Indications severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Dose • Apply thinly 1–2 times daily

Betamethasone Valerate (non-proprietary)

Cream, betamethasone valerate 0.1%, net price 30 g = £1.16. Label: 28, counselling, application, see p. 786. Potency: potent

Ointment, betamethasone valerate 0.1%, net price 30 g = £1.16. Label: 28, counselling, application, see p. 786. Potency: potent

Betacap® (Dermal) 

Scalp application, betamethasone valerate 0.1% in a water-miscible basis containing coconut oil derivative, net price 100 mL = £2.75. Label: 15, 28, counselling, application, see p. 786. Potency: potent

Betesil® (Genus) 

Medicated plasters, betamethasone valerate 2.25 mg, net price 4 = £9.92. Counselling, application. Potency: potent

Excipients include disodium edetate, hydroxybenzoates (parabens)

Dose ADULT over 18 years, apply plaster to clean, dry skin once daily; max. 6 plasters daily; max. duration of treatment 30 days

Counselling Leave at least 30 minutes between applications; plasters may be cut; avoid water contact with plaster—take bath or shower between applications; see also p. 789

Betesil® (Teva UK) 

Cream, alclometasone dipropionate 0.05%, net price 50 g = £2.68. Label: 28, counselling, application, see p. 788. Potency: moderate

Excipients include cetostearyl alcohol, chlorocresol, propylene glycol

Beclolemasone dipropionate

(Beclolemasone dipropionate)

Indications severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Dose • Apply thinly 1–2 times daily

Betnovate® (GSK) 

Cream, betamethasone (as valerate) 0.1% in a water-miscible basis, net price 30 g = £1.43, 100 g = £4.05. Label: 28, counselling, application, see p. 788. Potency: potent

Excipients include cetostearyl alcohol, chlorocresol

Ointment, betamethasone (as valerate) 0.1% in an anhydrous paraffin basis, net price 30 g = £1.43, 100 g = £4.05. Label: 28, counselling, application, see p. 788. Potency: potent

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)

Scalp application, betamethasone (as valerate) 0.1% in a water-miscible basis, net price 100 mL = £4.58. Label: 28, counselling, application, see p. 788. Potency: potent

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)

Betnovate-DR® (GSK) 

Cream, betamethasone (as valerate) 0.025% in a water-miscible basis (1 in 4 dilution of Betnovate® cream), net price 100 g = £3.15. Label: 28, counselling, application, see p. 788. Potency: moderate

Excipients include cetostearyl alcohol, chlorocresol

Ointment, betamethasone (as valerate) 0.025% in an anhydrous paraffin basis (1 in 4 dilution of Betnovate® ointment), net price 100 g = £3.15. Label: 28, counselling, application, see p. 788. Potency: moderate

Excipients none as listed in section 13.1.3

Betnovate-N® (MSD) 

Cream, betamethasone (as dipropionate) 0.05%, net price 30 g = £2.16, 100 g = £6.12. Label: 28, counselling, application, see p. 788. Potency: potent

Excipients include cetostearyl alcohol, chlorocresol

Ointment, betamethasone (as dipropionate) 0.05%, net price 30 g = £2.16, 100 g = £6.12. Label: 28, counselling, application, see p. 788. Potency: potent

Excipients none as listed in section 13.1.3

Bettamousse® (RPH) 

Foam (= scalp application), betamethasone valerate 0.12% (= betamethasone 0.1%), net price 100 g = £9.75. Label: 28, counselling, application, see p. 788. Potency: potent

Excipients include cetyl alcohol, polysorbate 60, propylene glycol, stearyl alcohol

Note Flammable

Diprosone® (MSD) 

Cream, betamethasone (as dipropionate) 0.05%, net price 30 mL = £2.73, 100 mL = £7.80. Label: 28, counselling, application, see p. 788. Potency: potent

Excipients none as listed in section 13.1.3

Dipsalic® (MSD) 

Cream, betamethasone (as dipropionate) 0.05%, salicylic acid 3%, net price 30 g = £3.18, 100 g = £9.14. Label: 28, counselling, application, see p. 788. Potency: potent

Excipients include disodium edetate

Dose apply a few drops 1–2 times daily

### With salicylic acid

See notes above for comment on compound preparations

For prescribing information on salicylic acid, see, p. 800

Diprosalic® (MSD) 

Ointment, betamethasone (as dipropionate) 0.05%, salicylic acid 2%, in an alcoholic basis, net price 100 mL = £10.10. Label: 28, counselling, application, see p. 788. Potency: potent

Excipients include disodium edetate

Dose apply thinly 1–2 times daily

Max. 60 g per week

Scalp application, betamethasone (as dipropionate) 0.05%, salicylic acid 2%, in an alcoholic basis, net price 100 mL = £10.10. Label: 28, counselling, application, see p. 788. Potency: potent

Excipients include disodium edetate

Dose apply a few drops 1–2 times daily

### Topical corticosteroids

13.4.1.3
13.4 Topical corticosteroids

**Betamethasone and clociquinol** (Non-proprietary)

*Cream*, betamethasone (as valerate) 0.1%, clociquinol 3%, net price 30 g = £9.48. Label: 28, counselling, application, see p. 788. Potency: potent

*Excipients* may include cetoestearyl alcohol, chlorocresol

*Note* Stains clothing

*Ointment*, betamethasone (as valerate) 0.1%, clociquinol 3%, net price 30 g = £9.48. Label: 28, counselling, application, see p. 788. Potency: potent

*Excipients* may include cetoestearyl alcohol, chlorocresol

*Note* Stains clothing

**Betamethasone and neomycin** (Non-proprietary)

*Cream*, betamethasone (as valerate) 0.1%, neomycin sulfate 0.5%, net price 30 g = £9.48, 100 g = £28.01. Label: 28, counselling, application, see p. 788. Potency: potent

*Excipients* may include cetoestearyl alcohol, chlorocresol

*Ointment*, betamethasone (as valerate) 0.1%, neomycin sulfate 0.5%, net price 30 g = £9.48, 100 g = £28.01. Label: 28, counselling, application, see p. 788. Potency: potent

**Fucibet® (LEO)**

*Cream*, betamethasone (as valerate) 0.1%, fusidic acid 2%, net price 30 g = £5.32, 60 g = £10.63. Label: 28, counselling, application, see p. 788. Potency: potent

*Excipients* may include cetoestearyl alcohol, chlorocresol

**Lipid cream**, betamethasone (as valerate) 0.1%, fusidic acid 2%, net price 30 g = £5.62. Label: 28, counselling, application, see p. 788. Potency: potent

*Excipients* may include cetoestearyl alcohol, hydroxybenzoates (parabens)

**Lotiderm® (TEVA UK)**

*Cream*, betamethasone dipropionate 0.064% (≡ betamethasone 0.05%), clotrimazole 1%, net price 30 g = £6.34. Label: 28, counselling, application, see p. 788. Potency: potent

*Excipients* include benzyl alcohol, cetoestearyl alcohol, propylene glycol

**Clobetasol propionate**

**Indications** short-term treatment only of severe resistant inflammatory skin disorders such as recalcitrant eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- Apply thinly 1–2 times daily

**Clarelux® (Fabre)**

*Foam* (= scalp application), clobetasol propionate 0.05%, net price 100 g = £11.06. Label: 15, 28, counselling, application, see p. 788. Potency: very potent

*Excipients* include cetyl alcohol, polysorbate 60, propylene glycol, stearyl alcohol

*Caution* flammable

*Note* Apply directly to scalp lesions (foam begins to subside immediately on contact with skin)

**Dermovate® (GSK)**

*Cream*, clobetasol propionate 0.05%, net price 30 g = £2.69, 100 g = £7.90. Label: 28, counselling, application, see p. 788. Potency: very potent

*Excipients* include beeswax (or beeswax substitute), cetoestearyl alcohol, chlorocresol, propylene glycol

**Ointment**, clobetasol propionate 0.05%, net price 30 g = £2.69, 100 g = £7.90. Label: 28, counselling, application, see p. 788. Potency: very potent

*Excipients* include propylene glycol

**Scalp application**, clobetasol propionate 0.05%, in a thickened alcoholic basis, net price 30 mL = £3.07, 100 mL = £10.42. Label: 28, counselling, application, see p. 788. Potency: very potent

*Excipients* none as listed in section 13.1.3

**Etrivex® (Galderma)**

*Shampoo*, clobetasol propionate 0.05%, net price 125 mL = £15.99. Label: 28, counselling, application, see p. 788. Potency: very potent

*Excipients* none as listed in section 13.1.3

**Dose** moderate scalp psoriasis, **ADULT** over 18 years, apply thinly once daily, rinse off after 15 minutes; reduce frequency of application after clinical improvement; max. duration of treatment 4 weeks

**With antimicrobials**

See notes above for comment on compound preparations

**Clobetasol with neomycin and nystatin** (Non-proprietary)

*Cream*, clobetasol propionate 0.05%, neomycin sulphate 0.5%, nystatin 100 000 units/g, net price 30 g = £64.00. Label: 28, counselling, application, see p. 788. Potency: very potent

*Ointment*, clobetasol propionate 0.05%, neomycin sulphate 0.5%, nystatin 100 000 units/g, in a paraffin basis, net price 30 g = £64.00. Label: 28, counselling, application, see p. 788. Potency: very potent

**CLOBETASONE BUTYRATE**

**Indications** eczemas and dermatitis of all types; maintenance between courses of more potent corticosteroids

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- Apply thinly 1–2 times daily

**Eumovate® (GSK)**

*Cream*, clobetasone butyrate 0.05%, net price 30 g = £1.86, 100 g = £5.44. Label: 28, counselling, application, see p. 788. Potency: moderate

*Excipients* include beeswax substitute, cetoestearyl alcohol, chlorocresol

**Ointment**, clobetasone butyrate 0.05%, net price 30 g = £1.86, 100 g = £5.44. Label: 28, counselling, application, see p. 788. Potency: moderate

*Excipients* none as listed in section 13.1.3

**With antimicrobials**

See notes above for comment on compound preparations

**Trimovate® (GSK)**

*Cream*, clobetasone butyrate 0.05%, oxytetracycline 3% (as calcium salt), nystatin 100 000 units/g, net price 30 g = £3.29. Label: 28, counselling, application, see p. 788. Potency: very potent

*Excipients* include benzyl alcohol, cetoestearyl alcohol, propylene glycol

Note Stains clothing

---

1. Cream can be sold to the public for short-term symptomatic treatment and control of patches of eczema and dermatitis (but not seborrhoeic dermatitis) in adults and children over 12 years provided pack does not contain more than 15 g
### DIFLUOCORTOLONE VALERATE

**Indications** severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; high strength (0.3%), short-term treatment of severe exacerbations; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Apply thinly 1–2 times daily for up to 4 weeks (0.1% preparations) or 2 weeks (0.3% preparations), reducing strength as condition responds; max. 60 g of 0.3% per week

**Nerisone**® (Meadow)  
**Cream**
- difluocortolone valerate 0.1%, net price 30 g = £1.59. Label: 28, counselling, application, see p. 788. Potency: potent  
- Excipients include disodium edetate, hydroxybenzoates (parabens), stearyl alcohol

**Oily cream**
- difluocortolone valerate 0.1%, net price 30 g = £2.56. Label: 28, counselling, application, see p. 788. Potency: potent  
- Excipients include beeswax

**Ointment**
- difluocortolone valerate 0.1%, net price 30 g = £1.59. Label: 28, counselling, application, see p. 788. Potency: potent  
- Excipients none as listed in section 13.1.3

**Nerisone Forte**® (Meadow)  
**Oily cream**
- difluocortolone valerate 0.3%, net price 15 g = £2.09. Label: 28, counselling, application, see p. 788. Potency: very potent  
- Excipients include propylene glycol, wool fat

**Ointment**
- difluocortolone valerate 0.3%, net price 15 g = £2.09. Label: 28, counselling, application, see p. 788. Potency: very potent  
- Excipients none as listed in section 13.1.3

### FLUOCINOLONE ACETONIDE

**Indications** inflammatory skin disorders such as eczemas; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Apply thinly 1–2 times daily, reducing strength as condition responds

**Synalar**® (GP Pharma)  
**Cream**, fluocinolone acetonide 0.025%, net price 30 g = £4.14, 100 g = £11.75. Label: 28, counselling, application, see p. 788. Potency: potent  
- Excipients include benzyl alcohol, cetostearyl alcohol, polysorbates, propylene glycol

**Gel**, fluocinolone acetonide 0.025%, net price 30 g = £5.56, 60 g = £10.02. For use on scalp and other hairy areas. Label: 28, counselling, application, see p. 788. Potency: potent  
- Excipients include hydroxybenzoates (parabens), propylene glycol

**Ointment**, fluocinolone acetonide 0.025%, net price 30 g = £4.14, 100 g = £11.75. Label: 28, counselling, application, see p. 788. Potency: potent  
- Excipients include propylene glycol, wool fat

**Synalar 1 in 4 Dilution**® (GP Pharma)  
**Cream**, fluocinolone acetonide 0.00625%, net price 50 g = £4.84. Label: 28, counselling, application, see p. 788. Potency: moderate  
- Excipients include benzyl alcohol, cetostearyl alcohol, polysorbates, propylene glycol

**Ointment**, fluocinolone acetonide 0.00625%, net price 50 g = £4.84. Label: 28, counselling, application, see p. 788. Potency: moderate  
- Excipients include propylene glycol, wool fat

**Synalar 1 in 10 Dilution**® (GP Pharma)  
**Cream**, fluocinolone acetonide 0.0025%, net price 50 g = £4.58. Label: 28, counselling, application, see p. 788. Potency: mild  
- Excipients include benzyl alcohol, cetostearyl alcohol, polysorbates, propylene glycol

**With antimicrobials**

See notes above for comment on compound preparations

**Synalar**C® (GP Pharma)  
**Cream**, fluocinolone acetonide 0.025%, clioquinol 3%, net price 15 g = £2.66. Label: 28, counselling, application, see p. 788. Potency: potent  
- Excipients include cetostearyl alcohol, disodium edetate, hydroxybenzoates (parabens), polysorbates, propylene glycol

**Ointment**, fluocinolone acetonide 0.025%, clioquinol 3%, net price 15 g = £2.66. Label: 28, counselling, application, see p. 788. Potency: potent  
- Note stains clothing  
- Excipients include benzyl alcohol, cetostearyl alcohol, polysorbates, propylene glycol

**Synalar N®** (GP Pharma)  
**Cream**, fluocinolone acetonide 0.025%, neomycin sulfate 0.5%, net price 30 g = £4.36. Label: 28, counselling, application, see p. 788. Potency: potent  
- Excipients include cetostearyl alcohol, hydroxybenzoates (parabens), polysorbates, propylene glycol

**Ointment**, fluocinolone acetonide 0.025%, neomycin sulfate 0.5%, in a greasy basis, net price 30 g = £4.36. Label: 28, counselling, application, see p. 788. Potency: potent  
- Excipients include propylene glycol, wool fat
**FLUCINONIDE**

**Indications** severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Apply thinly 1–2 times daily

**Metosyn** (GP Pharma)
- FAPS Cream, fluocinonide 0.05%, net price 25 g = £3.96, 100 g = £13.34. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include propylene glycol

**Ointment**, fluocinonide 0.05%, net price 25 g = £3.50, 100 g = £13.15. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include propylene glycol, wool fat

**FLUCORTOLONE**

**Indications** severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Apply thinly 1–2 times daily, reducing strength as condition responds

**Ultralanum Plain** (Meadow)
- Cream, fluocortolone caproate 0.25%, fluocortolone pivalate 0.25%, net price 50 g = £2.95. Label: 28, counselling, application, see p. 788. Potency: moderate

**Excipients** include disodium edetate, fragrance, hydroxybenzoates (parabens), stearyl alcohol

**Ointment**, fluocortolone 0.25%, fluocortolone caproate 0.25%, net price 50 g = £2.95. Label: 28, counselling, application, see p. 788. Potency: moderate

**Excipients** include wool fat, fragrance

**FLUTICASONE PROPIONATE**

**Indications** inflammatory skin disorders such as dermatitis and eczemas unresponsive to less potent corticosteroids

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Apply thinly 1–2 times daily

**Cutivate** (GSK)
- Cream, fluticasone propionate 0.05%, net price 15 g = £2.27, 30 g = £4.24. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include cetostearyl alcohol, imidurea, propylene glycol

**Ointment», fluticasone propionate 0.005%, net price 15 g = £2.27, 30 g = £4.24. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include propylene glycol

**MOMETASONE FUROATE**

**Indications** severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Apply thinly once daily (to scalp in case of lotion)

**Mometasone** (Non-proprietary)
- Ointment, mometasone furoate 0.1%, net price 30 g = £3.24, 100 g = £10.80. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include beeswax

**Ointment**, mometasone furoate 0.1%, net price 30 g = £4.32, 100 g = £12.44. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include beeswax, propylene glycol

**Scalp lotion**, mometasone furoate 0.1% in an aqueous isopropyl alcohol basis, net price 30 mL = £4.36. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include propylene glycol

**TRIAMCINOLONE ACETONIDE**

**Indications** severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Apply thinly 1–2 times daily

**Aureocort** (AMCo)
- Ointment, triamcinolone acetonide 0.1%, chlortetracycline hydrochloride 3%, in an anhydrous greasy basis containing wool fat and white soft paraffin, net price 15 g = £3.51. Label: 28, counselling, application, see p. 788. Potency: potent

**Excipients** include wool fat

**Note** Stains clothing

**With antimicrobials**

See notes above for comment on compound preparations

**13.5 Preparations for eczema and psoriasis**

**13.5.1 Preparations for eczema**

**13.5.2 Preparations for psoriasis**

**13.5.3 Drugs affecting the immune response**

Eczema (dermatitis) has several causes, which may influence treatment. The main types of eczema are irritant, allergic contact, atopic, venous and discoid; different types may co-exist. Lichenification, due to scratching and rubbing, may complicate any chronic
eczema. *Atopic eczema* is the most common type and it usually involves dry skin as well as infection and lichenification.

Management of eczema involves the removal or treatment of contributory factors including occupational and domestic irritants. Known or suspected contact allergens should be avoided. Rarely, ingredients in topical medicinal products may sensitise the skin; the BNF lists active ingredients together with excipients that have been associated with skin sensitisation.

Skin dryness and the consequent irritant eczema requires emollients (section 13.2.1) applied regularly (at least twice daily) and liberally to the affected area; this can be supplemented with bath or shower emollients. The use of emollients should continue even if the eczema improves or if other treatment is being used.

**Topical corticosteroids** (section 13.4) are also required in the management of eczema; the potency of the corticosteroid should be appropriate to the severity and site of the condition. Mild corticosteroids are generally used on the face and on flexures; potent corticosteroids are generally required for use on adults with discoid or lichenified eczema or with eczema on the scalp, limbs, and trunk. Treatment should be reviewed regularly, especially if a potent corticosteroid is required. In patients with frequent flares (2–3 per month), a topical corticosteroid can be applied on 2 consecutive days each week to prevent further flares.

Bandages (including those containing zinc and ichthammol) are sometimes applied over topical corticosteroids or emollients to treat eczema of the scalp. Dry-wrap dressings can be used to provide a physical barrier to help prevent scratching and improve retention of emollients.

For the role of topical *pimecrolimus* and *tacrolimus* in atopic eczema see section 13.5.3.

**Infection** Bacterial infection (commonly with *Staphylococcus aureus* and occasionally with *Streptococcus pyogenes*) can exacerbate eczema and requires treatment with topical or systemic antibacterial drugs (section 13.10.1 and section 5.1). Antibacterial drugs should be used in short courses (typically 1 week) to reduce the risk of drug resistance or skin sensitisation. Associated eczema is treated simultaneously with a topical corticosteroid which can be combined with a topical antimicrobial.

Eczema involving widespread or recurrent infection requires the use of a systemic antibacterial that is active against the infecting organism. Products that combine an antiseptic with an emollient application (section 13.2.1) and with a bath emollient (section 13.2.1.1) can also be used; antiseptic shampoos (section 13.9) can be used on the scalp.

Intertiginous eczema commonly involves candida and bacteria; it is best treated with a mild or moderately potent topical corticosteroid and a suitable antimicrobial drug.

Widespread herpes simplex infection may complicate atopic eczema and treatment with a systemic antiviral drug (section 5.3.2.1) is indicated.

The management of *seborrhoeic dermatitis* is described below.

**Management of other features of eczema** *Lichenification*, which results from repeated scratching is treated initially with a potent corticosteroid. Bandages containing ichthammol paste (to reduce pruritus) and other substances such as zinc oxide can be applied over the corticosteroid or emollient. *Coal tar* (section 13.5.2) and ichthammol can be useful in some cases of *chronic eczema*.

A *non-sedating antihistamine* (section 3.4.1) may be of some value in relieving severe itching or urticularia associated with eczema. A *sedating antihistamine* (section 3.4.1) can be used if itching causes sleep disturbance. *Exudative* (weeping) eczema requires a potent corticosteroid initially; infection may also be present and require specific treatment (see above). *Potassium permanganate* solution (1 in 10,000) can be used in exuding eczema for its antiseptic and astringent effects; treatment should be stopped when exudation stops.

**Severe refractory eczema** Severe refractory eczema is best managed under specialist supervision; it may require phototherapy or drugs that act on the immune system (section 13.5.3). *Alitretinoin* (p. 796) is licensed for the treatment of severe chronic hand eczema refractory to potent topical corticosteroids; patients with hyperkeratotic features are more likely to respond to alitretinoin than those with pompholyx.

**Seborrhoeic dermatitis** *Seborrhoeic dermatitis* (seborrhoeic eczema) is associated with species of the yeast *Malassezia* and affects the scalp, paranasal areas, and eyebrows. Shampoos active against the yeast (including those containing ketoconazole and coal tar, section 13.9) and combinations of mild corticosteroids with suitable antimicrobials (section 13.4) are used.

---

### Topical preparations for eczema

**ICHTHAMMOL**

**Indications** chronic lichenified eczema

**Side-effects** skin irritation

**Dose**

- Apply 1–3 times daily

**Ichthammol Ointment, BP 1980**

- Ointment, ichthammol 10%, yellow soft paraffin 45%, wool fat 45%

**Zinc and Ichthammol Cream, BP**

- Cream, ichthammol 5%, cetostearyl alcohol 3%, wool fat 10%, in zinc cream

Available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104

**Zinc Paste and Ichthammol Bandage, BP 1993**

See Appendix 5 (section A5.8.9)

---

### Oral retinoid for eczema

The retinoid, alitretinoin, is licensed for the treatment of severe chronic hand eczema refractory to potent topical corticosteroids; patients with hyperkeratotic features are more likely to respond to alitretinoin than those with pompholyx.

Alitretinoin should be prescribed only by, or under the supervision of, a consultant dermatologist.

Alitretinoin is teratogenic and must not be given to women of child-bearing potential unless they practise effective contraception and then only after detailed assessment and explanation by the physician. See also *Pregnancy Prevention under Cautions*, below.
13.5.2 Preparations for psoriasis

ALITRETINOIN

Indications severe chronic hand eczema refractory to potent topical corticosteroids

Cautions avoid blood donation during treatment and for at least 1 month after stopping treatment; monitor serum lipids (more frequently in those with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease)—discontinue if uncontrolled hyperlipidaemia; history of depression; dry eye syndrome; interactions: Appendix 1 (retinoids)

Pregnancy prevention In women of child-bearing potential, exclude pregnancy 1 month before treatment, up to 3 days before treatment, every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods. Each prescription for alitretinoin should be limited to a supply of up to 30 days’ treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment

Contra-indications uncontrolled hyperlipidaemia; uncontrolled hypothyroidism; hypervitaminosis A

Hepatic impairment manufacturer advises avoid—no information available

Renal impairment manufacturer advises avoid in severe impairment—no information available

Pregnancy avoid—teratogenic; effective contraception must be used—see Pregnancy Prevention above

Breast-feeding manufacturer advises avoid

Side-effects raised serum concentration of triglycerides and of cholesterol (risk of pancreatitis if triglycerides above 9 mmol/litre), flushing; headache; changes in thyroid function tests; anaemia; myalgia, raised creatine kinase, arthralgia; conjunctivitis, dry eyes (may respond to lubricating eye ointment or tear replacement therapy)—sometimes decreased tolerance to contact lenses, eye irritation; dryness of skin and lips, cheilitis, erythema, alopecia; less commonly epistaxis, hyperosmotic, ankylosing spondylitis, blurred vision, cataacts, pruritus, and atopic eczema; rarely benign intracranial hypertension (discontinue if severe headache, nausea, vomiting, papilloedema, or visual disturbances occur) and vasculitis; also reported mood changes, depression, suicidal ideation, keratitis and impaired night vision

Dose

• ADULT over 18 years, 30 mg once daily, reduced to 10 mg once daily if not tolerated; patients with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease, initially 10 mg once daily, increased if necessary up to max. 30 mg daily

Note Duration of treatment 12–24 weeks; discontinue if no response after 12 weeks. Course may be repeated in those who relapse. See also Pregnancy Prevention, above

Toc tin® (Basilea) (Pat) Capsules, alitretinoin 10 mg (brown), net price 30-cap pack = £411.43; 30 mg (red-brown), 30-cap pack = £411.43. Label: 10, patient information leaflet, 11, 21

Psoriasis is characterised by epidermal thickening and scaling. It commonly affects extensor surfaces and the scalp.

Occasionally, psoriasis is provoked or exacerbated by drugs such as lithium, chloroquine and hydroxychloroquine, beta-blockers, non-steroidal anti-inflammatory drugs, and ACE inhibitors. Psoriasis may not be seen until the drug has been taken for weeks or months.

Emollients (section 13.2.1), in addition to their effects on dryness, scaling and cracking, may have an anti-proliferative effect in psoriasis, and may be the only treatment necessary for mild psoriasis. They are particularly useful in inflammatory psoriasis and in plaque psoriasis of palms and soles, in which irritant factors can perpetuate the condition. Emollients are useful adjuncts to other more specific treatment.

More specific topical treatment for chronic stable plaque psoriasis on extensor surfaces of trunk and limbs involves the use of vitamin D analogues, coal tar, dithranol, and the retinoid tazarotene. However, they can irritate the skin and they are not suitable for the more inflammatory forms of psoriasis; their use should be suspended during an inflammatory phase of psoriasis. The efficacy and the irritancy of each substance varies between patients. If a substance irritates significantly, it should be stopped or the concentration reduced; if it is tolerated, its effects should be assessed after 4 to 6 weeks and treatment continued if it is effective.

Scalp psoriasis is usually scaly, and the scale may be thick and adherent; this will require softening with an emollient cream, ointment, or oil. A tar-based shampoo is first-line treatment for scalp psoriasis; a keratolytic, such as salicylic acid, should also be used if there is significant scaling, to allow other treatments to work.

Some preparations prescribed for psoriasis affecting the scalp, combine salicylic acid with coal tar or sulfur. The product should be applied generously, and an adequate quantity should be prescribed. It should be left on for at least an hour, often more conveniently overnight, before washing off. The use of scalp preparations containing a potent corticosteroid or a vitamin D analogue, either alone or in combination, can also be helpful.

Facial, flexural and genital psoriasis can be managed with short-term use of a mild or moderate potency topical corticosteroid (a mild potency topical corticosteroid is preferred for the initial treatment of facial psoriasis).
Calcitriol or tacalcitol can be used for longer-term treatment, or if the response to mild or moderate potency topical corticosteroids is inadequate; calcipotriol is more likely to cause irritation. Low strength tar preparations can also be used. Fimocromil or tacrolium by topical application (unlicensed indication) can be used short-term, under specialist supervision, in patients whose condition has not responded adequately to other treatments, or who are intolerant of them.

Widespread unstable psoriasis of erythrodemic or generalised pustular type requires urgent specialist assessment. Initial topical treatment should be limited to using emollients frequently and generously; emollients should be prescribed in quantities of 1 kg or more. More localised acute or subacute inflammatory psoriasis with hot, spreading or itchy lesions, should be treated topically with emollients or with a corticosteroid of moderate potency.

Calcipotriol and tacalcitol are analogues of vitamin D that affect cell division and differentiation. Calcipotriol is an active form of vitamin D. Vitamin D and its analogues are first-line for the long-term treatment of plaque psoriasis; they do not smell or stain and they may be more acceptable than tar or dithranol products. Of the vitamin D analogues, tacalcitol and calcipotriol are less likely to irritate.

Coal tar has anti-inflammatory properties that are useful in chronic plaque psoriasis; it also has antiscaling properties. Crude coal tar (coal tar, BP) is the most effective form, typically in a concentration of 1 to 10% in a soft paraffin base, but few outpatients tolerate the smell and mess. Cleaner extracts of coal tar included in proprietary preparations, are more practicable for home use but they are less effective and improvement takes longer. Contact of coal tar products with normal skin is not normally harmful and they can be used for widespread small lesions; however, irritation, contact allergy, and sterile folliculitis can occur. The milder tar extracts can be used on the face and flexures. Tar baths and tar shampoos are also helpful.

Dithranol is effective for chronic plaque psoriasis. Its major disadvantages are irritation (for which individual susceptibility varies) and staining of skin and of clothing. It should not be applied to chronic extensor plaques only, carefully avoiding normal skin. Dithranol is not generally suitable for widespread small lesions nor should it be used in the flexures or on the face. Treatment should be started with a low concentration such as dithranol 0.1%, and the strength increased gradually every few days up to 5%, according to tolerance. Proprietary preparations are more suitable for home use; they are usually washed off after 5 to 60 minutes (‘short contact’). Specialist nurses may apply intensive treatment with dithranol paste which is covered by stockinette dressings and usually retained overnight. Dithranol should be discontinued if even a low concentration causes acute inflammation; continued use can result in the psoriasis becoming unstable. When applying dithranol, hands should be protected by gloves or they should be washed thoroughly afterwards.

Tazaroteone, a retinoid, has a similar efficacy to vitamin D and its analogues, but is associated with a greater incidence of irritation. Although irritation is common, it is minimised by applying tazaroteone sparingly to the plaques and avoiding normal skin; application to the face and in flexures should also be avoided. Tazaroteone does not stain and is odourless.

A topical corticosteroid (section 13.4) is not generally suitable for long-term use or as the sole treatment of extensive chronic plaque psoriasis; any early improvement is not usually maintained and there is a risk of the condition deteriorating or of precipitating an unstable form of psoriasis (e.g. erythrodemic psoriasis or generalised pustular psoriasis) on withdrawal. Topical use of potent corticosteroids on widespread psoriasis can also lead to systemic as well as local side-effects. However, topical corticosteroids used short-term may be appropriate to treat psoriasis in specific sites such as the face or flexures (with a mild or moderate corticosteroid), and psoriasis of the scalp, palms, and soles (with a potent corticosteroid). Very potent corticosteroids should only be used under specialist supervision. Combining the use of a corticosteroid with another specific topical treatment may be beneficial in chronic plaque psoriasis; the drugs may be used separately at different times of the day or used together in a single formulation. Eczema co-existing with psoriasis may be treated with a corticosteroid, or coal tar, or both.

Phototherapy Phototherapy is available in speciality centres under the supervision of a dermatologist. Ultraviolet B (UVB) radiation is usually effective for chronic stable psoriasis and for guttate psoriasis. It may be considered for patients with moderately severe psoriasis in whom topical treatment has failed, but it may irritate inflammatory psoriasis.

Photochemotherapy combining long-wave ultraviolet A radiation with a psoralen (PUVA) is available in specialist centres under the supervision of a dermatologist. The psoralen, which enhances the effect of irradiation, is administered either by mouth or topically. PUVA is effective in most forms of psoriasis, including localised palmoplantar pustular psoriasis. Early adverse effects include phototoxicity and pruritus. Higher cumulative doses exaggerate skin ageing, increase the risk of dysplastic and neoplastic skin lesions, especially squamous cancer, and pose a theoretical risk of cataracts. Phototherapy combined with coal tar, dithranol, tazarotene, topical vitamin D or vitamin D analogues, or oral acitretin, allows reduction of the cumulative dose of phototherapy required to treat psoriasis.

Systemic treatment Systemic treatment is required for severe, resistant, unstable or complicated forms of psoriasis, and it should be initiated only under specialist supervision. Systemic drugs for psoriasis include acitretin (see below) and drugs that affect the immune response (such as ciclosporin and methotrexate, section 13.5.3). Systemic corticosteroids should be used only rarely in psoriasis because rebound deterioration may occur on reducing the dose.

Acitretin, a metabolite of etretinate, is a retinoid (vitamin A derivative); it is prescribed by specialists. The main indication for acitretin is psoriasis, but it is also used in disorders of keratinisation such as severe Darier’s disease (keratosis follicularis), and some forms of ichthyosis. Although a minority of cases of psoriasis respond well to acitretin alone, it is only moderately effective in many cases and it is combined with other treatments. A therapeutic effect occurs after 2 to 4 weeks and the maximum benefit after 4 months. Consideration should be given to stopping acitretin if the response is inadequate after 4 months at the optimum dose. The manufacturers of acitretin do not recommend...
continuous treatment for longer than 6 months. However, some patients may benefit from longer treatment, provided that the lowest effective dose is used, patients are monitored carefully for adverse effects, and the need for treatment is reviewed regularly.

Apart from teratogenicity, which remains a risk for 3 years after stopping, acitretin is the least toxic systemic treatment for psoriasis; in women with a potential for child-bearing, the possibility of pregnancy must be excluded before effective treatment and contraceptive must be used during treatment and for at least 3 years afterwards (oral progestogen-only contraceptives not considered effective).

### Topical preparations for psoriasis

#### Vitamin D and analogues

Calcipotriol, calcitriol, and tacalcitol are used for the management of plaque psoriasis. They should be avoided by those with calcium metabolism disorders, and used with caution in generalised pustular or erythrodermic exfoliative psoriasis (enhanced risk of hypercalcemia). Local skin reactions (itching, erythema, burning, paraesthesia, dermatitis) are common. Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas. Aggravation of psoriasis has also been reported.

#### Calcipotriol

**Indications** see under Dose

**Cautions** see notes above; avoid use on face; avoid excessive exposure to sunlight and sunlamps

**Contra-indications** see notes above

**Pregnancy** manufacturers advise avoid unless essential

**Breast-feeding** no information available

**Side-effects** see notes above; also photosensitivity, dry skin; rarely facial or perioral dermatitis

**Dose**

- Plaque psoriasis, apply ointment once or twice daily; max. 100 g weekly (less with scalp solution, see below); CHILD over 6 years, apply twice daily; 6–12 years max. 50 g weekly; over 12 years max. 75 g weekly

**Note** Patient information leaflet for Dovonex® ointment advises liberal application (but note max. recommended weekly dose, above)

- Scalp psoriasis, apply scalp solution twice daily; max. 60 mL weekly (less with ointment, see below); CHILD under 18 years see BNF for Children

**Note** When preparations used together max. total calcipotriol 5 mg in any one week, calcitriol 3 micrograms/g

**Calcipotriol (Non-proprietary)**

- **Ointment**, calcipotriol 50 micrograms/g, net price 120 g = £24.04

**Note** Not licensed for use in children under 18 years

**Calcitriol** (1,25-Dihydroxycholecalciferol)

**Indications** mild to moderate plaque psoriasis

**Cautions** see notes above

**Contra-indications** see notes above; do not apply under occlusion

**Pregnancy** manufacturer advises use in restricted amounts only if clearly necessary and to monitor urine- and serum-calcium concentration

**Breast-feeding** manufacturer advises avoid

**Side-effects** see notes above

**Dose**

- ADULT and CHILD over 12 years, apply twice daily; not more than 35% of body surface to be treated daily, max. 30 g daily

**Siliks®** (Galderma)

- **Ointment**, calcitriol 3 micrograms/g, net price 100 g = £16.34

**Excipients** none as listed in section 13.1.3

#### Tacalcitol

**Indications** plaque psoriasis

**Cautions** see notes above; avoid eyes; monitor serum calcium if risk of hypercalcemia; if used in conjunction with UV treatment, UV radiation should be given in the morning and tacalcitol applied at bedtime

**Contra-indications** see notes above

**Pregnancy** manufacturer advises avoid unless no safer alternative—no information available

**Breast-feeding** manufacturer advises avoid application to breast area; no information available on presence in milk

**Side-effects** see notes above

### With betamethasone

For prescribing information and for comment on the limited role of corticosteroids in psoriasis, see section 13.4.

#### Dovobet® (LEO)

- **Ointment**, betamethasone (as dipropionate) 0.05%, calcipotriol (as monohydrate) 50 micrograms/g, net price 30 g = £16.54. Label: 28

**Excipients** include butylated hydroxytoluene

**Dose** stable plaque psoriasis, apply once daily to max. 30% of body surface (max. 15 g daily) for 4 weeks; if necessary, treatment may be continued beyond 4 weeks or repeated, on the advice of a specialist; CHILD under 18 years see BNF for Children

**Gel**, betamethasone (as dipropionate) 0.05%, calcipotriol (as monohydrate) 50 micrograms/g, net price 30 g = £16.54, 60 g = £33.08, 2 × 60 g = £61.43. Label: 28

**Excipients** include butylated hydroxytoluene

**Dose** scalp psoriasis, apply 1–4 g to scalp once daily, shampoo off after leaving on scalp overnight or during day; usual duration of therapy 4 weeks; if necessary, treatment may be continued beyond 4 weeks or repeated, on the advice of a specialist; CHILD under 18 years see BNF for Children

**Mild to moderate plaque psoriasis**, apply once daily to max. 30% of body surface (max. 15 g daily) for 8 weeks; if necessary, treatment may be continued beyond 8 weeks or repeated, on the advice of a specialist; CHILD under 18 years see BNF for Children

**Note** When different preparations containing calcipotriol used together, max. total calcipotriol 5 mg in any one week
BNF 68

Tazarotene

Indications mild to moderate plaque psoriasis affecting up to 10% of skin area

Cautions wash hands immediately after use, avoid contact with eyes, face, intertriginous areas, hair-covered scalp, eczematous or inflamed skin; avoid excessive exposure to UV light (including sunlight, solariums, PUVA or UVB treatment); do not apply emollients or cosmetics within 1 hour of application

Pregnancy avoid; effective contraception required (oral progestogen-only contraceptives not considered effective)

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects local irritation (more common with higher concentration and may require discontinuation), pruritus, burning, erythema, desquamation, non-specific rash, contact dermatitis, and worsening of psoriasis; rarely stinging and inflamed, dry or painful skin

Dose

- Apply once daily in the evening usually for up to 12 weeks; CHILD under 18 years not recommended

Zorac® (Allergan) Gel, tazarotene 0.05%, net price 30g = £14.09; 100g = £42.96

- Include benzyl alcohol, butylated hydroxyanisole, butylated hydroxytoluene, disodium edetate, propylene glycol

Exipients none as listed in section 13.1.3

Proprietary preparations

Carbo-Dome® (Sandoz) Cream, coal tar solution 10%, in a water-miscible basis, net price 30g = £4.77; 100g = £16.38

- Include beeswax, hydroxybenzoates (parabens)

Dose psoriasis, apply to skin 2–3 times daily; CHILD under 12 years and ELDERLY, cream can be diluted with a few drops of water before applying

Cocos® (RPH) Scalp ointment, coal tar solution 12%, salicylic acid 2%, precipitated sulfur 4%, in a coconut oil emollient basis, net price 40g (with applicator nozzle) = £6.22, 100g = £11.69

- Include hydrocortisone (cortisone) (as monohydrate) 0.5%

Dose psoriasis, apply to skin or scalp 2–3 times daily; CHILD under 12 years and ELDERLY, lotion can be diluted with a few drops of water before applying

Exorex® (Forest) Lotion, coal tar solution 5% in an emollient basis, net price 100mL = £8.11, 250mL = £16.24

- Include hydroxybenzoates (parabens)

Dose psoriasis, apply to skin or scalp 2–3 times daily; CHILD under 12 years and ELDERLY, lotion can be diluted with a few drops of water before applying

Sebco® (Derma UK) Scalp ointment, coal tar solution 12%, salicylic acid 2%, precipitated sulfur 4%, in a coconut oil emollient basis, net price 40g = £4.54, 100g = £8.52

- Include hydrocortisone (cortisone) (as monohydrate) 0.5%

Dose psoriasis, apply to skin or scalp 2–3 times daily; CHILD under 12 years and ELDERLY, lotion can be diluted with a few drops of water before applying
### 13.5.2 Preparations for psoriasis

---

**Bath preparations**

**Coal Tar Solution, BP**

**Solution**, coal tar 20%, polysorbate ‘80’ 5%, in alcohol (96%), net price 500 mL = £11.20. Label: 15

**Excipients** include polysorbates

**Dose** use 100 mL in a bath

**Note** Strong Coal Tar Solution BP contains coal tar 40%

**Polytar Emollient®** (Stiefel)

**Bath additive**, coal tar solution 2.5%, arachis (peanut) oil extract of coal tar 7.5%, tar 7.5%, cade oil 7.5%, light liquid paraffin 35%, net price 500 mL = £5.78

**Excipients** include isopropyl palmitate

**Dose** psoriasis, eczema, atopic and pruritic dermatoses, use 2–4 capsfuls (15–30 mL) in bath and soak for 20 minutes

**Psoriderm®** (Dermal)

**Bath emulsion**, coal tar 40%, net price 200 mL = £2.74

**Excipients** include polysorbate 20

**Dose** psoriasis, use 30 mL in a bath and soak for 5 minutes

---

**Dithranol**

---

**DITHRANOL**

*(Anthralin)*

**Indications** subacute and chronic psoriasis, see notes above

**Cautions** avoid use near eyes and sensitive areas of skin; see also notes above

**Contra-indications** hypersensitivity; acute and pustular psoriasis

**Side-effects** local burning sensation and irritation; stains skin, hair, and fabrics

**Dose**

- See notes above and under preparations

  **Note** Some of these dithranol preparations also contain coal tar or salicylic acid—for cautions, contra-indications, and side-effects see under Tars (above) or under Salicylic Acid

**Non-proprietary preparations**

**Dithranol Ointment, BP** *(Dermal)*

**Ointment**, dithranol, in yellow soft paraffin; usual strengths 0.1–2%. Part of basis may be replaced by hard paraffin if a stiffer preparation is required. Label: 28

**Dithranol Paste, BP**

**Paste**, dithranol in zinc and salicylic acid (Lassar’s) paste. Usually strengths 0.1–1% of dithranol. Label: 28

**Proprietary preparations**

**Dithrocream®** (Dermal)

**Cream**, dithranol 0.1%, net price 50 g = £3.77; 0.25%, 50 g = £4.04; 0.5%, 50 g = £4.66; 1%, 50 g = £5.62; 2%, 50 g = £6.79. Label: 28

**Excipients** include cetostearyl alcohol, chlorocresol

**Dose** for application to skin or scalp; 0.1–0.5% cream suitable for overnight treatment, 1–2% cream for max. 1 hour

---

**Micanol®** (GP Pharma)

**Cream**, dithranol 1% in a lipid-stabilised basis, net price 50 g = £16.18; 3%, 50 g = £20.15. Label: 28

**Excipients** none as listed in section 13.1.3

**Dose** for application to skin or scalp, apply 1% cream for up to 30 minutes once daily, if necessary 3% cream can be used under medical supervision

**Note** At the end of contact time, use plenty of lukewarm (not hot) water to rinse off cream, soap may be used after the cream has been rinsed off, use shampoo before applying cream to scalp and if necessary after cream has been rinsed off

**Psorin®** (LPC)

**Ointment**, dithranol 0.11%, coal tar 1%, salicylic acid 1.6%, net price 50 g = £9.22, 100 g = £18.44. Label: 28

**Excipients** include beeswax, wool fat

**Dose** for application to skin up to twice daily

**Scalp gel**, dithranol 0.25%, salicylic acid 1.6% in gel basis containing methyl salicylate, net price 50 g = £7.03. Label: 28

**Excipients** none as listed in section 13.1.3

**Dose** for application to scalp, initially apply on alternate days for 10–20 minutes; may be increased to daily application for max. 1 hour and then wash off

---

**Salicylic acid**

---

**SALICYLIC ACID**

For coal tar preparations containing salicylic acid, see under Tars, p. 799; for dithranol preparations containing salicylic acid see under Dithranol, above

**Indications** hyperkeratotic skin disorders; warts and calluses (section 13.7); scalp conditions (section 13.9); fungal nail infections (section 13.10.2)

**Cautions** see notes above; avoid broken or inflamed skin

**Salicylate toxicity** Salicylate toxicity may occur particularly if applied on large areas of skin or neonatal skin

**Side-effects** sensitivity, excessive drying, irritation, systemic effects after widespread use (see under Cautions)

**Dose**

- See preparations

**Zinc and Salicylic Acid Paste, BP**

**Paste**, (Lassar’s Paste), zinc oxide 24%, salicylic acid 2%, starch 24%, white soft paraffin 50%

Available from ‘special-order’ manufacturers or specialist importing companies, see p. 1104

**Dose** apply twice daily

---

**Oral retinoids for psoriasis**

---

**ACITRETIN**

**Note** Acitretin is a metabolite of etretinate

**Indications** severe extensive psoriasis resistant to other forms of therapy; palmoplantar pustular psoriasis; severe congenital ichthyosis; severe Darier’s disease (keratosis follicularis)

**Cautions** avoid concomitant use of keratolytics; do not donate blood during and for 2 years after stopping therapy (keratogenic risk); check liver function at start, then every 2–4 weeks for first 2 months and then every 3 months; monitor serum-triglyceride and serum-cholesterol concentrations before treatment, 1 month after starting, then every 3 months; diabetes (can alter glucose tolerance—initial frequent blood
Neotigason

ADULT abdominal pain, diarrhoea, nausea, side-effects avoid in severe impairment; renal impairment avoid in severe impairment—

Contra-indications hyperlipidaemia

Hepatic impairment avoid in severe impairment—risk of further impairment

Renal impairment avoid in severe impairment; increased risk of toxicity

Pregnancy avoid—teratogenic; effective contraception must be used—see cautions above

Breast-feeding avoid

Side-effects abdominal pain, diarrhoea, nausea, vomiting, dryness and inflammation of mucous membranes, peripheral oedema, reversible increase in serum-cholesterol and serum-triglyceride concentrations (with high doses), headache, arthralgia, myalgia, dryness of conjunctiva (causing conjunctivitis and decreased tolerance to contact lenses), alopecia (reversible on withdrawal), abnormal hair texture, skin exfoliation, pruritus, epidermal fragility, sticky skin, dermatitis, erythema, brittle nails, paronychia; less commonly hepatitis, dizziness, visual disturbances, photosensitivity; rarely peripheral neuropathy; very rarely benign intracranial hypertension (discontinue if severe headache, nausea, vomiting, or visual disturbances occur), bone pain, exostosis (skeletal hyperostosis and extra-osseous calcification reported following long-term treatment with etretinate, and premature epiphyseal closure in children, see cautions above), night blindness, ulcerative lesions, impaired hearing, tinnitus, initial worsening of psoriasis, dry skin, sweating

Dose

• ADULT over 18 years (under expert supervision), initially 25–30 mg daily (Darier’s disease 10 mg daily) for 2–4 weeks, then adjusted according to response, usual range 25–50 mg daily; up to 75 mg daily for short periods in psoriasis (see p. 797); CHILD under 18 years see BNF for children

Neotigason® (Actavis)

Capsules, acitretin 10 mg (brown/white), net price 60-caps pack = £17.30; 25 mg (brown/yellow), 60-caps pack = £43.00. Label: 10, patient information leaflet, 11, 21

13.5.3 Drugs affecting the immune response

Drugs affecting the immune response are used for eczema or psoriasis. Systemic drugs acting on the immune system are used under specialist supervision.

Pimecrolimus by topical application is licensed for mild to moderate atopic eczema. Tacrolimus is licensed for topical use in moderate to severe atopic eczema. Both are drugs whose long-term safety is still being evaluated and they should not usually be considered first-line treatments unless there is a specific reason to avoid or reduce the use of topical corticosteroids. Treatment of atopic eczema with topical pimecrolimus or topical tacrolimus should be initiated only by prescribers experienced in managing the condition. For the role of topical tacrolimus and pimecrolimus in the treatment of psoriasis, see section 13.5.2.

NICE guidance Tacrolimus and pimecrolimus for atopic eczema (August 2004)

Topical pimecrolimus and tacrolimus are options for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).

Topical pimecrolimus is recommended for moderate atopic eczema on the face and neck of children aged 2–16 years and topical tacrolimus is recommended for moderate to severe atopic eczema in adults and children over 2 years. Pimecrolimus and tacrolimus should be used within their licensed indications.

The Scottish Medicines Consortium (p. 4) has advised (March 2010) that tacrolimus ointment (Protopic®) is accepted for restricted use within NHS Scotland for the prevention of flares in those with moderate to severe atopic eczema in accordance with the licensed indications; initiation of treatment is restricted to doctors (including general practitioners) with specialist interest and experience in treating atopic eczema with immunomodulatory therapy.

For the role of topical corticosteroids in eczema, see section 13.5.1, and for their role in psoriasis, see section 13.5.2. A short course of a systemic corticosteroid (section 6.3.2) can be given for eczema flares that have not improved despite appropriate topical treatment.

Ciclosporin by mouth can be used for severe psoriasis and for severe eczema. Azathioprine or mycophenolate mofetil (section 8.2.1) are used for severe refractory eczema [unlicensed indication].

Methotrexate can be used for severe psoriasis, the dose being adjusted according to severity of the condition and haematological and biochemical measurements. Folic acid (section 9.1.2) should be given to reduce the possibility of side-effects associated with methotrexate. Folic acid can be given at a dose of 5 mg once weekly [unlicensed indication], on a different day from the methotrexate; alternative regimens of folic acid may be used in some settings.

Etanercept,adalimumab, and infliximab inhibit the activity of tumour necrosis factor (TNFαs). They are used for severe plaque psoriasis either refractory to at least 2
standard systemic treatments and photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications; while either etanercept or adalimumab is considered to be the first choice in stable disease, infliximab or adalimumab may be useful when rapid disease control is required. Ustekinumab (a monoclonal antibody that inhibits interleukins 12 and 23) can be used for severe plaque psoriasis that has not responded to at least 2 standard systemic treatments and photochemotherapy, or when these treatments cannot be used because of intolerance or contra-indications (see also NICE guidance below). Adalimumab, etanercept, infliximab and ustekinumab are also licensed for psoriatic arthritis (section 10.1.3).

NICE guidance

Adalimumab for plaque psoriasis in adults (June 2008)

Adalimumab is recommended for the treatment of severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Adalimumab should be withdrawn if the response is not adequate after 16 weeks.

NICE guidance

Etanercept and efalizumab for plaque psoriasis in adults (July 2006)

Etanercept is recommended for severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Etanercept should be withdrawn if the response is not adequate after 12 weeks.

Following suspension of the marketing authorisation for efalizumab, NICE has temporarily withdrawn its guidance on the use of efalizumab for plaque psoriasis.

NICE guidance

Infliximab for plaque psoriasis in adults (January 2008)

Infliximab is recommended for the treatment of very severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) or to photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Infliximab should be withdrawn if the response is not adequate after 10 weeks.

NICE guidance

Ustekinumab for plaque psoriasis in adults (September 2009)

Ustekinumab is recommended for the treatment of severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and to photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Ustekinumab should be withdrawn if the response is not adequate after 16 weeks.

For patients weighing over 100 kg, the manufacturer should provide the 90-mg dose of ustekinumab at the same price as the 45-mg dose.

AZATHIOPRINE

Indications

severe refractory eczema [unlicensed indication]; inflammatory bowel disease (section 1.5.3); autoimmune conditions and prophylaxis of transplant rejection (section 8.2.1); rheumatoid arthritis (section 10.1.3)

Cautions

section 8.2.1

Contra-indications

section 8.2.1; also very low or absent thiopurine methyltransferase (TPMT) activity

Hepatic impairment

section 8.2.1

Renal impairment

section 8.2.1

Pregnancy

section 8.2.1

Breast-feeding

section 8.2.1

Side-effects

section 8.2.1

Dose

• Severe refractory eczema [unlicensed indication], by mouth, normal or high TPMT activity, 1–3 mg/kg daily; intermediate TPMT activity, 0.5–1.5 mg/kg daily

Preparations

Section 8.2.1

CICLOSPORIN

(Cyclosporin)

Indications

see under Dose; severe acute ulcerative colitis (section 1.5.3); transplantation and graft-versus-host disease (section 8.2.2)

Cautions

section 8.2.2

Additional cautions in atopic dermatitis and psoriasis

Contra-indicated in abnormal renal function, uncontrolled hypertension (see also below), infections not under control, and malignancy (see also below)

Dermatological and physical examination, including blood pressure and renal function measurements required at least twice before starting. During treatment, monitor serum creatinine every 2 weeks for first 3 months then every month; reduce dose by 25–50% if serum creatinine increases more than 30% above baseline (even if within normal range) and discontinue if reduction not successful within 1 month. Discontinue if hypertension develops that cannot be controlled by dose reduction or antihypertensive therapy. Avoid excessive exposure to sunlight and avoid use of UVB or PUVA. In atopic dermatitis, also allow herpes simplex infections to clear before starting (if they occur during treatment withdraw if severe). Staphylococcus aureus skin

2. The Scottish Medicines Consortium issued similar advice on the use of etanercept in adults (August 2009) and children over 6 years old (April 2012)
Methotrexate

**Indications**
Severe psoriasis unresponsive to conventional therapy (specialist use only); Crohn’s disease (section 1.5.3); malignant disease (section 8.1.3); rheumatoid arthritis (section 10.1.3)

**Cautions**
Section 10.1.3; also photosensitivity—psoriasis lesions aggravated by UV radiation (skin ulceration reported).

**Contra-indications**
Section 10.1.3

**Hepatic impairment**
Section 10.1.3

**Renal impairment**
See Cautions above

**Pregnancy**
See Immunosuppressant Therapy, p. 615

**Breast-feeding**
Section 10.1.3

**Side-effects**
Section 8.2.2

**Dose**
- Short-term treatment (usually for max. 8 weeks but can be longer under specialist supervision) of severe atopic dermatitis where conventional therapy ineffective or inappropriate, administered in accordance with expert advice, by **mouth**, **adult** and **child** over 16 years, initially 2.5 mg/kg daily in 2 divided doses, if good initial response not achieved within 2 weeks, increase rapidly to max. 5 mg/kg daily; initial dose of 5 mg/kg daily in 2 divided doses if very severe; **child** under 16 years see BNF for Children
- Severe psoriasis where conventional therapy ineffective or inappropriate, administered in accordance with expert advice, by **mouth**, **adult** and **child** over 16 years, initially 2.5 mg/kg daily in 2 divided doses, increased gradually to max. 5 mg/kg daily if no improvement within 1 month; initial dose of 5 mg/kg daily justified if rapid control required; discontinue if inadequate response after 3 months at the optimum dose; max. duration of treatment usually 1 year unless other treatments cannot be used; **child** under 16 years see BNF for Children

**Important**
For preparations and counselling and for advice on conversion between the preparations, see section 8.2.2

**Preparations**
Section 8.2.2

**Pimecrolimus**

**Indications**
See Dose

**Cautions**
UV light (avoid excessive exposure to sunlight and sunlamps), avoid other topical treatments except emollients at treatment site; alcohol consumption (risk of facial flushing and skin irritation)

**Contra-indications**
Contact with eyes and mucous membranes, application under occlusion, infection at treatment site; congenital epidermal barrier defects; immunosuppression; concomitant use with drugs that cause immunosuppression may be prescribed in exceptional circumstances by specialists; application to malignant or potentially malignant skin lesions

**Side-effects**
 Burning sensation, pruritus, erythema, contact with eyes and mucous membranes, application under occlusion, infection at treatment site; congenital epidermal barrier defects; immunosuppression; concomitant use with drugs that cause immunosuppression; alcohol consumption (risk of facial flushing and skin irritation)

**Dose**
- Short-term treatment of mild to moderate atopic eczema (including flares) when topical corticosteroids cannot be used (see also notes above), apply twice daily until symptoms resolve (stop treatment if eczema worsens or no response after 6 weeks); **child** under 2 years not recommended
- Short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy (unlicensed indication) (see also section 13.5.2), **adult** over 18 years, apply twice daily until symptoms resolve (max. duration of treatment 4 weeks)

**Elidel** (Meda) Cream, pimecrolimus 1%, net price 30 g = £19.69, 60 g = £37.41, 100 g = £59.07. Label: 4, 11, 28

**Excipients**
Include benzyl alcohol, cetyl alcohol, propylene glycol, stearyl alcohol

**Tacrolimus**

**Indications**
See Dose; other indications section 8.2.2

**Cautions**
UV light (avoid excessive exposure to sunlight and sunlamps); alcohol consumption (risk of facial flushing and skin irritation)
Cytokine modulators

**ADALIMUMAB**

**Indications** see notes above; Crohn's disease (section 1.5.3); ankylosing spondylitis, polyarticular juvenile idiopathic arthritis, psoriatic arthritis, rheumatoid arthritis (section 10.1.3)

**Cautions** section 10.1.3, p. 723

**Important** See section 10.1.3, p. 723 for information on tuberculosis and blood disorders

**Dose**

- By intravenous injection, plaque psoriasis, ADULT over 18 years, 5 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 8 weeks; discontinue if no response within 14 weeks of initial infusion

**Preparations** Section 10.1.3

**USTEKINUMAB**

**Indications** see notes above; psoriatic arthritis (section 10.1.3)

**Cautions** predisposition to infection; history or development of malignancy; monitor for non-melanoma skin cancer, especially in patients with a history of PUVA treatment or prolonged immuno-
suppressive therapy, or those over 60 years of age; elderly: Interactions: Appendix 1 (ustekinumab)

Tuberculosis Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting ustekinumab. Patients who have previously received adequate treatment for tuberculosis can start ustekinumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting ustekinumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with ustekinumab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

Contra-indications active infection

Pregnancy avoid; manufacturer advises effective contraception during treatment and for 15 weeks after stopping treatment

Breast-feeding manufacturer advises avoid—present in milk in animal studies

Side-effects diarrhoea, nausea, headache, malaise, dizziness, infections (sometimes severe), arthralgia, myalgia, oropharyngeal pain, pruritus, injection-site reactions; less commonly depression, facial palsy, nasal congestion, hypersensitivity reactions (possibly delayed onset), pustular psoriasis

Dose • By subcutaneous injection, plaque psoriasis, ADULT over 18 years, body-weight under 100 kg, initially 45 mg, then 45 mg 4 weeks after initial dose, then 45 mg every 12 weeks; body-weight over 100 kg, initially 45–90 mg, then 45–90 mg 4 weeks after initial dose, then 45–90 mg every 12 weeks Note Discontinue if no response within 16 weeks

Stelara® (Janssen) (mAb)

Injection, ustekinumab 90 mg/mL, net price 0.5–mL (45-mg) prefilled syringe = £2147.00. Label: 10, counselling, tuberculosis

13.6 Acne and rosacea

13.6.1 Topical preparations for acne

13.6.2 Oral preparations for acne

Acne Treatment of acne should be commenced early to prevent scarring. Patients should be counselled that an improvement may not be seen for at least a couple of months. The choice of treatment depends on whether the acne is predominantly inflammatory or comedonal and its severity.

Mild to moderate acne is generally treated with topical preparations (section 13.6.1). Systemic treatment (section 13.6.2) with oral antibacterials is generally used for moderate to severe acne or where topical preparations are not tolerated or are ineffective or where application to the site is difficult. Another oral preparation used for acne is the hormone treatment cyproheptadine (cyproterone acetate with ethinylenestradiol), it is for women only.

Severe acne, acne unresponsive to prolonged courses of oral antibacterials, scarring, or acne associated with psychological problems calls for early referral to a consultant dermatologist who may prescribe isotretinoin for administration by mouth.

Rosacea Brimonidine (section 13.6.3) is licensed for the treatment of facial erythema in rosacea. Rosacea is not comedonal (but may exist with acne which may be comedonal). The pustules and papules of rosacea respond to topical metronidazole (section 13.10.1.2) or to topical azelaic acid (section 13.6.1). Alternatively, oral administration of oxytetracycline or tetracycline 500 mg twice daily (section 5.1.3), or of erythromycin 500 mg twice daily (section 5.1.5), can be used; courses usually last 6–12 weeks and are repeated intermitently.

Doxycycline (section 5.1.3) 100 mg once daily can be used (unlicensed indication) if oxytetracycline or tetracycline is inappropriate (e.g. in renal impairment). A modified-release preparation of doxycycline is licensed in low doses of 40 mg once daily for the treatment of facial rosacea (section 5.1.3). Isotretinoin is occasionally given in refractory cases (unlicensed indication). Camouflagers (section 13.8.2) may be required for the redness.

Benzoyl peroxide and azelaic acid

Benzoyl peroxide is effective in mild to moderate acne. Both comedones and inflamed lesions respond well to benzoyl peroxide. The lower concentrations seem to be as effective as higher concentrations in reducing inflammation. It is usual to start with a lower strength and to increase the concentration of benzoyl peroxide gradually. Adverse effects include local skin irritation, particularly when therapy is initiated, but the scaling and redness often subside with treatment continued at a reduced frequency of application. If the acne does not respond after 2 months then use of a topical antibacterial should be considered.

Azelaic acid has antimicrobial and anti-comedonal properties. It may be an alternative to benzoyl peroxide or to a topical retinoid for treating mild to moderate comedonal acne, particularly of the face. Some patients prefer azelaic acid because it is less likely to cause local irritation than benzoyl peroxide.

Benzoyl peroxide is effective in mild to moderate acne. Both comedones and inflamed lesions respond well to benzoyl peroxide. The lower concentrations seem to be as effective as higher concentrations in reducing inflammation. It is usual to start with a lower strength and to increase the concentration of benzoyl peroxide gradually. Adverse effects include local skin irritation, particularly when therapy is initiated, but the scaling and redness often subside with treatment continued at a reduced frequency of application. If the acne does not respond after 2 months then use of a topical antibacterial should be considered.

It may be an alternative to benzoyl peroxide or to a topical retinoid for treating mild to moderate comedonal acne, particularly of the face. Some patients prefer azelaic acid because it is less likely to cause local irritation than benzoyl peroxide.
13.6.1 Topical preparations for acne

**Acneceid**<sup>®</sup> (Galderma)
- **Gel**, benzoyl peroxide 5% in an aqueous gel basis, net price 30 g = £5.44, 60 g = £10.88
- **Excipients** include propylene glycol

**Brevoxyl**<sup>®</sup> (GSK)
- **Creme**, benzoyl peroxide 4% in an aqueous basis, net price 50 g = £4.13
- **Excipients** include cetostearyl alcohol, fragrance, stearyl alcohol

**PanOxyl**<sup>®</sup> (GSK)
- **Aquaigel** (= aqueous gel), benzoyl peroxide 2.5%, net price 40 g = £1.76; 5%, 40 g = £1.92; 10%, 40 g = £2.13
- **Excipients** include propylene glycol

**Cream**, benzoyl peroxide 5% in a non-greasy basis, net price 40 g = £1.89
- **Excipients** include isopropyl palmitate, propylene glycol

**Gel**, benzoyl peroxide 10% in an aqueous alcoholic basis, net price 40 g = £1.99
- **Excipients** include fragrance

**Wash**, benzoyl peroxide 10% in a detergent basis, net price 150 mL = £4.00
- **Excipients** include imidurea

**Note** May be difficult to obtain

**With antimicrobials**
See also Topical Antibacterials for Acne, below and Antibacterials, below

**Duc**<sup>®</sup> **Once Daily** (GSK)<sup>®</sup>
- **Gel**, benzoyl peroxide 3%, clindamycin 1% (as phosphate) in an aqueous basis, net price 30 g = £11.94
- **Excipients** include disodium edetate
- **Dose** ADULT and CHILD over 12 years, apply once daily in the evening

**Gel**, benzoyl peroxide 5%, clindamycin 1% (as phosphate) in an aqueous basis, net price 25 g = £9.95, 50 g = £19.90
- **Excipients** include disodium edetate
- **Dose** ADULT and CHILD over 12 years, apply once daily in the evening

**Quinoderm**<sup>®</sup> (Alliance)
- **Cream**, benzoyl peroxide 5%, potassium hydroxyquinoline sulfate 0.5%, in an astringent vanishing-cream basis, net price 50 g = £2.43
- **Excipients** include cetostearyl alcohol, edetic acid (EDTA)
- **Dose** acne vulgaris, acneform eruptions, folliculitis, apply 2–3 times daily

**Cream**, benzoyl peroxide 10%, potassium hydroxyquinoline sulfate 0.5%, in an astringent vanishing-cream basis, net price 25 g = £1.58, 50 g = £2.55
- **Excipients** include cetostearyl alcohol, edetic acid (EDTA)
- **Dose** acne vulgaris, acneform eruptions, folliculitis, apply 2–3 times daily

**AZELAIC ACID**

**Indications** see preparations

**Cautions** avoid contact with eyes, mouth, and mucous membranes

**Side-effects** local irritation (reduce frequency or discontinue temporarily); less commonly skin discolouration; also reported worsening of asthma

**Finacea**<sup>®</sup> (Bayer)<sup>®</sup>
- **Gel**, azelaic acid 15%, net price 30 g = £7.48
- **Excipients** include disodium edetate, polysorbate 80, propylene glycol
- **Dose** facial acne vulgaris, ADULT and CHILD over 12 years, apply twice daily, discontinue if no improvement after 1 month
- Papulopustular rosacea, ADULT over 18 years, apply twice daily, discontinue if no improvement after 2 months

**Skinoren**<sup>®</sup> (Bayer)<sup>®</sup>
- **Cream**, azelaic acid 20%, net price 30 g = £3.74
- **Excipients** include propylene glycol
- **Dose** acne vulgaris, ADULT and CHILD over 12 years, apply twice daily (sensitive skin, once daily for first week)

**Topical antibacterials for acne**
For many patients with mild to moderate inflammatory acne, topical antibacterials may be no more effective than topical benzoyl peroxide or tretinoin. Topical antibacterials are probably best reserved for patients who wish to avoid oral antibacterials or who cannot tolerate them. Topical preparations of **erythromycin** and **clindamycin** are effective for inflammatory acne. Topical antibacterials can produce mild irritation of the skin, and on rare occasions cause sensitisation; gastrointestinal disturbances have been reported with topical clindamycin.

Antibacterial resistance of **Propionibacterium acnes** is increasing; there is cross-resistance between erythromycin and clindamycin. To avoid development of resistance:

- when possible use non-antibiotic antimicrobials (such as benzoyl peroxide or azelaic acid);
- avoid concomitant treatment with different oral and topical antibacterials;
- if a particular antibacterial is effective, use it for repeat courses if needed (short intervening courses of benzoyl peroxide or azelaic acid may eliminate any resistant propionibacteria);
- do not continue treatment for longer than necessary (however, treatment with a topical preparation should be continued for at least 6 months).

**ANTIBACTERIALS**

**Indications** acne vulgaris

**Cautions** some manufacturers advise preparations containing alcohol are not suitable for use with benzoyl peroxide; discontinue clindamycin preparations immediately if diarrhoea or colitis occur

**Dalacin T**<sup>®</sup> (Pharmacia)<sup>®</sup>
- **Topical solution**, clindamycin 1% (as phosphate), in an aqueous alcoholic basis, net price (both with applicator) 30 mL = £4.34, 50 mL = £7.23
- **Excipients** include propylene glycol
- **Dose** apply thrice weekly

**Lotion**, clindamycin 1% (as phosphate) in an aqueous basis, net price 30 mL = £5.08, 60 mL = £10.16
- **Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)
- **Dose** apply thrice weekly

**Sliemycin**<sup>®</sup> (Stiefel)<sup>®</sup>
- **Solution**, erythromycin 2% in an alcoholic basis, net price 50 mL = £7.69
- **Excipients** include propylene glycol
- **Dose** ADULT and CHILD over 12 years, apply thrice weekly

**Zindacin**<sup>®</sup> (Crawford)<sup>®</sup>
- **Gel**, clindamycin 1% (as phosphate), net price 30 g = £8.66
- **Excipients** include propylene glycol
- **Dose** ADULT and CHILD over 12 years, apply thrice weekly
### Topical retinoids and related preparations for acne

Topical *tretinoin*, its isomer *isotretinoin*, and *adapalene* (a retinoid-like drug), are useful for treating comedones and inflammatory lesions in mild to moderate acne. Patients should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop.

*Isotretinoin* is given by mouth in severe acne; see section 13.6.2 for warnings relating to use by mouth.

**Cautions** Topical retinoids should be avoided in severe acne involving large areas. Contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin should be avoided. These drugs should be used with caution in sensitive areas such as the neck, and accumulation in angles of the nose should be avoided. Exposure to UV light (including sunlight, solariums) should be avoided; if sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used. Use of retinoids with abrasive cleaners, comedogenic or astringent cosmetics should be avoided. Allow peeling (resulting from other irritant substances) to subside before using a topical retinoid; alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application).

**Pregnancy** Topical retinoids are contra-indicated in pregnancy; women of child-bearing age must use effective contraception (oral progestogen-only contraception not considered effective).

**Side-effects** Local reactions include burning, erythema, stinging, pruritus, dry or peeling skin (discontinue if severe). Increased sensitivity to UVB light or sunlight occurs. Temporary changes of skin pigmentation with tretinoin have been reported. Eye irritation and oedema, and blistering or crusting of skin have been reported rarely.

### Differin® (Galderma) (©)

**Cream**, adapalene 0.1%, net price 45 g = £16.15.

Label: 11

**Excipients** include disodium edetate, hydroxybenzoates (parabens)

**Gel**, adapalene 0.1%, net price 45 g = £16.15. Label: 11

**Excipients** include disodium edetate, hydroxybenzoates (parabens), propylene glycol

**With benzoyl peroxide**

**Epiduo®** (Galderma) (©)

**Gel**, adapalene 0.1%, benzoyl peroxide 2.5%, net price 45 g = £17.91. Label: 11

**Excipients** include disodium edetate, polysorbate 80, propylene glycol

**Dose** ADULT and CHILD over 9 years, acne vulgaris, apply thinly once daily in the evening

**Note** May bleach clothing and hair

**Note** The Scottish Medicines Consortium (p. 4) has advised (March 2014) that Epiduo® should be restricted for use in mild to moderate facial acne when monotherapy with benzoyl peroxide or adapalene is inappropriate.

### ISOTRETINOIN

**Note** Isotretinoin is an isomer of tretinoin

**Important** For prescribing information on isotretinoin when given by mouth, see p. 809

**Indications** see notes above; oral treatment (see section 13.6.2)

**Cautions** (topical application only) see notes above; also personal or familial history of non-melanoma skin cancer

**Contra-indications** (topical application only) rosacea, perioral dermatitis

**Pregnancy** (topical application only) see notes above

**Breast-feeding** avoid

**Side-effects** (topical application only) see notes above

**Dose**

- Apply thinly 1–2 times daily

**Isotrexin® (Stiefel) (©)

**Gel**, isotretonin 0.05%, net price 30 g = £5.94.

Label: 11

**Excipients** include butylated hydroxytoluene

**With antibiotic**

**Isotrexin® (Stiefel) (©)

**Gel**, isotretonin 0.05%, erythromycin 2% in ethanolic basis, net price 30 g = £7.47. Label: 11

**Excipients** include butylated hydroxytoluene

### TRETINOIN

**Note** Tretinoin is the acid form of vitamin A

**Indications** see preparations; malignant disease (section 8.1.5)

**Cautions** see notes above

**Contra-indications** personal or familial history of non-melanoma skin cancer; rosacea; perioral dermatitis

**Pregnancy** see notes above

**Breast-feeding** amount of drug in milk after topical application probably too small to be harmful; ensure infant does not come in contact with treated areas

**Side-effects** see notes above

**Dose**

- See preparations
Skin

Oral antibacterials for acne

Although minocycline is as effective as other tetracyclines for acne, it is associated with a greater risk of lupus erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation; it is given in a dose of 100 mg once daily or 50 mg twice daily. Erythromycin (section 5.1.5) in a dose of 500 mg twice daily is an alternative for the management of acne but propionibacteria strains resistant to erythromycin are becoming widespread and this may explain poor response.

Trimethoprim (section 5.1.8) in a dose of 300 mg twice daily may be used for acne resistant to other antibacterials [unlicensed indication]. Prolonged treatment with trimethoprim may depress haematopoiesis; it should generally be initiated by specialists.

Concomitant use of different topical and systemic antibacterials is undesirable owing to the increased likelihood of the development of bacterial resistance.

Hormone treatment for acne

Co-cyprindiol (cyproterone acetate with ethinylestradiol) contains an anti-androgen. It is licensed for use in women with moderate to severe acne that has not responded to topical therapy or oral antibacterials, and for moderately severe hirsutism. Although it is an effective hormonal contraceptive, it should not be used solely for contraception.

Improvement of acne with co-cyprindiol probably occurs because of decreased sebum secretion which is under androgen control. Some women with moderately severe hirsutism may also benefit because hair growth is also androgen-dependent.

There is an increased risk of venous thromboembolism in women taking co-cyprindiol, particularly during the first year of use. The incidence of venous thromboembolism is 1.5–2 times higher in women using co-cyprindiol than in women using combined oral contraceptives containing levonorgestrel, but the risk may be similar to that associated with use of combined oral contraceptives containing third-generation progestogens (desogestrel and gestodene) or drospirenone (see section 7.3.1). It is contra-indicated in those with a history of venous or arterial thromboembolism, or in those with severe or multiple risk factors for arterial disease or venous thromboembolism (see section 7.3.1). Women requiring co-cyprindiol may have an inherently increased risk of cardiovascular disease.

— 13.6.2 Oral preparations for acne —

Oral antibacterials for acne

Systemic antibacterial treatment is useful for inflammatory acne if topical treatment is not adequately effective or if it is inappropriate. Anticomedianal treatment (e.g. with topical benzoyl peroxide) may also be required.

Either oxytetracycline or tetracycline (section 5.1.3) is usually given for acne in a dose of 500 mg twice daily. If there is no improvement after the first 3 months another oral antibacterial should be used. Maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer.

Doxycycline and lymecycline (section 5.1.3) are alternatives to tetracycline. Doxycycline can be used in a dose of 100 mg daily. Lymecycline is given in a dose of 408 mg daily.

Although minocycline is as effective as other tetracyclines for acne, it is associated with a greater risk of
Side-effects see under Combined Hormonal Contraceptives, section 7.3.1

Dose
- 1 tablet daily for 21 days starting on day 1 of menstrual cycle; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs); time to symptom remission, at least 3 months; review need for treatment regularly

Co-cyprindiol (Non-proprietary) ▼ Tablets, co-cyprindiol 2000/35 (cypionate acetate 2 mg, ethinylestradiol 35 micrograms), net price 63-tab pack = £5.42
Brands include Acnocin®, Cirerama®, Clairette®

Dianette® (Bayern) ▼ Tablets, beige, s/c, co-cyprindiol 2000/35 (cypionate acetate 2 mg, ethinylestradiol 35 micrograms), net price 63-tab pack = £7.71

Oral retinoid for acne

The retinoïd isotretinoin reduces sebum secretion. It is used for the systemic treatment of nodulo-cystic and conglobate acne, severe acne, scarring, acne which has not responded to an adequate course of a systemic antibiotic, or acne which is associated with psychological problems. It is also useful in women who develop acne in the third or fourth decades of life, since late onset acne is frequently unresponsive to antibacterials.

Isotretinoin is a toxic drug that should be prescribed only by, or under the supervision of, a consultant dermatologist. It is given for at least 16 weeks; repeat courses are not normally required.

Side-effects of isotretinoin include severe dryness of the skin and mucous membranes, nose bleeds, and joint pains. The drug is teratogenic and must not be given to women of child-bearing age unless they practise effective contraception (oral progestogen-only contraceptives not considered effective) and then only after detailed assessment and explanation by the physician. Women must also be registered with a pregnancy prevention programme (see under Cautions below).

Although a causal link between isotretinoin use and psychiatric changes (including suicidal ideation) has not been established, the possibility should be considered before initiating treatment; if psychiatric changes occur during treatment, isotretinoin should be stopped, the prescriber informed, and specialist psychiatric advice should be sought.

13.6.2 Oral preparations for acne

ISOTRETINOIN

Note Isotretinoin is an isomer of tretinoin

Indications see notes above

Cautions see notes above; also avoid blood donation during treatment and for at least 1 month after treatment; history of depression; monitor all patients for depression; measure hepatic function and serum lipids before treatment, 1 month after starting and then every 3 months (reduce dose or discontinue if transaminase or serum lipids persistently raised); discontinue if uncontrolled hypertriglyceridaemia or pancreatitis; diabetes; dry eye syndrome (associated with risk of keratitis); avoid keratolytics; interactions: Appendix 1 (retinoids)

Pregnancy prevention In women of child-bearing potential, exclude pregnancy up to 3 days before treatment (start treatment on day 2 or 3 of menstrual cycle), every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle. Women should practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progesterone-only contraceptives are not considered effective. Barrier methods should not be used alone, but can be used in conjunction with other contraceptive methods. Each prescription for isotretinoin should be limited to a supply of up to 30 days' treatment and dispensed within 7 days of the date stated on the prescription; repeat prescriptions or fixed prescriptions are not acceptable. Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.

Counselling Warn patient to avoid wax epilation (risk of epidermal stripping), dermabrasion, and laser skin treatments (risk of scarring) during treatment and for at least 6 months after stopping. Patient should avoid exposure to UV light (including sunlight) and use sunscreen and emollient (including lip balm) preparations from the start of treatment.

