oral and perioral fungal infections

**Side-effects** oral irritation and sensitisation, nausea reported

**Dose**

- Treatment, ADULT and **CHILD**, 100 000 units 4 times daily after food, usually for 7 days (continued for 48 hours after lesions have resolved)

**Note** Unlicensed for treating candidiasis in **NEONATE**

**Nystatin** (Non-proprietary) Oral suspension, nystatin 100 000 units/mL, net price 30 mL = £20.46. Label: 9, counselling, use of pipette, hold in mouth, after food

**Dental prescribing on NHS** Nystatin Oral Suspension may be prescribed

### Oropharyngeal viral infections

The management of primary herpetic gingivostomatitis is a soft diet, adequate fluid intake, and analgesics as required, including local use of benzylamine (section 12.3.1). The use of chlorhexidine mouthwash (section 12.3.4) will control plaque accumulation if toothbrushing is painful and will also help to control secondary infection in general.

In the case of severe herpetic stomatitis, a systemic antiviral such as aciclovir is required (section 5.3.2.1). Valaciclovir and famciclovir are suitable alternatives for oral lesions associated with herpes zoster. Aciclovir and valaciclovir are also used for the prevention of frequently recurring herpes simplex lesions of the mouth, particularly when implicated in the initiation of erythema multiforme. See section 13.10.3 for the treatment of labial herpes simplex infections.

### 12.3.3 Lozenges and sprays

There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some of these preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

### 12.3.4 Mouthwashes, gargles, and dentifrices

Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. A warm saline mouthwash is ideal and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting compound sodium chlor- ide mouthwash with an equal volume of warm water.

Mouthwashes containing an oxidising agent, such as hydrogen peroxide, may be useful in the treatment of acute ulcerative gingivitis (Vincent’s infection) since the organisms involved are anaerobes. It also has a mechanical cleansing effect arising from frothing when in contact with oral debris.
Chlorhexidine is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover, chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed. Chlorhexidine mouthwash is used in the treatment of denture stomatitis. It is also used in the prevention of oral candidiasis in immunocompromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis following tooth extraction. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in patients undergoing dental procedures. Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetic stomatitis) or if the patient has a haemorrhagic disorder, or is disabled. Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis.

There is no convincing evidence that gargles are effective.

### CHLORHEXIDINE GLUCONATE

**Indications** see under preparations below

**Side-effects** mucosal irritation (if desquamation occurs, discontinue treatment or dilute mouthwash with an equal volume of water); taste disturbance; reversible brown staining of teeth, and of silicate or composite restorations; tongue discoloration; parotid gland swelling and hypersensitivity (including anaphylaxis) reported

**Note** Chlorhexidine gluconate may be incompatible with some ingredients in toothpaste; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing product

**Chlorhexidine (Non-proprietary)**

**Mouthwash**, chlorhexidine gluconate 0.2%, net price 300 mL = £3.45

**Dose** oral hygiene and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers, rinse mouth with 10 mL for about 1 minute twice daily

**Denture stomatitis, cleanse and soak dentures in mouthwash solution for 15 minutes twice daily**

**Corsodyl³⁶**(® GSK Consumer Healthcare)

**Dental gel**, chlorhexidine gluconate 1%. Net price 50 g = £1.21

**Dose** oral hygiene and plaque inhibition and gingivitis, brush on the teeth once or twice daily

**Local irritation; oral hygiene**

**Sodium Chloride Mouthwash, Compound, BP**

**Mouthwash**, chlorhexidine gluconate 0.2%, net price 300 mL (original or mint) = £2.28, 600 mL (mint) = £3.85; alcohol-free, 300 mL (mint) = £2.73

**Dose** oral hygiene and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers, rinse mouth with 10 mL for about 1 minute twice daily

**Denture stomatitis, cleanse and soak dentures in mouthwash solution for 15 minutes twice daily**

**Dental prescribing on NHS** May be prescribed as Chlorhexidine Mouthwash

**Oral spray**, chlorhexidine gluconate 0.2% (mint-flavoured). Net price 60 mL = £4.10

**Dose** oral hygiene and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers, apply as required to tooth, gingival, or ulcer surfaces using up to 12 actuations (approx. 0.14 mL/actuation) twice daily

**Dental prescribing on NHS** May be prescribed as Chlorhexidine Oral Spray

### Hexetidine

**Indications** oral hygiene

**Side-effects** local irritation; very rarely taste disturbance and transient anaesthesia

**Oraldene³⁶** (McNeil)

**Mouthwash or gurgle**, red or blue-green (mint-flavoured), hexetidine 0.1%. Net price 100 mL = £1.43; 200 mL = £2.21

**Dose** ADULT and CHILD over 6 years, use 10–15 mL (diluted with lukewarm water in measuring cup provided) 2–3 times daily

**Dental prescribing on NHS** Hydrogen Peroxide Mouthwash may be prescribed

**Peroxyl³⁶**(Colgate-Palmolive)

**Mouthwash**, hydrogen peroxide 1.5%, net price 300 mL = £2.94

**Dose** rinse the mouth with 10 mL, for about 1 minute up to 4 times daily (after meals and at bedtime)

### Hydrogen Peroxide

**Indications** oral hygiene, see notes above

**Side-effects** hypertrophy of papillae of tongue on prolonged use

**Hydrogen Peroxide Mouthwash, BP**

**Mouthwash**, consists of Hydrogen Peroxide Solution 6% (= approx. 20 volume) BP

**Dose** rinse the mouth for 2–3 minutes with 15 mL diluted in half a tumblerful of warm water 2–3 times daily

**Dental prescribing on NHS** Hydrogen Peroxide Mouthwash may be prescribed

**SODIUM CHLORIDE**

**Indications** oral hygiene, see notes above

**Sodium Chloride Mouthwash, Compound, BP**

**Mouthwash**, sodium bicarbonate 1%, sodium chloride 1.5% in a suitable vehicle with a peppermint flavour.

**Dose** extemporaneous preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL.

To be diluted with an equal volume of warm water

**Dental prescribing on NHS** Compound Sodium Chloride Mouthwash may be prescribed

**BNF 68**

**12.3.5 Treatment of dry mouth**

Dry mouth (xerostomia) may be caused by drugs with antimuscarinic (anticholinergic) side-effects (e.g. antispasmodics, tricyclic antidepressants, and some anti-psychotics), by diuretics, by irradiation of the head and
neck region or by damage to or disease of the salivary glands. Patients with a persistently dry mouth may develop a burning or scalded sensation and have poor oral hygiene; they may develop increased dental caries, periodontal disease, intolerance of dentures, and oral infections (particularly candidiasis). Dry mouth may be relieved in many patients by simple measures such as frequent sips of cool drinks or sucking pieces of ice or sugar-free fruit pastilles. Sugar-free chewing gum stimulates salivation in patients with residual salivary function.

**Artificial saliva** can provide useful relief of dry mouth. A properly balanced artificial saliva should be of a neutral pH and contain electrolytes (including fluoride) to correspond approximately to the composition of saliva. The acidic pH of some artificial saliva products may be inappropriate. Of the proprietary preparations, *Aquoral*, *BioXtra*, *Biotène Oralbalance*, and *Xerotin* can be used for any condition giving rise to a dry mouth. *BioXtra*, *Glandosane*, *Saliva Orthana*, and *Saliveze*, have ACBS approval for dry mouth associated only with radiotherapy or sicca syndrome. *Salivix* pastilles, which act locally as salivary stimulants, are also available for any condition leading to a dry mouth and SST tablets may be prescribed for dry mouth in patients with salivary gland impairment (and patent salivary ducts).

Pilocarpine tablets are licensed for the treatment of xerostomia following irradiation for head and neck cancer and for dry mouth and dry eyes (xerophthalmia) in Sjögren’s syndrome. They are effective only in patients who have some residual salivary gland function, and therefore should be withdrawn if there is no response.