Contra-indications hypergammaaminotransferase A, hyperlipidaemia

Hepatic impairment avoid—further impairment of liver function may occur

Renal impairment in severe impairment, reduce initial dose (e.g. 10 mg daily) and increase gradually up to 1 mg/kg daily as tolerated

Pregnancy avoid—teratogenic; effective contraception must be used—see Pregnancy Prevention above

Breast-feeding avoid

Side-effects dryness of skin (with dermatitis, scaling, thinning, erythema, pruritus), epidermal fragility (trauma may cause blistering), dryness of lips (sometimes chelitis), dryness of eyes (with blepharitis and conjunctivitis), dryness of pharyngeal mucosa (with hoarseness), dryness of nasal mucosa (with epistaxis), headache, myalgia and arthralgia, raised plasma-triglyceride concentration (risk of pancreatitis if tri-glycerides above 9 mmol/ltre), raised serum-cholesterol concentration (with reduced high-density lipoprotein concentration), raised blood-glucose concentration, raised serum-transaminase concentration, haematuria and proteinuria, thrombocytopenia, thrombocytosis, neutropenia and anaemia; rarely mood changes (depression, aggressive behaviour, anxiety, and very rarely psychosis and suicidal ideation)—expert referral required, skin reactions (including reports of Stevens-Johnson syndrome and toxic epidermal necrolysis), alopecia; very rarely nausea, hepatitis, inflammatory bowel disease, gastrointestinal haemorrhage, haemorrhagic diarrhoea (discontinue treatment), benign intracranial hyper-tension (avoid concomitant tetracyclines), convulsions, malaise, drowsiness, dizziness, diabetes mellitus, lymphadenopathy, hyperuricaemia, glomerulonephritis, tendinitis, arthritis, raised serum-creatinine kinase concentration, bone changes (including reduced bone density, early epiphyseal closure, and skeletal hyperostosis) and calcification of tendons and ligaments (taking long-term treatments); visual disturbances (papilloedema, corneal opacities, cataracts, decreased night vision, photophobia, blurred vision, colour blindness)—expert referral required and consider withdrawal, decreased tolerance to contact lenses, keratitis, impaired hearing, Gram-positive infections of skin and mucous membranes, exacerbation of acne, acne fulminans, allergic vaso-
13.7 Preparations for warts and calluses

Warts (verrucae) are caused by a human papillomavirus, which most frequently affects the hands, feet (plantar warts), and the anogenital region (see below); treatment usually relies on local tissue destruction. Warts may regress on their own and treatment is required only if the warts are painful, unsightly, persistent, or cause distress.

Preparations of salicylic acid, formaldehyde, glutaraldehyde or silver nitrate are available for purchase by the public; they are suitable for the removal of warts on hands and feet. Salicylic acid is a useful keratolytic which may be considered first; it is also suitable for the removal of corns and calluses. Preparations of salicylic acid in a collodion basis are available but some patients may develop an allergy to colophony in the formulation. Cryotherapy causes pain, swelling, and blistering, and may be no more effective than topical salicylic acid in the treatment of warts.

### Salicylic Acid

**Indications**

See under preparations; psoriasis (section 13.5.2); fungal nail infections (section 13.10.2)

**Cautions**

Significant peripheral neuropathy, patients with diabetes at risk of neuropathic ulcers; impaired peripheral circulation; protect surrounding skin and avoid broken skin; not suitable for application to face, anogenital region, or large areas

**Side-effects**

Skin irritation, skin ulceration (with high concentrations)

**Dose**

See under preparations; advise patient to apply carefully to wart and to protect surrounding skin (e.g. with soft paraffin or specially designed plaster); rub wart surface gently with file or pumice stone once weekly; treatment may need to be continued for up to 3 months

**Cuplex® (Crawford)**

*Gel*, salicylic acid 11%, lactic acid 4%, in a collodion basis, net price 5 g = £2.88. Label: 15

**Dose**

For plantar and mosaic warts, corns, and calluses, apply twice daily

**Note**

Contains colophony (see notes above)

**Duofilm® (GSK)**

*Paint*, salicylic acid 16.7%, lactic acid 16.7%, in flexible collodion, net price 15 mL (with applicator) = £2.25. Label: 15

**Dose**

For plantar and mosaic warts, apply daily

**Occlusal® (Alliance)**

*Cutaneous solution*, salicylic acid 26% in polyacrylic solution, net price 10 mL (with applicator) = £3.56. Label: 15

**Dose**

For common and plantar warts, apply daily

**Salactol® (Dermal)**

*Paint*, salicylic acid 16.7%, lactic acid 16.7%, in flexible collodion, net price 10 mL (with applicator) = £1.71. Label: 15

**Dose**

For warts, particularly plantar warts, verrucas, corns, and calluses, apply daily

**Note**

Contains colophony (see notes above)

**Salatac® (Dermal)**

*Gel*, salicylic acid 12%, lactic acid 4% in a collodion basis, net price 8 g (with applicator) = £2.98. Label: 15

**Dose**

For warts, verrucas, corns, and calluses, apply daily

**Verrugon® (Ransom)**

*Ointment*, salicylic acid 50% in a paraffin basis, net price 6 g = £3.12

**Dose**

For plantar warts, apply daily
FORMALDEHYDE

**Indications**  see under preparations

**Cautions**  see under Salicylic Acid

**Side-effects**  see under Salicylic Acid

Veracur® (Typharm)

_Gel, formaldehyde 0.75% in a water-miscible gel basis, net price 15 g = £2.41

**Dose**  for warts, particularly plantar warts, apply twice daily

GLUTARALDEHYDE

**Indications**  warts, particularly plantar warts

**Cautions**  protect surrounding skin; not for application to face, mucosa, or anogenital areas

**Side-effects**  rashes, skin irritation (discontinue if severe); stains skin brown

**Dose**

- Apply twice daily (see also under Salicylic acid)

Glutarol® (Dermal)

_**Solution (= application), glutaraldehyde 10%, net price 10 mL (with applicator) = £2.07**_

SILVER NITRATE

**Indications**  warts, verrucas, umbilical granulomas, over-granulating tissue, cauterisation

**Cautions**  protect surrounding skin and avoid broken skin; not suitable for application to face, ano-genital region, or large areas

**Side-effects**  chemical burns on surrounding skin; stains skin and fabric

**Dose**

- Common warts and verrucas, apply moistened caustic pencil tip for 1–2 minutes; repeat after 24 hours up to max. 3 applications for warts or max. 6 applications for verrucas

  **Note**  Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application

- Umbilical granulomas, apply moistened caustic pencil tip (usually containing silver nitrate 40%) for 1–2 minutes while protecting surrounding skin with soft paraffin

AVOCA® (Bray)

_Caustic pencil, tip containing silver nitrate 40%, potassium nitrate 60%, net price = 94p; silver nitrate 95%, potassium nitrate 5%, treatment pack (including emery file, 6 adhesive dressings and protector pads) = £2.27_

Anogenital warts

The treatment of anogenital warts (condylomata acuminata) should be accompanied by screening for other sexually transmitted infections. Podophyllotoxin (the major active ingredient of podophyllum) may be used for soft, non-keratinised external anogenital warts. Patients with a limited number of external warts or keratinised lesions may be better treated with cryotherapy or other forms of physical ablation.

Imiquimod cream is licensed for the treatment of external anogenital warts; it may be used for both keratinised and non-keratinised lesions. It is also licensed for the treatment of superficial basal cell carcinoma and actinic keratosis (section 13.8.1). Inosine pranobex (section 5.3.2.1) is licensed for adjunctive treatment of genital warts but it has been superseded by more effective drugs.

IMIQUIMOD

**Indications**  see preparations

**Cautions**  avoid contact with eyes, lips, nostrils, or broken skin, and open wounds; not suitable for internal genital warts; uncircumcised males (risk of phimosis or stricture of foreskin); autoimmune disease; immunosuppressed patients

**Breast-feeding**  no information available

**Side-effects**  local reactions (including itching, burning sensation, erythema, erosion, oedema, excoriation, and scabbing); headache; influenza-like symptoms; myalgia; _less commonly_ local ulceration and alopecia; _rarely_ Stevens-Johnson syndrome and cutaneous lupus erythematosus-like effect; _very rarely_ dysuria in women; permanent hypopigmentation or hyperpigmentation reported

**Dose**

- See preparations

Aldara® (Meda)®

_Cream, imiquimod 5%, net price 12-sachet pack = £48.60. Label: 10, patient information leaflet

Excipients  include benzyl alcohol, cetyl alcohol, hydroxybenzoates (parabens), polysorbate 60, stearyl alcohol

Condoms  may damage latex condoms and diaphragms

**Dose**  warts (external genital and perianal), apply thinly 3 times a week at night until lesions resolve (max. 16 weeks); _CHILD_ under 18 years see _BNF for Children_ Superficial basal cell carcinoma, apply to lesion (and 1 cm beyond it) on 5 nights each week for 6 weeks; assess response 12 weeks after completing treatment

Actinic keratosis, apply to lesion 3 times a week at night for 4 weeks; assess response after a 4 week treatment-free interval; repeat 4-week course if lesions persist; max. 2 courses

**Important**  Should be rubbed in and allowed to stay on the treated area for 6–10 hours for warts or for 8 hours for basal cell carcinoma and actinic keratosis, then washed off with mild soap and water (uncircumcised males treating warts under foreskin should wash the area daily). The cream should be washed off before sexual contact

Zyclara® (Meda)®

_Cream, imiquimod 3.75%, net price 28-sachet pack = £113.00. Label: 10, patient information leaflet

Excipients  include benzyl alcohol, cetyl alcohol, hydroxybenzoates (parabens), polysorbate 60, stearyl alcohol

Dose  Actinic keratosis, apply to lesion on face or balding scalp at bedtime for 2 weeks (max. 2 sachets daily); repeat course after a 2-week treatment-free interval; assess response 8 weeks after second course

**Important**  Should be rubbed in and allowed to stay on the treated area for 8 hours, then washed off with mild soap and water

PODOPHYLLOTOXIN

**Indications**  see under preparations

**Cautions**  avoid normal skin and open wounds; keep away from face; very irritant to eyes

**Breast-feeding**  avoid

**Side-effects**  local irritation
13.8 Sunscreens and camouflagers

13.8.1 Sunscreen preparations

Solar ultraviolet irradiation can be harmful to the skin. It is responsible for disorders such as polymorphic light eruption, solar urticaria, and it provokes the various cutaneous porphyrias. It also provokes (or at least aggravates) skin lesions of lupus erythematosus and may aggravate rosacea and some other dermatoses. Certain drugs, such as demeclocycline, phenothiazines, or amiodarone, can cause photosensitivity. All these conditions (as well as sunburn) may occur after relatively short periods of exposure to the sun. Solar ultraviolet irradiation may provoke attacks of recurrent herpes labialis (but it is not known whether the effect of sunlight exposure is local or systemic).

The effects of exposure over longer periods include ageing changes and more importantly the initiation of skin cancer. Solar ultraviolet radiation is approximately 200–400 nm in wavelength. The medium wavelengths (290–320 nm, known as UVB) cause sunburn. The long wavelengths (320–400 nm, known as UVA) are responsible for many photosensitivity reactions and photodermatoses. Both UVA and UVB contribute to long-term photodamage and to the changes responsible for skin cancer and ageing.

Sunscreen preparations contain substances that protect the skin against UVA and UVB radiation, but they are no substitute for covering the skin and avoiding sunlight. The sun protection factor (SPF, usually indicated in the preparation title) provides guidance on the degree of protection offered against UVB; it indicates the multiples of protection provided against burning, compared with unprotected skin; for example, an SPF of 8 should enable a person to remain 8 times longer in the sun without burning. However, in practice, users do not apply sufficient sunscreen product and the protection is lower than that found in experimental studies.

Some manufacturers use a star rating system to indicate the protection against UVA relative to protection against UVB for sunscreen products. However, the usefulness of the star rating system remains controversial. The EU Commission (September 2006) has recommended that the UVA protection factor for a sunscreen should be at least one-third of the sun protection factor (SPF); products that achieve this requirement will be labelled with a UVA logo alongside the SPF classification.

Preparations that also contain reflective substances, such as titanium dioxide, provide the most effective protection against UVA.

Sunscreen preparations may rarely cause allergic reactions.

For optimum photoprotection, sunscreen preparations should be applied thickly and frequently (approximately 2 hourly). In photodermatoses, they should be used from spring to autumn. As maximum protection from sunlight is desirable, preparations with the highest SPF should be prescribed.

The European Commission Cosmetic Products Regulation (EC) 1223/2009 requires the use of INCI (International Nomenclature of Cosmetic Ingredients) for cosmetics and sunscreens. This table includes the rINN and the INCI synonym for the active ingredients of sunscreen preparations in the BNF.

### Borderline substances

‘ACBS’ are regarded as drugs when prescribed for skin protection against ultraviolet radiation in abnormal cutaneous photosensitivity resulting from genetic disorders or photodermatoses, including vitiligo and those...
resulting from radiotherapy; chronic or recurrent herpes simplex labialis. Preparations with SPF less than 30 should not normally be prescribed. See also Appendix 2.

**Anthelios® (L’Oreal Active)**

**XL SPF 50+ Melt-in cream** (UVA and UVB protection; UVB-SPF 50+), avobenzone 3.5%, bemotrizinol 3%, drometrizole trisiloxane 0.5%, ecamsule 1%, octocrylene 2.5%, titanium dioxide 4.2%, net price 50 mL = £3.63. ACBS

Excipients include diosodium edetate, stearyl alcohol

Note For INCI synonyms, see table above

**Sunsense® Ultra** (Crawford)

**Lotion** (UVA and UVB protection; UVB-SPF 50+), octinoxate 6%, enzacamene 4%, avobenzone 2%, oxybenzone 2%, ensulizole 2%, titanium dioxide 3%, net price 50-mL bottle with roll-on applicator = £5.01, 125 mL = £8.14, 500-mL pump pack = £18.17. ACBS

Excipients include butylated hydroxytoluene, cetyl alcohol, fragrance, hydroxybenzoates (parabens), propylene glycol

Note For INCI synonyms, see table above

**Uvistat® (LPC)**

**Cream** (UVA and UVB protection; UVB-SPF 50), avobenzone 5%, bisocitrozile 1.5%, octinoxate 7.5%, octocrylene 4%, titanium dioxide 5.2%, net price 125 mL = £7.45. ACBS

Excipients include diosum edetate, hydroxybenzoates (parabens), propylene glycol

Note For INCI synonyms, see table above

**Sunsense®** (Crawford)

**Lotion** (UVA and UVB protection; UVB-SPF 50), octinoxate 6%, enzacamene 4%, avobenzone 2%, oxybenzone 2%, ensulizole 2%, titanium dioxide 3%, net price 50 mL = £8.45. ACBS

Excipients include diosum edetate, propylene glycol

Note For INCI synonyms, see table above

**Solaraze® (Almirall)**

**Gel**, diclofenac sodium 3% in a sodium hyaluronate basis, net price 50 g = £38.30, 100 g = £76.60

Excipients include benzyl alcohol

### Photodamage

Patients should be advised to use a high-SPF sunscreen and to minimise exposure of the skin to direct sunlight or sun lamps.

Topical treatments can be used for *actinic keratosis*. An *emollient* may be sufficient for mild lesions. *Diclofenac* gel is suitable for the treatment of superficial lesions in mild disease. *Fluorouracil* cream is effective against most types of non-hypertrophic actinic keratosis; a solution containing fluorouracil and salicylic acid is available for the treatment of low or moderately thick hyperkeratotic actinic keratosis. *Imiquimod* (section 13.7) is used for lesions on the face and scalp when cryo therapy or other topical treatments cannot be used. Fluorouracil and imiquimod produce a more marked inflammatory reaction than diclofenac but lesions resolve faster. A short course of *ingenol mebutate* is licensed for the treatment of non-hypertrophic actinic keratosis; response to treatment can usually be assessed 8 weeks after the course. *Photodynamic therapy* in combination with methyl-5-aminolevulinate cream (*Metlix®*, available from Galderma) or 5-aminolaevulinc acid gel (*Ameluz®*), available from Spirit Health-care) is used in specialist centres for treating superficial and confluent, non-hypertrophic actinic keratosis when other treatments are inadequate or unsuitable; it is particularly suitable for multiple lesions, for periorbital lesions, or for lesions located at sites of poor healing. Imiquimod or topical fluorouracil is used for treating superficial basal cell carcinomas. Photodynamic therapy in combination with methyl-5-aminolevulinate cream is used in specialist centres for treating superficial, nodular basal cell carcinomas when other treatments are unsuitable.

### DICLOFENAC SODIUM

**Indications** actinic keratosis

**Cautions** as for topical NSAIDs, see section 10.3.2

**Contra-indications** as for topical NSAIDs, see section 10.3.2

**Side-effects** as for topical NSAIDs, see section 10.3.2; also paraesthesia; application of large amounts may result in systemic effects, see section 10.1

**Dose**

- Apply thinly twice daily for 60–90 days; max. 8 g daily

**Solaraze®**

**Gel**, diclofenac sodium 3% in a sodium hyaluronate basis, net price 50 g = £38.30, 100 g = £76.60

Excipients include benzyl alcohol

### FLUOROURACIL

**Indications** superficial malignant and pre-malignant skin lesions; other malignant disease (section 8.1.3)

**Cautions** avoid contact with eyes and mucous membranes; do not apply to bleeding lesions; caution in handling—irritant to tissues

**Pregnancy** manufacturers advise avoid (teratogenic)

**Breast-feeding** manufacturers advise avoid

**Side-effects** local irritation (use a topical cortico-steroid for severe discomfort associated with inflammatory reactions), photosensitivity, erythema multiforme

**Dose**

- See under preparations

**Efudix® (Meda)**

**Cream**, fluorouracil 5%, net price 40 g = £32.90

Excipients include hydroxybenzoates (parabens), propylene 60, propylene glycol

Dose superficial malignant and pre-malignant skin lesions, apply thinly to the affected area once or twice daily; max. area of skin treated at one time, 500 cm² (e.g. 23 cm x 23 cm); usual duration of initial therapy, 3–4 weeks

Note Alternative regimens may be in use in some settings

**Actikerall** (Almirall)

**Solution**, fluorouracil 0.5%, salicylic acid 10%, net price 25 mL = £38.30. Label: 15

Excipients none as listed in section 13.1.3

Dose low or moderately thick hyperkeratotic actinic keratosis, apply to affected area once daily for up to 12 weeks; if severe side-effects occur, reduce frequency to 3 times a week until side-effects improve, if treating area with thin epidermis, reduce frequency of application and monitor response more often; max. area of skin treated at one time, 25 cm² (e.g. 5 cm x 5 cm)
### INGENOL MEBUTATE

**Indications** see under Dose

**Cautions** avoid contact with eyes, lips, broken skin, or inside of nostrils and ears; avoid occlusive dressings on treated area

**Pregnancy** not absorbed from skin, but manufacturer advises avoid

**Breast-feeding** not absorbed from skin; ensure infant does not come in contact with treated area for 6 hours after application

**Side-effects** local reactions (including erythema, blistering, crusting, erosion, exfoliation, pain, pruritus, oedema, infection), headache; less commonly local ulceration, paraesthesia

**Dose**
- Actinic keratosis on face and scalp, apply 150 micrograms/g gel once daily for 3 days
- Actinic keratosis on trunk and extremities, apply 500 micrograms/g gel once daily for 2 days

**Note** One tube covers skin area of 25cm². Allow gel to dry on treatment area for 15 minutes. Avoid washing or touching the treated area for 6 hours after application; after this time, area may be washed with mild soap and water. Avoid use immediately after shower or less than 2 hours before bedtime.

**Pico®** (LEO)

**Gel** ingeniol mebutate 150 micrograms/g, net price

3 × 0.47-g single-use tubes = £65.00; 500 micrograms/g, 2 × 0.47-g single-use tubes = £65.00

**Excipients** include benzy alcohol

**Note** Flammable

### 13.9 Shampoos and other preparations for scalp and hair conditions

_Dandruff_ is considered to be a mild form of seborrhoeic dermatitis (see also section 13.5.1). Shampoos containing antimicrobial agents such as _pyrithione zinc_ (which are widely available) and _selenium sulfide_ may have beneficial effects. Shampoos containing tar extracts may be useful and they are also used in _psoriasis_. _Ketoconazole_ shampoo should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

_Corticosteroid_ gels and lotions (section 13.4) can also be used.

Shampoos containing _coal tar_ and _salicylic acid_ may also be useful. A cream or an ointment containing coal tar and salicylic acid is very helpful in _psoriasis_ that affects the scalp (section 13.5.2). Patients who do not respond to these treatments may need to be referred to exclude the possibility of other skin conditions.

_Cradle cap_ in infants may be treated with _coconut oil_ or _olive oil_ applications followed by shampooing.

See below for male-pattern baldness and also section 13.5 (psoriasis and eczema), section 13.10.4 (lice), and section 13.10.2 (ringworm).

#### Shampoos

**1. Ketoconazole** (Non-proprietary)

**Cream**—section 13.10.2

**Shampoo**, ketoconazole 2%, net price 120 mL = £3.27

**Excipients** include imidurea

**Brands include** Dandravet® 2% Shampoo, _Nizoral®_

**Dose** ADULT and CHILD over 12 years, treatment of seborrhoeic dermatitis and dandruff apply twice weekly for 2–4 weeks (prophylaxis apply once every 1–2 weeks), treatment of pityriasis versicolor apply once daily for max. 5 days (prophylaxis apply once daily for up to 3 days before sun exposure), leave preparation on for 3–5 minutes before rinsing.

1. Can be sold to the public for the prevention and treatment of dandruff and seborrhoeic dermatitis of the scalp as a shampoo formulation containing ketoconazole max. 2%, in a pack containing max. 120 mL and labelled to show a max. frequency of application of once every 3 days.
Alphosyl 2 in 1® (GSK Consumer Healthcare)
Shampoo, alcoholic coal tar extract 5%, net price
125 mL = £1.89, 250 mL = £4.52
Excipients include hydroxybenzoates (parabens), fragrance
Dose: dandruff, use once or twice weekly as necessary; psoriasis, seborrhoeic dermatitis, scaling and itching, use every 2–3 days

Capasal® (Dermal)
Shampoo, coal tar 1%, coconut oil 1%, salicylic acid 0.5%, net price 250 mL = £4.69
Excipients: none as listed in section 13.1.3
Dose: scaly scalp disorders including psoriasis, seborrhoeic dermatitis, dandruff, and cradle cap, apply daily as necessary

Ceanel Concentrate® (Alliance)
Shampoo, cetrimide 10%, undecenoic acid 1%, net price 150 mL = £3.40, 500 mL = £9.80
Excipients: none as listed in section 13.1.3
Dose: scalp psoriasis, seborrhoeic dermatitis, dandruff, apply 3 times in first week then twice weekly

Dermax® (Dermal)
Shampoo, benzalkonium chloride 0.5%, net price 250 mL = £5.69
Excipients: none as listed in section 13.1.3
Dose: seborrhoeic scalp conditions associated with dandruff and scaling, apply as necessary

Psoriderm® (Dermal)
Scalp lotion (= shampoo), coal tar 2.5%, lecithin 0.3%, net price 250 mL = £4.74
Excipients: include disodium edetate
Dose: scalp psoriasis, use as necessary

Selsun® (Chattem UK)
Shampoo, selenium sulfide 2.5%, net price 50 mL = £1.44, 100 mL = £1.96, 150 mL = £2.75
Excipients include fragrance
Cautions: avoid using 48 hours before or after applying hair colouring, straightening or waving preparations
Dose: scalp psoriasis, seborrhoeic dermatitis and dandruff, apply twice weekly for 2 weeks then once weekly for 2 weeks and then as necessary; CHILD under 5 years not recommended; pityriasis versicolor, section 13.10.2 [unlicensed indication]

T/Gel® (Ikaria)
Shampoo, coal tar extract 2%, net price 125 mL = £3.61, 250 mL = £5.12
Excipients include fragrance, hydroxybenzoates (parabens), imidurea
Dose: scalp psoriasis, seborrhoeic dermatitis, dandruff, apply 2–3 times weekly

Other scalp preparations
Cocos®
Section 13.5.2

Etrivex®
Section 13.4

Polytar® (GSK)
Liquid, tar blend 1%, net price 250 mL = £2.23
Excipients include arachis (peanut) oil, fragrance, imidurea, polysorbate 80
Dose: scalp disorders including psoriasis, seborrhoea, eczema, pruritus, and dandruff, apply 1–2 times weekly

Polytar Plus® (GSK)
Liquid, tar blend 1%, net price 500 mL = £3.91
Excipients include arachis (peanut) oil, fragrance, imidurea, polysorbate 80
Dose: scalp disorders including psoriasis, seborrhoea, pruritus, and dandruff, apply 1–2 times weekly

Sebco®
Section 13.5.2

Hirsutism
Hirsutism may result from hormonal disorders or as a side-effect of drugs such as minoxidil, corticosteroids, anabolic steroids, androgens, danazol, and progestogens.

Weight loss can reduce hirsutism in obese women.

Women should be advised about local methods of hair removal, and in the mildest cases this may be all that is required.

Eflobrinidine, an antiprototol drug, inhibits the enzyme ornithine decarboxylase in hair follicles. Topical eflobrinidine can be used as an adjunct to laser therapy for facial hirsutism in women. Eflobrinidine should be discontinued in the absence of improvement after treatment for 4 months.

Co-xyprindiol (section 13.6.2) may be effective for moderately severe hirsutism. Metformin (section 6.1.2.2) is an alternative in women with polycystic ovary syndrome [unlicensed indication]. Systemic treatment is required for 6–12 months before benefit is seen.

Eflornithine
Indications see notes above
Pregnancy toxicity in animal studies—manufacturer advises avoid
Breast-feeding manufacturer advises avoid—no information available
Side-effects acne, application site reactions including burning and stinging sensation, rash; less commonly abnormal hair texture and growth
Dose
ADULT over 18 years, apply thinly twice daily
Note: Preparation must be rubbed in thoroughly; cosmetics may be applied over treated area 5 minutes after eflornithine; do not wash treated area for 4 hours after application

Vaniqa® (Almirall) (Fel) Cream, eflobrinidine (as hydrochloride monohydrate) 11.5%, net price 60 g = £56.87
Excipients include cetostearyl alcohol, hydroxybenzoates, stearyl alcohol
Note: The Scottish Medicines Consortium has advised (September 2005) that eflornithine for facial hirsutism be restricted for use in women in whom alternative drug treatment cannot be used

Androgenetic alopecia
Finasteride is licensed for the treatment of androgenetic alopecia in men. Continuous use for 3–6 months is required before benefit is seen, and effects are reversed 6–12 months after treatment is discontinued.

Topical application of minoxidil may stimulate limited hair growth in a small proportion of adults but only for as long as it is used.

Finasteride
Indications androgenetic alopecia in men; benign prostatic hyperplasia (section 6.4.2)
Cautions section 6.4.2
Side-effects section 6.4.2
Dose
By mouth 1 mg daily

Propecia® (MSD) Tablets, f/c, beige, finasteride 1 mg, net price 28-tab pack = £26.99, 84-tab pack = £81.55
Skin

Erysipelas wounds are almost always cellulitis. Lower leg infections or infections spreading around the skin and subcutaneous tissue, requires systemic antibacterial treatment (see Table 1, section 5.1).

Cellulitis, a rapidly spreading deeply seated inflammation of the skin and subcutaneous tissue, requires systemic antibacterial treatment (see Table 1, section 5.1). Lower leg infections or infections spreading around wounds are almost always cellulitis. *Erysipelas*, a superficial infection with clearly defined edges (and often affecting the face), is also treated with a systemic antibacterial (see Table 1, section 5.1).

In the community, acute *impetigo* on small areas of the skin may be treated by short-term topical application of fusidic acid; *mupirocin* should be used only to treat meticillin-resistant *Staphylococcus aureus*. If the *impetigo* is extensive or longstanding, an oral antibacterial such as *flucloxacillin* (or *clarithromycin* in penicillin-allergy) (Table 1, section 5.1) should be used. Mild antiseptics (section 13.11) can be used to soften crusts.

Although many antibacterial drugs are available in topical preparations, some are potentially hazardous and frequently their use is not necessary if adequate hygienic measures can be taken. Moreover, not all skin conditions that are oozing, crusted, or characterised by redness, scaling, or pus can be treated. Topical antibacterials should be avoided on *leg ulcers* unless used in short courses for defined infections; treatment of bacterial colonisation is generally inappropriate.

To minimise the development of resistant organisms it is advisable to limit the choice of antibacterials applied topically to those not used systemically. Unfortunately some of these, for example neomycin, may cause sensitisation, and there is cross-sensitivity with other aminoglycoside antibiotics, such as gentamicin. If large areas of skin are being treated, ototoxicity may also be a hazard with aminoglycoside antibiotics (and also with polymyxins), particularly in children, in the elderly, and in those with renal impairment. *Resistant organisms* are more common in hospitals, and whenever possible swabs should be taken for bacteriological examination before beginning treatment.

*Mupirocin* is not related to any other antibacterial in use; it is effective for skin infections, particularly those due to Gram-positive organisms but it is not indicated for pseudomonal infection. Although *Staphylococcus aureus* strains with low-level resistance to mupirocin are emerging, it is generally useful in infections resistant to other antibacterials. To avoid the development of resistance, mupirocin or fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital. In the presence of mupirocin-resistant MRSA infection, a topical antiseptic such as povidone–iodine, chlorhexidine, or alcohol can be used; their use should be discussed with the local microbiologist.

*Retapamulin* can be used for *impetigo* and other superficial bacterial skin infections caused by *Staphylococcus aureus* and *Streptococcus pyogenes* that are resistant to first-line topical antibacterials. However, it is not effective against MRSA. The *Scottish Medicines Consortium* (p. 4) has advised (March 2008) that retapamulin (Altar®) is not recommended for use within NHS Scotland for the treatment of superficial skin infections.

*Silver sulfadiazine* is used in the treatment of infected burns.

### 13.10 Anti-infective skin preparations

#### 13.10.1 Antibacterial preparations

- **Antibacterial preparations only used topically**
- **Antibacterial preparations also used systemically**

*Cellulitis*, a rapidly spreading deeply seated inflammation of the skin and subcutaneous tissue, requires systemic antibacterial treatment (see Table 1, section 5.1). Lower leg infections or infections spreading around wounds are almost always cellulitis. *Erysipelas*, a superficial infection with clearly defined edges (and often affecting the face), is also treated with a systemic antibacterial (see Table 1, section 5.1).

In the community, acute *impetigo* on small areas of the skin may be treated by short-term topical application of fusidic acid; *mupirocin* should be used only to treat meticillin-resistant *Staphylococcus aureus*. If the *impetigo* is extensive or longstanding, an oral antibacterial such as *flucloxacillin* (or *clarithromycin* in penicillin-allergy) (Table 1, section 5.1) should be used. Mild antiseptics (section 13.11) can be used to soften crusts.

Although many antibacterial drugs are available in topical preparations, some are potentially hazardous and frequently their use is not necessary if adequate hygienic measures can be taken. Moreover, not all skin conditions that are oozing, crusted, or characterised by redness, scaling, or pus can be treated. Topical antibacterials should be avoided on *leg ulcers* unless used in short courses for defined infections; treatment of bacterial colonisation is generally inappropriate.

To minimise the development of resistant organisms it is advisable to limit the choice of antibacterials applied topically to those not used systemically. Unfortunately some of these, for example neomycin, may cause sensitisation, and there is cross-sensitivity with other aminoglycoside antibiotics, such as gentamicin. If large areas of skin are being treated, ototoxicity may also be a hazard with aminoglycoside antibiotics (and also with polymyxins), particularly in children, in the elderly, and in those with renal impairment. *Resistant organisms* are more common in hospitals, and whenever possible swabs should be taken for bacteriological examination before beginning treatment.

*Mupirocin* is not related to any other antibacterial in use; it is effective for skin infections, particularly those due to Gram-positive organisms but it is not indicated for pseudomonal infection. Although *Staphylococcus aureus* strains with low-level resistance to mupirocin are emerging, it is generally useful in infections resistant to other antibacterials. To avoid the development of resistance, mupirocin or fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital. In the presence of mupirocin-resistant MRSA infection, a topical antiseptic such as povidone–iodine, chlorhexidine, or alcohol can be used; their use should be discussed with the local microbiologist.

*Retapamulin* can be used for *impetigo* and other superficial bacterial skin infections caused by *Staphylococcus aureus* and *Streptococcus pyogenes* that are resistant to first-line topical antibacterials. However, it is not effective against MRSA. The *Scottish Medicines Consortium* (p. 4) has advised (March 2008) that retapamulin (Altar®) is not recommended for use within NHS Scotland for the treatment of superficial skin infections.

*Silver sulfadiazine* is used in the treatment of infected burns.
impairment because it contains macrogols (polyethylene glycol)

**Pregnancy** manufacturer advises avoid unless potential benefit outweighs risk—no information available

**Breast-feeding** no information available

**Side-effects** local reactions including irritation, urticaria, pruritus, burning sensation, rash

### Dose
- **ADULT** and **CHILD** over 1 year, apply up to 3 times daily for up to 10 days; **CHILD** under 1 year see BNF for Children

Neomycin Cream BPC

- **Ointment**, mupirocin 2%, net price 15 g = £5.36

**Bactroban**

- **Ointment**, mupirocin (as mupirocin calcium) 2%, net price 15 g = £4.38
- **Cream**, mupirocin sulfate 0.5%, cetomacrogol emulsifying ointment 30%, chlorocresol 0.1%, disodium edetate 0.01%, in freshly boiled and cooled purified water, net price 15 g = £2.17
- **Excipients** include cetostearyl alcohol, cetyl alcohol, stearyl alcohol

**SILVER SULFADIAZINE**

#### Indications
- prophylaxis and treatment of infection in burn wounds; as an adjunct to short-term treatment of infection in leg ulcers and pressure sores; as an adjunct to prophylaxis of infection in skin graft donor sites and extensive abrasions; for conservative management of finger-tip injuries

#### Cautions
- G6PD deficiency; may inactivate enzymatic debriding agents—concomitant use may be inappropriate; for large amounts see also interactions: Appendix 1 (sulfonamides)
- Large areas Plasma-sulfadiazine concentrations may approach therapeutic levels with side-effects and interactions as for sulfonamides (see section 5.1.5) if large areas of skin are treated. Owing to the association of sulfonamides with severe blood and skin disorders, treatment should be stopped immediately if blood disorders or rashes develop—but leucopenia developing 2–3 days after starting treatment of burns patients is reported usually to be self-limiting and silver sulfadiazine need not usually be discontinued provided blood counts are monitored carefully to ensure return to normalcy within a few days. Argyria may also occur if large areas of skin are treated (or if application is prolonged).

#### Contra-indications
- sensitivity to sulfonamides; not recommended for neonates
- **Hepatic impairment** manufacturer advises caution if significant impairment; see also Large Areas, above
- **Renal impairment** manufacturer advises caution if significant impairment; see also Large Areas, above
- **Pregnancy** risk of neonatal haemolysis and methaemoglobinemia in third trimester

#### Breast-feeding
- small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants

#### Side-effects
- allergic reactions including burning, itching and rashes; argyria reported following prolonged use; leucopenia reported (monitor blood levels)

Flamazine®

- **Cream**, silver sulfadiazine 1%, net price 20 g = £2.91, 50 g = £3.85, 250 g = £10.32, 500 g = £18.27
- **Excipients** include cetyl alcohol, polysorbates, propylene glycol
- **Dose** burns, apply daily or more frequently if very exudative; leg ulcers or pressure sores, apply daily or on alternate days (not recommended if ulcer very exudative); finger-tip injuries, apply every 2–3 days; consult product literature for details
- **Note** Apply with sterile applicator

13.10.1.2 Antibacterial preparations also used systemically

**Sodium fusidate** is a narrow-spectrum antibacterial used for staphylococcal infections. For the role of sodium fusidate in the treatment of impetigo see p. 816.

**Metronidazole** is used topically for rosacea and to reduce the odour associated with anaerobic infections;
oral metronidazole (section 5.1.11) is used to treat wounds infected with anaerobic bacteria.

Angular cheilitis An ointment containing sodium fusidate is used in the fissures of angular cheilitis when associated with staphylococcal infection. For further information on angular cheilitis, see section 12.3.2.

**FUSIDIC ACID**

**Indications** staphylococcal skin infections; penicillin-resistant staphylococcal infections (section 5.1.7); staphylococcal eye infections (section 11.3.1)

**Cautions** see notes above; avoid contact with eyes

**Side-effects** rarely hypersensitivity reactions

**Dose**

• Apply 3–4 times daily

Fucidin® (Ferndale) 
Cream, fusidic acid 2%, net price 15 g = £1.92, 30 g = £3.59

Excipients include butylated hydroxyanisole, cetyl alcohol

Ointment, sodium fusidate 2%, net price 15 g = £2.23, 30 g = £3.79

Excipients include cetyl alcohol, wool fat

Dental prescribing on NHS May be prescribed as Sodium Fusidate ointment

**METRONIDAZOLE**

**Indications** see preparations; rosacea (see also section 13.6); Helicobacter pylori eradication (section 1.3); anaerobic infections (section 5.1.11 and section 7.2.2); protozoal infections (section 5.4.2)

**Cautions** avoid exposure to strong sunlight or UV light

**Side-effects** skin irritation

**Dose**

• See preparations

Acea® (LEO) 
Cream, metronidazole 0.75%, net price 40 g = £9.95

Excipients include disodium edetate, hydroxybenzoates (parabens), propylene glycol

Dose acute inflammatory exacerbation of rosacea, apply thinly twice daily for 8 weeks

Anabact® (CHS) 
Gel, metronidazole 0.75%, net price 15 g = £4.47, 30 g = £7.89

Excipients include hydroxybenzoates (parabens), propylene glycol

Dose malodorous fungating tumours and malodorous gravitational and decubitus ulcers, apply to clean wound 1–2 times daily and cover with non-adherent dressing

Metrogel® (Galderma) 
Gel, metronidazole 0.75%, net price 40 g = £22.63

Excipients include hydroxybenzoates (parabens), propylene glycol

Dose acute inflammatory exacerbation of rosacea, apply thinly twice daily for 8–9 weeks

Malodorous fungating tumours, apply to clean wound 1–2 times daily and cover with non-adherent dressing

Metrosa® (Linderma) 
Gel, metronidazole 0.75%, net price 40 g = £19.90

Excipients include propylene glycol

Dose acute exacerbation of rosacea, apply thinly twice daily for up to 8 weeks

Rosiced® (Fabre) 
Cream, metronidazole 0.75%, net price 30 g = £7.50

Excipients include propylene glycol

Dose inflammatory papules and pustules of rosacea, apply twice daily for 6 weeks (longer if necessary)

**Rozex® (Galderma)** 
Cream, metronidazole 0.75%, net price 30 g = £6.60, 40 g = £9.88

Excipients include benzyl alcohol, isopropyl palmitate

Gel, metronidazole 0.75%, net price 30 g = £6.60, 40 g = £9.88

Excipients include disodium edetate, hydroxybenzoates (parabens), propylene glycol

Dose inflammatory papules, pustules and erythema of rosacea, apply twice daily for 3–4 months

**Zyomet® (AMCo)** 
Gel, metronidazole 0.75%, net price 30 g = £12.00

Excipients include benzyl alcohol, disodium edetate, propylene glycol

Dose acute inflammatory exacerbation of rosacea, apply thinly twice daily for 8–9 weeks

**13.10.2 Antifungal preparations**

Localised fungal infections are treated with topical preparations. To prevent relapse, local antifungal treatment should be continued for 1–2 weeks after the disappearance of all signs of infection. Systemic therapy (section 5.2) is necessary for scalp infection or if the skin infection is widespread, disseminated, or intractable; although topical therapy may be used to treat some nail infections, systemic therapy (section 5.2) is more effective. Skin scrapings should be examined if systemic therapy is being considered or where there is doubt about the diagnosis.

**Dermatophytes** Ringworm infection can affect the scalp (tinea capitis), body (tinea corporis), groin (tinea cruris), hand (tinea manuum), foot (tinea pedis, athlete’s foot), or nail (tinea unguium). Scalp infection requires systemic treatment (section 5.2); additional application of a topical antifungal, during the early stages of treatment, may reduce the risk of transmission. A topical antifungal can also be used to treat asymptomatic carriers of scalp ringworm. Most other local ringworm infections can be treated adequately with topical antifungal preparations (including shampoos, section 13.9). The imidazole antifungals clotrimazole, econazole, ketoconazole, and miconazole are all effective. Terbinafine cream is also effective but it is more expensive. Other topical antifungals include griseofulvin and the undecenoates. Compound benzoic acid ointment (Whitfield’s ointment) has been used for ringworm infections but it is cosmetically less acceptable than proprietary preparations. Topical preparations for athlete’s foot containing tolnaftate are on sale to the public.

Antifungal dusting powders are of little therapeutic value in the treatment of fungal skin infections and may cause skin irritation; they may have some role in preventing re-infection.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infections of the nails. If treatment is necessary, a systemic antifungal (section 5.2) is more effective than topical therapy. However, topical application of amorolfin or tioconazole may be useful for treating early onychomycosis when involvement is limited to mild distal disease, or for superficial white onychomycosis, or where there are contra-indications to systemic therapy.

**Pityriasis versicolor** Pityriasis (tinea) versicolor can be treated with ketoconazole shampoo (section 13.9). Alternatively, selenium sulfide shampoo [uni-
cialised indication] (section 13.9) can be used as a lotion (diluting with a small amount of water can reduce irritation) and left on the affected area for 10 minutes before rinsing off; it should be applied once daily for 7 days, and the course repeated if necessary.

Topical imidazole antifungals such as clotrimazole, econazole, ketoconazole, or miconazole, or topical terbinafine are alternatives, but large quantities may be required.

If topical therapy fails, or if the infection is widespread, pityriasis versicolor is treated systemically with a triazole antifungal (section 5.2). Relapse is common, especially in the immunocompromised.

Candidiasis Candidal skin infections can be treated with a topical imidazole antifungal, such as clotrimazole, econazole, ketoconazole, or miconazole; topical terbinafine is an alternative. Topical application of nystatin is also effective for candidiasis but it is ineffective against dermatophytosis. Refractory candidiasis requires systemic treatment (section 5.2) generally with a triazole such as fluconazole; systemic treatment with terbinafine is not appropriate for refractory candidiasis.

Angular cheilitis Miconazole cream is used in the fissures of angular cheilitis when associated with Candida. For further information on angular cheilitis, see p. 775.

Compound topical preparations Combination of an imidazole and a mild corticosteroid (such as hydrocortisone 1%) (section 13.4) may be of value in the treatment of eczematous intertrigo and, in the first few days only, of a severely inflamed patch of ringworm. Combination of a mild corticosteroid with either an imidazole or nystatin may be of use in the treatment of intertrigo associated with candida.

Cautions Contact with eyes and mucous membranes should be avoided.

Side-effects Occasional local irritation and hypersensitivity reactions include mild burning sensation, erythema, and itching. Treatment should be discontinued if these are severe.

AMOROLFINE

Indications fungal nail infections

Cautions see notes above; also avoid contact with ears; use with caution in child likely to suck affected digits

Side-effects see notes above

Dose

- Apply to infected nails 1–2 times weekly after filing and cleansing; allow to dry (approx. 3 minutes); treat finger nails for 6 months, toe nails for 9–12 months (review at intervals of 3 months); avoid nail varnish or artificial nails during treatment

Amorolfine (Non-proprietary) (§M)

Nail lacquer, amorolfin (as hydrochloride) 5%, net price 5-mL pack = £14.18, 2 x 2.5-mL pack = £19.53. Label: 10, patient information leaflet

Brands include Ominar®

Note Amorolfin nail lacquer can be sold to the public if supplied for the treatment of mild cases of distal and lateral subungual onychomycoses caused by dermatophytes, yeasts and moulds; subject to treatment of max. 2 nails, max. strength of nail lacquer amorolfin 5% and a pack size of 3 mL

Loceryl® (Galderma) (§M)

Nail lacquer, amorolfin (as hydrochloride) 5%, net price 5-mL pack (with nail files, spatulas, and cleansing swabs) = £9.08. Label: 10, patient information leaflet

Excipients none as listed in section 13.1.3

BENZOIC ACID

Indications ringworm (tinea), but see notes above

Benzoc Acid Ointment, Compound, BP (Whitfield’s ointment)

Ointment, benzoic acid 6%, salicylic acid 3%, in emulsifying ointment

Excipients include cetostearyl alcohol

Dose apply twice daily

CLOTIRMAZOLE

Indications fungal skin infections; vaginal candidiasis (section 7.2.2); otitis externa (section 12.1.1)

Cautions see notes above

Pregnancy minimal absorption from skin; not known to be harmful

Side-effects see notes above

Dose

- Apply 2–3 times daily

Clotrimazole (Non-proprietary)

Cream, clotrimazole 1%, net price 20 g = £1.26

Canesten® (Bayer Consumer Care)

Cream, clotrimazole 1%, net price 20 g = £2.14, 50 g = £3.50

Excipients include benzyl alcohol, cetostearyl alcohol, polysorbate 60

Solution, clotrimazole 1% in macrogol 400 (polyethylene glycol 400), net price 20 mL = £2.30. For hairy areas

Excipients none as listed in section 13.1.3

Spray, clotrimazole 1%, in 30% isopropyl alcohol, net price 40-mL atomiser = £4.72. Label: 15. For large or hairy areas

Excipients include propylene glycol

ECONAZOLE NITRATE

Indications fungal skin infections; vaginal candidiasis (section 7.2.2)

Cautions see notes above

Pregnancy minimal absorption from skin; not known to be harmful

Side-effects see notes above

Dose

- Skin infections apply twice daily; nail infections, apply once daily under occlusive dressing

Pevaryl® (Janssen)

Cream, econazole nitrate 1%, net price 30 g = £3.71

Excipients include butylated hydroxyisole, fragrance

GRESEOFULVIN

Indications tinea pedis; resistant fungal infections (section 5.2.5)

Cautions see notes above

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk

Breast-feeding manufacturer advises avoid unless potential benefit outweighs risk
**13.10.2 Antifungal preparations**

**Side-effects** see notes above

**Dose**
- **D** Apply 400 micrograms (1 spray) to an area approx. 13 cm² once daily, increased to 1.2 mg (3 sprays, allowing each spray to dry between applications) once daily if necessary; max. treatment duration 4 weeks

**Grisol AF** (Transdermal)
- **Spray**, griseofulvin 400 micrograms/metered spray, net price 20-ml (400-dose) spray = £3.35.

**Miconazole**
- **(Non-proprietary)**
  - Apply twice daily continuing for 10 days after lesions have healed.
  - **Dose**
    - **ADULT** over 18 years, tinea pedis, apply twice daily; other fungal infections, apply 1–2 times daily
  - **Nizoral** (Janssen) **(Non-proprietary)**
    - **Cream**, ketoconazole 2%, net price 30 g = £4.24
    - **Exipients** include ceteryl alcohol, polysorbates, propylene glycol, stearyl alcohol
    - **Note** A 15-g tube is available for sale to the public for the treatment of tinea pedis, tinea cruris, and candidal intertrigo

**KETOCONAZOLE**
- **Indications** fungal skin infections; vulval candidiasis (section 7.2.2)
- **Cautions** see notes above
- **Side-effects** see notes above
- **Dose**
  - **ADULT** over 18 years, tinea pedis, apply twice daily; other fungal infections, apply 1–2 times daily

**Nystaform** (Typharm) **(Phm)**
- **Cream**, nystatin 100 000 units/g, chlorhexidine hydrochloride 1%, net price 30 g = £2.62
- **Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbate 60
- **Dose** apply 2–3 times daily continuing for 7 days after lesions have healed.

**SALICYLIC ACID**
- **Indications** fungal nail infections, particularly tinea; hyperkeratotic skin disorders (section 13.5.2); warts and calluses (section 13.7)
- **Cautions** avoid broken or inflamed skin
- **Salicylate toxicity** Salicylate toxicity can occur particularly if applied on large areas of skin
- **Pregnancy** avoid
- **Side-effects** see notes above
- **Dose**
  - **ADULT** and **CHILD** over 5 years, apply twice daily and after washing

**Phytex** (Wynlit) **(Phm)**
- **Paint**, salicylic acid 1.46% (total combined), tannic acid 4.89% and boric acid 3.12% (as borotannic complex), in a vehicle containing alcohol and ethyl acetate, net price 25 ml (with brush) = £2.97
- **Excipients** none as listed in section 13.1.3

**Note** Flammable

**TERBINAFINE**
- **Indications** fungal skin infections
- **Cautions** avoid contact with eyes
- **Pregnancy** manufacturer advises use only if potential benefit outweighs risk—animal studies suggest no adverse effects
- **Breast-feeding** manufacturer advises avoid—present in milk, but less than 5% of the dose is absorbed after topical application of terbinafine; avoid application to mother’s chest
- **Side-effects** see notes above
- **Dose**
  - **Apply thinly 1–2 times daily for up to 1 week in tinea pedis, 1–2 weeks in tinea corporis and tinea cruris, 2 weeks in cutaneous candidiasis and pityriasis versicolor; review after 2 weeks; CHILD** see BNF for Children

**TIOCONAZOLE**
- **Indications** fungal skin infections due to *Candida* spp.; oral fungal infections (section 12.3.2)
- **Cautions** see notes above
- **Side-effects** see notes above

**1.** except for seborrhoeic dermatitis and pityriasis versicolor and endorsed ‘SLS’

**1** Preparations of terbinafine hydrochloride (max. 1%) can be sold to the public for external use for the treatment of tinea pedis as a cutaneous solution in a pack containing max. 15 g, or for the treatment of tinea pedis and cruris as a cream in a pack containing max. 15 g, or for the treatment of tinea pedis, cruris, and corporis as a spray in a pack containing max. 30 mL spray or as a gel in a pack containing max. 30 g gel.
**Side-effects** see notes above; also local oedema, dry skin, nail discoloration, periungual inflammation, nail pain, rash, exfoliation

**Dose**
- Apply to nails and surrounding skin twice daily usually for up to 6 months (may be extended to 12 months)

**Trosyl** (Pfizer)
- Cutaneous solution, tioconazole 28%, net price 12 mL (with applicator brush) = £27.38
- Excipients none as listed in section 13.1.3

**UNDECENOATES**

**Indications** see under preparations below

**Cautions** see notes above; avoid broken skin

**Side-effects** see notes above

**Dose**
- See under preparations below

**Mycota** (Thornton & Ross)
- Cream, zinc undecenoate 20%, undecenoic acid 5%, net price 25 g = £2.01
- Excipients include cetostearyl alcohol, fragrance

- **Dose** treatment of athlete’s foot, apply twice daily continuing for 7 days after lesions have healed
- Prevention of athlete’s foot, apply once daily

**Powder**, zinc undecenoate 20%, undecenoic acid 2%, net price 70 g = £2.71
- Excipients include fragrance

- **Dose** treatment of athlete’s foot, apply twice daily continuing for 7 days after lesions have healed
- Prevention of athlete’s foot, apply once daily

**Spray application**, undecenoic acid 3.9%, dichloro-phen 0.4% (pressurised aerosol pack), net price 100 mL = £2.50
- Excipients include fragrance

- **Dose** treatment of athlete’s foot, apply twice daily continuing for 7 days after lesions have healed
- Prevention of athlete’s foot, apply once daily

**Note** flammable

---

**ACICLOVIR**

**(Acyclovir)**

**Indications** see notes above; herpes simplex and varicella–zoster infections (section 5.3.2.1); eye infections (section 11.3.3)

**Cautions** avoid contact with eyes and mucous membranes

**Pregnancy** not known to be harmful—manufacturers advise use only when potential benefit outweighs risk; limited absorption from topical aciclovir preparations

**Side-effects** transient stinging or burning; occasionally erythema, itching or drying of the skin

**Dose**
- Apply to lesions every 4 hours (5 times daily) for 5–10 days, starting at first sign of attack

**Aciclovir** (Non-proprietary)
- Cream, aciclovir 5%, net price 2 g = £4.15
- Dental prescribing on NHS Aciclovir Cream may be prescribed

**Note** A 2-g tube and a pump pack are on sale to the public for the treatment of cold sores

**Zovirax** (GSK)
- Cream, aciclovir 5%, net price 2 g = £4.63, 10 g = £13.96
- Excipients include cetostearyl alcohol, propylene glycol

**Eye ointment**—section 11.3.3

**Tablets**—section 5.3.2.1

---

**PENCICLOVIR**

**Indications** see notes above

**Cautions** avoid contact with eyes and mucous membranes

**Side-effects** transient stinging, burning, numbness; hypersensitivity reactions also reported

**Vectavir** (Novartis Consumer Health)
- Cream, penciclovir 1%, net price 2 g = £4.20
- Excipients include cetostearyl alcohol, propylene glycol

- **Dose** herpes labialis, apply to lesions every 2 hours during waking hours for 4 days, starting at first sign of attack;
  - **CHILD** under 12 years, not recommended

**Dental prescribing on NHS** May be prescribed as Penciclovir Cream

---

**ACICLOVIR**

**(Acyclovir)**

**Indications** see notes above; herpes simplex and varicella–zoster infections (section 5.3.2.1); eye infections (section 11.3.3)

**Cautions** avoid contact with eyes and mucous membranes

**Pregnancy** not known to be harmful—manufacturers advise use only when potential benefit outweighs risk; limited absorption from topical aciclovir preparations

**Side-effects** transient stinging or burning; occasionally erythema, itching or drying of the skin

**Dose**
- Apply to lesions every 4 hours (5 times daily) for 5–10 days, starting at first sign of attack

**Aciclovir** (Non-proprietary)
- Cream, aciclovir 5%, net price 2 g = £4.15
- Dental prescribing on NHS Aciclovir Cream may be prescribed

**Note** A 2-g tube and a pump pack are on sale to the public for the treatment of cold sores

**Zovirax** (GSK)
- Cream, aciclovir 5%, net price 2 g = £4.63, 10 g = £13.96
- Excipients include cetostearyl alcohol, propylene glycol

**Eye ointment**—section 11.3.3

**Tablets**—section 5.3.2.1

---

**PENCICLOVIR**

**Indications** see notes above

**Cautions** avoid contact with eyes and mucous membranes

**Side-effects** transient stinging, burning, numbness; hypersensitivity reactions also reported

**Vectavir** (Novartis Consumer Health)
- Cream, penciclovir 1%, net price 2 g = £4.20
- Excipients include cetostearyl alcohol, propylene glycol

- **Dose** herpes labialis, apply to lesions every 2 hours during waking hours for 4 days, starting at first sign of attack;
  - **CHILD** under 12 years, not recommended

**Dental prescribing on NHS** May be prescribed as Penciclovir Cream

---

13.10.3 Antiviral preparations

**Aciclovir** cream is licensed for the treatment of initial and recurrent labial and genital *herpes simplex infections*; treatment should begin as early as possible. Systemic treatment is necessary for buccal or vaginal infections and for *herpes zoster* (shingles) (for details of systemic use see section 5.3.2.1).

**Herpes labialis** Aciclovir cream can be used for the treatment of initial and recurrent labial herpes simplex infections (cold sores). It is best applied at the earliest possible stage, usually when prodromal changes of sensation are felt in the lip and before vesicles appear.

**Penciclovir** cream is also licensed for the treatment of herpes labialis; it needs to be applied more frequently than aciclovir cream.

Systemic treatment is necessary if cold sores recur frequently or for infections in the mouth (see p. 423).

---

**ACICLOVIR**

**(Acyclovir)**

**Indications** see notes above; herpes simplex and varicella–zoster infections (section 5.3.2.1); eye infections (section 11.3.3)

---

13.10.4 Parasiticidal preparations

**Suitable quantities of parasiticidal preparations**

These amounts are usually suitable for an adult for single application.

---

**Scabies**

Permethrin is used for the treatment of *scabies* (*Sarcoptes scabiei*); *malathion* can be used if permethrin is inappropriate.

**Benzy1 benzoate** is an irritant and should be avoided in children; it is less effective than malathion and permethrin.

**Ivermectin** (available on a named patient basis from ‘special-order’ manufacturers or specialist importing
companies, see p. 1104) in a dose of 200 micrograms/kg by mouth has been used, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or ‘Norwegian’) scabies that does not respond to topical treatment alone; further doses of 200 micrograms/kg may be required.

**Application** Although acaricides have traditionally been applied after a hot bath, this is not necessary and there is even evidence that a hot bath may increase absorption into the blood, removing them from their site of action on the skin.

All members of the affected household should be treated simultaneously. Treatment should be applied to the whole body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. It is now recommended that malathion and permethrin should be applied twice, one week apart; in the case of benzyl benzoate up to 3 applications on consecutive days may be needed. It is important to warn users to reapply treatment to the hands if they are washed. Patients with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

**Itching** The itch and eczema of scabies persists for some weeks after the infestation has been eliminated and treatment for pruritus and eczema (section 13.5.1) may be required. Application of crotamiton can be used to control itching after treatment with more effective acaricides. A topical corticosteroid may help to reduce absorption into the blood, removing them from their site of action on the skin.

All members of the affected household should be treated simultaneously. Treatment should be applied to the whole body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. It is now recommended that malathion and permethrin should be applied twice, one week apart; in the case of benzyl benzoate up to 3 applications on consecutive days may be needed. It is important to warn users to reapply treatment to the hands if they are washed. Patients with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

**Crab lice**

**Permethrin** and malathion are used to eliminate crab lice (*Pthirus pubis*). An aqueous preparation should be applied, allowed to dry naturally and washed off after 12 hours; a second treatment is needed after 7 days to kill lice emerging from surviving eggs. All surfaces of the body should be treated, including the scalp, neck, and face (paying particular attention to the eyebrows and other facial hair). A different insecticide should be used if a course of treatment fails.

**Benzyl benzoate**

Benzyl benzoate is effective for scabies but is not a first-choice for scabies (see notes above).

**BENZYL BENZOATE**

**Indications** scabies (but see notes above)

**Cautions** children (not recommended, see also under Dose, below), avoid contact with eyes and mucous membranes; do not use on broken or secondarily infected skin

**Breast-feeding** suspend feeding until product has been washed off

**Side-effects** skin irritation, burning sensation especially on genitalia and excoriations, occasionally rashes

**Dose**

- Apply over the whole body; repeat without bathing on the following day and wash off 24 hours later; a third application may be required in some cases

**Note** Not recommended for children—dilution to reduce irritant effect also reduces efficacy. Some manufacturers recommend application to the body but to exclude the head and neck. However, application should be extended to the scalp, neck, face, and ears

**Benzyl Benzoate Application, BP (Non-proprietary)**

**Application**, benzyl benzoate 25% in an emulsion basis, net price 500 mL = £2.50

**Dimeticone**

Dimeticone coats head lice and interferes with water balance in lice by preventing the excretion of water; it is less active against eggs and treatment should be repeated after 7 days.

**DIMETICONE**

**Indications** head lice

**Cautions** avoid contact with eyes; children under 6 months, medical supervision required

**Side-effects** skin irritation

**Dose**

- Rub into dry hair and scalp, allow to dry naturally, shampoo after minimum 8 hours (or overnight); repeat application after 7 days

**Hedrin® (Thornton & Ross)**

**Lotion**, dimeticone 4%. net price 50 mL = £2.98, 120 mL spray pack = £7.13, 150 mL = £6.92

**Note** Patients should be told to keep hair away from fire and flames during treatment
Malathion

Malathion is recommended for scabies, head lice and crab lice (for details see notes above).

The risk of systemic effects associated with 1–2 applications of malathion is considered to be very low; however, applications of malathion liquid repeated at intervals of less than 1 week or application for more than 3 consecutive weeks should be avoided since the likelihood of eradication of lice is not increased.

MALATHION

Indications see notes above and under preparations

Cautions avoid contact with eyes; do not use on broken or secondarily infected skin; children under 6 months, medical supervision required

Side-effects skin irritation and hypersensitivity reactions; chemical burns also reported

Dose
- Head lice, rub 0.5% preparation into dry hair and scalp, allow to dry naturally, remove by washing after 12 hours (see also notes above); repeat application after 7 days
- Crab lice, apply 0.5% aqueous preparation over whole body, allow to dry naturally, wash off after 12 hours or overnight; repeat application after 7 days
- Scabies, apply 0.5% preparation over whole body, and wash off after 24 hours; if hands are washed with soap within 24 hours, they should be retreated; see also notes above; repeat application after 7 days

Note For scabies, manufacturer recommends application to the body but not necessarily to the head and neck. However, application should be extended to the scalp, neck, face, and ears

Derbac-M® (SSL)

Liquid, malathion 0.5% in an aqueous basis, net price 50 mL = £3.05, 200 mL = £7.33

Excipients include cetostearyl alcohol, fragrance, hydroxybenzoates (parabens)

For crab lice, head lice, and scabies

Permethrin

Permethrin is effective for scabies and crab lice (for details see notes above). Permethrin is active against head lice but the formulation and licensed methods of application of the current products make them unsuitable for the treatment of head lice.

PERMETHRIN

Indications see notes above and under Dose

Cautions avoid contact with eyes; do not use on broken or secondarily infected skin; children under 6 months, medical supervision required for cream rinse (head lice); children aged 2 months–2 years, medical supervision required for dermal cream (scabies)

Side-effects pruritus, erythema, and stinging; rarely rashes and oedema

Dose
- Scabies, apply 5% preparation over whole body and wash off after 8–12 hours; CHILD (see also Cautions, above) apply over whole body including face, neck, scalp and ears; if hands washed with soap within 8 hours of application, they should be treated again with cream (see notes above); repeat application after 7 days

Note Manufacturer recommends application to the body but to exclude head and neck. However, application should be extended to the scalp, neck, face, and ears

Larger patients may require up to two 30-g packs for adequate treatment
- Crab lice, ADULT over 18 years, apply 5% cream over whole body, allow to dry naturally and wash off after 12 hours or after leaving on overnight; repeat application after 7 days

Permethrin (Non-proprietary)

Cream, permethrin 5%, net price 30 g = £6.96

Lyclear® Creme Rinse (Omega Pharma)

Cream rinse, permethrin 1% in basis containing isopropyl alcohol 20%, net price 59 mL = £3.55, 2 x 59-mL pack = £6.46

Excipients include cetyl alcohol

Dose head lice, not recommended, therefore no dose stated (insufficient contact time)

Lyclear® Dermal Cream (Omega Pharma)

Dermal cream, permethrin 5%, net price 30 g = £5.71. Label: 10, patient information leaflet

Excipients include butylated hydroxytoluene, wool fat derivative

13.10.5 Preparations for minor cuts and abrasions

Some of the preparations listed are used in minor burns, and abrasions. They are applied as necessary but should not be used on large wounds or for prolonged periods because of the possibility of hypersensitivity. The effervescent effect of hydrogen peroxide (section 13.11.6) is used to clean minor cuts and abrasions. Preparations containing camphor and sulfonamides should be avoided. Preparations such as magnesium sulfate paste are also listed but are now rarely used to treat carbuncles and boils as these are best treated with antibiotics (section 5.1.1.2).

Cetrimide Cream, BP

Cream, cetrimide 0.5% in a suitable water-miscible basis such as cetostearyl alcohol 5%, liquid paraffin 50% in freshly boiled and cooled purified water, net price 50 g = £1.11

Proflavine Cream, BPC

Cream, proflavine hemisulfate 0.1%, yellow beeswax 2.5%, chlorocresol 0.1%, liquid paraffin 67.3%, freshly boiled and cooled purified water 25%, wool fat 5%, net price 100 mL = £2.40

Excipients include beeswax, wool fat

Note Stains clothing

Magnesium Sulfate Paste, BP

Paste, dried magnesium sulfate 45 g, glycerol 55 g, phenol 500 mg, net price 25 g = 97p, 50 g = £1.93

Note Should be stirred before use

Dose apply under dressing

Preparations for boils

Magnesium Sulfate Paste, BP
**13.11 Skin cleansers, antiseptics, and desloughing agents**

**Alcohols and saline**

**SODIUM CHLORIDE**

**Indications** see notes above; nebuliser diluent (section 3.1.5); sodium depletion (section 9.2.1.2); electrolyte imbalance (section 9.2.2.1); eye (section 11.8.1); oral hygiene (section 12.3.4)

**Solution** 120-mL Bellows Pack = £1.53

**Irriclen®** (Convatec)

**Solution** in aerosol can (sterile), sodium chloride 0.9%, net price 240-mL can = £3.46

**Iripod®** (C D Medical)

**Solution** (sterile), sodium chloride 0.9%, net price 25 x 20-mL unit = £4.95, 200-mL can = £2.65, 1 litre = 80p

**Miniversol®** (Aguettant)

**Solution** (sterile), sodium chloride 0.9%, net price 30 x 45-mL unit = £13.20; 30 x 100-mL unit = £19.50

**Normasol®** (Mölndlycke)

**Solution** (sterile), sodium chloride 0.9%, net price 25 x 25-mL sachet = £6.36; 10 x 100-mL sachet = £7.73
Stericlen® (C D Medical)  
**Solution** in aerosol can (sterile), sodium chloride 0.9%, net price 100-mL can = £2.06, 240-mL can = £3.13

Steripod® Sodium Chloride (Medlock)  
**Solution** (sterile), sodium chloride 0.9%, net price 25 x 20-mL sachet = £7.84

---

### 13.11.2 Chlorhexidine salts

#### CHLORHEXIDINE

**Indications** see under preparations; bladder irrigation and catheter patency solutions (see section 7.4.4)

**Cautions** avoid contact with eyes, brain, meninges and middle ear; not for use in body cavities; alcoholic solutions not suitable before diathermy

**Side-effects** occasional sensitivity

**Chlorhexidine 0.05%** (Baxter)  
**2000 Solution** (sterile), pink, chlorhexidine acetate 0.05%, net price 1000 mL = 77p

For cleansing and disinfecting wounds and burns

**Cepton®** (LPC)  
**Skin wash** (= solution), red, chlorhexidine gluconate 1%, net price 150 mL = £3.64

For use as skin wash in acne

**Lotion**, blue, chlorhexidine gluconate 0.1%, net price 150 mL = £2.48

For skin disinfection in acne

**Chloraprep®** (CareFusion)  
**Cutaneous solution**, sterile, chlorhexidine gluconate 2% in isopropyl alcohol 70%, net price (all with single applicator) 0.67 mL (with SEPP® applicator) = 30p, 1.5 mL (with FREPP® applicator) = 55p, 1.5 mL = 55p, 3 mL = 85p, 10.5 mL = £2.92, 26 mL = £6.93 (all with single applicator, with tint) 3 mL = 89p, 10.5 mL = £3.07, 26 mL = £6.83

For skin disinfection before invasive procedures; CHILD under 2 months, not recommended

**Note** Flammable

**CX Antiseptic Dusting Powder®** (Ecolab)  
**Dusting powder** sterile, chlorhexidine acetate 1%, net price 15 g = £3.93

For skin disinfection

**Hibiscrub®** (Mölnlycke)  
**Cleansing solution**, red, chlorhexidine gluconate 4%, perfumed, in a surfactant solution, net price 250 mL = £4.25, 500 mL = £5.25, 5 litres = £24.00

**Excipients** include fragrance

Use instead of soap for pre-operative hand and skin preparation and for general hand and skin disinfection

**Hibi® Liquid Hand Rub+** (Mölnlycke)  
**Solution**, chlorhexidine gluconate 0.5%, in isopropyl alcohol 70%, net price 500 mL = £5.25

To be used undiluted for hand and skin disinfection

**Hibitane Obstetric®** (Derma UK)  
**Cream**, chlorhexidine gluconate solution 5% (≡ 1% chlorhexidine gluconate), in a pourable water-miscible basis, net price 250 mL = £9.00

For use in obstetrics and gynaecology as an antiseptic and lubricant (for application to skin around vulva and perineum and to hands of midwife or doctor)

---

### 13.11.3 Cationic surfactants and soaps

#### CETRIMIDE

**Indications** skin disinfection

**Cautions** avoid contact with eyes; avoid use in body cavities

**Side-effects** skin irritation and occasionally sensitisation

**Preparations** skin irritation and occasionally sensitisation

**Ingredient of Tisept® and Travasept® 100**, see above

---

### 13.11.4 Iodine

#### POVIDONE–IODINE

**Indications** skin disinfection

**Cautions** broken skin (see below)

**Large open wounds** The application of povidone–iodine to large wounds or severe burns may produce systemic adverse effects such as metabolic acidosis, hypernatraemia and impairment of renal function.

**Contra-indications** corrected gestational age under 32 weeks; avoid regular use in patients with thyroid disorders or those receiving lithium therapy

**Renal impairment** avoid regular application to inflamed or broken mucosa

**Pregnancy** sufficient iodine may be absorbed to affect the fetal thyroid in the second and third trimester
Breast-feeding avoid
Side-effects rarely sensitivity; may interfere with thyroid function tests

Betadine® (Ayrton Saunders)
Dry powder spray, povidone–iodine 2.5% in a pressurised aerosol unit, net price 150-g unit = £2.63
For skin disinfection, particularly minor wounds and infections. CHILD under 2 years not recommended
Note Not for use in serous cavities

Savlon® Dry (Novartis Consumer Health)
Powder spray, povidone–iodine 1.14% in a pressurised aerosol unit, net price 50-mL unit = £2.51
For minor wounds

Videne® (Ecolab)
Alcoholic tincture, povidone–iodine 10%, net price 500 mL = £5.43
To be applied undiluted in pre-operative skin disinfection

Antiseptic solution, povidone–iodine 10% in aqueous solution, net price 500 mL = £5.43
To be applied undiluted in pre-operative skin disinfection and general antisepsis

Surgical scrub, povidone–iodine 7.5% in aqueous solution, net price 500 mL = £5.43
To be used as a pre-operative scrub for hand and skin disinfection

13.11.5 Phenolics
Triclosan has been used for disinfection of the hands and wounds, and for disinfection of the skin before surgery.

13.11.6 Oxidisers and dyes

HYDROGEN PEROXIDE
Indications see under preparations below
Cautions large or deep wounds; avoid on healthy skin and eyes; bleaches fabric; incompatible with products containing iodine or potassium permanganate

Hydrogen Peroxide Solution, BP
Solution 6% (20 vols), net price 200 mL = 54p
Solution 3% (10 vols), net price 200 mL = 53p
For skin disinfection, particularly cleansing and deodorising wounds and ulcers
Note The BP directs that when hydrogen peroxide is prescribed, hydrogen peroxide solution 6% (20 vols) should be dispensed.
Important Strong solutions of hydrogen peroxide which contain 27% (90 vols) and 30% (100 vols) are only for the preparation of weaker solutions

Crystacide® (Derma UK)
Cream, hydrogen peroxide 1%, net price 25 g = £8.07, 40 g = £11.62
Excipients include edetic acid (EDTA), propylene glycol
Dose superficial bacterial skin infection, apply 2–3 times daily for up to 3 weeks

POTASSIUM PERMANGANATE
Indications cleansing and deodorising suppurating eczematous reactions and wounds
Cautions irritant to mucous membranes
Dose
• Wet dressings or baths, approx. 0.01% solution
Note Stains skin and clothing

Potassium Permanganate Solution
Solution, potassium permanganate 0.1% (1 in 1000) in water
Dose to be diluted 1 in 10 to provide a 0.01% (1 in 10 000) solution

Permitabs® (Alliance)
Solution tablets, for preparation of topical solution, potassium permanganate 400 mg, net price 30-tab pack = £14.59
Note 1 tablet dissolved in 4 litres of water provides a 0.01% (1 in 10 000) solution

13.11.7 Desloughing agents
Alginate, hydrogel and hydrocolloid dressings (Appendix 5) are effective at wound debridement. Sterile larvae (maggots) (available from BioMonde) are also used for managing sloughing wounds and are prescribable on the NHS.
Desloughing solutions and creams are of little clinical value. Substances applied to an open area are easily absorbed and perilesional skin is easily sensitised; gravitational dermatitis may be complicated by superimposed contact sensitivity to substances such as neo-mycin or lanolin.
For further information on wound management products see Appendix 5, p. 1061.

13.12 Antiperspirants
Aluminium chloride is a potent antiperspirant used in the treatment of hyperhidrosis. Aluminium salts are also incorporated in preparations used for minor fungal skin infections associated with hyperhidrosis.
In more severe cases specialists use glycopyrronium bromide as a 0.05% solution in the iontophoretic treatment of hyperhidrosis of plantar and palmar areas. Botox® contains botulinum toxin type A complex and is licensed for use intradermally for severe hyperhidrosis of the axillae unresponsive to topical antiperspirant or other antihidrotic treatment (section 4.9.3).

ALUMINIUM SALTS
Indications see under Dose below
Cautions avoid contact with eyes or mucous membranes; avoid on broken or irritated skin; do not shave axillae or use depilatories within 12 hours of application; avoid contact with clothing
Side-effects skin irritation

Dose
• Hyperhidrosis affecting axillae, hands or feet, apply liquid formulation at night to dry skin, wash off the following morning, initially daily then reduce frequency as condition improves—do not bathe immediately before use
• Hyperhidrosis, bromhidrosis, intertrigo, and prevention of tinea pedis and related conditions, apply powder to dry skin

Anhydrol® Forte (Dermal)
Solution (=application), aluminium chloride hexahydrate 20% in an alcoholic basis, net price 60-mL bottle with roll-on applicator = £2.51. Label: 15
Excipients none as listed in section 13.1.3
Driclor® (Stiefel)
Application, aluminium chloride hexahydrate 20% in an alcoholic basis, net price 75-mL bottle with roll-on applicator = £3.01. Label: 15
Excipients none as listed in section 13.1.3
Note A 30-mL pack is on sale to the public

ZeaSORB® (Stiefel)
Dusting powder, aldioxa 0.22%, chloroxylenol 0.5%, net price 50 g = £2.61
Excipients include fragrance

GLYCOPYRRONIUM BROMIDE

Indications iontophoretic treatment of hyperhidrosis; drying secretions (see Prescribing in Palliative Care, p. 21); maintenance treatment of chronic obstructive pulmonary disease (section 3.1.2); other indications, see section 15.1.3

Cautions see notes (Antimuscarinics) in section 1.2 (but poorly absorbed and systemic effects unlikely)

Contra-indications see notes (Antimuscarinics) in section 1.2 (but poorly absorbed and systemic effects unlikely); also infections affecting the treatment site

Side-effects see notes (Antimuscarinics) in section 1.2 (but poorly absorbed and systemic effects unlikely); also tingling at administration site

Dose
• Consult product literature; only 1 site to be treated at a time, max. 2 sites treated in any 24 hours, treatment not to be repeated within 7 days

Robinul® (AMCo)
Powder, glycopyrronium bromide, net price 3 g = £266.00

13.13 Topical circulatory preparations

These preparations are used to improve circulation in conditions such as bruising, superficial thrombophlebitis, chilblains and varicose veins but are of little value. Chilblains are best managed by avoidance of exposure to cold; neither systemic nor topical vasodilator therapy is established as being effective. Sclerotherapy of varicose veins is described in section 2.13.

Rubefacients are described in section 10.3.2.

Hirudoid® (Genus)
Cream, heparinoid 0.3% in a vanishing-cream basis, net price 50 g = £3.99
Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)
Gel, heparinoid 0.3%, net price 50 g = £3.99
Excipients include propylene glycol, fragrance
Dose apply up to 4 times daily in superficial soft-tissue injuries and superficial thrombophlebitis
14 Immunological products and vaccines

14.1 Active immunity

Active immunity can be acquired by natural disease or by vaccination. Vaccines stimulate production of antibodies and other components of the immune mechanism; they consist of either:

1. a live attenuated form of a virus (e.g. measles, mumps and rubella vaccine) or bacteria (e.g. BCG vaccine), or
2. inactivated preparations of the virus (e.g. influenza vaccine) or bacteria, or
3. detoxified exotoxins produced by a micro-organism (e.g. tetanus vaccine), or
4. extracts of a micro-organism, which may be derived from the organism (e.g. pneumococcal vaccine) or produced by recombinant DNA technology (e.g. hepatitis B vaccine).

Live attenuated vaccines usually produce a durable immunity, but not always as long-lasting as that resulting from natural infection.

Inactivated vaccines may require a primary series of injections of vaccine to produce an adequate antibody response, and in most cases booster (reinforcing) injections are required; the duration of immunity varies from months to many years. Some inactivated vaccines are adsorbed onto an adjuvant (such as aluminium hydroxide) to enhance the antibody response.

Advice in this chapter reflects that in the handbook Immunisation against Infectious Disease (2006), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI).

Chapters from the handbook are available at www.immunisation.dh.gov.uk

The advice in this chapter also incorporates changes announced by the Chief Medical Officer and Health Department Updates.

Cautions Most individuals can safely receive the majority of vaccines. Vaccination may be postponed if the individual is suffering from an acute illness; however, it is not necessary to postpone immunisation in patients with minor illnesses without fever or systemic upset. See also Predisposition to Neurological Problems, below. For individuals with bleeding disorders, see Route of Administration, below. If alcohol or disinfectant is used for cleansing the skin it should be allowed to evaporate before vaccination to prevent possible inactivation of live vaccines.

When 2 or more vaccines are required (and are not available as a combined preparation), they should be given simultaneously at different sites, preferably in a different limb; if more than one injection is to be given in the same limb, they should be administered at least 2.5 cm apart (but see also BCG Vaccines, p. 832). When 2 live vaccines cannot be given at the same time, they should be separated by an interval of at least 4 weeks. For interactions see Appendix 1 (vaccines).

See also Cautions under individual vaccines.

Contra-indications Vaccines are contra-indicated in those who have a confirmed anaphylactic reaction to a preceding dose of a vaccine containing the same antigens or vaccine component (such as antibacterials in viral vaccines). The presence of the following excipients in vaccines and immunological products has been noted under the relevant entries:

Hypersensitivity to egg Individuals with evidence of previous anaphylactic reaction to egg should not be given tick-borne encephalitis vaccine, and yellow fever vaccine should only be considered under the guidance of a specialist. Individuals with a history of egg allergy can be immunised with either an egg free influenza vaccine, if available, or an influenza vaccine with an ovalbumin content less than 120 nanograms/mL (facilities should be available to treat anaphylaxis). If an influenza vaccine containing ovalbumin is being considered in those with a history of anaphylaxis to egg or egg allergy with uncontrolled asthma, these individuals should be referred to a specialist in hospital. See also Cautions under MMR vaccine.

See also Vaccines and HIV infection, below.

Live vaccines may be contra-indicated temporarily in individuals who are:

- immunosuppressed (see Impaired Immune Response, below);
- pregnant (see Pregnancy and Breast-feeding, below).

See also Contra-indications under individual vaccines.