### Local treatment

**Aquoral** *(Sinclair IS)*

- **Oral spray**, oxidised glycerol triesters, silicon dioxide, flavouring agents, net price 40-mL bottle = £9.85
- **Excipients** include aspartame (section 9.4.1)
- **Dose** symptomatic treatment of dry mouth, 1 spray onto the inside of each cheek 3–4 times daily

**AS Saliva Orthana** *(AS Pharma)*

- **Oral spray**, gastric mucin (porcine) 3.5%, xylitol 2%, sodium fluoride 4.2 mg/litre, with preservatives and flavouring agents, pH neutral. Net price 50-mL bottle = £4.92. 500-mL refill = £34.27
- **Dose** ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, spray as required

**Biotène Oralbalance** *(GSK)*

- **Saliva replacement gel**, lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis, net price 50-g tube = £4.46
- **Dose** symptomatic treatment of dry mouth, apply to gums and tongue as required

**Note** Avoid use with toothpastes containing detergents (including foaming agents)

**Dental prescribing on NHS** *Biotène Oralbalance* Saliva Replacement Gel may be prescribed as Artificial Saliva Gel

**BioXtra** *(RIS Products)*

- **Gel**, lactoperoxidase, lactoferrin, lysozyme, whey colostrum, xylitol and other ingredients, net price 40-mL tube = £3.94, 50-mL spray = £3.94
- **Dose** ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, apply to oral mucosa as required

**Glandosane** *(Fresenius Kabi)*

- **Aerosol spray**, carmellrose sodium 500 mg, sorbitol 1.5 g, potassium chloride 60 mg, sodium chloride 42.2 mg, magnesium chloride 2.6 mg, calcium chloride 7.3 mg, and dipotassium hydrogen phosphate 17.1 mg/50 g, pH 5.75. Net price 50-mL unit (neutral, lemon or peppermint flavoured) = £5.38
- **Dose** ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, 1 spray onto oral mucosa as required

**Saliveze** *(Wyvern)*

- **Oral spray**, carmellrose sodium (sodium carboxymethylcellulose), calcium chloride, magnesium chloride, potassium chloride, sodium chloride, and dibasic sodium phosphate, pH neutral. Net price 50-mL bottle (mint-flavoured) = £3.50
- **Dose** ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, 1 spray onto oral mucosa as required

**Salivix** *(Galen)*

- **Pastilles**, sugar-free, reddish-amber, acacia, malic acid and other ingredients. Net price 50-pastille pack = £3.55
- **Dose** symptomatic treatment of dry mouth, suck 1 pastille when required

**SST** *(Medac)*

- **Tablets**, sugar-free, citric acid, malic acid and other ingredients in a sorbitol base, net price 100-tab pack = £4.86
- **Dose** symptomatic treatment of dry mouth in patients with impaired salivary gland function and patent salivary ducts, allow 1 tablet to dissolve slowly in the mouth when required

**Xeroton** *(SpePharm)*

- **Oral spray**, sugar-free, water, sorbitol, carmellrose (carboxymethylcellulose), potassium chloride, sodium chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral. Net price 100-mL unit = £6.86
- **Dose** symptomatic treatment of dry mouth, spray as required

**Dental prescribing on NHS** *Xeroton* Oral Spray may be prescribed as Artificial Saliva Oral Spray
Systemic treatment

**PILOCARPINE HYDROCHLORIDE**

**Indications**  xerostomia following irradiation for head and neck cancer (see also notes above); dry mouth and dry eyes in Sjogren’s syndrome

**Cautions**  asthma and chronic obstructive pulmonary disease (avoid if uncontrolled, see Contra-indications), cardiovascular disease (avoid if uncontrolled); cholelithiasis or biliary-tract disease, peptic ulcer, risk of increased urethral smooth muscle tone and renal colic; maintain adequate fluid intake to avoid dehydration associated with excessive sweating; cognitive or psychiatric disturbances; susceptibility to angle-closure glaucoma; interactions: Appendix 1 (parasympathomimetics)

**Counselling**  Blurred vision or dizziness may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting

**Contra-indications**  uncontrolled asthma and chronic obstructive pulmonary disease (increased bronchial secretions and increased airways resistance); uncontrolled cardiorenal disease; acute iritis

**Hepatic impairment**  reduce initial oral dose in moderate or severe cirrhosis

**Renal impairment**  manufacturer advises caution with tablets

**Pregnancy**  avoid—smooth muscle stimulant; toxicity in animal studies

**Breast-feeding**  manufacturer advises avoid—present in milk in animal studies

**Side-effects**  dyspepsia, diarrhoea, abdominal pain, nausea, vomiting, constipation; flushing, hypertension, palpitation, headache, dizziness, asthma, influenza-like symptoms, sweating; increased urinary frequency; visual disturbances, lacrimation, ocular pain, conjunctivitis, rhinitis; rash, pruritus; less commonly flatulence, urinary urgency

**Dose**

- Xerostomia following irradiation for head and neck cancer, 5 mg 3 times daily with or immediately after meals (last dose always with evening meal); if tolerated but response insufficient after 4 weeks, may be increased to max. 30 mg daily in divided doses; max. therapeutic effect normally within 4–8 weeks; discontinue if no improvement after 2–3 months; **CHILD** not recommended

- Dry mouth and dry eyes in Sjogren’s syndrome, 5 mg 4 times daily (with meals and at bedtime); if tolerated but response insufficient, may be increased to max. 30 mg daily in divided doses; discontinue if no improvement after 2–3 months; **CHILD** not recommended

**Salagen® (Novartis)**

Tablets, f/c; pilocarpine hydrochloride 5 mg. Net price 84-tab pack = £41.14. Label: 21, 27, counselling, driving

Gels consist of active ingredients in suitable hydrophilic or hydrophobic bases; they generally have a high water content. Gels are particularly suitable for application to the face and scalp. Lotions have a cooling effect and may be preferred to ointments or creams for application over a hairy area. Lotions in alcoholic basis can sting if used on broken skin. Shake lotions (such as calamine lotion) contain insoluble powders which leave a deposit on the skin surface.

Ointments are greasy preparations which are normally anhydrous and insoluble in water, and are more occlusive than creams. They are particularly suitable for chronic, dry lesions. The most commonly used ointment bases consist of soft paraffin or a combination of soft, liquid, and hard paraffin. Some ointment bases have both hydrophilic and lipophilic properties; they may have occlusive properties on the skin surface, encourage hydration, and also be miscible with water; they often have a mild anti-inflammatory effect. Water-soluble ointments contain macrogols which are freely soluble in water and are therefore readily washed off; they have a limited but useful role where ready removal is desirable.

Pastes are stiff preparations containing a high proportion of finely powdered solids such as zinc oxide and starch suspended in an ointment. They are used for circumscribed lesions such as those which occur in lichen simplex, chronic eczema, or psoriasis. They are less occlusive than ointments and can be used to protect inflamed, lichenified, or excoriated skin.

Dusting powders are used only rarely. They reduce friction between opposing skin surfaces. Dusting powders should not be applied to moist areas because they can cake and abrade the skin. Talc is a lubricant but it does not absorb moisture; it can cause respiratory irritation. Starch is less lubricant but absorbs water.

Dilution The BP directs that creams and ointments should not normally be diluted but that should dilution be necessary care should be taken, in particular, to prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing; excessive dilution may affect the stability of some creams. Diluted creams should normally be used within 2 weeks of preparation.

These amounts are usually suitable for an adult for twice daily application for 1 week. The recommendations do not apply to corticosteroid preparations—for suitable quantities of corticosteroid preparations, see section 13.4.

### 13.1.3 Excipients and sensitisation

Excipients in topical products rarely cause problems. If a patch test indicates allergy to an excipient, products containing the substance should be avoided (see also Anaphylaxis, p. 209). The following excipients in topical preparations are associated, rarely, with sensitisation; the presence of these excipients is indicated in the entries for topical products. See also Excipients, under General Guidance, p. 2.