Impaired immune response Immune response to vaccines may be reduced in immunosuppressed patients and there is also a risk of generalised infection with live vaccines. Severely immunosuppressed patients should not be given live vaccines (including those with severe primary immunodeficiency). Specialist advice should be sought for those being treated with high doses of corticosteroids (dose equivalents of prednisolone: 1. Click the download button below to save the text. 2. Open the downloaded file and view the plain text. 3. You can now edit, copy, and paste the text as needed.
Post-immunisation pyrexia in infants
The parent should be advised that if pyrexia develops after childhood immunisation, and the infant seems distressed, a dose of paracetamol can be given and, if necessary, a second dose can be given 4–6 hours later. Ibuprofen can be used if paracetamol is unsuitable, but if a second dose of ibuprofen is required, it is given 6 hours after the first dose. The parent should be warned to seek medical advice if the pyrexia persists.

For post-immunisation pyrexia in an infant aged 2–3 months, the dose of paracetamol is 60 mg; the dose of ibuprofen is 50 mg (on a doctor’s advice). An oral syringe can be obtained from any pharmacy to give the small volume required.

Predisposition to neurological problems
When there is a personal or family history of febrile convulsions, there is an increased risk of these occurring during fever from any cause including immunisation, but this is not a contra-indication to immunisation. In children who have had a seizure associated with fever without neurological deterioration, immunisation is recommended; advice on the management of fever (see Post-immunisation pyrexia in infants, above) should be given before immunisation. When a child has had a convulsion not associated with fever, and the neurological condition is not deteriorating, immunisation is recommended. Children with stable neurological disorders (e.g. spina bifida, congenital brain abnormality, and perinatal hypoxic-ischaemic encephalopathy) should be immunised according to the recommended schedule. When there is a still evolving neurological problem, including poorly controlled epilepsy, immunisation should be deferred and the child referred to a specialist. Immunisation is recommended if a cause for the neurological disorder is identified. If a cause is not identified, immunisation should be deferred until the condition is stable.

Further information on adverse effects associated with specific vaccines can be found under individual vaccines.

Vaccines and HIV infection
HIV-positive individuals with or without symptoms can receive the following live vaccines:
- MMR (but avoid if immunity significantly impaired), varicella-zoster vaccine against chickenpox (but avoid if immunity significantly impaired—consult product literature)
- BCG, influenza nasal spray (unless stable HIV infection and receiving antiretroviral therapy), typhoid (oral), yellow fever

Note
The advice above differs from that for other immunocompromised patients. Imunisation Guidelines for HIV-infected Adults issued by British HIV Association (BHIVA) are available at www.bhiva.org and, Immunisation of HIV-infected Children issued by Children’s HIV Association (CHIVA) are available at www.chiva.org.uk

1. Live vaccines should be postponed until at least 3 months after stopping high-dose systemic corticosteroids and at least 6 months after stopping other immunosuppressive drugs or generalised radiotherapy (at least 12 months after discontinuing immunosuppressants following bone-marrow transplantation).
2. Use of normal immunoglobulin should be considered after exposure to measles (see p. 853) and varicella–zoster immunoglobulin considered after exposure to chickenpox or herpes zoster (see p. 855).
Vaccines for the childhood immunisation schedule should be obtained from local health organisations or from ImmForm (www.immform.dh.gov.uk) — not to be prescribed on FP10 (HS21 in Northern Ireland, GP10 in Scotland, WP10 in Wales).

Preterm birth
Babies born preterm should receive all routine immunisations based on their actual date of birth. The risk of apnoea following vaccination is increased in preterm babies, particularly in those born at or before 28 weeks gestational age. If babies at risk of apnoea are in hospital at the time of their first immunisation, they should be monitored for 48 hours after immunisation. If a baby develops apnoea, bradycardia, or desaturation after the first immunisation, the second immunisation should also be given in hospital with similar monitoring. Seroconversion may be unreliable in babies born earlier than 28 weeks’ gestation or in babies treated with corticosteroids for chronic lung disease; consideration should be given to testing for antibodies against Haemophilus influenzae type b, meningococcal C, and hepatitis B after primary immunisation.

When to immunise (for preterm infants—see note above)

  First dose  
• Rotavirus vaccine  
  Second dose |
| 4 months | • Diphtheria, Tetanus, Pertussis (Acellular, Component), Poliomyelitis (Inactivated), and Haemophilus Type b Conjugate Vaccine (Adsorbed)  
  Third dose  
• Pneumococcal Polysaccharide Conjugate Vaccine (Adsorbed)  
  Second dose |
| 12–13 months | • Measles, Mumps and Rubella Vaccine, Live (MMR)  
  First dose  
• Pneumococcal Polysaccharide Conjugate Vaccine (Adsorbed)  
  Single booster dose  
• Haemophilus Type b Conjugate Vaccine and Meningococcal Group C Conjugate Vaccine  
  Single booster dose |
| Between 3 years and 4 months, and 5 years | • Adsorbed Diphtheria [low dose], Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine  
  or  
• Adsorbed Diphtheria, Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine  
  Single booster dose  
  Note: Preferably allow interval of at least 3 years after completing primary course  
• Measles, Mumps and Rubella Vaccine, Live (MMR)  
  Second dose |
| 11–14 years (females only) | • Human Papillomavirus Vaccine  
  2 doses; second dose 12 months after first dose  
2,3 |
| 13–15 years | • Meningococcal Group C Conjugate Vaccine  
  Single booster dose |
| 13–18 years | • Adsorbed Diphtheria [low dose], Tetanus, and Poliomyelitis (Inactivated) Vaccine  
  Single booster dose  
  Note: Can be given at the same time as the booster dose of meningococcal group C conjugate vaccine at 13–15 years of age |
| During adult life, women of child-bearing age susceptible to rubella | • Measles, Mumps and Rubella Vaccine, Live (MMR)  
  Women of child-bearing age who have not received 2 doses of a rubella-containing vaccine or who do not have a positive antibody test for rubella should be offered rubella immunisation (using the MMR vaccine)—exclude pregnancy before immunisation, but see also section 14.4, Measles, Mumps and Rubella Vaccine |

1. First dose of HPV vaccine will be offered to females aged 12–13 years of age in England, Wales, and Northern Ireland, and 11–14 years of age in Scotland.
2. If a 3-dose course of HPV vaccine has been started under the 2013/2014 programme, where possible, the course should be completed.
3. The two human papillomavirus vaccines are not interchangeable and, ideally, one vaccine product should be used for the entire course. However, for those females who started the schedule with Cervarix® under the national immunisation programme, but did not complete the vaccination course, the course can be completed with Gardasil®.
Vaccines and asplenia

The following vaccines are recommended for asplenic patients or those with splenic dysfunction:

- *Haemophilus influenzae* type b; influenza; meningococcal A, C, W135, and Y conjugate; pneumococcal.

For antibiotic prophylaxis in asplenia see p. 357.

**Route of administration**

Vaccines should not be given intravenously. Most vaccines are given by the intramuscular route, although some are given by either the intradermal, deep subcutaneous, or oral route. The intramuscular route should not be used in patients with bleeding disorders such as haemophilia or thrombocytopenia, vaccines usually given by the intramuscular route should be given by deep subcutaneous injection instead.

**Note**

The Department of Health has advised against the use of jet guns for vaccination owing to the risk of transmitting blood-borne infections, such as HIV.

### High-risk groups

For information on high-risk groups, see section 14.4 under individual vaccines

- **BCG Vaccines**
- **Hepatitis A Vaccine**
- **Hepatitis B Vaccine**
- **Influenza Vaccine**
- **Pneumococcal Vaccines**
- **Tetanus Vaccines**

### 14.2 Passive immunity

Immunity with immediate protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought (see under Immunoglobulins, section 14.5). The duration of this passive immunity varies according to the dose and the type of immunoglobulin.

Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated.

Antibodies of human origin are usually termed *immunoglobulins*. The term *antiserum* is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antiserum, this therapy has been replaced wherever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins but reports of such reactions are very rare.

### 14.3 Storage and use

Care must be taken to store all vaccines and other immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many vaccines and immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Vaccines and immunoglobulins should be protected from light. Reconstituted vaccines and opened multidose vials must be used within the period recommended in the product literature. Unused vaccines should be disposed of by incineration at a registered disposal contractor.

Particular attention must be paid to instructions on the use of diluents. Vaccines which are liquid suspensions or are reconstituted before use should be adequately mixed to ensure uniformity of the material to be injected.

### 14.4 Vaccines and antisera

**Availability**

Anthrax and yellow fever vaccines, botulinum antitoxin, diphtheria antitoxin, and snake and spider venom antitoxins are available from local designated holding centres.

For antivenom, see Emergency Treatment of Poisoning, p. 43.

Enquiries for vaccines not available commercially can also be made to:

- Vaccines and Countermeasures Response Department
  Public Health England
  Wellington House
  133–155 Waterloo Road
  London, SE1 8UG
  vaccinesupply@phe.gov.uk

In Scotland information about availability of vaccines can be obtained from a Specialist in Pharmaceutical Public Health.

In Wales enquiries for vaccines not available commercially should be directed to:

- Welsh Medicines Information Centre
  University Hospital of Wales
  Cardiff, CF14 4XW
  Tel: (029) 2074 2979
In Northern Ireland:
Pharmacy and Medicines Management Centre
Beech House
Antrim Hospital Site
Northern Health and Social Care Trust
Bush Road
Antrim, BT41 2RL
rphps.admin@northerntrust.hscni.net
For further details of availability, see under individual vaccines.

**Anthrax vaccine**

Anthrax vaccine is made from antigens from *B. anthracis*. Anthrax immunisation is indicated for individuals who handle infected animals, for those exposed to imported infected animal products, and for laboratory staff who work with *Bacillus anthracis*. A 4-dose regimen is used for primary immunisation; booster doses should be given annually to workers at continued risk of exposure to anthrax.

In the event of possible contact with *B. anthracis*, post-exposure immunisation may be indicated, in addition to antimicrobial prophylaxis (section 5.1.12). Advice on the use of anthrax vaccine for post-exposure prophylaxis must be obtained from Public Health England Colindale (tel. 020 8200 4400).

### ANTHRAX VACCINE

**Indications**  pre-exposure immunisation against anthrax; post-exposure immunisation (see notes above)

**Cautions**  see section 14.1

**Contra-indications**  see section 14.1

**Pregnancy**  see p. 829

**Breast-feeding**  see p. 829

**Side-effects**  see section 14.1

**Dose**

- By intramuscular injection in deltoid region, initial course 3 doses of 0.5 mL at intervals of 3 weeks followed by a fourth dose after an interval of 6 months; booster, 0.5 mL every 12 months

**Anthrax Vaccine (dry)**

*Injection, suspension of anthrax antigens (not less than 0.125 mL/0.5 mL dose), sterile filtrate, adsorbed on to aluminium potassium sulfate*

*Excipients*  include thiomersal

*Available from Public Health England’s Centre for Emergency Preparedness and Response (Porton Down)*

**BCG vaccines**

BCG (Bacillus Calmette-Guérin) is a live attenuated strain derived from *Mycobacterium bovis* which stimulates the development of hypersensitivity to *M. tuberculosis*. BCG vaccine should be given intradermally by operators skilled in the technique (see below).

The expected reaction to successful BCG vaccination is induration at the site of injection followed by a local lesion which starts as a papule 2 or more weeks after vaccination; the lesion may ulcerate then subside over several weeks or months, leaving a small, flat scar. A dry dressing may be used if the ulcer discharges, but air should not be excluded.

Apart from children under 6 years, any person being considered for BCG immunisation must first be given a skin test for hypersensitivity to tuberculoprotein (see under Diagnostic Agents, below). A skin test is not necessary for a child under 6 years provided that the child has not stayed for longer than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000; the child has not had contact with a person with tuberculosis, and there is no family history of tuberculosis within the last 5 years.

BCG is recommended for the following groups if BCG immunisation has not previously been carried out:

- neonates with a family history of tuberculosis in the last 5 years;
- all neonates and infants (0–12 months) born in areas where the incidence of tuberculosis is greater than 40 per 100 000;
- neonates, infants, and children under 16 years with a parent or grandparent born in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged under 16 years who were born in, or lived for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged 16–35 years from Sub-Saharan Africa or a country with an incidence of tuberculosis greater than 500 per 100 000
- contacts aged under 36 years of those with active respiratory tuberculosis (for healthcare or laboratory workers who have had contact with clinical materials or patients with tuberculosis, age limit does not apply);
- healthcare workers and laboratory staff (irrespective of age) who are likely to have contact with patients, clinical materials, or derived isolates; other individuals under 35 years at occupational risk including veterinary and other staff who handle animal species susceptible to tuberculosis, and staff working directly with prisoners, in care homes for the elderly, or in hostels or facilities for the homeless or refugees;
- individuals under 16 years intending to live with local people for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000 (section 14.6).

BCG vaccine can be given simultaneously with another live vaccine (see also section 14.1), but if they are not given at the same time an interval of 4 weeks should normally be allowed. When BCG is given to infants, there is no need to delay routine primary immunisations. No further vaccination should be given in the arm used for BCG vaccination for at least 3 months because of the risk of regional lymphadenitis.

Bladder instillations of BCG are licensed for the management of bladder carcinoma (section 8.2.4).

For advice on chemoprophylaxis against tuberculosis, see section 5.1.9; for the treatment of infection following vaccination, seek expert advice.

1. List of countries or primary care trusts where the incidence of tuberculosis is greater than 40 cases per 100 000 is available at www.hpa.org.uk
2. There is inadequate evidence of protection by BCG vaccine in adults aged over 35 years; however, vaccination is recommended for healthcare workers irrespective of age because of the increased risk to them or their patients
**bacillus calmette-guérin vaccine**

**bcg vaccine**

**indications** immunisation against tuberculosis

**cautions** see section 14.1

**contra-indications** see section 14.1; also neonate in household contact with known or suspected case of active tuberculosis; generalised septic skin conditions (for patients with eczema, lesion-free site should be used)

**pregnancy** see p. 829

**breast-feeding** see p. 829

**side-effects** see section 14.1 and notes above; also at the injection site, subcutaneous abscess, prolonged ulceration; rarely disseminated complications such as osteitis or osteomyelitis

**dose**

- by intradermal injection adult and child over 1 year, 0.1 mL; neonate and child under 1 year, 0.05 mL. Intradermal injection technique Skin is stretched between thumb and forefinger and needle (size 25G or 26G) inserted (bevel upwards) for about 3 mm into superficial layers of dermis (almost parallel with surface). Needle should be short with short bevel (can usually be seen through epidermis during insertion). Tense raised blanch ed bleb showing tips of hair follicles is sign of correct injection, 7 mm bleb ≥ 0.1 mL injection, 3 mm bleb = 0.05 mL injection, if considerable resistance not felt, needle too deep and should be removed and reinserted before giving more vaccine. To be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided.

**intradermal**

bacillus calmette-guérin vaccine

**injection (powder for suspension)** freeze-dried preparation of live bacteria of a strain derived from the bacillus of Calmette and Guérin. Available from health organisations or direct from ImmForm (SSI brand, multidose vial with diluent)

**diagnostic agents**

The Mantoux test is recommended for tuberculin skin testing, but no licensed preparation is currently available. Guidance for healthcare professionals is available at [www.dh.gov.uk/immunisation](http://www.dh.gov.uk/immunisation).

In the Mantoux test, the diagnostic dose is administered by intradermal injection of Tuberculin Purified Protein Derivative (PPD). The Mantoux test, 2 units (0.1 mL of 20 units/mL strength) for routine Mantoux test; if first test is negative and a further test is considered appropriate 10 units (0.1 mL of 100 units/mL strength) Available from ImmForm (SSI brand)

**note** The strength of tuberculin PPD in this product may be different to the strengths of products used previously for the Mantoux test; care is required to select the correct strength

**botulism antitoxin**

A polyvalent botulism antitoxin is available for the post-exposure prophylaxis of botulism and for the treatment of persons thought to be suffering from botulism. It specifically neutralises the toxins produced by *Clostridium botulinum* types A, B, and E. It is not effective against infantile botulism as the toxin (type A) is seldom, if ever, found in the blood in this type of infection. Hypersensitivity reactions are a problem. It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc. All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).

**botulism antitoxin**

A preparation containing the specific antitoxic globulins that have the power of neutralising the toxins formed by types A, B, and E of *Clostridium botulinum*. The BP title Botulinum Antitoxin is not used because botulins that have the power of neutralising the toxins produced by types A, B, and E of *Clostridium botulinum* specifically neutralises the toxins produced by types A, B, and E of *Clostridium botulinum*. It is not effective against infantile botulism as the toxin (type A) is seldom, if ever, found in the blood in this type of infection. Hypersensitivity reactions are a problem. It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc. All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).

**cholera vaccine**

Cholera vaccine (oral) contains inactivated Inaba (including El-Tor biotype) and Ogawa strains of *Vibrio cholerae*, serotype O1 together with recombinant B-subunit of the cholera toxin produced in Inaba strains of *V. cholerae*, serotype O1.

Oral cholera vaccine is licensed for travellers to endemic or epidemic areas on the basis of current recommendations (see also section 14.6). Immunisation should be completed at least 1 week before potential exposure. However, there is no requirement for cholera vaccination for international travel. Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is essential.

Injectable cholera vaccine provides unreliable protection and is no longer available in the UK.
14.4 Vaccines and antisera

**CHOLERA VACCINE**

**Indications**
see notes above

**Cautions**
see section 14.1 and notes above

**Contra-indications**
see section 14.1; also acute gastro-intestinal illness

**Pregnancy**
see p. 829

**Breast-feeding**
see p. 829

**Side-effects**
see section 14.1; also rarely respiratory symptoms such as rhinitis and cough; very rarely sore throat, insomnia

**Dose**
- **ADULT** and **CHILD** over 6 years 2 doses separated by an interval of 1–6 weeks; **CHILD** 2–6 years 3 doses each separated by an interval of 1–6 weeks

**Note**
If more than 6 weeks have elapsed between doses, the primary course should be restarted

**Dukoral**® (Crucell) (PH)

Oral suspension, for dilution with solution of effervescent sodium bicarbonate granules, heat- and formaldehyde-inactivated Inaba (including El-Tor biotype) and Ogawa strains of *Vibrio cholerae* bacteria and recombinant cholera toxin B-subunit produced in *V. cholerae*, net price 2-dose pack = £23.42. Counselling, administration

**Diphtheria vaccines**

Diphtheria vaccines are prepared from the toxin of *Corynebacterium diphtheriae* and adsorption on aluminium hydroxide or aluminium phosphate improves antigenicity. The vaccine stimulates the production of the protective antitoxin. The quantity of diphtheria toxoid in a preparation determines whether the vaccine is defined as ‘high dose’ or ‘low dose’. Vaccines containing the higher dose of diphtheria toxoid are used for primary immunisation of children under 10 years of age. Vaccines containing the lower dose of diphtheria toxoid are used for primary immunisation in adults and children over 10 years. Single-antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

For primary immunisation of children aged between 2 months and 10 years vaccination is recommended usually in the form of 3 doses (separated by 1-month intervals) of diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed) (see Immunisation schedule, section 14.1). In unimmunised individuals aged over 10 years the primary course comprises of 3 doses of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine.

A booster dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed). Children under 10 years should receive either adsorbed diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine or adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine. Individuals aged over 10 years should receive adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine.

A second booster dose, of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, should be given 10 years after the previous booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed).

**Travel**
Those intending to travel to areas with a risk of diphtheria infection should be fully immunised according to the UK schedule (see also section 14.6). If more than 10 years have lapsed since completion of the UK schedule, a dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine should be administered.

**Contacts**
Staff in contact with diphtheria patients or with potentially pathogenic clinical specimens or working directly with *C. diphtheriae* or *C. ulcerans* should receive a booster dose if fully immunised (with 5 doses of diphtheria-containing vaccine given at appropriate intervals); further doses should be given at 10-year intervals if risk persists. Individuals at risk who are not fully immunised should complete the primary course; a booster dose should be given after 5 years and then at 10-year intervals. Adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine is used for this purpose; immunity should be checked by antibody testing at least 3 months after completion of immunisation.

Advice on the management of cases, carriers and outbreaks must be sought from health protection units. The immunisation history of infected individuals and their contacts should be determined; those who have been incompletely immunised should complete their immunisation and fully immunised individuals should receive a reinforcing dose. For advice on antibacterial treatment to prevent a secondary case of diphtheria in a non-immune individual, see Table 2, section 5.1.

**DIPHTHERIA-CONTAINING VACCINES**

**Indications**
see notes above

**Cautions**
see section 14.1 and see also individual components of vaccines

**Contra-indications**
see section 14.1 and see also individual components of vaccines

**Pregnancy**
see p. 829

**Breast-feeding**
see p. 829

**Side-effects**
see section 14.1; also restlessness, sleep disturbances, and unusual crying in infants

**Dose**
- See under preparations
**Diphtheria-containing vaccines for children under 10 years**

**Important** For persons aged 10 years or over see Diphtheria-containing Vaccines for Children over 10 years and Adults, below, and see Diphtheria-containing Vaccines for Immunisation of Pregnant Women Against Pertussis, below.

**Diphtheria, Tetanus, Pertussis (Acellular, Component), Poliomyelitis (Inactivated) and Haemophilus Type b Conjugate Vaccine (Adsorbed)** *(Pediacel)*

 Injection, suspension of diphtheria toxoid, tetanus toxoid, acellular pertussis, inactivated poliomyelitis and *Haemophilus influenzae* type b (conjugated to tetanus protein), net price 0.5-mL prefilled syringe = £32.00

Excipients may include neomycin, polymyxin B and streptomycin

Brands include Pediacel®, available as part of childhood immunisation schedule from health organisations or ImmuForm

**Dose** by intramuscular injection, CHILD 2 months–10 years, primary immunisation, 3 doses each of 0.5 mL separated by intervals of 1 month; see also notes on booster doses, above.

**Adsorbed Diphtheria, Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine (PedvaxHib)**

 Injection, suspension of diphtheria toxoid, tetanus toxoid, acellular pertussis and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL prefilled syringe = £17.56

Excipients may include neomycin and polymyxin B

Brands include Infanrix-Hib™, available as part of childhood immunisation schedule from health organisations or ImmuForm

**Dose** by intramuscular injection, CHILD 3–10 years, first booster dose 3 years after primary immunisation, 0.5 mL; see also notes on booster doses, above.

**Adsorbed Diphtheria [low dose], Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine (Repevax)**

 Injection, suspension of diphtheria toxoid, tetanus toxoid, acellular pertussis and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL prefilled syringe = £20.00

Excipients may include neomycin, polymyxin B and streptomycin

Brands include Repevax®, available from ImmuForm

**Dose** by intramuscular injection, CHILD 3–10 years, first booster dose 3 years after primary immunisation, 0.5 mL; see also notes on booster doses, above.

**Diphtheria-containing vaccines for children over 10 years and adults**

A **low dose** of diphtheria toxoid is sufficient to recall immunity in individuals previously immunised against diphtheria but whose immunity may have diminished with time; it is insufficient to cause serious reactions in an individual who is already immune. Preparations containing low dose diphtheria should be used for adults and children over 10 years, for both primary immunisation and booster doses. For immunisation of pregnant women against pertussis see Diphtheria-containing Vaccines for Immunisation of Pregnant Women Against Pertussis, below.

**Adsorbed Diphtheria [low dose], Tetanus and Poliomyelitis (Inactivated) Vaccine (ImmuForm)**

 Injection, suspension of diphtheria toxoid [low dose], tetanus toxoid and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL prefilled syringe = £6.50

Excipients may include neomycin, polymyxin B and streptomycin

Brands include Revasix®, available as part of immunisation schedule from health organisations or ImmuForm

**Dose** by intramuscular injection, ADULT and CHILD over 10 years, primary immunisation, 3 doses each of 0.5 mL separated by intervals of 1 month; second booster dose, 0.5 mL given 10 years after first booster dose (may also be used as first booster dose in those over 10 years who have received only 3 previous doses of a diphtheria-containing vaccine); see also notes on booster doses and contacts, above.

**Diphtheria-containing vaccines for immunisation of pregnant women against pertussis**

For immunisation of children over 10 years and adults against diphtheria see Diphtheria-containing Vaccines for Children over 10 years and Adults, above.

**Adsorbed Diphtheria [low dose], Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine (ImmuForm)**

 Injection, suspension of diphtheria toxoid [low dose], tetanus toxoid, acellular pertussis and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL prefilled syringe = £20.00

Excipients may include neomycin, polymyxin B and streptomycin

Brands include Revasix®, available from ImmuForm

**Contra-indications** section 14.1; see also individual components of vaccine; also contra-indicated in pregnant women with a history of encephalopathy of unknown origin within 7 days of previous immunisation with a pertussis-containing vaccine

**Dose** Vaccination of pregnant women against pertussis (see p. 845), by intramuscular injection, 0.5 mL as a single dose.

**Diphtheria antitoxin**

**Diphtheria antitoxin** is used for passive immunisation in suspected cases of diphtheria only (without waiting for bacteriological confirmation); tests for hypersensitivity should be first carried out. It is derived from horse serum, and reactions are common after administration; resuscitation facilities should be available immediately.

It is no longer used for prophylaxis because of the risk of hypersensitivity; unimmunised contacts should be promptly investigated and given antibacterial prophylaxis (section 5.1, table 2) and vaccine (see Contacts above).

**Diphtheria Antitoxin (ImmuForm)**

Dip/Ser

**Dose** prophylaxis, not recommended therefore no dose stated (see notes above)

Treatment, consult product literature

Available from Centre for Infections (Tel (020) 8200 6868) or in Northern Ireland from Public Health Laboratory, Belfast City Hospital (Tel (028) 9032 9241)

**Haemophilus type b conjugate vaccine**

Haemophilus influenzae type b (Hib) vaccine is made from capsular polysaccharide; it is conjugated with a protein such as tetanus toxoid to increase immunogenicity, especially in young children. Haemophilus influenzae type b vaccine immunisation is given in combination with diphtheria, tetanus, pertussis (acellular,
component) and poliomyelitis (inactivated) vaccine, as a component of the primary course of childhood immunisation (see Immunisation schedule, section 14.1) (see under Diphtheria-containing Vaccines). For infants under 1 year, the course consists of 3 doses of a vaccine containing *Haemophilus influenzae* type b component with an interval of 1 month between doses. A booster dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given at 12–13 months of age.

Children 1–10 years who have not been immunised against *Haemophilus influenzae* type b need to receive only 1 dose of Haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine). However, if a primary course of immunisation has not been completed, these children should be given 3 doses of diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed). The risk of infection falls sharply in older children and the vaccine is not normally required for children over 10 years.

Haemophilus influenzae type b vaccine may be given to those over 10 years who are considered to be at increased risk of invasive *H. influenzae* type b disease (such as those with sickle-cell disease or complement deficiency, or those receiving treatment for malignancy).

**Invasive *Haemophilus influenzae* type b disease**

After recovery from infection, unimmunised and partially immunised index cases under 10 years of age should complete their age-specific course of immunisation. Previously vaccinated cases under 10 years of age should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if Hib antibody concentrations are low or if it is not possible to measure antibody concentrations. Index cases of any age with asplenia or splenic dysfunction should complete their immunisation according to the recommendations below; fully vaccinated cases with asplenia or splenic dysfunction should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if they received their previous dose over 1 year ago.

For use of rifampicin in the prevention of secondary cases of *Haemophilus influenzae* type b disease, see Table 2, section 5.1.

**Asplenia, splenic dysfunction or complement deficiency** Individuals diagnosed with asplenia, splenic dysfunction, or complement deficiency at:

- **under 2 years of age** should be vaccinated according to the Immunisation Schedule (section 14.1). The booster dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine), given at 12–13 months of age, should be followed at least 1 month later by one dose of meningooccocal A, C, W135, and Y conjugate vaccine. An additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given after the second birthday;

- **over 2 years of age** should receive one dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine), followed 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine.

### HAEMOPHILUS TYPE B CONJUGATE VACCINE

**Indications** see notes above

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Pregnancy** see p. 829

**Breast-feeding** see p. 829

**Side-effects** see section 14.1; also atopic dermatitis, hypotonia

**Dose**

- Primary immunisation, see under Diphtheria
- Booster dose, see notes above and under preparation below

**Menitorix** (GSK) **Injection**, powder for reconstitution, capsular polysaccharide of *Haemophilus influenzae* type b and capsular polysaccharide of *Neisseria meningitidis* group C (both conjugated to tetanus protein), net price single-dose vial (with syringe containing 0.5 mL diluent) = £37.76

**Dose** by intramuscular injection, CHILD 1–10 years, 0.5 mL

**ADULT** and **CHILD** over 1 year, with asplenia or splenic dysfunction (see notes above), 0.5 mL

Available as part of the childhood immunisation schedule from ImmForm

### Combined vaccines

See also under Diphtheria-containing Vaccines

### Hepatitis A vaccine

**Hepatitis A vaccine** is prepared from formaldehyde-inactivated hepatitis A virus grown in human diploid cells.

Immunisation is recommended for:

- laboratory staff who work directly with the virus;
- staff and residents of homes for those with severe learning difficulties;
- workers at risk of exposure to untreated sewage;
- individuals who work with primates;
- patients with haemophilia or other conditions treated with plasma-derived clotting factors;
- patients with severe liver disease;
- travellers to high-risk areas (see p. 857);
- individuals who are at risk due to their sexual behaviour;
- parenteral drug abusers.

Immunisation should be considered for:

- patients with chronic liver disease including chronic hepatitis B or chronic hepatitis C;
- prevention of secondary cases in close contacts of confirmed cases of hepatitis A, within 14 days of exposure to the primary case (within 8 weeks of exposure to the primary case where there is more than 1 contact in the household).

A booster dose is usually given 6–12 months after the initial dose. A second booster dose can be given 20 years after the previous booster dose to those who continue to be at risk. Specialist advice should be sought on re-immunisation of immunocompromised individuals.
For rapid protection against hepatitis A after exposure or during an outbreak, in adults a single dose of a monovalent vaccine is recommended; for children under 16 years, a single dose of the combined vaccine Ambirix® can also be used.

Intramuscular normal immunoglobulin (section 14.5.1) is recommended for use in addition to Hepatitis A vaccine for close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed or over 50 years of age.

Post-exposure prophylaxis is not required for healthy children under 1 year of age, so long as all those involved in nappy changing are vaccinated against hepatitis A. However, children 2–12 months of age can be given a dose of hepatitis A vaccine if it is not possible to vaccinate their carers, or if the child becomes a source of infection to others [unlicensed use]; in these cases, if the child goes on to require long-term protection against hepatitis A after the first birthday, the full course of 2 doses should be given.

**HEPATITIS A VACCINE**

**Indications** immunisation against hepatitis A infection

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Pregnancy** see p. 829

**Breast-feeding** see p. 829

**Side-effects** see section 14.1; for combination vaccines, see also Typhoid vaccine, p. 850

**Dose**

- See under preparations

**Single component**

Avaxim® (Sanofi Pasteur)®

**Injection**, suspension of formaldehyde-inactivated hepatitis A virus (GBM grown in human diploid cells) 320 antigen units/mL adsorbed onto aluminium hydroxide, net price 0.5-mL prefilled syringe = £18.10

**Excipients** include neomycin

**Dose** by intramuscular injection (see note below), ADULT and CHILD over 16 years, 0.5 mL as a single dose; booster dose 0.5 mL 6–12 months after initial dose

**Note** Booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose with Havrix Monodose®. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

Vaqta® Paediatric (Sanofi Pasteur)®

**Injection**, suspension of formaldehyde-inactivated hepatitis A virus (grown in human diploid cells) 50 antigen units/mL adsorbed onto aluminium hydroxyphosphate sulfate, net price 0.5-mL prefilled syringe = £14.74

**Excipients** include neomycin

**Dose** by intramuscular injection (see note below) CHILD 1–17 years, 0.5 mL as a single dose; booster dose 0.5 mL 6–18 months after initial dose, under 1 year, not recommended

**Note** The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be reduced)

Vaqta® Adult (Sanofi Pasteur)®

**Injection**, suspension of formaldehyde-inactivated hepatitis A virus (grown in human diploid cells) 50 antigen units/mL adsorbed onto aluminium hydroxyphosphate sulfate, net price 1-mL prefilled syringe = £18.10

**Excipients** include neomycin

**Dose** by intramuscular injection (see note below) ADULT over 18 years, 1 mL as a single dose; booster dose 1 mL 6–18 months after initial dose

**Note** The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be delayed)

**With hepatitis B vaccine**

Ambirix® (GSK)®

**Injection**, suspension of inactivated hepatitis A virus (grown in human diploid cells) 720 ELISA units/mL adsorbed onto aluminium hydroxide, and recombinant (DNA) hepatitis B surface antigen (grown in yeast cells) 20 micrograms/mL adsorbed onto aluminium phosphate, net price 1-mL prefilled syringe = £31.18

**Excipients** include neomycin

**Dose** CHILD 1–15 years, by intramuscular injection (see note below), primary course, 2 doses of 1 mL, the second 6–12 months after initial dose

**Note** Primary course should be completed with Ambirix® (single component vaccines given at appropriate intervals may be used for booster dose); the deltoid region is the preferred site of injection in older children, anterolateral thigh is the preferred site in infants, not to be injected into the buttock (vaccine efficacy reduced); subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

Important: Ambirix® is recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular, or mucous membrane exposure to hepatitis B virus
In the UK, groups at high-risk of hepatitis B include:

- parenteral drug misusers, their sexual partners, and household contacts; other drug misusers who are likely to ‘progress’ to injecting;
- individuals who change sexual partners frequently;
- close family contacts of a case or individual with chronic hepatitis B infection;
- babies whose mothers have had acute hepatitis B during pregnancy or are positive for hepatitis B surface antigen (regardless of e-antigen markers); hepatitis B vaccination is started immediately on delivery and hepatitis B immunoglobulin (see p. 854) given at the same time (but preferably at a different site). Babies whose mothers are positive for hepatitis B surface antigen and for e-antigen antibody should receive the vaccine only (but babies weighing 1.5 kg or less should also receive the immunoglobulin regardless of the mother’s e-antigen antibody status);
- individuals with haemophilia, those receiving regular blood transfusions or blood products, and carers responsible for the administration of such products;
- patients with chronic renal failure including those on haemodialysis. Haemodialysis patients should be monitored for antibodies annually and re-immunised if necessary. Home carers (of dialysis patients) should be vaccinated;
- individuals with chronic liver disease;
- healthcare personnel (including trainees) who have direct contact with blood or blood-stained body fluids or with patients’ tissues;
- laboratory staff who handle material that may contain the virus;
- other occupational risk groups such as morticians and embalmers;
- staff and patients of day-care or residential accommodation for those with severe learning difficulties;
- staff and inmates of custodial institutions;
- those travelling to areas of high or intermediate prevalence who are at increased risk or who plan to remain there for lengthy periods (see p. 857);
- families adopting children from countries with a high or intermediate prevalence of hepatitis B;
- foster carers and their families.

Different immunisation schedules for hepatitis B vaccine are recommended for specific circumstances (see under individual preparations). Generally, three or four doses are required for primary immunisation; an ‘accelerated schedule’ is recommended for pre-exposure prophylaxis in high-risk groups where rapid protection is required, and for post-exposure prophylaxis (see below).

Immunisation may take up to 6 months to confer adequate protection; the duration of immunity is not known precisely, but a single booster 5 years after the primary course may be sufficient to maintain immunity for those who continue to be at risk.

Immunisation does not eliminate the need for commonsense precautions for avoiding the risk of infection from known carriers by the routes of infection which have been clearly established, consult *Guidance for Clinical
Health Care Workers: Protection against Infection with Blood-borne Viruses (available at www.dh.gov.uk). Accidental inoculation of hepatitis B virus-infected blood into a wound, incision, needle-prick, or abrasion may lead to infection, whereas it is unlikely that indirect exposure to a carrier will do so.

Following significant exposure to hepatitis B, an accelerated schedule, with the second dose given 1 month, and the third dose 2 months after the first dose, is recommended. For those at continued risk, a fourth dose should be given 12 months after the first dose. More detailed guidance is given in the handbook Immunisation against Infectious Disease see p. 828.

Specific hepatitis B immunoglobulin (‘HBIG’) is available for use with the vaccine in those accidentally inoculated and in neonates at special risk of infection (section 14.5.2).

A combined hepatitis A and hepatitis B vaccine is also available.

Hepatitis B Vaccine

### Indications
Immunisation against hepatitis B infection

### Cautions
See section 14.1

### Contra-indications
See section 14.1

### Pregnancy
See p. 829

### Breast-feeding
See p. 829

### Side-effects
See section 14.1

#### Dose
- See under preparations

#### Single component

**Engerix B**® (GSK) **For**

**Injection**, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 20 micrograms/mL adsorbed onto aluminium hydroxide, net price 0.5-mL (paediatric) prefilled syringe = £9.67, 1-mL vial = £12.34, 1-mL prefilled syringe = £12.99

**Dose** by intramuscular injection (see note below), ADULT and CHILD over 18 years, 3 doses of 20 micrograms, the second 1 month and the third 6 months after the first dose; NEONATE (except if born to hepatitis B surface antigen-positive mother, see below) and CHILD 1 month–16 years, 3 doses of 10 micrograms

Accelerated schedule (all ages), second dose 1 month after first dose, third dose 2 months after first dose and fourth dose 12 months after first dose; booster doses may be required in those with low antibody concentration.

Alternative schedule for CHILD 1–15 years, 2 doses of 20 micrograms, the second dose 6 months after the first dose (this schedule not suitable if high risk of infection between doses or if compliance with second dose uncertain)

**NEONATE** born to hepatitis B surface antigen-positive mother (see also notes above), 4 doses of 10 micrograms, first dose at birth with hepatitis B immunoglobulin injection (separate site) the second 1 month, the third 2 months and the fourth 12 months after the first dose

Renal insufficiency (including haemodialysis patients), by intramuscular injection (see note below), ADULT and CHILD over 18 years, 4 doses of 40 micrograms, the second 1 month, the third 2 months and the fourth 6 months after the first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration.

**NEONATE** (except if born to hepatitis B surface antigen-positive mother, see above) and CHILD 1 month–16 years 3 doses of 10 micrograms, second dose 1 month and the third dose 6 months after first dose or accelerated schedule, 4 doses of 10 micrograms, second dose 1 month, third dose 2 months and fourth dose 12 months after first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration.

**Note** Deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in neonates, infants and young children, not to be injected into the buttck (vaccine efficacy reduced)

**Fendrix**® (GSK) **For**

**Injection**, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 40 micrograms/mL adsorbed onto aluminium phosphate, net price 0.5-mL prefilled syringe = £38.10

**Excipients** include traces of thiomersal

**Dose** ADULT and CHILD over 15 years with renal insufficiency (including pre-haemodialysis and haemodialysis patients), by intramuscular injection (see note below) 4 doses of 20 micrograms, the second 1 month, the third 2 months and the fourth 6 months after the first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration.

**Note** Deltoid muscle is preferred site of injection, not to be injected into the buttock (vaccine efficacy reduced)

**HBVaxPRO**® (Sanofi Pasteur) **For**

**Injection**, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 10 micrograms/mL adsorbed onto aluminium hydroxypropylsulphate, net price 0.5-mL (5-microgram) prefilled syringe = £8.95, 1-mL (10-microgram) prefilled syringe = £12.20; 40 micrograms/mL, 1-mL (40-microgram) vial = £27.60

**Dose** by intramuscular injection (see note below), ADULT and CHILD over 16 years, 3 doses of 10 micrograms, the second 1 month and the third 6 months after the first dose; CHILD under 16 years, 3 doses of 5 micrograms

**Accelerated schedule** (all ages), second dose 1 month after first dose, third dose 2 months after first dose and fourth dose 12 months after first dose; booster doses may be required in those with low antibody concentration

**Note** Deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in neonates and infants, not to be injected into the buttock (vaccine efficacy reduced)

**With hepatitis A vaccine**

See Hepatitis A Vaccine

Human papillomavirus vaccines

Human papillomavirus vaccine is available as a bivalent vaccine (Cervarix®) or a quadrivalent vaccine (Gardasil®). Cervarix® is licensed for use in females for the prevention of cervical cancer and other pre-cancerous lesions caused by human papillomavirus types 16 and 18. Gardasil® is licensed for use in females for the prevention of cervical cancer, genital warts and pre-cancerous lesions caused by human papillomavirus types 6, 11, 16, and 18. The vaccines may also provide limited protection against disease caused by other types of human papillomavirus. The two vaccines are not interchangeable and one vaccine product should be used for an entire course.
**Human papillomavirus vaccine**

Human papillomavirus vaccine will be most effective if given before sexual activity starts. From September 2014, a 2-dose schedule is recommended, as long as the first dose is received before the age of 15 years. The first dose is given to females aged 11 to 14 years, and the second dose is given 6–24 months after the first dose (for the purposes of planning the national immunisation programme, it is appropriate to give the second dose 12 months after the first—see Immunisation schedule, section 14.1). If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more. Females receiving their first dose aged 15 years or older require a 3-dose schedule (see Cervarix® and Gardasil®), with the second and third doses given 1 and 4–6 months after the first dose; all 3 doses should be given within a 12-month period. If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses. If a 3-dose course of vaccination has been started before September 2014, then where possible this should be completed; if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses. Under the national programme in England, females remain eligible to receive the vaccine up to the age of 18 years if they did not receive the vaccine when scheduled. Where appropriate, immunisation with human papillomavirus vaccine should be offered to females coming into the UK as they may not have been offered protection in their country of origin. The duration of protection has not been established, but current studies suggest that protection is maintained for at least 6 years after completion of the primary course. As the vaccines do not protect against all strains of human papillomavirus, routine cervical screening should continue.

**Influenza vaccines**

While most viruses are antigenically stable, the influenza viruses A and B (especially A) are constantly altering their antigenic structure as indicated by changes in the haemagglutinins (H) and neuraminidases (N) on the surface of the viruses. It is essential that influenza vaccines in use contain the H and N components of the prevalent strain or strains as recommended each year by the World Health Organization.

Seasonal influenza vaccines will not control epidemics—immunisation is recommended for persons at high risk, and to reduce transmission of infection. Annual immunisation is strongly recommended for individuals aged over 6 months with the following conditions:

- chronic respiratory disease (includes asthma treated with continuous or repeated use of inhaled or systemic corticosteroids or asthma with previous exacerbations requiring hospital admission);
- chronic heart disease;
- chronic liver disease;
- chronic renal disease;
- chronic neurological disease;
- diabetes mellitus;
- immunosuppression because of disease (including asplenia or splenic dysfunction) or treatment (including prolonged systemic corticosteroid treatment [for over 1 month at dose equivalents of prednisolone: adult and child over 20 kg, 20 mg or more daily; child under 20 kg, 1 mg/kg or more daily] and chemotherapy);
- HIV infection (regardless of immune status).

Seasonal influenza vaccine is also recommended for all pregnant women, for all persons aged over 65 years, for residents of nursing or residential homes for the elderly and other long-stay facilities, and for carers of persons whose welfare may be at risk if the carer falls ill. Influenza immunisation should also be considered for household contacts of immunocompromised individuals.

As part of winter planning, NHS employers should offer vaccination to healthcare workers who are directly involved in patient care. Employers of social care workers should consider similar action.

Unless contra-indicated, the live influenza vaccine, Flu-vax Tetra®, is preferred in children aged 2–18 years because it provides a higher level of protection than inactivated influenza vaccine. From 1 September 2014, seasonal influenza vaccine will be offered to all children aged 2–4 years (i.e. those born between 2 September 2009 and 1 September 2012).

**Immunological products and vaccines**

**HUMAN PAPILLOMAVIRUS VACCINES**

**Indications**

- See notes above and under preparations

**Cautions**

- See section 14.1

**Contra-indications**

- See section 14.1

**Pregnancy**

- Not known to be harmful, but vaccination should be postponed until completion of pregnancy

**Breast-feeding**

- See p. 829

**Side-effects**

- See section 14.1

**Dose**

- See notes above and under preparations

**Note**

- To avoid confusion, prescribers should specify the brand to be dispensed

**Cervarix®** (GSK) *(PfM)*

**Injection**, suspension of virus-like particles of human papillomavirus type 16 (40 micrograms/mL), type 18 (40 micrograms/mL) capsid protein (prepared by recombinant DNA technique using a Baculovirus expression system) in monophosphoryl lipid A adjuvant adsorbed onto aluminium hydroxide, net price 0.5-mL prefilled syringe = £80.50

**Dose**

- Prevention of premalignant genital lesions and cervical cancer, by intramuscular injection into deltoid region, ADULT and CHILD over 15 years, 2 doses of 0.5 mL, the second 1–2.5 months, and the third 5–12 months after the first dose; CHILD 9–14 years, 2 doses of 0.5 mL, the second 5–7 months after the first dose (if second dose administered earlier than 5 months after the first, a third dose should be administered)

**Gardasil®** (Sanofi Pasteur) *(PfM)*

**Injection**, suspension of virus-like particles of human papillomavirus type 6 (40 micrograms/mL), type 11 (80 micrograms/mL), type 16 (80 micrograms/mL), type 18 (40 micrograms/mL) capsid protein (prepared from yeast cells by recombinant DNA technique) adsorbed onto aluminium hydroxymetaphosphate sulfate, net price 0.5-mL prefilled syringe = £86.50

**Dose**

- Prevention of premalignant genital lesions, cervical cancer and genital warts, by intramuscular injection preferably into deltoid region or higher anterolateral thigh, ADULT and CHILD over 9 years, 3 doses of 0.5 mL, the second at least 1 month after the first dose, and the third at least 3 months after the second dose, schedule should be completed within 12 months after the first dose; alternative schedule for CHILD 9–13 years, 2 doses of 0.5 mL, the second 6 months after the first dose (if administered earlier than 6 months, a third dose should be administered)
Information on pandemic influenza, avian influenza and swine influenza may be found at www.dh.gov.uk/pandemicflu and at www.hpa.org.uk.

**INFLUENZA VACCINES**

**Indications** annual immunisation against seasonal influenza

**Cautions** see section 14.1; increased risk of fever in child under 5 years with Viroflu® and Intanza® V, and in child 5–9 years with Enzira® or preparations marketed by Pfizer or CSL Biotherapies

**Contra-indications** see section 14.1 and also Fluenz Tetra® below; avoid Enzira® or preparations marketed by Pfizer, or CSL Biotherapies in child under 5 years—increased risk of febrile convulsions

**Pregnancy** see section 14.1; inactivated vaccines not known to be harmful; avoid Fluenz Tetra®

**Breast-feeding** see section 14.1; inactivated vaccines not known to be harmful; avoid Fluenz Tetra®

**Side-effects** see section 14.1; also reported febrile convulsions and transient thrombocytopenia; with intranasal spray, rhinorrhea and less commonly epistaxis

**Dose**
- By intramuscular injection, ADULT and CHILD over 9 years, 0.5 mL as a single dose; CHILD 6 months–9 years, 0.5 mL; for children 6 months to 9 years who have not received seasonal influenza vaccine previously, repeat after at least 4 weeks
- By intradermal injection, see under Intanza® below
- Intranasally, see under Fluenz Tetra® below

**Trivalent seasonal influenza vaccines for intramuscular use**

**Inactivated Influenza Vaccine (Split Virion)**

**Flu** injection, suspension of formaldehyde-inactivated influenza virus (split virion grown in fertilised hens’ eggs), net price 0.25-mL prefilled syringe = £6.59

**Excipients** may include neomycin and polymyxin B

Available from Sanofi Pasteur

Cautions increased risk of fever in child 5–9 years with preparations marketed by Pfizer or CSL Biotherapies—use alternative influenza vaccine if available

**Contra-indications** avoid preparations marketed by Pfizer or CSL Biotherapies in child under 5 years—increased risk of febrile convulsions

**Inactivated Influenza Vaccine (Surface Antigen)**

**Flu or Flu(ad)** injection, suspension of propiolactone-inactivated influenza virus (surface antigen, grown in fertilised hens’ eggs), net price 0.5-mL prefilled syringe = £4.15

**Excipients** may include neomycin and polymyxin B, and traces of thiomersal

Available from Novartis Vaccines

**Note** Not licensed for children under 4 years

**Agrippal®** (Novartis Vaccines) injection, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens’ eggs), net price 0.5 mL, 15 micrograms as a single dose

**Excipients** include kanamycin and neomycin

**Enzira®** (Pfizer) injection, suspension of inactivated influenza virus (split virion, grown in fertilised hens’ eggs), net price 0.5-mL prefilled syringe = £5.25

**Excipients** include neomycin and polymyxin B

Cautions child 5–9 years (increased risk of fever)—use alternative influenza vaccine if available

**Contra-indications** child under 5 years—increased risk of febrile convulsions

**Fluvirin®** (Novartis Vaccines) injection, suspension of formaldehyde-inactivated influenza virus (split virion, grown in fertilised hens’ eggs), net price 0.5 mL, 15 micrograms as a single dose

**Excipients** include neomycin, polymyxin B, and traces of thiomersal

Note Ovabumin content less than 100 nanograms/mL

**Fluvirin®** (GSK) injection, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens’ eggs), net price 0.5 mL, 15 micrograms as a single dose

**Excipients** include gentamicin

**Imuvac®** (Abbott Healthcare) injection, suspension of formaldehyde-inactivated influenza virus (split virion, grown in fertilised hens’ eggs), net price £5.55

**Excipients** include neomycin, polymyxin B

Cautions child under 5 years—increased risk of fever—use only if a safer alternative influenza vaccine is not available

**Note** Ovabumin content less than 100 nanograms/mL

**Note** Also available as Inflexal® V

**Viroflu®** (Janssen) injection, suspension of inactivated influenza virus (surface antigen, virosome, grown in fertilised hens’ eggs), net price 0.5 mL, 15 micrograms as a single dose

**Excipients** include neomycin and polymyxin B

Cautions adult and child under 5 years (increased risk of fever)—use only if a safer alternative influenza vaccine is not available

**Note** Ovabumin content less than 100 nanograms/mL

**Tetravalent seasonal influenza vaccine for intramuscular use**

**Fluarix®** (GSK) injection, suspension of formaldehyde-inactivated influenza virus (split virion, grown in fertilised hens’ eggs), net price £9.94

**Excipients** include gentamicin

**Note** Ovabumin content less than 100 nanograms/mL

**Note** Not licensed for use in children under 3 years of age

**Tetravalent seasonal influenza vaccine for intradermal use**

**Intanza®** (Sanofi Pasteur) injection, suspension of formaldehyde-inactivated influenza virus (split virion, grown in fertilised hens’ eggs), net price, prefilled syringe, 9 micrograms (0.1 mL) = £9.05; prefilled syringe, 15 micrograms (0.1 mL) = £9.05

**Excipients** include neomycin

Dose by intradermal injection into deltoid region, ADULT over 60 years, 9 micrograms as a single dose; ADULT over 60 years, 15 micrograms as a single dose
Tetraavalent seasonal influenza vaccine for intranasal use
Fluenz Tetra® (AstraZeneca) ▼
Nasal spray, suspension of live, attenuated influenza virus (produced in vero cells and grown in fertilised hens’ eggs), net price 0.2 mL nasal applicator = £14.00
Excipients include gelatin and gentamicin
Contra-indications see section 14.1; also severe asthma, active whooping cough, avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination, concomitant use with antiviral therapy for influenza (avoid antiviral for at least 2 weeks after Fluenz Tetra®, avoid Fluenz Tetra® for at least 48 hours after stopping the antiviral), concomitant use with salicylates in children

Dose
CHILD 2–18 years, 0.1 mL into each nostril as a single dose; for children 2–9 years in the clinical risk groups, who have not received seasonal influenza vaccine previously, repeat after at least 4 weeks

Japanese encephalitis vaccine
Japanese encephalitis vaccine is indicated for travellers to areas in Asia and the Far East where infection is endemic and for laboratory staff at risk of exposure to the virus. The primary immunisation course of 2 doses should be completed at least one week before potential exposure to Japanese encephalitis virus.

Up-to-date information on the risk of Japanese encephalitis in specific countries can be obtained from the National Travel Health Network and Centre (www.nathnac.org)

JAPANESE ENCEPHALITIS VACCINE
Indications immunisation against Japanese encephalitis
Cautions see section 14.1
Contra-indications see section 14.1
Pregnancy although manufacturer advises avoid because of limited information, miscarriage has been associated with Japanese encephalitis virus infection acquired during the first 2 trimesters of pregnancy
Breast-feeding see Side-effects see section 14.1; also less commonly migraine, vertigo; rarely dyspnoea, palpitation, tachycardia, thrombocytopenia, neuritis
Dose
● See under preparation

Ixiaro® (Novartis Vaccines) ▼
Injection, suspension, inactivated Japanese encephalitis virus (produced in Vero cells), adsorbed onto aluminium hydroxide, net price 0.5 mL (6 micrograms) prefilled syringe = £59.50
Dose by intramuscular injection in deltoid region, ADULT over 18 years, 2 doses of 0.5 mL separated by interval of 28 days; booster dose 1–2 years after completing primary course, but for those at continued risk the booster dose should be given 1 year after completing the primary course; CHILD 2 months–3 years, 2 doses of 0.25 mL separated by interval of 28 days; CHILD 3–18 years, 2 doses of 0.5 mL separated by interval of 28 days
Note Anterior lateral thigh is preferred site in infants. The subcutaneous route may be used for patients with bleeding disorders see section 14.1

Measles vaccine
Measles vaccine has been replaced by a combined live measles, mumps and rubella vaccine (MMR vaccine).

MMR vaccine may be used in the control of outbreaks of measles (see under MMR Vaccine).

Single antigen vaccine
No longer available in the UK

Combined vaccines
See MMR vaccine

Measles, Mumps and Rubella (MMR) vaccine
A combined live measles, mumps, and rubella vaccine (MMR vaccine) aims to eliminate measles, mumps, and rubella (and congenital rubella syndrome). Every child should receive two doses of MMR vaccine by entry to primary school, unless there is a valid contra-indication (see section 14.1). MMR vaccine should be given irrespective of previous measles, mumps, or rubella infection or vaccination.

The first dose of MMR vaccine is given to children aged 12–13 months. A second dose is given before starting school at 3 years and 4 months–5 years of age (see Immunisation Schedule, section 14.1).

Children presenting for pre-school booster who have not received the first dose of MMR vaccine should be given a dose of MMR vaccine followed 3 months later by a second dose.

At school-leaving age or at entry into further education, MMR immunisation should be offered to individuals of both sexes who have not received 2 doses during childhood. In those who have received only a single dose of MMR in childhood, a second dose is recommended to achieve full protection. If 2 doses of MMR vaccine are required, the second dose should be given one month after the initial dose. The decision on whether to vaccinate adults should take into consideration their vaccination history, the likelihood of the individual remaining susceptible, and the future risk of exposure and disease.

MMR vaccine should be used to protect rubella in seronegative women of child-bearing age (see Immunisation Schedule, section 14.1); unimmunised healthcare workers who might put pregnant women and other vulnerable groups at risk of rubella or measles should be vaccinated. MMR vaccine may also be offered to previously unimmunised and seronegative post-partum women (see MMR Vaccine, section 14.5.3)—vaccination a few days after delivery is important because about 60% of congenital abnormalities from rubella infection occur in babies of women who have borne more than one child. Immigrants arriving after the age of school immunisation are particularly likely to require immunisation.

Contacts MMR vaccine may also be used in the control of outbreaks of measles and should be offered to susceptible children aged over 6 months who are contacts of a case, within 3 days of exposure to infection. Children immunised before 12 months of age should still receive two doses of MMR vaccine at the recommended ages. If one dose of MMR vaccine has already been given to a child, then the second dose may be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given. Children aged under 9 months for whom avoid...
ance of measles infection is particularly important (such as those with history of recent severe illness) can be given normal immunoglobulin (section 14.5.1) after exposure to measles; routine MMR immunisation should then be given after at least 3 months at the appropriate age.

MMR vaccine is not suitable for prophylaxis following exposure to mumps or rubella since the antibody response to the mumps and rubella components is too slow for effective prophylaxis.

Children and adults with impaired immune response should not receive live vaccines (for advice on HIV see section 14.1). If they have been exposed to measles infection they should be given normal immunoglobulin (section 14.5.1).

Travel Unimmunised travellers, including children over 6 months, to areas where measles is endemic or epidemic should receive MMR vaccine. Children immunised before 12 months of age should still receive two doses of MMR vaccine at the recommended ages. If one dose of MMR vaccine has already been given to a child, then the second dose should be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given.

Side-effects See section 14.1: also malaise, fever, or a rash can occur after the first dose of MMR vaccine, most commonly about a week after vaccination and lasting about 2 to 3 days. Leaflets are available for parents on advice for reducing fever (including the use of paracetamol). Febrile seizures occur rarely 6 to 11 days after MMR vaccination; the incidence of febrile seizures is lower than that following measles infection. Parotid swelling occurs occasionally, usually in the third week, and rarely, arthropathy 2 to 3 weeks after immunisation. Adverse reactions are considerably less frequent after the second dose of MMR vaccine than after the first dose.

Idiopathic thrombocytopenic purpura has occurred rarely following MMR vaccination, usually within 6 weeks of the first dose. The risk of idiopathic thrombocytopenic purpura after MMR vaccine is much less than the risk after infection with wild measles or rubella virus. Children who develop idiopathic thrombocytopenic purpura after MMR vaccine is much less than the risk after infection with wild measles or rubella virus. Children who develop idiopathic thrombocytopenic purpura after MMR vaccine has now been discontinued; no cases have been confirmed in association with the currently used Jeryl Lynn mumps vaccine. Children with post-vaccination symptoms are not infectious.

Post-vaccination aseptic meningitis was reported (rarely and with complete recovery) following vaccination with MMR vaccine containing Urabe mumps vaccine, which has now been discontinued; no cases have been confirmed in association with the currently used Jeryl Lynn mumps vaccine. Children with post-vaccination symptoms are not infectious.

**MEASLES, MUMPS AND RUBELLA VACCINE, LIVE**

**Indications** immunisation against measles, mumps, and rubella

**Cautions** see section 14.1; also, after immunoglobulin administration or blood transfusion, leave an interval of at least 3 months before MMR immunisation as antibody response to measles component may be reduced—see also p. 856

**Hypersensitivity to egg** MMR vaccine can be given safely even when the child has had an anaphylactic reaction to food containing egg. Dislike of eggs, refusal to eat egg, or confirmed anaphylactic reactions to egg-containing food is not a contra-indication to MMR vaccination. Children with a confirmed anaphylactic reaction to the MMR vaccine should be assessed by a specialist.

**Contra-indications** see section 14.1

**Pregnancy** avoid pregnancy for at least 1 month after vaccination; see also, p. 829

**Breast-feeding** see p. 829

**Side-effects** see section 14.1 and notes above; also less commonly sleep disturbances, unusual crying in infants; also reported peripheral and optic neuritis

**Dose**

- By intramuscular or deep subcutaneous injection, ADULT and CHILD over 9 months (but see also notes above), primary immunisation, 2 doses each of 0.5 mL, see Immunisation Schedule, section 14.1, p. 830; see also notes above for use in outbreaks, for contacts of cases, and for travel

**Combined vaccines**

- MMRIvaxPro® (Sanofi Pasteur) injection, powder for reconstitution, live attenuated, measles virus (Enders’ Edmonston strain) and mumps virus (Jeryl Lynn strain) prepared in chick embryo cells, and rubella virus (Wistar RA 27/3 strain); single-dose vial (with syringe containing solvent)

  **Excipients** include gelatin and neomycin

- Only available as part of childhood immunisation schedule from health organisations or ImmForm

- Priorix® (GSK) injection, powder for reconstitution, live attenuated, measles virus (Schwarz strain) and mumps virus (RIT 4385 strain) prepared in chick embryo cells, and rubella virus (Wistar RA 27/3 strain); net price single-dose vial (with syringe containing solvent) = £7.64

  **Excipients** include neomycin

- Also available as part of childhood immunisation schedule from health organisations or ImmForm
Meningococcal vaccines

Almost all childhood meningococcal disease in the UK is caused by *Neisseria meningitidis* serogroups B and C. Meningococcal group C conjugate vaccine protects only against infection by serogroup C. The risk of meningococcal disease declines with age—immunisation is not generally recommended after the age of 25 years.

Tetravalent meningococcal vaccines that cover serogroups A, C, W135, and Y are available. Although the duration of protection has not been established, the meningococcal groups A, C, W135, and Y conjugate vaccine is likely to provide longer-lasting protection than the unconjugated meningococcal polysaccharide vaccine. The antibody response to serogroup C in unconjugated meningococcal polysaccharide vaccines in young children may be suboptimal.

A meningococcal group B vaccine, Bexsero® is licensed in the UK against infection caused by *Neisseria meningitidis* serogroup B. Bexsero® contains 3 recombinant *Neisseria meningitidis* serogroup B proteins and the outer membrane vesicles from the NZ 98/254 strain, in order to achieve broad protection against *Neisseria meningitidis* serogroup B; the proteins are adsorbed onto an aluminium compound to stimulate an enhanced immune response.

**Childhood immunisation** Meningococcal group C conjugate vaccine provides long-term protection against infection by serogroup C of *Neisseria meningitidis*. Immunisation consists of 1 dose given at 3 months of age; 2 booster doses are recommended, the first is given at 12–13 months of age (combined with haemophilus influenzae type b vaccine), and the second at 13–15 years of age (see Immunisation Schedule, section 14.1, p. 830).

Unimmunised children aged 4–12 months should be given 1 dose of meningococcal group C conjugate vaccine and then they should be vaccinated according to the Immunisation Schedule (section 14.1, p. 830). Unimmunised children aged 1–10 years should be given 1 dose of meningococcal group C conjugate vaccine, followed by a booster dose at 13–15 years of age. Unimmunised individuals aged 10–25 years should be given 1 dose of meningococcal group C conjugate vaccine, but a booster dose is not required.

From August 2014 there will be a catch-up programme for individuals aged under 25 years who are attending university for the first time and who did not receive a dose of meningococcal group C conjugate vaccine at 13–15 years of age.

Patients under 25 years of age with confirmed serogroup C disease, who have previously been immunised with meningococcal group C vaccine, should be offered meningococcal group C conjugate vaccine before discharge from hospital.

**Asplenia, splenic dysfunction, or complement deficiency** See p. 836.

**Travel** Individuals travelling to countries of risk (see below) should be immunised with meningococcal groups A, C, W135, and Y conjugate vaccine, even if they have previously received meningococcal group C conjugate vaccine. If an individual has recently received meningococcal group C conjugate vaccine, an interval of at least 4 weeks should be allowed before administration of the tetravalent (meningococcal groups A, C, W135, and Y) vaccine.

Vaccination is particularly important for those living or working with local people or visiting an area of risk during outbreaks.

Immunisation recommendations and requirements for visa entry for individual countries should be checked before travelling, particularly to countries in Sub-Saharan Africa, Asia, and the Indian sub-continent where epidemics of meningococcal outbreaks and infection are reported. Country-by-country information is available from the National Travel Health Network and Centre (www.nathnac.org).

Proof of vaccination with the tetravalent (meningococcal groups A, C, W135, and Y) vaccine is required for those travelling to Saudi Arabia during the Hajj and Umrah pilgrimages (where outbreaks of the W135 strain have occurred).

**Contacts** For advice on the immunisation of laboratory workers and close contacts of cases of meningococcal disease in the UK and on the role of the vaccine in the control of local outbreaks, consult Guidance for Public Health Management of Meningococcal Disease in the UK at www.hpa.org.uk. See Table 2, section 5.1 for antibacterial prophylaxis for prevention of secondary cases of meningococcal meningitis.

The need for immunisation of laboratory staff who work directly with *Neisseria meningitidis* should be considered.
Meningococcal group C conjugate vaccine with Haemophilus influenzae type B vaccine
See Haemophilus influenzae type B vaccine

Meningococcal groups A, C, W135, and Y conjugate vaccine
Menevo® (Novartis Vaccines)
Injection, powder for reconstitution, capsular oligosaccharide antigens of Neisseria meningitidis groups A, C, W135, and Y (conjugated to Corynebacterium diphtheriae protein), net price single-dose vial (with vial or prefilled syringe containing diluent) = £30.00
Dose by intramuscular injection preferably into deltoid region, ADULT and CHILD over 1 year 0.5 mL as a single dose; CHILD 2–11 years 2 doses of 0.5 mL separated by an interval of 1 month.
Note Advice in BNF may differ from that in product literature

Nimenrix® (GSK)
Injection, powder for reconstitution, capsular polysaccharide antigens of Neisseria meningitidis groups A, C, W135, and Y, net price single-dose vial (with syringe containing diluent) = £30.00
Protein, net price single-dose vial (with syringe containing diluent) = £75.00
Dose by intramuscular injection preferably into deltoid region (or anterolateral thigh in child 1–2 years), ADULT and CHILD over 1 year 0.5 mL as a single dose; a second dose may be considered after 1 year in those who continue to be at risk of Neisseria meningitidis serogroup A infection

Meningococcal polysaccharide A, C, W135 and Y vaccine
ACWY Vax® (GSK)
Injection, powder for reconstitution, capsular polysaccharide antigens of Neisseria meningitidis groups A, C, W135, and Y, net price single-dose vial (with syringe containing diluent) = £16.73
Dose by deep subcutaneous injection, ADULT and CHILD over 5 years 0.5 mL as a single dose, booster dose for those at continued risk, 0.5 mL every 5 years

Meningococcal group B vaccine
Bexsero® (Novartis Vaccines)
Injection, suspension of antigen of Neisseria meningitidis group B (produced in E. coli cells by recombinant DNA technology), adsorbed onto aluminium hydroxide, net price 0.5 mL prefilled syringe = £75.00
Excipients may include traces of kanamycin
Dose by deep intramuscular injection preferably into deltoid region (or anterolateral thigh in infants), ADULT and CHILD over 11 years (unimmunised), 2 doses of 0.5 mL separated by an interval of at least 1 month, booster dose of 0.5 mL given between 1–2 years of age, CHILD 2–6 months, primary immunisation 3 doses of 0.5 mL separated by an interval of at least 1 month, booster dose of 0.5 mL given between 1–2 years of age, CHILD 6 months–1 year (unimmunised), primary immunisation 2 doses of 0.5 mL separated by an interval of at least 2 months, booster dose of 0.5 mL given between 1–2 years of age and at least 2 months after completion of primary immunisation, CHILD 1–2 years (unimmunised), primary immunisation 2 doses of 0.5 mL separated by an interval of at least 2 months, booster dose of 0.5 mL given 12–24 months after completion of primary immunisation, CHILD 2–11 years (unimmunised), 2 doses of 0.5 mL separated by an interval of at least 2 months

Mumps vaccine
Single antigen vaccine
No longer available in the UK

Combined vaccines
See MMR Vaccine

Pertussis vaccine

Pertussis vaccine is given as a combination preparation containing other vaccines (see Diphtheria containing Vaccines). Acellular vaccines are derived from highly purified components of Bordetella pertussis. Primary immunisation against pertussis (whooping cough) requires 3 doses of an acellular pertussis-containing vaccine (see Immunisation schedule, section 14.1), given at intervals of 1 month from the age of 2 months. All children up to the age of 10 years should receive primary immunisation with diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed). A booster dose of an acellular pertussis-containing vaccine should ideally be given 3 years after the primary course, although, the interval can be reduced to 1 year if the primary course was delayed.

Children aged 1–10 years who have not received a pertussis-containing vaccine as part of their primary immunisation should be offered 1 dose of a suitable pertussis-containing vaccine; after an interval of at least 1 year, a booster dose of a suitable pertussis-containing vaccine should be given. Immunisation against pertussis is not routinely recommended in individuals over 10 years of age.

Vaccination of pregnant women against pertussis
In response to the pertussis outbreak, the UK health departments introduced a temporary programme (October 2012) to vaccinate pregnant women against pertussis, and this programme will continue until further notice. The aim of the programme is to boost the levels of pertussis-specific antibodies that are transferred through the placenta, from the mother to the fetus, so that the newborn is protected before routine immunisation begins at 2 months of age.

Pregnant women should be offered a single dose of acellular pertussis-containing vaccine (as adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine; Repevax®) between 28 to 38 weeks of pregnancy; the optimal time for vaccination is between 28–32 weeks of pregnancy. Pregnant women should be offered a single dose of acellular pertussis-containing vaccine up to the onset of labour if they missed the opportunity for vaccination at 28–38 weeks of pregnancy. A single dose of acellular pertussis-containing vaccine may also be offered to new mothers, who have never previously been vaccinated against pertussis, until the child receives the first vaccination.

While this programme is in place, women who become pregnant again should be offered vaccination during each pregnancy to maximise transplacental transfer of antibody.

Contacts Vaccination against pertussis should be considered for close contacts of cases with pertussis who have been offered antibacterial prophylaxis (Table 2, section 5.1). Unimmunised or partially immunised contacts under 10 years of age should complete their vaccination against pertussis. A booster dose of an acellular pertussis-containing vaccine is recommended for contacts aged over 10 years who have not received a pertussis-containing vaccine in the last 5 years and who have not received adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine in the last month.
Pneumococcal vaccines

Pneumococcal vaccines protect against infection with Streptococcus pneumoniae (pneumococcus); the vaccines contain polysaccharide from capsular pneumococci.

**Pneumococcal polysaccharide vaccine** contains purified polysaccharide from 23 capsular types of pneumococci, whereas pneumococcal polysaccharide conjugate vaccine (adsorbed) contains polysaccharide from either 10 capsular types (Synflorix®) or 13 capsular types (Prevenar 13®) and the polysaccharide is conjugated to protein.

The 13-valent conjugate vaccine (Prevenar 13®) is used in the childhood immunisation schedule. The recommended schedule consists of 3 doses, the first at 2 months of age, the second at 4 months, and the third at 12–13 months (see Immunisation Schedule, section 14.1).

Pneumococcal vaccination is recommended for individuals at increased risk of pneumococcal infection as follows:

- age over 65 years;
- asplenia or splenic dysfunction (including homozygous sickle cell disease and coeliac disease which could lead to splenic dysfunction);
- chronic respiratory disease (includes asthma treated with continuous or frequent use of a systemic corticosteroid);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- diabetes mellitus requiring insulin or oral hypoglycaemic drugs;
- immune deficiency because of disease (e.g. HIV infection) or treatment (including prolonged systemic corticosteroid treatment for over 1 month)

A patient card and information leaflet for patients with asplenia are available from the Department of Health or in Scotland from the Scottish Executive, Public Health Division 1 (Tel (0131) 244 2501).

**Choice of vaccine** Children under 2 years at increased risk of pneumococcal infection (see list above) should receive the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) at the recommended ages, followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday (see below). Children at increased risk of pneumococcal infection presenting late for vaccination should receive 2 doses (separated by at least 1 month) of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) before the age of 12 months, and a third dose at 12–13 months. Children over 12 months and under 5 years (who have not been vaccinated or not completed the primary course) should receive a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) (2 doses separated by an interval of 2 months in the immunocompromised or those with asplenia or splenic dysfunction). All children under 5 years at increased risk of pneumococcal infection should receive a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday and at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children over 5 years and adults who are at increased risk of pneumococcal disease should receive a single dose of the 23-valent unconjugated pneumococcal polysaccharide vaccine.

**Revaccination** In individuals with higher concentrations of antibodies to pneumococcal polysaccharides, revaccination with the 23-valent pneumococcal polysaccharide vaccine more commonly produces adverse reactions. Revaccination is therefore not recommended, except every 5 years in individuals in whom the antibody concentration is likely to decline rapidly (e.g. asplenia, splenic dysfunction and nephrotic syndrome). If there is doubt, the need for revaccination should be discussed with a haematologist, immunologist, or microbiologist.
Further booster doses are only necessary for adults at special risk, such as travellers to endemic areas, or laboratory staff likely to be exposed to the viruses, or healthcare workers in possible contact with cases; booster doses should be given to such individuals every 10 years.

Live (oral) poliomyelitis vaccine is no longer available for routine use; its use may be considered during large outbreaks, but advice should be sought from Public Health England. The live (oral) vaccine poses a very rare risk of vaccine-associated paralytic polio because the attenuated strain of the virus can revert to a virulent form. For this reason the live (oral) vaccine must not be used for immunosuppressed individuals or their household contacts. The use of inactivated poliomyelitis vaccine removes the risk of vaccine-associated paralytic polio altogether.

**Travel** Unimmunised travellers to areas with a high incidence of poliomyelitis should receive a full 3-dose course of a preparation containing inactivated poliomyelitis vaccine. Those who have not been vaccinated in the last 10 years should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine. Information about countries with a high incidence of poliomyelitis can be obtained from www.travax.nhs.uk or from the National Travel Health Network and Centre (www.nathnac.org).

**Rabies vaccine**

Rabies vaccine contains inactivated rabies virus cultivated in either human diploid cells or purified chick embryo cells; vaccines are used for pre- and post-exposure prophylaxis.

**Pre-exposure prophylaxis**

Immunisation should be offered to those at high risk of exposure to rabies—laboratory staff who handle the rabies virus, those working in quarantine stations, animal handlers, veterinary surgeons and field workers who are likely to be bitten by infected wild animals, certain port officials, and bat handlers. Transmission of rabies by humans has not been recorded but it is advised that those caring for patients with the disease should be vaccinated. Immunisation against rabies is also recommended where there is limited access to prompt medical care for those living in areas where rabies is enzootic, for those travelling to such areas for longer than 1 month, and for those on shorter visits who may be exposed to unusual risk.
Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

Up-to-date country-by-country information on the incidence of rabies can be obtained from the National Travel Health Network and Centre (www.nathnac.org) and, in Scotland, from Health Protection Scotland (www.hps.scot.nhs.uk).

Immunisation against rabies requires 3 doses of rabies vaccine, with further booster doses for those who remain at frequent risk. To ensure continued protection in persons at high risk (e.g. laboratory workers), the concentration of antirabies antibodies in plasma is used to determine the intervals between doses.

Post-exposure management Following potential exposure to rabies, the wound or site of exposure (e.g. mucous membrane) should be cleansed under running water and washed for several minutes with soapy water as soon as possible after exposure. Disinfectant and a simple dressing can be applied, but suturing should be delayed because it may increase the risk of introducing rabies virus into the nerves.

Post-exposure prophylaxis against rabies depends on the level of risk in the country, the nature of exposure, and the individual’s immunity. In each case, expert risk assessment and advice on appropriate management should be obtained from the local Public Health England Centre or Public Health England’s Virus Reference Department, Colindale (tel. (020) 8200 4400) or the PHF Colindale Duty Doctor (tel. (020) 8200 8668), in Wales from the Public Health Wales local Health Protection Team or Public Health Wales Virus Reference Laboratory (tel. (029) 2074 7747), in Scotland from the local on-call infectious diseases consultant, and in Northern Ireland from the Public Health Agency Duty Room (tel (028) 9055 3997/(028) 9063 2662) or the Regional Virology Service (tel. (028) 9024 0505).

There are no specific contra-indications to the use of rabies vaccine for post-exposure prophylaxis and its use should be considered whenever a patient has been attacked by an animal in a country where rabies is enzootic, even if there is no direct evidence of rabies in the attacking animal. Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis.

For post-exposure prophylaxis of fully immunised individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine), 2 doses of cell-derived vaccine are likely to be sufficient; the first dose is given on day 0 and the second dose is given between days 3–7. Rabies immunoglobulin is not necessary in such cases.

Post-exposure treatment for unimmunised individuals (or those whose prophylaxis is possibly incomplete) comprises 5 doses of rabies vaccine given over 1 month (on days 0, 3, 7, 14, and the fifth dose is given between day 28–30); also, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin (section 14.5.2) is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine. The immunisation course can be discontinued if it is proved that the individual was not at risk.

### Rabies Vaccine

**Indications** immunisation against rabies

**Cautions** see section 14.1

**Contra-indications** see section 14.1; but see also Post-exposure Management in notes above

**Pregnancy** see p. 829

**Breast-feeding** see p. 829

**Side-effects** see section 14.1; also reported paresis

**Dose**
- Pre-exposure prophylaxis, by intramuscular injection in deltoid region or anterolateral thigh in infants, 1 mL on days 0, 7, and 28 (3rd dose can be given from day 21 if insufficient time before travel), for those at continuous risk, measure plasma-concentration of antirabies antibodies every 6 months and give a booster dose if the titre is less than 0.5 units/mL; for those at frequent risk, give a single reinforcing dose 1 year after the primary course is completed, and then give booster doses every 3–5 years or determine the frequency of booster doses according to plasma concentration of antirabies antibodies; for those at infrequent risk, consider giving a booster dose 10 years after the primary course is completed
- Post-exposure prophylaxis, by intramuscular injection in deltoid region or anterolateral thigh in infants, 1 mL (see notes above)

#### Rabies Vaccine (Sanofi Pasteur)

**Injection**, powder for reconstitution, freeze-dried inactivated Wistar rabies virus strain PM/ WI 1503-3M cultivated in human diploid cells, net price single-dose vial with syringe containing diluent = £33.90

**Excipients** include neomycin

#### Rabipur® (Novartis Vaccines)

**Injection**, powder for reconstitution, freeze-dried inactivated Flury LEF rabbit virus strain cultivated in chick embryo cells, net price single-dose vial = £28.80

**Excipients** include neomycin

### Rotavirus Vaccine

Rotavirus vaccine is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection. The recommended schedule consists of 2 doses, the first at 2 months of age, and the second at 3 months of age (see Immunisation schedule, section 14.1). The first dose of rotavirus vaccine must be given between 6–15 weeks of age and the second dose should be given after an interval of at least 4 weeks; the vaccine should not be started in children 15 weeks of age or older. Ideally, the full course should be completed before 16 weeks of age to provide protection before the main burden of disease, and to avoid a temporal association between vaccination and intussusception; the course must be completed before 24 weeks of age.

The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with immunosuppressed close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus. Carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby’s nappies.
ROTAVIRUS VACCINE

Indications immunisation against gastro-enteritis caused by rotavirus

Cautions see section 14.1; also diarrhoea or vomiting (postpone vaccination); immunosuppressed close contacts (see notes above)

Contra-indications see section 14.1, however, with the exception of severe combined immunodeficiency, benefit from vaccination is likely to outweigh the risk in other types of immunosuppression—if there is any doubt, seek specialist advice; also predisposition to, or history of, intussusception

Side-effects see section 14.1

Dose
- By mouth, CHILD over 6 weeks, 2 doses of 1.5 mL, separated by an interval of at least 4 weeks; first dose must be given between 6–15 weeks of age; course should be completed before 24 weeks of age (preferably before 16 weeks)

Rotarix\textregistered\textsuperscript{\textregistered} (GSK) (flu) Oral suspension, live attenuated rotavirus (RIX4414 strain), net price 1.5 mL prefilled oral syringe = £34.76

Rubella vaccine

A combined measles, mumps and rubella vaccine (MMR vaccine) aims to eliminate rubella (German measles) and congenital rubella syndrome. MMR vaccine is used for childhood vaccination as well as for vaccinating adults (including women of child-bearing age) who do not have immunity against rubella (see MMR vaccine, p. 842)

\section*{Single antigen vaccine}

No longer available in the UK, the combined live measles, mumps and rubella vaccine is a suitable alternative

\section*{Combined vaccines}

see MMR vaccine

Smallpox vaccine

Limited supplies of smallpox vaccine are held at the Specialist and Reference Microbiology Division, Public Health England Colindale (Tel. (020) 8200 4400) for the exclusive use of workers in laboratories where pox viruses (such as vaccinia) are handled.

If a wider use of the vaccine is being considered, Guidelines for smallpox response and management in the post-eradication era should be consulted at www.hpa.org.uk.

Tetanus vaccines

Tetanus vaccine contains a cell-free purified toxin of Clostridium tetani adsorbed on aluminium hydroxide or aluminium phosphate to improve antigenicity.

Primary immunisation for children under 10 years consists of 3 doses of a combined preparation containing adsorbed tetanus vaccine (see Diphtheria-containing Vaccines), with an interval of 1 month between doses. Following routine childhood vaccination, 2 booster doses of a preparation containing adsorbed tetanus vaccine are recommended, the first before school entry and the second before leaving school (see Immunisation schedule, section 14.1).

The recommended schedule of tetanus vaccination not only gives protection against tetanus in childhood but also gives the basic immunity for subsequent booster doses. In most circumstances, a total of 5 doses of tetanus vaccine is considered sufficient for long term protection.

For primary immunisation of adults and children over 10 years previously unimmunised against tetanus, 3 doses of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine are given with an interval of 1 month between doses (see Diphtheria-containing Vaccines).

Cautions See also section 14.1. When an individual presents for a booster dose but has been vaccinated following a tetanus-prone wound, the vaccine preparation administered at the time of injury should be determined. If this is not possible, the booster should still be given to ensure adequate protection against all antigens in the booster vaccine.

Very rarely, tetanus has developed after abdominal surgery; patients awaiting elective surgery should be asked about tetanus immunisation and immunised if necessary.

Parenteral drug abuse is also associated with tetanus; those abusing drugs by injection should be vaccinated if unimmunised—booster doses should be given if there is any doubt about their immunisation status.

All laboratory staff should be offered a primary course if unimmunised.

Travel recommendations see section 14.6.

Contra-indications See section 14.1.

Pregnancy See p. 829.

Breast-feeding See p. 829.

Side effects See section 14.1.

Wounds Wounds are considered to be tetanus-prone if they are sustained more than 6 hours before surgical treatment or at any interval after injury and are puncture-type (particularly if contaminated with soil or manure) or show much devitalised tissue or are septic or are compound fractures or contain foreign bodies. All wounds should receive thorough cleansing.

- For clean wounds: fully immunised individuals (those who have received a total of 5 doses of a tetanus-containing vaccine at appropriate intervals) and those whose primary immunisation is complete (with boosters up to date), do not require tetanus vaccine; individuals whose primary immunisation is incomplete or whose boosters are not up to date require a reinforcing dose of a tetanus-containing vaccine (followed by further doses as required to complete the schedule); non-immunised individuals (or those whose immunisation status is not known or who have been fully immunised but are now immunocompromised) should be given a dose of the appropriate tetanus-containing vaccine immediately (followed by completion of the full course of the vaccine if records confirm the need).

- For tetanus-prone wounds: management is as for clean wounds with the addition of a dose of tetanus immunoglobulin (section 14.5.2) given at a different site; in fully immunised individuals and those whose primary immunisation is complete (with boosters up to date) the immunoglobulin is needed only if
the risk of infection is especially high (e.g. contamination with manure). Antibacterial prophylaxis (with benzylpenicillin, co-amoxiclav, or metronidazole) may also be required for tetanus-prone wounds.

**Combined vaccines**

See Diphtheria-containing Vaccines

---

**Tick-borne encephalitis vaccine**

Tick-borne encephalitis vaccine contains inactivated tick-borne encephalitis virus cultivated in chick embryo cells. It is recommended for immunisation of those working in, or visiting, high-risk areas (see International Travel, section 14.6). Those working, walking or camping in warm forested areas of Central and Eastern Europe, Scandinavia, Northern and Eastern China, and some parts of Japan, particularly from April to November when ticks are most prevalent, are at greatest risk of tick-borne encephalitis. For full protection, 3 doses of the vaccine are required; booster doses are required every 3–5 years for those still at risk. Ideally, immunisation should be completed at least one month before travel.

---

**TICK-BORNE ENCEPHALITIS VACCINE, INACTIVATED**

**Indications**  immunisation against tick-borne encephalitis

**Cautions**  see section 14.1

**Contra-indications**  see section 14.1

**Pregnancy**  see p. 829

**Breast-feeding**  see p. 829

**Side-effects**  see section 14.1

**Dose**

- Initial immunisation, by intramuscular injection in deltoid region or anterolateral thigh in infants, ADULT and CHILD over 16 years, 3 doses each of 0.5 mL, second dose after 1–3 months and third dose after further 5–12 months; CHILD 1–16 years 3 doses of 0.25 mL, second dose after 1–3 months and third dose after further 5–12 months; ELDERLY over 60 years and immunocompromised (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved

**Note**  To achieve more rapid protection, second dose may be given 14 days after first dose

- Booster doses, give first dose within 3 years after initial course completed, then every 3–5 years

**TicoVac® (MASTA)**

- **Injection**, suspension, formaldehyde-inactivated Neudorff tick-borne encephalitis virus strain (cultivated in chick embryo cells) adsorbed onto hydrated aluminium hydroxide, net price 0.25–mL prefilled syringe ($\text{TicoVac Junior}^\text{®}$) = £28.00, 0.5–mL prefilled syringe = £32.00

**Excipients**  include gentamicin and neomycin

---

**Typhoid vaccines**

Typhoid vaccine is available as VI capsular polysaccharide (from Salmonella typhi) vaccine for injection and as live attenuated Salmonella typhi for oral use.

Typhoid immunisation is advised for:

- travellers to areas where typhoid is endemic, especially if staying with or visiting local people;
- travellers to endemic areas where frequent or prolonged exposure to poor sanitation and poor food hygiene is likely;
- laboratory personnel who, in the course of their work, may be exposed to Salmonella typhi.

Typhoid vaccination is not a substitute for scrupulous personal hygiene (see p. 858).

Capsular polysaccharide typhoid vaccine is usually given by intramuscular injection. Children under 2 years may respond suboptimally to the vaccine, but children aged between 1–2 years should be immunised if the risk of typhoid fever is considered high (immunisation is not recommended for infants under 12 months). Revaccination is needed every 3 years on continued exposure.

**Oral typhoid vaccine**  is a live attenuated vaccine contained in an enteric-coated capsule. One capsule taken on alternate days for a total of 3 doses, provides protection 7–10 days after the last dose. Protection may persist for up to 3 years in those constantly (or repeatedly) exposed to Salmonella typhi, but those who only occasionally travel to endemic areas require further courses at intervals of 1 year.

**Interactions**  Oral typhoid vaccine is inactivated by concomitant administration of antibacterials or antimalarials:

- Antibacterials should be avoided for 3 days before and after oral typhoid vaccination;
- Mefloquine should be avoided for at least 12 hours before or after oral typhoid;
- For other antimalarial vaccination with oral typhoid vaccine should be completed at least 3 days before the first dose of the antimalarial (except proguanil hydrochloride with atovaquone, which may be given concomitantly).

**TYPHOID VACCINE**

**Indications**  immunisation against typhoid fever

**Cautions**  section 14.1; **interactions:** see above and Appendix 1 (vaccines)

**Contra-indications**  section 14.1; also for oral vaccine, acute gastro-intestinal illness

**Pregnancy**  see p. 829

**Breast-feeding**  see p. 829

**Side-effects**  section 14.1

**Dose**

- See under preparations

**Typhoid polysaccharide vaccine for injection**

**Typhertix® (GSK)**

- **Injection**, Vi capsular polysaccharide typhoid vaccine, 50 micrograms/mL virulence polysaccharide antigen of Salmonella typhi, net price 0.5mL prefilled syringe = £9.93

**Dose**  by intramuscular injection, 0.5 mL at least 2 weeks before potential exposure to typhoid infection, CHILD under 2 years (see notes above)

**Note**  May be difficult to obtain

**Typhim Vi® (Sanofi Pasteur)**

- **Injection**, Vi capsular polysaccharide typhoid vaccine, 50 micrograms/mL virulence polysaccharide antigen of formaldehyde-inactivated Salmonella typhi, net price 0.5mL prefilled syringe = £9.30

**Dose**  by intramuscular injection, 0.5 mL, at least 2 weeks before potential exposure to typhoid infection CHILD under 2 years (see notes above)
**14.4 Vaccines and antisera**

**Poly saccharide vaccine with hepatitis A vaccine**
See Hepatitis A Vaccine

**Typhoid vaccine, live (oral)**

Vivotif® (Crucell) Flh
Capsules, e/c, live attenuated Salmonella typhi (Ty21a), net price 3-cap pack = £14.77. Label: 25, counselling, administration

Dose ADULT and CHILD over 6 years, 1 capsule on days 1, 3, and 5

Counselling Take one hour before a meal. Swallow as soon as possible after placing in mouth with a cold or lukewarm drink; it is important to store capsules in a refrigerator.

**Varicella–zoster vaccines**

The live varicella–zoster vaccines, Varilrix® and Varivax®, are licensed for immunisation against varicella (chickenpox) in seronegative individuals. They are not recommended for routine use in children, but can be given to seronegative healthy children over 1 year who come into close contact with individuals at high risk of severe varicella infections. The Department of Health recommends these vaccines for seronegative healthcare workers who come into direct contact with patients. Those with a history of chickenpox or shingles can be considered immune, but healthcare workers with a negative or uncertain history should be tested.

Rarely, the varicella–zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:

- varicella-susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

Healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and be allowed to continue working unless in contact with patients at high risk of severe varicella.

The high potency, live varicella–zoster vaccine, Zostavax®, is recommended for the prevention of herpes zoster (shingles) in adults 70 years of age; however, it can be given up to 80 years of age. A catch-up programme with Zostavax® will be offered from 1 September 2013 to all those born between 2 September 1933 and 1 September 1934. A single dose of Zostavax® is likely to give protection for at least 7 years, but the need for, or timing of, a booster dose has not been established. Although Zostavax® is not recommended for the treatment of shingles or post-herpetic neuralgia, it can be given to those with a previous history of shingles; ideally the vaccine should be delayed until systemic antiviral therapy has been completed.

Varicella–zoster immunoglobulin is used to protect susceptible individuals at increased risk of varicella infection, see p. 855.

**VARICELLA-ZOSTER VACCINE**

**Indications** see notes above and preparations below

**Cautions** see section 14.1; also post-vaccination close-contact with susceptible individuals (see notes above)

**Contra-indications** see section 14.1

**Pregnancy** avoid pregnancy for 3 months after vaccination; see also p. 829

**Breast-feeding** see p. 829

**Side-effects** see section 14.1; also conjunctivitis and varicella-like rash; rarely thrombocytopenia

**Dose**
- See under preparations

Varilrix® (GSK) Flh
Injection, powder for reconstitution, live attenuated varicella–zoster virus (Oka/Merck strain) propagated in human diploid cells, net price 0.5-mL vial (with diluent) = £27.31

Excipients include neomycin

Dose prevention of varicella infection (chickenpox), by subcutaneous injection preferably into deltoid region, ADULT and CHILD over 1 year (see notes above), 2 doses of 0.5 mL separated by an interval of at least 6 weeks (minimum 4 weeks)

Varivax® (Sanofi Pasteur) Flh
Injection, powder for reconstitution, live attenuated varicella-zoster virus (Oka/Merck strain) propagated in human diploid cells, net price 0.5-mL vial (with diluent) = £30.28

Excipients include gelatin and neomycin

Dose prevention of varicella infection (chickenpox), by intramuscular or subcutaneous injection into deltoid region (or higher anterolateral thigh in children), ADULT and CHILD over 13 years (see notes above), 2 doses of 0.5 mL separated by 4–8 weeks, CHILD 1–13 years (see notes above) 2 doses of 0.5 mL separated by an interval of at least 4 weeks (two doses separated by 12 weeks in children with asymptomatic HIV infection)

Zostavax® (Sanofi Pasteur) Flh
Injection, powder for reconstitution, live attenuated varicella–zoster virus (Oka/Merck strain) propagated in human diploid cells, net price single-dose vial (with syringe containing diluent) = £99.96

Excipients include gelatin and neomycin

Dose prevention of herpes zoster (shingles), by subcutaneous injection preferably into deltoid region, ADULT 70–80 years, 0.65 mL as a single dose

Note Advice in BNF may differ from that in product literature

**Yellow fever vaccine**

Live yellow fever vaccine is indicated for those traveling or living in areas where infection is endemic (see p. 857) and for laboratory staff who handle the virus or who handle clinical material from suspected cases. Infants under 6 months of age should not be vaccinated because there is a small risk of encephalitis; infants aged 6–9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (seek expert advice). The immunity which probably lasts for life is officially accepted for 10 years starting from 10 days after primary immunisation and for a further 10 years immediately after revaccination.

Very rare, vaccine-associated adverse effects have been reported, such as viscerotopic disease (yellow fever vaccine-associated viscerotopic disease, YEL-AVD), a syndrome which may include metabolic acidosis, muscle and liver cytolysis, and multi-organ failure. Neurological disorders (yellow fever vaccine-associated neurotropic disease, YEL-AND) such as encephalitis have also been reported. These very rare adverse effects usually have occurred after the first dose of yellow fever vaccine in those with no previous immunity.

**Pregnancy** Live yellow fever vaccine should not be given during pregnancy because there is a theoretical
14 Immunological products and vaccines

14.5 Immunoglobulins

852 14.5 Immunoglobulins

BNF 68

---

risk of fetal infection. Pregnant women should be advised not to travel to areas at high risk of yellow fever. If exposure cannot be avoided during pregnancy, then the vaccine should be given if the risk from disease in the mother outweighs the risk to the fetus from vaccination.

Breast-feeding
Avoid; seek specialist advice if exposure to virus cannot be avoided.

YELLOW FEVER VACCINE, LIVE

Indications
immunisation against yellow fever

Cautions
see section 14.1; also individuals over 60 years—greater risk of vaccine-associated adverse effects, see notes above

Contra-indications
see section 14.1 and notes above; also children under 6 months; history of thymus dysfunction

Pregnancy
see notes above

Breast-feeding
see notes above

Side-effects
see section 14.1; also reported neurotropic and viscerotropic disease (see notes above)

Dose
- By deep subcutaneous injection, ADULT and CHILD over 9 months, 0.5 mL (see also notes above)

Yellow Fever Vaccine, Live

Injection, powder for reconstitution, live, attenuated 17D-204 strain of yellow fever virus, cultivated in chick embryos; single dose vial with syringe containing 0.5 mL, diluent

Available (only to designated Yellow Fever Vaccination centres) as Stamaril®

14.5.1 Normal immunoglobulin

Human immunoglobulin is a sterile preparation of concentrated antibodies (immune globulins) recovered from pooled human plasma or serum obtained from outside the UK, tested and found non-reactive for hepatitis B surface antigen and for antibodies against hepatitis C virus and human immunodeficiency virus (types 1 and 2). A global shortage of human immunoglobulin and the rapidly increasing range of clinical indications for treatment with immunoglobulins has resulted in the need for a Demand Management programme in the UK (for further information consult www.ivig.nhs.uk and Clinical Guidelines for Immunoglobulin Use, www.gov.uk/dh.

Immunoglobulins of animal origin (antisera) were frequently associated with hypersensitivity reactions and are no longer used.

Further information on the use of immunoglobulins is included in the Health Protection Agency’s Immunoglobulin Handbook www.hpa.org.uk, and in the Department of Health’s publication, Immunisation against Infectious Disease, www.gov.uk/dh.

Availability
Normal immunoglobulin for intramuscular administration is available from some regional Public Health laboratories for protection of contacts and the control of outbreaks of hepatitis A, measles, and rubella only. For other indications, subcutaneous or intravenous normal immunoglobulin should be purchased from the manufacturer.

Disease-specific immunoglobulins (section 14.5.2) are available from some regional Public Health laboratories, with the exception of tetanus immunoglobulin which is available from BPL, hospital pharmacies, or blood transfusion departments. Rabies immunoglobulin is available from the Specialist and Reference Microbiology Division, Public Health England, Colindale. Hepatitis B immunoglobulin required by transplant centres should be obtained commercially.

In Scotland all immunoglobulins are available from the Scottish National Blood Transfusion Service (SNBTS).

In Wales all immunoglobulins are available from the Welsh Blood Service (WBS).

In Northern Ireland all immunoglobulins are available from the Northern Ireland Blood Transfusion Service (NIBTS).

14.5.1 Normal immunoglobulin

Human normal immunoglobulin (‘HNIG’) is prepared from pools of at least 1000 donations of human plasma; it contains immunoglobulin G (IgG) and antibodies to hepatitis A, measles, mumps, rubella, varicella, and other viruses that are currently prevalent in the general population.

Normal immunoglobulin may interfere with the immune response to live virus vaccines which should therefore only be given at least 3 weeks before or 3 months after an injection of normal immunoglobulin (this does not apply to yellow fever vaccine since normal immunoglobulin does not contain antibody to this virus).

Uses
Normal immunoglobulin (containing 10%–18% protein) is administered by intramuscular injection for the protection of susceptible contacts against hepatitis A virus (infectious hepatitis), measles and, to a lesser extent, rubella. Injection of immunoglobulin produces immediate protection lasting several weeks.

Normal immunoglobulin (containing 3%–12% protein) for intravenous administration is used as replacement therapy for patients with congenital agammaglobulinaemia and hypogammaglobulinaemia, and for the short-term treatment of idiopathic thrombocytopenic purpura and Kawasaki disease; it is also used for the prophylaxis of infection following bone-marrow transplantation and in children with symptomatic HIV infection who have recurrent bacterial infections. Normal immunoglobulin for replacement therapy may also be given intramuscularly or subcutaneously, but intravenous formulations are normally preferred. Intravenous immunoglobulin is also used in the treatment of Guillain-Barré syndrome as an alternative to plasma exchange.

For guidance on the use of intravenous normal immunoglobulins and alternative therapies for certain conditions, consult Clinical Guidelines for Immunoglobulin Use (www.gov.uk/dh).
Hepatitis A
Hepatitis A vaccine is preferred for individuals at risk of infection (see p. 836) including those visiting areas where the disease is highly endemic (all countries excluding Northern and Western Europe, North America, Japan, Australia, and New Zealand). In unimmunised individuals, transmission of hepatitis A is reduced by good hygiene. Intramuscular normal immunoglobulin is no longer recommended for routine prophylaxis in travellers, but it may be indicated for immunocompromised patients if their antibody response to the vaccine is unlikely to be adequate.

Measles
Intravenous or subcutaneous normal immunoglobulin may be given to prevent or attenuate an attack of measles in individuals who do not have adequate immunity. Intramuscular normal immunoglobulin should be given as soon as possible, preferably within 14 days of exposure to the primary case. However, normal immunoglobulin can still be given to contacts at risk of severe disease up to 28 days after exposure to the primary case. Hepatitis A vaccine can be given at the same time, but it should be given at a separate injection site.

Rubella
Intramuscular immunoglobulin after exposure to rubella does not prevent infection in non-immune contacts and is not recommended for protection of pregnant women exposed to rubella. It may, however, reduce the likelihood of a clinical attack which may possibly reduce the risk to the fetus. Risk of intrauterine transmission is greatest in the first 11 weeks of pregnancy, between 16 and 20 weeks there is minimal risk of deafness only, after 20 weeks there is no increased risk. Intramuscular normal immunoglobulin should be used only if termination of pregnancy would be unacceptable to the pregnant woman—it should be given as soon as possible after exposure. Serological follow-up of recipients is essential to determine if the woman has become infected despite receiving immunoglobulin.

For routine prophylaxis against Rubella, see MMR vaccine (p. 842).

14.5.1 Normal immunoglobulin

**NORMAL IMMUNOGLOBULIN**

**Indications**

- see notes above

**Cautions**

- hypo- or agammaglobulinaemia with or without IgA deficiency; interference with live virus vaccines—see p. 852

**Intravenous use**

- thrombophilic disorders, or risk factors for arterial or venous thromboembolic events; obesity, ensure adequate hydration, renal insufficiency

**Contra-indications**

- patients with selective IgA deficiency who have known antibody against IgA

**Renal impairment**

- monitor for acute renal failure; also reported with thromboembolic events including myocardial infarction, stroke, pulmonary embolism, and deep vein thrombosis

**Note**

- Adverse reactions are more likely to occur in patients receiving normal immunoglobulin for the first time, or following a prolonged period between treatments, or when a different brand of normal immunoglobulin is administered.

**Dose**

- See under preparations

**Note**

- Antibody titres can vary widely between normal immunoglobulin preparations from different manufacturers—formulations are not interchangeable; patients should be maintained on the same formulation throughout long-term treatment to avoid adverse effects

**For intramuscular use**

**Normal Immunoglobulin**

- Normal immunoglobulin injection. 250-mg vial; 750-mg vial

**Dose**

- by deep intramuscular injection, to control outbreaks of hepatitis A (see notes above), 500 mg; CHILD under 10 years 250 mg

**Rubella in pregnancy, prevention of clinical attack, 750 mg Available from the Centre for Infections and other regional Health Protection Agency offices (for contacts and control of outbreaks only, see above)**

**For subcutaneous use**

**Gammanorm®**

- (Octapharma) Normal immunoglobulin (protein 16.5%) injection, net price 1.85 mg (10 mL) = £96.77, 3.3 g (20 mL) = £193.55

**Electrolytes**

- Na⁺ 1.09 mmol/10-mL vial

**Dose**

- by subcutaneous infusion, antibody deficiency syndromes, consult product literature

**Note**

- May be administered by intramuscular injection (if subcutaneous route not possible) but not for patients with thrombocytopenia or other bleeding disorders

**Hizentra®**

- (CSL Behring) Normal immunoglobulin (protein 20%) injection, net price 1 g (5 mL) = £45.90, 2 g (10 mL) = £91.80, 4 g (20 mL) = £183.60

**Note**

- Contains L-proline, contra-indicated in patients with hyperprolinaemia

**Dose**

- by subcutaneous infusion, antibody deficiency syndromes, consult product literature
**Subcutiva**® (Baxter) | **Subcutvin**® (Octapharma)<br>Normal immunoglobulin (protein 16%) injection, net price 800 mg (5 mL) = £32.56, 1.6 g (10 mL) = £65.12<br><br>Dose by subcutaneous infusion, ADULT and CHILD over 12 years antibody deficiency syndromes, consult product literature<br><br>Note May be administered by intramuscular injection (if subcutaneous route not possible) but not for patients with thrombocytopenia or other bleeding disorders

**Subgammaglobulin A**® (BPL) | **Subgammaglobulin A**® (Octapharma)<br>Normal immunoglobulin (protein 14%-18%) injection, net price 250-mg vial = £11.20, 750-mg vial = £34.20, 1.5-g vial = £68.40<br><br>Dose by subcutaneous infusion, antibody deficiency syndromes, consult product literature<br><br>By intramuscular injection, Hepatitis A prophylaxis in outbreaks (see notes above), ADULT and CHILD over 10 years, 750 mg. CHILD under 10 years, 500 mg.<br><br>Rubella, in pregnancy, prevention of clinical attack (see also notes above). 750 mg.<br><br>Note Subgammaglobulin A® is not licensed for prophylactic use, but due to difficulty in obtaining suitable immunoglobulin products, the Health Protection Agency recommends intramuscular use for prophylaxis against Hepatitis A or rubella.

**Aramgam®**<br>Intravenous infusion, human normal immunoglobulin, protein 5%, net price 2.5 g (50 mL) = £145.00, 5 g (100 mL) = £290.00, 10 g (200 mL) = £580.00, 20 g (400 mL) = £1160.00<br><br>Excipients include glucose 50 mg/mL.

**Flebogamma® DIF** (Grifols)<br>Intravenous infusion, human normal immunoglobulin, protein 5%, net price 0.5 g (10 mL) = £30.00, 2.5 g (50 mL) = £150.00, 5 g (100 mL) = £300.00, 10 g (200 mL) = £600.00, 20 g (400 mL) = £1200.00<br><br>protein 10%, 5 g (50 mL) = £300.00, 10 g (100 mL) = £600.00, 20 g (200 mL) = £1200.00<br><br>Note Both strengths contain sorbitol 50 mg/mL, contra-indicated in patients with hereditary fructose intolerance

**Gammagard S/D®** (Baxter) | **Gammagard S/D** (Pajit)<br>Intravenous infusion, (providing protein 5% or 10%), net price 5 g (with diluent) = £200.50, 10 g (with diluent) = £401.00.<br><br>**Gammagard S/D®** (BPL) | **Gammagard S/D** (Pajit)<br>Intravenous infusion, human normal immunoglobulin, protein 5%, net price 2.5 g (50 mL) = £104.50, 5 g (100 mL) = £209.00, 10 g (200 mL) = £418.00<br><br>Note Contains sorbitol 50 mg/mL; contra-indicated in patients with hereditary fructose intolerance

**GamaMune®** (Grifols)<br>Intravenous infusion, human normal immunoglobulin, protein 10%, net price 5 g (50 mL) = £250.00, 10 g (100 mL) = £500.00, 20 g (200 mL) = £1000.00<br><br>Note Use Glucose 5% intravenous infusion if dilution prior to infusion is required

**Intratect®** (Biotest UK)<br>Intravenous infusion, human normal immunoglobulin, protein 5%, net price 1 g (20 mL) = £45.00, 2.5 g (50 mL) = £112.50, 5 g (100 mL) = £225.00, 10 g (200 mL) = £450.00; protein 10%, 1 g (10 mL) = £45.00, 5 g (50 mL) = £225.00, 10 g (100 mL) = £450.00, 20 g (200 mL) = £900.00

**Kiovig®** (Baxter) | **Kiovig** (Pajit)<br>Intravenous infusion, human normal immunoglobulin (protein 10%), net price 1 g (10 mL) = £49.00, 2.5 g (25 mL) = £122.50, 5 g (50 mL) = £245.00, 10 g (100 mL) = £490.00, 20 g (200 mL) = £980.00, 30 g (300 mL) = £1470.00<br><br>Note Use Glucose 5% intravenous infusion, if dilution prior to administration is required

**Octagam®** (Octapharma)<br>Intravenous infusion, human normal immunoglobulin, protein 5%, net price 2.5 g (50 mL) = £1.02, 5 g (100 mL) = £2.04, 10 g (200 mL) = £4.08, 10% protein, 2 g (20 mL) = £1.17, 5 g (50 mL) = £2.93, 10 g (100 mL) = £5.86, 20 g (200 mL) = £11.73<br><br>Note Contains maltose (may cause falsely elevated results with blood glucose testing systems)

**Privigen®** (CSL Behring)<br>Intravenous infusion, human normal immunoglobulin (protein 10%), net price 2.5 g (25 mL) = £114.75, 5 g (50 mL) = £229.50, 10 g (100 mL) = £459.00, 20 g (200 mL) = £918.00<br><br>Note Contains L-proline; contra-indicated in patients with hyperprolinaemia

**Vigam®** (BPL) | **Vigam** (Pajit)<br>Intravenous infusion, human normal immunoglobulin (protein 5%), net price 2.5 g (50 mL) = £95.00, 5 g (100 mL) = £209.00, 10 g (200 mL) = £418.00<br><br>Note Contains sucrose (see Renal impairment, above)

---

**Disease-specific immunoglobulins**

Specific immunoglobulins are prepared by pooling the plasma of selected human donors with high levels of the specific antibody required. For further information, see Immunoglobulin Handbook (www.hpa.org.uk).

There are no specific immunoglobulins for hepatitis A, measles, or rubella—normal immunoglobulin, section 14.5.1 is used in certain circumstances. There is no specific immunoglobulin nor MMR vaccine is effective as post-exposure prophylaxis.

**Hepatitis B**

Disease-specific hepatitis B immunoglobulin (‘HBIG’) is available for use in association with hepatitis B vaccine for the prevention of infection in laboratory and other personnel who have been accidentally inoculated with hepatitis B virus, and in infants born to mothers who have become infected with this virus in pregnancy or who are high-risk carriers (see Hepatitis B Vaccine, p. 838). Hepatitis B immunoglobulin will not inhibit the antibody response when given at the same time as hepatitis B vaccine but should be given at different sites.

An intravenous and subcutaneous preparation of hepatitis B-specific immunoglobulin is licensed for the prevention of hepatitis B recurrence in HBV-DNA negative patients who have undergone liver transplantation for liver failure caused by the virus.

**Hepatitis B IMMUNOGLOBULIN**

**Indications** prophylaxis against hepatitis B infection

**Cautions** IgA deficiency; interference with live virus vaccines see under Normal Immunoglobulin, p. 852.
Side-effects injection site reactions; less frequently, buccal ulceration, glossitis, abdominal pain, chest pain, dyspnoea, anaphylaxis, tremor, dizziness, headache, arthralgia; for side-effects associated with intravenous immunoglobulin, see section 14.5.1

Dose
- See under preparations and see also notes above

For intramuscular use
Hepatitis B Immunoglobulin (Biomed) Injection, hepatitis B-specific immunoglobulin, 100 units/mL. Vials containing 200 units or 500 units, available from selected Health Protection Agency and NHS laboratories (except for Transplant Centres, see p. 852), also available from BPL.
Dose by intramuscular injection (as soon as possible after exposure, ideally within 12–48 hours, but no later than 7 days after exposure), ADULT and CHILD over 10 years 500 units; CHILD under 5 years 200 units, 5–9 years 300 units. NEONATE 200 units
Prevention of transmitted infection at birth, NEONATE 200 units as soon as possible after birth; for full details consult Immunisation against Infectious Disease (www.dh.gov.uk)

For intravenous use
Hepatect®CP (Biotest UK) Intravenous infusion, hepatitis B-specific immunoglobulin 50 units/mL, net price 500 units (10 mL) = £300.00, 2000 units (40 mL) = £1100.00. 5000 units (100 mL) = £3000.00
Dose by intravenous infusion, after exposure to hepatitis B virus-contaminated material—consult product literature
Prevention of transmitted infection at birth—consult product literature
Prevention of hepatitis B in haemodialysed patients, prophylaxis against re-infection of transplanted liver—consult product literature

For subcutaneous use
Zutectra® (Biotest UK) Injection, hepatitis B-specific immunoglobulin, 500 units/mL, net price 5 × 1 mL prefilled syringes = £1500.00
Dose prevention of hepatitis B re-infection more than 6 months after liver transplantation in stable HBV-DNA negative patients starting 2–3 weeks after last dose of intravenous hepatitis B immunoglobulin, by subcutaneous injection, ADULT body-weight under 75 kg 500 units once weekly, increased if necessary up to 1000 units once weekly; body-weight over 75 kg 1000 units once weekly

Rabies
Following exposure of an unimmunised individual to an animal in or from a country where the risk of rabies is high the site of the bite should be washed with soapy water and specific rabies immunoglobulin of human origin administered. All of the dose should be injected around the site of the wound; if this is difficult or the wound has completely healed it can be given in the anterolateral thigh (remote from the site used for vaccination).
Rabies vaccine should also be given intramuscularly at a different site (for details see Rabies vaccine p. 847). If there is delay in giving the rabies immunoglobulin, it should be given within 7 days of starting the course of rabies vaccine.

Rabies Immunoglobulin (Antirabies Immunoglobulin Injection)
Indications post-exposure prophylaxis against rabies infection
Cautions IgA deficiency; interference with live virus vaccines—see p. 852 under Normal Immunoglobulin
Side-effects injection site swelling and pain; rarely anaphylaxis; buccal ulceration, glossitis, chest tightness, dyspnoea, tremor, dizziness, arthralgia, and facial oedema also reported
Dose
- See under preparation

Tetanus
For the management of tetanus-prone wounds, tetanus immunoglobulin should be used in addition to wound cleansing and, where appropriate, antibacterial prophylaxis and a tetanus-containing vaccine (see Diphtheria-containing Vaccines, section 14.4). Tetanus immunoglobulin, together with metronidazole (section 5.1.11) and wound cleansing, should also be used for the treatment of established cases of tetanus.

TETANUS IMMUNOGLOBULIN
Indications post-exposure prophylaxis and treatment of tetanus infection
Cautions IgA deficiency; interference with live virus vaccines—see p. 852
Side-effects injection site swelling and pain; rarely anaphylaxis
Dose
- Post-exposure prophylaxis, by intramuscular injection 250 units, increased to 500 units if more than 24 hours have elapsed or there is risk of heavy contamination or following burns
- Treatment of tetanus infection, by intramuscular injection 150 units/kg (multiple sites)

Varicella—zoster
Varicella—zoster immunoglobulin (VZIG) is recommended for individuals who are at increased risk of severe varicella and who have no antibodies to vari-
Anti-D (Rh0) immunoglobulin is prepared from plasma taken from rhesus-negative donors who have been immunised against the anti-D-antigen. Anti-D (Rh0) immunoglobulin is used to prevent a rhesus-negative mother from forming antibodies to fetal rhesus-positive cells which may pass into the maternal circulation. The objective is to protect any subsequent child from the hazard of haemolytic disease of the newborn.

Anti-D immunoglobulin should be administered to the mother following any sensitising episode (e.g. abortion, miscarriage and birth); it should be injected within 72 hours of the episode but even if a longer period has elapsed it may still give protection and should be administered. Anti-D (Rh0) immunoglobulin is also given when significant feto-maternal haemorrhage occurs in rhesus-negative women during delivery. The dose of anti-D immunoglobulin is determined according to the level of exposure to rhesus-positive blood.

For routine antenatal prophylaxis NICE recommends that two doses of either 500 units or 1000–1650 units of anti-D immunoglobulin should be given, the first at 28 weeks’ gestation and the second at 34 weeks; alternatively a single dose of 1500 units given between 28 and 30 weeks gestation can be used (see also NICE guidance below). Use of routine antenatal anti-D prophylaxis should be given irrespective of previous anti-D prophylaxis for a sensitising event early in the same pregnancy. Similarly, postpartum anti-D prophylaxis should be given irrespective of previous routine antenatal anti-D prophylaxis or antenatal anti-D prophylaxis for a sensitising event in the same pregnancy.

Anti-D (Rh0) immunoglobulin is also given to women of child-bearing potential after the inadvertent transfusion of rhesus-incompatible blood components and is used for the treatment of idiopathic thrombocytopenia purpura.

NICE guidance

Routine antenatal anti-D prophylaxis for rhesus-negative women (August 2008)
Routine antenatal anti-D prophylaxis should be offered to all non-sensitised pregnant women who are rhesus negative.

www.nice.org.uk/TA156

MMR vaccine

MMR vaccine may be given in the postpartum period with anti-D (Rh0) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

Anti-D (Rh0) immunoglobulin is also given to women of child-bearing potential after the inadvertent transfusion of rhesus-incompatible blood components and is used for the treatment of idiopathic thrombocytopenia purpura.

14.5.3 Anti-D (Rh0) immunoglobulin

Anti-D (Rh0) immunoglobulin is prepared from plasma taken from rhesus-negative donors who have been immunised against the anti-D-antigen. Anti-D (Rh0) immunoglobulin is used to prevent a rhesus-negative mother from forming antibodies to fetal rhesus-positive cells which may pass into the maternal circulation. The objective is to protect any subsequent child from the hazard of haemolytic disease of the newborn.

Anti-D immunoglobulin should be administered to the mother following any sensitising episode (e.g. abortion, miscarriage and birth); it should be injected within 72 hours of the episode but even if a longer period has elapsed it may still give protection and should be administered. Anti-D (Rh0) immunoglobulin is also given when significant feto-maternal haemorrhage occurs in rhesus-negative women during delivery. The dose of anti-D immunoglobulin is determined according to the level of exposure to rhesus-positive blood.

For routine antenatal prophylaxis NICE recommends that two doses of either 500 units or 1000–1650 units of anti-D immunoglobulin should be given, the first at 28 weeks’ gestation and the second at 34 weeks; alternatively a single dose of 1500 units given between 28 and 30 weeks gestation can be used (see also NICE guidance below). Use of routine antenatal anti-D prophylaxis should be given irrespective of previous anti-D prophylaxis for a sensitising event early in the same pregnancy. Similarly, postpartum anti-D prophylaxis should be given irrespective of previous routine antenatal anti-D prophylaxis or antenatal anti-D prophylaxis for a sensitising event in the same pregnancy.

Anti-D (Rh0) immunoglobulin is also given to women of child-bearing potential after the inadvertent transfusion of rhesus-incompatible blood components and is used for the treatment of idiopathic thrombocytopenia purpura.

NICE guidance

Routine antenatal anti-D prophylaxis for rhesus-negative women (August 2008)
Routine antenatal anti-D prophylaxis should be offered to all non-sensitised pregnant women who are rhesus negative.

www.nice.org.uk/TA156

MMR vaccine

MMR vaccine may be given in the postpartum period with anti-D (Rh0) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

Anti-D (Rh0) immunoglobulin is also given to women of child-bearing potential after the inadvertent transfusion of rhesus-incompatible blood components and is used for the treatment of idiopathic thrombocytopenia purpura.
1. There is inadequate evidence of protection by BCG vaccine in adults aged over 35 years; however, vaccination is recommended for healthcare workers irrespective of age because of the increased risk to them or their patients who may be in close contact with the local population in countries with an incidence of tuberculosis greater than 40 per 100 0002; it should preferably be given 3 months or more before departure.

Yellow fever immunisation (see p. 851) is recommended for travel to the endemic zones of Africa and South America. Many countries require an International Certificate of Vaccination from individuals arriving from, or who have been travelling through, endemic areas; other countries require a certificate from all entering travellers (consult the Department of Health handbook, Health Information for Overseas Travel, www.dh.gov.uk).

Immunisation against meningococcal meningitis is recommended for a number of areas of the world (for details, see p. 844).

Protection against hepatitis A is recommended for travellers to high-risk areas outside Northern and Western Europe, North America, Japan, Australia and New Zealand. Hepatitis A vaccine (see p. 836) is preferred and it is likely to be effective even if given shortly before departure; normal immunoglobulin is no longer given routinely but may be indicated in the immunocompromised (see p. 853). Special care must also be taken with food hygiene (see below).

Hepatitis B vaccine (see p. 838) is recommended for those travelling to areas of high or intermediate prevalence who intend to seek employment as healthcare workers or who plan to remain there for lengthy periods and who may therefore be at increased risk of acquiring infection as the result of medical or dental procedures carried out in those countries. Short-term tourists or business travellers are not generally at increased risk of infection but may put themselves at risk by their sexual behaviour when abroad.

Prophylactic immunisation against rabies (see p. 847) is recommended for travellers to enzootic areas on long journeys or to areas out of reach of immediate medical attention.

Travellers who have not had a tetanus booster in the last 10 years and are visiting areas where medical attention may not be accessible should receive a booster dose of an adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine (see p. 834), even if they have received 5 doses of a tetanus-containing vaccine previously.

Typhoid vaccine (see p. 850) is indicated for travellers to countries where typhoid is endemic, but the vaccine is no substitute for personal precautions (see below).

There is no requirement for cholera vaccination as a condition for entry into any country, but oral cholera vaccine (see p. 833) should be considered for backpackers and those travelling to situations where the risk is greatest (e.g. refugee camps). Regardless of vaccination, travellers to areas where cholera is endemic should take special care with food hygiene (see below).

Advice on diphtheria (see p. 834), on Japanese encephalitis (see p. 842), and on tick-borne encephalitis (see p. 850) is included in Health Information for Overseas Travel, see below.
Food hygiene  In areas where sanitation is poor, good food hygiene is important to help prevent hepatitis A, typhoid, cholera, and other diarrhoeal diseases (including travellers’ diarrhoea). Food should be freshly prepared and hot, and uncooked vegetables (including green salads) should be avoided; only fruits which can be peeled should be eaten. Only suitable bottled water, or tap water that has been boiled or treated with sterilising tablets, should be used for drinking.

Information on health advice for travellers
Health professionals and travellers can find the latest information on immunisation requirements and precautions for avoiding disease while travelling from: www.nathnac.org

The handbook, Health Information for Overseas Travel (2010), which draws together essential information for healthcare professionals regarding health advice for travellers, can also be obtained from this website.

Immunisation requirements change from time to time, and information on the current requirements for any particular country may be obtained from the embassy or legation of the appropriate country or from:

15 Anaesthesia

15.1 General anaesthesia

15.1.1 Intravenous anaesthetics

15.1.2 Inhalational anaesthetics

15.1.3 Antimuscarinic drugs

15.1.4 Sedative and analgesic perioperative drugs

15.1.4.1 Benzodiazepines

15.1.4.2 Non-opioid analgesics

15.1.4.3 Opioid analgesics

15.1.4.4 Other drugs for sedation

15.1.5 Neuromuscular blocking drugs

15.1.6 Drugs for reversal of neuromuscular blockade

15.1.7 Antagonists for central and respiratory depression

15.1.8 Drugs for malignant hyperthermia

Important

The drugs in section 15.1 should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

Several different types of drug are given together during general anaesthesia. Anaesthesia is induced with either a volatile drug given by inhalation (section 15.1.2) or with an intravenously administered drug (section 15.1.1); anaesthesia is maintained with an intravenous or inhalational anaesthetic. Analgesics (section 15.1.4), usually short-acting opioids, are also used. The use of neuromuscular blocking drugs (section 15.1.5) necessitates intermittent positive-pressure ventilation. Following surgery, anticholinesterases (section 15.1.6) can be given to reverse the effects of neuromuscular blocking drugs; specific antagonists (section 15.1.7) can be used to reverse central and respiratory depression caused by some drugs used in surgery. A local topical anaesthetic (section 15.2) can be used to reduce pain at the injection site.

Individual requirements vary considerably and the recommended doses are only a guide. Smaller doses are indicated in ill, shocked, or debilitated patients and in significant hepatic impairment, while robust individuals may require larger doses. The required dose of induction agent may be less if the patient has been premedicated with a sedative agent or if an opioid analgesic has been used.

Surgery and long-term medication

The risk of losing disease control on stopping long-term medication before surgery is often greater than the risk posed by continuing it during surgery. It is vital that the anaesthetist knows about all drugs that a patient is (or has been) taking.

Patients with adrenal atrophy resulting from long-term corticosteroid use (section 6.3.2) may suffer a precipitous fall in blood pressure unless corticosteroid cover is provided during anaesthesia and in the immediate postoperative period. Anaesthetists must therefore know whether a patient is, or has been, receiving corticosteroids (including high-dose inhaled corticosteroids).
Other drugs that should normally not be stopped before surgery include antiepileptics, antiparkinsonian drugs, antipsychotics, anxiolytics, bronchodilators, cardiovascular drugs (but see potassium-sparing diuretics, angiotensin-converting enzyme inhibitors, and angiotensin-II receptor antagonists below), glaucoma drugs, immuno-suppressants, drugs of dependence, and thyroid or antithyroid drugs. Expert advice is required for patients receiving antivirals for HIV infection. For general advice on surgery in diabetic patients see section 6.1.1. p. 457.

Patients taking antplatelet medication or an oral anti-coagulant present an increased risk for surgery. In these circumstances, the anaesthetist and surgeon should assess the relative risks and decide jointly whether the antplatelet or the anticoagulant drug should be stopped or replaced with unfractionated or low molecular weight heparin therapy.

Drugs that should be stopped before surgery include combined oral contraceptives (see Surgery, section 7.3.1 for details); for advice on hormone replacement therapy, see section 6.4.1.1. If antidepressants need to be stopped, they should be withdrawn gradually to avoid withdrawal symptoms. MAOIs can have important interactions with some drugs used during surgery, such as pethidine (for interactions of MAOIs, see Appendix 1, MAOIs). Tricyclic antidepressants need not be stopped, but there may be an increased risk of arrhythmias and hypotension (and dangerous interactions with vasopressor drugs); therefore, the anaesthetist should be informed if they are not stopped. Lithium should be stopped 24 hours before major surgery but the normal dose can be continued for minor surgery (with careful monitoring of fluids and electrolytes). Potassium-sparing diuretics may need to be withheld on the morning of surgery because hyperkalaemia may develop if renal perfusion is impaired or if there is tissue damage. Angiotensin-converting enzyme (ACE) inhibitors and angiotensin-II receptor antagonists can be associated with severe hypotension after induction of anaesthesia; these drugs may need to be discontinued 24 hours before surgery. Herbal medicines may be associated with adverse effects when given with anaesthetic drugs and consideration should be given to stopping them before surgery.

**Anaesthesia and driving** Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving afterwards. For intravenous benzodiazepines and for a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

**Prophylaxis of acid aspiration** Regurgitation and aspiration of gastric contents (Mendelson’s syndrome) can be an important complication of general anaesthesia, particularly in obstetrics and during emergency surgery, and requires prophylaxis against acid aspiration. Prophylaxis is also needed in those with gastrointestinal reflux disease and in circumstances where gastric emptying may be delayed.

A H₂-receptor antagonist (section 1.3.1) can be used before surgery to increase the pH and reduce the volume of gastric fluid. It does not affect the pH of fluid already in the stomach and this limits its value in emergency procedures; an oral H₂-receptor antagonist can be given 1–2 hours before the procedure. Antacids are frequently used to neutralise the acidity of the fluid already in the stomach; ‘clear’ (non-particulate) antacids such as sodium citrate are preferred. Sodium citrate 300 mmol/litre (88.2 mg/mL) oral solution is licensed for use before general anaesthesia for caesarean section (available from Viridian).

**Anaesthesia, sedation, and resuscitation in dental practice**

For details see A Conscious Decision: A Review of the use of general anaesthesia and conscious sedation in primary dental care; report by a group chaired by the Chief Medical Officer and Chief Dental Officer, July 2000 and associated documents. Further details can also be found in Conscious Sedation in the Provision of Dental Care; report of an Expert Group on Sedation for Dentistry (commissioned by the Department of Health), 2003.

Guidance is also included in Conscious Sedation in Dentistry: Dental Clinical Guidance, Scottish Dental Clinical Effectiveness Programme, June 2012 (www.sdcep.org.uk).

**Intravenous anaesthetics**

Intravenous anaesthetics may be used either to induce anaesthesia or for maintenance of anaesthesia throughout surgery. Intravenous anaesthetics nearly all produce their effect in one arm-brain circulation time and can cause apnoea and hypotension, and so adequate resuscitative facilities must be available. They are contraindicated if the anaesthetist is not confident of being able to maintain the airway (e.g. in the presence of a tumour in the pharynx or larynx). Extreme care is required in surgery of the mouth, pharynx, or larynx and in patients with acute circulatory failure (shock) or fixed cardiac output.

To facilitate tracheal intubation, induction is usually followed by a neuromuscular blocking drug (section 15.1.5) or a short-acting opioid (section 15.1.4.3). The doses of all intravenous anaesthetic drugs should be titrated to effect (except when using ‘rapid sequence induction’). The doses and rates of administration should be reduced in the elderly, and particularly in those with hypovolaemia or cardiovascular disease; lower doses may also be required in premedicated patients.

**Total intravenous anaesthesia** This is a technique in which major surgery is carried out with all drugs given intravenously. Respiration can be spontaneous, or controlled with oxygen-enriched air. Neuromuscular blocking drugs can be used to provide relaxation and prevent reflex muscle movements. The main problem to be overcome is the assessment of depth of anaesthesia. Target Controlled Infusion (TCI) systems can be used to titrate intravenous anaesthetic infusions to predicted plasma-drug concentrations in ventilated adult patients.

**Anaesthesia and driving** See section 15.1.
Drugs used for intravenous anaesthesia

Propofol, the most widely used intravenous anaesthetic, can be used for induction or maintenance of anaesthesia in adults and children, but it is not commonly used in neonates. Propofol is associated with rapid recovery and less hangover effect than other intravenous anaesthetics. It causes bone pain on intravenous injection, which can be reduced by intravenous lidocaine. Significant extraneous muscle movements can occur. Rarely, convulsions, anaaphylaxis, and delayed recovery from anaesthesia can occur after propofol administration; the onset of convulsions can be delayed. Propofol is associated with bradycardia, occasionally profound; intravenous administration of an antimuscarinic drug is used to treat this.

Propofol can be used for sedation during diagnostic procedures. In adults, it can be used for sedation in intensive care, but it is contra-indicated in children under 16 years receiving intensive care because of the risk of propofol infusion syndrome (potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis, hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure).

Thiopental sodium is a barbiturate that is used for induction of anaesthesia, but has no analgesic properties. Induction is generally smooth and rapid, but dose-related cardiovascular and respiratory depression can occur. Awakening from a moderate dose of thiopental is rapid because the drug redistributes into other tissues, particularly fat. However, metabolism is slow and sedative effects can persist for 24 hours. Repeated doses have a cumulative effect and recovery is much slower.

Etomidate is an intravenous agent associated with rapid recovery without a hangover effect. Etomidate causes less hypotension than thiopental and propofol during induction. It produces a high incidence of extraneous muscle movements, which can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction. Pain on injection can be reduced by injecting into a larger vein or by giving an opioid analgesic just before induction. Etomidate suppresses adrenocortical function, particularly during continuous administration, and it should not be used for maintenance of anaesthesia. It should be used with caution in patients with underlying adrenal insufficiency, for example, those with sepsis. Ketamine is used rarely. Ketamine causes less hypotension than thiopental and propofol during induction. It is used mainly for paediatric anaesthesia, particularly when repeated administration is required (such as for serial burns dressings); recovery is relatively slow and there is a high incidence of extraneous muscle movements. The main disadvantage of ketamine is the high incidence of hallucinations, nightmares, and other transient psychotic effects; these can be reduced by a benzodiazepine such as diazepam or midazolam.

**ETOMIDATE**

**Indications** induction of anaesthesia

**Cautions** see under Intravenous Anaesthetics and notes above; avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (anaesthetics, general)

**Contra-indications** see under Intravenous Anaesthetics and notes above

**Hepatic impairment** reduce dose in liver cirrhosis

**Pregnancy** may depress neonatal respiration if used during delivery

**Breast-feeding** breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

**Side-effects** see notes above; also nausea, vomiting, hypotension, apnoea, hyperventilation, stridor, rash; less commonly hyperalgesia, arrhythmias, hypertension, hiccups, cough, phlebitis; AV block, cardiac arrest, respiratory depression, seizures, shivering, and Stevens-Johnson syndrome also reported

**Dose**
- **ADULT**, by slow intravenous injection over 30–60 seconds, 150–300 micrograms/kg (max. total dose 60 mg);
- **ELDERLY** 150–200 micrograms/kg (max. total dose 60 mg);
- **CHILD** see BNF for Children

Note: Adjusted according to response (2 mg/kg usually produces 1–2 minutes of surgical anaesthesia).

**Side-effects** see notes above; also nausea, vomiting, tachycardia, hypertension, diaphoresis, dystagmus, rash; less commonly arrhythmias, hypotension, bradycardia, respiratory depression, laryngospasm; rarely hyperalgesia, hypertension, hypotension, raised intracranial pressure; head trauma; acute porphyria (section 9.8.2)

**Hepatic impairment** consider dose reduction

**Pregnancy** may depress neonatal respiration if used during delivery

**Breast-feeding** avoid for at least 12 hours after last dose

**Side-effects** see notes above; also nausea, vomiting, tachycardia, hypertension, diaphoresis, dystagmus, rash; less commonly arrhythmias, hypotension, bradycardia, respiratory depression, laryngospasm; rarely hyperalgesia, hypertension, hypotension, raised intracranial pressure; head trauma; acute porphyria (section 9.8.2)

**Dose**
- **ADULT**, by slow intravenous injection, 4 mg/kg
- **CHILD** see BNF for Children

Note: Adjusted according to response (2 mg/kg usually produces 1–2 minutes of surgical anaesthesia).

**Side-effects** see notes above; also nausea, vomiting, tachycardia, hypertension, diaphoresis, dystagmus, rash; less commonly arrhythmias, hypotension, bradycardia, respiratory depression, laryngospasm; rarely hyperalgesia, hypertension, hypotension, raised intracranial pressure; head trauma; acute porphyria (section 9.8.2)

**Dose**
- **ADULT**, by slow intravenous injection, 4 mg/kg
- **CHILD** see BNF for Children

Note: Adjusted according to response (2 mg/kg usually produces 1–2 minutes of surgical anaesthesia).

**Side-effects** see notes above; also nausea, vomiting, tachycardia, hypertension, diaphoresis, dystagmus, rash; less commonly arrhythmias, hypotension, bradycardia, respiratory depression, laryngospasm; rarely hyperalgesia, hypertension, hypotension, raised intracranial pressure; head trauma; acute porphyria (section 9.8.2)
15.1.1 Intravenous anaesthetics

By intravenous infusion of a solution containing 1 mg/mL, longer procedures, ADULT, induction, total dose of 0.5–2 mg/kg; maintenance, 10–45 micrograms/kg/minute, rate adjusted according to response; CHILD under 18 years see BNF for Children

Ketalar® (Pfizer) (Propofol) injection, ketamine (as hydrochloride) 10 mg/mL, net price 20-mL vial = £5.06; 50 mg/mL, 10-mL vial = £8.77; 100 mg/mL, 10-mL vial = £16.10

Administration For intravenous injection, dilute 100 mg/mL, strength to a concentration of not more than 50 mg/mL, with Glucose 5% or Sodium Chloride 0.9% or Water for Injections

Note May be difficult to obtain

PROPOFOL

Indications see under Dose

Cautions see under Intravenous Anaesthetics and notes above; cardiac impairment; respiratory impairment; elderly; hypovolaemia; epilepsy; hypotension; raised intracranial pressure; monitor blood-lipid concentration if risk of fat overload or if sedation longer than 3 days; interactions: Appendix 1 (anaesthetics, general)

Contra-indications see under Intravenous Anaesthetics and notes above

Hepatic impairment use with caution

Renal impairment use with caution

Pregnancy may depress neonatal respiration if used during delivery; max. dose for maintenance of anaesthesia 6 mg/kg/hour

Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia

Side-effects see notes above; also hypotension, tachycardia, transient apnoea, headache; less commonly thrombosis, phlebitis; rarely arrhythmia, euphoria; very rarely pancreatitis, pulmonary oedema, sexual disinhibition, and discoloration of urine; propofol infusion syndrome (potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis, hyperlipidaemia, hyperkalaemia, hepatitis, and renal failure) reported with prolonged infusion of doses exceeding 4 mg/kg/hour

Dose

Induction of anaesthesia using 0.5% or 1% injection, by slow intravenous injection or infusion, ADULT under 55 years, 1.5–2.5 mg/kg at a rate of 20–40 mg every 10 seconds until response; ADULT over 55 years or debilitated, 1–1.5 mg/kg at a rate of 20 mg every 10 seconds until response; CHILD 1 month–18 years see BNF for Children

Induction of anaesthesia using 2% injection, by slow intravenous injection or infusion, ADULT under 55 years, 1.5–2.5 mg/kg at a rate of 20–40 mg every 10 seconds until response; ADULT over 55 years or debilitated, 1–1.5 mg/kg at a rate of 20 mg every 10 seconds until response; CHILD 1 month–18 years see BNF for Children

Induction of anaesthesia using 2% injection, by intravenous infusion, ADULT under 55 years, 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response (additionally, if rapid increase in sedation required, by slow intravenous injection, 10–20 mg); patients over 55 years or debilitated may require lower dose and rate of administration; CHILD 17–18 years see BNF for Children

Maintenance of sedation for surgical and diagnostic procedures using 1% injection, by intravenous infusion, ADULT, 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response (additionally, if rapid increase in sedation required, by slow intravenous injection, 10–20 mg); patients over 55 years or debilitated may require lower dose and rate of administration; CHILD 1 month–18 years see BNF for Children

Maintenance of sedation for surgical and diagnostic procedures using 2% injection, by intravenous infusion, ADULT, 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response (additionally, if rapid increase in sedation required, by slow intravenous injection, 10–20 mg); patients over 55 years or debilitated may require lower dose and rate of administration; CHILD 1 month–18 years see BNF for Children

Maintenance of sedation for surgical and diagnostic procedures using 2% injection, by intravenous infusion, ADULT, 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response (additionally, if rapid increase in sedation required, by slow intravenous injection, 10–20 mg); patients over 55 years or debilitated may require lower dose and rate of administration; CHILD 1 month–18 years see BNF for Children

Maintenance of sedation for surgical and diagnostic procedures using 2% injection, by intravenous infusion, ADULT, 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response (additionally, if rapid increase in sedation required, by slow intravenous injection, 10–20 mg); patients over 55 years or debilitated may require lower dose and rate of administration; CHILD 1 month–18 years see BNF for Children

Diprivan® (AstraZeneca) (Propofol) 0.5% injection (emulsion), propofol 5 mg/mL, net price 20-mL amp = £3.46

Brands include Propofol-Lipuro®

1% injection (emulsion), propofol 10 mg/mL, net price 20-mL amp = £4.18, 50-mL bottle = £10.10, 100-mL bottle = £19.40

Brands include Propofol-Lipuro® Propoven®

2% injection (emulsion), propofol 20 mg/mL, net price 50-mL vial = £21.30

Brands include Propofol-Lipuro® Propoven®

Diprivan® (AstraZeneca) (Thiopental) 0.5% injection (emulsion), propofol 10 mg/mL, net price 20-mL amp = £3.07, 50-mL prefilled syringe (for use with Diprivan® TCI system) = £10.68

2% injection (emulsion), propofol 20 mg/mL, net price 50-mL prefilled syringe (for use with Diprivan® TCI system) = £15.16

THIOPENTAL SODIUM (Thiopentone sodium)

Indications induction of general anaesthesia; anaesthesia of short duration; reduction of raised intracranial pressure if ventilation controlled; status epilepticus (see also section 4.8.2)

Cautions see under Intravenous Anaesthetics and notes above; cardiovascular disease; reconstituted solution is highly alkaline—extravasation causes tissue necrosis and severe pain; avoid intra-arterial injection; interactions: Appendix 1 (anaesthetics, general)
Inhalational anaesthetics include gases and volatile liquids. Gaseous anaesthetics require suitable equipment for storage and administration. Volatile liquid anaesthetics are administered using calibrated vapourisers, using air, oxygen, or nitrous oxide–oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times. Higher concentrations of oxygen (greater than 30%) are usually required during inhalational anaesthesia when nitrous oxide is being administered, see Nitrous Oxide, p. 864.

Inhalational anaesthetics include gases and volatile liquids. Gaseous anaesthetics require suitable equipment for storage and administration. Volatile liquid anaesthetics are administered using calibrated vapourisers, using air, oxygen, or nitrous oxide–oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times. Higher concentrations of oxygen (greater than 30%) are usually required during inhalational anaesthesia when nitrous oxide is being administered, see Nitrous Oxide, p. 864.

**Anaesthesia and driving** See section 15.1.

**Volatile liquid anaesthetics**

Volatile liquid anaesthetics can be used for induction and maintenance of anaesthesia, and following induction with an intravenous anaesthetic (section 15.1.1).

Volatile liquid anaesthetics can trigger malignant hyperthermia (section 15.1.8) and are contra-indicated in those susceptible to malignant hyperthermia. They can increase cerebrospinal pressure and should be used with caution in those with raised intracranial pressure. They can also cause hepatotoxicity in those sensitised to halogenated anaesthetics. In children with neuromuscular disease, inhalational anaesthetics are very rarely associated with hyperkalaemia, resulting in cardiac arrhythmias and death. Cardiorespiratory depression, hypotension, and arrhythmias are common side-effects of volatile liquid anaesthetics; convulsions have also been reported. They may also cause mood changes that can last for several days.

**Isoflurane** is a volatile liquid anaesthetic. Heart rhythm is generally stable during isoflurane anaesthesia, but heart-rate can rise, particularly in younger patients. Systemic arterial pressure and cardiac output can fall, owing to a decrease in systemic vascular resistance. Muscle relaxation occurs and the effects of muscle relaxant drugs are potentiated. Isoflurane can irritate mucous membranes, causing cough, breath-holding, and laryngospasm. Isoflurane is the preferred inhalational anaesthetic for use in obstetrics.

**Desflurane** is a rapid acting volatile liquid anaesthetic; it is reported to have about one-fifth the potency of isoflurane. Emergence and recovery from anaesthesia are particularly rapid because of its low solubility. Desflurane is not recommended for induction of anaesthesia as it is irritant to the upper respiratory tract; cough, breath-holding, apnoea, laryngospasm, and increased secretions can occur.

**Sevoflurane** is a rapid acting volatile liquid anaesthetic and is more potent than desflurane. Emergence and recovery are particularly rapid, but slower than desflurane. Sevoflurane is non-irritant and is therefore often used for inhalational induction of anaesthesia; it has little effect on heart rhythm compared with other volatile liquid anaesthetics. Sevoflurane can interact with carbon dioxide absorbents to form compound A, a potentially nephrotoxic vinyl ether. However, in spite of extensive use, no cases of sevoflurane-induced permanent renal injury have been reported and the carbon dioxide absorbents used in the UK produce very low concentrations of compound A, even in low-flow anaesthetic systems.
Contra-indications see notes above
Pregnancy may depress neonatal respiration if used during delivery
Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia
Side-effects see notes above
Dose
- Induction of anaesthesia, by inhalation using specifically calibrated vapouriser, in oxygen or nitrous oxide–oxygen, increased gradually according to response from 0.5% to 3%
- Maintenance of anaesthesia, by inhalation using specifically calibrated vapouriser, 1–2.5% in nitrous oxide–oxygen; an additional 0.5–1% may be required when given with oxygen alone; caesarean section, 0.5–0.75% in nitrous oxide–oxygen

Nitrous oxide
Nitrous oxide is used for maintenance of anaesthesia and, in sub-anaesthetic concentrations, for analgesia. For anaesthesia, nitrous oxide is commonly used in a concentration of 50 to 66% in oxygen as part of a balanced technique in association with other inhalational or intravenous agents. Nitrous oxide is unsatisfactory as a sole anaesthetic owing to lack of potency, but is useful as part of a combination of drugs since it allows a significant reduction in dosage.

For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (Entonox®, Equinox®) is used. Self-administration using a demand valve is popular in obstetric practice, for changing painful dressings, as an aid to postoperative physiotherapy, and in emergency ambulances.

Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

Hypoxia can occur immediately following the administration of nitrous oxide; additional oxygen should always be given for several minutes after stopping the flow of nitrous oxide.

Exposure of patients to nitrous oxide for prolonged periods, either by continuous or by intermittent administration, may result in megaloblastic anaemia owing to interference with the action of vitamin B₁₂; neurological toxic effects can occur without preceding overt haematological changes. For the same reason, exposure of theatre staff to nitrous oxide should be minimised. Depression of white cell formation may also occur.

Assessment of plasma-vitamin B₁₂ concentration should be considered in those at risk of deficiency, including the elderly, those who have a poor, vegetarian, or vegan diet, and those with a history of anaemia. Nitrous oxide should not be given continuously for longer than 24 hours or more frequently than every 4 days without close supervision and haematological monitoring.

SEVOFLURANE
Indications see notes above
Cautions see notes above; susceptibility to QT-interval prolongation; interactions: Appendix 1 (anaesthetics, general)
Contra-indications see notes above
Renal impairment use with caution
Pregnancy may depress neonatal respiration if used during delivery
Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia
Side-effects see notes above; also urinary retention, leucopenia, agitation in children; cardiac arrest, torsade de pointes, and dystonia also reported
Dose
- Induction of anaesthesia, by inhalation using a specifically calibrated vapouriser, in oxygen or nitrous oxide–oxygen, adjusted according to response, ADULT and CHILD over 1 month initially 0.5–1% then increased gradually up to 6%
- Maintenance of anaesthesia, by inhalation using a specifically calibrated vapouriser, in oxygen or nitrous oxide–oxygen, adjusted according to response, ADULT and CHILD over 1 month 0.5–3%

NITROUS OXIDE
Indications see notes above
Cautions see notes above; interactions: Appendix 1 (anaesthetics, general)
Pregnancy may depress neonatal respiration if used during delivery
Breast-feeding breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia
Side-effects see notes above
Dose
- Maintenance of anaesthesia in conjunction with other anaesthetic agents, by inhalation using suitable anaesthetic apparatus, 50–66% in oxygen
- Analgesia, by inhalation using suitable apparatus, up to 50% in oxygen, according to the patient’s needs

15.1.3 Antimuscarinic drugs
Important
The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use.

Antimuscarinic drugs are used (less commonly nowadays) as premedicants to dry bronchial and salivary secretions which are increased by intubation, upper airway surgery, or some inhalational anaesthetics. They are also used before or with neostigmine (section 15.1.6) to prevent bradycardia, excessive salivation, and other muscarinic actions of neostigmine. They also prevent bradycardia and hypotension associated with drugs such as propofol and suxamethonium.

Atropine sulfate is now rarely used for premedication but still has an emergency role in the treatment of vagotonic side-effects. For its role in acute arrhythmias after myocardial infarction, see section 2.3.1.

Hyoscine hydrobromide reduces secretions and also provides a degree of amnesia, sedation, and anti-emesis. Unlike atropine it may produce bradycardia rather than
tachycardia. In some patients, especially the elderly, hyoscine may cause the central anticholinergic syndrome (excitement, ataxia, hallucinations, behavioural abnormalities, and drowsiness).

Glycopyrronium bromide reduces salivary secretions. When given intravenously it produces less tachycardia than atropine. It is widely used with neostigmine for reversal of non-depolarising neuromuscular blocking drugs (section 15.1.5).

Phenothiazines do not effectively reduce secretions when used alone.

### ATROPINE SULFATE

**Indications** premedication; intra-operative bradycardia; with anticholinesterases for reversal of non-depolarising neuromuscular block; antidote to organophosphorous poisoning (see Emergency Treatment of Poisoning p. 42); symptomatic relief of gastrointestinal disorders characterised by smooth muscle spasm (section 1.2); bradycardia (section 2.3.1); cardiod pulmonary resuscitation (section 2.7.3); cycloplegia, anterior uveitis (section 11.5)

**Cautions** see notes in section 1.2

**Duration of action** Since atropine has a shorter duration of action than neostigmine, late unopposed bradycardia may result; close monitoring of the patient is necessary

**Contra-indications** see notes in section 1.2

**Pregnancy** not known to be harmful; manufacturer advises caution

**Breast-feeding** small amount present in milk—manufacturer advises caution

**Side-effects** see notes in section 1.2

**Dose**

- Premedication, by intravenous injection, 300–600 micrograms immediately before induction of anaesthesia; **CHILD** under 12 years see **BNF for Children**
- By subcutaneous or intramuscular injection, 300–600 micrograms 30–60 minutes before induction of anaesthesia; **CHILD** under 12 years see **BNF for Children**
- Intra-operative bradycardia, by intravenous injection, 300–600 micrograms (larger doses in emergencies); **CHILD** under 12 years see **BNF for Children**
- Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block, by intravenous injection, 0.6–1.2 mg; **CHILD** under 12 years see **BNF for Children**
- Arrhythmias after myocardial infarction, see section 2.3.1

1. **Atropine** (Non-proprietary) **(PBM)**
   - Injection, atropine sulfate 600 micrograms/mL, net price 1-mL amp = £8.6p
     - Note Other strengths also available
   - Injection, prefilled disposable syringe, atropine sulfate 100 micrograms/mL, net price 5 mL = £4.58, 10 mL = £5.39, 30 mL = £8.95
   - Injection, prefilled disposable syringe, atropine sulfate 200 micrograms/mL, net price 5 mL = £6.78; 300 micrograms/mL, 10 mL = £6.47; 600 micrograms/mL, 1 mL = £6.78

2. **Minijet® Atropine** (UCB Pharma) **(PBM)**
   - Injection, atropine sulfate 100 micrograms/mL, net price 5 mL = £6.34, 10 mL = £7.11, 30 mL = £11.19

1. **(PBM)** restriction does not apply where administration is for saving life in emergency

---

### GLYCOPYRRONIUM BROMIDE

**Glycopyrrolate**

**Indications** drying secretions (see Prescribing in Palliative Care, p. 21); premedication; intra-operative bradycardia; with neostigmine for reversal of non-depolarising neuromuscular block; maintenance treatment of chronic obstructive pulmonary disease (section 3.1.2); hyperhidrosis (section 13.12)

**Cautions** see notes in section 1.2 (Antimuscarinics)

**Contra-indications** see notes in section 1.2 (Antimuscarinics)

**Side-effects** see notes in section 1.2 (Antimuscarinics)

**Dose**

- Premedication, by intramuscular or intravenous injection, 200–400 micrograms or 4–5 micrograms/kg (max. 400 micrograms); **CHILD** 1 month–12 years, 4–8 micrograms/kg (max. 200 micrograms)
- Intra-operative bradycardia, by intravenous injection, 200–400 micrograms or 4–5 micrograms/kg (max. 400 micrograms), repeated if necessary; **CHILD** 1 month–18 years, 4–8 micrograms/kg (max. 200 micrograms), repeated if necessary
- Control of muscarinic side-effects of neostigmine in reversal of non-depolarising neuromuscular block, by intravenous injection, 200 micrograms per 1 mg of neostigmine, or 10–15 micrograms/kg; **CHILD** 1 month–12 years, 10 micrograms/kg (max. 500 micrograms)

**Glycopyrronium bromide** (Non-proprietary) **(PBM)**

- Injection, glycopyrronium bromide 200 micrograms/mL, net price 1-mL amp = 54p, 3-mL amp = £1.50

*With neostigmine methylsulfate*

Section 15.1.6

### HYOSCINE HYDROBROMIDE

**Scopalamine hydrobromide**

**Indications** premedication, motion sickness, hyper-salivation associated with clozapine therapy (section 4.6); excessive respiratory secretions (see Prescribing in Palliative Care, p. 21)

**Cautions** see notes in section 1.2 and notes above; also epilepsy

**Contra-indications** see notes in section 1.2

**Hepatic impairment** use with caution

**Renal impairment** use with caution

**Pregnancy** use only if potential benefit outweighs risk; injection may depress neonatal respiration

**Breast-feeding** amount too small to be harmful

**Side-effects** see notes in section 1.2

**Dose**

- Premedication, by subcutaneous or intramuscular injection, 200–600 micrograms 30–60 minutes before induction of anaesthesia; **CHILD** 15 micrograms/kg

**Hyosine** (Non-proprietary) **(PBM)**

- Injection, hyoscine hydrobromide 400 micrograms/mL, net price 1-mL amp = £2.88, 600 micrograms/mL, 1-mL amp = £2.53

*With papaveretum*

Section 4.7.2
15.1.4 Sedative and analgesic peri-operative drugs

15.1.4.1 Benzodiazepines

Benzodiazepines may occasionally cause marked respiratory depression and facilities for its treatment are essential; flumazenil (section 15.1.7) is used to antagonise the effects of benzodiazepines.

Diazepam is used to produce mild sedation with amnesia. It is a long-acting drug with active metabolites and a second period of drowsiness can occur several hours after its administration. Peri-operative use of diazepam in children is not recommended; its effect and timing of response are unreliable and paradoxical effects may occur.

Diazepam is relatively insoluble in water and preparations formulated in organic solvents are painful on intravenous injection and give rise to a high incidence of venous thrombosis (which may not be noticed for several days after the injection). Intramuscular injection of diazepam is painful and absorption is erratic. An emulsion formulated for intravenous injection is less irritant and reduces the risk of venous thrombosis; it is not suitable for intramuscular injection.

Temazepam is given by mouth for premedication and has a shorter duration of action and a more rapid onset than oral diazepam; anxiolytic and sedative effects last about 90 minutes although there may be residual drowsiness.

Lorazepam produces more prolonged sedation than temazepam and it has marked amnesic effects.

Midazolam is a water-soluble benzodiazepine that is often used in preference to intravenous diazepam; recovery is faster than from diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing. Midazolam is associated with profound sedation when high doses are given intravenously or when it is used with certain other drugs.

Overdosage with midazolam

There have been reports of overdosage when high strength midazolam has been used for conscious sedation. The use of high-strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be restricted to general anaesthesia, intensive care, palliative care, or other situations where the risk has been assessed. It is advised that flumazenil (section 15.1.7) is available when midazolam is used, to reverse the effects if necessary.

15.1.4.2 Non-opioid analgesics

Indications

Premedication

Fear and anxiety before a procedure (including the night before) can be minimised by using a sedative drug, usually a benzodiazepine. Premedication may also augment the action of anaesthetics and provide some degree of pre-operative amnesia. The choice of drug depends on the individual, the nature of the procedure, the anaesthetic to be used, and other prevailing circumstances such as outpatients, obstetrics, and availability of recovery facilities. Sedative premedication with benzodiazepines should be avoided in patients with a compromised airway, CNS depression, or a history of sleep apnoea.

Premedics can be given the night before major surgery; a further, smaller dose may be required before surgery. Alternatively, the first dose may be given on the day of the procedure.

Premedication in children

Oral administration is preferred; the rectal route should only be used in exceptional circumstances. For further details, consult BNF for Children. Conscious sedation for clinical procedures

Sedation of patients during diagnostic and therapeutic procedures is used to reduce fear and anxiety, to control pain, and to minimise excessive movement. The choice of sedative drug will depend upon the intended procedure; some procedures are safer and more successful under anaesthesia. The patient should be monitored carefully; monitoring should begin as soon as the sedative is given or when the patient becomes drowsy, and should be continued until the patient wakes up.

For details on sedation for clinical procedures in children, see BNF for Children.

Dental procedures

Sedation for dental procedures should be limited to conscious sedation. Diazepam and temazepam are effective anxiolytics for dental treatment in adults. For further information on hypnotics used for dental procedures, see section 4.1.1.

For details on sedation for dental procedures in children, see BNF for Children.

Anaesthesia and driving

See section 15.1.

15.1.4.3 Opioid analgesics

15.1.4.4 Other drugs for sedation

Important

The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

Important

The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

Important

The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

Important

The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

Important

The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

Important

The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.
**LORAZEPAM**

**Indications** conscious sedation for procedures; premedication; short-term use in anxiety or insomnia (section 4.1.2); status epilepticus (section 4.8.2)

**Cautions** see notes above and section 4.1.2; interactions: Appendix 1 (anxiolytics and hypnotics)

**Contra-indications** see Diazepam, section 4.1.2

**Hepatic impairment** see Benzodiazepines, section 4.1.2

**Renal impairment** see Benzodiazepines, section 4.1.2

**Pregnancy** see Benzodiazepines, section 4.1.2

**Breast-feeding** see Benzodiazepines, section 4.1.2

**Side-effects** see notes above and Diazepam, section 4.1.2

**Dose**
- **By mouth**, **ADULT** over 18 years, 5–10 mg 1–2 hours before procedure (up to max. 20 mg for dental procedures carried out in hospital); **ELDERLY** (or debilitated), half adult dose
- **By intramuscular injection** into a large vein (emulsion preparation preferred), sedative cover for minor surgical and medical procedures, **ADULT** over 18 years, 10–20 mg over 2–4 minutes, immediately before procedure; premedication 100–200 micrograms/kg

**Preparations**

Section 4.1.2

**MIDAZOLAM**

**Indications** conscious sedation for procedures; sedation in intensive care; sedation in anaesthesia; premedication; induction of anaesthesia; status epilepticus (section 4.8.2)

**Cautions** see notes above; cardiac disease; respiratory disease; myasthenia gravis; neonates; children (particularly if cardiovascular impairment); risk of airways obstruction and hypoventilation in children under 6 months (monitor respiratory rate and oxygen saturation); history of drug or alcohol abuse; reduce dose in elderly and debilitated; risk of severe hypotension in hypovolaemia, vasoconstriction, hypothermia; avoid prolonged use (and abrupt withdrawal thereafter); concentration of midazolam in children under 15 kg not to exceed 1 mg/mL; **interactions**: Appendix 1 (anxiolytics and hypnotics)

**Contra-indications** marked neuromuscular respiratory weakness including unstable myasthenia gravis; severe respiratory depression; acute pulmonary insufficiency; sleep apnoea syndrome

**Hepatic impairment** use with caution; can precipitate coma

**Renal impairment** use with caution in chronic renal failure—increased cerebral sensitivity

**Pregnancy** avoid regular use (risk of neonatal withdrawal symptoms); use only if clear indication such as seizure control (high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression)

**Breast-feeding** small amount present in milk—avoid breast-feeding for 24 hours after administration (although amount probably too small to be harmful after single doses)

**Side-effects** see notes above; gastro-intestinal disturbances, dry mouth, hiccups, increased appetite, jaundice; hypotension, cardiac arrest, heart rate changes, anaphylaxis, thrombosis; laryngospasm, bronchospasm, respiratory depression and respiratory arrest (particularly with high doses or on rapid injection); drowsiness, confusion, ataxia, amnesia, headache, euphoria, hallucinations, convulsions (more common in neonates), dizziness, vertigo, involuntary movements, paradoxical excitement and aggression (especially in children and elderly), dysarthria; urinary retention, incontinence, changes in libido; blood disorders; muscle weakness; visual disturbances; salivation changes; skin reactions; injection site reactions

**Dose**
- Conscious sedation for procedures, by slow intravenous injection (approx. 2 mg/minute) 5–10 minutes before procedure, initially 2–2.5 mg (ELDERLY 0.5–1 mg), increased if necessary in steps of 1 mg (ELDERLY 0.5–1 mg); usual total dose 3.5–5 mg (max. 7.5 mg), ELDERLY max. 3.5 mg; **CHILD** 1 month–18 years see BNF for Children
- **By rectum**, **CHILD** 6 months–18 years see BNF for Children
- **By mouth**, **CHILD** 1 month–18 years see BNF for Children
- **By buccal administration**, **CHILD** 6 months–18 years see BNF for Children
- **By intravenous injection**, 30–100 micrograms/kg repeated as required or by continuous intravenous infusion, 30–100 micrograms/kg/hour (ELDERLY lower doses needed), **CHILD** not recommended
- **Premedication, by deep intramuscular injection**, **ADULT** over 18 years, 70–100 micrograms/kg (ELDERLY or debilitated 25–50 micrograms/kg) 20–60 minutes before induction
- **By intravenous injection**, **ADULT** over 18 years, 1–2 mg 5–30 minutes before procedure, repeated as required (ELDERLY or debilitated 0.5 mg, repeat dose slowly as required)
- **By rectum**, **CHILD** 6 months–12 years see BNF for Children
- **By mouth**, **CHILD** 1 month–18 years see BNF for Children
- **Induction (but rarely used), by slow intravenous injection**, 150–200 micrograms/kg (ELDERLY or debilitated 50–150 micrograms/kg) given in divided doses (max. 5 mg) at intervals of 2 minutes; max. total dose 600 micrograms/kg; **CHILD** 7–18 years initially 150 micrograms/kg (max. 7.5 mg) given in steps of 50 micrograms/kg (max. 2.5 mg) over 2–5 minutes; wait for 2–5 minutes then give additional doses of 50 micrograms/kg (max. 2.5 mg) every 2 minutes if necessary; max. total dose 500 micrograms/kg (not exceeding 25 mg)
ANAESTHESIA

15.1.4 Sedative and analgesic peri-operative drugs

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastro-intestinal motility, and do not cause dependence, they may be useful alternatives or adjuncts to opioids for the relief of postoperative pain. NSAIDs may be inadequate for the relief of postoperative pain. Intramuscular injections of diclofenac and ketoprofen may be effective alternatives to the parenteral use of these drugs.