<table>
<thead>
<tr>
<th>Excipient</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Beeswax</td>
<td>In some preparations, notably emollients, beeswax is used as an emollient and an occlusive. It is particularly suitable for chronic, dry lesions.</td>
</tr>
<tr>
<td>Benzyl alcohol</td>
<td>A permeation enhancer for topical preparations.</td>
</tr>
<tr>

### 13.2 Emollient and barrier preparations

#### 13.2.1 Emollients

Emollients soothe, smooth, and hydrate the skin and are indicated for all dry or scaling disorders. Their effects are short-lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis (section 13.5.2). The choice of an appropriate emollient will depend on the severity of the condition, patient preference, and the site of application. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis. Ointments may exacerbate acne and folliculitis. Some ingredients rarely cause sensitisation (section 13.1.3) and this should be suspected if an eczematous reaction

#### 13.2.2 Barrier preparations

#### 13.2.3 Borderline substances

The preparations marked ‘ACBS’ are regarded as drugs when prescribed in accordance with the advice of the Advisory Committee on Borderline Substances for the clinical conditions listed. Prescriptions issued in accordance with this advice and endorsed ‘ACBS’ will normally not be investigated. See Appendix 2 for listing by clinical condition.

### 13.2.1.1 Emollient bath and shower preparations

Emollients soothe, smooth, and hydrate the skin and are indicated for all dry or scaling disorders. Their effects are short-lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis (section 13.5.2). The choice of an appropriate emollient will depend on the severity of the condition, patient preference, and the site of application. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis. Ointments may exacerbate acne and folliculitis. Some ingredients rarely cause sensitisation (section 13.1.3) and this should be suspected if an eczematous reaction

1. Purified versions of wool fat have reduced the problem

occurs. The use of aqueous cream as a leave-on emollient may increase the risk of skin reactions, particularly in eczema.

**Fire hazard with paraffin-based emollients**

Emulsifying ointment or 50% Liquid Paraffin and 50% White Soft Paraffin Ointment in contact with dressings and clothing is easily ignited by a naked flame. The risk is greater when these preparations are applied to large areas of the body, and clothing or dressings become soaked with the ointment. Patients should be told to keep away from fire or flames, and not to smoke when using these preparations. The risk of fire should be considered when using large quantities of any paraffin-based emollient.

Preparations such as aqueous cream (section 13.2.1.1) and emulsifying ointment can be used as soap substitutes for hand washing and in the bath; the preparation is rubbed on the skin before rinsing off completely. The addition of a bath oil (section 13.2.1.1) may also be helpful.

Preparations containing an antibacterial (section 13.10) should be avoided unless infection is present or is a frequent complication.

Urea is a keratin softener and hydrating agent used in the treatment of dry, scaling conditions (including ichthyosis) and may be useful in elderly patients. It is occasionally used with other topical agents such as corticosteroids to enhance penetration of the skin.

### Non-proprietary emollient preparations

*Emulsifying Ointment, BP*

**Ointment**, emulsifying wax 30%, white soft paraffin 50%, liquid paraffin 20%, net price 500 g = £2.12

**Excipients** include cetostearyl alcohol

*Hydrous Ointment, BP*

**Ointment**, (oily cream), dried magnesium sulfate 0.5%, phenoxyethanol 1%, wool alcohols ointment 50%, in freshly boiled and cooled purified water, net price 500 g = £4.89

*Liquid and White Soft Paraffin Ointment, NPF*

**Ointment**, liquid paraffin 50%, white soft paraffin 50%, net price 500 g = £2.21

*Paraffin, White Soft, BP*

White petroleum jelly, net price 100 g = 50p

*Paraffin, Yellow Soft, BP*

Yellow petroleum jelly, net price 100 g = 54p

### Proprietary emollient preparations

*Aquamax®* (Dermato Logical)

**Cream**, light liquid paraffin 8%, white soft paraffin 20%, phenoxyethanol 1%, net price 100 g = £1.89, 500 g = £3.99

**Excipients** include cetostearyl alcohol, polysorbate 60

*For dry skin conditions*

*Aquamol®* (Thomson & Ross)

**Cream**, containing liquid paraffin, white soft paraffin, net price 50 g = £1.22, 500-g pump pack = £6.40

**Excipients** include cetostearyl alcohol, chlorocresol

*For dry skin conditions*

*Aveeno®* (B&J)

**Cream**, colloidal oatmeal in emollient basis, net price 100 mL = £3.97, 300-mL pump pack = £6.80

**Excipients** include benzyl alcohol, cetyl alcohol, isopropyl palmitate

*ACBS*: For endogenous and exogenous eczema, xeroderma, ichthyosis, and senile pruritus (pruritus of the elderly) associated with dry skin

**Lotion**, colloidal oatmeal in emollient basis, net price 500 mL = £6.66

**Excipients** include benzyl alcohol, cetyl alcohol, isopropyl palmitate, stearyl alcohol

*ACBS*: as for Aveeno® Cream

*Cetraben®* (Genus)

**Emollient cream**, white soft paraffin 13.2%, light liquid paraffin 10.5%, net price 50-g pump pack = £1.40, 150-g pump pack = £3.98, 500-g pump pack = £5.99, 100-g pump pack = £11.62

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

For inflamed, damaged, dry or chapped skin including eczema

**Dermamist®** (Alliance)

**Spray application**, white soft paraffin 10% in a basis containing liquid paraffin, fractionated coconut oil, net price 250-mL pressurised aerosol unit = £5.97

**Excipients** none as listed in section 13.1.3

For dry skin conditions including eczema, ichthyosis, pruritus of the elderly

*Note Flammable*

**Diprobase®** (MSD)

**Cream**, cetomacrogol 2.25%, cetostearyl alcohol 7.2%, liquid paraffin 6%, white soft paraffin 15%, water-miscible basis used for Diprosone® cream, net price 50 g = £1.28, 500-g pump pack = £6.32

**Excipients** include cetostearyl alcohol, chlorocresol

*For dry skin conditions*

**Ointment**, liquid paraffin 5%, white soft paraffin 95%, basis used for Diprosone® ointment, net price 50 g = £1.28, 500 g = £5.99

**Excipients** none as listed in section 13.1.3

*For dry skin conditions*

**Doublebase®** (Dermal)

**Gel**, isopropyl myristate 15%, liquid paraffin 15%, net price 100 g = £2.65, 500 g = £5.83

**Excipients** none as listed in section 13.1.3

For dry, chapped, or itchy skin conditions

**Dayleve Gel**, isopropyl myristate 15%, liquid paraffin 15%, net price 100 g = £2.65, 500-g pump pack = £6.29

**Excipients** none as listed in section 13.1.3

For dry, chapped, or itchy skin conditions

**E45®** (Reckitt Benckiser)

**Cream**, light liquid paraffin 12.6%, white soft paraffin 14.5%, hypoallergenic anhydrous wool fat (hypoallergenic lanolin) 1% in self-emulsifying monostearin, net price 50 g = £1.61, 125 g = £2.90, 350 g = £5.17, 500-g pump pack = £5.62

**Excipients** include cetyl alcohol, hydroxybenzoates (parabens)

*For dry skin conditions*

**Lotion**, light liquid paraffin 4%, cetomacrogol, white soft paraffin 10%, hypoallergenic anhydrous wool fat (hypoallergenic lanolin) 1% in glyceryl monostearate, net price 200 mL = £2.40, 500-mL pump pack = £4.50

**Excipients** include isopropyl palmitate, hydroxybenzoates (parabens), benzyl alcohol

*ACBS*: for symptomatic relief of dry skin conditions, such as those associated with atopic eczema and contact dermatitis
13.2.1 Emollients

**Emollin®** (C D Medical)

Spray, liquid paraffin 50%, white soft paraffin 50% in aerosol basis, net price 150 ml = £3.97, 240 ml = £6.35

Excipients none as listed in section 13.1.3

For dry skin conditions

**Epaderm®** (Molynex)

Cream, yellow soft paraffin 15%, liquid paraffin 10%, emulsifying wax 5%, net price 50-g pump pack = £1.70, 500-g pump pack = £6.95

Excipients include cetostearyl alcohol, chlorocresol

For dry skin conditions

Ointment, yellow soft paraffin 30%, liquid paraffin 40%, net price 125 g = £3.85, 500 g = £6.53, 1 kg = £12.02

Excipients include cetostearyl alcohol

For use as an emollient or soap substitute

**Hydromol®** (Alliance)

Cream, sodium pidoilate 2.5%, liquid paraffin 13.8%, net price 50 g = £2.19, 100 g = £4.09, 500 g = £11.92

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)

For dry skin conditions

Ointment, yellow soft paraffin 30%, emulsifying wax 30%, liquid paraffin 40%, net price 125 g = £2.88, 500 g = £4.89, 1 kg = £9.09

Excipients include cetostearyl alcohol

For use as an emollient, bath additive, or soap substitute

**Lipobase®** (Astellas)

Cream, fatty cream basis used for Locoid Lipocream®, net price 50 g = £1.46

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)

For dry skin conditions, also for use during treatment with topical corticosteroids and as diluent for Locoid Lipocream®

**Oilatum®** (Stiefel)

Cream, light liquid paraffin 6%, white soft paraffin 15%, net price 50 g = £1.63, 150 g = £2.46, 500-mL pump pack = £4.99, 1.05-litre pump pack = £9.98

Excipients include benzyl alcohol, cetostearyl alcohol

For dry skin conditions

Oilatum® Junior Cream, light liquid paraffin 6%, white soft paraffin 15%, net price 150 g = £3.38, 350 mL = £4.65, 500 mL = £4.99, 1.05-litre pump pack = £9.98

Excipients include benzyl alcohol, cetostearyl alcohol

For dry skin conditions

**QV®** (Sound Opinion)

Cream, glycerol 10%, light liquid paraffin 10%, white soft paraffin 5%, net price 100 g = £2.04, 500 g = £5.86, 1.05-kg pump pack = £11.94

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)

For dry skin conditions including eczema, psoriasis, ichthyosis, pruritus

Intensive ointment, light liquid paraffin 50.5%, white soft paraffin 20%, net price 450 g = £5.65

Excipients include cetostearyl alcohol

For dry skin conditions including eczema, psoriasis, ichthyosis, pruritus

Lotion, white soft paraffin 5%, net price 250 mL = £3.14, 500-mL pump pack = £5.24

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)

For dry skin conditions including eczema, psoriasis, ichthyosis, pruritus

**Ultrabase®** (Derma UK)

Cream, water-miscible, containing liquid paraffin and white soft paraffin, net price 50 g = £1.40, 500-g pump pack = £4.80

Excipients include fragrance, hydroxybenzoates (parabens), disodium edetate, stearyl alcohol

For dry skin conditions

**Unguentum M®** (Almirall)

Cream, containing saturated neutral oil, liquid paraffin, white soft paraffin, net price 50 g = £1.41, 100 g = £2.78, 200-mL pump pack = £5.50, 500 g = £8.48

Excipients include cetostearyl alcohol, polysorbate 40, propylene glycol, sorbic acid

For dry skin conditions and nappy rash

**ZeroAQS®** (Thornton & Ross)

Cream, macrolegyl cetostearyl ether 1.8%, liquid paraffin 6%, white soft paraffin 15%, net price 100 g = £1.65, 500 g = £3.29

Excipients include cetostearyl alcohol, chlorocresol

For use as an emollient or soap substitute

**Zerobase®** (Thornton & Ross)

Cream, liquid paraffin 11%, net price 50 g = £1.04, 500-g pump pack = £5.26

Excipients include cetostearyl alcohol, chlorocresol

For dry skin conditions

**Zerocream®** (Thornton & Ross)

Cream, liquid paraffin 12.6%, white soft paraffin 14.5%, net price 50 g = £1.17, 500-g pump pack = £4.08

Excipients include cetyl alcohol, hydroxybenzoates (parabens), lanolin anhydrous

For dry skin conditions

**Zeroderm®** (Thornton & Ross)

Ointment, liquid paraffin 40%, white soft paraffin 30%, net price 125 g = £2.41, 500 g = £4.10

Excipients include cetostearyl alcohol, polysorbate 60

For dry skin conditions

**Zerougent®** (Thornton & Ross)

Cream, liquid paraffin 8%, white soft paraffin 4%, refined soya bean oil 5%, net price 100 g = £2.33, 500 g = £6.99

Excipients include cetostearyl alcohol, polysorbate 40, propylene glycol, sorbic acid

For dry skin conditions

**Preparations containing urea**

**Aquadrade®** (Alliance)

Cream, urea 10%, net price 100 g = £4.37

Excipients none as listed in section 13.1.3

Dose for dry, scaling and itching skin, apply thinly twice daily

**Balneum®** (Almirall)

Cream, urea 5%, ceramide 0.1%, net price 50-g pump pack = £2.85, 500-g pump pack = £9.97

Excipients include cetostearyl alcohol, polysorbates, propylene glycol

Dose for dry skin conditions, apply twice daily

**Balneum® Plus Cream**, urea 5%, lauromacrogols 3%, net price 100 g = £3.29, 500-g pump pack = £14.99

Excipients include benzyl alcohol, polysorbates

Dose for dry, scaling and itching skin, apply twice daily

**Calmurid®** (Galdaroma)

Cream, urea 10%, lactic acid 5%, net price 100 g = £9.27, 500-g pump pack = £35.70

Excipients none as listed in section 13.1.3

Dose for dry, scaling and itching skin, apply a thick layer for 3–5 minutes, massage into area, and remove excess, usually twice daily. Use half-strength cream for 1 week if stinging occurs.

Note: Can be diluted with aqueous cream (life of diluted cream 14 days)
13.2.1 Emollients

**Dermatronics Once Heel Balm**
- **Cream**, urea 25%, net price 75 mL = £3.60, 200 mL = £8.50
- **Excipients** include beeswax, lanolin
- **Dose** for dry skin on soles of feet, **ADULT** and **CHILD** over 12 years, apply once daily

**E45® Itch Relief Cream**
- **Cream**, urea 5%, macrogol lauryl ether 3%, net price 50 g = £2.81, 100 g = £3.74, 500-g pump pack = £14.99
- **Excipients** include benzyl alcohol, polysorbates
- **Dose** for dry, scaling, and itching skin, apply twice daily

**Eucerin® Intensive**
- **Cream**, urea 10%, net price 100 mL = £7.59
- **Excipients** include benzyl alcohol, isopropyl palmitate, wool fat
- **Dose** for dry skin conditions including eczema, ichthyosis, xeroderma, hyperkeratosis, apply thinly and rub into area twice daily

**Hydromol® Intensive**
- **Cream**, urea 10%, net price 30 g = £1.64, 100 g = £4.37
- **Excipients** none as listed in section 13.1.3
- **Dose** for dry, scaling and itching skin, apply thinly twice daily

**Nutraplus®**
- **Cream**, urea 10%, net price 100 g = £4.37
- **Excipients** include hydroxybenzoates (parabens), propylene glycol
- **Dose** for dry, scaling and itching skin, apply 2–3 times daily

**Flexitol® (LaCorium)**
- **Heel balm**, urea 25%, net price 40 g = £2.75, 75 g = £3.80, 200 g = £9.40, 500 g = £14.75
- **Excipients** include benzyl alcohol, cetostearyl alcohol, fragrance, lanolin
- **Dose** for dry skin on soles of feet and heels, **ADULT** and **CHILD** over 12 years, apply 1–2 times daily

**Aqueous Cream, BP**
- **Cream**, emulsifying ointment 30%, 1% phenoxethanol, net price 100 g = 90p, 500 g = £4.50
- **Excipients** include cetostearyl alcohol