**KETOROLAC TROMETAMOL**

**Indications** short-term management of moderate to severe acute postoperative pain only

**Cautions** section 10.1.1; interactions: Appendix 1 (NSAIDs)

**Contra-indications** section 10.1.1; also complete or partial syndrome of nasal polyps; haemorrhagic diatheses (including coagulation disorders) and following operations with high risk of haemorrhage or incomplete haemostasis; confirmed or suspected cerebro-vascular bleeding; hypovolaemia or dehydration

**Hepatic impairment** section 10.1.1

**Renal impairment** max. 60 mg daily by intramuscular or intravenous injection; avoid if serum creatinine greater than 160 micromol/litre; see also section 10.1.1

**Pregnancy** section 10.1.1

**Breast-feeding** amount too small to be harmful

**Side-effects** section 10.1.1; also gastro-intestinal disturbances, taste disturbances, dry mouth; flushing, bradycardia, palpitation, chest pain, hypertension, pallor; dyspnoea, asthma; malaise, euphoria, psychosis, paraesthesia, convulsions, abnormal dreams, hyperkinesia, confusion, hallucinations; urinary frequency, thirst, sweating; hyponatraemia, hyperkalaemia, myalgia; visual disturbances (including optic neuritis); purpura, pain at injection site

**Dose**

- **By mouth**, premedication, ADULT, 10–20 mg (up to 30 mg in exceptional circumstances) 1–2 hours before procedure; ELDERLY 10 mg (up to 20 mg in exceptional circumstances); CHILD 12–18 years see BNF for Children

- **By mouth**, conscious sedation for dental procedures, ADULT over 18 years, 15–30 mg 30–60 minutes before procedure

**Note** Temazepam doses in BNF may differ from those in product literature

**Preparations**

Section 4.1.1

| **15.1.4.2 Non-opioid analgesics** |

</thead>
</table>

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastro-intestinal motility, and do not cause dependence, they may be useful alternatives or adjuncts to opioids for the relief of postoperative pain. NSAIDs may be inadequate for the relief of severe pain.

**Parecoxib** (a selective inhibitor of cyclo-oxygenase-2) can be given by intramuscular or intravenous injection (but see also NSAIDs and Cardiovascular Events, section 10.1.1). The **Scottish Medicines Consortium** (p. 4) has advised (January 2003) that parecoxib is not recommended for use within NHS Scotland.

**Suppositories** of diclofenac and ketoprofen may be effective alternatives to the parenteral use of these drugs.

**KETOROLAC TROMETAMOL**

**Indications** short-term management of moderate to severe acute postoperative pain only

**Cautions** section 10.1.1; interactions: Appendix 1 (NSAIDs)

**Contra-indications** section 10.1.1; also complete or partial syndrome of nasal polyps; haemorrhagic diatheses (including coagulation disorders) and following operations with high risk of haemorrhage or incomplete haemostasis; confirmed or suspected cerebro-vascular bleeding; hypovolaemia or dehydration

**Hepatic impairment** section 10.1.1

**Renal impairment** max. 60 mg daily by intramuscular or intravenous injection; avoid if serum creatinine greater than 160 micromol/litre; see also section 10.1.1

**Pregnancy** section 10.1.1

**Breast-feeding** amount too small to be harmful

**Side-effects** section 10.1.1; also gastro-intestinal disturbances, taste disturbances, dry mouth; flushing, bradycardia, palpitation, chest pain, hypertension, pallor; dyspnoea, asthma; malaise, euphoria, psychosis, paraesthesia, convulsions, abnormal dreams, hyperkinesia, confusion, hallucinations; urinary frequency, thirst, sweating; hyponatraemia, hyperkalaemia, myalgia; visual disturbances (including optic neuritis); purpura, pain at injection site

**Dose**

- **By mouth**, premedication, ADULT, 10–20 mg (up to 30 mg in exceptional circumstances) 1–2 hours before procedure; ELDERLY 10 mg (up to 20 mg in exceptional circumstances); CHILD 12–18 years see BNF for Children

**Preparations**

Section 4.1.1

**15.1.4.4 Non-opioid analgesics**

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastro-intestinal motility, and do not cause dependence, they may be useful alternatives or adjuncts to opioids for the relief of postoperative pain. NSAIDs may be inadequate for the relief of severe pain.

**Acetaminophen**, **Diclofenac**, **Flurbiprofen**, **Ibuprofen**, **Ketoprofen** (section 10.1.1), **Paracetamol** (section 4.7.1), **Parecoxib**, and **Ketorolac** are licensed for postoperative use. Diclofenac and paracetamol can be given by injection as well as by mouth. Diclofenac can be given by intravenous infusion for the treatment or prevention of postoperative pain. Intramuscular injections of diclofenac and ketoprofen are rarely used; they are given deep into the gluteal muscle to minimise pain and tissue damage. Ketorolac is less irritant on intramuscular injection but pain has been reported; it can also be given by intravenous injection.
Opioid analgesics are now rarely used as premedicants; they are more likely to be administered at induction. Pre-operative use of opioid analgesics is generally limited to those patients who require control of existing pain. The main side-effects of opioid analgesics are respiratory depression, cardiovascular depression, nausea, and vomiting; for general notes on opioid analgesics and their use in postoperative pain, see section 10.1.7.

**Contra-indications** section 4.7.2 and notes above; also hypertension, myoclonic movements; less commonly arrhythmias, hiccups, laryngospasm; rarely epistaxis; also reported cardiac arrest, cough, convulsions, and pyrexia.

**Dose**

- Spontaneous respiration: analgesia and enhancement of anaesthesia for short procedures, by intravenous injection, **ADULT**, initially up to 500 micrograms over 30 seconds; supplemental doses 250 micrograms
- Assisted ventilation: analgesia and enhancement of anaesthesia for short procedures, by intravenous injection, **ADULT**, initially 30–50 micrograms/kg; supplemental doses 15 micrograms/kg; **CHILD** under 18 years see **BNF for Children**
- Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia for longer procedures, by intravenous infusion, **ADULT**, initially 50–100 micrograms/kg over 10 minutes or as a bolus, followed by maintenance of 30–60 micrograms/kg/hour; **CHILD** under 18 years see **BNF for Children**
- Assisted ventilation: analgesia and suppression of respiratory activity during intensive care, by intravenous infusion, **ADULT** over 18 years, initially 2 mg/hour subsequently adjusted according to response (usual range 0.5–10 mg/hour); more rapid initial control may be obtained with an intravenous dose of 5 mg given in divided portions over 10 minutes (reduce rate of administration if hypotension or bradycardia occur); additional doses of 0.5–1 mg may be given by intravenous injection during short painful procedures

**Alfentanil**

**Indications** analgesia especially during short operative procedure and outpatient surgery; enhancement of anaesthesia; analgesia and suppression of respiratory activity in patients receiving intensive care, with assisted ventilation, for up to 4 days

**Cautions** section 4.7.2 and notes above

**Contra-indications** section 4.7.2

**Hepatic impairment** section 4.7.2

**Renal impairment** section 4.7.2

**Pregnancy** section 4.7.2

**Breast-feeding** present in milk—withdraw breast-feeding for 24 hours

**Side-effects** section 4.7.2 and notes above; also hypertension, myoclonic movements; less commonly arrhythmias, hiccups, laryngospasm; rarely epistaxis; also reported cardiac arrest, cough, convulsions, and pyrexia.

**Dose**

- To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

### 15.1.4 Sedative and analgesic peri-operative drugs

#### 15.1.4.3 Opioid analgesics

Opioid analgesics are given in small doses before or with induction reduce the dose requirement of some drugs used during anaesthesia. Alfentanil, fentanyl, and remifentanil are particularly useful because they act within 1–2 minutes and have short durations of action. The initial doses of alfentanil or fentanyl are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect. Repeated intra-operative doses of alfentanil or fentanyl should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intense. Alfentanil, fentanyl, and remifentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by non-specific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression. Remifentanil should not be given by intravenous injection intra-operatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanil.

**Alfentanil**

**Injection**, alfentanil (as hydrochloride) 500 micrograms/mL, net price 2-mL amp = £70p, 10-mL amp = £3.20. Injection, alfentanil (as hydrochloride) 5 mg/mL, net price 1-mL amp = £2.50. **Note** To be diluted before use

**Rapifen** (Lanssens)

**Injection**, alfentanil (as hydrochloride) 500 micrograms/mL, net price 2-mL amp = £63p, 10-mL amp = £2.90. **Intensive care injection**, alfentanil (as hydrochloride) 5 mg/mL, net price 1-mL amp = £2.32. **Note** To be diluted before use
15.1.4 Sedative and analgesic peri-operative drugs

**FENTANYL**

**Indications** analgesia during operation, enhancement of anaesthesia; analgesia and respiratory depression in assisted respiration in intensive care; analgesia in other situations (section 4.7.2).

**Cautions** see Fentanyl, section 4.7.2 and notes above.

**Contra-indications** see sections 4.7.2 and notes above.

**Hepatic impairment** see sections 4.7.2 and notes above.

**Renal impairment** see section 4.7.2.

**Pregnancy** see section 4.7.2.

**Breast-feeding** see section 4.7.2.

**Side-effects** see Fentanyl, section 4.7.2 and notes above; also myoclonic movements; less commonly laryngospasm; rarely asystole and insomnia.

**Dose**

*To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight.*

- Spontaneous respiration: analgesia and enhancement of anaesthesia during operation, by slow intravenous injection, ADULT, initially 50–100 micrograms (max. 200 micrograms on specialist advice), then 25–50 micrograms as required, by intravenous infusion, ADULT, 3–4.8 micrograms/kg/hour adjusted according to response; CHILD 1 month–18 years see BNF for Children.

- Assisted ventilation: analgesia and enhancement of anaesthesia during operation, analgesia and respiratory depression in intensive care, by slow intravenous injection, ADULT, initially 300–3500 micrograms, then 100–200 micrograms as required, by intravenous infusion, ADULT, initially 10 micrograms/kg over 10 minutes, then 6 micrograms/kg/hour adjusted according to response; may require up to 180 micrograms/kg/hour during cardiac surgery; CHILD under 18 years see BNF for Children.

**Fentanyl** (Non-proprietary) (GSK)

- Injection, fentanyl (as citrate) 50 micrograms/mL, net price 2-mL amp = 30p, 10-mL amp = 75p

**Sublimaze** (Janssen) (Non-proprietary)

- Injection, fentanyl (as citrate) 50 micrograms/mL, net price 10-mL amp = £1.31

**REMIFENTANIL**

**Indications** analgesia and enhancement of anaesthesia during induction and maintenance of anaesthesia (consult product literature for use in patients undergoing cardiac surgery); analgesia and sedation in ventilated, intensive care patients.

**Cautions** section 4.7.2 (but no dose adjustment necessary in renal impairment) and notes above.

**Contra-indications** section 4.7.2 and notes above; analgesia in conscious patients.

**Hepatic impairment** section 4.7.2.

**Pregnancy** no information available: see also section 4.7.2.

**Breast-feeding** avoid breast-feeding for 24 hours after administration—present in milk in animal studies

**Side-effects** section 4.7.2 and notes above; also hypertension; less commonly hypoxia; rarely asystole; AV block and convulsions also reported.

**Dose**

*To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.*

- Analgesia and enhancement of anaesthesia at induction, by intravenous infusion, ADULT, 30–60 micrograms/kg/hour, with or without an initial dose by intravenous injection of 0.25–1 micrograms/kg over at least 30 seconds; CHILD 12–18 years see BNF for Children.

**Note**

If patient to be intubated more than 8 minutes after start of intravenous infusion, initial intravenous injection dose is not necessary.

- Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia, by intravenous infusion, ADULT, 3–120 micrograms/kg/hour, with or without an initial dose by intravenous injection of 0.25–1 micrograms/kg over at least 30 seconds, according to anaesthetic technique and adjusted according to response; in light anaesthesia supplemental doses by intravenous injection every 2–5 minutes; CHILD under 18 years see BNF for Children.

- Spontaneous respiration: analgesia and enhancement of anaesthesia during maintenance of anaesthesia, by intravenous infusion, ADULT, initially 2.4 micrograms/kg/hour adjusted according to response, usual range 1.5–6 micrograms/kg/hour; CHILD 12–18 years see BNF for Children.

- Assisted ventilation: analgesia and sedation in intensive-care patients, for max. 3 days, by intravenous infusion, ADULT over 18 years, initially 6–9 micrograms/kg/hour adjusted according to response in steps of 1.5 micrograms/kg/hour (allow at least 5 minutes between dose adjustments); usual range 0.36–44.4 micrograms/kg/hour; if an infusion rate of 12 micrograms/kg/hour does not produce adequate sedation add another sedative (consult product literature for details).

- Assisted ventilation: additional analgesia during stimulating or painful procedures in intensive-care patients, by intravenous infusion, ADULT over 18 years, maintain infusion rate of at least 6 micrograms/kg/hour for at least 5 minutes before procedure and adjust every 2–5 minutes according to requirements, usual range 15–45 micrograms/kg/hour.

- Cardiac surgery, consult product literature.

**Note** Remifentanil doses in BNF may differ from those in product literature.

**Remifentanil** (Non-proprietary) (GSK)

- Injection, powder for reconstitution, remifentanil (as hydrochloride), net price 1-mg vial = £4.61; 2-mg vial = £9.21; 5-mg vial = £23.02

**Ultiva** (GSK) (Non-proprietary)

- Injection, powder for reconstitution, remifentanil (as hydrochloride), net price 1-mg vial = £5.12; 2-mg vial = £10.23; 5-mg vial = £25.58

**15.1.4.4 Other drugs for sedation**

Dexmedetomidine and clonidine (section 2.5.2) are alpha2-adrenergic agonists with sedative properties. Dexmedetomidine is licensed for the sedation of patients receiving intensive care who need to remain responsive to verbal stimulation. Clonidine [unlicensed indication] can be used by mouth or by intravenous injection as a sedative agent when adequate sedation cannot be achieved with standard treatment.
Neuromuscular blocking drugs in anaesthesia are also known as muscle relaxants. By specific blockade of the neuromuscular junction they enable light anaesthesia to be used with adequate relaxation of the muscles of the abdomen and diaphragm. They also relax the vocal cords and allow the passage of a tracheal tube. Their action differs from the muscle relaxants used in anaesthesia to be used with adequate relaxation of the muscles of the abdomen and diaphragm. They also relax the vocal cords and allow the passage of a tracheal tube. Their action differs from the muscle relaxants used in

**DEXMEDETOMIDINE**

**Indications**  
Maintenance of sedation during intensive care

**Cautions**  
Monitor cardiac function; monitor respiratory function in non-intubated patients; severe neuromuscular disorders; bradycardia; ischaemic heart disease or severe cerebrovascular disease (especially at higher doses); spinal cord injury; abrupt withdrawal after prolonged use; malignant hyperthermia

**Contra-indications**  
Second- or third-degree AV block (unless pacemaker fitted); uncontrolled hypotension; acute cerebrovascular disorders

**Hepatic impairment**  
Manufacturer advises caution—dose reduction may be required

**Pregnancy**  
Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies

**Breast-feeding**  
Manufacturer advises avoid unless potential benefit outweighs risk—present in milk in animal studies

**Side-effects**  
Nausea, vomiting, dry mouth, bradycardia, myoccardial ischaemia, myocardial infarction, tachycardia, blood pressure changes, agitation, changes in blood sugar, hyperthermia; less commonly abdominal distension, AV block, decreased cardiac output, dyspnoea, hallucination, metabolic acidosis, hypoalbuminaemia, thirst

**Dose**

- **By intravenous infusion,** ADULT over 18 years, 0.7 micrograms/kg/hour adjusted according to response (usual range 0.2–1.4 micrograms/kg/hour)

**Dexdor®** (Orium)  
Injection, dexmedetomidine (as hydrochloride)  
100 micrograms/mL, net price 2-mL amp = £15.66; 4-mL vial = £31.32; 10-mL vial = £78.30

**Note**  
To be diluted before use

**15.1.5 Neuromuscular blocking drugs**

Important  
The drugs in this section should only be administered by, or under direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

Neuromuscular blocking drugs used in anaesthesia are highly ionised at physiological pH and are therefore unlikely to cross the placenta in significant amounts.

**Pregnancy**  
Non-depolarising neuromuscular blocking drugs (except cisatracurium) are associated with histamine release, which can cause skin flushing, hypotension, tachycardia, bronchospasm, and very rarely anaphylactoid reactions. Most aminosteroid neuromuscular blocking drugs produce minimal histamine release. Drugs with vagolytic activity

**Breast-feeding**  
Because they are ionised at physiological pH, non-depolarising neuromuscular blocking drugs are unlikely to be present in milk in significant amounts. Breast-feeding may be resumed once the mother has recovered from neuromuscular block.

**Side-effects**  
Benzylisoquinolinium non-depolarising neuromuscular blocking drugs (except cisatracurium) are associated with histamine release, which can cause skin flushing, hypotension, tachycardia, bronchospasm, and very rarely anaphylactoid reactions. Most aminosteroid neuromuscular blocking drugs produce minimal histamine release. Drugs with vagolytic activity
can counteract any bradycardia that occurs during surgery. Acute myopathy has also been reported after prolonged use in intensive care.

**Atracurium**, a mixture of 10 isomers, is a benzylisoquinolinium neuromuscular blocking drug with an intermediate duration of action. It undergoes non-enzymatic metabolism which is independent of liver and kidney function, thus allowing its use in patients with hepatic or renal impairment. Cardiovascular effects are associated with significant histamine release; histamine release can be minimised by administering slowly or in divided doses over at least 1 minute.

**Cisatracurium** is a single isomer of atracurium. It is more potent and has a slightly longer duration of action than atracurium and provides greater cardiovascular stability because cisatracurium lacks histamine-releasing effects.

**Mivacurium**, a benzylisoquinolinium neuromuscular blocking drug, has a short duration of action. It is metabolised by plasma cholinesterase and muscle paralysis is prolonged in individuals deficient in this enzyme. It is not associated with vagolytic activity or ganglionic blockade although histamine release can occur, particularly with rapid injection.

**Pancuronium**, an aminosteroid neuromuscular blocking drug, has a long duration of action and is often used in patients receiving long-term mechanical ventilation in intensive care units. It lacks a histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension.

**Rocuronium** exerts an effect within 2 minutes and has the most rapid onset of any of the non-depolarising neuromuscular blocking drugs. It is an aminosteroid neuromuscular blocking drug with an intermediate duration of action. It is reported to have minimal cardiovascular effects; high doses produce mild vagolytic activity.

**Vecuronium**, an aminosteroid neuromuscular blocking drug, has an intermediate duration of action. It does not generally produce histamine release and lacks cardiovascular effects.

---

### ATRACURIUM BESILATE (Atracurium besylate)

**Indications** neuromuscular blockade (short to intermediate duration) for surgery or during intensive care

**Cautions** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; seizures also reported

**Dose**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Intubation and surgery, **ADULT**, by intravenous injection, initially 300–600 micrograms/kg; then 100–200 micrograms/kg as required or initially by intravenous injection, 300–600 micrograms/kg followed by intravenous infusion, 300–600 micrograms/kg/hour; **CHILD** under 18 years see **BNF for Children**
- Intensive care, **ADULT**, by intravenous injection, initially 300–600 micrograms/kg (optional) then by intravenous infusion 270–1770 micrograms/kg/hour (usual dose 650–780 micrograms/kg/hour); **CHILD** under 18 years see **BNF for Children**

---

### CISATRACURIUM

**Indications** neuromuscular blockade (intermediate duration) for surgery or during intensive care

**Cautions** see notes above

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above; also bradycardia

**Dose**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Intubation and surgery, **ADULT**, by intravenous injection, initially 150 micrograms/kg; maintenance, by intravenous infusion, 30 micrograms/kg approx. every 20 minutes or by intravenous infusion, initially 180 micrograms/kg/hour, then after stabilisation, 60–120 micrograms/kg/hour; **CHILD** 1 month–18 years see **BNF for Children**
- Intensive care, **ADULT**, by intravenous injection, initially 150 micrograms/kg (optional), then by intravenous infusion 180 micrograms/kg/hour adjusted according to response (usual range 30–600 micrograms/kg/hour)

**Cisatracurium** (Non-proprietary)

**Injection**, cisatracurium (as besilate) 2 mg/mL, net price 10-mL vial = £7.55, 5 mg/mL, 30-mL vial = £31.09

**Nimbox®** (GSK)

**Injection**, cisatracurium (as besilate) 2 mg/mL, net price 10-mL amp = £7.55

Forte injection, cisatracurium (as besilate) 5 mg/mL, net price 30-mL vial = £31.09

---

### MIVACURIUM

**Indications** neuromuscular blockade (short duration) for surgery

**Cautions** see notes above; low plasma cholinesterase activity; elderly

**Hepatic impairment** reduce dose in severe impairment

**Renal impairment** clinical effect prolonged in renal failure—reduce dose according to response

**Pregnancy** see notes above

**Breast-feeding** see notes above

**Side-effects** see notes above

**Dose**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Intubation and surgery, **ADULT**, by intravenous injection, 70–250 micrograms/kg; maintenance, by intravenous injection, 100 micrograms/kg every 15 minutes or by intravenous infusion, 8–10 micrograms/kg/minute, adjusted if necessary every 3 minutes by
1 microgram/kg/minute to usual dose of 6–7 micrograms/kg/minute; CHILD 2 months–18 years see BNF for Children

Note Doses up to 150 micrograms/kg may be given over 5–15 seconds; higher doses should be given over 30 seconds. In patients with asthma, cardiovascular disease or those who are sensitive to falls in arterial blood pressure give over 60 seconds.

Mivacron® (GSK) (OM)
Injection, mivacurium (as chloride) 2 mg/mL, net price 5-mL amp = £2.79; 10-mL amp = £4.51

### PANCURONIUM BROMIDE

#### Indications
euromuscular blockade (long duration) for surgery or during intensive care
Cautions see notes above
Hepatic impairment possibly slower onset, higher dose requirement, and prolonged recovery time
Renal impairment use with caution; prolonged duration of block
Pregnancy see notes above
Breast-feeding see notes above

#### Side-effects see notes above

#### Dose

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Intubation and surgery, ADULT, by intravenous injection, initially 100 micrograms/kg then 20 micrograms/kg as required; CHILD under 18 years see BNF for Children
- Intensive care, ADULT, by intravenous injection, initially 100 micrograms/kg (optional) then 60 micrograms/kg every 60–90 minutes

Pancuronium (Non-proprietary) (OM)
Injection, pancuronium bromide 2 mg/mL, net price 2-mL amp = £4.00

### ROCURONIUM BROMIDE

#### Indications
euromuscular blockade (intermediate duration) for surgery or during intensive care
Cautions see notes above
Hepatic impairment reduce dose
Renal impairment reduce maintenance dose; prolonged paralysis
Pregnancy see notes above
Breast-feeding see notes above

#### Side-effects see notes above

#### Dose

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Intubation and surgery, ADULT, by intravenous injection, initially 100 micrograms/kg; maintenance, by intravenous injection, 150 micrograms/kg (ELDERLY 75–100 micrograms/kg) or by intravenous infusion, 300–600 micrograms/kg/hour (ELDERLY up to 400 micrograms/kg/hour) adjusted according to response; CHILD under 18 years see BNF for Children
- Intensive care, ADULT, by intravenous injection, initially 600 micrograms/kg (optional); maintenance by intravenous infusion, 300–600 micrograms/kg/hour for first hour, then adjusted according to response; CHILD 1 month–18 years see BNF for Children

Rocuronium (Non-proprietary) (OM)
Injection, rocuronium bromide 10 mg/mL, net price 5-mL vial = £3.00, 10-mL vial = £6.00

Esmeron® (MSD) (PM)
Injection, rocuronium bromide 10 mg/mL, net price 5-mL vial = £2.89, 10-mL vial = £5.79

### VECURONIUM BROMIDE

#### Indications
euromuscular blockade (intermediate duration) for surgery
Cautions see notes above
Hepatic impairment use with caution in significant impairment
Renal impairment use with caution in renal failure
Pregnancy see notes above
Breast-feeding see notes above

#### Side-effects see notes above

#### Dose

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Intubation and surgery, ADULT, by intravenous injection, 80–100 micrograms/kg; maintenance, by intravenous injection, 20–30 micrograms/kg, adjusted according to response (max. 100 micrograms/kg in caesarian section) or by intravenous infusion, 0.8–1.4 micrograms/kg/minute, adjusted according to response; CHILD under 18 years see BNF for Children

Norcuron® (MSD) (PM)
Injection, powder for reconstitution, vecuronium bromide, net price 10-mg vial = £3.37 (with water for injections)

### Depolarising neuromuscular blocking drugs

Suxamethonium has the most rapid onset of action of any of the neuromuscular blocking drugs and is ideal if fast onset and brief duration of action are required, e.g. with tracheal intubation.

Suxamethonium acts by mimicking acetylcholine at the neuromuscular junction but hydrolysis is much slower than for acetylcholine; depolarisation is therefore prolonged, resulting in neuromuscular blockade. Unlike the non-depolarising neuromuscular blocking drugs, its action cannot be reversed and recovery is spontaneous; anticholinesterases such as neostigmine potentiate the neuromuscular block.

Suxamethonium should be given after anaesthetic induction because paralysis is usually preceded by painful muscle fasciculations. While tachycardia occurs with single use, bradycardia may occur with repeated doses in adults and with the first dose in children. Premedication with atropine reduces bradycardia as well as the excessive salivation associated with suxamethonium use.

Prolonged paralysis may occur in dual block, which occurs with high or repeated doses of suxamethonium and is caused by the development of a non-depolarising block following the initial depolarising block. Individuals with myasthenia gravis are resistant to suxamethonium but can develop dual block resulting in delayed recovery. Prolonged paralysis may also occur in those with low or atypical plasma cholinesterase. Assisted ventilation should be continued until muscle function is restored.
SUXAMETHONIUM CHLORIDE
(Succinylcholine chloride)

**Indications**
neuromuscular blockade (short duration) for surgery

**Cautions**
see notes above; hypersensitivity to other neuromuscular blocking drugs; patients with cardiac, respiratory, or neuromuscular disease; raised intraocular pressure (avoid in penetrating eye injury); severe sepsis (risk of hyperkalaemia); interactions: Appendix 1 (muscle relaxants)

**Contra-indications**
family history of malignant hyperthermia, hyperkalaemia; major trauma, severe burns, neurological disease involving acute wasting of major muscle, prolonged immobilisation—risk of hyperkalaemia, personal or family history of congenital myotonic disease, Duchenne muscular dystrophy, low plasma-cholinesterase activity (including severe liver disease, see Hepatic Impairment)

**Hepatic impairment**
prolonged apnoea may occur in severe liver disease because of reduced hepatic synthesis of pseudocholinesterase

**Pregnancy**
mildly prolonged maternal neuromuscular blockade may occur

**Breast-feeding**
likely to be present in breast milk in significant amounts (ionised at physiological pH); breast-feeding may be resumed once the mother recovered from neuromuscular block

**Side-effects**
see notes above; also increased gastric pressure; hyperkalaemia; postoperative muscle pain, recovered from neuromuscular block

**Dose**

- Intubation and surgery, **ADULT**, by intravenous injection, 1–1.5 mg/kg; **CHILD** under 18 years, see BNF for Children

**Note**
Doses of suxamethonium in BNF may differ from those in product literature

Suxamethonium Chloride (Non-proprietary) (Tab) Injection, suxamethonium chloride 50 mg/mL, net price 2-mL amp = £5.8p, 2-mL prefilled syringe = £8.45

Anectine® (GSK) (Tab) Injection, suxamethonium chloride 50 mg/mL, net price 2-mL amp = 71p

Other drugs for reversal of neuromuscular blockade

Neostigmine is used specifically for reversal of non-depolarising (competitive) blockade. It acts within one minute of intravenous injection and its effects last for 20 to 30 minutes; a second dose may then be necessary. Glycopyrronium or alternatively atropine (section 15.1.5), given before or with neostigmine, prevent bradycardia, excessive salivation, and other muscarinic effects of neostigmine.

NEOSTIGMINE METILSULFATE
(Neostigmine methylsulfate)

**Indications**
see under Dose

**Cautions**
section 10.2.1 and notes above; glycopyrronium or atropine should also be given

**Contra-indications**
section 10.2.1 and notes above

**Renal impairment**
section 10.2.1

**Pregnancy**
section 10.2.1

**Breast-feeding**
section 10.2.1

**Side-effects**
section 10.2.1 and notes above

**Dose**

- Reversal of non-depolarising neuromuscular blockade, by intravenous injection over 1 minute, **ADULT** over 18 years, 2.5 mg repeated if necessary (max. 5 mg) after or with glycopyrronium or atropine; **CHILD** under 18 years see BNF for Children

- Myasthenia gravis, see section 10.2.1

**Neostigmine** (Non-proprietary) (Tab) Injection, neostigmine metilsulfate 2.5 mg/mL, net price 1-mL amp = 50p

**With glycopyrronium bromide**

Glycopyrronium–Neostigmine (Non-proprietary) (Tab) Injection, neostigmine metilsulfate 2.5 mg, glycopyrronium bromide 500 micrograms/mL, net price 1-mL amp = £1.15

**Dose**

- Reversal of non-depolarising neuromuscular blockade, by intravenous injection over 10–30 seconds, 1–2 mL or 0.02 mL/kg, dose may be repeated if required (total max. 2 mL); **CHILD** 0.02 mL/kg (or 0.2 mL/kg of a 1 in 10 dilution using water for injections or sodium chloride injection 0.9%), dose may be repeated if required (total max. 2 mL)

Anticholinesterases

Anticholinesterases reverse the effects of the non-depolarising (competitive) neuromuscular blocking drugs such as pancuronium but they prolong the action of the depolarising neuromuscular blocking drug suxamethonium.

**Important**
The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use.

**SUGAMMADEX**

**Indications**
reversal of neuromuscular blockade induced by rocuronium or vecuronium

**Cautions**
recurrence of neuromuscular blockade—monitor respiratory function until fully recovered; recovery may be delayed in cardiovascular disease and elderly; pre-existing coagulation disorders or use of anticoagulants (unrelated to surgery); wait 24 hours

**Other drugs for reversal of neuromuscular blockade**

Sugammadex is a modified gamma cyclodextrin that can be used for rapid reversal of neuromuscular blockade induced by rocuronium or vecuronium (section 15.1.5). In practice, sugammadex is used mainly for rapid reversal of neuromuscular blockade in an emergency.

The Scottish Medicines Consortium, p. 4 has advised (February 2013) that sugammadex (Bridion®) is accepted for restricted use within NHS Scotland for the routine reversal of neuromuscular blockade in high-risk patients only, or where prompt reversal of neuromuscular block is required.
before re-administering rocuronium or vecuronium; interactions: Appendix 1 (sugammadex)

Renal impairment avoid if eGFR less than 30 mL/ minute/1.73 m²

Pregnancy use with caution—no information available

Side-effects bronchospasm, bradycardia, cardiac arrest, hypersensitivity reactions

Dose
- Routine reversal of neuromuscular blockade induced by rocuronium or vecuronium, by intravenous injection, ADULT over 18 years, 2–4 mg/kg (consult product literature); a further dose of 4 mg/kg may be required if recurrence of neuromuscular blockade occurs
- Routine reversal of neuromuscular blockade induced by rocuronium, by intravenous injection, CHILD 2–18 years, 2 mg/kg (consult product literature)
- Immediate reversal of neuromuscular blockade induced by rocuronium, by intravenous injection, ADULT over 18 years, 16 mg/kg (consult product literature)

Bridion® (MSD) Injection, sugammadex (as sodium salt) 100 mg/mL, net price 2-mL amp = £59.64, 5-mL amp = £149.10

BNF 68 15.1.7 Antagonists for central and respiratory depression 875

Electrolytes Na⁺ 0.42 mmol/mL

15.1.7 Antagonists for central and respiratory depression

Important The drugs in this section should only be administered by, or under the direct supervision of, personnel experienced in their use.

Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by naloxone. Naloxone will immediately reverse opioid-induced respiratory depression but the dose may have to be repeated because of the short duration of action of naloxone; however, naloxone will also antagonise the analgesic effect.

Flumazenil is a benzodiazepine antagonist for the reversal of the central sedative effects of benzodiazepines after anaesthetic and similar procedures. Flumazenil has a shorter half-life and duration of action than diazepam or midazolam so patients may become reseated.

Doxapram (section 3.5.1) is a central and respiratory stimulant but is of limited value in anaesthesia.

Contra-indications life-threatening condition (e.g. raised intracranial pressure, status epilepticus) controlled by benzodiazepines

Hepatic impairment carefully titrate dose

Breast-feeding avoid breast-feeding for 24 hours

Side-effects nausea and vomiting; less commonly palpitation, anxiety, fear; also reported transient hypertension, tachycardia, flushing, agitation, convulsions (particularly in those with epilepsy), dizziness, sensory disturbance, chill, sweating

Dose
- Anaesthesia and clinical procedures, by intravenous injection, 200 micrograms over 15 seconds, then 100 micrograms at 60-second intervals if required; usual dose range, 300–600 micrograms; max. total dose 1 mg. CHILD 1 month–18 years see BNF for Children
- Intensive care, by intravenous injection, 300 micrograms over 15 seconds, then 100 micrograms at 60-second intervals if required; max. total dose 2 mg; then if drowsiness recurs either, by intravenous injection, 300 micrograms, or by intravenous infusion, 100–400 micrograms/hour, adjusted according to response; CHILD 1 month–18 years see BNF for Children

Flumazenil (Non-proprietary) Injection, flumazenil 100 micrograms/mL, net price 5-mL amp = £13.50

NALOXONE HYDROCHLORIDE

Indications see under Dose

Cautions cardiovascular disease or those receiving cardiotoxic drugs (serious adverse cardiovascular effects reported); physical dependence on opioids (precipitates withdrawal); pain (see also under Titration of Dose, below); has short duration of action (repeated doses or infusion may be necessary to reverse effects of opioids with longer duration of action) Titrated of dose In postoperative use, the dose should be titrated for each patient in order to obtain sufficient respiratory response; however, naloxone antagonises analgesia

Pregnancy use only if potential benefit outweighs risk

Breast-feeding not orally bioavailable

Side-effects nausea, vomiting, hypotension, hypertension, tachycardia, headache, dizziness; less commonly diarrhoea, dry mouth, bradycardia, arrhythmia, hyperventilation, tremor, sweating; rarely seizures; very rarely ventricular fibrillation, cardiac arrest, pulmonary oedema, erythema multiforme, and hypersensitivity reactions including anaphylaxis; also reported agitation

Dose
- Reversal of postoperative respiratory depression, ADULT and CHILD over 12 years, by intravenous injection, 100–200 micrograms (1.5–3 micrograms/kg); if response inadequate, give subsequent dose of 100 micrograms every 2 minutes; alternatively, subsequent doses can be given by intramuscular injection every 1–2 hours; CHILD 1 month–12 years see BNF for Children
- Reversal of respiratory and CNS depression resulting from opioid administration to mother during labour, NEONATE, by intramuscular injection, 200 micrograms (60 micrograms/kg) as a single dose at birth; alter-
Malignant hyperthermia is a rare but potentially lethal complication of anaesthesia. It is characterised by a rapid rise in temperature, increased muscle rigidity, tachycardia, and acidosis. The most common triggers of malignant hyperthermia are the volatile anaesthetics. Succinylcholine has also been implicated, but malignant hyperthermia is more likely if it is given following a volatile anaesthetic. Dantrolene sodium should be avoided during anaesthesia in patients at high risk of malignant hyperthermia.

Dantrolene is used in the treatment of malignant hyperthermia. It acts on skeletal muscle cells by interfering with calcium efflux, thereby stopping the contractile process.

**DANTROLENE SODIUM**

**Indications** malignant hyperthermia; chronic severe spasticity of voluntary muscle (section 10.2.2)

**Cautions** avoid extravasation (risk of tissue necrosis); interactions: Appendix 1 (muscle relaxants)

**Pregnancy** use only if potential benefit outweighs risk

**Breast-feeding** present in milk—use only if potential benefit outweighs risk

**Side-effects** hepatotoxicity, pulmonary oedema, dizziness, weakness, and injection-site reactions including erythema, rash, swelling, and thrombophlebitis

**Dose** By rapid intravenous injection, ADULT, initially 2–3 mg/kg, then 1 mg/kg repeated as required to a cumulative max. of 10 mg/kg; CHILD 1 month–18 years see BNF for Children

**Dantrium Intravenous®** (SpePharm) Injection, powder for reconstitution, dantrolene sodium, net price 20-mg vial = £51.00 (hosp. only)

**Use of local anaesthetics** Local anaesthetic drugs act by causing a reversible block to conduction along nerve fibres. They vary widely in their potency, toxicity, duration of action, stability, solubility in water, and ability to penetrate mucous membranes. These factors determine their application, e.g. topical (surface), infiltration, peripheral nerve block, intravenous regional anaesthesia (Bier’s block), plexus, epidural (extradural), or spinal (intrathecal or subarachnoid) block. Local anaesthetics may also be used for postoperative pain relief, thereby reducing the need for analgesics such as opioids.

**Administration** The dose of local anaesthetic depends on the injection site and the procedure used. In determining the safe dosage, it is important to take account of the rate of absorption and excretion, and of the potency. The patient’s age, weight, physique, and clinical condition, and the vascularity of the administration site and the duration of administration, must also be considered.

Uptake of local anaesthetics into the systemic circulation determines their duration of action and produces toxicity.

Great care must be taken to avoid accidental intravascular injection; local anaesthetic injections should be given slowly in order to detect inadvertent intravascular administration. When prolonged analgesia is required, a long-acting local anaesthetic is preferred to minimise the likelihood of cumulative systemic toxicity. Local anaesthesia around the oral cavity may impair swallowing and therefore increases the risk of aspiration.

Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects (see Toxicity and Side-effects, p. 877) is necessary during the first 30 minutes after injection.

Epidermal anaesthesia is commonly used during surgery, often combined with general anaesthesia, because of its protective effect against the stress response of surgery. It is often used when good postoperative pain relief is essential (e.g. major thoracic or intra-abdominal surgery).

**Use of vasoconstrictors** Local anaesthetics cause dilatation of blood vessels. The addition of a vasoconstrictor such as adrenaline (epinephrine) to the local anaesthetic preparation diminishes local blood flow, slowing the rate of absorption and thereby prolonging the anaesthetic effect. Great care should be taken to avoid inadvertent intravenous administration of a preparation containing adrenaline, and it is not advisable to give adrenaline with a local anaesthetic injection in digits or appendages because of the risk of ischaemic necrosis.

Adrenaline must be used in a low concentration when administered with a local anaesthetic (but see also Dental Anaesthesia, p. 877). The total dose of adrenaline should not exceed 500 micrograms and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture...
is to be injected. Care must also be taken to calculate a safe maximum dose of local anaesthetic when using combination products. For prescribing information on adrenaline, see section 2.7.3. For drug interactions of adrenaline, see Appendix 1 (sympathomimetics).

In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.

**Dental anaesthesia** Lidocaine is widely used in dental procedures; it is most often used in combination with adrenaline (epinephrine). Lidocaine 2% combined with adrenaline 1 in 80 000 (12.5 micrograms/mL) is a safe and effective preparation; there is no justification for using higher concentrations of adrenaline. See also Use of Vasoconstrictors, p. 876.

The local anaesthetics articaine and mepivacaine are also used in dentistry; they are available in cartridges suitable for dental use. Mepivacaine is available with or without adrenaline and articaine is available with adrenaline.

In patients with severe hypertension or unstable cardiac rhythm, mepivacaine without adrenaline may be used. Alternatively, prilocaine with or without felypressin can be used but there is no evidence that it is any safer. Felypressin can cause coronary vasoconstriction when used at high doses; limit dose in patients with coronary artery disease.

**Cautions of local anaesthetics** Local anaesthetics should be administered with caution in children, elderly or debilitated patients (consider dose reduction), or in patients with impaired cardiac conduction, cardio-ovascular disease, hypovolaemia, shock, impaired respiratory function, epilepsy, or myasthenia gravis. See also Administration and Use of Vasoconstrictors, above.

**Contra-indications of local anaesthetics** Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. In such circumstances, increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH. See also Use of Vasoconstrictors, p. 876.

Local anaesthetic preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block).

Local anaesthetics can cause ototoxicity and should not be applied to the middle ear. They are also contra-indicated in patients with complete heart block.

**Toxicity and side-effects** A single application of a topical lidocaine preparation does not generally cause systemic side-effects. Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems. CNS effects include a feeling of inebriation and lightheadedness followed by drowsiness, numbness of the tongue and perioral region, restlessness, paraesthesia (including sensations of hot and cold), dizziness, blurred vision, tinnitus, headache, nausea and vomiting, muscle twitching, tremors, and convulsions. Transient excitement may also occur, followed by depression with drowsiness, respiratory failure, unconsciousness, and coma. Effects on the cardiovascular system include myocardial depression and peripheral vasodilatation resulting in hypotension and bradycardia; arrhythmias and cardiac arrest can occur.

Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

### Management of severe local anaesthetic-induced cardiovascular toxicity

After injection of a bolus of local anaesthetic, toxicity may develop at any time in the following hour. In the event of signs of toxicity during injection, the administration of the local anaesthetic must be stopped immediately.

Cardiovascular status must be assessed and cardiopulmonary resuscitation procedures must be followed, see section 2.7.3 (Cardiopulmonary Resuscitation).

In the event of local anaesthetic-induced cardiac arrest, standard cardiopulmonary resuscitation should be initiated immediately. Lidocaine must not be used as anti-arrhythmic therapy.

If the patient does not respond rapidly to standard procedures, 20% lipid emulsion such as *Intralipid®* [unlicensed indication] should be given intravenously at an initial bolus dose of 1.5 mL/kg over 1 minute, followed by an infusion of 15 mL/kg/hour. After 5 minutes, if cardiovascular stability has not been restored or circulation deteriorates, give a maximum of two further bolus doses of 1.5 mL/kg over 1 minute, 5 minutes apart, and increase the infusion rate to 30 mL/kg/hour. Continue infusion until cardiovascular stability and adequate circulation are restored or maximum cumulative dose of 12 mL/kg is given.

Standard cardiopulmonary resuscitation must be maintained throughout lipid emulsion treatment. Propofol is not a suitable alternative to lipid emulsion.

Further advice on ongoing treatment should be obtained from the National Poisons Information Service, p. 33.

Detailed treatment algorithms and accompanying notes are available at www.toxbase.org or www.aagbi.org (search site for: local anaesthetic toxicity).

---

**Articaine**

Articaine is an amide-type local anaesthetic used for dental anaesthesia (see Dental Anaesthesia, above). It is available in a preparation that also contains adrenaline (see Use of Vasoconstrictors, p. 876).

**ARTICAIN HYDROCHLORIDE WITH ADRENALINE**

(*Carticaine hydrochloride with adrenaline*)

**Indications** infiltration anaesthesia in dentistry

**Cautions** see Cautions of Local Anaesthetics, above and Adrenaline, section 2.7.3
Contra-indications see Contra-indications of Local Anaesthetics, p. 877 and Adrenaline, section 2.7.3

Hepatic impairment use with caution; increased risk of side-effects in severe impairment

Renal impairment see Adrenaline, section 2.7.3

Pregnancy use only if potential benefit outweighs risk—no information available

Breast-feeding avoid breast-feeding for 48 hours after administration

Side-effects see Toxicity and Side-effects, p. 877 and Adrenaline, section 2.7.3; also methaemoglobinaemia (see Prilocaine (p. 882) for treatment)

Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

- ADULT and CHILD over 4 years, consult expert dental sources; important: see also Administration, p. 876

Septanest® (Septodont) (pH 5.3)
Injection, articaine hydrochloride 40 mg/mL, adrenaline 1 in 200 000 (5 micrograms/mL), net price 2.2-mL cartridge = 41p
Excipients include sulfites
Injection, articaine hydrochloride 40 mg/mL, adrenaline 1 in 100 000 (10 micrograms/mL), net price 2.2-mL cartridge = 41p
Excipients include sulfites

Bupivacaine

Bupivacaine has a longer duration of action than other local anaesthetics. It has a slow onset of action, taking up to 30 minutes for full effect. It is often used in lumbar epidural blockade and is particularly suitable for continuous epidural analgesia in labour, or for postoperative pain relief. It is the principal drug used for spinal anaesthesia. Hyperbaric solutions containing glucose may be used for spinal block.

BUPIVACAINE HYDROCHLORIDE

Indications see under Dose
Cautions see Cautions of Local Anaesthetics, p. 877; myocardial depression can be more severe and more resistant to treatment; cardiovascular disease; hypertension; hypotension; cerebral atheroma; interactions: Appendix 1 (bupivacaine)

Contra-indications see Contra-indications of Local Anaesthetics, p. 877

Hepatic impairment use with caution in severe impairment

Renal impairment use with caution in severe impairment

Pregnancy large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block; use lower doses for intrathecal use during late pregnancy

Breast-feeding amount too small to be harmful

Side-effects see Toxicity and Side-effects, p. 877

Dose

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

Note Doses should be adjusted according to patient’s physical status and nature of procedure—important: see also under Administration, p. 876

- Surgical anaesthesia
  - Lumbar epidural block, ADULT and CHILD over 12 years, 75–150 mg using a 5 mg/mL (0.5%) solution
  - Thoracic epidural block, ADULT and CHILD over 12 years, 12.5–50 mg using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution
  - Caudal epidural block, ADULT and CHILD over 12 years, 50–150 mg using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution
  - Major nerve block, ADULT and CHILD over 12 years, 50–175 mg using a 5 mg/mL (0.5%) solution
  - Field block, ADULT and CHILD over 12 years, up to max. 150 mg using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution
  - Intrathecal injection, see Marcain Heavy®

- Acute pain
  - Lumbar epidural block, ADULT and CHILD over 12 years, by intermittent injection, 15–37.5 mg using a 2.5 mg/mL (0.25%) solution, repeated when required (at intervals of at least 30 minutes) or by continuous epidural infusion, 12.5–18.8 mg/hour using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; labour pain, by continuous epidural infusion, 6.25–12.5 mg/hour using a 1.25 mg/mL (0.125%) solution; max. 400 mg in 24 hours
  - Thoracic epidural block, ADULT and CHILD over 12 years, by continuous epidural infusion, 6.3–18.8 mg/hour using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; max. 400 mg in 24 hours
  - Intra-articular block, ADULT and CHILD over 12 years, up to max. 100 mg using a 2.5 mg/mL (0.25%) solution; when co-administered with bupivicaine by another route, total max. 150 mg
  - Field block, ADULT and CHILD over 12 years, up to max. 150 mg using a 2.5 mg/mL (0.25%) solution
  - With fentanyl, see Bufyl®

Important
The licensed doses stated above may not be appropriate in some settings and expert advice should be sought

Bupivacaine (Non-proprietary) (pH 5.3)
Injection, anhydrous bupivacaine hydrochloride 2.5 mg/mL (0.25%), net price 10 mL = 88p; 5 mg/mL (0.5%), 10 mL = 92p
Infusion (epidural), anhydrous bupivacaine hydrochloride 1 mg/mL (0.1%), net price 100 mL = £9.41, 250 mL = £10.59; 1.25 mg/mL (0.125%), 250 mL = £10.80

Marcain® (AstraZeneca) (pH 5.3)
Injection, anhydrous bupivacaine hydrochloride 2.5 mg/mL (Marcain® 0.25%), net price 10-mL Polyamp® = £1.06; 5 mg/mL (Marcain® 0.5%), 10-mL Polyamp® = £1.21
Marcain Heavy® (AstraZeneca) 

**Injection** anhydrous bupivacaine hydrochloride
5 mg/mL (0.5%), glucose 80 mg/mL, net price 4-mL amp = £1.45

**Dose** ADULT and CHILD over 12 years, intrathecal anaesthesia for surgery, 10–20 mg bupivacaine hydrochloride; dose may need to be reduced in elderly and in late pregnancy

For prescribing information on adrenaline, see section 2.7.3.; also Use of Vasocostrictors, p. 876.

**Bupivacaine and Adrenaline (Non-proprietary)**

**Injection** anhydrous bupivacaine hydrochloride
2.5 mg/mL (0.25%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 10-mL amp = £1.40

**Injection** anhydrous bupivacaine hydrochloride
5 mg/mL (0.5%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 10-mL amp = £2.10

For prescribing information on fentanyl, see section 15.1.4.3

**Bufl® (AMCo)**

**Infusion (epidural)**, bupivacaine hydrochloride
1 mg/mL (0.1%), fentanyl (as citrate) 2 micrograms/mL, net price 250 mL = £8.50, 500 mL = £9.20

**Infusion (epidural)**, bupivacaine hydrochloride
1.25 mg/mL (0.125%), fentanyl (as citrate) 2 micrograms/mL, net price 250 mL = £9.05, 500 mL = £9.20

**Electrolytes** Na⁺ < 0.5 mmol/mL

**Dose** ADULT, continuous lumbar epidural infusion during labour (once epidural block established), 10–18.75 mg/hour bupivacaine, 16–30 micrograms/hour fentanyl; continuous thoracic, upper abdominal, or lower abdominal epidural infusion for postoperative pain (once epidural block established), 4–18.75 mg/hour bupivacaine, 8–16 micrograms/hour fentanyl; max. 400 mg bupivacaine or 720 micrograms fentanyl in 24 hours; not recommended for use in children

**Chloroprocaine**

Chloroprocaine, a para-aminobenzoic acid ester, is used for spinal anaesthesia in adults where the planned procedure should not exceed 40 minutes.

**CHLOROPROCAINE HYDROCHLORIDE**

**Indications** intrathecal anaesthesia for surgical procedures lasting up to 40 minutes

**Cautions** see Cautions of Local Anaesthetics, p. 877; also acute porphyria (section 9.8.2); interactions: Appendix 1 (chloroprocaine)

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 877; also severe anaemia

**Hepatic impairment** use with caution in severe impairment

**Renal impairment** use with caution in severe impairment

**Pregnancy** avoid—no information available

**Breast-feeding** avoid—no information available

**Side-effects** see Toxicity and Side-effects, p. 877; also less commonly hypertension

**Dose** To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

**Note** Doses should be adjusted according to patient’s physical status and nature of the procedure—important: see also under Administration, p. 876

- **ADULT** over 18 years, by slow intrathecal injection, 40–50 mg depending on desired length of block

**Important**

The licensed doses stated above may not be appropriate in some settings and expert advice should be sought

**Ampres® (AMCo)**

**Injection**, chloroprocaine hydrochloride 10 mg/mL, net price 5-mL amp = £8.75

**Levobupivacaine**

Levobupivacaine, an isomer of bupivacaine, has anaesthetic and analgesic properties similar to bupivacaine, but is thought to have fewer adverse effects.

**LEVOBUPIVACAINE**

**Note** Levobupivacaine is an isomer of bupivacaine

**Indications** see under Dose

**Cautions** see Cautions of Local Anaesthetics, p. 877; cardiovascular disease; interactions: Appendix 1 (levobupivacaine)

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 877

**Hepatic impairment** use with caution

**Pregnancy** large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block; avoid if possible in the first trimester—toxicity in animal studies; may cause fetal distress syndrome; do not use for paracervical block in obstetrics; do not use 7.5 mg/mL strength in obstetrics

**Breast-feeding** amount too small to be harmful

**Side-effects** see Toxicity and Side-effects, p. 877; also sweating, pyrexia, anaemia

**Dose**

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

**Note** Doses should be adjusted according to patient’s physical status and nature of procedure—important: see also under Administration, p. 876

- **Surgical anaesthesia**

  **Lumbar epidural**, ADULT, 50–150 mg using a 5 mg/mL (0.5%) or 7.5 mg/mL (0.75%) solution, given over 5 minutes; caesarean section, 75–150 mg using a 5 mg/mL (0.5%) solution, given over 15–20 minutes

  **Intrathecal injection**, ADULT, 15 mg using a 5 mg/mL (0.5%) solution

  **Peripheral nerve block**, ADULT, 2.5–150 mg using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

  **Peribulbar block**, ADULT, 37.5–112.5 mg using a 7.5 mg/mL (0.75%) solution

**15 Anaesthesia**
15.2 Local anaesthesia

Local infiltration, ADULT, 2.5–150 mg using a 2.5 mg/mL (0.25%) solution
- Acute pain
  - Lumbar epidural, ADULT, labour pain, by intermittent injection, 15–25 mg using a 2.5 mg/mL (0.25%) solution, repeated as required at intervals of at least 15 minutes or by continuous epidural infusion, 5–12.5 mg/hour using a 1.25 mg/mL (0.125%) solution; postoperative pain, by continuous epidural infusion, 12.5–18.75 mg/hour using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; max. 400 mg in 24 hours

**Important**
The licensed doses stated above may not be appropriate in some settings and expert advice should be sought

**Chirocaine**® (AbbVie)
- Injection, levobupivacaine (as hydrochloride) 2.5 mg/mL, net price 10-mL amp = £1.41; 5 mg/mL, 10-mL amp = £1.62; 7.5 mg/mL, 10-mL amp = £2.42
  - Note For 1.25 mg/mL concentration dilute standard solutions with sodium chloride 0.9%
- Epidural infusion, levobupivacaine (as hydrochloride) 1.25 mg/mL, net price 100 mL = £7.26, 200 mL = £12.20

**Lidocaine**
Lidocaine is effectively absorbed from mucous membranes and is a useful surface anaesthetic in concentrations up to 10%. Except for surface anaesthesia and dental anaesthesia, solutions should not usually exceed 1% in strength. The duration of the block (with adrenaline) is about 90 minutes.

**LIDOCAINE HYDROCHLORIDE** (Lignocaine hydrochloride)
- **Indications** see under Dose; ventricular arrhythmias (section 2.3.2); eye (section 11.7); oral lesions (section 12.3.1)
- **Cautions** See Cautions of Local Anaesthetics, p. 877 and section 2.3.2; hypertensive; topical preparations can damage plastic cuffs of endotracheal tubes
- **Contra-indications** see notes above, Contra-indications of Local Anaesthetics, p. 877, and section 2.3.2
- **Hepatic impairment** section 2.3.2
- **Renal impairment** section 2.3.2
- **Pregnancy** large doses can cause fetal bradycardia; large doses during delivery can cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block
- **Breast-feeding** section 2.3.2
- **Side-effects** see Toxicity and Side-effects, p. 877 and section 2.3.2; also methaemoglobinemia (see under Prilocaine (p. 882) for treatment), nystagmus, rash; hypoglycaemia also reported following intrathecal or paravertebral block
- **Dose**
  - To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body weight
  - Infiltration anaesthesia, ADULT, according to patient’s weight and nature of procedure, max. 200 mg (or 500 mg if given in solutions containing adrenaline)—see also Administration, p. 876 and important warning below; CHILD under 18 years see **BNF for Children**
  - Intravenous regional anaesthesia and nerve blocks, seek expert advice
  - Surface anaesthesia, see preparations below

**Important**
The licensed doses stated above may not be appropriate in some settings and expert advice should be sought

**Lidocaine hydrochloride injections**
**Lidocaine** (Non-proprietary)
- **Injection**, lidocaine hydrochloride 5 mg/mL (0.5%), net price 10-mL amp = 50p; 10 mg/mL (1%), 2-mL amp = 27p, 5-mL amp = 27p, 10-mL amp = 40p, 10-mL prefilled syringe = €0.48; 20-mL amp = 76p; 20 mg/mL (2%), 2-mL amp = 31p, 5-mL amp = 31p

**With adrenaline**
For prescribing information on adrenaline see section 2.7.3; see also Use of Vasoconstrictors, p. 876.

**Xylocaine**® (AstraZeneca)
- **Injection**, anhydrous lidocaine hydrochloride 10 mg/mL (1%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 20-mL vial = €1.93
- **Exipients** include sulfates
- **Injection**, anhydrous lidocaine hydrochloride 20 mg/mL (2%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 20-mL vial = €1.77
- **Exipients** include sulfates

**Lidocaine injections for dental use**
A variety of lidocaine injections with adrenaline is available in dental cartridges; brands include Lignospan Special®, Rexocaine®, and Xylocaine®.

For prescribing information on adrenaline see section 2.7.3; see also Use of Vasoconstrictors, p. 876.

- **Note** Consult expert dental sources for specific advice in relation to dose of lidocaine for dental anaesthesia

**Lidocaine for surface anaesthesia**
**Lidocaine** (Non-proprietary)
- **Ointment**, lidocaine 5%, net price 15 g = £6.18
- **Dose**
  - Dental practice, rub gently into dry gum
  - Sore nipples from breast-feeding, apply using gauze and wash off immediately before next feed
  - Pain relief (in anal fissures, haemorrhoids, pruritus ani, pruritus vulvae, herpes zoster, or herpes labialis), lubricant in cystoscopy or proctoscopy, apply 1–2 mL when necessary; avoid long-term use

**Dental prescribing on NHS** Lidocaine Ointment, 5% may be prescribed

**Instillagel**® (CliniMed)
- **Gel**, lidocaine hydrochloride 2%, chlorhexidine gluconate solution 0.25%, in a sterile lubricant basis in disposable syringe, net price 6-mL syringe = 23p, 11-mL syringe = 4p
- **Exipients** include hydroxybenzoates (parabens)
- **Dose** urethral sounding and catheterisation, 6–11 mL into urethra
- Cystoscopy, 11 mL (a further installation of 6–11 mL may be required)
Lidocaine with prilocaine

Solution, lidocaine hydrochloride 40 mg/mL (4%), net price per unit (4-mL vial and disposable sterile cannula with cover and vapor injector) = £5.10

Note: May be difficult to obtain

Dose: anesthesia of mucous membranes of oropharynx, trachea, or respiratory tract, 40–200 mg (1–5 mL) as a single dose sprayed, instilled (if a cavity), or applied with a swab (reduce dose according to size, age and condition of patient), usual dose 160 mg (4 mL), CHILD up to 3 mg/kg

LMX 4 \(^{\text{®}}\) (female)

Cream, lidocaine 4%, net price 5-g tube = £2.98, 30-g tube = £14.90; 12 x 5-g tube with 24 waterproof dressings = £38.16

Excipients: include benzyl alcohol and propylene glycol

Dose: ADULT and CHILD over 1 month, anesthesia before versus cannulation or venepuncture, apply thick layer (1–2.5 g; CHILD under 1 year max. 1 g) to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours (CHILD 1–3 months, 60 minutes; CHILD 3 months–1 year, 4 hours), remove cream with gauze and perform procedure after approximately 5 minutes

Versatis \(^{\text{®}}\) (Grunenthal) \(^{\text{®}}\)

Plasters, lidocaine 5% (700 mg/medicated plaster), net price 30-g pack = £7.40

Excipients: include hydroxybenzoates (parabens), propylene glycol

Dose: postherpetic neuralgia, ADULT over 18 years, apply to intact, dry, non-hairy, non-irritated skin once daily for up to 12 hours, followed by a 12-hour plaster-free period, discontinue if no response after 4 weeks

Note: Up to 3 plasters may be used to cover large areas; plasters may be cut

Note: The Scottish Medicines Consortium (p. 4) has advised (July 2008) that Versatis \(^{\text{®}}\) is accepted for restricted use within NHS Scotland for the treatment of postherpetic neuralgia in patients who are intolerant of first-line systemic therapies or when they have been ineffective

Xylocaine \(^{\text{®}}\) (AstraZeneca)

Spray, lidocaine 10% (100 mg/g) supplying 10 mg lidocaine/dose; 500 spray doses per container, net price 50-mL bottle = £6.29

Dose: dental practice, 1–5 doses

Maxillary sinus puncture, 3 doses

During delivery in obstetrics, up to 20 doses

Bronchoscopy, laryngoscopy, oesophagoscopy, endotracheal intubation, up to 20 doses; CHILD up to 3 mg/kg

With prilocaine

For prescribing information on prilocaine, see p. 882

Lidocaine with prilocaine (Non-proprietary)

Cream, lidocaine 2.5%, prilocaine 2.5%, net price 5-g tube = £2.84; 30-g tube (surgical pack) = £14.75; 5-g tube with 2 occlusive dressings = £3.29; 5 x 5-g tube with 12 occlusive dressings (premedication pack) = £12.99

Brands include Denola

Contra-indications: use in child less than 37 weeks corrected gestational age

Dose: ADULT and CHILD over 1 year, anesthesia before minor skin procedures including venepuncture, apply thick layer under occlusive dressing 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting); max. 2 doses in 24 hours for CHILD 1–12 years; CHILD under 3 months, apply max. 1 g under occlusive dressing for max. 1 hour before procedure; max. 1 dose in 24 hours, CHILD 3–12 months, apply max. 2 g under occlusive dressing for max. 4 hours before procedure; max. 2 doses in 24 hours

Note: Shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca)

Anaesthesia on genital skin before injection of local anaesthetics, apply under occlusive dressing for 15 minutes (in adult men) and 60 minutes (in adult women)

Anaesthesia before surgical treatment of lesions on genital mucosa in adults, apply up to 10 g 5–10 minutes before procedure

Anaesthesia before surgical treatment of lesions on genital mucosa in adults, apply up to 10 g 5–10 minutes before procedure

Anaesthesia before cervical curettage in adults, administer 10 g in lateral vaginal fornices for 10 minutes

Anaesthesia before mechanical cleansing or debridement of leg ulcer in adults, apply up to 10 g under occlusive dressing for 30–60 minutes

With tetracaine

For prescribing information on tetracaine, see p. 883

Pliaglis \(^{\text{®}}\) (Galderma) \(^{\text{®}}\)

Cream, lidocaine 7% (70 mg/g), tetracaine 7% (70 mg/g), net price 15-g tube = £22.95

Excipients: include hydroxybenzoates (parabens)

Dose: ADULT anesthesia before dermatological procedures and venepuncture, apply 1 mm layer using a spatula 30 minutes before procedure, then peel off immediately before procedure; max. application area 400 cm\(^2\)

Note: Application time of 60 minutes indicated for certain procedures, such as laser-assisted tattoo removal and laser leg vein ablation

Lidocaine with phenylephrine (Non-proprietary)

Topical solution, lidocaine hydrochloride 5%, phenylephrine hydrochloride 0.5%, net price 2.5 mL (with nasal applicator) = £11.48

Dose: anesthesia before nasal surgery, endoscopy, laryngoscopy, or removal of foreign bodies from the nose, ADULT and CHILD over 12 years, up to max. 8 sprays

BNF 68
Mepivacaine

Mepivacaine is an amide-type local anaesthetic used for dental anaesthesia (see Dental Anaesthesia, p. 877).

**MEPIVACAINE HYDROCHLORIDE**

**Indications** infiltration anaesthesia and nerve block in dentistry

**Cautions** see Cautions of Local Anaesthetics, p. 877

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 877

**Hepatic impairment** use with caution; increased risk of side-effects in severe impairment

**Renal impairment** use with caution; increased risk of side-effects

**Pregnancy** use with caution in early pregnancy

**Breast-feeding** use with caution

**Side-effects** see Toxicity and Side-effects, p. 877

**Dose**

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

- **ADULT** and **CHILD** over 3 years, consult expert dental sources; **important**: see also Administration, p. 876

**Scandonest® 3% Plain** (Septodont). **Injection**, mepivacaine hydrochloride 30 mg/mL, net price 2.2-mL cartridge = 36p

**With adrenaline**

For prescribing information on adrenaline, see section 2.7.3; see also Use of Vasococonstrictors, p. 876.

**Scandonest® 2% Special** (Septodont). **Injection**, mepivacaine hydrochloride 20 mg/mL, adrenaline 1 in 100 000 (10 micrograms/mL), net price 2.2-mL cartridge = 36p

**Excipients** include sulfites

Prilocaine

Prilocaine is a local anaesthetic of low toxicity which is similar to lidocaine. If used in high doses, methaemoglobinemia may occur, which can be treated with an intravenous injection of **methylthioninium chloride** (see Emergency Treatment of Poisoning, p. 34). Infants under 6 months are particularly susceptible to acquired methaemoglobinemia. A hyperbaric solution of prilocaine (containing glucose) may be used for spinal anaesthesia.

**PRILOCAINE HYDROCHLORIDE**

**Indications** see under preparations

**Cautions** see Cautions of Local Anaesthetics, p. 877; severe or untreated hypertension; concomitant use of drugs that cause methaemoglobinemia; acute porphyria (section 9.8.2); **interactions**: Appendix 1 (prilocaine)

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 877; anaemia or congenital or acquired methaemoglobinemia

**Hepatic impairment** use with caution; lower doses may be required for intrathecal anaesthesia

**Renal impairment** use with caution; lower doses may be required for intrathecal anaesthesia

**Pregnancy** large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block; avoid paracervical or pudendal block in obstetrics (neonatal methaemoglobinemia reported); use lower doses for intrathecal use during late pregnancy

**Breast-feeding** present in milk but not known to be harmful

**Side-effects** see notes above and Toxicity and Side-effects, p. 877; also hypertension

**Dose**

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

- **See under preparations—important**: see also Administration, p. 876

**Citanest 1%** (AstraZeneca). **Injection**, prilocaine hydrochloride 10 mg/mL, net price 50-mL multidose vial = £5.06

**Dose** infiltration anaesthesia and nerve block, adjusted according to site of administration and response, 100–200 mg/minute, or in incremental doses, to max. total dose 400 mg (dose may need to be adjusted in ELDERLY or debilitated patients). **Child** over 6 months up to 5 mg/kg

**Prilotekal** (AMCo). **Injection**, prilocaine hydrochloride 20 mg/mL (2%), glucose 60 mg/mL, net price 5-mL amp = £7.88

**Dose** spinal anaesthesia, by intrathecal injection, **ADULT** over 18 years, usually 40–60 mg, max. 80 mg (dose may need to be reduced in ELDERLY or debilitated patients, or in late pregnancy).

**Note** The Scottish Medicines Consortium (p. 4) has advised (December 2010) that prilocaine 2% hyperbaric solution for injection (**Prilotekal**) is accepted for restricted use within NHS Scotland for use in spinal anaesthesia in ambulatory surgery settings.

**With lidocaine**

See Lidocaine, p. 881

**For dental use**

**Note** Consult expert dental sources for specific advice in relation to dose of prilocaine for dental anaesthesia.

**Citanest 3% with Octapressin** (Dentsply). **Injection**, prilocaine hydrochloride 30 mg/mL, felypressin 0.03 unit/mL, net price 2.2-mL cartridge and self-aspirating cartridge (both) = 47p

Ropivacaine

Ropivacaine is an amide-type local anaesthetic agent similar to bupivacaine. It is less cardiotoxic than bupivacaine, but also less potent.

**ROPIVACAINE HYDROCHLORIDE**

**Indications** see under Dose

**Cautions** see Cautions of Local Anaesthetics, p. 877; also acute porphyria (section 9.8.2); **interactions**: Appendix 1 (ropivacaine)

**Contra-indications** see Contra-indications of Local Anaesthetics, p. 877

**Hepatic impairment** use with caution in severe impairment

**Renal impairment** caution in severe impairment; increased risk of systemic toxicity in chronic renal failure
**Pregnancy**  not known to be harmful; do not use for paracervical block in obstetrics

**Breast-feeding**  not known to be harmful

**Side-effects**  see Toxicity and Side-effects, p. 877; also hypertension, pyrexia; *less commonly* syncope and hypothermia

**Dose**

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight

**Note**  Doses should be adjusted according to patient’s physical status and nature of procedure—important see also under Administration, p. 876

- Surgical anaesthesia
  
  Lumbar epidural block, **ADULT** and **CHILD** over 12 years, 113–200 mg using a 7.5 mg/mL (0.75%) or 10 mg/mL (1%) solution, caesarean section, 113–150 mg in incremental doses using a 7.5 mg/mL (0.75%) solution

  Thoracic epidural block  (to establish block for postoperative pain), **ADULT** and **CHILD** over 12 years, 38–113 mg using a 7.5 mg/mL (0.75%) solution

  Major nerve block  (brachial plexus block), **ADULT** and **CHILD** over 12 years, 225–300 mg using a 7.5 mg/mL (0.75%) solution

  Field block, **ADULT** and **CHILD** over 12 years, 7.5–225 mg using a 7.5 mg/mL (0.75%) solution

- Acute pain, using a 2 mg/mL (0.2%) solution

  Lumbar epidural block, **ADULT** and **CHILD** over 12 years, 20–40 mg followed by 20–30 mg at intervals of at least 30 minutes; or as a *continuous epidural infusion* (labour pain) 12–20 mg/hour (up to 28 mg/hour for postoperative pain)

  Thoracic epidural block  (for postoperative pain), **ADULT** and **CHILD** over 12 years, 12–28 mg/hour as a *continuous epidural infusion*

  Field block, **ADULT** and **CHILD** over 12 years, 2–200 mg

  Peripheral nerve block, **ADULT** and **CHILD** over 12 years, 10–20 mg/hour as a *continuous infusion* or by *intermittent injection*

**Ropivacaine**  (Non-proprietary)  *(Prop)*

Injection, ropivacaine hydrochloride 2 mg/mL, net price 10 mL = £1.65; 7.5 mg/mL, 10 mL = £2.50; 10 mg/mL, 10 mL = £3.00

Infusion, ropivacaine hydrochloride 2 mg/mL, net price 200 mL = £13.70

**Naropin®**  *(AstraZeneca)*  *(Prop)*

Injection, ropivacaine hydrochloride 2 mg/mL, net price 10-mL *Polyamp®* = £1.37; 7.5 mg/mL, 10-mL *Polyamp®* = £2.65; 10 mg/mL, 10-mL *Polyamp®* = £3.20

Electrolytes  Na⁺ <0.5 mmol/mL

Infusion, ropivacaine hydrochloride 2 mg/mL, net price 200-mL *Polybag®* = £17.34

Electrolytes  Na⁺ <0.5 mmol/mL

**Tetracaine**

*Tetracaine*, a para-aminobenzoic acid ester, is an effective local anaesthetic for topical application; a 4% gel is indicated for anaesthesia before venepuncture or venous cannulation. It is rapidly absorbed from mucous membranes and should *never* be applied to inflamed, traumatised, or highly vascular surfaces. It should never be used to provide anaesthesia for bronchoscopy or cystoscopy because lidocaine is a safer alternative.

### TETRACAINE  *(Amethocaine)*

**Indications**  see under preparation; eye (section 11.7)

**Cautions**  see Cautions of Local Anaesthetics, p. 877

**Contra-indications**  see Contra-indications of Local Anaesthetics, p. 877

**Breast-feeding**  not known to be harmful

**Side-effects**  see Toxicity and Side-effects, p. 877

**Important**  Rapid and extensive absorption may result in systemic side-effects (see also notes above)

**Ametop®**  *(S&N Hlth.)*

Gel, tetracaine 4%, net price 1.5-g tube = £1.08

**Excipients**  include hydroxybenzoates (parabens)

**Dose**  **ADULT** and **CHILD** over 1 month, apply contents of tube to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation; **NEONATE**  see *BNF for Children*

**Note**  **ADULT** and **CHILD** over 5 years, contents of max. 5 tubes applied at separate sites at a single time; **CHILD** 1 month–5 years, contents of max. 1 tube applied at separate sites at a single time

**With lidocaine**  

See Lidocaine, p. 881

---

**Tetrahydrofuran  (THF)**

**Use**

For solubilisation

**Dose**

Add 0.5 g to 10 mL of lidocaine hydrochloride 2% solution

**Important**

Rapid and extensive absorption may result in systemic side-effects

**Side-effects**  see Toxicity and Side-effects, p. 877

**Important**  Rapid and extensive absorption may result in systemic side-effects
Appendix 1: Interactions

Due to changes in protein binding

Protein-binding sites are non-specific and one drug can displace another thereby increasing its proportion free to diffuse from plasma to its site of action. This only produces a detectable increase in effect if it is an extensively bound drug (more than 90%) that is not widely distributed throughout the body. Even so displacement rarely produces more than transient potentiation because this increased concentration of free drug results in an increased rate of elimination.

Displacement from protein binding plays a part in the potentiation of warfarin by sulfonamides and tolbutamide but the importance of these interactions is due mainly to the fact that warfarin metabolism is also inhibited.

Affecting renal excretion

Drugs are eliminated through the kidney both by glomerular filtration and by active tubular secretion. Competition occurs between those which share active transport mechanisms in the proximal tubule. For example, salicylates and some other NSAIDs delay the excretion of methotrexate; serious methotrexate toxicity is possible.

Relative importance of interactions

Many drug interactions are harmless and many of those which are potentially harmful only occur in a small proportion of patients; moreover, the severity of an interaction varies from one patient to another. Drugs with a small therapeutic ratio (e.g. phenytoin) and those which require careful control of dosage (e.g. anticoagulants, antihypertensives, and antidiabetics) are most often involved.

Patients at increased risk from drug interactions include the elderly and those with impaired renal or liver function.

Serious interactions

The symbol ● has been placed against interactions that are potentially serious and where concomitant administration of the drugs involved should be avoided (or only undertaken with caution and appropriate monitoring).
Interactions that have no symbol do not usually have serious consequences.

**List of drug interactions**

The following is an alphabetical list of drugs and their interactions; to avoid excessive cross-referencing each drug or group is listed twice: in the alphabetical list and also against the drug or group with which it interacts. For explanation of symbol see above.