**Aquamax® (Dermato Logical)**
- **Cream wash**, light liquid paraffin 8%, white soft paraffin 20%, phenoxethanol 1%, net price 250 g = £2.99
- **Excipients** include cetostearyl alcohol, polysorbates 60
- **Dose** for dry skin conditions, apply to wet or dry skin and rinse

**Avene® (J&J)**
- **Avene® Bath oil**, colloidal oatmeal, white oat fraction in emollient basis, net price 250 mL = £4.49
- **Excipients** include beeswax, fragrance
- **Dose** **ACBS**: for endogenous and exogenous eczema, xeroderma, ichthyosis, and senile pruritus (pruritus of the elderly) associated with dry skin, add 20–30 mL/bath or apply to wet skin and rinse

**Balneum® (Almirall)**
- **Balneum® bath oil**, soya oil 84.75%, net price 200 mL = £2.48, 500 mL = £5.38, 1 litre = £10.39
- **Excipients** include butylated hydroxytoluene, propylene glycol, fragrance
- **Dose** for dry skin conditions including those associated with dermatitis and eczema, add 20–60 mL/bath (**INFANT** 5–15 mL) do not use undiluted

**Cetiraben® (Genus)**
- **Emollient bath additive**, light liquid paraffin 82.8%, net price 500 mL = £5.75
- **Excipients** none as listed in section 13.1.3
- **Dose** for dry skin conditions, including eczema, add 1–2 capfuls/bath (**CHILD** ½–1 capful) or apply to wet skin and rinse

**Dermalo® (Dermal)**
- **Bath emollient**, acetylated wool alcohols 5%, liquid paraffin 65%, net price 500 mL = £3.44
- **Excipients** none as listed in section 13.1.3
- **Dose** for dermatitis, dry skin conditions including ichthyosis and prunus of the elderly, add 15–20 mL/bath (**INFANT** and **CHILD** 5–10 mL) or apply to wet skin and rinse

---

1. The BP permits use of alternative antimicrobials provided their identity and concentration are stated on the label.
Doublebase® (Derma)  
*Emollient bath additive*, liquid paraffin 65%, net price 500 mL = £5.45  
**Excipients** include cetostearyl alcohol  
**Dose** for dry skin conditions including dermatitis, ichthyosis, and pruritus of the elderly, add 15–20 mL/bath, *(INFANT and CHILD 5–10 mL)*  
**Emollient shower gel**, isopropyl myristate 15%, liquid paraffin 15%, net price 200 g = £5.21  
**Excipients** none as listed in section 13.1  
**Note**: Also available as Doublebase® Emollient Wash Gel

E45® (Reckitt Benckiser)  
*Emollient bath oil*, cetyl dimeticone 5%, liquid paraffin 91%, net price 250 mL = £3.19, 500 mL = £5.11  
**Excipients** none as listed in section 13.1  
**Dose** as listed in section 13.1.3  
**ACBS**: for endogenous and exogenous eczema, xeroderma, ichthyosis, and senile pruritus (pruritus of the elderly) associated with dry skin, add 15 mL/bath *(CHILD 5–10 mL)* or apply to wet skin and rinse  
**Emollient wash cream**, soap substitute, zinc oxide 5% in an emollient basis, net price 250-mL pump pack = £3.19  
**Excipients** none as listed in section 13.1.3  
**ACBS**: for endogenous and exogenous eczema, xeroderma, ichthyosis and senile pruritus (pruritus of the elderly) associated with dry skin, use as soap substitute

Hydromol® (Alliance)  
*Emollient shower emollient*, isopropyl myristate 13%, light liquid paraffin 37.8%, net price 350 mL = £3.88, 500 mL = £4.42, 1 litre = £8.80  
**Excipients** none as listed in section 13.1  
**Dose** for dry skin conditions including eczema, ichthyosis and pruritus of the elderly, add 1–3 capfuls/bath *(INFANT ½–2 capfuls)* or apply to wet skin and rinse

LPL 63.4® (Huxley)  
*Emollient bath additive*, light liquid paraffin 63.4%, net price 500 mL = £3.10  
**Excipients** include acetylated wool alcohols, isopropyl palmitate  
**Dose** for dry skin conditions, add 1–3 capfuls/bath *(CHILD 1 month–12 years; ½–2 capfuls)* or apply to wet skin and rinse

Oilatum® (Stiefel)  
*Emollient bath additive* *(emulsion)*, light liquid paraffin 63.4%, net price 250 mL = £2.75, 500 mL = £4.57  
**Excipients** include acetylated lanolin alcohols, isopropyl palmitate, fragrance  
**Dose** for dry skin conditions including dermatitis, pruritus of the elderly, and ichthyosis, add 1–3 capfuls/bath *(INFANT 0.5–2 capfuls)* or apply to wet skin and rinse  
**Junior bath additive**, light liquid paraffin 63.4%, net price 150 mL = £2.82, 250 mL = £3.25, 300 mL = £5.10, 600 mL = £5.89  
**Excipients** include acetylated lanolin alcohols, isopropyl palmitate  
**Dose** for dry skin conditions including dermatitis, pruritus of the elderly, and ichthyosis, add 1–3 capfuls/bath *(INFANT 0.5–2 capfuls)* or apply to wet skin and rinse  
**Shower emollient* (gel)*, light liquid paraffin 70%, net price *(with fragrance or fragrance-free)* 150 g = £5.15  
**Excipients** none as listed in section 13.1.3  
**Dose** for dry skin conditions including dermatitis, pruritus of the elderly, and ichthyosis, apply to wet skin and rinse

QV® (Sound Opinion)  
*Emollient bath oil*, liquid paraffin 85.13%, net price 200 mL = £2.20, 500 mL = £4.66  
**Excipients** none as listed in section 11.3  
**Dose** for dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus, add 10 mL/bath *(INFANT 5 mL)* or apply to wet skin and rinse  
**Gentle wash**, glycerol 15%, net price 250 mL = £3.14, 500 mL pump pack = £5.24  
**Excipients** include hydroxybenzoates (parabens)  
**Dose** for dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus, use as soap substitute

Zerolatum® (Thorn & Ross)  
*Emollient medicinal bath oil*, liquid paraffin 65%, acetylated wool alcohols 5%, net price 500 mL = £4.79  
**Excipients** none as listed in section 13.1  
**Dose** for dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus, add 15–20 mL/bath *(CHILD 5–10 mL)*

Zeroneum® (Thorn & Ross)  
*Bath oil*, refined soy bean oil 83.35%, net price 500 mL = £4.48  
**Excipients** include butylated hydroxytoluene, fragrance, propylene glycol  
**Dose** for dry skin conditions including eczema, add 20 mL/bath *(CHILD 5 mL)*

**With antimicrobials**

Dermol® (Derma)  
*Dermol 600® Bath Emollient*, benzalkonium chloride 0.5%, liquid paraffin 25%, isopropyl myristate 25%, net price 600 mL = £7.55  
**Excipients** include polysorbate 60  
**Dose** for dry and pruritic skin conditions including eczema and dermatitis, add up to 30 mL/bath *(INFANT up to 15 mL)*, do not use undiluted  
**Dermol® 200 Shower Emollient**, benzalkonium chloride 0.1%, chlorhexidine hydrochloride 0.1%, liquid paraffin 2.5%, isopropyl myristate 2.5%, net price 200 mL = £3.55  
**Excipients** include cetostearyl alcohol  
**Dose** for dry and pruritic skin conditions including eczema and dermatitis, apply to skin or use as soap substitute

Dermol®® Wash Emulsion**, benzalkonium chloride 0.1%, chlorhexidine hydrochloride 0.1%, liquid paraffin 2.5%, isopropyl myristate 2.5%, net price 200 mL = £3.55  
**Excipients** include cetostearyl alcohol  
**Dose** for dry and pruritic skin conditions including eczema and dermatitis, apply to skin or use as soap substitute

Emulsiderm® (Dermal)  
*Liquid emulsion*, benzalkonium chloride 0.5%, liquid paraffin 25%, isopropyl myristate 25%, net price 300 mL (with 15-mL measure) = £3.85, 1 litre (with 30-mL measure) = £12.00  
**Excipients** include polysorbate 60  
**Dose** for dry skin conditions including eczema and ichthyosis, add 7–30 mL/bath or rub into dry skin until absorbed

Oilatum® Plus (Stiefel)  
*Bath additive*, benzalkonium chloride 6%, triclosan 2%, light liquid paraffin 52.5%, net price 500 mL = £6.98  
**Excipients** include acetylated lanolin alcohols, isopropyl palmitate  
**Dose** for topical treatment of eczema including eczema at risk from infection, add 1–2 capfuls/bath *(INFANT over 6 months 1 mL)*, do not use undiluted
Barrier preparations often contain water-repellent substances such as dimeticone or other silicones. They are used on the skin around stomas, bedsores, and pressure areas in the elderly where the skin is intact. Where the skin has broken down, barrier preparations have a limited role in protecting adjacent skin. Barrier preparations should be applied after the corticosteroid preparation to prevent further skin damage.