### Abacavir

- Analgesics: abacavir possibly reduces plasma concentration of methadone
- Antibacterials: plasma concentration of abacavir possibly reduced by rifampicin
- Antiepileptics: plasma concentration of abacavir possibly reduced by phenobarbital and phenytoin
- Antivirals: abacavir possibly reduces effects of abiraterone; plasma concentration of abacavir reduced by tipranavir
- Orlistat: absorption of abacavir possibly reduced by orlistat

### Abiraterone

- Antibacterials: plasma concentration of abiraterone possibly reduced by rifabutin—manufacturer of abiraterone advises avoid concomitant use; plasma concentration of abiraterone reduced by rifampicin—manufacturer of abiraterone advises avoid concomitant use
- Antidepressants: plasma concentration of abiraterone possibly reduced by St John’s wort—manufacturer of abiraterone advises avoid concomitant use
- Antiepileptics: plasma concentration of abiraterone possibly reduced by carbamazepine, phenobarbital and phenytoin—manufacturer of abiraterone advises avoid concomitant use
- Antituberculosis: increased risk of hyperkalaemia when abiraterone given with rifampicin
- Calcium-channel blockers: enhanced hypotensive effect when ACE inhibitors given with calcium-channel blockers
- Cardiac glycosides: captopril possibly increases plasma concentration of abiraterone
- Diazoxide: enhanced hypotensive effect when ACE inhibitors given with diazoxide
- Diuretics: enhanced hypotensive effect when ACE inhibitors given with diuretics; increased risk of severe hyperkalaemia when ACE inhibitors given with calcium-channel blockers
- Dopamine: enhanced hypotensive effect when ACE inhibitors given with dopamine
- Lisinopril: increased risk of hyperkalaemia when ACE inhibitors given with lisinopril
- Lithium: ACE inhibitors reduce excretion of lithium (increased plasma concentration)
- Potassium salts: increased risk of severe hyperkalaemia when ACE inhibitors given with potassium salts
- Probenecid: excretion of captopril reduced by probenecid

### ACE Inhibitors (continued)

- Antacids: absorption of ACE inhibitors possibly reduced by antacids; absorption of captopril, enalapril and fosinopril reduced by antacids
- Antibacterials: plasma concentration of active metabolite of imidapril reduced by rifampicin (reduced antihypertensive effect); quinapril tablets reduce absorption of tetracyclines (quinapril tablets contain magnesium carbonate); possible increased risk of hyperkalaemia when ACE inhibitors given with trimethoprim
- Anticoagulants: increased risk of hyperkalaemia when ACE inhibitors given with heparins
- Antidepressants: hypotensive effect of ACE inhibitors possibly enhanced by MAOIs
- Antidiabetics: ACE inhibitors possibly enhance hypoglycaemic effect of insulin, metformin and sulphonylureas
- Antipsychotics: enhanced hypotensive effect when ACE inhibitors given with antipsychotics
- Anxiolytics and Hypnotics: enhanced hypotensive effect when ACE inhibitors given with anxiolytics and hypnotics
- Avanafl: hypotensive effect of enalapril possibly enhanced by avanafl
- Azathioprine: increased risk of anaemia or leukopenia when captopril given with azathioprine especially in renal impairment; increased risk of anaemia when enalapril given with azathioprine especially in renal impairment
- Beta-blockers: enhanced hypotensive effect when ACE inhibitors given with beta-blockers
- Calcium-channel blockers: enhanced hypotensive effect when ACE inhibitors given with calcium-channel blockers
- Cardiac Glycosides: captopril possibly increases plasma concentration of digoxin
- Ciclosporin: increased risk of hyperkalaemia when ACE inhibitors given with ciclosporin
- Clonidine: enhanced hypotensive effect when ACE inhibitors given with clonidine; antihypertensive effect of captolloipril possibly delayed by previous treatment with clonidine
- Corticosteroids: hypotensive effect of ACE inhibitors antagonised by corticosteroids
- Diazoxide: enhanced hypotensive effect when ACE inhibitors given with diazoxide
- Diuretics: enhanced hypotensive effect when ACE inhibitors given with diuretics; increased risk of severe hyperkalaemia when ACE inhibitors given with potassium-sparing diuretics and aldosterone antagonists
- Dopaminergics: enhanced hypotensive effect when ACE inhibitors given with dopaminergics
- Gold: flushing and hypotension reported when ACE inhibitors given with gold
- Lithium: ACE inhibitors reduce excretion of lithium (increased plasma concentration)
- Methylprednisolone: enhanced hypotensive effect when ACE inhibitors given with methylprednisolone
- Moxisylyte: enhanced hypotensive effect when ACE inhibitors given with moxisylyte
- Moxonidine: enhanced hypotensive effect when ACE inhibitors given with moxonidine
- Muscle Relaxants: enhanced hypotensive effect when ACE inhibitors given with muscle relaxants
- Nitrates: enhanced hypotensive effect when ACE inhibitors given with nitrates
- Oestrogens: hypotensive effect of ACE inhibitors antagonised by oestrogens
- Potassium Salts: increased risk of severe hyperkalaemia when ACE inhibitors given with potassium salts
- Probenecid: excretion of captopril reduced by probenecid
Appendix 1: Interactions

ACE Inhibitors (continued)
Prostaglandins: enhanced hypotensive effect when ACE inhibitors given with alprostadil
Vasodilator Anti-hypertensives: enhanced hypotensive effect when ACE inhibitors given with hydralazine, minoxidil or sodium nitroprusside
Acebutolol see Beta-blockers
Acelefnec see NSAIDs
Acemetacin see NSAIDs
Aconcomarol see Coumarins
Acelzalomide see Diuretics
Aciclovir
Note: Interactions do not apply to topical aciclovir preparations
• Valaciclovir interactions as for aciclovir
Ciclosporin: increased risk of nephrotoxicity when aciclovir given with ciclosporin
Mycofenolate: plasma concentration of aciclovir increased by mycofenolate, also plasma concentration of inactive metabolite of mycofenolate increased
Probenecid: excretion of aciclovir reduced by probenecid (increased plasma concentration)
Tacrolimus: possible increased risk of nephrotoxicity when aciclovir given with tacrolimus
Theophylline: aciclovir possibly increases plasma concentration of theophylline
Acitretin see Retinoids
Acrivastine see Antihistamines
Adalimumab
Abatacept: increased risk of side-effects when adalimumab given with abatacept
• Anakinra: avoid concomitant use of adalimumab with anakinra
• Vaccines: avoid concomitant use of adalimumab with live vaccines (see p. 828)
Adefovir
Antivirals: avoidance of adefovir advised by manufacturer of tenofovir
Interferons: manufacturer of adefovir advises caution before interferons given with peginterferon alfa
Adenosine
Note: Possibility of interaction with drugs tending to impair myocardial conduction
Anesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine
• Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other anti-arrhythmics
• Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with antipsychotics that prolong the QT interval
• Beta-blockers: increased myocardial depression when anti-arrhythmics given with beta-blockers
Caffeine citrate: anti-arrhythmic effect of adenosine antagonised by caffeine citrate—manufacturer of adenosine advises avoid caffeine citrate for at least 12 hours before adenosine
Diprydiamole: effect of adenosine enhanced and extended by diprydiamole (important risk of toxicity)—reduce dose of adenosine, see Dose under Adenosine, p. 96
Nicotine: effects of adenosine possibly enhanced by nicotine
Theophylline: anti-arrhythmic effect of adenosine antagonised by theophylline—manufacturer of adenosine advises avoid theophylline for 24 hours before adenosine
Adrenaline (epinephrine) see Sympathomimetics
Adrenergic Neurone Blockers
Alcohol: enhanced hypotensive effect when adrenergic neurone blockers given with alcohol
Adrenergic Neurone Blockers (continued)
Alpha-blockers: enhanced hypotensive effect when adrenergic neurone blockers given with alpha-blockers
• Anesthetics, General: enhanced hypotensive effect when adrenergic neurone blockers given with general anesthetics
Analgesics: hypotensive effect of adrenergic neurone blockers antagonised by NSAIDs
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when adrenergic neurone blockers given with angiotensin-II receptor antagonists
Antidepressants: enhanced hypotensive effect when adrenergic neurone blockers given with MAOIs; hypotenive effect of adrenergic neurone blockers antagonised by tricyclics
Antipsychotics: hypotensive effect of adrenergic neurone blockers antagonised by haloperidol; hypotensive effect of adrenergic neurone blockers antagonised by higher doses of chlorpromazine; enhanced hypotensive effect when adrenergic neurone blockers given with phenothiazines
Anxiolytics and Hypnotics: enhanced hypotensive effect when adrenergic neurone blockers given with anxiolytics and hypnotics
Beta-blockers: enhanced hypotensive effect when adrenergic neurone blockers given with beta-blockers
Calcium-channel Blockers: enhanced hypotensive effect when adrenergic neurone blockers given with calcium-channel blockers
Clonidine: enhanced hypotensive effect when adrenergic neurone blockers given with clonidine
Corticosteroids: hypotensive effect of adrenergic neurone blockers antagonised by corticosteroids
Diazoxy: enhanced hypotensive effect when adrenergic neurone blockers given with diazoxide
Diuretics: enhanced hypotensive effect when adrenergic neurone blockers given with diuretics
Dopaminergics: enhanced hypotensive effect when adrenergic neurone blockers given with levodopa
Methyldopa: enhanced hypotensive effect when adrenergic neurone blockers given with methyldopa
Moxisylyte: enhanced hypotensive effect when adrenergic neurone blockers given with moxisylyte
Moxonidine: enhanced hypotensive effect when adrenergic neurone blockers given with moxonidine
Muscle Relaxants: enhanced hypotensive effect when adrenergic neurone blockers given with baclofen or tizanidine
Nitrites: enhanced hypotensive effect when adrenergic neurone blockers given with nitrites
Oestrogens: hypotensive effect of adrenergic neurone blockers antagonised by oestrogens
Pizotifen: hypotensive effect of adrenergic neurone blockers antagonised by pizotifen
Prostaglandins: enhanced hypotensive effect when adrenergic neurone blockers given with alprostadil
Sympathomimetics: hypotensive effect of guanethidine antagonised by dexamfetamine and lisdexamfetamine; hypotensive effect of adrenergic neurone blockers antagonised by ephedrine, isometheptene, metaraminol, methylphenidate, noradrenaline (norepinephrine), oxymetazoline, phelyphrine, pseudoephedrine and xylometazoline
Vasodilator Antihypertensives: enhanced hypotensive effect when adrenergic neurone blockers given with hydralazine, minoxidil or sodium nitroprusside
Adsorbents see Kaolin
Afatinib
Anti-arrhythmics: plasma concentration of afatinib possibly increased by amiodarone—manufacturer of afatinib advises separating administration of amiodarone by 6 to 12 hours
Antibacterials: plasma concentration of afatinib possibly increased by erythromycin—manufacturer of
Anticoagulants:

Alcohol

Antidepressants:

Antibacterials:

Agomelatine

Agalsidase Alfa and Beta

Antirhythmics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)

Antivirals: plasma concentration of afatinib increased by ritonavir—manufacturer of afatinib advises separating administration of ritonavir by 6 to 12 hours

Angiotensin-II Receptor Antagonists: enhanced hypotensive and sedative effect when alcohol given with adrenergic neurone blockers

Alpha-blockers: plasma concentration of afatinib possibly increased by itraconazole—manufacturer of afatinib advises separating administration of itraconazole by 6 to 12 hours

Antifungals:

Afatinib

Antibacterials (continued)

Afatinib advises separating administration of erythromycin by 6 to 12 hours; plasma concentration of afatinib reduced by rifampicin

Antifungals: plasma concentration of afatinib possibly increased by itraconazole—manufacturer of afatinib advises separating administration of itraconazole by 6 to 12 hours

Anticoagulants: some beverages containing alcohol and some dealkohlised beverages contain tyramine which interacts with MAOIs (hypertensive crisis)—if no tyramine, enhanced hypotensive effect; sedative effects possibly increased when alcohol given with SSRIs; increased sedative effect when alcohol given with mirtazapine, tricyclic-related antidepressants or TCAs

Antidiabetics: alcohol enhances hypoglycaemic effect of antidiabetics; increased risk of lactic acidosis when alcohol given with metformin

Antiepileptics: alcohol possibly increases CNS side-effects of carbamazepine; increased sedative effect when alcohol given with phenobarbital; chronic heavy consumption of alcohol possibly reduces plasma concentration of phenytoin; increased risk of blurred vision when alcohol given with retigabine

Antifungals: effects of alcohol possibly enhanced by giseofulvin

Antihistamines: increased sedative effect when alcohol given with antihistamines (possibly less effect with non-sedating antihistamines)

Antimuscarinics: increased sedative effect when alcohol given with hyoscyamine

Antipsychotics: increased sedative effect when alcohol given with antipsychotics

Anxiolytics and Hypnotics: increased sedative effect when alcohol given with anxiolytics and hypnotics

Avanafil: possible enhanced hypotensive effect when alcohol given with avanafil

Beta-blockers: enhanced hypotensive effect when alcohol given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when alcohol given with calcium-channel blockers; plasma concentration of alcohol possibly increased by verapamil

Clonidine: enhanced hypotensive effect when alcohol given with clonidine

Cytotoxics: disulfiram-like reaction when alcohol given with procarbazine

Dapoxetine: increased sedative effect when alcohol given with dapoxetine

Diazoxide: enhanced hypotensive effect when alcohol given with diazoxide

Disulfram: disulfiram reaction when alcohol given with disulfram (see p. 334)

Diatrizoate: possible enhanced hypotensive effect when alcohol given with disulfram

Dopaminergics: alcohol reduces tolerance to bromocriptine

Levamisole: possibility of disulfiram-like reaction when alcohol given with levamisole

Lipid-regulating Drugs: avoidance of alcohol advised by manufacturer of lomitapide

Lofezidine: increased sedative effect when alcohol given with lofezidine

Methyldopa: enhanced hypotensive effect when alcohol given with methyldopa

Metoclopramide: absorption of alcohol possibly increased by metoclopramide

Moxonidine: enhanced hypotensive effect when alcohol given with moxonidine

Muscle Relaxants: increased sedative effect when alcohol given with baclofen, methocarbamol or tizanidine

Nicorandil: alcohol possibly enhances hypotensive effect of nicorandil

Nitrates: enhanced hypotensive effect when alcohol given with nitrates

Paraldehyde: increased sedative effect when alcohol given with paraldehyde

Retinoids: presence of alcohol causes etretinate to be formed from acitretin (increased risk of teratogenicity in women of child-bearing potential)
Appendix 1: Interactions

**Alcohol** (continued)

Sympathomimetics: alcohol possibly enhances effects of methylphenidate

Vasodilator Antihypertensives: enhanced hypotensive effect when alcohol given with hydralazine, minoxidil or sodium nitroprusside

**Aldesleukin**

ACE Inhibitors: enhanced hypotensive effect when aldesleukin given with ACE inhibitors

Alpha-blockers: enhanced hypotensive effect when aldesleukin given with alpha-blockers

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when aldesleukin given with angiotensin-II receptor antagonists

Antivirals: aldesleukin possibly increases plasma concentration of indinavir

Beta-blockers: enhanced hypotensive effect when aldesleukin given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when aldesleukin given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when aldesleukin given with clonidine

• Corticosteroids: manufacturer of aldesleukin advises avoid concomitant use with corticosteroids

• Cytoxics: manufacturer of aldesleukin advises avoid concomitant use with cisplatin, dacarbazine and vinblastine

Diazoxide: enhanced hypotensive effect when aldesleukin given with diazoxide

Diuretics: enhanced hypotensive effect when aldesleukin given with diuretics

Methyldopa: enhanced hypotensive effect when aldesleukin given with methyldopa

Moxonidine: enhanced hypotensive effect when aldesleukin given with moxonidine

Nitrates: enhanced hypotensive effect when aldesleukin given with nitrates

Vasodilator Antihypertensives: enhanced hypotensive effect when aldesleukin given with hydralazine, minoxidil or sodium nitroprusside

**Alemtuzumab**

• Vaccines: avoid concomitant use of alemtuzumab with live vaccines (see p. 828)

• Alendronic Acid see Bisphosphonates

• Alfentanil see Opioid Analgesics

• Alfuzosin see Alpha-blockers

• Alimemazine see Antihistamines

• Aliskiren see Renin inhibitors

• ACE Inhibitors: avoid concomitant use of aliskiren with ACE inhibitors (see also under Renin inhibitors, p. 128)

• Angiotensin-II Receptor Antagonists: avoid concomitant use of aliskiren with angiotensin-II receptor antagonists (see also under Renin inhibitors, p. 128); plasma concentration of aliskiren possibly reduced by irbesartan

• Antibacterials: plasma concentration of aliskiren reduced by rifampicin

• Anticoagulants: increased risk of hyperkalaemia when aliskiren given with heparins

• Antianginals: plasma concentration of aliskiren increased by transconozole—avoid concomitant use

• Calcium-channel Blockers: plasma concentration of aliskiren increased by verapamil

• Ciclosporin: plasma concentration of aliskiren increased by ciclosporin—avoid concomitant use

• Diuretics: aliskiren increases plasma concentration of furosemide; increased risk of hyperkalaemia when aliskiren given with potassium-sparing diuretics and aldosterone antagonists

• Grapefruit juice: plasma concentration of aliskiren reduced by grapefruit juice—avoid concomitant use

**Alistiren** (continued)

Potassium Salts: increased risk of hyperkalaemia when aliskiren given with potassium salts

**Alitretinoin** see Retinoids

**Alogliptin** see Diabetics

**Alpha2-adrenoceptor Stimulants** see Under HT

**Aloftiptin** see Antidiabetics

**Alpha-blockers**

ACE Inhibitors: enhanced hypotensive effect when alpha-blockers given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when alpha-blockers given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when alpha-blockers given with alcohol; increased sedative effect when indomarin given with alcohol

Aldesleukin: enhanced hypotensive effect when alpha-blockers given with aldesleukin

• Anaesthetics, General: enhanced hypotensive effect when alpha-blockers given with general anaesthetics

• Analgesics: hypotensive effect of alpha-blockers antagonised by NSAIDs

• Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alpha-blockers given with angiotensin-II receptor antagonists

• Antidepressants: manufacturer of indoramin advises avoid concomitant use with MAOIs; enhanced hypotensive effect when alpha-blockers given with MAOIs

• Antipsychotics: enhanced hypotensive effect when alpha-blockers given with antipsychotics

• Antibacterials: plasma concentration of aliskiren possibly increased by ritonavir—avoid concomitant use; avoidance of aliskiren advised by manufacturer of telaprevir

• Anti-Diabetics and Hypotensives: enhanced hypotensive and sedative effects when alpha-blockers given with anti-Diabetics and Hypotensives

• Avanafil: enhanced hypotensive effect when alpha-blockers given with avanafil—see also p. 558

• Beta-blockers: enhanced hypotensive effect when alpha-blockers given with beta-blockers, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
Alpha-blockers (continued)  
- Calcium-channel blockers: enhanced hypertensive effect when alpha-blockers given with calcium-channel blockers, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin; plasma concentration of tamsulosin increased by verapamil.
- Cardiac Glycosides: prazosin increases plasma concentration of digoxin.
- Clonidine: enhanced hypertensive effect when alpha-blockers given with clonidine.
- Cobicistat: plasma concentration of alfuzosin possibly increased by cobicistat—manufacturer of cobicistat advises avoid concomitant use.
- Corticosteroids: hypertensive effect of alpha-blockers antagonised by corticosteroids.
- Diazoxide: enhanced hypertensive effect when alpha-blockers given with diazoxide.
- Diltiazem: enhanced hypertensive effect when alpha-blockers given with diuretics, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin.
- Dopaminergics: enhanced hypertensive effect when alpha-blockers given with levodopa.
- Methylphenidate: enhanced hypertensive effect when alpha-blockers given with methylphenidate.
- Moxisylyte: possible severe postural hypotension when alpha-blockers given with moxisylyte.
- Moxonidine: enhanced hypertensive effect when alpha-blockers given with moxonidine.
- Muscle Relaxants: enhanced hypertensive effect when alpha-blockers given with levodopa.
- Silodosin: enhanced hypertensive effect when alpha-blockers given with silodosin (avoid alpha-blockers for 4 hours after silodosin)—see also p. 558.
- Sympathomimetics: avoid concomitant use of tolazamide with aminophylline (epinephrine) or dopamine.
- Tadalafil: enhanced hypertensive effect when alpha-blockers given with tadalafil.
- Tolvaptan: enhanced hypertensive effect when alpha-blockers given with tolvaptan.
- Ulcer-healing Drugs: effects of tolazamide antagonised by cimetidine and ranitidine.
- Vardenafil: enhanced hypertensive effect when alpha-blockers given with vardenafil—separate doses by 6 hours (except with tamsulosin)—see also p. 558.
- Vasoconstrictors: increased risk of otoxicity when alpha-blockers given with cyclosporin (see Dose under Ambri-sentan, p. 110).
- Opioid analgesics: increased risk of otoxicity when alpha-blockers given with cyclosporin.
- Opioid antidiabetics: increased risk of otoxicity when alpha-blockers given with cyclosporin.
- Opioid anticonvulsants: increased risk of otoxicity when alpha-blockers given with cyclosporin.
- Opioid antihistamines: increased risk of otoxicity when alpha-blockers given with cyclosporin.
- Opioid antipsychotics: increased risk of otoxicity when alpha-blockers given with cyclosporin.
- Opioid antagonists: increased risk of otoxicity when alpha-blockers given with cyclosporin.
- Opioid antidepressants: increased risk of otoxicity when alpha-blockers given with cyclosporin.
- Opioid anxiolytics and hypnotics: increased risk of otoxicity when alpha-blockers given with cyclosporin.
- Opioid anticholinergics: increased risk of otoxicity when alpha-blockers given with cyclosporin.
- Opioid antihypertensives: increased risk of otoxicity when alpha-blockers given with cyclosporin.
- Opioid antidepressants: increased risk of otoxicity when alpha-blockers given with cyclosporin.
- Opioid anticonvulsants: increased risk of otoxicity when alpha-blockers given with cyclosporin.
- Opioid anxiolytics and hypnotics: increased risk of otoxicity when alpha-blockers given with cyclosporin.
- Opioid antipsychotics: increased risk of otoxicity when alpha-blockers given with cyclosporin.
Amiodarone

Note Amiodarone has a long half-life; there is a potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped. Agalsidase Alfa and Beta: amiodarone possibly inhibits effects of agalsidase alfa and beta (manufacturers of agalsidase alfa and beta advise avoiding concomitant use).

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine.

Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other anti-arrhythmics; increased risk of ventricular arrhythmias when amiodarone given with disopyramide or dronedarone—avoid concomitant use; amiodarone increases plasma concentration of felicainide (halve dose of flecainide).

Antibacterials: increased risk of ventricular arrhythmias when amiodarone given with parenteral erythromycin—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with levofloxacin or moxifloxacin—avoid concomitant use; possible increased risk of ventricular arrhythmias when amiodarone given with sulfamethoxazole and trimethoprim (as co-trimoxazole)—manufacturer of amiodarone advises avoiding concomitant use of co-trimoxazole; possible increased risk of ventricular arrhythmias when amiodarone given with thalidomide.

Anticoagulants: amiodarone inhibits metabolism of coumarin and phenindione (enhanced anti-coagulant effect); amiodarone increases plasma concentration of dabigatran (see Dose under Dabigatran, p. 154).

Antidepressants: avoidance of amiodarone advised by manufacturer of citalopram and escitalopram (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when amiodarone given with tricyclics—avoid concomitant use.

Antiepileptics: amiodarone inhibits metabolism of phenytoin (increased plasma concentration).

Antihistamines: increased risk of ventricular arrhythmias when amiodarone given with azelastine—avoid concomitant use.

Antimalarials: avoidance of amiodarone advised by manufacturer of piperaquine with artenomil (possible risk of ventricular arrhythmias); avoidance of amiodarone advised by manufacturer of arteether with lumefantrine (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when amiodarone given with chloroquine and hydroxychloroquine, mefloquine or quinine—avoid concomitant use.

Antimuscarinics: increased risk of ventricular arrhythmias when amiodarone given with olotroderine.

Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with antipsychotics that prolong the QT interval; increased risk of ventricular arrhythmias when amiodarone given with biperiden—manufacturer of benperiden advises avoiding concomitant use; increased risk of ventricular arrhythmias when amiodarone given with droperidol, haloperidol, phenothiazines, pimozide or sulclopenthixol—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with sulpiride.

Antivirals: plasma concentration of amiodarone possibly increased by stavudinavir; plasma concentration of amiodarone possibly increased by fosamprenavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of amiodarone possibly increased by indinavir—avoid concomitant use; plasma concentration of amiodarone increased by ritonavir (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when amiodarone given with atazanavir—avoid concomitant use; avoidance of amiodarone advised by manufacturer of elaprevir (risk of ventricular arrhythmias).

Atomoxetine: increased risk of ventricular arrhythmias when amiodarone given with telaprevir; increased risk of ventricular arrhythmias when amiodarone given with atazanavir—avoid concomitant use.

Beta-blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with beta-blockers; increased myocardial depression when anti-arrhythmics given with beta-blockers; increased risk of ventricular arrhythmias when amiodarone given with sotalol—avoid concomitant use.

Calcium-channel Blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with diltiazem or verapamil.

Cardiac Glycosides: amiodarone increases plasma concentration of digoxin (halve dose of digoxin).

Ciclosporin: amiodarone possibly increases plasma concentration of ciclosporin.

Cobicistat: plasma concentration of amiodarone possibly increased by cobicistat—manufacturer of cobicistat advises avoiding concomitant use.

Colchicine: amiodarone possibly increases risk of colchicine toxicity.

Cytotoxics: amiodarone possibly increases the plasma concentration of afatinib—manufacturer of afatinib advises separating administration of amiodarone by 6 to 12 hours; possible increased risk of ventricular arrhythmias when amiodarone given with bosutinib; possible increased risk of ventricular arrhythmias when amiodarone given with vandetanib—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with arsenic trioxide.

Diotetics: increased cardiac toxicity with amiodarone if hypokalaemia occurs with acetazolamide, loop diuretics or thiazides and related diuretics; amiodarone increases plasma concentration of eplerenone (reduce dose of eplerenone).

Fidaxomicin: avoidance of amiodarone advised by manufacturer of fidaxomicin.

Fingolimod: possible increased risk of bradycardia when amiodarone given with fingolimod.

Grapefruit Juice: plasma concentration of amiodarone increased by grapefruit juice.

Ivabradine: increased risk of ventricular arrhythmias when amiodarone given with ivabradine.

Lipid-regulating Drugs: increased risk of myopathy when amiodarone given with simvastatin (see Dose under Simvastatin, p. 173).

Lithium: manufacturer of amiodarone advises avoiding concomitant use with lithium (risk of ventricular arrhythmias).

Orlistat: plasma concentration of amiodarone possibly reduced by orlistat.

Pentamidine Isetionate: increased risk of ventricular arrhythmias when amiodarone given with pentamidine isetionate—avoid concomitant use.

Thyroid Hormones: for concomitant use of amiodarone and thyroid hormones see p. 97.

Ulcer-healing Drugs: plasma concentration of amiodarone increased by cicetidine.

Amitriptyline see Antidepressants.

Amlopidine see Calcium-channel Blockers.

Amodicillin see Penicillins.

Amphotericin see Antifungals.

Note Close monitoring required with concomitant administration of nephrotoxic or cytotoxic agents.

Antibacterials: increased risk of nephrotoxicity when amphotericin given with aminoglycosides or poly-
Amphotericin
Antibacterials (continued)
mycoses; possible increased risk of nephrotoxicity when amphotericin given with vancomycin
Antihypertensives: amphotericin reduces renal excretion and increases cellular uptake of flucytosine (toxicity possibly increased); effects of amphotericin possibly antagonised by imidazoles and triazoles; plasma concentration of amphotericin possibly increased by micafungin
• Cardiac Glycosides: hypokalaemia caused by amphotericin increases cardiac toxicity with cardiac glycosides
• Ciclosporin: increased risk of nephrotoxicity when amphotericin given with ciclosporin
• Corticosteroids: increased risk of hypokalaemia when amphotericin given with corticosteroids—avoid concomitant use unless corticosteroids needed to control reactions
• Cytostatics: increased risk of ventricular arrhythmias when amphotericin given with arsenic trioxide
Diuretics: increased risk of hypokalaemia when amphotericin given with loop diuretics or thiazides and related diuretics
Pentamidine isethionate: possible increased risk of nephrotoxicity when amphotericin given with pentamidine isethionate
• Sodium Stibogluconate: possible increased risk of nephrotoxicity when amphotericin given after sodium stibogluconate—manufacturer of sodium stibogluconate advises giving 14 days apart
• Tacrolimus: increased risk of nephrotoxicity when amphotericin given with tacrolimus
Ampicillin see Penicillins
Anabolic Steroids
• Anticoagulants: anabolic steroids enhance anticoagulant effect of coumarins and phenindione
Antidiabetics: anabolic steroids possibly enhance glycoside effect of antidiabetics
Anaesthetics, General
Note See also Surgery and Long-term Medication, p. 859
ACE Inhibitors: enhanced hypotensive effect when general anaesthetics given with ACE inhibitors
• Adrenergic Neurone Blockers: enhanced hypotensive effect when general anaesthetics given with adrenergic neurone blockers
• Alpha-blockers: enhanced hypotensive effect when general anaesthetics given with alpha-blockers
Analgesics: metabolism of etomidate inhibited by fentanyl (consider reducing dose of etomidate); effects of thiopental possibly enhanced by aspirin; effects of intravenous general anaesthetics and volatile liquid general anaesthetics possibly enhanced by opioid analgesics
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when general anaesthetics given with angiotensin-II receptor antagonists
Antibacterials: increased risk of hepatotoxicity when isoflurane given with isoniazid; effects of thiopental enhanced by sulphonamides; hypersensitivity-like reactions can occur when general anaesthetics given with intravenous vancomycin
Antidepressants: increased risk of arrhythmias and hypotension when general anaesthetics given with tricyclics
• Antipsychotics: enhanced hypotensive effect when general anaesthetics given with antipsychotics; effects of thiopental enhanced by droperidol
Antioxidants and Hypnotics: increased sedative effect when general anaesthetics given with anxiolytics and hypnotics
Beta-blockers: enhanced hypotensive effect when general anaesthetics or isoflurane given with calcium-channel blockers; general anaesthetics
Calcium-channel Blockers: enhanced hypotensive effect when general anaesthetics or isoflurane given with calcium-channel blockers; general anaesthetics
Anaesthetics, General
• Calcium-channel Blockers (continued)
  enhance hypotensive effect of verapamil (also AV delay)
Clonidine: enhanced hypotensive effect when general anaesthetics given with clonidine
• Cytotoxics: nitrous oxide increases antifolate effect of methotrexate—avoid concomitant use
Diazoxide: enhanced hypotensive effect when general anaesthetics given with diazoxide
Diuretics: enhanced hypotensive effect when general anaesthetics given with diuretics
• Dopaminergics: increased risk of arrhythmias when volatile liquid general anaesthetics given with levodopa
• Doxapram: increased risk of arrhythmias when volatile liquid general anaesthetics given with doxapram (avoid doxapram for at least 10 minutes after volatile liquid general anaesthetics)
• Memantine: increased risk of CNS toxicity when ketamine given with memantine (manufacturer of memantine advises avoid concomitant use) Methyldopa: enhanced hypotensive effect when general anaesthetics given with methyldopa
Metoclopramide: effects of thiopental enhanced by metoclopramide
Moxonidine: enhanced hypotensive effect when general anaesthetics given with moxonidine
• Muscle Relaxants: increased risk of myocardial depression and bradycardia when propofol given with saxamethonium; volatile liquid general anaesthetics enhance effects of non-depolarising muscle relaxants and suxamethonium; ketamine enhances effects of atracurium
Nitrites: enhanced hypotensive effect when general anaesthetics given with nitrites
Oxytocin: oxytocic effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when volatile liquid general anaesthetics given with oxytocin
Probenecid: effects of thiopental possibly enhanced by probenecid
• Sympathomimetics: manufacturer of isoflurane advises avoid concomitant use with sympathomimetics (risk of ventricular arrhythmias); increased risk of arrhythmias when volatile liquid general anaesthetics given with adrenaline (epinephrine) or noradrenaline (norepinephrine); increased risk of hypertension when volatile liquid general anaesthetics given with methotrexate—avoid concomitant use
Theophylline: increased risk of convulsions when ketamine given with theophylline
Vasoconstrictors
Anagrelide: manufacturer of anagrelide advises avoid concomitant use with clopidogrel
• Phosphodiesterase Type-3 Inhibitors: manufacturer of anagrelide advises avoid concomitant use with enoximone and eminilone
Anakinra
• Adalimumab: avoid concomitant use of anakinra with adalimumab
• Certolizumab pegol: avoid concomitant use of anakinra with certolizumab pegol
• Etanercept: avoid concomitant use of anakinra with etanercept
Appendix 1: Interactions 891
Appendix 1: Interactions

Anakinra (continued)
- Golimumab: avoid concomitant use of anakinra with golimumab
- Infliximab: avoid concomitant use of anakinra with infliximab
- Vaccines: avoid concomitant use of anakinra with live vaccines (see p. 828)

Analgesics see Aspirin, Nefopam, NSAIDs, Opioid Analgesics, and Paracetamol

Angiotensin-II Receptor Antagonists
- ACE inhibitors: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with ACE inhibitors
- Adrenergic Neurone Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with adrenergic neurone blockers
- Alcohol: enhanced hypotensive effect when angiotensin-II receptor antagonists given with alcohol
- Aldesleukin: enhanced hypotensive effect when angiotensin-II receptor antagonists given with aldesleukin
- Aliskiren: avoid concomitant use of angiotensin-II receptor antagonists with aliskiren (see also under Renin inhibitor, p. 128); aliskiren possibly reduces plasma concentration of aliskiren
- Alpha-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with alpha-blockers
- Anesthetics, General: enhanced hypotensive effect when angiotensin-II receptor antagonists given with general anaesthetics
- Analgesics: increased risk of renal impairment when angiotensin-II receptor antagonists given with NSAIDs, also hypotensive effect antagonised
- Antibacterials: plasma concentration of losartan and its active metabolite reduced by rifampicin; possible increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with trimethoprim
- Anticoagulants: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with heparins
- Antidepressants: hypotensive effect of angiotensin-II receptor antagonists possibly enhanced by MAOIs
- Antipsychotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with antipsychotics
- Anxiolytics and Hypnotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with anxiolytics and hypnotics
- Beta-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with beta-blockers
- Calcium-channel Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with calcium-channel blockers
- Ciclosporin: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with ciclosporin
- Clonidine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with clonidine
- Corticosteroids: hypotensive effect of angiotensin-II receptor antagonists antagonised by corticosteroids
- Diazoxide: enhanced hypotensive effect when angiotensin-II receptor antagonists given with diazoxide
- Diuretics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with diuretics; increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with potassium-sparing diuretics and aldosterone antagonists
- Dopaminergics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with levodopa
- Lithium: angiotensin-II receptor antagonists reduce excretion of lithium (increased plasma concentration)

Angiotensin-II Receptor Antagonists (continued)
- Methyldopa: enhanced hypotensive effect when angiotensin-II receptor antagonists given with methyldopa
- Moxisylyte: enhanced hypotensive effect when angiotensin-II receptor antagonists given with moxisylyte
- Moxonidine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with moxonidine
- Muscle Relaxants: enhanced hypotensive effect when angiotensin-II receptor antagonists given with bacofer or tizanidine
- Nitrates: enhanced hypotensive effect when angiotensin-II receptor antagonists given with nitrates
- Oestrogens: hypotensive effect of angiotensin-II receptor antagonists antagonised by oestrogens
- Potassium Salts: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with potassium salts
- Prostaglandins: enhanced hypotensive effect when angiotensin-II receptor antagonists given with alprostadil
- Tacrolimus: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with tacrolimus
- Vasodilator Antihypertensives: enhanced hypotensive effect when angiotensin-II receptor antagonists given with hydralazine, minoxidil or sodium nitroprusside

Antacids
Note Antacids should preferably not be taken at the same time as other drugs since they may impair absorption of ACE Inhibitors: antacids possibly reduce absorption of ACE inhibitors; antacids reduce absorption of captopril, enalapril and fosinopril
- Analgesics: possibly reduce absorption of acetaminophen; oral glucose solution probably reduces absorption of acetaminophen
- Antihistamines: reduce absorption of fexofenadine
- Antimalarials: antacids reduce absorption of chloroquine and hydroxychloroquine; oral magnesium salts (as magnesium trisilicate) reduce absorption of nitrofurantoin
- Antiepileptics: antacids reduce absorption of gabapentin and phenytoin
- Antifungals: antacids reduce absorption of itraconazole
- Antihistamines: antacids reduce absorption of fexofenadine
- Antimalarials: antacids reduce absorption of chloroquine and hydroxychloroquine; oral magnesium salts (as magnesium trisilicate) reduce absorption of progua
- Antipsychotics: antacids reduce absorption of pheno
- Antivirals: antacids reduce absorption of atazanavir (give at least 2 hours before or 1 hour after antacids); oral magnesium salts possibly reduce absorption of dolutegravir—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after oral magnesium salts; aluminium hydroxide possibly reduces absorption of dolutegravir—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after aluminium hydroxide; antacids reduce absorption of elvitegravir (give at least 4 hours apart); antacids possibly reduce absorption of raltegravir (give at least 2 hours after raltegravir; antacids reduce absorption of tipranavir
- Bile Acids: antacids possibly reduce absorption of bile phosphonates: antacids reduce absorption of bisphosphonates
Antacids (continued)
Cardiac Glycosides: antacids possibly reduce absorption of digoxin
Corticosteroids: antacids reduce absorption of deflazacort
• Cytotoxics: aluminium hydroxide and oral magnesium salts possibly reduce absorption of estramustine—manufacturer of estramustine advises avoid concomitant administration; separating administration with antacids by about 12 hours advised by manufacturer of bosutinib; antacids possibly reduce plasma concentration of erlotinib—give antacids at least 4 hours before or 2 hours after erlotinib
Deferasirox: antacids containing aluminium possibly reduce absorption of deferasirox (manufacturer of deferasirox advises avoid concomitant use)
Deferiprone: antacids containing aluminium possibly reduce absorption of deferiprone (manufacturer of deferiprone advises avoid concomitant use)
Dipyridamole: antacids possibly reduce absorption of dipyridamole
Eltrombopag: antacids reduce absorption of eltrombopag (give at least 4 hours apart)
Iron: oral magnesium salts (as magnesium trisilicate) reduce absorption of oral iron
Lipid-regulating Drugs: antacids reduce absorption of rosuvastatin
Lithium: sodium bicarbonate increases excretion of lithium (reduced plasma concentration)
Mycophenolate: antacids reduce absorption of mycophenolate
Penicillamine: antacids reduce absorption of penicillamine
Polystyrene Sulfonate Resins: risk of intestinal obstruction when aluminium hydroxide given with polystyrene sulfonate resins; risk of metabolic alkalosis when oral magnesium salts given with polystyrene sulfonate resins
Riociguat: antacids reduce absorption of riociguat (give at least 2 hours before or 1 hour after riociguat)
Symptomomimetics: aluminium hydroxide possibly increases absorption of pseudoephedrine
Thyroid Hormones: antacids possibly reduce absorption of levothyroxine
Ulcera-healing Drugs: antacids possibly reduce absorption of lanosoprazole
• Ulipristal: avoidance of antacids advised by manufacturer of ulipristal (contraceptive effect of ulipristal possibly reduced)
Antazoline see Antihistamines
Anti-arrhythmics see Adenosine, Amiodarone, Disopyramide, Dronedaron, Flecainide, Lidocaine, and Propafenone
Antibiotics see individual drugs
Anticoagulants see Apixaban, Coumarin, Dabigatran, Heparins, Phenindione, and Rivaroxaban
Antidepressants see Agomelatine, Antidepressants, SSRI, Antidepressants, Tricyclic, Antidepressants, Tricyclic (related); MAOIs; Mirtazapine; Moclobemide; Reboxetine; St John’s Wort; Venlafaxine
Antidepressants, Noradrenaline Re-uptake Inhibitors see Reboxetine
Antidepressants, SSRI
Note see also Dapoxetine
Alcohol: sedative effects possibly increased when SSRIs given with alcohol
Anaesthetics, Local: fluoxetine inhibits metabolism of ropivacaine—avoid prolonged administration of ropivacaine
• Analgesics: increased risk of bleeding when SSRIs given with NSAIDs or aspirin; possible increased Antidepressants, SSRI
• Analgesics (continued)
serotonic effects when SSRIs given with fentanyl; fluoxetine, fluvoxamine, paroxetine and sertraline possibly increase plasma concentration of methadone; increased risk of CNS toxicity when SSRIs given with tramadol
• Anti-arrhythmics: manufacturer of citalopram and escitalopram advises avoid concomitant use with amiodarone (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with disopyramide (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with dronedaron (risk of ventricular arrhythmias); fluoxetine increases plasma concentration of flecainide; fluoxetine and paroxetine possibly inhibit metabolism of propafenone
• Antibacterials: manufacturer of citalopram and escitalopram advises avoid concomitant use with intravenous erythromycin (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises concomitant use with moxifloxacin (risk of ventricular arrhythmias); possible increased risk of ventricular arrhythmias when citalopram given with diazepam
• Anticoagulants: SSRIs possibly enhance anticoagulant effect of coumarins; possible increased risk of bleeding when SSRIs given with dabigatran
• Antidepressants: avoidance of fluvoxamine advised by manufacturer of reboxetine; possible increased serotonergic effects when SSRIs given with duloxetine; fluvoxamine inhibits metabolism of duloxetine—avoid concomitant use; citalopram, escitalopram, fluvoxamine, paroxetine or sertraline should not be started until 2 weeks after stopping MAOIs, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, fluvoxamine, paroxetine or sertraline; fluoxetine should not be started until 2 weeks after stopping MAOIs, also MAOIs should not be started until at least 5 weeks after stopping fluoxetine; CNS effects of SSRIs increased by MAOIs (risk of serious toxicity); increased risk of CNS toxicity when escitalopram given with moclobemide, preferably avoid concomitant use; after stopping citalopram, fluoxetine, paroxetine or sertraline do not start moclobemide for at least 1 week; after stopping fluoxetine do not start moclobemide for 5 weeks; increased serotonergic effects when SSRIs given with St John’s wort—avoid concomitant use; fluoxetine inhibits metabolism of gemelamine (increased plasma concentration); possible increased serotonergic effects when fluoxetine or fluvoxamine given with mirtazapine; SSRIs increase plasma concentration of some tricyclics; manufacturer of citalopram and escitalopram advises avoid concomitant use with tricyclics (risk of ventricular arrhythmias)
• Antiepileptics: SSRIs antagonise anticonvulsant effect of antiepileptics (convulsive threshold lowered); fluoxetine and fluvoxamine increase plasma concentration of carbamazepine; plasma concentration of paroxetine reduced by phenobarbital and phenytoin; fluoxetine and fluvoxamine increase plasma concentration of ethosyntoin; plasma concentration of sertraline possibly reduced by phenytoin, also plasma concentration of phenytoin possibly increased
• Antifungals: plasma concentration of paroxetine possibly increased by terbinafine
• Antihistamines: manufacturer of citalopram and escitalopram advises avoid concomitant use with nizatidine (risk of ventricular arrhythmias); anti-depressant effect of SSRIs possibly antagonised by cyproheptadine
Appendix 1: Interactions

Antidepressants, SSRI (continued)

- **Antimalarials**: manufacturer of citalopram and escitalopram advises avoid concomitant use with dapoxetine (risk of ventricular arrhythmias); avoidance of antidepressants advised by manufacturer of artemether with lumefantrine and piperaquine with arteninol

- **Antimuscarinics**: paroxetine increases plasma concentration of darifenacin and procyclidine

- **Beta-blockers**: increase plasma concentration of clozapine and escitalopram; manufacturer of citalopram and escitalopram advises avoid concomitant use with haloperidol (risk of ventricular arrhythmias); increase plasma concentration of citalopram, haloperidol and risperidone; fluoxetine possibly increases plasma concentration of asenapine and haloperidol; paroxetine inhibits metabolism of perphenazine (reduce dose of perphenazine); fluoxetine and paroxetine possibly increase plasma concentration of risperidone (reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of paroxetine possibly increased by paroxetine; fluoxetine and paroxetine possibly increase plasma concentration of clozapine; citalopram possibly increases plasma concentration of clozapine (increased risk of toxicity); fluvoxamine increases plasma concentration of clonazepam; manufacturer of citalopram and escitalopram advises avoid concomitant use with phenothiazines (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with pimozide (risk of ventricular arrhythmias); SSRIs possibly increase plasma concentration of clozapine; (increased risk of toxicity) paroxetine possibly increases plasma concentration of risperidone (increased risk of toxicity)

- **Antipsychotics**: plasma concentration of paroxetine and sertraline possibly reduced by paroxetine; plasma concentration of paroxetine possibly reduced by ritonavir; plasma concentration of SSRIs possibly increased by ritonavir

- **Antiallergics**: fluoxetine increases plasma concentration of alprazolam; fluoxetine increases plasma concentration of some benzodiazepines; fluvoxamine increases plasma concentration of el découronamine—avoid concomitant use; sertraline possibly increased by co-administration of zolpidem; Atorvastatin: possible increased risk of convulsions when antidepressants given with atorvastatin; fluoxetine and paroxetine possibly inhibited metabolism of atorvastatin

- **Antihypertensives**: paroxetine increases plasma concentration of metoprolol; paroxetine possibly increased the plasma concentration of metoprolol—increased risk of AV block (manufacturer of paroxetine advises avoid concomitant use in cardiac insufficiency); fluvoxamine increases plasma concentration of propranolol; manufacturer of escitalopram advises avoid concomitant use with sotalol (risk of ventricular arrhythmias); increase risk of ventricular arrhythmias when citalopram given with sotalol—avoid concomitant use; Bupropion: plasma concentration of citalopram possibly increased by bupropion; Calcium-channel Blockers: fluoxetine possibly inhibits metabolism of nifedipine (increased plasma concentration)

- **Clopixol**: fluoxetine and fluvoxamine possibly inhibit metabolism of findipine (increased plasma concentration)

- **Clopixol**: fluoxetine and fluvoxamine possibly increased risk of serotonergic effects when SSRIs given with dapoxetine (manufacturer of dapoxetine advises SSRIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping SSRIs)

- **Dopaminergics**: increased risk of CNS toxicity when SSRIs given with rasagiline; fluoxetine should not be started until 2 weeks after stopping rasagiline; fluoxetine should not be started until 2 weeks after stopping rasagiline, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; increased risk of hypertension and CNS excitation when paroxetine given with selegiline (selegiline should not be started until 2 weeks after stopping paroxetine, avoid paroxetine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when fluvoxamine or sertraline given with selegiline (selegiline should not be started until 1 week after stopping fluvoxamine or sertraline, avoid fluvoxamine or sertraline for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when fluvoxamine or sertraline given with selegiline (selegiline should not be started until 1 week after stopping fluvoxamine or sertraline, avoid fluvoxamine or sertraline for 2 weeks after stopping selegiline; avoided citalopram and escitalopram advised by manufacturer of selegiline

- **Grapefruit Juice**: plasma concentration of sertraline possibly increased by grapefruit juice

- **Hormone Antagonists**: fluoxetine and paroxetine possibly inhibit metabolism of SAXOTRAN to active metabolite (avoid concomitant use)

- **5HT-Receptor Agonists**: increased risk of CNS toxicity when citalopram given with 5HT, agonists (manufacturer of citalopram advises avoid concomitant use); fluvoxamine inhibits the metabolism of frouxatrican; possible increased serotonergic effects when SSRIs given with naratriptan; increased risk of CNS toxicity when citalopram, escitalopram, fluoxetine, fluvoxamine or paroxetine given with sumatriptan; CNS toxicity reported when sertraline given with sumatriptan; fluoxetine possibly inhibits metabolism of zolmitriptan (reduce dose of zolmitriptan)

- **Lithium**: increased risk of CNS effects when SSRIs given with lithium (lithium toxicity reported)

- **Methylthioninium**: risk of CNS toxicity when SSRIs given with methylthioninium—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for 4 to 6 hours after a single dose). Atorvastatin: possible increased risk of convulsions when antidepressants given with atorvastatin; fluoxetine and paroxetine possibly inhibited metabolism of atorvastatin

- **Muscle Relaxants**: fluoxetine increases plasma concentration of tizanidine (increased risk of toxicity)—avoid concomitant use

- **Parasymptomatics**: paroxetine increases plasma concentration of galantamine

- **Pentamidine Isetionate**: manufacturer of citalopram and escitalopram advises avoid concomitant use with pentamidine isetionate (risk of ventricular arrhythmias)

- **Piperidones**: fluoxetine increases plasma concentration of piperidone—manufacturer of piperidone advises avoid concomitant use

- **Pomalidomide**: fluoxetine increases plasma concentration of pomalidomide

- **Ranolazine**: paroxetine increases plasma concentration of ranolazine

- **Roflumilast**: fluoxetine inhibits the metabolism of roflumilast

- **Sympathomimetics**: metabolism of SSRIs possibly inhibited by methyphenidate

- **Theophylline**: fluoxetine increases plasma concentration of theophylline (concomitant use should usually be avoided, but where not possible halve...
Antidepressants, SSRI
- Theophylline (continued)
  theophylline dose and monitor plasma-theophylline concentration
Ticagrelor: possible increased risk of bleeding when
citalopram, paroxetine or sertraline given with ticagrelor
Ulcercirving Drugs: plasma concentration of citalopram,
escitalopram and sertraline increased by cinemetidine; fluvoxamine possibly increases plasma
concentration of escitalopram increased by omeprazole
Antidepressants, SSRI (related) see Duloxetine and Venlafaxine
Antidepressants, Tricyclic
Adrenergic Neurone Blockers: tricyclics antagonise
hypotensive effect of adrenergic neurone blockers
  - Alcohol: increased sedative effect when tricyclics
given with alcohol
  - Alpha2-adrenoceptor Stimulants: avoidance of tricyclics
advised by manufacturer of apraclonidine and brimonidine
Anaesthetics, General: increased risk of arrhythmias
and hypotension when tricyclics given with general anaesthetics
  - Analgesics: increased risk of CNS toxicity when tricyclics
given with tramadol; side-effects possibly increased when tricyclics given with nefopam; sedative
effects possibly increased when tricyclics given with opioid analgesics
  - Anti-arrhythmics: increased risk of ventricular arrhythmias
when tricyclics given with amiodarone—
  avoid concomitant use; increased risk of ventricular arrhythmias
when tricyclics given with disopyramide or flecaainide; avoidance of tricyclics advised by manufacturer of
dronedarone (risk of ventricular arrhythmias); increased risk of arrhythmias when tricyclics given with propafenone
  - Antibacterials: increased risk of ventricular arrhythmias
when tricyclics given with moxifloxacin—
  avoid concomitant use; possible increased risk of ventricular arrhythmias when tricyclics given with
epthromycin
  - Anticoagulants: tricyclics may enhance or reduce anticoagulant effect of coumarins
  - Antidepressants: avoidance of tricyclics advised by manufacturer of citalopram and escitalopram
  (risk of ventricular arrhythmias); possible increased serotonergic effects when amitriptyline or clomipramine given with duloxetine; increased risk of hyper
tension and CNS excitation when tricyclics given with MAOIs, tricyclics should not be started until
2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine); after stopping tricyclics do not start moclobemide for at least 1 week; plasma concentration of moclobemide increased by SSRIs;
plasma concentration of amitriptyline reduced by St John’s wort
  - Antiepileptics: tricyclics antagonise anticonvulsant effect of antiepileptics (convulsive threshold lowered);
metabolism of tricyclics accelerated by carbamazepine (reduced plasma concentration and reduced effect); metabolism of tricyclics possibly accelerated by phenobarbital (reduced plasma concentration); plasma concentration of tricyclics possibly reduced by phenoxytin
Antifungals: plasma concentration of amitriptyline and nortriptyline possibly increased by fluconazole;
plasma concentration of tricyclics possibly increased by terbinafine
Antihistamines: increased antimuscarinic and sedative
effects when tricyclics given with antihistamines
Appendix 1: Interactions
Antidepressants, Tricyclic (continued)
- Antimalarial: avoidance of antidepressants advised by
manufacturer of artemether with lumefantrine and eperaparne with artemirol
Antimuscarinics: increased risk of antimuscarinic side
effects when tricyclics given with antimuscarinics
- Antipsychotics: avoidance of tricyclics advised by
manufacturer of droperidol, olanzapine, haloperidol, sulpiride and ziprasidone (risk of ventricular arrhythmias); possible increased anti
muscarinic side-effects when tricyclics given with clozapine; increased risk of antimuscarinic side
effects when tricyclics given with phenothiazines; possible increased risk of ventricular arrhythmias
when tricyclics given with risperidone
  - Antivirals: plasma concentration of tricyclics possibly increased by ritonavir; increased risk of ventricular arrhythmias when tricyclics given with saquinavir—avoid concomitant use
Antioxidants: increased sedative effect when tricyclics given with
anxiolytics and hypnotics
  - Atomoxetine: increased risk of ventricular arrhythmias
when tricyclics given with atomoxetine; possible increased risk of convulsions when antidepressants given with atomoxetine
  - Beta-blockers: plasma concentration of imipramine
increased by labetalol and propranolol; increased risk of ventricular arrhythmias when tricyclics given with sotalol
Bupropion: plasma concentration of tricyclics possibly increased by bupropion (possible increased risk of convulsions)
Calcium-channel Blockers: plasma concentration of tricyclics possibly increased by diltiazem and verapamil; plasma concentration of imipramine increased by diltiazem and verapamil
Cannabis Extract: possible increased risk of hyper
tension and tachycardia when tricyclics given with cannabis extract
Clonidine: tricyclics antagonise hypnototopic effect of
clonidine, also increased risk of hypertension on clonidine withdrawal
Cytoxotics: increased risk of ventricular arrhythmias
when amitriptyline or clomipramine given with arsenic trioxide
Dapoxetine: possible increased risk of serotoninergic effects when tricyclics given with dapoxetine
(manufacturer of dapoxetine advises tricyclics should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tricyclics)
Disulfiram: metabolism of tricyclics inhibited by disulf
iram (increased plasma concentration); concomitant amitriptyline reported to increase disulfiram reac
tion with alcohol
Dirotics: increased risk of postural hypotension when tricyclics given with diuretics
  - Dopamine and noradrenalin with tricyclics
advised by manufacturer of entacapone; increased risk of CNS toxicity when tricyclics given with erasagiline; CNS toxicity reported when tricyclics given with sele
giline
Histamine: tricyclics theoretically antagonise effects of
histamine—manufacturer of histamine advises avoid concomitant use
Lithium: risk of toxicity when tricyclics given with lithium
Methylthionium: risk of CNS toxicity when clomipramine given with methylthionium—avoid concomi
tant use (if avoidance not possible, use lowest possible dose of methylthionium and observe
patient for up to 4 hours after administration)
Moxonidine: tricyclics possibly antagonise hypoten
sive effect of moxonidine (manufacturer of moxoni
dine advises avoid concomitant use)
Antidepressants, Tricyclic (continued)

Muscle Relaxants: tricyclics enhance muscle relaxant effect of baclofen
Nicorandil: tricyclics possibly enhance hypotensive effect of nicorandil
Nitrites: tricyclics reduce effects of sublingual tablets of nitrates (failure to dissolve under tongue owing to dry mouth)
Oestrogens: antidepressant effect of tricyclics antagonised by oestrogens (but side-effects of tricyclics possibly increased due to increased plasma concentration)
  • Pentamidine Isetionate: increased risk of ventricular arrhythmias when tricyclics given with pentamidine
Sodium Oxbate: increased risk of side-effects when tricyclics given with sodium oxbate
  • Sympathomimetics: increased risk of hypertension and arrhythmias when tricyclics given with adrenaline (epinephrine) (but local anaesthetics with adrenaline appear to be safe); metabolism of tricyclics possibly inhibited by methylphenidate; increased risk of hypertension and arrhythmias when tricyclics given with noradrenaline (norepinephrine) or phenylephrine
Thyroid Hormones: effects of tricyclics possibly enhanced by thyroid hormones; effects of amitriptyline and imipramine enhanced by thyroid hormones
Ulcer-healing Drugs: plasma concentration of tricyclics possibly increased by cimetidine; metabolism of amitriptyline, doxepin, imipramine and nortriptyline inhibited by cimetidine (increased plasma concentration)
Antidepressants, Tricyclic (related)
  • Alcohol: increased sedative effect when tricyclic-related antidepressants given with alcohol
Alpha-2-adrenoceptor Stimulants: avoidance of tricyclic-related antidepressants advised by manufacturer of apraclonidine and brimonidine
Antibacterials: plasma concentration of trazodone possibly increased by clarithromycin, amitriptyline, doxepin, imipramine and nortriptyline
Anticoagulants: plasma concentration of mianserin reduced by phenytoin, and possibly enhanced by neomycin, also severity of gastrointestinal effects increased; effects of repaglinide enhanced by clarithromycin; effects of glibenclamide possibly enhanced by norfloxacin; plasma concentration of canagliflozin and nateglinide reduced by rifampicin; effects of sulfonylureas possibly enhanced by rifampicin; hypoglycaemic effect of repaglinide possibly antagonised by rifampicin; effects of sulfonylureas enhanced by chloramphenicol; metabolism of tolbutamide accelerated by rifampicin; hypoglycaemic effect of sulfonylureas possibly enhanced by tetracyclines; hypoglycaemic effect of repaglinide possibly enhanced by trimethoprim—manufacturer advises avoid concomitant use
  • Anticoagulants: exenatide possibly enhances anticoagulant effect of warfarin; hypoglycaemic effect of sulfonylureas possibly enhanced by coumarins, also possible changes to anticoagulant effect
Antidepressants: hypoglycaemic effect of antidepressants possibly enhanced by MAOIs; hypoglycaemic effect of insulin, metformin and sulfonylureas enhanced by MAOIs
Antidiabetics: manufacturer of dapagliflozin advises avoid concomitant use with pioglitazone
Antiepileptics: tolbutamide transiently increases plasma concentration of phenytoin (possibility of toxicity); plasma concentration of metformin possibly increased by topiramate; plasma concentration of glibenclamide possibly reduced by topiramate
Antifungals: plasma concentration of sulfonylureas increased by fluconazole and miconazole; hypoglycaemic effect of glipizide and glipizide enhanced by miconazole—avoid concomitant use; hypoglycaemic effect of nateglinide possibly enhanced by fluconazole; hypoglycaemic effect of repaglinide possibly enhanced by itraconazole; hypoglycaemic effect of gliptide possibly enhanced by posaconazole.
Antidiabetics

- Sulfinpyrazone: plasma concentration of sulfonylureas possibly increased by voriconazole
- Antithrombins: thrombocyte count depressed when metformin given with ketotifen (manufacturer of ketotifen advises avoid concomitant use)
- Antipsychotics: hypoglycaemic effect of sulfonylureas possibly antagonised by phenothiazines
- Aromatics: plasma concentration of tolbutamide possibly increased by ritonavir
- Aprepitant: plasma concentration of tolbutamide reduced by aprepitant
- Beta-blockers: warning signs of hypoglycaemia (such as dizziness, diaphoresis, palpitation) may be masked when given with beta-blockers; hypoglycaemic effect of insulin enhanced by beta-blockers
- Bosentan: increased risk of hepatotoxicity when glibenclamide given with bosentan—avoid concomitant use
- Calcium-channel Blockers: glucose tolerance occasionally impaired when insulin given with nifedipine
- Cardiac Glycosides: canagliflozin and sitagliptin increase plasma concentration of digoxin; acarbose possibly reduces plasma concentration of digoxin
- Ciclosporin: hypoglycaemic effect of repaglinide possibly enhanced by ciclosporin
- Corticosteroids: hypoglycaemic effect of antidiabetics antagonised by corticosteroids
- Cytosporins: avoidance of repaglinide advised by manufacturer of lapatinib; plasma concentration of metformin possibly increased by vandetanib (consider reducing dose of metformin)
- Diazoxide: hypoglycaemic effect of antidiabetics antagonised by diazoxide
- Diuretics: canagliflozin possibly enhances diuretic effect of diuretics; manufacturer of canagliflozin advises avoid concomitant use with loop diuretics; hypoglycaemic effect of antidiabetics antagonised by loop diuretics and thiazides and related diuretics; dapagliflozin possibly enhances diuretic effect of loop diuretics; thiazides and related diuretics
- Hormone Antagonists: requirements for antidiabetics possibly reduced by lanreotide, octreotide and pasireotide
- Leflunomide: hypoglycaemic effect of tolbutamide possibly enhanced by leflunomide
- Lipid-regulating Drugs: absorption of glibenclamide and glipizide reduced by colesvelam; absorption of glimepiride reduced by colesvelam—manufacturer of glimepiride advises give at least 4 hours before or 4—6 hours after bile acid sequestrants; may be improved glucose tolerance and an additive effect when insulin or sulfonylureas given with fibrates
- Oestrogens: hypoglycaemic effect of antidiabetics antagonised by oestrogens
- Orlistat: avoidance of acarbose advised by manufacturer of orlistat
- Pancreatin: hypoglycaemic effect of acarbose antagonised by pancreatin
- Progestogens: hypoglycaemic effect of antidiabetics antagonised by progestogens
- Sulfinpyrazone: effects of sulfonylureas enhanced by sulfinpyrazone
- Teriflunomide: plasma concentration of repaglinide increased by teriflunomide
- Beta-blockers: increased risk of hepatotoxicity when glibenclamide given with bosentan—avoid concomitant use
- Calcium-channel Blockers: glucose tolerance occasionally impaired when insulin given with nifedipine
- Cardiac Glycosides: canagliflozin and sitagliptin increase plasma concentration of digoxin; acarbose possibly reduces plasma concentration of digoxin
- Ciclosporin: hypoglycaemic effect of repaglinide possibly enhanced by ciclosporin
- Corticosteroids: hypoglycaemic effect of antidiabetics antagonised by corticosteroids
- Cytosporins: avoidance of repaglinide advised by manufacturer of lapatinib; plasma concentration of metformin possibly increased by vandetanib (consider reducing dose of metformin)
- Diazoxide: hypoglycaemic effect of antidiabetics antagonised by diazoxide
- Diuretics: canagliflozin possibly enhances diuretic effect of diuretics; manufacturer of canagliflozin advises avoid concomitant use with loop diuretics; hypoglycaemic effect of antidiabetics antagonised by loop diuretics and thiazides and related diuretics; dapagliflozin possibly enhances diuretic effect of loop diuretics; thiazides and related diuretics
- Hormone Antagonists: requirements for antidiabetics possibly reduced by lanreotide, octreotide and pasireotide
- Leflunomide: hypoglycaemic effect of tolbutamide possibly enhanced by leflunomide
- Lipid-regulating Drugs: absorption of glibenclamide and glipizide reduced by colesvelam; absorption of glimepiride reduced by colesvelam—manufacturer of glimepiride advises give at least 4 hours before or 4—6 hours after bile acid sequestrants; may be improved glucose tolerance and an additive effect when insulin or sulfonylureas given with fibrates
- Oestrogens: hypoglycaemic effect of antidiabetics antagonised by oestrogens
- Orlistat: avoidance of acarbose advised by manufacturer of orlistat
- Pancreatin: hypoglycaemic effect of acarbose antagonised by pancreatin
- Progestogens: hypoglycaemic effect of antidiabetics antagonised by progestogens
- Sulfinpyrazone: effects of sulfonylureas enhanced by sulfinpyrazone
- Teriflunomide: plasma concentration of repaglinide increased by teriflunomide

Antidiabetics (continued)

- Testosterone: hypoglycaemic effect of antidiabetics possibly enhanced by testosterone
- Ulcer-healing Drugs: excretion of metformin reduced by cimetidine (increased plasma concentration); hypoglycaemic effect of sulfonylureas enhanced by cimetidine
- Antiepileptics see Carbamazepine, Eilicarbazepine, Ethosuximide, Gabapentin, Lacosamide, Lamotrigine, Levetiracetam, Oxcarbazepine, Perampanel, Phenobarbital, Phenytion, Pregabal, Retigabine, Rufinamide, Striplentol, Tiagamine, Topiramate, Valproate, Vigabatrin, and Zonisamide
- Antifungals see Amphotericin; Antifungals, Imidazole; Antifungals, Triazole; Caspofungin; Flucytosine; Griseofulvin, Micafungin; Terbinafine
- Antifungals, Imidazole

- Antiocoagulants: miconazole enhances anticoagulant effect of warfarin (miconazole oral gel and possibly vaginal and topical formulations absorbed)
- Antidepressants: avoidance of imidazoles advised by manufacturer of reboxetine
- Antidiabetics: miconazole enhances hypoglycaemic effect of glipizide and glimepiride—avoid concomitant use; miconazole increases plasma concentration of sulfonylureas
- Antiepileptics: miconazole possibly increases plasma concentration of carbamazepine; miconazole enhances anticonvulsant effect of phenytoin (plasma concentration of phenytoin increased)
- Antifungals: imidazoles possibly antagonise effects of amphotericin
- Antithrombins: imidazoles possibly inhibit metabolism of minoxidil (avoid concomitant use)
- Antimicrobial: avoidance of imidazoles advised by manufacturer of piperazine with artemisin (possible risk of ventricular arrhythmias); avoidance of imidazoles advised by manufacturer of artether with artesunate (possible risk of ventricular arrhythmias)
- Antipsychotics: increased risk of ventricular arrhythmias when imidazoles given with pimozone—avoid concomitant use; imidazoles possibly increase plasma concentration of etepatine—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: imidazoles possibly increase plasma concentration of saquinavir
- Ciclosporin: miconazole possibly inhibits metabolism of ciclosporin (increased plasma concentration)
- Ergot Alkaloids: increased risk of ergotism when imidazoles given with ergotamine—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when imidazoles given with atorvastatin; possible increased risk of myopathy when miconazole given with simvastatin
- Oestrogens: anecdotal reports of contraceptive failure when imidazoles given with oestrogens
- Sirolimus: miconazole increases plasma concentration of sirolimus
- Tacrolimus: miconazole oral gel possibly increases plasma concentration of tacrolimus
- Antifungals, Polylene see Amphotericin
- Antifungals, Triazole

Note In general, fluconazole interactions relate to multiple-dose treatment
- Alikiren: iraconazole increases plasma concentration of aliskiren—avoid concomitant use
- Analgesics: fluconazole increases plasma concentration of celecoxib (half-life of celecoxib); voriconazole increases plasma concentration of diclofenac, ibuprofen and oxycodeone; fluconazole increases plasma concentration of flurbiprofen, ibuprofen and methadone; fluconazole increases plasma concentration of parecoxib (reduce dose of parecoxib); voriconazole increases plasma concentration of alflunatil and methadone (consider...
Appendix 1: Interactions

Antifungals, Triazole

- Analgesics: *continued*
  - Reducing dose of alfentanil and methadone; fluconazole inhibits metabolism of alfentanil (risk of prolonged or delayed respiratory depression); itraconazole possibly inhibits metabolism of alfentanil; triazoles possibly increase plasma concentration of fentanyl; itraconazole possibly increases plasma concentration of methadone (increased risk of ventricular arrhythmias); itraconazole increases plasma concentration of oxycodone.

- Antacids: absorption of itraconazole reduced by antacids.

- Antibacterials: plasma concentration of itraconazole increased by clarithromycin; manufacturer of fluconazole advises avoid concomitant use with discosporamide; avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of itrodenare.

- Antifungals: triazoles possibly antagonise effects of amphotericin; monitoring for increased voriconazole side effects advised by manufacturer of fluconazole if voriconazole given after fluconazole; plasma concentration of itraconazole increased by macafungin (consider reducing dose of itraconazole); plasma concentration of fluconazole increased by terbinafine.

- Antihistamines: itraconazole inhibits metabolism of mizolastine; avoid concomitant use.

- Antimalarials: avoiding itraconazole advised by manufacturer of darifenacin and tolterodine; manufacturer of fosaprendorine advises dose reduction when itraconazole given with fosaprendorine—consult fosaprendorine product literature; itraconazole possibly increases plasma concentration of olfenacin—see Dose under Solifenacin, p. 553.

- Antipsychotics: itraconazole possibly increases plasma concentration of haloperidol; itraconazole possibly increases plasma concentration of amipiprazole (reduce dose of amipiprazole—consult amipiprazole product literature); increased risk of ventricular arrhythmias when triazoles given with pimozide; avoid concomitant use; triazoles possibly increase plasma concentration of quetiapine—manufacturer of quetiapine advises avoid concomitant use; posaconazole possibly increases side-effects of risperidone.

- Antivirals: posaconazole increases plasma concentration of atazanavir; plasma concentration of voriconazole increased or decreased by atazanavir and plasma concentration of atazanavir also reduced; plasma concentration of voriconazole reduced by efavirenz, also plasma concentration of elavirenz increased (increase voriconazole dose and reduce efavirenz dose); plasma concentration of itraconazole and posaconazole reduced by efavirenz; plasma concentration of both drugs may increase when itraconazole given with fosaprendorinavir; plasma concentration of posaconazole possibly reduced by fosaprendorinavir; itraconazole increases plasma concentration of indinavir (consider reducing dose of indinavir); fluconazole increases plasma concentration of nevirapine, ritonavir and tipranavir; plasma concentration of itraconazole possibly reduced by nevirapine—consider increasing dose of itraconazole; plasma concentration of itraconazole reduced by ritonavir—avoid concomitant use; combination of itraconazole with ritonavir may increase plasma concentration of either drug (or both); triazoles possibly increase plasma concentration of saquinavir; plasma concentration of itraconazole possibly increased by telaprevir; plasma concentration of voriconazole possibly affected by telaprevir (possible increased risk of ventricular arrhythmias); plasma concentration of posaconazole possibly increased by telaprevir (increased risk of ventricular arrhythmias); fluconazole increases plasma concentration of ezidovudine (increased risk of toxicity).

- Anxiety and Hypnotics: itraconazole increases plasma concentration of alprazolam; fluconazole and voriconazole increase plasma concentration of zolpidem (risk of prolonged sedation); fluconazole, itraconazole, posaconazole and voriconazole increase plasma concentration of midazolam (risk of prolonged sedation); itraconazole increases...
Antifungals, Triazole
- Azoxystrobin: interactions with liposomes (increased risk of toxicity)
- Bosentan: itraconazole possibly increases plasma concentration of bosentan; interaction of bosentan and itraconazole possibly increases risk of toxicity; itraconazole increases plasma concentration of bosentan above 200mg/day; itraconazole and voriconazole possibly increase plasma concentration of bosentan
- Buspirone: itraconazole possibly increases plasma concentration of buspirone (30-100%)
- Cilostazol: itraconazole possibly increases plasma concentration of cilostazol (increase by 40-60%)
- Ciclosporin: itraconazole and voriconazole possibly increase plasma concentration of ciclosporin; voriconazole and azole antifungals possibly increase plasma concentration of ciclosporin
- Colchicine: interactions with colchicine are uncommon; interactions with colchicine are not recommended
- Domperidone: itraconazole possibly increases plasma concentration of domperidone; voriconazole possibly increases plasma concentration of domperidone; itraconazole and voriconazole possibly increase plasma concentration of domperidone
- Eflornithine: voriconazole possibly increases plasma concentration of eflornithine; voriconazole possibly increases plasma concentration of eflornithine when given with itraconazole avoid or consider reducing dose of itraconazole
- Epirubicin: itraconazole and voriconazole possibly increase plasma concentration of epirubicin
- Everolimus: itraconazole and voriconazole possibly increase plasma concentration of everolimus; voriconazole possibly increases plasma concentration of everolimus; itraconazole and voriconazole possibly increase plasma concentration of everolimus by 6-12 times; itraconazole possibly increases plasma concentration of everolimus by 2-15 times
- Fluticasone: itraconazole possibly increases plasma concentration of fluticasone
- Foscarnet: itraconazole possibly increases plasma concentration of foscarnet
- Ipilimumab: itraconazole possibly increases plasma concentration of ipilimumab
- Ipratropium: itraconazole possibly increases plasma concentration of ipratropium
- Labetalol: itraconazole possibly increases plasma concentration of labetalol
- Ranolazine: voriconazole possibly increases plasma concentration of ranolazine; voriconazole possibly increases plasma concentration of ranolazine; voriconazole and ranolazine possibly increase plasma concentration of ranolazine
- Ranitidine: itraconazole possibly increases plasma concentration of ranitidine
- Sermorelin: voriconazole possibly increases plasma concentration of sermorelin
- Tegafur: voriconazole increases plasma concentration of tegafur
- Temozolomide: itraconazole possibly increases plasma concentration of temozolomide
- Vorinostat: voriconazole possibly increases plasma concentration of vorinostat
- Vorozoxorin: voriconazole possibly increases plasma concentration of vorozoxorin
- Warfarin: itraconazole possibly increases plasma concentration of warfarin
- Zidovudine: voriconazole possibly increases plasma concentration of zidovudine
Antifungals, Triazole (continued)
- Retinoids: fluconazole and voriconazole possibly increase risk of retinoid toxicity.
- Riociguat: avoidance of itraconazole and voriconazole advised by manufacturer of riociguat.
- Sildenafil: itraconazole increases plasma concentration of sildenafil—reduce initial dose of sildenafil.
- Sirolimus: fluconazole and posaconazole possibly increase plasma concentration of sirolimus—advises concomitant use.
- Tacrolimus: fluconazole, itraconazole, posaconazole and voriconazole increase plasma concentration of tacrolimus—avoid concomitant use.
- Tadalafil: itraconazole possibly increases plasma concentration of tadalafil.
- Theophylline: fluconazole possibly increases plasma concentration of theophylline.
- Ulcer-healing Drugs: plasma concentration of posaconazole reduced by voriconazole and omeprazole—manufacturer of posaconazole suspension advises avoid concomitant use.
- Fluconazole and posaconazole possibly increase plasma concentration of omeprazole—consider reducing dose of omeprazole.
- Posaconazole possibly reduced by itraconazole—avoid concomitant use.
- Fluconazole possibly increases plasma concentration of voriconazole.
- Itraconazole possibly increases plasma concentration of voriconazole.
- Omeprazole: increased sedative effect possibly increased when mizolastine given with orlistat—avoid concomitant use.
- Betahistine: absorption of fexofenadine reduced by antacids.
- Antacids: increased sedative effect when antihistamines given with alcohol (possibly less effect with non-sedating antihistamines).
- Analgesics: sedative effects possibly increased when antihistamines given with opioid analgesics.
- Antacids: absorption of fexofenadine reduced by antacids.
- Anti-arrhythmics: increased risk of ventricular arrhythmias when mizolastine given with ketoconazole (risk of ventricular arrhythmias); manufacturer of ketoconazole advises avoid concomitant use.
- Analgesics: possible increased risk of antimuscarinic side-effects when antihistamines given with nefopam.
- Antihistamines: possible increased risk of antimuscarinic side-effects when antihistamines given with nefopam.
- Antihistamines: possible increased risk of antimuscarinic side-effects when antihistamines given with nefopam.
- Anti-arrhythmics: increased risk of ventricular arrhythmias when mizolastine given with ketoconazole; manufacturer of ketoconazole advises avoid concomitant use.
- Analgesics: possible increased antimuscarinic and sedative effects when antihistamines given with MAOIs or tricyclics; cyproheptadine
Antimuscarinics (continued)

Antibacterials: manufacturer of fesoterodine advises dose reduction when fesoterodine given with clarithromycin and telithromycin—consult fesoterodine product literature; manufacturer of tolterodine advises avoid concomitant use with clarithromycin and erythromycin; plasma concentration of darifenacin possibly increased by erythromycin; plasma concentration of active metabolite of fesoterodine reduced by ritampicin.

Antidepressants: plasma concentration of darifenacin and procyclidine increased by paroxetine; increased risk of antimuscarinic side-effects when antimuscarinics given with MAOIs or tricyclics; possible increased antimuscarinic side-effects when antimuscarinics given with tricyclic-related antidepressants.

Antifungals: manufacturer of fesoterodine advises dose reduction when fesoterodine given with itraconazole—consult fesoterodine product literature; manufacturer of darifenacin and tolterodine advises avoid concomitant use with itraconazole; plasma concentration of sofislafen possibly increased by itraconazole—see Dose under Sofislafen, p. 553.

Antihistamines: increased risk of antimuscarinic side-effects when antimuscarinics given with antihistamines.

Antipsychotics: antimuscarinics possibly reduce effects of haloperidol; increased risk of antimuscarinic side-effects when antimuscarinics given with clozapine; antimuscarinics reduce plasma concentration of phenothiazines, but risk of antimuscarinic side-effects increased.

Antiarrhythmics: manufacturer of fesoterodine advises dose reduction when fesoterodine given with atazanavir, indinavir, ritonavir and saquinavir—consult fesoterodine product literature; manufacturer of darifenacin advises avoid concomitant use with atazanavir, fosamprenavir, indinavir, lopinavir, ritonavir, saquinavir and tipranavir; manufacturer of tolterodine advises avoid concomitant use with fosamprenavir, indinavir, lopinavir, ritonavir and saquinavir; plasma concentration of sofislafen possibly increased by ritonavir—see Dose under Sofislafen, p. 553.

Beta-blockers: increased risk of ventricular arrhythmias when tolterodine given with sotalol.

Calcium-channel Blockers: plasma concentration of sofislafen increased by verapamil; manufacturer of darifenacin advises avoid concomitant use with verapamil.

Cardiac Glycosides: darifenacin possibly increases plasma concentration of digoxin.

Ciclosporin: manufacturer of darifenacin advises avoid concomitant use with ciclosporin.

Dopemiderone: antimuscarinics antagonise effects of dopemiderone on gastrointestinal activity.

Dopaminergics: antimuscarinics possibly reduce absorption of levodopa.

Hormone Antagonists: possible increased risk of bradycardia when ipratropium or oxbutynin given with pasireotide.

Mebimatine: effects of antimuscarinics possibly enhanced by mebimatine.

Metoclopramide: antimuscarinics antagonise effects of metoclopramide on gastrointestinal activity.

Nitrites: antimuscarinics possibly reduce effects of sublingual tablets of nitrites (failure to dissolve under tongue owing to dry mouth).

Parasympathomimetics: antimuscarinics antagonise effects of parasympathomimetics.

Antipsychotics

Note: increased risk of toxicity with myelosuppressive drugs.

Note: avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis.

ACE Inhibitors: enhanced hypotensive effect when antipsychotics given with ACE inhibitors.

Antipsychotics (continued)

Angiotensin-II Receptor Antagonists: increased risk of ventricular arrhythmias when antimuscarinics given with tricyclics; possible increased hypotensive and sedative effects when antipsychotics given with general anaesthetics.

Analgesics: possible severe drowsiness when haloperidol given with acetamin or indometacin; increased risk of ventricular arrhythmias when antimuscarinics given with pimozide; increased antimuscarinic side-effects when antimuscarinics given with tricyclic-related antidepressants; possible increased risk of ventricular arrhythmias when antimuscarinics given with methadone; increased risk of ventricular arrhythmias when amisulpride given with methadone—avoid concomitant use; increased risk of convulsions when antipsychotics given with tramadol; enhanced hypotensive and sedative effects when antipsychotics given with opioid analgesics.

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when antipsychotics given with angiotensin-II receptor antagonists.

Antacids: absorption of phenothiazines and sulpiride reduced by antacids.

Anti-arrhythmics: increased risk of ventricular arrhythmias when antimuscarinics that prolong the QT interval given with anti-arrhythmics that prolong the QT interval; increased risk of ventricular arrhythmias when antimuscarinics given with amiodarone—avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with amiodarone—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with amiodarone or disopyramide; increased risk of ventricular arrhythmias when amisulpride, droperidol, haloperidol, phenothiazines, pimozide or zuclopenthixol given with amiodarone—avoid concomitant use; possible increased risk of ventricular arrhythmias when haloperidol given with disopyramide—avoid concomitant use; increased risk of ventricular arrhythmias when haloperidol given with disopyramide; possible increased risk of ventricular arrhythmias when amiodarone or disopyramide—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone or disopyramide—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with amiodarone; avoidance of phenothiazines advised by manufacturer of dofetilide (risk of ventricular arrhythmias); increased risk of arrhythmias when clozapine given with dofetilide.

Antibacterials: increased risk of ventricular arrhythmias when pimozide given with clarithromycin, moxifloxacin or telithromycin—avoid concomitant use; plasma concentration of quetiapine possibly increased by clarithromycin—manufacturer of quetiapine advises avoid concomitant use; increased risk of ventricular arrhythmias when amisulpride given with erythromycin—avoid concomitant use; plasma concentration of clozapine possibly increased by erythromycin (possible increased risk of convulsions); possible increased risk of ventricular arrhythmias when pimozide given with erythromycin—avoid concomitant use; plasma concentration of quetiapine increased by erythromycin—manufacturer of quetiapine advises avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with paroxetine.

Antipsychotics

Adrenergic Neurone Blockers: enhanced hypotensive effect when phenothiazines given with adrenergic neurone blockers; higher doses of chlorpromazine antagonise hypotensive effect of adrenergic neurone blockers; haloperidol antagonises hypotensive effect of adrenergic neurone blockers.