Preparations containing hydrocortisone should be discontinued as soon as the inflammation subsides. The occlusive effect of nappies and water-proof pants may avoid the rash. The nappies are changed frequently and that tightly fitting water-proof pants are avoided. Barrier cream preparations containing hydrocortisone should be applied for no more than a week; the hydrocortisone preparation should be applied after the corticosteroid preparation to prevent further skin damage.

Preparations containing butyrate may occasionally be required in severe or recurrent infection. Hydrocortisone may be used in combination with antimicrobial preparations if there is treatment of pruritus in palliative care, see p. 23. Medications that cause pruritus that occur in otherwise healthy elderly people can also be treated with an emollient.

Preparations containing crotamiton are sometimes used but are of uncertain value. Preparations containing calamine are often ineffective.
A topical preparation containing doxepin 5% is licensed for the relief of pruritus in eczema; it can cause drowsiness and there may be a risk of sensitisation.

Pruritus is common in biliary obstruction, especially in primary biliary cirrhosis and drug-induced cholestasis. Oral administration of colestyramine is the treatment of choice (section 1.9.2).

Topical antihistamines and local anaesthetics are only marginally effective and occasionally cause sensitisation. For insect stings and insect bites, a short course of a topical corticosteroid is appropriate. Short-term treatment with a sedating antihistamine (section 3.4.1) may help in insect stings and in intractable pruritus where sedation is desirable. Calamine preparations are of little value for the treatment of insect stings or bites.

For preparations used in pruritus ani, see section 1.7.1.

**CALAMINE**

**Indications** pruritus

**Contra-indications** avoid application prior to x-ray (zinc oxide may affect outcome of x-ray)

**Calamine** (Non-proprietary)

- **Aqueous cream**, calamine 4%, zinc oxide 3%, liquid paraffin 20%, self-emulsifying glycerol monostearate 5%, cetomacrogol emulsifying wax 5%, phenoxyethanol 0.3%, freshly boiled and cooled purified water 62.5%, net price 100 mL = £1.23
- **Lotion** (=cutaneous suspension), calamine 15%, zinc oxide 5%, glycerol 5%, bentonite 3%, sodium citrate 0.5%, liquefied phenol 0.5%, in freshly boiled and cooled purified water, net price 200 mL = 88p
- **Olly lotion** (BP 1980), calamine 5%, arachis (peanut) oil 50%, oleic acid 0.5%, wool fat 1%, in calcium hydroxide solution, net price 200 mL = £1.57

**CROTAMITON**

**Indications** pruritus (including pruritus after scabies—section 13.10.4); see notes above

**Cautions** avoid use near eyes, in buccal mucosa, or on broken or very inflamed skin; use on doctor’s advice for children under 3 years

**Contra-indications** acute exudative dermatoses

**Pregnancy** manufacturer advises avoid, especially during the first trimester—no information available

**Breast-feeding** no information available; avoid application to nipple area

**Dose** 
- Pruritus, apply 2–3 times daily; CHILD under 3 years, apply once daily

- **Eurax**® (Novartis Consumer Health)
  - **Cream**, crotamiton 10%, net price 30 g = £2.38, 100 g = £4.15
  - **Excipients** include beeswax, fragrance, hydroxybenzoates (parabens), stearyl alcohol
  - **Lotion**, crotamiton 10%, net price 100 mL = £3.14
  - **Excipients** include cetyl alcohol, fragrance, propylene glycol, sorbic acid, stearyl alcohol

**DOXEPIN HYDROCHLORIDE**

**Indications** pruritus in eczema; depressive illness (section 4.3.1)

**Cautions** susceptibility to angle-closure glaucoma; urinary retention; mania; cardiac arrhythmias; severe heart disease; avoid application to large areas; interactions: Appendix 1 (antidepressants, tricyclic)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Hepatic impairment** manufacturer advises caution in severe liver disease

**Pregnancy** manufacturer advises use only if potential benefit outweighs risk

**Breast-feeding** manufacturer advises use only if potential benefit outweighs risk

**Side-effects** drowsiness; local burning, stinging, irritation, tingling and rash; systemic side-effects such as antimuscarinic effects, headache, fever, dizziness, gastro-intestinal disturbances also reported

**Dose**
- **ADULT** and **CHILD** over 12 years, apply thinly 3–4 times daily; usual max. 3 g per application; usual total max. 12 g daily; coverage should be less than 10% of body surface area

**Xepin**® (CHS) (BP)

- **Cream**, doxepin hydrochloride 5%, net price 30 g = £11.70. Label: 2, 10. patient information leaflet

- **Excipients** include benzyl alcohol

**LEVEMENTHOL**

**Indications** pruritus

**Indications** relief of local pain, see notes above. See section 15.2 for use in surface anaesthesia

**Cautions** occasionally cause hypersensitivity

**Note** Topical anaesthetic preparations may be absorbed, especially through mucosal surfaces, therefore excessive application should be avoided and they should preferably not be used for more than about 3 days; not generally suitable for young children

**TOPOCAL ANTITHERMSTAMINES**

**Indications** see notes above

**Cautions** may cause hypersensitivity; avoid in eczema; photosensitivity (diphenhydramine); not recommended for longer than 3 days

**13.4 Topical corticosteroids**

Topical corticosteroids are used for the treatment of inflammatory conditions of the skin (other than those arising from an infection), in particular eczema (section 13.5.1), contact dermatitis, insect stings (p. 43), and eczema of scabies (section 13.10.4). Corticosteroids suppress the inflammatory reaction during use; they are not curative and on discontinuation a rebound exacerbation of the condition may occur. They are generally used to relieve symptoms and suppress signs of the disorder when other measures such as emollients are ineffective.

Topical corticosteroids are not recommended in the routine treatment of urticaria; treatment should only be...
be initiated and supervised by a specialist. Topical corticosteroids are contra-indicated in rosacea. They may worsen ulcerated or secondarily infected lesions. They should not be used indiscriminately in pruritus (where they will only benefit if inflammation is causing the itch) and are not recommended for acne vulgaris.

Systemic or very potent topical corticosteroids should be avoided or given only under specialist supervision in psoriasis because, although they may suppress the psoriasis in the short term, relapse or vigorous rebound occurs on withdrawal (sometimes precipitating severe pustular psoriasis). For the role of topical corticosteroids in the treatment of psoriasis, see section 13.5.2.

In general, the most potent topical corticosteroids should be reserved for recalcitrant dermatoses such as chronic discoid lupus erythematosus, lichen simplex chronicus, hypertrophic lichen planus, and palmoplantar pustulosis. Potent corticosteroids should generally be avoided on the face and skin flexures, but specialists occasionally prescribe them for use on these areas in certain circumstances.