Adsorbents: absorption of phenothiazines possibly reduced by kaolin.

Alcohol: increased hypotensive and sedative effect when antipsychotics given with alcohol.

Alpha-blockers: enhanced hypotensive effect when antipsychotics given with alpha-blockers.

Anaesthetics, General: droperidol enhances effects of thiopental; enhanced hypotensive effect when antipsychotics given with general anaesthetics.

Analgesics: possible severe drowsiness when haloperidol given with acetamin or indometacin; increased risk of ventricular arrhythmias when antipsychotics given with pimozide; increased antimuscarinic side-effects when antimuscarinics given with tricyclic-related antidepressants; possible increased risk of ventricular arrhythmias when antimuscarinics given with methadone; increased risk of ventricular arrhythmias when amisulpride given with methadone—avoid concomitant use; increased risk of convulsions when antipsychotics given with tramadol; enhanced hypotensive and sedative effects when antipsychotics given with opioid analgesics.

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when antipsychotics given with angiotensin-II receptor antagonists.

Antacids: absorption of phenothiazines and sulpiride reduced by antacids.

Anti-arrhythmics: increased risk of ventricular arrhythmias when antimuscarinics that prolong the QT interval given with anti-arrhythmics that prolong the QT interval; increased risk of ventricular arrhythmias when antimuscarinics given with amiodarone—avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with amiodarone—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with amiodarone or disopyramide; increased risk of ventricular arrhythmias when amisulpride, droperidol, pimozide or zuclopenthixol given with amiodarone—avoid concomitant use; possible increased risk of ventricular arrhythmias when benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with amiodarone or disopyramide; increased risk of ventricular arrhythmias when amisulpride, droperidol, haloperidol, phenothiazines, pimozide or zuclopenthixol given with amiodarone—avoid concomitant use; possible increased risk of ventricular arrhythmias when haloperidol given with disopyramide—avoid concomitant use; increased risk of ventricular arrhythmias when haloperidol given with disopyramide; possible increased risk of ventricular arrhythmias when amiodarone or disopyramide—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with amiodarone; avoidance of phenothiazines advised by manufacturer of dofetilide (risk of ventricular arrhythmias); increased risk of arrhythmias when clozapine given with dofetilide.
Antipsychotics

- Antibacterials (continued)
  - Increased by ciprofloxacin; increased risk of ventricular arrhythmias when droperidol, haloperidol, phenothiazines or sulphonamides given with moxifloxacin—avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with moxifloxacin—manufacturer of benperidol advises avoid concomitant use; plasma concentration of aripiprazole possibly reduced by rifampicin and erythromycin (reduced plasma concentration); avoid concomitant use of clozapine with chloramphenicol or sulphonamides (increased risk of agranulocytosis); manufacturer of droperidol advises avoid concomitant use with macrolides (risk of ventricular arrhythmias); possible increased risk of ventricular arrhythmias when chlorprozamine given with telithromycin; plasma concentration of quetiapine possibly increased by telithromycin.

- Antidepressants: plasma concentration of clozapine possibly increased by citalopram (increased risk of toxicity); avoidance of haloperidol, phenothiazines and pimozide advised by manufacturer of citalopram (risk of ventricular arrhythmias); avoidance of haloperidol, phenothiazines and pimozide advised by manufacturer of escitalopram (risk of ventricular arrhythmias); plasma concentration of aripiprazole possibly increased by fluoxetine and paroxetine (reduce dose of haloperidol—consult aripiprazole product literature); plasma concentration of clozapine, haloperidol and risperidone increased by fluoxetine; manufacturer of droperidol advises avoid concomitant use with fluoxetine, escitalopram, sertraline and tricyclics (risk of ventricular arrhythmias); plasma concentration of aripiprazole possibly increased by citalopram and paroxetine; plasma concentration of clozapine increased by paroxetine and sertraline; plasma concentration of risperidone possibly increased by paroxetine (increased risk of toxicity); metabolism of phenylalanine inhibited by paroxetine (reduce dose of perphenazine); plasma concentration of haloperidol increased by venlafaxine; clozapine possibly increases CNS effects of MAOIs; plasma concentration of pimozide possibly increased by SSRIIs (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by St. John’s wort (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); possible increased risk of ventricular arrhythmias when risperidone given with tricyclics; possible increased antimuscarinic side-effects when clozapine given with tricyclics; manufacturer of fluoxetine, haloperidol, sulpiride and zuclopenthixol advises avoid concomitant use with tricyclics (risk of ventricular arrhythmias); increased risk of antimuscarinic side-effects when phenothiazines given with tricyclics.

- Antidiabetics: phenothiazines possibly antagonise hypoglycaemic effect of sulfonylureas.

- Antiepileptics: antiepileptics antagonise anti- convulsant effect of antiepileptics (convulsive threshold lowered); plasma concentration of paliperidone reduced by carbamazepine; metabolism of haloperidol, olanzapine, quetiapine and risperidone accelerated by carbamazepine (reduced plasma concentration); metabolism of clozapine accelerated by carbamazepine (reduced plasma concentration), also avoid concomitant use of drugs with substantial potential for causing agranulocytosis; plasma concentration of aripiprazole reduced by carbamazepine (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of aripiprazole possibly reduced by fluoxetine and phenytoin (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); metabolism of haloperidol accelerated by phenobarbital (reduced plasma concentration) of both drugs reduced when chlorpromazine given with phenobarbital; plasma concentration of clozapine possibly reduced by phenobarbital; plasma concentration of haloperidol reduced by phenytoin; chlorpromazine possibly increased by ciprofloxacin; increased risk of ventricular arrhythmias when sulpiride given with valproate; plasma concentration of clozapine possibly increased or decreased by valproate.

- Antifungals: plasma concentration of aripiprazole possibly increased byitraconazole (reduce dose of aripiprazole—consult aripiprazole product literature); side-effects of risperidone possibly increased by itraconazole; plasma concentration of haloperidol possibly increased by itraconazole; plasma concentration of quetiapine possibly increased by imidazoles and triazoles—manufacturer of quetiapine advises avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with imidazoles or triazoles—avoid concomitant use.

- Antimalarials: avoidance of droperidol, haloperidol, phenothiazines and pimozide advised by manufacturer of piperaquine with artemether (possible risk of ventricular arrhythmias); avoidance of antipsychotics advised by manufacturer of artemether with lumefantrine; increased risk of ventricular arrhythmias when droperidol given with chloroquine and hydroxychloroquine or quinine—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with mefloquine or quinine—avoid concomitant use; manufacturer of amisulpride advises avoid concomitant use with mefloquine; possible increased risk of ventricular arrhythmias when haloperidol given with mefloquine or quinine—avoid concomitant use; manufacturer of amisulpride advises avoid concomitant use with mefloquine; possible increased risk of ventricular arrhythmias when risperidone given with quinine.

- Antimuscarinics: increased risk of antimuscarinic side-effects when clozapine given with antimuscarinics; plasma concentration of phenothiazines reduced by antimuscarinics; but risk of antimuscarinic side-effects increased; effects of haloperidol possibly reduced by antimuscarinics.

- Antipsychotics: increased risk of ventricular arrhythmias when amisulpride, pimozide or sulpiride given with droperidol—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines that prolong the QT interval given with droperidol—avoid concomitant use; avoid concomitant use of clozapine with depot formulation of flupentixol; fluphenazine, haloperidol, pipotiazine, risperidone or zuclopenthixol as cannot be withdrawn quickly if neutropenia occurs; increased risk of ventricular arrhythmias when sulpiride given with haloperidol; chlorpromazine possibly increases plasma concentration of haloperidol; increased risk...
Antipsychotics

- Antipsychotics (continued)
  of ventricular arrhythmias when haloperidol given with *haloperidol*—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with *phenothiazines*—avoid concomitant use; possible increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with *tramadol, ivabradine, zonisamide, metoprolol.*

- Antivirals: plasma concentration of pimozide possibly increased by *atazanavir, efavirenz, ritonavir, saquinavir* and *telaprevir* (reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of quetiapine possibly increased by *atazanavir, efavirenz, ritonavir, saquinavir, etoposide* and *telaprevir*—manufacturer of quetiapine advises avoid concomitant use; avoidance of pimozide advised by manufacturer of *efavirenz, ritonavir, saquinavir, etoposide* and *telaprevir*; plasma concentration of aripiprazole possibly reduced by *clarithromycin, warfarin*; increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with *tramadol, ivabradine, zonisamide, metoprolol.*

- Antipsychotics (continued)

  Clonidine: enhanced hypotensive effect when phenothiazines given with *clonidine*
  
  - Cobicistat: plasma concentration of pimozide possibly increased by *cobicistat*—manufacturer of cobicistat advises avoid concomitant use
  
  - Cytotoxics: avoid concomitant use of clozapine with *cytotoxics* (increased risk of agranulocytosis); possible increased risk of ventricular arrhythmias when haloperidol given with *bosutinib,* caution with pimozide advised by manufacturer of *erlotinib,* avoidance of pimozide advised by manufacturer of *lapatinib,* possible increased risk of ventricular arrhythmias when amisulpride, chlorpromazine, haloperidol, pimozide, sulpiride or sulpiride given with *vandetanib*—avoid concomitant use; increased risk of ventricular arrhythmias when haloperidol given with *arsenic trioxide*; increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with *arsenic trioxide*.

  Deferasirox: avoidance of clozapine advised by manufacturer of *deferasirox*
  
  Desferrioxamine: manufacturer of levomephramine advises avoid concomitant use with *deferasirox*; avoidance of prochlorperazine advised by manufacturer of *deferasirox*
  
  Diazoxide: enhanced hypotensive effect when phenothiazines given with *diazoxide*
  
  - Diuretics: risk of ventricular arrhythmias with amisulpride increased by hypokalaemia caused by *diuretics*; risk of ventricular arrhythmias with pimozide increased by hypokalaemia caused by *diuretics* (avoid concomitant use); enhanced hypotensive effect when phenothiazines given with *diuretics.*

  Dopaminergics: increased risk of extrapyramidal side-effects when antipsychotics given with *amantadine*; antipsychotics antagonise effects of *apomorphine, levodopa* and pergolide; antipsychotics antagonise hyperprolactinemia and antiprolactin effects of bromocriptine and cabergoline; manufacturer of amisulpride advises avoid concomitant use of *levodopa* (antagonism of effect); avoidance of antipsychotics advised by manufacturer of *pramipexole,ropinirole and rotigotine* (antagonism of effect).

  Grapefruit juice: plasma concentration of quetiapine possibly increased by *grapefruit juice,* manufacturer of quetiapine advises avoid concomitant use with *disulfiram.*

  Histamine: antipsychotics theoretically antagonise effects of *histamine*—manufacturer of histamine advises avoid concomitant use

  Hormone Antagonists: manufacturer of droperidol advises avoid concomitant use with *tamoxifen* (risk of ventricular arrhythmias)

  Ivabradine: increased risk of ventricular arrhythmias when pimozide given with *ivabradine*

  Lithium: increased risk of extrapyramidal side-effects and possibly neurotoxicity when clozapine, flupentixol, haloperidol, phenothiazines, risperidone or zuclopenthixol given with *lithium,* possible risk of toxicity when olanzapine given with *lithium,* increased risk of extrapyramidal side-effects when sulpiride given with *lithium.*

  Mecamylamine: effects of antipsychotics possibly reduced by *mecamylamine*

  Methyldopa: enhanced hypotensive effect when antipsychotics given with *methyldopa* (also increased risk of extrapyramidal effects)

  Metoclopramide: increased risk of extrapyramidal side-effects when antipsychotics given with *metoclopramide*

  Moxonidine: enhanced hypotensive effect when phenothiazines given with *moxonidine*

  Muscle Relaxants: promazine possibly enhances effects of *suxamethonium* (increased risk of extrapyramidal side-effects when antipsychotics given with *suxamethonium* when pimozide given with *nitrites***

Antipsychotics

- Antipsychotics (continued)

  of ventricular arrhythmias when droperidol given with *haloperidol*—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with *phenothiazines*—avoid concomitant use; possible increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with *tramadol, ivabradine, zonisamide, metoprolol.*

- Antivirals: plasma concentration of pimozide possibly increased by *atazanavir*—avoid concomitant use; plasma concentration of aripiprazole possibly increased by *atazanavir, efavirenz, ritonavir, saquinavir* and *telaprevir*—manufacturer of quetiapine advises avoid concomitant use; avoidance of pimozide advised by manufacturer of *efavirenz, ritonavir, saquinavir, etoposide* and *telaprevir*; plasma concentration of aripiprazole possibly reduced by *clarithromycin, warfarin*; increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with *tramadol, ivabradine, zonisamide, metoprolol.*
Antipsychotics (continued)
- Penicillamine: avoid concomitant use of clozapine with penicillamine (increased risk of agranulocytosis)
- Pentamidine isetionate: increased risk of ventricular arrhythmias when amisulpride or droperidol given with pentamidine isetionate—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with pentamidine isetionate
- Sodium Benzocaine: haloperidol possibly reduces effects of sodium benzocaine
- Sodium Oxybate: antipsychotics possibly enhance effects of sodium oxybate
- Sodium Phenylbutyrate: haloperidol possibly reduces effects of sodium phenylbutyrate

Symptomimetics: antipsychotics antagonise hypotensive effect of sympathomimetics; antipsychotic effects of chlorpromazine possibly antagonised by dexamfetamine; chlorpromazine possibly reduces effects of lidocaine; side-effects of risperidone possibly increased by methylphenidate
- Tacrolimus: manufacturer of droperidol advises avoid concomitant use with tacrolimus (risk of ventricular arrhythmias)

Tetrazenazine: increased risk of extrapyramidal side-effects when antipsychotics given with tetrazenazine

Ulcer-healing Drugs: effects of antipsychotics, chlorpromazine and clozapine possibly enhanced by cinemetidine; plasma concentration of clozapine possibly reduced by omeprazole; absorption of sulpiride reduced by sucralfate

Vasodilator Antihypertensives: enhanced hypotensive effect when phenothiazines given with hydralazine, minoxidil or sodium nitroprusside

Antivirals see individual drugs

Anxiolytics and Hypnotics

ACE Inhibitors: enhanced hypotensive effect when anxioytics and hypnotics given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when anxioytics and hypnotics given with adrenergic neurone blockers

Alcohol: increased sedative effect when anxioytics and hypnotics given with alcohol

Alpha-blockers: enhanced hypotensive and sedative effects when anxioytics and hypnotics given with alpha-blockers

Aneasthetics, General: increased sedative effect when anxioytics and hypnotics given with general anaeasthetics

Analgescics: metabolism of midazolam possibly inhibited by fentanyl; increased sedative effect when anxioytics and hypnotics given with opioid analgesics

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when anxioytics and hypnotics given with angiotensin-II receptor antagonists
- Antibacterials: metabolism of midazolam inhibited by clarithromycin; erythromycin and clarithromycin (increased plasma concentration with increased sedation); plasma concentration of busiprione increased by erythromycin (reduce dose of busiprione); metabolism of zopiclone inhibited by erythromycin; metabolism of benzodiazepines possibly accelerated by rifampicin (reduced plasma concentration); metabolism of diazepam and zaleplon accelerated by rifampicin (reduced plasma concentration); metabolism of busiprione possibly accelerated by rifampicin; metabolism of zolpidem accelerated by rifampicin (reduced plasma concentration and reduced effect); plasma concentration of zopiclone significantly reduced by rifampicin; metabolism of diazepam inhibited by ironizid

Anticoagulants: chloral may transiently enhance anticoagulant effect of coumarins

Antidepressants: plasma concentration of alprazolam increased by fluoxetine; plasma concentration of melatonin increased by fluvoxamine—avoid concomitant use; plasma concentration of some benzodiazepines increased by fluvoxamine; sedative effects possibly increased when zolpidem given with sertraline; manufacturer of buspirone advises avoid concomitant use with MAOIs; avoidance of busiprione for 14 days after stopping tranylcypromine—avoid concomitant use

- Antipsychotics possibly enhance effects of oral midazolam possibly reduced by St John’s wort; increased sedative effect when anxioytics and hypnotics given with mirtazapine, tricyclic-related antidepressants or tricyclics

Antiepileptics: plasma concentration of clonazepam often reduced by carbamazepine, phenobarbital and phenytoin; plasma concentration of midazolam reduced by carbamazepine and penicillin (increased risk of agranulocytosis); increased sedative effect when anxioytics and hypnotics given with phenytoin; benzodiazepines possibly increase or decrease plasma concentration of phenytoin; plasma concentration of clozapine increased by stiripentol; increased risk of side-effects when clonazepam given with valproate; clozapine possibly increases plasma concentration of valproate; plasma concentration of diazepam and lorazepam possibly increased by valproate

- Antifungals: plasma concentration of diazepam and midazolam increased by fluconazole (risk of prolonged sedation); plasma concentration of alprazolam increased by itraconazole; plasma concentration of midazolam increased by voriconazole; plasma concentration of haloperidol; busiprione increases plasma concentration of haloperidol; serious adverse events reported with concomitant use of benzodiazepines and clonazepam (causality not established); increased risk of hypotension, bradycardia and respiratory depression when parenteral benzodiazepine given with intramuscular clonazepam

- Antivirals: plasma concentration of midazolam possibly increased by foscarnet—avoid concomitant use of oral midazolam; plasma concentration of oral midazolam increased by boceprevir—manufacturer of boceprevir advises avoid concomitant use; increased risk of prolonged sedation when midazolam given with foscarnet—avoid concomitant use; plasma concentration of midazolam possibly increased by ritonavir—avoid concomitant use; plasma concentration of midazolam increased by fosamprenavir, enfuvirtide, ritonavir and atazanavir (risk of prolonged sedation—avoid concomitant use); plasma concentration of midazolam possibly increased by atazanavir—avoid concomitant use; plasma concentration of midazolam possibly increased by atazanavir; plasma concentration of alprazolam, diazepam, flurazepam and zolpidem possibly increased by ritonavir (risk of extreme sedation and respiratory depression—avoid concomitant use); plasma concentration of busiprione increased by ritonavir (increased risk of toxicity); plasma concentration of midazolam increased by saquinavir (risk of prolonged sedation—avoid concomitant use of oral midazolam
Anxiolytics and Hypnotics (continued)

Aprepitant: plasma concentration of midazolam increased by aprepitant (risk of prolonged sedation)

Beta-blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with calcium-channel blockers; midazolam increases absorption of lercanidipine; plasma concentration of buspirone increased by diltiazem and verapamil (reduce dose of buspirone); metabolism of midazolam inhibited by diltiazem and verapamil (increased plasma concentration with increased sedation)

Cardiac Glycosides: alprazolam increases plasma concentration of digoxin (increased risk of toxicity)

Clonidine: enhanced hypotensive effect when anxiolytics and hypnotics given with clonidine

● Cocotoxins: avoidance of oral midazolam advised by manufacturer of cocotoxins

● Cytotoxics: plasma concentration of midazolam increased by etrizotinib and nilotinib

Deferasirox: plasma concentration of midazolam possibly reduced by deferasirox

Diazoxide: enhanced hypotensive effect when anxiolytics and hypnotics given with diazoxide

Disulfiram: metabolism of benzodiazepines inhibited by disulfiram (increased sedative effects); increased risk of temazepam toxicity when given with disulfiram

Diuretics: enhanced hypotensive effect when anxiolytics and hypnotics given with diuretics; administration of chloral with parenteral furosemide may displace thyroid hormone from binding sites

Dopaminergics: benzodiazepines possibly antagonise effects of levodopa

Grapefruit Juice: plasma concentration of oral midazolam possibly increased by grapefruit juice; plasma concentration of buspirone increased by grapefruit juice

Ivacaftor: plasma concentration of midazolam increased by ivacaftor

Lipid-regulating Drugs: plasma concentration of midazolam possibly increased by lovastatin

Lithium: increased risk of neurotoxicity when clonazepam given with lithium

Lofexidine: increased sedative effect when anxiolytics and hypnotics given with lofexidine

Methyldopa: enhanced hypotensive effect when anxiolytics and hypnotics given with methyldopa

● Methylthioninium: possible risk of CNS toxicity when buspirone given with methylthioninium—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)

Moxonidine: enhanced hypotensive effect when anxiolytics and hypnotics given with moxonidine; sedative effects possibly increased when benzodiazepines given with moxonidine

Muscle Relaxants: increased sedative effect when anxiolytics and hypnotics given with baclofen or tizanidine

Nitrate: enhanced hypotensive effect when anxiolytics and hypnotics given with nitrates

Oestrogens: plasma concentration of melatonin increased by oestrogens; plasma concentration of chloridiazepoxide, diazepam and nitratrexam possibly increased by oestrogens; plasma concentration of lorazepam, oxazepam and temazepam possibly reduced by oestrogens

Probepenicid: excretion of lorazepam reduced by probepenicid (increased plasma concentration); excretion of nitratrexam possibly reduced by probepenicid (increased plasma concentration)

Progestogens: plasma concentration of chloridiazepoxide, diazepam and nitratrexam possibly

Anxiolytics and Hypnotics (continued)

Progestogens (continued)

increased by progestogens; plasma concentration of lorazepam, oxazepam and temazepam possibly reduced by progestogens

● Sodium Oxybate: benzodiazepines enhance effects of sodium oxybate (avoid concomitant use)

Theophylline: effects of benzodiazepines possibly reduced by theophylline

Ulcerc-Healing Drugs: plasma concentration of melatonin increased by cimetidine; metabolism of benzodiazepines, clomethiazole and zaleplon inhibited by cimetidine (increased plasma concentration); metabolism of diazepam possibly inhibited by omeprazole (increased plasma concentration)

Vasoconstrictor Antihypertensives: enhanced hypotensive effect when anxiolytics and hypnotics given with hydralazine, minoxidil or sodium nitroprusside

Apixaban

● Analgesics: increased risk of haemorrhage when anti-coagulants given with intravenous diclofenac (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anti-coagulants given with etoricoxib (avoid concomitant use, including low-dose heparins)

Antibacterials: plasma concentration of apixaban reduced by rifampicin

● Anticoagulants: increased risk of haemorrhage when apixaban given with other anticoagulants (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with dabigatran and rivaroxaban (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)

● Antidepressants: plasma concentration of apixaban possibly reduced by St John's wort

● Antiepileptics: plasma concentration of apixaban possibly reduced by carbamazepine, phenobarbital and phenytoin

Antifungals: manufacturer of apixaban advises avoid concomitant use with itraconazole, posaconazole and voriconazole

Antivirals: manufacturer of apixaban advises avoid concomitant use with atazanavir, boceprevir, darunavir, fosamprenavir, indinavir, lopinavir, ritonavir, saquinavir and tipranavir

Sulfinpyrazone: increased risk of bleeding when apixaban given with sulfinpyrazone

Apomorphine

Antipsychotics: effects of apomorphine antagonised by antipsychotics

Dopaminergics: effects of apomorphine possibly enhanced by entacapone

● SHT-2-receptor Antagonists: possible increased hypotensive effect when apomorphine given with ondansetron—avoid concomitant use

Memantine: effects of dopaminergics possibly enhanced by memantine

Methyldopa: antiparkinsonian effect of dopaminergics possibly increased by methyldopa

Aproclonidine

Antidepressants: manufacturer of aproclonidine advises avoid concomitant use with MAOIs, tricyclic-related antidepressants and tricyclics

Sympathomimetics: manufacturer of aproclonidine advises avoid concomitant use with sympathomimetics

Aprepitant

Note: Fosaprepitant is a prodrug of aprepitant

Antibacterials: plasma concentration of aprepatin possibly reduced by clarithromycin and telithromycin; plasma concentration of aprepatin reduced by rifampicin
Appendix 1: Interactions

Anticoagulants: aprepitant possibly reduces anti-coagulant effect of warfarin

- Antidepressants: manufacturer of aprepitant advises avoid concomitant use with St John’s wort

Antidiabetics: aprepitant reduces plasma concentration of tolbutamide

Antiepileptics: plasma concentration of aprepitant possibly reduced by carbamazepine, phenobarbital and phenytoin

Antipsychotics: manufacturer of aprepitant advises avoid concomitant use with pimozide

Antivirals: plasma concentration of aprepitant possibly increased by ritonavir

Antioxidants and Hypnotics: aprepitant increases plasma concentration of midazolam (risk of prolonged sedation)

Aprelafil: aprepitant possibly increases plasma concentration of avanafil—see Dose under Aprelafil, p. 560

Calcium-channel Blockers: manufacturer of dапoxetine advises dose reduction when aprepitant given with dapoxetine (see Dose under Dапoxetine, p. 177)

Corticosteroids: aprepitant inhibits metabolism of dexamethasone and methylprednisolone (reduce dosage of dexamethasone and methylprednisolone)

Cytotoxics: aprepitant possibly increases the plasma concentration of bosutinib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib

Dapoxetine: manufacturer of dapoxetine advises dose reduction when aprepitant given with dapoxetine (see Dose under Dapoxetine, p. 560)

Lipid-regulating Drugs: manufacturer of lomitapide advises dose reduction when fosaprepitant given with lomitapide (see Dose under Lomitapide, p. 177)

Oestrogens: aprepitant possibly causes contraceptive failure of hormonal contraceptives containing oestrogens (alternative contraception recommended)

Progestogens: aprepitant possibly causes contraceptive failure of hormonal contraceptives containing progestogens (alternative contraception recommended)

Aripiprazole see Antipsychotics

Arsenic Trioxide
- Anti-arrhythmics: increased risk of ventricular arrhythmias when arsenic trioxide given with amiodarone or disopyramide

- Anti-infective agents: increased risk of ventricular arrhythmias when arsenic trioxide given with erythromycin, levofloxacin or moxifloxacin

- Antidepressants: increased risk of ventricular arrhythmias when arsenic trioxide given with amitriptyline or clomipramine

- Antiinflammatories: increased risk of ventricular arrhythmias when arsenic trioxide given with amphotericin

- Antimalarials: avoidance of arsenic trioxide advised by manufacturer of piperaquine with artenin (possible risk of ventricular arrhythmias)

- Antipsychotics: increased risk of ventricular arrhythmias when arsenic trioxide given with antipsychotics that prolong the QT interval: increased risk of ventricular arrhythmias when arsenic trioxide given with diphenhydramine; avoid concomitant use of antipsychotics with clozapine (increased risk of agranulocytosis)

- Beta-blockers: increased risk of ventricular arrhythmias when arsenic trioxide given with sotalol

- Cytotoxics: possible increased risk of ventricular arrhythmias when arsenic trioxide given with etoposide or nab-paclitaxel (increased risk of agranulocytosis)

- Diuretics: risk of ventricular arrhythmias with arsenic trioxide increased by hypokalaemia caused by diuretics

- Diuretics (continued)
  - acetazolamide, loop diuretics or thiazides and related diuretics

- Lithium: increased risk of ventricular arrhythmias when arsenic trioxide given with lithium

Artemether with Lumefantrine
- Anti-infective agents: increased risk of ventricular arrhythmias when arsenic trioxide given with lumefantrine

- Antipsychotics (continued)
  - amiodarone, cyclosporine and felodipine (risk of ventricular arrhythmias)

- Antibacterials: manufacturer of artemether with lumefantrine advises avoid concomitant use with macrolides and quinolones

- Antifungals: manufacturer of artemether with lumefantrine advises avoid concomitant use with trimethoprim and triazoles

- Antimalarials: manufacturer of artemether with lumefantrine advises avoid concomitant use with chloroquine and proguanil

- Antipsychotics: manufacturer of artemether with lumefantrine advises avoid concomitant use with antipsychotics

- Antivirals: manufacturer of artemether with lumefantrine advises caution with atazanavir, fosamprenavir, indinavir, lopinavir, ritonavir, saquinavir and tipranavir; avoidance of artemether with lumefantrine advised by manufacturer of etravirine; plasma concentration of lumefantrine increased by darunavir; plasma concentration of artemether with lumefantrine reduced by etravirine

- Beta-blockers: manufacturer of artemether with lumefantrine advises avoid concomitant use with metoprolol and sotalol

- Cytotoxics: possibly increased risk of ventricular arrhythmias when artemether with lumefantrine given with cyclophosphamide, lomustine, mitomycin C, temozolomide, irinotecan, Gemcitabine and paclitaxel

- Diuretics: plasma concentration of artemether with lumefantrine possibly increased by grapefruit juice

- Histamine: avoidance of antimalarials advised by manufacturer of histamine

- Ulcer-healing Drugs: manufacturer of artemether with lumefantrine advises avoid concomitant use with metamizole

- Vaccines: antimalarials inactivate oral typhoid vaccine—see p. 850

Ascorbic acid see Vitamins

Asenapine see Antipsychotics

Aspirin
- Adsorbents: absorption of aspirin possibly reduced by kaolin

- Anaesthetics, General: aspirin possibly enhances effects of thiopental

- Analgesics: avoid concomitant use of aspirin with NSAIDs (increased aideffects); antiplatelet effect of aspirin possibly reduced by buprenorphine

- Anticoumarins: excretion of aspirin increased by alkaline urine due to some antacids

- Anticoagulants: increased risk of bleeding when aspirin given with coumarins or phenindione (due to antiplatelet effect); aspirin enhances anti-coagulant effect of heparins

- Antidepressants: increased risk of bleeding when aspirin given with SSRIs or venlafaxine

- Antiparkinsonian agents: aspirin enhances effects of phenytoin and valproate

- Clopidogrel: increased risk of bleeding when aspirin given with clopidogrel
Antidepressants: increased risk of gastrointestinal bleeding and ulceration when aspirin given with corticosteroids, also corticosteroids reduce plasma concentration of salicylate

- Cytotoxics: aspirin reduces excretion of methotrexate (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 718; aspirin possibly reduces renal excretion of pemetrexed—consult product literature

- Diuretics: increased risk of toxicity when high-dose aspirin given with acetazolamide; aspirin antagonises diuretic effect of spironolactone; possible increased risk of toxicity when high-dose aspirin given with loop diuretics (also possible reduced effect of loop diuretics)

Iloprost: increased risk of bleeding when aspirin given with iloprost

Leukotriene Receptor Antagonists: aspirin increases plasma concentration of zafirlukast

Metoclopramide: rate of absorption of aspirin increased by metoclopramide (enhanced effect)

Probenecid: aspirin antagonises effects of probenecid

Sulfinpyrazone: aspirin antagonises effects of sulfinpyrazone

**Atazanavir**

Antacids: absorption of atazanavir reduced by antacids (give at least 2 hours before or 1 hour after antacids)

- Anti-arrhythmics: atazanavir possibly increases plasma concentration of amiodarone and lidocaine

- Antibacterials: plasma concentration of both drugs increased when atazanavir given with clarithromycin; atazanavir increases plasma concentration of rifampin (reduce dose of rifabutin); plasma concentration of atazanavir reduced by rifampicin—avoid concomitant use; avoidance of concomitant atazanavir in severe renal and hepatic impairment advised by manufacturer of clarithromycin

- Anticoaguulants: atazanavir may enhance or reduce anticoagulant effect of warfarin; avoidance of atazanavir advised by manufacturer of apixaban and rivaroxaban

- Antidepressants: plasma concentration of atazanavir reduced by St John’s wort—avoid concomitant use

- Antifungals: plasma concentration of atazanavir increased by posaconazole; atazanavir increases or decreases the plasma concentration of voriconazole and plasma concentration of atazanavir also reduced

- Antimalarials: caution with atazanavir advised by manufacturer of artemether with lumefantrine; atazanavir possibly increases plasma concentration of quinine (increased risk of toxicity)

- Antimuscarinics: avoidance of atazanavir advised by manufacturer of darifenacin; manufacturer of fesoterodine advises dose reduction when atazanavir given with fesoterodine—consult fesoterodine product literature

- Antipsychotics: atazanavir possibly increases plasma concentration of aripiprazole (reduce dose of aripiprazole—consult aripiprazole product literature); atazanavir possibly increases plasma concentration of aripiprazole—avoid concomitant use; atazanavir possibly increases plasma concentration of equetiapine—manufacturer of quetiapine advises avoid concomitant use

- Antivirals: plasma concentration of atazanavir reduced by boceprevir; absorption of atazanavir reduced by didanosine tablets (give at least 2 hours before or 1 hour after didanosine tablets); manufacturer of atazanavir advises avoid concomitant use with efavirenz (plasma concentration of atazanavir reduced); atazanavir boosted with ritonavir increases plasma concentration of etravirine (reduce dose of elvitegravir)

- Antibacterials: atazanavir possibly increases plasma concentration of efavirenz (consider reducing dose of maraviroc); plasma concentration of atazanavir possibly reduced by nevirapine—avoid concomitant use; increased risk of ventricular arrhythmias when atazanavir given with saquinavir—avoid concomitant use; atazanavir possibly reduces plasma concentration of telaprevir, also plasma concentration of atazanavir possibly increased; plasma concentration of atazanavir reduced by tenofovir, also plasma concentration of tenofovir possibly increased; atazanavir increases plasma concentration of efavirenz (also plasma concentration of atazanavir reduced)

- Anxiolytics and Hypnotics: atazanavir possibly increases plasma concentration of emidazolam—avoid concomitant use of oral midazolam

- Anxiolytics and Hypnotics: atazanavir possibly increases plasma concentration of emidazolam—avoid concomitant use of oral midazolam

- Calcium-channel Blockers: atazanavir increases plasma concentration of ediltuzum (reduce dose of diltiazem); atazanavir possibly increases plasma concentration of verapamil

- Ciclosporin: atazanavir possibly increases plasma concentration of ciclosporin

- Colchicine: atazanavir possibly increases risk of colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)

- Cytotoxics: atazanavir possibly increases plasma concentration of axitinib (reduce dose of axitinib—consult axitinib product literature); atazanavir possibly increases the plasma concentration of bosutinib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; atazanavir possibly increases plasma concentration of crizotinib and everolimus—manufacturer of crizotinib and everolimus advises avoid concomitant use; atazanavir possibly increases plasma concentration of pazopanib (reduce dose of pazopanib); avoidance of atazanavir advised by manufacturer of cabazitaxel; atazanavir possibly inhibits metabolism of erlotinib (increased risk of toxicity)

- Dapoxetine: avoidance of atazanavir advised by manufacturer of dapoxetine (increased risk of toxicity)

- Ergot Alkaloids: atazanavir possibly increases plasma concentration of ergot alkaloids—avoid concomitant use

- Lipid-regulating Drugs: possible increased risk of myopathy when atazanavir given with atorvastatin or pravastatin; atazanavir increases plasma concentration of eresuvastatin—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when atazanavir given with simvastatin (avoid concomitant use)

- Oestrogens: atazanavir increases plasma concentration of ethinylestradiol

- Orlistat: absorption of atazanavir possibly reduced by orlistat

- Progestogens: atazanavir increases plasma concentration of norethisterone

- Ranolazine: atazanavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use

- Sildenafil: atazanavir possibly increases side-effects of sildenafil

- Sirolimus: atazanavir possibly increases plasma concentration of sirolimus

- Tacrolimus: atazanavir possibly increases plasma concentration of tacrolimus

- Tadalafil: atazanavir possibly increases plasma concentration of tadalafil—manufacturer of tadalafil advises avoid concomitant use

- Ticagrelor: atazanavir possibly increases plasma concentration of ticagrelor—manufacturer of ticagrelor advises avoid concomitant use

- Zidovudine: atazanavir possibly increases plasma concentration of zidovudine—manufacturer of zidovudine advises avoid concomitant use
Appendix 1: Interactions

Atazanavir (continued)
- Ulcer-healing Drugs: manufacturer of atazanavir advises adjust doses of both drugs when atazanavir given with cimetidine and ranitidine—consult atazanavir product literature; plasma concentration of atazanavir reduced by enalapril and amiodarone (adjust doses of both drugs—consult atazanavir product literature); plasma concentration of atazanavir reduced by proton pump inhibitors—avoid or adjust dose of both drugs (consult product literature)
- Sodium channel blockaders: manufacturer of atazanavir advises avoid concomitant use; plasma concentration of atazanavir increased by metformin, telithromycin and ketoconazole—see Dose under Avanafil, p. 559

Avanafil
- ACE inhibitors: avanafil possibly enhances hypotensive effect of enalapril
- Alcohol: possible enhanced hypotensive effect when avanafil given with alcohol
- Alpha-blockers: enhanced hypotensive effect when avanafil given with α-blockers—see also p. 558
- Antibacterials: plasma concentration of avanafil possibly increased by clarithromycin and telithromycin—manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil increased by erythromycin—see Dose under Afinafil, p. 559; plasma concentration of avanafil possibly reduced by rifampicin—manufacturer of avanafil advises avoid concomitant use
- Antifungals: plasma concentration of avanafil possibly increased by ketoconazole and phenobarbital—manufacturer of avanafil advises avoid concomitant use
- Antivirals: plasma concentration of avanafil possibly increased by ritonavir—avoid concomitant use; atazanavir possibly reduces plasma concentration of avanafil—see Dose under Avanafil, p. 559; plasma concentration of avanafil possibly increased by nortriptyline—avoid concomitant use
- Antidepressants: plasma concentration of avanafil significantly increased by nortriptyline—avoid concomitant use
- Antipsychotics: increased risk of ventricular arrhythmias when atomoxetine given with amisulpride or dipropylamine
- Anti-arrhythmics: increased risk of ventricular arrhythmias when atomoxetine given with propranolol
- Analgesics: increased risk of toxicity when atorvastatin given with tramadol
- Anti-inflammatory: possible increased risk of toxicity when atorvastatin given with tramadol
- Antihistamines: increased risk of toxicity when atomoxetine given with triptans
- Anxiolytics: increased risk of toxicity when atomoxetine given with triazolam
- Antidepressants: increased risk of toxicity when atomoxetine given with mirtazapine
- Anticonvulsants: possible increased risk of toxicity (increased risk of toxicity)
- Antiepileptics: plasma concentration of atorvastatin possibly reduced by felbamate—consult atorvastatin product literature; plasma concentration of atorvastatin possibly reduced by vigabatrin—manufacturer of atorvastatin advises avoid concomitant use; plasma concentration of atorvastatin possibly reduced by zonisamide—manufacturer of atorvastatin advises avoid concomitant use; plasma concentration of atorvastatin possibly reduced by pimozide—manufacturer of atorvastatin advises avoid concomitant use
- Anti-muscarinics: increased risk of toxicity when atomoxetine given with propranolol
- Antihypertensives: increased risk of toxicity when atomoxetine given with propranolol
- Anticoagulants: possible increased risk of toxicity (increased risk of toxicity)
**Appendix 1: Interactions**

**Beta-blockers (continued)**

**Anaesthetics:** General: enhanced hypotensive effect when beta-blockers given with general anaesthetics

**Anaesthetics:** Local: propranolol increases risk of putative nausea toxicity

**Analgesics:** hypotensive effect of beta-blockers antagonised by NSAIDs; plasma concentration of esmolol possibly increased by morphine

**Angiotensin-II Receptor Antagonists:** enhanced hypotensive effect when beta-blockers given with angiotensin-II receptor antagonists

**Anti-arrhythmics:** increased myocardial depression when beta-blockers given with anti-arrhythmics; increased risk of ventricular arrhythmias when sotalol given with azathioprine; increased risk of myocardial depression and Bradycardia when beta-blockers given with flecainide; propranolol increases risk of lidocaine toxicity; nadolol possibly increases risk of lidocaine toxicity; plasma concentration of metoprolol and propranolol increased by propafenone

**Antibacterials:** increased risk of ventricular arrhythmias when sotalol given with minocycline—avoid concomitant use; metabolism of bisoprolol and propranolol accelerated by rifampicin; plasma concentration significantly reduced); plasma concentration of carvedilol, celiprolol and metoprolol reduced by rifampicin

**Antidepressants:** plasma concentration of metoprolol increased by citalopram and escitalopram, increased risk of ventricular arrhythmias when sotalol given with citalopram—avoid concomitant use; avoidance of sotalol advised by manufacturer of escitalopram (risk of ventricular arrhythmias). plasma concentration of propranolol increased by fluvoxamine; plasma concentration of metoprolol possibly increased by paroxetine—increased risk of AV block (manufacturer of paroxetine advises avoid concomitant use in cardiac insufficiency); labetalol and propranolol increase plasma concentration of imipramine; enhanced hypotensive effect when beta-blockers given with MAOIs; increased risk of ventricular arrhythmias when sotalol given with tricyclics

**Antiabetic:** beta-blockers may mask warning signs of hypoglycaemia (such as tremor) with anti-diabetic; beta-blockers enhance hypoglycaemic effect of insulin

**Antiepileptics:** plasma concentration of propranolol possibly reduced by phenobarbital

**Antihistamines:** increased risk of ventricular arrhythmias when sotalol given with mizolastine—avoid concomitant use

**Antimalarials:** avoidance of sotalol advised by manufacturer of eperaquine with arteninol (possible risk of ventricular arrhythmias); avoidance of metoprolol and sotalol advised by manufacturer of artenether with lumefantrine; increased risk of Bradycardia when beta-blockers given with medofquine

**Antimuscarinics:** increased risk of ventricular arrhythmias when sotalol given with tolterodine

**Antipsychotics:** increased risk of ventricular arrhythmias when sotalol given with droperidol or zuclopenthixol—avoid concomitant use; possible increased risk of ventricular arrhythmias when sotalol given with haloperidol—avoid concomitant use; Plasma concentration of both drugs may increase when propranolol given with chlorpromazine; increased risk of ventricular arrhythmias when sotalol given with amisulpride, phenothiazines,
Appendix 1: Interactions

**Beta-blockers**
- Antipsychotics (continued)
  - Pimozide or sulpiride: enhanced hypotensive effect when beta-blockers with phenothiazines; possible increased risk of ventricular arrhythmias when sotalol given with esperidine
- Antivirals: increased risk of ventricular arrhythmias when sotalol given with adefovir—avoid concurrent use; avoidance of sotalol advised by manufacturer of telaprevir (risk of ventricular arrhythmia); avoidance of metoprolol for heart failure advised by manufacturer of tipranavir
- Anxiolytics and Hypnotics: enhanced hypotensive effect when beta-blockers given with anxiolytics
- Atomoxetine: increased risk of ventricular arrhythmias when sotalol given with atomoxetine
- Calcium-channel Blockers: enhanced hypotensive effect when beta-blockers given with calcium-channel blockers; possible increased risk of hypotension and heart failure when beta-blockers given with nilverapine; increased risk of AV block and bradycardia when beta-blockers given with diliazem; asystole, severe hypotension and heart failure when beta-blockers given with verapamil (see p. 137)
- Cardiac Glycosides: increased risk of AV block and bradycardia when beta-blockers given with cardiac glycosides
- Ciclosporin: carvedilol increases plasma concentration of ciclosporin
- Clonidine: increased risk of withdrawal hypertension when beta-blockers given with clonidine (withdraw beta-blockers several days before slowly withdrawing clonidine)
- Corticosteroids: hypotensive effect of beta-blockers antagonised by corticosteroids
- Cytotoxics: possible increased risk of ventricular arrhythmias when sotalol given with docetaxel; possible increased risk of ventricular arrhythmias when sotalol given with erlotinib; possible increased risk of ventricular arrhythmias when sotalol given with vandetanib—avoid concomitant use; increased risk of ventricular arrhythmias when sotalol given with arsenic trioxide
- Diazoxide: enhanced hypotensive effect when beta-blockers given with diazoxide
- Diuretics: enhanced hypotensive effect when beta-blockers given with diuretics; risk of ventricular arrhythmias with sotalol increased by hypokalaemia caused by loop diuretics or thiazides and related diuretics
- Dopaminergics: enhanced hypotensive effect when beta-blockers given with levodopa
- Ergot Alkaloids: increased peripheral vasoconstriction when beta-blockers given with ergotamine
- Fingolimod: possible increased risk of bradycardia when beta-blockers given with fingolimod
- Hormone Antagonists: possible increased risk of bradycardia when carteolol, metoprolol, propranolol or sotalol given with pasireotide
- SH2, receptor Agonists: propranolol increases plasma concentration of ritazurin; (manufacturer of rizatriptan advises halve dose and avoid within 2 hours of propranolol)
- Ibravadin: increased risk of ventricular arrhythmias when sotalol given with ibravadin
- Methyldopa: enhanced hypotensive effect when beta-blockers given with methyldopa
- Mirabegron: plasma concentration of metoprolol increased by mirabegron
- Moxisylyte: possible severe postural hypotension when beta-blockers given with moxisylyte
- Moxonidine: enhanced hypotensive effect when beta-blockers given with moxonidine
- Muscle Relaxants: propranolol enhances effects of muscle relaxants; enhanced hypotensive effect

**Beta-blockers**
- Muscle Relaxants (continued)
  - when beta-blockers given with baclofen; possible enhanced hypotensive effect and bradycardia when beta-blockers given with tizanidine
- Nitrites: enhanced hypotensive effect when beta-blockers given with nitrites
- Oestrogens: enhanced hypotensive effect when beta-blockers given with oestrogens
- Parasympathomimetics: propranolol antagonises effects of neostigmine and pyridostigmine; increased risk of arrhythmias when beta-blockers given with pilocarpine
- Prostaglandins: enhanced hypotensive effect when beta-blockers given with alprostadil
- Ranolazine: avoidance of sotalol advised by manufacturer of ranolazine
- Sympathomimetics: increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with drenaline (epinephrine), also reponse to adrenaline (epinephrine) may be reduced; increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with dobutamine; possible increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with noradrenaline (norepinephrine)
- Thyroid Hormones: metabolism of propranolol accelerated by levothyroxine
- Ulcer-healing Drugs: plasma concentration of labelotil, metropolol and propranolol increased by cimetidine
- Vasodilator Antihypertensives: enhanced hypotensive effect when beta-blockers given with hydralazine, minoxidil or sodium nitroprusside

**Betahistine**
- Antihistamines: effect of betahistine theoretically antagonised by antihistamines
- Betamethasone see Corticosteroids
- Betaxolol see Beta-blockers
- Bethanechol see Parasympathomimetics
- Bevacizumab
  - Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
- Bexarotene
  - Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
- Lipid-regulating Drugs: plasma concentration of bexarotene increased by gemfibrozil—avoid concomitant use
- Bezaflurib see Fibrates
- Bicalutamide
  - Anti-coagulants: bicalutamide possibly enhances anti-coagulant effect of coumarin
- Biguanides see Antidiabetics
- Bilastine see Antihistamines
- Bile Acid Sequestrants see Colesevelam, Colestipol, and Colestyramine
- Bile Acids
  - Antacids: absorption of bile acids possibly reduced by antacids
  - Ciclosporin: unsodeoxycholic acid increases absorption of ciclosporin
  - Lipid-regulating Drugs: absorption of bile acids possibly reduced by colestipol and colestyramine
- Bisoprolol see Beta-blockers
- Bisphosphonates
  - ANTACIDS: absorption of bisphosphonates reduced by antacids
  - Antibacterials: increased risk of hypocalcaemia when bisphosphonates given with aminoglycosides
  - Calcium Salts: absorption of bisphosphonates reduced by calcium salts
  - Cytotoxics: sodium clodronate increases plasma concentration of estramustine
BNF 68

Appendix 1: Interactions

Bisphosphonates (continued)

Iron: absorption of bisphosphonates reduced by oral iron

Bleomycin
- Antipsychotics: avoid concomitant use of cytoxicotics with clozapine (increased risk of agranulocytosis)
- Cardiac Glycosides: bleomycin possibly reduces absorption of digoxin tablets
- Cytotoxic: increased pulmonary toxicity when bleomycin given with cisplatin; increased risk of pulmonary toxicity when bleomycin given with orentuximab vedotin—avoid concomitant use

Boceprevir

Analgesics: possible increased risk of prolonged sedation and respiratory depression when boceprevir given with buprenorphine; boceprevir possibly affects plasma concentration of methadone
- Antibacterials: manufacturer of boceprevir advises avoid concomitant use with linezolid (plasma concentration of boceprevir possibly reduced)
- Antiarhythmics: avoidance of boceprevir advised by manufacturer of apixaban
- Antiepileptics: manufacturer of boceprevir advises avoid concomitant use with carbamazepine, phenobarbital and phenytoin (plasma concentration of boceprevir possibly reduced)
- Antimalarials: manufacturer of boceprevir advises avoid concomitant use with artemether with lumefantrine
- Antipsychotics: manufacturer of boceprevir advises avoid concomitant use with pimozide; boceprevir possibly increases plasma concentration of eqetiamine—manufacturer of quetiapine advises avoid concomitant use
- Antiretrovirals: boceprevir reduces plasma concentration of atazanavir; avoid concomitant use of boceprevir with darunavir; effects of both drugs possibly reduced when boceprevir given with etravirine; avoidance of boceprevir advised by manufacturer of saquinavir and nevirapine; manufacturers advise avoid concomitant use of boceprevir with lopinavir; boceprevir increases plasma concentration of maraviroc (consider reducing dose of maraviroc); plasma concentration of boceprevir increased by lopinavir and ritonavir (consider reducing dose of boceprevir); boceprevir possibly reduces plasma concentration of telaprevir, also plasma concentration of boceprevir possibly increased

Avanafil: boceprevir possibly reduces plasma concentration of avanafil—manufacturer of avanafil advises avoid concomitant use
- Ciclosporin: plasma concentration of bosentan increased by ciclosporin (also plasma concentration of ciclosporin reduced—avoid concomitant use)
- Cobicistat: avoidance of bosentan advised by manufacturer of cobicistat
- Cytotoxic: bosentan possibly reduces plasma concentration of bosutinib—manufacturer of bosutinib advises avoid concomitant use
- Lipid-regulating Drugs: boceprevir increases plasma concentration of simvastatin
- Oestrogens: bosentan possibly causes contraceptive failure of hormonal contraceptives containing oestrogens (alternative contraception recommended)
- Progestogens: bosentan possibly causes contraceptive failure of hormonal contraceptives containing progestogens (alternative contraception recommended)
- Riociguat: bosentan reduces plasma concentration of riociguat
- Sildenafil: bosentan reduces plasma concentration of sildenafil, also plasma concentration of bosentan increased
- Tadalafil: bosentan reduces plasma concentration of tadalafil

Boceprevir

Lipid-regulating Drugs (continued)

of pravastatin; manufacturers advise avoid concomitant use of boceprevir with simvastatin
- Progestogens: boceprevir increases plasma concentration of drospirenone (increased risk of toxicity)
- Sirolimus: boceprevir increases plasma concentration of sirolimus (increased risk of toxicity—reduce sirolimus dose)
- Tacrolimus: boceprevir increases plasma concentration of tacrolimus (reduce dose of tacrolimus)

Bortezomib

Antipsychotics: avoid concomitant use of cytoxicotics with clozapine (increased risk of agranulocytosis)

Bosentan

Antibacterials: plasma concentration of bosentan reduced by rifampicin—avoid concomitant use
- Anticoagulants: manufacturer of bosentan recommends monitoring anticoagulant effect of coumestins
- Anti-diabetics: increased risk of hepatotoxicity when bosentan given with glibenclamide—avoid concomitant use
- Anti-fungals: plasma concentration of bosentan possibly increased by itraconazole
- Antivirals: avoidance of bosentan advised by manufacturer of elvitegravir and tipranavir; bosentan possibly reduces plasma concentration of indinavir; plasma concentration of bosentan increased by lopinavir and ritonavir (consider reducing dose of bosentan); bosentan possibly reduces plasma concentration of telaprevir, also plasma concentration of bosentan possibly increased
- Avanafil: bosentan possibly reduces plasma concentration of avanafil—manufacturer of avanafil advises avoid concomitant use
- Ciclosporin: plasma concentration of bosentan increased by ciclosporin (also plasma concentration of ciclosporin reduced—avoid concomitant use)
- Cobicistat: avoidance of bosentan advised by manufacturer of cobicistat
- Cytotoxic: bosentan possibly reduces plasma concentration of bosutinib—manufacturer of bosutinib advises avoid concomitant use
- Lipid-regulating Drugs: bosentan reduces plasma concentration of simvastatin
- Oestrogens: bosentan possibly causes contraceptive failure of hormonal contraceptives containing oestrogens (alternative contraception recommended)
- Progestogens: bosentan possibly causes contraceptive failure of hormonal contraceptives containing progestogens (alternative contraception recommended)
- Riociguat: bosentan reduces plasma concentration of riociguat
- Sildenafil: bosentan reduces plasma concentration of sildenafil, also plasma concentration of bosentan increased
- Tadalafil: bosentan reduces plasma concentration of tadalafil

Bosutinib

Analgesics: possible increased risk of ventricular arrhythmias when bosutinib given with methadone
- Antacids: manufacturer of bosutinib advises separating administration with antacids by about 12 hours
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when bosutinib given with amiodarone and disopyramide; plasma concentration of bosutinib possibly increased by dronedarone—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Antibacterials: plasma concentration of bosutinib possibly increased by ciprofloxacin, clarithromycin,
Bosutinib
- Antibacterials (continued)
  • erythromycin and • telithromycin—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; possible increased risk of ventricular arrhythmias when bosutinib given with • moxifloxacin; plasma concentration of bosutinib possibly reduced by • rifabutin—manufacturer of bosutinib advises avoid concomitant use.
  • Antidpressants: plasma concentration of bosutinib possibly reduced by • St John’s wort—manufacturer of bosutinib advises avoid concomitant use.
  • Antiepileptics: plasma concentration of bosutinib possibly reduced by • carbamazepine, • phenobarbital and • phenytoin—manufacturer of bosutinib advises avoid concomitant use.
  • Antifungals: plasma concentration of bosutinib possibly reduced by • terbinafine (increased risk of agranulocytosis).
- Antimalarials: possible increased risk of ventricular arrhythmias when bosutinib given with • chloroquine and hydroxychloroquine.
- Antipsychotics: possible increased risk of ventricular arrhythmias when bosutinib given with • haloperidol; avoid concomitant use of cytoxotics with • clozapine (increased risk of agranulocytosis).
- Antivirals: plasma concentration of bosutinib possibly increased by • stavudine, • zidovudine, • didanosine and • efavirenz—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib.
- Calcium-channel Blockers: plasma concentration of bosutinib possibly increased by • diltiazem and • verapamil—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib.
- Cytotoxics: plasma concentration of bosutinib possibly increased by • minocycline—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib.
- Domperidone: manufacturer of bosutinib advises avoid concomitant use with • domperidone (risk of ventricular arrhythmias).
- Grapefruit juice: plasma concentration of bosutinib possibly increased by • grapefruit juice—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib.
- Modafinil: plasma concentration of bosutinib possibly reduced by • modafinil—manufacturer of bosutinib advises avoid concomitant use.
- Ulcer-healing Drugs: plasma concentration of bosutinib reduced by • lansoprazole.

Brentuximab vedotin
- Antibacterials: effects of brentuximab vedotin possibly reduced by • rifampicin.
- Antipsychotics: avoid concomitant use of cytoxotics with • clozapine (increased risk of agranulocytosis).
- Cytoxotics: increased risk of pulmonary toxicity when brentuximab vedotin given with • bleomycin—avoid concomitant use.

Bromine
- Antidepressants: manufacturer of bromine advises avoid concomitant use with MAOIs, tricyclic-related antidepressants and tricyclics.
- Bupropion: see Diuretics.

Bromocriptine
- Alcohol: tolerance of bromocriptine reduced by alcohol.
- Antibacterials: plasma concentration of bromocriptine increased by • erythromycin (increased risk of toxicity); plasma concentration of bromocriptine possibly increased by • macrolides (increased risk of toxicity).
- Antipsychotics: hypoprolactinaemic and anti-parkinsonian effects of bromocriptine antagonised by antipsychotics.
- Domperidone: hypoprolactinaemic effect of bromocriptine possibly antagonised by domperidone.
- Hormone Antagonists: plasma concentration of bromocriptine increased by • octreotide.
- Memantine: effects of dopaminergics possibly increased by • memantine.
- Metyldopa: anti-parkinsonian effect of dopaminergics antagonised by • metyldopa.
- Metoclopramide: hypoprolactinaemic effect of bromocriptine antagonised by • metoclopramide.
- Symptomatherapeutics: risk of toxicity when bromocriptine given with • lisuride.

Buclizine see Antihistamines

Budesonide see Corticosteroids

Bumetanide see Diuretics

Bupicacaine
- Anti-arhythmic: increased myocardial depression when bupicacaine given with • anti-arrhythmics.
- Beta-blockers: increased risk of bupicacaine toxicity when given with • propranolol.

Buprenorphine see Opioid Analgesics

Bupropion
- Antidepressants: bupropion possibly increases plasma concentration of citalopram; manufacturer of bupropion advises avoid for 2 weeks after stopping • MAOIs; manufacturer of bupropion advises avoid concomitant use with • moclobemide; bupropion possibly increases plasma concentration of tricyclics (possible increased risk of convulsions).
- Antiepileptics: plasma concentration of bupropion reduced by • carbamazepine and • phenytoin; metabolism of bupropion inhibited by • valproate.
- Antivirals: metabolism of bupropion accelerated by • efavirenz (possible increased risk of convulsions); plasma concentration of bupropion reduced by • ritonavir.
- Atomoxetine: possible increased risk of convulsions when bupropion given with • atomoxetine.
- Dopaminergics: increased risk of side-effects when bupropion given with • amantadine or • levodopa.
- Hormone Antagonists: bupropion possibly inhibits metabolism of • tamoxifen to active metabolite (avoid concomitant use).
- Methylthioninium: possible risk of CNS toxicity when bupropion given with • methylthioninium—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration).

Buspirone see Anxiolytics and Hypnotics

Busulfan
- Analgesics: metabolism of intravenous busulfan possibly inhibited by • paracetamol (manufacturer of intravenous busulfan advises caution within 72 hours of paracetamol).
- Antibacterials: plasma concentration of busulfan increased by • metronidazole (increased risk of toxicity).
- Antiepileptics: plasma concentration of busulfan possibly reduced by • phenytoin.
Calcium Salts

Calcium Salts (continued)

Cardiac Glycosides: large intravenous doses of calcium salts can precipitate arrhythmias when given with cardiac glycosides

Corticosteroids: absorption of calcium salts reduced by corticosteroids

Cytotoxics: calcium salts reduce absorption of extramustine (manufacturer of extramustine advises avoid concomitant administration)

Diuretics: increased risk of hypercalcaemia when calcium salts given with thiazides and related diuretics

Eltrombopag: calcium salts possibly reduce absorption of eltrombopag (give at least 4 hours apart)

Fluorides: calcium salts reduce absorption of fluoro-iron: calcium salts reduce absorption of oral iron

Thyroid Hormones: calcium salts reduce absorption of levothyroxine

Zinc: calcium salts reduce absorption of zinc

Calcium-channel Blockers

Note: Dihydropropydine calcium-channel blockers include amlodipine, felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, and nimodipine

ACE Inhibitors: enhanced hypotensive effect when calcium-channel blockers given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when calcium-channel blockers given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when calcium-channel blockers given with alcohol; verapamil possibly increases plasma concentration of alcohol

Aldesleukin: enhanced hypotensive effect when calcium-channel blockers given with aldesleukin

Alikiren: verapamil increases plasma concentration of aliskiren

Alpha-blockers: verapamil increases plasma concentration of tamsulosin; enhanced hypotensive effect when calcium-channel blockers given with α-blockers, also increased risk of first-dose hypotension with post-synaptic α-blockers such as prazosin

Anaesthetics, General: enhanced hypotensive effect when calcium-channel blockers given with general anaesthetics or isoflurane; hypotensive effect of verapamil enhanced by general anaesthetics (also AV delay)

Analgesics: hypotensive effect of calcium-channel blockers antagonised by NSAIDs; diltiazem inhibits metabolism of alfentanil (risk of prolonged or delayed respiratory depression)

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when calcium-channel blockers given with angiotensin-II receptor antagonists

Anti-arrhythmics: increased risk of bradycardia, AV block and myocardial depression when diltiazem or verapamil given with amiodarone; increased risk of myocardial depression and asystole when verapamil given with disopyramide or flecainide; nifedipine increases plasma concentration of edronacarone; increased risk of bradycardia and myocardial depression when diltiazem and verapamil given with edronacarone

Antibacterials: metabolism of calcium-channel blockers possibly inhibited by clarithromycin, erythromycin and telithromycin (increased risk of side-effects); manufacturer of lercanidipine advises avoid concomitant use with erythromycin

Anticoagulants: warfarin possibly increased plasma concentration of dabigatran (see Dose under Dabigatran, p. 154)

Anti-inflammatory Drugs: possible significantly reduced plasma concentration of methotrexate
Appendix 1: Interactions

### Calcium-channel Blockers (continued)

- **Antidepressants**: metabolism of nifedipine possibly inhibited by **fluoxetine** (increased plasma concentration); diltiazem and verapamil increase plasma concentration of **imipramine**; enhanced hypotensive effect when calcium-channel blockers given with **MAOIs**; plasma concentration of nifedipine reduced by **St John’s wort**; plasma concentration of amlo- dipine and felodipine possibly reduced by **St John’s wort**; plasma concentration of verapamil significantly reduced by **St John’s wort**; diltiazem and verapamil possibly increase plasma concentration of **tricyclics**

- **Antidiabetics**: glucose tolerance occasionally impaired when calcium-channel blockers given with **metformin**

- **Antiepileptics**: diltiazem and verapamil enhance effects of **carbamazepine**; manufacturer of nimo- dipine advises avoid concomitant use with **carba- mazepine** and **phenytoin** (plasma concentration of nifedipine possibly reduced by **carbamazepine**; effects of felodipine reduced by **carbamazepine** and **phenytoin**; effects of calcium-channel blockers probably reduced by **phenobarbital**; manufacturer of nimodipine advises avoid concomitant use with **phenobarbital** (plasma concentration of nimodipine reduced); diltiazem increases plasma concentration of **phenytoin** but also effect of diltiazem increased; effects of verapamil reduced by **phenytoin**

- **Antifungals**: negative inotropic effect possibly increased when calcium-channel blockers given with **itraconazole**; metabolism of dihydropyridines possibly inhibited by **itraconazole** (increased plasma concentration); metabolism of felodipine inhibited by **itraconazole** (increased plasma concentration); manufacturer of lercanidipine advises avoid concomitant use with **itraconazole**; plasma concentration of nifedipine increased by **mefloquine**

- **Antimucocarins**: avoidance of verapamil advised by manufacturer of **dutasteride**; verapamil increases plasma concentration of **sildenafil**

- **Antipsychotics**: enhanced hypotensive effect when calcium-channel blockers given with **antipsychotics**

- **Antivirals**: plasma concentration of diltiazem increased by **atazanavir**; plasma concentration of diltiazem reduced by **efavirenz**; plasma concentration of calcium-channel blockers possibly increased by **ritonavir**; manufacturer of lercanidipine advises avoid concomitant use with **ritonavir**; plasma concentration of amiodipine increased by **telaprevir** (consider reducing dose of amiodipine); caution with diltiazem, felodipine, nicardipine, nifedipine and verapamil advised by manufacturer; effects of **telaprevir**

- **Anxiolytics and Hypnotics**: enhanced hypotensive effect when calcium-channel blockers given with **anxiolytics and hypnotics**; diltiazem and verapamil inhibit metabolism of **midazolam** (increased plasma concentration with increased sedation); absorption of lercanidipine increased by **midazolam**; diltiazem and verapamil increase plasma concentration of **buspironel** (reduce dose of buspironel)

- **Aprepitant**: plasma concentration of both drugs may increase when diltiazem given with **aprepitant**

- **Avanafil**: diltiazem and verapamil possibly increase plasma concentration of **avanafil**—see Dose under Avanafil, p. 559

- **Beta-blockers**: enhanced hypotensive effect when calcium-channel blockers given with **beta-blockers**; increased risk of AV block and bradycardia when diltiazem given with **beta-blockers**: asystole, severe

### Calcium-channel Blockers (continued)

- **Beta-blockers (continued)**
  
  - Hypotension and heart failure when verapamil given with **beta-blockers** (see p. 137); possible severe hypotension and heart failure when nifedipine given with **beta-blockers**

- **Cardiac Glycosides**: nifedipine possibly increases plasma concentration of **digoxin**; manufacturer of **diltiazem**, **lercanidipine** and **nicardipine** increase plasma concentration of **digoxin**; **verapamil** increases plasma concentration of **digoxin**, also increased risk of AV block and bradycardia

- **Ciclosporin**: diltiazem, nicardipine and verapamil increase plasma concentration of **ciclosporin**; combination of lercanidipine with **ciclosporin** may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentration of nifedipine possibly increased by **ciclosporin** (increased risk of toxicity including gingival hyperplasia)

- **Cilostazol**: diltiazem increases plasma concentration of **cilostazol** (consider reducing dose of cilostazol)

- **Clonidine**: enhanced hypotensive effect when calcium-channel blockers given with **clonidine**

- **Colchicine**: diltiazem and verapamil possibly increase risk of **colchicine toxicity**—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)

- **Corticosteroids**: enhanced hypotensive effect when calcium-channel blockers antagonised by **corticosteroids**; diltiazem increases plasma concentration of **methylprednisolone**

- **Cytotoxics**: verapamil possibly increase plasma concentration of **doxorubicin**; verapamil possibly increases the plasma concentration of **afatinib**—manufacturer of afatinib advises separating administration of verapamil by 6 to 12 hours; diltiazem and verapamil possibly increase the plasma concentration of **bosutinib**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutini- nib; possible increased risk of bradycardia when diltiazem or verapamil given with **crizotinib**; plasma concentration of both drugs may increase when verapamil given with **everolimus** (consider reducing the dose of everolimus—consult everolimus product literature); nifedipine possibly inhibits metabolism of **vincristine**

- **Dapoxetine**: manufacturer of dapoxetine advises dose reduction when diltiazem and verapamil given with **dapoxetine** (see Dose under Dapoxetine, p. 560)

- **Diastolic**: enhanced hypotensive effect when calcium-channel blockers given with **diastolic**

- **Diuretics**: enhanced hypotensive effect when calcium-channel blockers given with **diuretics**; diltiazem and verapamil increase plasma concentration of **eplerene- none** (reduce dose of eplerenone)

- **Dopaminergic**: enhanced hypotensive effect when calcium-channel blockers given with **levodopa**

- **Fingolimod**: possible increased risk of bradycardia when diltiazem or verapamil given with **fingolimod**

- **Grapefruit Juice**: plasma concentration of felodipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine and verapamil increased by **grapefruit juice**; plasma concentration of amiodipine possibly increased by **grapefruit juice**

- **Hormone Antagonists**: diltiazem and verapamil increase plasma concentration of **dutasteride**; possible increased risk of bradycardia when diltiazem or verapamil given with **pamidronate**

- **Hyperkalaemia**: manufacturer of **furosemide**
Calcium-channel Blockers (continued)

- Ivabradine: diltiazem and verapamil increase plasma concentration of ivabradine—avoid concomitant use
- Levaldilomide: verapamil possibly increases plasma concentration of levaldilomide (increased risk of toxicity)
- Lipid-regulating Drugs: diltiazem increases plasma concentration of atorvastatin—possible increased risk of myopathy; possible increased risk of myopathy when amiodopine and diltiazem given with simvastatin (see Dose under Simvastatin, p. 173); increased risk of myopathy when verapamil given with simvastatin (see Dose under Simvastatin, p. 173); avoidance of diltiazem and verapamil advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased)

Lithium: neurotoxicity may occur when diltiazem or verapamil given with lithium without increased plasma concentration of lithium
- Magnesium (parenteral): profound hypotension reported with concomitant use of nifedipine and parenteral magnesium in pre-eclampsia
- Methylodopa: enhanced hypotensive effect when calcium-channel blockers given with methylodopa
- Moxisyltyle: enhanced hypotensive effect when calcium-channel blockers given with moxisyltyle
- Moxonidine: enhanced hypotensive effect when calcium-channel blockers given with moxonidine
- Muscle Relaxants: verapamil enhances effects of non-depolarising muscle relaxants and suxamethonium; enhanced hypotensive effect when calcium-channel blockers given with vecuronium; increased risk of ventricular arrhythmias when diltiazem given with intravenous dantrolene—manufacturer of diltiazem advises avoid concomitant use; calcium-channel blockers possibly enhance effects of non-depolarising muscle relaxants

Nitrates: enhanced hypotensive effect when calcium-channel blockers given with nitrates

Oestrogens: hypotensive effect of calcium-channel blockers antagonised by oestrogens

Prostaglandins: enhanced hypotensive effect when calcium-channel blockers given with flurbiprofen and naproxal.
- Ranolazine: diltiazem and verapamil increase plasma concentration of ranolazine (consider reducing dose of ranolazine)
- Sildenafil: enhanced hypotensive effect when amlo-dipine given with sildenafil
- Sirolimus: diltiazem increases plasma concentration of sirolimus; plasma concentration of both drugs increased when verapamil given with sirolimus
- Sulfinpyrazone: plasma concentration of verapamil reduced by sulfinpyrazone

- Tacrolimus: diltiazem and nifedipine increase plasma concentration of tacrolimus; felodipine, nicardipine and verapamil possibly increase plasma concentration of tacrolimus
- Theophylline: calcium-channel blockers possibly increase plasma concentration of theophylline (enhanced effect); diltiazem increases plasma concentration of theophylline; verapamil increases plasma concentration of theophylline (enhanced effect)
- Ticagrelor: diltiazem increases plasma concentration of ticagrelor
- Ulcer-healing Drugs: metabolism of calcium-channel blockers possibly inhibited by cimetidine (increased plasma concentration)
- Ulipristal: avoidance of verapamil advised by manufacturer of ulipristal
- Vardenafil: enhanced hypotensive effect when nifedipine given with vardenafil

Calcium-channel Blockers (continued)

- Vasodilators: Antihypertensives: enhanced hypotensive effect when calcium-channel blockers given with hydralazine, minoxidil or sodium nitroprusside
- Calcium-channel Blockers (dihydropyridines) see Calcium-channel Blockers

Canagliflozin see Antidiabetics

Candesartan see Angiotensin-II Receptor Antagonists

Cannabis Extract

Antidepressants: possible increased risk of hypotension and tachycardia when cannabis extract given with tricyclics

Capcetabine see Fluourouracil

Carprofen

Antibacterials: increased risk of nephrotoxicity when carprofen given with colistimethate sodium or polymyxins; increased risk of nephrotoxicity and ototoxicity when carprofen given with aminoglycosides or vancomycin

Cytotoxics: increased risk of nephrotoxicity and ototoxicity when carprofen given with platinum compounds

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

Capnortril see ACE Inhibitors

Carbamazepine

Alcohol: CNS side-effects of carbamazepine possibly increased by alcohol
- Analgesics: effects of carbamazepine enhanced by dextropropoxyphene; carbamazepine possibly accelerates metabolism of fentanyl (reduced effect); carbamazepine reduces plasma concentration of methadone; carbamazepine reduces effects of tramadol; carbamazepine possibly accelerates metabolism of paracetamol (also isolated reports of hepatotoxicity)

- Anti-arrhythmics: carbamazepine possibly reduces plasma concentration of dronedarone—avoid concomitant use
- Anti-bacterials: plasma concentration of carbamazepine increased by clarithromycin (consider reducing dose of carbamazepine); plasma concentration of carbamazepine increased by erythromycin; plasma concentration of carbamazepine reduced by rifabutin; carbamazepine accelerates metabolism of doxycycline (reduced effect); plasma concentration of carbamazepine increased by tienilizumab (also possibly reduced by isoniazid hepatotoxicity); carbamazepine reduces plasma concentration of felithromycin (avoid during and for 2 weeks after carbamazepine)

- Anticoagulants: carbamazepine possibly reduces plasma concentration of apixaban; carbamazepine accelerates metabolism of coumarins (reduced antiocoagulant effect); carbamazepine possibly reduces plasma concentration of dabigatran—manufacturer of dabigatran advises avoid concomitant use; carbamazepine possibly reduces plasma concentration of rivaroxaban—manufacturer of rivaroxaban advises monitor for signs of thrombosis

- Antidepressants: carbamazepine possibly reduces plasma concentration of reboxetine; plasma concentration of carbamazepine increased by fluoxetine and fluoxetine; carbamazepine reduces plasma concentration of mianserin, mirtazapine and trazodone; manufacturer of carbamazepine advises avoid for 2 weeks after stopping MAOIs, also antagonism of anticoagulant effect; anti-convulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIIs and tricyclics (convulsive threshold lowered); plasma concentration of carbamazepine possibly reduced by St John’s wort; carbamazepine accelerates metabolism of carbamazepine possibly inhibited by cimetidine (increased plasma concentration)
Appendix 1: Interactions

Carbamazepine
- Antidepressants (continued) metabolism of tricyclics (reduced plasma concentration and reduced effect)
- Antiepileptics: carbamazepine possibly reduces plasma concentration of elcicarbazine but risk of side-effects increased; carbamazepine possibly reduces plasma concentration of ethosuximide and retigabine; carbamazepine often reduces plasma concentration of lamotrigine, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); possible increased risk of carbamazepine toxicity when given with levetiracetam; plasma concentration of carbamazepine possibly reduced when carbamazepine given with rifampicin (but concentration of an active metabolite of carbamazepine may be increased); plasma concentration of an active metabolite of oxcarbazine may be increased), also plasma concentration of an active metabolite of oxcarbazine often reduced; carbamazepine reduces plasma concentration of neflunin and valproate, also plasma concentration of active metabolite of carbamazepine increased.
- Antifungals: plasma concentration of carbamazepine possibly increased by fluconazole and itraconazole; carbamazepine possibly reduces plasma concentration of itraconazole and osoaconazole; carbamazepine possibly reduces plasma concentration of voriconazole—avoid concomitant use; carbamazepine possibly reduces plasma concentration of topiramate; carbamazepine reduces plasma concentration of valproate, also plasma concentration of active metabolites of carbamazepine increased.
- Antimalarials: avoidance of carbamazepine advised by manufacturer of piperaquine with artesunate; anti-convulsant effect of antiepileptics antagonised by nefloquine.
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by aripiprazole (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); carbamazepine accelerates metabolism of haloperidol, elanazpine,quetiapine and risperidone (reduced plasma concentration); carbamazepine reduces plasma concentration of aripiprazole (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); carbamazepine accelerates metabolism of clozapine (reduced plasma concentration), also avoid concomitant use of drugs with substantial potential for causing agranulocytosis; carbamazepine reduces plasma concentration of paliperidone.
- Antivirals: avoidance of carbamazepine advised by manufacturer of bocceprevir and telipivirine (plasma concentration of bocceprevir and rilpivirine possibly reduced); carbamazepine possibly reduces plasma concentration of darunavir, fosamprenavir, lopinavir, saquinavir and tipranavir; avoidance of carbamazepine advised by manufacturer of dolutegravir, elvitegravir, etravirine, sofosbuvir and telaprevir; plasma concentration of both drugs reduced when carbamazepine given with efavirenz; carbamazepine possibly reduces plasma concentration of etravirine; also plasma concentration of carbamazepine possibly increased; carbamazepine reduces plasma concentration of nevirapine; plasma concentration of carbamazepine possibly increased by ritonavir.

Carbamazepine (continued)
- Anxiolytics and Hypnotics: carbamazepine often reduces plasma concentration of clonazepam; carbamazepine reduces plasma concentration of midazolam
- Aprepitant: carbamazepine possibly reduces plasma concentration of aprepitant
- Avanafil: carbamazepine possibly reduces plasma concentration of avanafil—manufacturer of avanafil advises avoid concomitant use
- Bupropion: carbamazepine reduces plasma concentration of bupropion
- Calcium-channel Blockers: carbamazepine reduces effects of felodipine; carbamazepine probably reduces effects of dihydropropyridines, nicardipine and nifedipine; avoidance of carbamazepine advised by manufacturer of nimodipine (plasma concentration of nimodipine possibly reduced); effects of carbamazepine enhanced by pilatezem and verapamil.
- Ciclosporin: carbamazepine accelerates metabolism of ciclosporin (reduced plasma concentration).
- Clopidogrel: carbamazepine possibly reduces anti-platelet effect of clopidogrel.
- Cobicitistat: carbamazepine possibly reduces plasma concentration of cobicitistat—manufacturer of cobicitistat advises avoid concomitant use.
- Corticosteroids: carbamazepine accelerates metabolism of corticosteroids (reduced effect).
- Cytotoxics: carbamazepine possibly decreases plasma concentration of axitinib (increase dose of axitinib—consult axitinib product literature); carbamazepine possibly reduces plasma concentration of bosutinib and crizotinib—manufacturer of bosutinib and crizotinib advises avoid concomitant use; avoidance of carbamazepine advised by manufacturer of cabazitaxel, dabrafenib, gefitinib and vemurafenib; carbamazepine reduces plasma concentration of imatinib and lapatinib—avoid concomitant use; avoidance of carbamazepine advised by manufacturer of vandetanib and vismodegib (plasma concentration of vandetanib and vismodegib possibly reduced); carbamazepine possibly reduces plasma concentration of eribulin; carbamazepine reduces plasma concentration of irinotecan and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when carbamazepine given with procarbazine.
- Diuretics: increased risk of hyponatraemia when carbamazepine given with diuretics; plasma concentration of carbamazepine increased by ecosal and atorvastatin—manufacturer of ecosal and atorvastatin advises avoid concomitant use; metabolism of carbamazepine inhibited by 5HT1 receptor Antagonists: carbamazepine accelerates metabolism of ondansetron (reduced effect).
- Ivacifor: carbamazepine possibly reduces plasma concentration of ivacifor—manufacturer of ivacifor advises avoid concomitant use.
- Lipid-regulating Drugs: carbamazepine reduces plasma concentration of simvastatin—consider increasing dose of simvastatin.
- Lithium: neurotoxicity may occur when carbamazepine given with lithium without increased plasma concentration of lithium.
- Macitentan: avoidance of carbamazepine advised by manufacturer of macitentan.
Carbamazepine (continued)

Muscle Relaxants: carbamazepine antagonises muscle relaxant effect of non-depolarising muscle relaxants (accelerated recovery from neuromuscular blockade).