When topical treatment has failed, intralesional corticosteroid injections (section 10.1.2.2) may be used. These are more effective than the very potent topical corticosteroid preparations and should be reserved for severe cases where there are localised lesions such as keloid scars, hypertrophic lichen planus, or localised alopecia areata.

**Perioral lesions** Hydrocortisone cream 1% can be used for up to 7 days to treat uninfected inflammatory lesions on the lips. Hydrocortisone and miconazole cream or ointment is useful where infection by susceptible organisms co-exist, particularly for initial treatment (up to 7 days) e.g. in angular cheilitis (see also p. 775). Organisms susceptible to miconazole include Candida spp. and many Gram-positive bacteria including streptococci and staphylococci.

**Children** Children, especially infants, are particularly susceptible to side-effects. However, concern about the safety of topical corticosteroids in children should not result in the child being undertreated. The aim is to control the condition as well as possible; inadequate treatment will perpetuate the condition. A mild corticosteroid such as hydrocortisone 0.5% or 1% is useful for treating nappy rash (section 13.2.2) and hydrocortisone 1% for atopic eczema in childhood (section 13.3.1). A moderately potent or potent corticosteroid may be appropriate for severe atopic eczema on the limbs, for 1–2 weeks only, switching to a less potent preparation as the condition improves. In an acute flare-up of atopic eczema, it may be appropriate to use more potent formulations of topical corticosteroids for a short period to regain control of the condition. A very potent corticosteroid should be initiated under the supervision of a specialist. Continuous daily application of a mild corticosteroid such as hydrocortisone 1% is equivalent to a potent corticosteroid such as betamethasone 0.1% applied intermittently. Carers of young children should be advised that treatment should not necessarily be reserved to ‘treat only the worst areas’ and they may need to be advised that patient information leaflets may contain inappropriate advice for the patient’s condition.

**Choice of formulation** Water-miscible corticosteroid creams are suitable for moist or weeping lesions whereas ointments are generally chosen for dry, lichenified or scaly lesions or where a more occlusive effect is required. Lotions may be useful when minimal application to a large or hair-bearing area is required or for the treatment of exudative lesions. Occlusive polythene or hydrocolloid dressings increase absorption, but also increase the risk of side-effects; they are therefore used only under supervision on a short-term basis for areas of very thick skin (such as the palms and soles). The inclusion of urea or salicylic acid also increases the penetration of the corticosteroid.

In the BNF topical corticosteroids for the skin are categorised as ‘mild’, ‘moderately potent’, ‘potent’ or ‘very potent’ (see p. 789); the least potent preparation which is effective should be chosen but dilution should be avoided whenever possible.

**Cautions** Avoid prolonged use of a topical corticosteroid on the face (and keep away from eyes). In children avoid prolonged use and use potent or very potent corticosteroids under specialist supervision; extreme caution is required in dermatoses of infancy including nappy rash—treatment should be limited to 5–7 days.

**Psoriasis** The use of potent or very potent corticosteroids in psoriasis can result in rebound relapse, development of generalised pustular psoriasis, and local and systemic toxicity.

**Contra-indications** Topical corticosteroids are contra-indicated in untreated bacterial, fungal, or viral skin lesions, in acne, in rosacea, and in perioral dermatitis; potent corticosteroids are contra-indicated in widespread plaque psoriasis (see notes above).

**Side-effects** Mild and moderately potent topical corticosteroids are associated with few side-effects but care is required in the use of potent and very potent corticosteroids. Absorption through the skin can rarely cause adrenal suppression and even Cushing’s syndrome (section 6.3.2), depending on the area of the body being treated and the duration of treatment. Absorption is greatest where the skin is thin or raw, and from intertriginous areas; it is increased by occlusion. Local side-effects include:

- spread and worsening of untreated infection;
- thinning of the skin which may be restored over a period after stopping treatment but the original structure may never return;
- irreversible striae atrophicae and telangiectasia;
- contact dermatitis;
- perioral dermatitis;
- acne, or worsening of acne or rosacea;
- mild depigmentation which may be reversible;
- hypertrichosis also reported.

In order to minimise the side-effects of a topical corticosteroid, it is important to apply it thinly to affected areas only, no more frequently than twice daily, and to use the least potent formulation which is fully effective.

**Application** Topical corticosteroid preparations should be applied no more frequently than twice daily; once daily is often sufficient.

Topical corticosteroids should be spread thinly on the skin but in sufficient quantity to cover the affected areas. The length of cream or ointment expelled from a tube may be used to specify the quantity to be applied to a
given area of skin. This length can be measured in terms of a fingertip unit (the distance from the tip of the adult index finger to the first crease). One fingertip unit (approximately 500 mg from a tube with a standard 5-mm diameter nozzle) is sufficient to cover an area that is twice that of the flat adult handprint (palm and fingers).

### Suitable quantities of corticosteroid preparations to be prescribed for specific areas of the body

<table>
<thead>
<tr>
<th>Area of body</th>
<th>Creams and Ointments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Face and neck</td>
<td>15 to 30 g</td>
</tr>
<tr>
<td>Both hands</td>
<td>15 to 30 g</td>
</tr>
<tr>
<td>Scalp</td>
<td>15 to 30 g</td>
</tr>
<tr>
<td>Both arms</td>
<td>30 to 60 g</td>
</tr>
<tr>
<td>Both legs</td>
<td>100 g</td>
</tr>
<tr>
<td>Trunk</td>
<td>100 g</td>
</tr>
<tr>
<td>Groins and genitalia</td>
<td>15 to 30 g</td>
</tr>
</tbody>
</table>

These amounts are usually suitable for an adult for a single daily application for 2 weeks.

If a patient is using topical corticosteroids of different potencies, the patient should be told when to use each corticosteroid. The potency of each topical corticosteroid (see Topical Corticosteroid Preparation Potencies, below) should be included on the label with the directions for use. The label should be attached to the container (for example, the tube) rather than the outer packaging.

**Compound preparations** The advantages of including other substances (such as antibacterials or antifungals) with corticosteroids in topical preparations are uncertain, but such combinations may have a place where inflammatory skin conditions are associated with bacterial or fungal infection, such as infected eczema. In these cases the antimicrobial drug should be chosen according to the sensitivity of the infecting organism and used regularly for a short period (typically twice daily for 1 week). Longer use increases the likelihood of resistance and of sensitisation.

The keratolytic effect of salicylic acid facilitates the absorption of topical corticosteroids; however, excessive and prolonged use of topical preparations containing salicylic acid may cause salicylism.

### Topical corticosteroid preparation potencies

Potency of a topical corticosteroid is a result of the formulation as well as the corticosteroid. Therefore, proprietary names are shown below.

**Mild**
- Hydrocortisone 0.1–2.5%, Dioderm, Mildison, Synalar 1 in 10 dilution
- Mild with antimicrobials: Canesten HC, Daktacort, Econacort, Fucidin H, Nystaform-HC, Terra-Cortril, Timodine

**Moderate**
- Betnovate-RD, Eumovate, Haelan, Modrasone, Synalar 1 in 4 Dilution, Ultralanum Plain

- Moderate with antimicrobials: Trimovate
- Moderate with urea: Alphaderm, Calmurid HC

**Potent**
- Beclometasone dipropionate 0.025%, Betamethasone valerate 0.1%, Betacap, Betasiil, Betamouse, Betnovate, Cativate, Diprosone, Elocon, Hydrocortisone butyrate, Locoid, Locoid Crelo, Metovyn, Mometasone furoate 0.1%, Nersione, Synalar
- Potent with antimicrobials: Aureocort, Betamethasone and cloquinol, Betamethasone and neomycin, Fucibet, Lotroiderm, Synalar C, Synalar N
- Potent with salicylic acid: Diprosalic

**Very potent**
- Clarelux, Dermovate, Etrivex, Nersione Forte
- Very potent with antimicrobials: Clobetasol with neomycin and nystatin

**HYDROCORTISONE**

**Indications** mild inflammatory skin disorders such as eczemas (but for over-the-counter preparations, see below); nappy rash (see also section 13.2.2)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Apply thinly 1–2 times daily

**Hydrocortisone (Non-proprietary)**

- **Cream**, hydrocortisone 0.5%, net price, 15 g = £1.31, 30 g = £2.96; 1%, 15 g = £1.04, 30 g = £2.08, 50 g = £3.47; 2.5%, 15 g = £24.07. Label: 28, counselling, application, see above. Potency: mild

**Dental prescribing on NHS** Hydrocortisone Cream 1% 15 g may be prescribed

- **Ointment**, hydrocortisone 0.5%, net price 15 g = £3.92, 30 g = £4.90; 1%, 15 g = £1.10, 30 g = £2.20, 50 g = £3.67; 2.5%, 15 g = £23.82. Label: 28, counselling, application, see above. Potency: mild

When hydrocortisone cream or ointment is prescribed and no strength is stated, the 1% strength should be supplied

**Over-the-counter hydrocortisone preparations**

Skin creams and ointments containing hydrocortisone (alone or with other ingredients) can be sold to the public for the treatment of allergic contact dermatitis, irritant dermatitis, insect bite reactions and mild to moderate eczema, to be applied sparingly over the affected area 1–2 times daily for max. 1 week. Over-the-counter hydrocortisone preparations should not be sold without medical advice for children under 10 years or for pregnant women; they should not be sold for application to the face, anogenital region, broken or infected skin (including cold sores, acne, and athlete’s foot); over-the-counter hydrocortisone preparations containing clotrimazole or miconazole nitrate can be sold to the public for athlete’s foot and candidal intertrigo

**Proprietary hydrocortisone preparations**

**Dioder® (Dermal)**

- **Cream**, hydrocortisone 0.1%, net price 30 g = £2.39. Label: 28, counselling, application, see p. 788. Potency: mild

**Excipients** include cetostearyl alcohol, propylene glycol

Note: Although this contains only 0.1% hydrocortisone, the formulation is designed to provide a clinical activity comparable to that of Hydrocortisone Cream 1% BP
**Mildison® (Astellas) (A)**

Lipocream, hydrocortisone 1%, net price 30 g = £1.71. Label: 28, counselling, application, see p. 788. Potency: mild

**Excipients**
- include benzyl alcohol, cetostearyl alcohol, hydroxybenzoates (parabens)

**Compound preparations**
- Compound preparations with coal tar, see section 13.5.2

**Alphaderm® (Alliance) (A)**

Cream, hydrocortisone 1%, urea 10%, net price 30 g = £2.38; 100 g = £7.03. Label: 28, counselling, application, see p. 788. Potency: moderate

**Excipients**
- none as listed in section 13.1.3

**Calmurid HC® (Galderma) (A)**

Cream, hydrocortisone 1%, urea 10%, lactic acid 5%, net price 100 g = £10.51. Label: 28, counselling, application, see p. 788. Potency: moderate

**Excipients**
- none as listed in section 13.1.3

**Note**
- If stinging occurs, manufacturer advises dilute to half-strength with aqueous cream for 1 week then transfer to undiluted preparation (but see section 13.1.1 for advice to avoid dilution where possible)

**With antimicrobials**
- See notes above for comment on compound preparations

**Canesten HC® (Bayer Consumer Care) (A)**

Cream, hydrocortisone 1%, clotrimazole 1%, net price 30 g = £2.42. Label: 28, counselling, application, see p. 788. Potency: mild

**Excipients**
- include benzyl alcohol, cetostearyl alcohol, hydroxybenzoates (parabens)

**Note**
- A 15-g tube is on sale to the public for the treatment of athlete’s foot and fungal infection of skin folds with associated inflammation

**Daktacort® (Janssen) (A)**

Cream, hydrocortisone 1%, miconazole nitrate 2%, net price 30 g = £2.49. Label: 28, counselling, application, see p. 788. Potency: mild

**Excipients**
- include butylated hydroxyanisole, disodium edetate

**Cautions**
- interactions: Appendix 1 (antifungals, imidazoles)

**Dental prescribing on NHS**
- May be prescribed as Miconazole and Hydrocortisone Cream for max. 7 days

**Note**
- A 15-g tube is on sale to the public for the treatment of athlete’s foot and candidal intertrigo

**Ointment, hydrocortisone 1%, miconazole nitrate 2%, net price 30 g = £2.50. Label: 28, counselling, application, see p. 788. Potency: moderate

**Excipients**
- none as listed in section 13.1.3

**Cautions**
- interactions: Appendix 1 (antifungals, imidazoles)

**Dental prescribing on NHS**
- May be prescribed as Miconazole and Hydrocortisone Ointment for max. 7 days

**Fucidin H® (LEO) (A)**

Cream, hydrocortisone acetate 1%, fusidic acid 2%, net price 30 g = £5.02, 60 g = £10.04. Label: 28, counselling, application, see p. 788. Potency: mild

**Excipients**
- include butylated hydroxyanisole, cetyl alcohol, polysorbate 60, potassium sorbate

**Nystaform-HC® (Typharm) (A)**

Cream, hydrocortisone 0.5%, nystatin 100 000 units/g, chlorhexidine hydrochloride 1%, net price 30 g = £2.66. Label: 28, counselling, application, see p. 788. Potency: mild

**Excipients**
- include benzyl alcohol, cetostearyl alcohol, polysorbate 60

**Ointment, hydrocortisone 1%, nystatin 100 000 units/g, chlorhexidine acetate 1%, net price 30 g = £2.66. Label: 28, counselling, application, see p. 788. Potency: mild

**Excipients**
- none as listed in section 13.1.3

**ALCLOMETASONE DIPROPIONATE**

**Indications**
- inflammatory skin disorders such as eczemas

**Cautions**
- see notes above

**Contra-indications**
- see notes above

**Side-effects**
- see notes above

**Dose**
- Apply thinly 1–2 times daily

**Locoid® (Astellas) (A)**

Cream, hydrocortisone butyrate 0.1%, net price 30 g = £1.60, 100 g = £4.93. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients**
- include cetostearyl alcohol, hydroxybenzoates (parabens)

**Lipocream, hydrocortisone butyrate 0.1%, net price 30 g = £1.69, 100 g = £5.17. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients**
- include benzyl alcohol, cetostearyl alcohol, hydroxybenzoates (parabens)

**Note**
- For bland cream basis see Lipobase®, section 13.2.1

**Ointment, hydrocortisone butyrate 0.1%, net price 30 g = £1.60, 100 g = £4.93. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients**
- include cetostearyl alcohol, hydroxybenzoates (parabens)

**Ointment, hydrocortisone butyrate 0.1%, in an aqueous isopropyl alcohol basis, net price 100 mL = £6.83. Label: 15, 28, counselling, application, see p. 788. Potency: potent

**Excipients**
- none as listed in section 13.1.3

**Locoid Crelo® (Astellas) (A)**

Lotion (topical emulsion), hydrocortisone butyrate 0.1% in a water-miscible basis, net price 100 g (with applicator nozzle) = £5.91. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients**
- include butylated hydroxytoluene, cetostearyl alcohol, hydroxybenzoates (parabens), propylene glycol

**HYDROCORTISONE BUTYRATE**

**Indications**
- severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions**
- see notes above

**Contra-indications**
- see notes above

**Side-effects**
- see notes above

**Dose**
- Apply thinly 1–2 times daily

**HYDROCORTISONE BUTYRATE**

**Indications**
- severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions**
- see notes above

**Contra-indications**
- see notes above

**Side-effects**
- see notes above

**Dose**
- Apply thinly 1–2 times daily

**HYDROCORTISONE BUTYRATE**

**Indications**
- severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions**
- see notes above

**Contra-indications**
- see notes above

**Side-effects**
- see notes above

**Dose**
- Apply thinly 1–2 times daily
Betamethasone esters (non-proprietary)