- Oestrogens: carbamazepine accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 536)
- Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat
- Progestogens: carbamazepine accelerates metabolism of progestogens (reduced contraceptive effect—see p. 536)

Retinoids: plasma concentration of carbamazepine possibly reduced by isotretinoin

Roflumilast: carbamazepine possibly inhibits effects of roflumilast (manufacturer of roflumilast advises avoid concomitant use)

Theophylline: carbamazepine accelerates metabolism of theophylline (possibly reduced effect)

Thyroid Hormones: carbamazepine accelerates metabolism of thyroid hormones (may increase requirements for thyroid hormones in hypothyroidism)

Tibolone: carbamazepine accelerates metabolism of tibolone (reduced plasma concentration)

Ticagrelor: carbamazepine possibly reduces plasma concentration of ticagrelor

- Ulcer-healing Drugs: metabolism of carbamazepine inhibited by ecemidetin (increased plasma concentration)
- Ulipristal: avoidance of carbamazepine advised by manufacturer of ulipristal (contraceptive effect of ulipristal possibly reduced)

Vitamins: carbamazepine possibly increases requirements for vitamin D

Carbam pancremen see Etrepone, Imepenem with Cilastatin, and Meropenem

Carbonic Anhydrase Inhibitors see Diuretics

Carboxplain see Platinum Compounds

Carboprost see Prostaglandins

Cardiac Glycosides

ACE Inhibitors: plasma concentration of digoxin possibly increased by captopril

Alpha-blockers: plasma concentration of digoxin increased by prazosin

Aminosaliclylates: absorption of digoxin possibly reduced by sulfaazaline

Analgesics: plasma concentration of cardiac glycosides possibly increased by NSAIDs, also possible exacerbation of heart failure and reduction of renal function

Antacids: absorption of digoxin possibly reduced by antacids

Anti-arrhythmic: plasma concentration of digoxin increased by amiodarone, droxenedane and propafenone (halve dose of digoxin)

Antibacterial: plasma concentration of digoxin possibly increased by gentamycin, teithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin possibly reduced by rifampicin; plasma concentration of digoxin increased by macrodol (increased risk of toxicity)

Antidepressants: plasma concentration of digoxin reduced by St John’s wort—avoid concomitant use

Antidiabetics: plasma concentration of digoxin possibly reduced by acarbose; plasma concentration of digoxin increased by canagliflozin and sitagliptin

Antiepileptics: plasma concentration of digoxin possibly reduced by phenytoin

Antifungals: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with samphotericin; plasma concentration of digoxin increased by teraconazole

Cardiac Glycosides (continued)

- Antiarrhythmics: plasma concentration of digoxin possibly increased by chloroquine and hydroxychloroquine; possible increased risk of bradycardia when digoxin given with mefloquine; plasma concentration of digoxin increased by etravirine and telaprevir; plasma concentration of digoxin possibly increased by ritonavir

Antimuscarinics: plasma concentration of digoxin possibly increased by darifenac

Antivirals: side-effects of digoxin possibly increased by boceprevir; plasma concentration of digoxin increased by etravirine and telaprevir; plasma concentration of digoxin possibly increased by ritonavir

Anti-lytics and Hypnotics: plasma concentration of digoxin increased by alprazolam (increased risk of toxicity)

Beta-blockers: increased risk of AV block and bradycardia when cardiac glycosides given with beta-blockers

Calcium Salts: arrhythmias can be precipitated when cardiac glycosides given with large intravenous doses of calcium salts

Calcium-channel Blockers: plasma concentration of digoxin increased by diltiazem, lercanidipine and nicardipine; plasma concentration of digoxin possibly increased by nifedipine; plasma concentration of digoxin increased by verapamil, also increased risk of AV block and bradycardia

Ciclosporin: plasma concentration of digoxin increased by ciclesporin (increased risk of toxicity)

Clobicitast: plasma concentration of digoxin possibly increased by clobicitast—reduce initial dose of digoxin

Colchicine: possible increased risk of myopathy when digoxin given with colchicine

Corticosteroids: increased risk of hypokalaemia when cardiac glycosides given with corticosteroids

Cytotoxic: absorption of digoxin tablets possibly reduced by bleomycin, carmustine, cyclophosphamide, cytarabine, doxorubicin, melphalan, methotrexate, procarbazine and vincristine; possible increased risk of bradycardia when digoxin given with crizotinib; plasma concentration of digoxin increased by vandetanib—possible increased risk of bradycardia

Diuretics: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with acetasolamid, loop diuretics or thiazides and related diuretics; plasma concentration of digoxin possibly increased by potassium carrenoate; plasma concentration of digoxin increased by spironolacton

Lenalidomide: plasma concentration of digoxin possibly increased by lenalidomide

Lipid-regulating Drugs: absorption of cardiac glycosides possibly reduced by colesterol and colestyramine; plasma concentration of digoxin possibly increased by atorvastatin

Mirabegron: plasma concentration of digoxin increased by mirabegron—reduce initial dose of digoxin

Muscle Relaxants: risk of ventricular arrhythmias when cardiac glycosides given with suxamethonium; possible increased risk of bradycardia when cardiac glycosides given with tizanidine

Penicillamine: plasma concentration of digoxin possibly reduced by penicillamine

Ranolazine: plasma concentration of digoxin increased by ranolazine

Symptomametics, Beta: plasma concentration of digoxin possibly reduced by salbutamol

Ticagrelor: plasma concentration of digoxin increased by ticagrelor

Tolvaptan: plasma concentration of digoxin increased by tolvaptan (increased risk of toxicity)

Uler-healing Drugs: plasma concentration of digoxin possibly slightly increased by proton pump inhi-
Cardiac Glycosides
Ulcer-healing Drugs (continued)

- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Antidepressants: avoid concomitant use of cytoxotics (increased plasma concentration)

Carmustine

- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Antidepressants: avoid concomitant use of cytoxotics (increased plasma concentration)

Cefotaxime

- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Antidepressants: avoid concomitant use of cytoxotics (increased plasma concentration)

Cefpodoxime

- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Antidepressants: avoid concomitant use of cytoxotics (increased plasma concentration)

Cefixime

- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Antidepressants: avoid concomitant use of cytoxotics (increased plasma concentration)

Cefadroxil

- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Antidepressants: avoid concomitant use of cytoxotics (increased plasma concentration)

Cefaclor

- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Antidepressants: avoid concomitant use of cytoxotics (increased plasma concentration)

Chloramphenicol (continued)

- Antidiabetics: chloramphenicol enhances effects of sulfonylureas
- Antiepileptics: metabolism of chloramphenicol possibly accelerated by phenobarbital (reduced plasma concentration); chloramphenicol increases plasma concentration of phenytoin (increased risk of toxicity)
- Antipsychotics: avoid concomitant use of chloramphenicol with clozapine (increased risk of agranulocytosis)
- Ciclosporin: chloramphenicol possibly increases plasma concentration of ciclosporin
- Clopidogrel: chloramphenicol possibly increases anti-platelet effect of clopidogrel

Hydroxocobalamin: chloramphenicol reduces response to hydroxocobalamin

Tacrolimus: chloramphenicol possibly increases plasma concentration of tacrolimus

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

Chlor Diazepoxide see Anxiolytics and Hypnotics

Chloropropham see Anticonvulsants

Chlorpropham see Anticonvulsants

Chloropropham see Anticonvulsants

Chloroquine and Hydroxychloroquine

Adsorbents: absorption of chloroquine and hydroxychloroquine reduced by kaolin

Agalsidase Alfa and Beta: chloroquine and hydroxychloroquine possibly inhibit effects of agalsidase alfa and beta (manufacturers of agalsidase alfa and beta advise concomitant use)

Antacids: absorption of chloroquine and hydroxychloroquine reduced by antacids

Anti-arrhythmics: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with amiodarone—avoid concomitant use

Antibacterials: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with mexitiloxacin—avoid concomitant use

Antidepressants: avoidance of antimalarials advised by manufacturer of citalopram and escitalopram (risk of ventricular arrhythmias)

Antimalarials: avoidance of antimalarials advised by manufacturer of artemether with lumefantrine; increased risk of convulsions when chloroquine and hydroxychloroquine given with mexitiloxacin—avoid concomitant use

Cardiac Glycosides: chloroquine and hydroxychloroquine possibly increase plasma concentration of digoxin

Ciclosporin: chloroquine and hydroxychloroquine increase plasma concentration of ciclosporin (increased risk of toxicity)

Cytotoxics: possible increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with bosutinib

Histamine: avoidance of antimalarials advised by manufacturer of histamine

Lanthanum: absorption of chloroquine and hydroxychloroquine possibly reduced by lanthanum (give at least 2 hours apart)

Laronidase: chloroquine and hydroxychloroquine possibly inhibit effects of laronidase (manufacturer of laronidase advises avoid concomitant use)

Parasymptomimetics: chloroquine and hydroxychloroquine have potential to increase symptoms of myasthenia gravis and thus diminish effect of neostigmine and pyridostigmine

Ulcer-healing Drugs: metabolism of chloroquine and hydroxychloroquine inhibited by cimetidine (increased plasma concentration)
Antimalarials:

- Chloroquine and Hydroxychloroquine (continued)

Vaccines: antimalarials inactivate oral typhoid vaccine—see p. 850

Chlorothiazide see Diuretics

Chlorphenamine see Antihistamines

Chlorpromazine see Antipsychotics

Chlortalidone see Diuretics

Ciclesonide see Corticosteroids

Ciclosporin

- ACE Inhibitors: increased risk of hyperkalaemia when ciclosporin given with ACE inhibitors

- Aliskiren: ciclosporin increases plasma concentration of aliskiren—avoid concomitant use

- Analgesics: increased risk of nephrotoxicity when ciclosporin given with NSAIDs; ciclosporin increases plasma concentration of diclofenac (halve dose of diclofenac)

- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when ciclosporin given with angiotensin-II receptor antagonists

- Antithrombinics: plasma concentration of ciclosporin possibly increased by amiodarone and propafenone

- Antibacterials: metabolism of ciclosporin inhibited by clarithromycin and erythromycin (increased plasma concentration); metabolism of ciclosporin accelerated by rifampicin (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by sulfadiazine; increased risk of nephrotoxicity when ciclosporin given with aminoglycosides, polymyxins, equinolone, sulphonamides or vancomycin; plasma concentration of ciclosporin possibly increased by chlormphenicol and e التيromycin; increased risk of myopathy when ciclosporin given with daptomycin (preferably avoid concomitant use); metabolism of ciclosporin possibly inhibited by macrolides (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with minocycline; also plasma concentration of ciclosporin reduced by intravenous trimethoprim

- Antiarrhythmics: metabolism of ciclosporin possibly increased by enalapril (increased plasma concentration); risk of toxicity when ciclosporin given with amiodarone; also plasma concentration of ciclosporin reduced by intravenous trimethoprim

- Anticoagulants: ciclosporin possibly increases plasma concentration of dabigitan—manufacturer of dabigitan advises avoid concomitant use

- Antidepressants: plasma concentration of ciclosporin reduced by St John’s wort—avoid concomitant use

- Antidiabetics: ciclosporin possibly enhances hypoglycaemic effect of repaglinide

- Antiepileptics: metabolism of ciclosporin accelerated by carbamazepine, phenobarbital and phenytoin (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by oxcarbazepine

- Antifungals: metabolism of ciclosporin possibly inhibited by miconazole (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with amphotericin; metabolism of ciclosporin inhibited by itraconazole, voriconazole, posaconazole and voriconazole (increased plasma concentration); ciclosporin increases plasma concentration of caspofungin (manufacturer of caspofungin recommends monitoring liver enzymes); plasma concentration of ciclosporin possibly reduced by griseofulvin and terbinafine; plasma concentration of ciclosporin possibly increased by micafungin

- Antimalarials: plasma concentration of ciclosporin increased by chloroquine and hydroxychloroquine (increased risk of toxicity)

- Antimuscarinics: avoidance of ciclosporin advised by manufacturer of darifenacin

- Antivirals: increased risk of nephrotoxicity when ciclosporin given with aciclovir; plasma concentration of ciclosporin possibly increased by atazanavir and ritonavir; plasma concentration of ciclosporin increased by boceprevir, fosamprenavir and indinavir; plasma concentration of ciclosporin possibly increased by efavirenz; plasma concentration of both drugs increased when ciclosporin given with saquinavir; plasma concentration of both drugs increased when ciclosporin given with telaprevir (reduce dose of ciclosporin)

- Beta-blockers: plasma concentration of ciclosporin increased by carvedilol

- Blase Acids: absorption of ciclosporin increased by ursodeoxycholic acid

- Bosentan: ciclosporin increases plasma concentration of bosentan (also plasma concentration of ciclosporin reduced—avoid concomitant use)

- Calcium-channel Blockers: combination of ciclosporin with verapamil may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentration of ciclosporin increased by dilzem, nicardipine and verapamil; ciclosporin possibly increases plasma concentration of nifedipine (increased risk of toxicity including gingival hyperplasia)

- Cardiac Glycosides: ciclosporin increases plasma concentration of digoxin (increased risk of toxicity)

- Colchicine: possible increased risk of nephrotoxicity and myotoxicity when ciclosporin given with colchicine—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)

- Colestil: manufacturer of colestilan advises give ciclosporin at least 1 hour before or 3 hours after colestilan

- Corticosteroids: plasma concentration of ciclosporin increased by high-dose methylprednisolone (risk of convulsions); ciclosporin increases plasma concentration of prednisolone

- Cytotoxics: increased risk of nephrotoxicity when ciclosporin given with melphalan; increased risk of neurotoxicity when ciclosporin given with doxorubicin; ciclosporin increases plasma concentration of etoposide (increased risk of toxicity) (consider reducing the dose of etoposide—consult everolimus product literature); plasma concentration of ciclosporin possibly increased by imatinib; in vitro studies suggest a possible interaction between ciclosporin and docetaxel (consult docetaxel product literature); ciclosporin possibly increases plasma concentration of etoposide (increased risk of toxicity)

- Diuretics: plasma concentration of ciclosporin possibly increased by acetazolamide; increased risk of hyperkalaemia when ciclosporin given with potassium-sparing diuretics and aldosterone antagonists; increased risk of nephrotoxicity and possibly hyper-magnesaemia when ciclosporin given with thiazides and related diuretics

- Fidaxomicin: avoidance of ciclosporin advised by manufacturer of fidaxomicin

- Grapefruit Juice: plasma concentration of ciclosporin increased by grapefruit juice (increased risk of toxicity)

- Hormone Antagonists: metabolism of ciclosporin inhibited by danazol (increased plasma concentration of...
Ciclosporin
- Hormone Antagonists (continued)
  - Plasma concentration of ciclosporin reduced by lanreotide and octreotide; plasma concentration of ciclosporin possibly reduced by exenatide
- Lenalidomide: ciclosporin possibly increases plasma concentration of lenalidomide (increased risk of toxicity)
- Lipid-regulating Drugs: absorption of ciclosporin reduced by colesevelam; increased risk of renal impairment when ciclosporin given with bezafibrate or fenofibrate; increased risk of myopathy when ciclosporin given with atorvastatin (see Dose under Atorvastatin, p. 171); increased risk of myopathy when ciclosporin given with simvastatin or pravastatin; increased risk of myopathy when ciclosporin given with rosuvastatin or simvastatin (avoid concomitant use); plasma concentration of both drugs may increase when ciclosporin given with omeprazole
- Mannitol: possible increased risk of nephrotoxicity when ciclosporin given with mannitol
- Metoclopramide: plasma concentration of ciclosporin increased by metoclopramide
- Mifamurtide: avoidance of ciclosporin advised by manufacturer of mifamurtide
- Modafinil: plasma concentration of ciclosporin reduced by modafinil
- Oestrogens: plasma concentration of ciclosporin possibly increased by oestrogens
- Orlistat: absorption of ciclosporin possibly reduced by orlistat
- Potassium Salts: increased risk of hyperkalaemia when ciclosporin given with potassium salts
- Progestogens: plasma concentration of ciclosporin possibly increased by progestogens
- Ranolazine: plasma concentration of both drugs may increase when ciclosporin given with ranolazine
- Sevelamer: plasma concentration of ciclosporin possibly reduced by sevelamer
- Sirolimus: ciclosporin increases plasma concentration of sirolimus
- Sulfinpyrazone: plasma concentration of ciclosporin reduced by sulfinpyrazone
- Tacrolimus: plasma concentration of ciclosporin increased by tacrolimus (increased risk of nephrotoxicity)—avoid concomitant use
- Ticagrelor: ciclosporin increases plasma concentration of ticagrelor
- Ulcer-healing Drugs: plasma concentration of ciclosporin possibly increased by omeprazole
- Vitamins: plasma concentration of ciclosporin possibly affected by vitamin E

Cidofovir
- Antivirals: manufacturers advise avoid concomitant use of cidofovir with etofovir

Cilazapril see ACE Inhibitors

Cilostazol
- Angiureide: avoidance of cilostazol advised by manufacturer of angiureide
- Antibacterials: plasma concentration of cilostazol possibly increased by clarithromycin (see Dose under Cilostazol, p. 140); plasma concentration of cilostazol increased by erythromycin (see Dose under Cilostazol, p. 140)
- Antifungals: plasma concentration of cilostazol possibly increased by itraconazole (see Dose under Cilostazol, p. 140)
- Antivirals: plasma concentration of cilostazol possibly increased by boceprevir, simeprevir and telaprevir (see Dose under Cilostazol, p. 140)
- Calcium-channel Blockers: plasma concentration of cilostazol increased by diltiazem (consider reducing dose of cilostazol)

Cilostazol (continued)
- Ulcer-healing Drugs: plasma concentration of cilostazol increased by omeprazole (see Dose under Cilostazol, p. 140)

Cimetidine see Histamine H2-antagonists

Cinacalcet
- Hormone Antagonists: cinacalcet possibly inhibits metabolism of tamoxifen to active metabolite (avoid concomitant use)

Cinnarizine see Antihistamines

Ciprofibrate see Fibrates

Ciprofloxacin see Quinolones

Cisatracurium see Muscle Relaxants

Cisplatin see Platinum Compounds

Citalopram see Antidepressants, SSRI

Cladidine
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Antivirals: avoidance of cladidine advised by manufacturer of lamivudine

Clarithromycin see Macrolides

Clomethiazole see Antipsychotics

Clonazepam see Antipsychotics

Clonidine
- ACE Inhibitors: enhanced hypotensive effect when clonidine given with ACE inhibitors; previous treatment with clonidine possibly delays antihypertensive effect of captopril
- Adrenergic Neurone Blockers: enhanced hypotensive effect when clonidine given with adrenergic neurone blockers
- Alcohol: enhanced hypotensive effect when clonidine given with alcohol
- Aldesleukin: enhanced hypotensive effect when clonidine given with aldesleukin
- Alpha-blockers: enhanced hypotensive effect when clonidine given with alpha-blockers
- Anaesthetics, General: enhanced hypotensive effect when clonidine given with general anaesthetics
- Analgesics: enhanced hypotensive effect of clonidine antagonised by NSAIDs
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when clonidine given with angiotensin-II receptor antagonists
- Antidepressants: enhanced hypotensive effect when clonidine given with MAOIs; hypotensive effect of clonidine possibly antagonised by mirtazapine; hypotensive effect of clonidine antagonised by tricyclics, also increased risk of hypertension on clonidine withdrawal
- Antipsychotics: enhanced hypotensive effect when clonidine given with phenothiazines
- Axonolitics and Hypnotics: enhanced hypotensive effect when clonidine given with axonolitics and hypnotics
- Beta-blockers: increased risk of withdrawal hypertension when clonidine given with beta-blockers (withdraw beta-blockers several days before slowly withdrawing clonidine)
- Calcium-channel Blockers: enhanced hypotensive effect when clonidine given with calcium-channel blockers
- Corticosteroids: hypotensive effect of clonidine antagonised by corticosteroids
Clonidine (continued)

Cytotoxics: possible increased risk of bradycardia when clonidine given with crizotinib
Diazoxide: enhanced hypotensive effect when clonidine given with diazoxide
Diuretics: enhanced hypotensive effect when clonidine given with diuretics
Dopaminergics: enhanced hypotensive effect when clonidine given with levodopa
Histamine: avoidance of clonidine advised by manufacturer of histamine
Methyldopa: enhanced hypotensive effect when clonidine given with methyldopa
Moxisylyte: enhanced hypotensive effect when clonidine given with moxisylyte
Moxonidine: enhanced hypotensive effect when clonidine given with moxonidine
Muscle Relaxants: enhanced hypotensive effect when clonidine given with baclofen or tizanidine
Nitrates: enhanced hypotensive effect when clonidine given with nitrates
Oestrogens: hypotensive effect of clonidine antagonised by oestrogens
Prostaglandins: enhanced hypotensive effect when clonidine given with alprostadil
● Sympathomimetics: possible risk of hypertension when clonidine given with adrenaline (epinephrine) or noradrenaline (norepinephrine); serious adverse events reported with concomitant use of clonidine and o-methylphenidate (causality not established)
Vasodilator Antihypertensives: enhanced hypotensive effect when clonidine given with hydralazine, minoxidil or sodium nitroprusside

Clozapine see Diuretics

Clodigogrel

Analgesics: increased risk of bleeding when clopidogrel given with NSAIDs or aspirin
● Antibacterials: antplatelet effect of clopidogrel possibly reduced by evelorhamphenicol, eprosoproxacin and erythromycin
● Anticoagulants: manufacturer of clopidogrel advises avoid concomitant use with warfarin; antplatelet action of clopidogrel enhances anticoagulant effect of coumarins and ephenindione; increased risk of bleeding when clopidogrel given with heparins
● Antidepressants: antplatelet effect of clopidogrel possibly reduced by fluoxetine, fluvoxamine and moclobemide
● Antiepileptics: antplatelet effect of clopidogrel possibly reduced by barbamazine and oxcarbazepine
● Antifungals: antplatelet effect of clopidogrel possibly reduced by fluconazole, itracarzozole and voriconazole
● Antivirals: antplatelet effect of clopidogrel possibly reduced by etravirine
Dipryidamole: increased risk of bleeding when clopidogrel given with diprydalone
Iloprost: increased risk of bleeding when clopidogrel given with iloprost
Prasugrel: possible increased risk of bleeding when clopidogrel given with prasugrel
● Ulcer-healing Drugs: antplatelet effect of clopidogrel possibly reduced by esometidine, lanoporazone, pantoprazole and rabeprazole; antplatelet effect of clopidogrel reduced by esomeprazole and omeprazole
Clozapine see Antipsychotics
Co-amoxilav see Penicillins
Co-beneldopa see Levodopa
Cobicistat
● Alpha-blockers: cobicistat possibly increases plasma concentration of alfuzosin—manufacturer of cobicistat advises avoid concomitant use

Appendix 1: Interactions

Cobicistat (continued)
● Anti-arrhythmics: cobicistat possibly increases plasma concentration of amiodarone—manufacturer of cobicistat advises avoid concomitant use
● Antibacterials: plasma concentration of cobicistat reduced by efavatrin (adjust dose—consult product literature); plasma concentration of cobicistat possibly reduced by ritampicin—manufacturer of cobicistat advises avoid concomitant use
● Anticoagulants: cobicistat possibly enhances anticoagulant effect of rivaroxaban—avoid concomitant use
● Antidepressants: plasma concentration of cobicistat possibly reduced by St John’s Wort—manufacturer of cobicistat advises avoid concomitant use
● Antiepileptics: plasma concentration of cobicistat possibly reduced by carbamazepine, phenobarbital and phenytoin—manufacturer of cobicistat advises avoid concomitant use
● Antifungals: cobicistat possibly increases plasma concentration of itracazozole—manufacturer of cobicistat advises reduce dose of itracazozole
● Antipsychotics: cobicistat possibly increases plasma concentration of ezipinol—manufacturer of cobicistat advises avoid concomitant use
● Antiarrhythmics: manufacturer of cobicistat advises avoid concomitant use with cobicistat
● Antivirals: manufacturer of cobicistat advises avoid concomitant use with boceprevir; cobicistat possibly increases plasma concentration of maraviroc; avoidance of cobicistat advised by manufacturer of nevirapine
● Anxiolytics and Hypnotics: manufacturer of cobicistat advises avoid concomitant use with orod midazolam
● Bosentan: manufacturer of cobicistat advises avoid concomitant use with bosentan
● Cardiac Glycosides: cobicistat possibly increases plasma concentration of digoxin—reduce initial dose of digoxin
● Domperidone: possible increased risk of ventricular arrhythmias when cobicistat given with domperidone—avoid concomitant use
● Ergot Alkaloids: cobicistat possibly increases plasma concentration of ergot alkaloids—manufacturer of cobicistat advises avoid concomitant use
● Lipid-regulating Drugs: cobicistat possibly increases plasma concentration of atorvastatin—manufacturer of cobicistat advises reduce dose of atorvastatin; manufacturer of cobicistat avoids concomitant use with simvastatin
● Oestrogens: cobicistat accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 536)
● Progestogens: cobicistat increases plasma concentration of norgestimate
● Sildenafil: cobicistat possibly increases plasma concentration of sildenafil—manufacturer of cobicistat advises avoid concomitant use of sildenafil for erectile dysfunction—consult cobicistat product literature
● Sildenafil: cobicistat possibly increases plasma concentration of sildenafil—manufacturer of cobicistat advises avoid concomitant use of sildenafil for pulmonary arterial hypertension or reduce dose of sildenafil for erectile dysfunction—consult cobicistat product literature
● Tadalafil: cobicistat possibly increases plasma concentration of tadalafil—manufacturer of cobicistat advises reduce dose of tadalafil (consult cobicistat product literature)
● Vardenafil: cobicistat possibly increases plasma concentration of vardenafil—manufacturer of cobicistat advises reduce dose of vardenafil (consult cobicistat product literature)
● Co-careldopa see Levodopa
● Codeine see Opioid Analgesics
● Co-fluampicil see Penicillins
● Colchicine
● Anti-arrhythmics: possible increased risk of colchicine toxicity when given with amiodarone
Appendix 1: Interactions

Colchicine (continued)
- Anti-infectives: possible increased risk of colchicine toxicity when given with clarithromycin, erithromycin and azithromycin (avoid concomitant use in hepatic or renal impairment)
- Anti-inflammatory: possible increased risk of colchicine toxicity when given with naproxen—may reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Antiinfectives: possible increased risk of colchicine toxicity when given with clarithromycin (avoid concomitant use in hepatic or renal impairment)
- Antihypertensives: possible increased risk of colchicine toxicity when given with atenolol, metoprolol and thebaine—may reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Antiplatelet agents: possible increased risk of colchicine toxicity when given with aspirin and dipyridamole—may reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Antispasmodics: possible increased risk of colchicine toxicity when given with hyoscine butylbromide (avoid concomitant use in hepatic or renal impairment)
- Antithyroid agents: possible increased risk of colchicine toxicity when given with propylthiouracil and carbimazole (avoid concomitant use in hepatic or renal impairment)
- Antithyroid agents: possible increased risk of colchicine toxicity when given with carbimazole—may reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Antiulcer agents: possible increased risk of colchicine toxicity when given with cimetidine—may reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Antivirals: possible increased risk of colchicine toxicity when given with ritonavir and nelfinavir (avoid concomitant use in hepatic or renal impairment)
- Calcium-channel blockers: possible increased risk of colchicine toxicity when given with amlodipine and felodipine—may reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Calcium-channel blockers: possible increased risk of colchicine toxicity when given with diltiazem and verapamil—may reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cardiovascular: possible increased risk of myopathy when colchicine given with digoxin
- Cisplatin: possible increased risk of nephrotoxicity and myotoxicity when colchicine given with cisplatin—may reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cytotoxic agents: possible increased risk of colchicine toxicity when given with cyclophosphamide and vincristine (avoid concomitant use in hepatic or renal impairment)
- Grapefruit juice: possible increased risk of colchicine toxicity when given with grapefruit juice
- Lipid-regulating Drugs: possible increased risk of myopathy when colchicine given with fibrates or statins
- Colesevelam
  - Note: Other drugs should be taken at least 4 hours before or after colesevelam to reduce possible interference with absorption
  - Antidiabetics: colesevelam reduces absorption of glybenclamide and glipizide; colesevelam reduces absorption of glyburide—manufacturer of glimepiride advises give at least 4 hours before colesevelam; manufacturer of canagliflozin advises give bile acid sequestrants at least 1 hour after or 4—6 before canagliflozin
  - Antiepileptics: colesevelam possibly reduces absorption of phenytoin
  - Ciclosporin: colesevelam reduces absorption of ciclosporin
  - Lipid-regulating Drugs: bile acid sequestrants possibly reduce absorption of lomitapide (give at least 4 hours apart)
  - Oestrogens: colesevelam reduces absorption of ethinylestradiol
  - Thyroid Hormones: colesevelam reduces absorption of levothyroxine

Colestipol
  - Note: Other drugs should be taken at least 1 hour before or 3 hours after colestipol to reduce possible interference with absorption
  - Ciclosporin: manufacturer of colestipol advises give ciclosporin at least 1 hour before or 3 hours after colestipol
  - Mycofenolate: manufacturer of colestipol advises give mycofenolate at least 1 hour before or 3 hours after colestipol
  - Tacrolimus: manufacturer of colestipol advises give tacrolimus at least 1 hour before or 3 hours after colestipol
  - Thyroid Hormones: manufacturer of colestipol advises give levothyroxine at least 1 hour before or 3 hours after colestipol

Colestipol (continued)
- Antidiabetics: manufacturer of canagliflozin advises give bile acid sequestrants at least 1 hour after or 4—6 before canagliflozin
- Bile Acids: colestipol possibly reduces absorption of bile acids
- Cardiac Glycosides: colestipol possibly reduces absorption of cardiac glycosides
- Diuretics: colestipol reduces absorption of triazoles and related diuretics (give at least 2 hours apart)
- Lipid-regulating Drugs: bile acid sequestrants possibly reduce absorption of lomitapide (give at least 4 hours apart)
- Thyroid Hormones: colestipol reduces absorption of thyroid hormones

Colestyramine
  - Note: Other drugs should be taken at least 1 hour before or 4—6 hours after colestyramine to reduce possible interference with absorption
  - Analgesics: colestyramine increases the excretion of meloxicam; colestyramine reduces absorption of paracetamol
  - Antibacterials: colestyramine possibly reduces absorption of tetracycline; colestyramine antagonises effects of oral vancomycin
  - Anticoagulants: colestyramine may enhance or reduce anticoagulant effect of coumarins and phenindione
  - Antibacterials: colestyramine possibly enhances hypoglycaemic effect of acarbose; manufacturer of canagliflozin advises give bile acid sequestrants at least 1 hour after or 4—6 before canagliflozin
  - Antiepileptics: colestyramine possibly reduces absorption of valproate
- Bile Acids: colestyramine possibly reduces absorption of bile acids
- Cardiac Glycosides: colestyramine possibly reduces absorption of cardiac glycosides
- Diuretics: colestyramine reduces absorption of thiadiazoles and related diuretics (give at least 2 hours apart)
- Leflunomide: colestyramine significantly decreases effect of leflunomide (enhanced elimination)—avoid unless drug elimination desired
- Lipid-regulating Drugs: bile acid sequestrants possibly reduce absorption of lomitapide (give at least 4 hours apart)
- Mycofenolate: colestyramine reduces absorption of mycofenolate
- Raloxifene: colestyramine reduces absorption of raloxifene (manufacturer of raloxifene advises avoid concomitant administration)
- Teriflunomide: colestyramine significantly decreases effect of teriflunomide (enhanced elimination)—avoid unless drug elimination desired
- Thyroid Hormones: colestyramine reduces absorption of thyroid hormones
- Vitamins: colestyramine possibly reduces absorption of calcitriol (give at least 1 hour before or 4 to 6 hours after colestyramine)

Colistimethate Sodium see Polymyxins

Contraceptives, oral see Oestrogens and Progestogens

Corticosteroids
- Note: Interactions do not generally apply to corticosteroids used for topical action (including inhalation) unless specified
- ACE Inhibitors: corticosteroids antagonise hypotensive effect of ACE inhibitors
- Adrenergic Neurone Blockers: corticosteroids antagonise hypotensive effect of adrenergic neurone blockers
  - Aldesleukin: avoidance of corticosteroids advised by manufacturer of aldesleukin
  - Alpha-blockers: corticosteroids antagonise hypotensive effect of alpha-blockers
- Analgesics: increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with
Corticosteroids

Analgesics (continued) NSAIDs; increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with aspirin, also corticosteroids reduce plasma concentration of salicylate

Angiotensin-II Receptor Antagonists: corticosteroids antagonise hypotensive effect of angiotensin-II receptor antagonists

Antacids: absorption of deflaacort reduced by antacids

Antibacterials: plasma concentration of methylprednisolone possibly increased by clarithromycin; metabolism of corticosteroids possibly inhibited by erythromycin; metabolism of methylprednisolone inhibited by erythromycin; corticosteroids possibly reduce plasma concentration of isoniazid; metabolism of corticosteroids accelerated by rifampicins (reduced effect)

Anticoagulants: corticosteroids may enhance or reduce anticoagulant effect of coumarins (high-dose corticosteroids enhance anticoagulant effect); corticosteroids may enhance or reduce anti-coagulant effect of phenindione

Antidiabetics: corticosteroids antagonise hypoglycaemic effect of oral antidiabetics

Antifungals: increased risk of hypokalaemia when corticosteroids given with amphotericin—avoid concomitant use unless corticosteroids needed to control reactions; metabolism of corticosteroids and methylprednisolone possibly inhibited by itraconazole; plasma concentration of inhaled and oral (and possibly also intranasal and rectal) budesonide increased by itraconazole; plasma concentration of inhaled fluticasone increased by itraconazole; dexamethasone possibly reduces plasma concentration of caspofungin—consider increasing dose of caspofungin

Antivirals: dexamethasone possibly reduces plasma concentration of indinavir, lopinavir, saquinavir and telaprevir; avoidance of dexamethasone (except when given as a single dose) advised by manufacturer of telaprevir; plasma concentration of inhaled and intranasal fluticasone increased by itraconavir—increased risk of adrenal suppression; plasma concentration of budesonide (including inhaled, intranasal, and rectal budesonide) possibly increased by itraconavir—increased risk of adrenal suppression; plasma concentration of corticosteroids possibly increased by itraconavir—increased risk of adrenal suppression; plasma concentration of inhaled and intranasal budesonide and fluticasone possibly increased by telaprevir

Aprepitant: metabolism of dexamethasone and methylprednisolone inhibited by aprepitant (reduce dose of dexamethasone and methylprednisolone)

Beta-blockers: corticosteroids antagonise hypotensive effect of beta-blockers

Calcium Salts: corticosteroids reduce absorption of calcium salts

Calcium-channel Blockers: corticosteroids antagonise hypotensive effect of calcium-channel blockers; plasma concentration of methylprednisolone increased by diltiazem

Cardiac Glycosides: increased risk of hypokalaemia when corticosteroids given with cardiac glycosides

Ciclosporin: high-dose methylprednisolone increases plasma concentration of ciclosporin (risk of convulsions); plasma concentration of prednisolone increased by ciclosporin

Clonidine: corticosteroids antagonise hypotensive effect of clonidine

Ciclosporin

Antibacterials:

Corticosteroids

BNF 68 Appendix 1: Interactions 923

Anticoagulants: corticosteroids antagonise hypotensive effect of coumarins

Cardiac Glycosides: increased risk of hypokalaemia when corticosteroids given with acetylsalicylate, loop diuretics or thiazides and related diuretics

Histamine: avoidance of corticosteroids advised by manufacturer of histamine

Methylpredniso: corticosteroids antagonise hypotensive effect of methylpredniso

Mifamurtide: avoidance of corticosteroids advised by manufacturer of mifamurtide

Mifepristone: effect of corticosteroids (including inhaled corticosteroids) may be reduced for 3–4 days after mifepristone

Moxonidine: corticosteroids antagonise hypotensive effect of moxonidine

Muscle Relaxants: corticosteroids possibly antagonise effects of pancuronium and vecuronium

Nitrate: corticosteroids antagonise hypotensive effect of nitrates

Oestrogens: plasma concentration of corticosteroids increased by oral contraceptives containing oestrogens

Sodium Benzoate: corticosteroids possibly reduce effects of sodium benzoate

Sodium Phenylbutyrate: corticosteroids possibly reduce effects of sodium phenylbutyrate

Somatropin: corticosteroids may inhibit growth-promoting effect of somatropin

Sympathomimetics: metabolism of dexamethasone accelerated by ephedrine

Sympathomimetics, Beta-2: increased risk of hypokalaemia when corticosteroids given with high doses of beta-2 sympathomimetics—see Hypokalaemia, p. 186

Theophylline: increased risk of hypokalaemia when corticosteroids given with theophylline

Ticagrelor: dexamethasone possibly reduces plasma concentration of ticagrelor

Vaccines: high doses of corticosteroids impair immune response to vaccines, avoid concomitant use with live vaccines (see p. 828)

Vasodilators: Antihypertensives: corticosteroids antagonise hypotensive effect of hydralazine, minoxidil and sodium nitroprusside

Co-trimoxazole see Trimethoprim and Sulfamethoxazole

Cumarins

Note: Change in patient’s clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect anticoagulant control

Alcohol: anticoagulant control with coumarins may be affected by major changes in consumption of alcohol

Allopurinol: anticoagulant effect of coumarins possibly enhanced by allopurinol

Anabolic Steroids: anticoagulant effect of coumarins possibly enhanced by anabolic steroids

Analgesics: anticoagulant effect of coumarins possibly enhanced by NSAIDs; increased risk of haemorrhage when anticoagulants given with intravenous diclofenac (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with diclofenac (avoid concomitant use, including low-dose heparins); anti-coagulant effect of coumarins enhanced by...
Appendix 1: Interactions

Anticoagulants: increased risk of haemorrhage when other anticoagulants given with azithromycin, aztreonam, cefpodoxim, cefuroxim, ceftriaxone, clindamycin, clindamycin and trimethoprim; anti-coagulant effect of warfarin enhanced by chloramphenicol, clarithromycin, erythromycin, metronidazol, nalidixic acid, norfloxacin, ofloxacin and sulfonamides; an interaction between coumarins and broad-spectrum penicillins has not been demonstrated in studies, but common experience in anticoagulant clinics is that INR can be altered; metabolism of coumarins accelerated by rifampicins (reduced anticoagulant effect)

Antidepressants: anticoagulant effect of warfarin possibly enhanced by venlafaxine; anti-coagulant effect of warfarin may be enhanced or reduced by trazodone; anti-coagulant effect of coumarins possibly enhanced by SSRIs; anticoagulant effect of coumarins reduced by St John’s wort (avoid concomitant use) anticoagulant effect of warfarin enhanced by mirtazapine; anticoagulant effect of coumarins may be enhanced or reduced by tricyclics

Antidiabetics: anticoagulant effect of warfarin possibly enhanced by exenatide; coumarins possibly enhance hypoglycaemic effect of sulfonylureas, also possible changes to anticoagulant effect

Antiepileptics: metabolism of coumarins accelerated by carbamazepine and phenobarbital (reduced anticoagulant effect); plasma concentration of warfarin reduced by esterification; metabolism of coumarins accelerated by phenytoin (possibility of reduced anticoagulant effect, but enhancement also reported); anticoagulant effect of coumarins possibly enhanced by valproate

Analgesics: anticoagulant effect of coumarins enhanced by miconazole (miconazole oral gel and possibly vaginal and topical formulations absorbed); anticoagulant effect of coumarins enhanced by fluconazole, troconazole and voriconazole; anticoagulant effect of coumarins reduced by glyceofulvin

Antimalarials: isolated reports that anticoagulant effect of warfarin may be enhanced by progua nil; plasma concentration of both drugs increased when warfarin given with quinine

Antivirals: anticoagulant effect of warfarin may be enhanced or reduced by atazanavir, nevirapine and ritonavir; plasma concentration of coumarins possibly affected by elavirenz; anticoagulant effect of coumarins may be enhanced or reduced by fosamprenavir; anticoagulant effect of coumarins possibly enhanced by ritonavir; anticoagulant effect of warfarin possibly enhanced by saquinavir;
**Coumarins (continued)**

Mexitelin: anticoagulant effect of warfarin possibly enhanced by **mexitelin**

Oestrogens: anticoagulant effect of coumarins may be enhanced or reduced by **oestrogens**

Orlistat: monitoring anticoagulant effect of coumarins recommended by manufacturer of **orlistat**

Prasugrel: possible increased risk of bleeding when warfarin given with **prasugrel**

Progestogens: anticoagulant effect of coumarins may be enhanced or reduced by **progestogens**

Raxifene: anticoagulant effect of coumarins antagonised by **raxifene**

- Retinoids: anticoagulant effect of coumarins possibly reduced by **retinoids**

- Sulfipyrazone: anticoagulant effect of coumarins enhanced by **sulfipyrazone**

- Symptomatomimetics: anticoagulant effect of coumarins possibly enhanced by **symptomatomimetics**

- Testolactone: anticoagulant effect of coumarins enhanced by **testolactone**

- Testosterone: anticoagulant effect of coumarins enhanced by **testosterone**

- Thyroid Hormones: anticoagulant effect of coumarins enhanced by **thyroid hormones**

- Ubidecaconone: anticoagulant effect of warfarin may be enhanced or reduced by **ubidecaconone**

- Ulcer-healing Drugs: metabolism of coumarins inhibited by **ulcer-healing Drugs** (enhanced anticoagulant effect); anticoagulant effect of coumarins possibly enhanced by **omeprazole** and **omeprazole**; anticoagulant effect of coumarins may be enhanced by **pantoprazole**; absorption of coumarins possibly reduced by **pantoprazole**

- Vaccines: anticoagulant effect of warfarin possibly enhanced by **influenza vaccine**

- Vitamins: anticoagulant effect of coumarins possibly enhanced by **vitamin E**; anticoagulant effect of coumarins antagonised by **vitamin K**

**Craberry Juice**

- Anticoagulants: craberry juice possibly enhances anticoagulant effect of **coumarins**—avoid concomitant use

**Crizotinib (continued)**

- Anxiolytics and Hypnotics: crizotinib increases plasma concentration of **midazolam**

- Beta-blockers: possible increased risk of bradycardia when crizotinib given with beta-blockers

- Calcium-channel Blockers: possible increased risk of bradycardia when crizotinib given with **diltiazem** or **verapamil**

- Cardiac Glycosides: possible increased risk of bradycardia when crizotinib given with **digoxin**

- Ciclosporin: manufacturer of crizotinib advises caution with **ciclosporin**

- Clonidine: possible increased risk of bradycardia when crizotinib given with **clonidine**

- Ergot Alkaloids: manufacturer of crizotinib advises caution with **ergot alkaloids**

- Grapefruit juice: plasma concentration of crizotinib possibly increased by **grapefruit juice**—manufacturer of crizotinib advises avoid concomitant use

- Oestrogens: manufacturer of crizotinib advises contraceptive effect of **oestrogens** possibly reduced

- Parasympathomimetics: possible increased risk of bradycardia when crizotinib given with **pilocarpine**

- Progestogens: manufacturer of crizotinib advises contraceptive effect of **progestogens** possibly reduced

- Sirolimus: manufacturer of crizotinib advises caution with **sirolimus**

- Tacrolimus: manufacturer of crizotinib advises caution with **tacrolimus**

- Cyclizine see Antihistamines

- Cyclophosphamide see Antineoplastic agents

- Cyclophosphamide Antifungals: side-effects of cyclophosphamide possibly increased by **fluconazole** and **itraconazole**

- Antipsychotics: avoid concomitant use of cytoxics with **clozapine** (increased risk of agranulocytosis)

- Cardiac Glycosides: cyclophosphamide possibly reduces absorption of **digoxin tablets**

- Cytotoxics: increased toxicity when high-dose cyclophosphamide given with **pentostatin**—avoid concomitant use

- Muscle Relaxants: cyclophosphamide enhances effects of **suxamethonium**

**Cycloserine**

- Alcohol: increased risk of convulsions when cycloserine given with **alcohol**

- Antibacterials: increased risk of CNS toxicity when cycloserine given with **isoniazid**

- Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

**Cypophosphate** see Antihistamines

**Cytarabine**

- Antifungals: cytarabine possibly reduces plasma concentration of **flucytosine**

- Antipsychotics: avoid concomitant use of cytoxics with **clozapine** (increased risk of agranulocytosis)

- Cardiac Glycosides: cytarabine possibly reduces absorption of **digoxin tablets**

- Cytotoxics: intracellular concentration of cytarabine increased by **fluorouracil**

**Cytotoxic see individual drugs**

**Dabigatran**

- Analgesics: possible increased risk of bleeding when dabigatran given with **NSAIDs**; increased risk of haemorrhage when anticoagulants given with intra-venous **diclofenac** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with **ketorolac** (avoid concomitant use, including low-dose heparins)

- Anti-arrhythmics: plasma concentration of dabigatran increased by **amiodarone** (see Dose under Dabigatran, p. 154); plasma concentration of dabigatran increased by **dronedarone**—avoid concomitant use
Dabigatran (continued)

- Antibacterials: possible increased risk of bleeding when dabigatran given with clarithromycin; plasma concentration of dabigatran reduced by rifampicin—manufacturer of dabigatran advises avoid concomitant use.
- Anticoagulants: increased risk of haemorrhage when dabigatran given with other anticoagulants (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with apixaban and rivaroxaban (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency).
- Antidepressants: possible increased risk of bleeding when dabigatran given with SSRIs or SSRIs; plasma concentration of dabigatran possibly reduced by St John’s wort—manufacturer of dabigatran advises avoid concomitant use.
- Antiepileptics: plasma concentration of dabigatran possibly reduced by carbamazepine and phenytoin—manufacturer of dabigatran advises avoid concomitant use.
- Antifungals: manufacturer of dabigatran advises avoid concomitant use with itraconazole.
- Antivirals: plasma concentration of dabigatran possibly increased by verapamil (see Dose under Dabigatran, p. 154).
- Ciclosporin: plasma concentration of dabigatran possibly increased by ciclosporin—manufacturer of dabigatran advises avoid concomitant use.
- Sulfapyrazine: possible increased risk of bleeding when dabigatran given with sulfapyrazine.
- Tacrolimus: plasma concentration of dabigatran possibly increased by tacrolimus.
- Ticagrelor: plasma concentration of dabigatran increased by ticagrelor.
- Ulipristal: manufacturer of ulipristal advises give dabigatran at least 1.5 hours before or after ulipristal.

Dabrafenib

- Antibacterials: manufacturer of dabrafenib advises avoid concomitant use with rifampicin.
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with St John’s wort.
- Antiepileptics: manufacturer of dabrafenib advises avoid concomitant use with carbamazepine, phenobarbital and phenytoin.
- Antipsychotics: avoid concomitant use of cytoxycys with olanzapine (increased risk of agranulocytosis).
- Oestrogens: manufacturer of dabrafenib advises concomitant use of oestrogens possibly reduced (alternative contraceptive recommended).
- Progestogens: manufacturer of dabrafenib advises concomitant use of progestogens possibly reduced (alternative contraceptive recommended).
- Ulcer-healing Drugs: manufacturer of dabrafenib advises avoid concomitant use with proton pump inhibitors (plasma concentration of dabrafenib possibly reduced).

Dacarbazine

- Aldesleukin: avoidance of dacarbazine advised by manufacturer of aldesleukin.
- Antipsychotics: avoid concomitant use of cytoxycys with olanzapine (increased risk of agranulocytosis).

Dairy Products

- Antibacterials: dairy products reduce absorption of ciprofloxacin and norfloxacin; dairy products reduce absorption of tetracyclines (except doxycycline and minocycline).

Dairy Products (continued)

Cytotoxics: dairy products possibly reduce plasma concentration of mercaptopurine—manufacturer of mercaptopurine advises give at least 1 hour before or 2 hours after dairy products.

Eltrombopag: dairy products possibly reduce absorption of eltrombopag (give at least 4 hours apart).

Dalteparin see Heparins

Danazol

- Anticoagulants: danazol inhibits metabolism of coumarins (enhanced anticoagulant effect).
- Antiepileptics: danazol inhibits metabolism of carbamazepine (increased risk of toxicity).
- Ciclosporin: danazol inhibits metabolism of ciclosporin (increased plasma concentration).
- Lipid-Regulating Drugs: possible increased risk of myopathy when danazol given with simvastatin—avoid concomitant use.
- Tacrolimus: danazol possibly increases plasma concentration of tacrolimus.

Dantrolene see Muscle Relaxants

Dapagliflozin see Antidiabetics

Dapoxetine

- Alcohol: increased sedative effect when dapoxetine given with alcohol.
- Analgesics: possible increased risk of serotoninergic effects when dapoxetine given with tramadol (manufacturer of dapoxetine advises tramadol should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tramadol).
- Antibacterials: manufacturer of dapoxetine advises dose reduction when dapoxetine given with clarithromycin and erythromycin (see Dose under Dapoxetine, p. 560); manufacturer of dapoxetine advises avoid concomitant use with efavirenz (increased risk of toxicity).
- Antidepressants: possible increased risk of serotoninergic effects when dapoxetine given with SSRIs, St John’s wort, duloxetine, tricyclics and venlafaxine (manufacturer of dapoxetine advises SSRIs, St John’s wort, duloxetine, tricyclics and venlafaxine should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping SSRIs, St John’s wort, duloxetine, tricyclics and venlafaxine); increased risk of serotoninergic effects when dapoxetine given with MAOIs (MAOIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping MAOIs).
- Antifungals: manufacturer of dapoxetine advises dose reduction when dapoxetine given with fluconazole (see Dose Under Dapoxetine, p. 560); manufacturer of dapoxetine advises avoid concomitant use with itraconazole (increased risk of toxicity).
- Antivirals: manufacturer of dapoxetine advises avoid concomitant use with atazanavir, ritonavir and saquinavir (increased risk of toxicity); manufacturer of dapoxetine advises dose reduction when dapoxetine given with fosamprenavir (see Dose under Dapoxetine, p. 560).

Aprepitant: manufacturer of dapoxetine advises dose reduction when dapoxetine given with aprepitant (see Dose under Dapoxetine, p. 560).

Calcium-channel Blockers: manufacturer of dapoxetine advises dose reduction when dapoxetine given with diltiazem and verapamil (see Dose under Dapoxetine, p. 560).

5HT1-receptor Agonists: possible increased risk of serotoninergic effects when dapoxetine given with SHT, agonists (manufacturer of dapoxetine advises SHT, agonists should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping SHT, agonists).

Lithium: possible increased risk of serotoninergic effects when dapoxetine given with lithium (manufacturer
Dapoxetine
- Lithium (continued) of dapoxetine advises lithium should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping lithium; Sildenafil: manufacturer of dapoxetine advises avoid concomitant use with sildenafil; Tadalafil: manufacturer of dapoxetine advises avoid concomitant use with tadalafil; Vardenafil: manufacturer of dapoxetine advises avoid concomitant use with vardenafil.

Dapsone
- Antibacterials: plasma concentration of dapsone reduced by rifampicin; plasma concentration of both drugs may increase when dapsone given with trimethoprim.
- Antivirals: increased risk of ventricular arrhythmias when dapsone given with osaguanavir—avoid concomitant use.
- Probenecid: excretion of dapsone reduced by probenecid (increased risk of side-effects).
- Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850.

Daptomycin
- Cilastatin: increased risk of myopathy when daptomycin given with cilastatin (preferably avoid concomitant use).
- Lipid-regulating Drugs: increased risk of myopathy when daptomycin given with fibrates or statins (preferably avoid concomitant use).
- Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850.

Darifenacin
See Antimuscarinics.

Darunavir
- Anti-arrhythmics: darunavir possibly increases plasma concentration of lidocaine—avoid concomitant use.
- Antibacterials: darunavir increases plasma concentration of rifabutin (reduce dose of rifabutin); plasma concentration of darunavir significantly reduced by rifampicin—avoid concomitant use.
- Anticoagulants: avoidance of darunavir advised by manufacturer of apixaban and rivaroxaban.
- Antidepressants: plasma concentration of paroxetine and sertraline; plasma concentration of darunavir reduced by St John’s wort—avoid concomitant use.
- Antiepileptics: plasma concentration of darunavir possibly reduced by carbamazepine, phenobarbital and phenytoin.
- Antimalarials: darunavir increases plasma concentration of lumefantrine; darunavir possibly increases plasma concentration of quinine (increased risk of toxicity).
- Antipsychotics: darunavir possibly increases plasma concentration of antiprazole (reduce dose of antiprazole—consult antiprazole product literature); darunovir possibly increases plasma concentration of quetiapine—manufacturer of quetiapine advises avoid concomitant use.
- Antivirals: avoid concomitant use of darunavir with boceprevir or telaprevir; manufacturer of darunavir advises take didanosine 1 hour before or 2 hours after darunavir; plasma concentration of darunavir reduced by elafiravir (adjust dose—consult product literature); plasma concentration of both drugs increased when darunavir given with indinavir; plasma concentration of darunavir reduced by lopinavir, also plasma concentration of lopinavir increased (avoid concomitant use); darunavir increases plasma concentration of maraviroc (consider reducing dose of maraviroc); increased risk of rash when darunavir given with raltegravir; plasma concentration of darunavir reduced by saquinavir.
- Cytotoxics: darunavir possibly increases the plasma concentration of busulfan—manufacturer of busulfan advises avoid or consider reducing dose of.
Didanosine (continued)

Antibacterials: manufacturer of norfloxacin advises give didanosine at least 2 hours before or after norfloxacin.

● Antivirals: didanosine tablets reduce absorption of atazanavir (give at least 2 hours before or 1 hour after didanosine tablets); manufacturer of darunavir advises take didanosine 1 hour before or 2 hours after darunavir; plasma concentration of didanosine possibly increased by ganciclovir; didanosine tablets reduce absorption of indinavir (give at least 1 hour apart); increased risk of side-effects when didanosine given with ritonavir—avoid concomitant use; manufacturer of ritonavir advises didanosine and ritonavir should be taken 2.5 hours apart; increased risk of side-effects when didanosine given with stavudine; plasma concentration of didanosine increased by ritonavir (increased risk of toxicity)—avoid concomitant use; plasma concentration of didanosine reduced by tipranavir—manufacturer of tipranavir advises tipranavir and didanosine capsules should be taken at least 2 hours apart.

● Cytotoxics: increased risk of toxicity when didanosine given with hydroxyurea—avoid concomitant use.

● Orlistat: absorption of didanosine possibly reduced by orlistat.

Dienogest see Progestogens

Digoxin see Cardiac Glycosides

Dihydrocodeine see Opioid Analgesics

Diltiazem see Calcium-channel Blockers

Dimethyl sulfoxide

● Analgesics: avoid concomitant use of dimethyl sulfoxide with eulindac.

Dinoprost see Prostaglandins

Diphenoxylate see Opioid Analgesics

Dipipanone see Opioid Analgesics

Dipyridamole

Antacids: absorption of dipyridamole possibly reduced by antacids.

● Anti-arrhythmics: dipyridamole enhances and extends anti-arrhythmic effect of adenosine (important risk of toxicity)—reduce dose of adenosine, see Dose under Adenosine, p. 96.

● Anticoagulants: antiplatelet action of dipyridamole possibly increased by cefamandole (increased risk of toxicity); plasma concentration of dipyridamole possibly increased by phenylbutazone.

● Antidepressants: increased risk of bleeding when dipyridamole given with warfarin.

Clotidrogl: increased risk of bleeding when dipyridamole given with clotidrogl.

Cytotoxics: dipyridamole possibly reduced effects of fludarabine.

Disopyramide

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine.

● Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with anti-arrhythmics; increased risk of ventricular arrhythmias when disopyramide given with amiodarone or lidocaine—avoid concomitant use.

● Antibacterials: plasma concentration of disopyramide possibly increased by azithromycin (increased risk of toxicity); plasma concentration of disopyramide possibly increased by clarithromycin (increased risk of ventricular arrhythmias); plasma concentration of disopyramide increased by erythromycin (increased risk of toxicity); increased risk of ventricular arrhythmias when disopyramide given with moxifloxacin—avoid concomitant use; metabolism of disopyramide accelerated by rifampicins (reduced plasma concentration); possible increased...
Disopyramide
• Antibacterials (continued)
  risk of ventricular arrhythmias when disopyramide given with ceflithromycin
Anticoagulants: disopyramide may enhance or reduce anticoagulant effects
• Antidepressants: avoidance of disopyramide advised by manufacturer of citalopram and escitalopram (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when disopyramide given with tricyclics
Antidiabetics: disopyramide possibly enhances hypoglycaemic effect of glitazide, insulin and metformin
Antiepileptics: metabolism of disopyramide accelerated by phenobarbital (reduced plasma concentration); plasma concentration of disopyramide reduced by phenytoin
• Antifungals: avoidance of disopyramide advised by manufacturer of terconazole
• Antihistamines: increased risk of ventricular arrhythmias when disopyramide given with mizolastine—avoid concomitant use
• Antimalarials: avoidance of disopyramide advised by manufacturer of piperaquine with arteinmol (possible risk of ventricular arrhythmias); avoidance of disopyramide advised by manufacturer of arteether with lumefantrine (risk of ventricular arrhythmias)
• Antimuscarinics: increased risk of antimuscarinic side-effects when disopyramide given with antimuscarinics; increased risk of ventricular arrhythmias when disopyramide given with colterodine
• Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with antipsychotics that prolong the QT interval; increased risk of ventricular arrhythmias when disopyramide given with amisulpride, droperidol, pimozide or zuclopenthixol—avoid concomitant use; possible increased risk of ventricular arrhythmias when disopyramide given with haloperidol—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with sulpiride
• Antivirals: plasma concentration of disopyramide possibly increased by etonnavir (increased risk of toxicity); increased risk of ventricular arrhythmias when disopyramide given with saquinavir—avoid concomitant use; avoidance of disopyramide advised by manufacturer of telaprevir (risk of ventricular arrhythmias)
• Atomoxetine: increased risk of ventricular arrhythmias when disopyramide given with atomoxetine
• Beta-blockers: increased risk of myocardial depression when anti-arrhythmics given with beta-blockers; increased risk of ventricular arrhythmias when disopyramide given with sotalol—avoid concomitant use
• Calcium-channel Blockers: increased risk of myocardial depression and asystole when disopyramide given with verapamil
• Cytotoxics: possible increased risk of ventricular arrhythmias when disopyramide given with busulnib; possible increased risk of ventricular arrhythmias when disopyramide given with vandetanib—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with arsenic trioxide
• Diuretics: increased cardiac toxicity with diisopyramide if hypokalaemia occurs with acetazolamide, diuretics or triazolam and related diuretics
• Fingolimod: possible increased risk of bradycardia when disopyramide given with fingolimod
• Ibradine: increased risk of ventricular arrhythmias when disopyramide given with ibradine

Disopyramide (continued)
Nitrate: disopyramide reduces effects of sublingual tablets of nitrates (failure to dissolve under tongue owing to dry mouth)
• Pentamidine isethionate: possible increased risk of ventricular arrhythmias when disopyramide given with pentamidine isethionate
• Ranolazine: avoidance of disopyramide advised by manufacturer of ranolazine
• Sildenafil: manufacturer of disopyramide advises avoid concomitant use with sildenafil (risk of ventricular arrhythmias)
• Tadalafil: manufacturer of disopyramide advises avoid concomitant use with tadalafil (risk of ventricular arrhythmias)
• Vardenafil: manufacturer of disopyramide advises avoid concomitant use with vardenafil (risk of ventricular arrhythmias)

Disulfram
Alcohol: disulfiram reaction when disulfiram given with alcohol (see p. 334)
Antibacterials: psychotom reaction reported when disulfiram given with metronidazole; CNS effects of disulfiram possibly increased by isoniazid
• Anticoagulants: disulfiram enhances anticoagulant effect of coumarins
Antidepressants: increased disulfiram reaction with alcohol reported with concomitant amitriptyline; disulfiram inhibits metabolism of tricyclics (increased plasma concentration)
• Antiepileptics: disulfiram inhibits metabolism of phenytoin (increased risk of toxicity)
Anxiolytics and Hypnotics: disulfiram increases risk of temazepam toxicity; disulfiram inhibits metabolism of benzo diazepines (increased sedative effects)
• Paraldehyde: risk of toxicity when disulfiram given with paraldehyde
Theophylline: disulfiram inhibits metabolism of theophylline (increased risk of toxicity)

Diuretics
Note Since systemic absorption may follow topical application of brinzolamide to the eye, the possibility of interactions should be borne in mind
Note Since systemic absorption may follow topical application of dorzolamide to the eye, the possibility of interactions should be borne in mind
• ACE Inhibitors: enhanced hypotensive effect when diuretics given with ace inhibitors; increased risk of severe hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with ace inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when diuretics given with adrenergic neurone blockers
Alcohol: enhanced hypotensive effect when diuretics given with alcohol
Aldesleukin: enhanced hypotensive effect when diuretics given with aldesleukin
Aliskiren: plasma concentration of furosemide reduced by aliskiren; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with aliskiren
Allopurinol: increased risk of hypersensitivity when thiadane and related diuretics given with allopurinol especially in renal impairment
• Alpha-blockers: enhanced hypotensive effect when diuretics given with alpha-blockers, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
Anaesthetics, General: enhanced hypotensive effect when diuretics given with general anaesthetics
• Analgesics: possible increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with NSAIDs; diuretics increase risk of nephrotoxicity of NSAIDs, also antagonism of diuretic effect, Diuretic effect of potassium can-
Appendix 1: Interactions

Antidepressants: increased risk of hypokalaemia when potassium-sparing diuretics and aldosterone antagonists given with indomethacin; occasional reports of reduced renal function when triamterene given with indomethacin—avoid concomitant use; diuretic effect of spironolactone antagonised by aspirin; possible increased risk of toxicity when loop diuretics given with high-dose aspirin (also possibly reduced effect of loop diuretics); increased risk of toxicity when acetazolamide given with high-dose aspirin.

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when diuretics given with angiotensin-II receptor antagonists; increased risk of hyperkalaemia when spironolactone given with trichlormethiazide, diuretics or thiazides and related diuretics increases cardiac toxicity with amiodarone; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with diuretics or thiazides and related diuretics increases cardiac toxicity with furosemide—avoid concomitant use; plasma concentration of eplerenone reduced by digoxin; spironolactone increases plasma concentration of digoxin; plasma concentration of eplerenone increased by diltiazem and verapamil (reduce dose of eplerenone).

Anti-arrhythmics: plasma concentration of eplerenone increased by clarithromycin and telithromycin—avoid concomitant use; plasma concentration of eplerenone reduced by rifampicin—avoid concomitant use; avoidance of diuretics advised by manufacturer of lymeclorine; increased risk of otopathy when loop diuretics given with aminoglycosides; polymyxins or vancomycin; acetazolamide antagonises actions of lidocaine.

Antibacterials: concentration of eplerenone increased by clarithromycin and telithromycin—avoid concomitant use; plasma concentration of eplerenone reduced by rifampicin—avoid concomitant use; avoidance of diuretics advised by manufacturer of lymeclorine; increased risk of otopathy when loop diuretics given with aminoglycosides; polymyxins or vancomycin; acetazolamide antagonises actions of lidocaine.

Antidepressants: loop diuretics and thiazides and related diuretics antagonises pharmacodynamic effect of antidiabetics; diuretic effect of diuretics possibly enhanced by canagliflozin; avoidance of loop diuretics advised by manufacturer of canagliflozin; diuretic effect of loop diuretics and thiazides and related diuretics possibly enhanced by dapagliflozin.

Antiepileptics: plasma concentration of eplerenone reduced by carbamazepine, phenobarbital and phenytoin—avoid concomitant use; increased risk of hyponatraemia when diuretics given with carbamazepine, acetazolamide increases plasma concentration of carbamazepine; increased risk of osteomalacia when carbonic anhydrase inhibitors given with phenobarbital or phenytoin; effects of furosemide antagonised by phenytoin; acetazolamide possibly increases plasma concentration of phenytoin; hydrochlorothiazide possibly increases plasma concentration of topiramate; avoidance of carbamazepine.

Antidiabetics: loop diuretics and thiazides and related diuretics antagonises pharmacodynamic effect of antidiabetics; diuretic effect of diuretics possibly enhanced by canagliflozin; avoidance of loop diuretics advised by manufacturer of canagliflozin; diuretic effect of loop diuretics and thiazides and related diuretics possibly enhanced by dapagliflozin.

Antibacterials: concentration of eplerenone increased by clarithromycin and telithromycin—avoid concomitant use; plasma concentration of eplerenone reduced by rifampicin—avoid concomitant use; avoidance of diuretics advised by manufacturer of lymeclorine; increased risk of otopathy when loop diuretics given with aminoglycosides; polymyxins or vancomycin; acetazolamide antagonises actions of lidocaine.

Antidepressants: loop diuretics and thiazides and related diuretics antagonises pharmacodynamic effect of antidiabetics; diuretic effect of diuretics possibly enhanced by canagliflozin; avoidance of loop diuretics advised by manufacturer of canagliflozin; diuretic effect of loop diuretics and thiazides and related diuretics possibly enhanced by dapagliflozin.

Antiepileptics: plasma concentration of eplerenone reduced by carbamazepine, phenobarbital and phenytoin—avoid concomitant use; increased risk of hyponatraemia when diuretics given with carbamazepine, acetazolamide increases plasma concentration of carbamazepine; increased risk of osteomalacia when carbonic anhydrase inhibitors given with phenobarbital or phenytoin; effects of furosemide antagonised by phenytoin; acetazolamide possibly increases plasma concentration of phenytoin; hydrochlorothiazide possibly increases plasma concentration of topiramate; avoidance of carbamazepine.

Antidiabetics: loop diuretics and thiazides and related diuretics antagonises pharmacodynamic effect of antidiabetics; diuretic effect of diuretics possibly enhanced by canagliflozin; avoidance of loop diuretics advised by manufacturer of canagliflozin; diuretic effect of loop diuretics and thiazides and related diuretics possibly enhanced by dapagliflozin.

Antiepileptics: plasma concentration of eplerenone reduced by carbamazepine, phenobarbital and phenytoin—avoid concomitant use; increased risk of hyponatraemia when diuretics given with carbamazepine, acetazolamide increases plasma concentration of carbamazepine; increased risk of osteomalacia when carbonic anhydrase inhibitors given with phenobarbital or phenytoin; effects of furosemide antagonised by phenytoin; acetazolamide possibly increases plasma concentration of phenytoin; hydrochlorothiazide possibly increases plasma concentration of topiramate; avoidance of carbamazepine.

Antidiabetics: loop diuretics and thiazides and related diuretics antagonises pharmacodynamic effect of antidiabetics; diuretic effect of diuretics possibly enhanced by canagliflozin; avoidance of loop diuretics advised by manufacturer of canagliflozin; diuretic effect of loop diuretics and thiazides and related diuretics possibly enhanced by dapagliflozin.

Antiepileptics: plasma concentration of eplerenone reduced by carbamazepine, phenobarbital and phenytoin—avoid concomitant use; increased risk of hyponatraemia when diuretics given with carbamazepine, acetazolamide increases plasma concentration of carbamazepine; increased risk of osteomalacia when carbonic anhydrase inhibitors given with phenobarbital or phenytoin; effects of furosemide antagonised by phenytoin; acetazolamide possibly increases plasma concentration of phenytoin; hydrochlorothiazide possibly increases plasma concentration of topiramate; avoidance of carbamazepine.

Antidiabetics: loop diuretics and thiazides and related diuretics antagonises pharmacodynamic effect of antidiabetics; diuretic effect of diuretics possibly enhanced by canagliflozin; avoidance of loop diuretics advised by manufacturer of canagliflozin; diuretic effect of loop diuretics and thiazides and related diuretics possibly enhanced by dapagliflozin.
Diuretics (continued)

Diuretics (continued) with acetazolamide; profound diuresis possible when metolazone given with furosemide; increased risk of hypokalaemia when thiazides and related diuretics given with loop diuretics

Dopaminergics: enhanced hypotensive effect when diuretics given with levodopa

Hormone Antagonists: increased risk of hypercalcaemia when thiazides and related diuretics given with tolterodine

Lipid-regulating Drugs: absorption of thiazides and related diuretics reduced by colestipol and colestipol

(benzindole) (give at least 2 hours apart)

- Lithium: loop diuretics and thiazides and related diuretics reduce excretion of lithium (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides; potassium-sparing diuretics and aldosterone antagonists reduce excretion of lithium (increased plasma concentration and risk of toxicity); acetoazolamide increases the excretion of lithium

Methyldopa: enhanced hypotensive effect when diuretics given with methyldopa

Moxonidine: enhanced hypotensive effect when diuretics given with moxonidine

Muscle Relaxants: enhanced hypotensive effect when diuretics given with baclofen or tizanidine

Nitrites: enhanced hypotensive effect when diuretics given with nitrites

Oestrogens: diuretic effect of diuretics antagonised by oestrogens

- Potassium Salts: increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with potassium salts

Progestogens: risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with drospirenone (monitor serum potassium during first cycle)

Prostaglandins: enhanced hypotensive effect when diuretics given with alprostadil

Sympathomimetics, Beta₂: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with high doses of beta sympathomimetics—see Hypokalaemia, p. 186

- Tacrolimus: increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with tacrolimus

Theophylline: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with theophylline

Vasodilator Antihypertensives: enhanced hypotensive effect when diuretics given with hydralazine, minoxidil or sodium nitroprusside

Vitamins: increased risk of hyperkalaemia when thiazides and related diuretics given with vitamin D

Diuretics, Loop see Diuretics

Diuretics, Potassium-sparing and Aldosterone Antagonists see Diuretics

Diuretics, Thiazide and related see Diuretics

Dobutamine see Sympathomimetics

Docetaxel

Antibacterials: in vitro studies suggest a possible interaction between docetaxel and erythromycin (consult docetaxel product literature)

- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)

- Antivirals: plasma concentration of docetaxel possibly increased by ritonavir (increased risk of toxicity)

Ciclosporin: in vitro studies suggest a possible interaction between docetaxel and ciclosporin (consult/docetaxel product literature)

Appendix 1: Interactions

Docetaxel (continued)

Cytotoxics: possible increased risk of neutropenia when docetaxel given with lapatinib; plasma concentration of docetaxel increased by sorafenib

Dolutegravir

Antacids: absorption of dolutegravir possibly reduced by aluminium hydroxide and oral magnesium salts—manufacturer of dolutegravir advises at least 2 hours before or 6 hours after aluminium hydroxide and oral magnesium salts

Antibacterials: plasma concentration of dolutegravir reduced by rifabutin (see Dose under Dolutegravir, p. 421); plasma concentration of dolutegravir reduced by rifampicin or saquinavir (see Dose under Dolutegravir, p. 421); plasma concentration of dolutegravir possibly reduced by ritonavir (see Dose under Dolutegravir, p. 421)

Calcium Salts: absorption of dolutegravir possibly reduced by calcium salts—manufacturer of dolutegravir advises at least 2 hours before or 6 hours after calcium salts

Domperidone

Analgesics: effects of domperidone on gastro-intestinal activity antagonised by opioid analgesics

Antibacterials: possible increased risk of ventricular arrhythmias when domperidone given with clarithromycin or clithromycin—avoid concomitant use; plasma concentration of domperidone increased by erythromycin (increased risk of ventricular arrhythmias—avoid concomitant use)

Antifungals: possible increased risk of ventricular arrhythmias when domperidone given withitraconazole or voriconazole—avoid concomitant use

Antimalariais: avoidance of domperidone advised by manufacturer of piperaquine with artemino (possible risk of ventricular arrhythmias)

Antimuscarinics: effects of domperidone on gastrointestinal activity antagonised by antimuscarinics

Antivirals: possible increased risk of ventricular arrhythmias when domperidone given with boceprevir, ritonavir, esquinavir or telaprevir—avoid concomitant use

Cobicistat: increased risk of ventricular arrhythmias when domperidone given with cobicistat—avoid concomitant use

Cytotoxics: avoidance of domperidone advised by manufacturer of busulfan (risk of ventricular arrhythmias)

Dopaminergics: domperidone possibly antagonises hypoprolactinaemic effects of bromocriptine and cabergoline

Donepezil see Parasympathomimetics

Dopamine see Sympathomimetics

Dopaminergics see Amantadine, Apomorphine, Bromocriptine, Cabergoline, Entacapone, Levodopa, pergolide, Pramipexole, Quinagolide, Rasagilin, Ropinirole, Rotigotine, Selegiline, and Tolcapone

Dopexamine see Sympathomimetics

Dorzolamide see Diuretics

Doxapram see Antidepressants, Tricyclic

Doxapram

- Analgesics: General: increased risk of arrhythmias when doxapram given with volatil liquid general anaesthetics (avoid doxapram for at least 10 minutes after volatile liquid general anaesthetics)
Appendix 1: Interactions

Antidepressants: effects of doxapram enhanced by MAOIs

Doxapram (continued)

Doxapram (continued)

Antidepressants: increased risk of hypertension when doxapram given with sympathomimetics

Theophylline: increased CNS stimulation when doxapram given with theophylline

Doxazosin see Alpha-blockers

Doxepin see Antidepressants, Tricyclic

Doxorubicin

Antipsychotics: avoid concomitant use with cytoxics with -cladopine (increased risk of agranulocytosis) -Antivirals: doxorubicin possibly inhibits effects of stavudine

Calcium-channel Blockers: plasma concentration of doxorubicin possibly increased by verapamil

Cardiac Glycosides: doxorubicin possibly reduces absorption of digoxin tablets

Ciclosporin: increased risk of neurotoxicity when doxorubicin given with ciclosporin

Cytotoxics: plasma concentration of doxorubicin possibly increased by sorafenib

Doxycycline see Tetracyclines

Dronedarone

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine

Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other anti-arrhythmics: increased risk of ventricular arrhythmias when dronedarone given with amiodarone or disopyramide—avoid concomitant use

Antibacterials: manufacturer of dronedarone advisesavoid concomitant use with clarithromycin (risk of ventricular arrhythmias); plasma concentration of dronedarone increased by erythromycin (increased risk of ventricular arrhythmias)—avoid concomitant use; plasma concentration of dronedarone reduced by rifampicin—avoid concomitant use; increased risk of ventricular arrhythmias when dronedarone given with rifampicin—avoid concomitant use

Anticoagulants: dronedarone possibly enhances anti-coagulant effect of coumarins and phenindione; dronedarone increases plasma concentration of dabigatran—avoid concomitant use; avoidance of dronedarone advised by manufacturer of rivaroxaban

Antidepressants: avoid dronedarone advised by manufacturer of citalopram and escitalopram (risk of ventricular arrhythmias); plasma concentration of dronedarone possibly reduced by St John’s wort—avoid concomitant use; manufacturer of dronedarone advises avoid concomitant use with ciclosporin

Antiepileptics: plasma concentration of dronedarone possibly reduced by carbamazepine, phenobarbital and phenytoin—avoid concomitant use

Antifungals: manufacturer of dronedarone advises avoid concomitant use withitraconazole, posaconazole and voriconazole

Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with antipsychotics that prolong the QT interval, manufacturer of dronedarone advises avoid concomitant use with phenothiazines (risk of ventricular arrhythmias)

Antivirals: manufacturer of dronedarone advises avoid concomitant use with ritonavir; increased risk of ventricular arrhythmias when dronedarone given with saquinavir—avoid concomitant use

Beta-blockers: increased myocardial depression when anti-arrhythmics given with beta-blockers; dronedarone possibly increases plasma concentration of metoprolol and propranolol; increased risk of ventricular arrhythmias when dronedarone given with sotalol—avoid concomitant use

Dronedarone (continued)

Dronedarone (continued)

Calcium-channel Blockers: Plasma concentration of doxorubicin possibly increased by verapamil

Cardiac Glycosides: Increased plasma concentration of digoxin (half dose of digoxin)

Cytotoxics: dornedarone possibly increases the plasma concentration of bosutinib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib

Fidaxomycin: avoidance of dronedarone advised by manufacturer of fidaxomycin

Fingolimod: possible increased risk of bradycardia when dronedarone given with fingolimod

Grapefruit Juice: Plasma concentration of dronedarone increased by grapefruit juice—avoid concomitant use

Lipid-regulating Drugs: dornedarone possibly increases plasma concentration of atorvastatin; dornedarone increases plasma concentration of rosuvastatin—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when dornedarone given with simvastatin; avoidance of dornedarone advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased)

Sirolimus: manufacturer of dronedarone advises caution with sirolimus

Tacrolimus: manufacturer of dronedarone advises caution with tacrolimus

Droperidol see Antipsychotics

Drosopirine see Progestogens

Duloxetine

Analgesics: possible increased serotonergic effects when SSRI-related antidepressants given with fentanyl; possible increased serotonergic effects when duloxetine given with phenytoin or trimadol

Antibacterials: metabolism of duloxetine inhibited by ciprofloxacin—avoid concomitant use

Anticoagulants: possible increased risk of bleeding when SSRI-related antidepressants given with dabigatran

Antidepressants: metabolism of duloxetine inhibited by fluvoxamine—avoid concomitant use; possible increased serotonergic effects when duloxetine given with SSRIs, St John’s wort, amitriptyline, clomipramine, moclobemide or venlafaxine; duloxetine should not be started until 2 weeks after stopping MAOIs; also MAOIs should not be started until at least 5 days after stopping duloxetine; after stopping SSRIs-related antidepressants do not start moclobemide for at least 1 week

Antimalarials: avoidance of antidepressants advised by manufacturer of eartemether with lumefantrine and piperaquine with artenimol

Atorvastatin: possible increased risk of convulsions when antidepressants given with atorvastatin

Dapoxetine: possible increased risk of serotoninergic effects when duloxetine given with ritonavir, amitriptyline, clomipramine, moclobemide or venlafaxine; duloxetine should be not started until 2 weeks after stopping dapoxetine; dapoxetine should be used for 2 weeks after stopping duloxetine

5HT-receptor Agonists: possible increased serotonergic effects when duloxetine given with 5HT agonists

Methylinimum: risk of CNS toxicity when SSRI-related antidepressants given with methylinimum—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylinimum and observe patient for up to 4 hours after administration)
Appendix 1: Interactions

Dutasteride
Calcium-channel Blockers: plasma concentration of dutasteride increased by diltiazem and verapamil

Dydrogesterone see Progestogens

Efaliquone see Parasympathomimetics

Efavirenz
Analgesics: efavirenz reduces plasma concentration of methadone
Antibacterials: efavirenz reduces plasma concentration of clarithromycin, also plasma concentration of active metabolite of clarithromycin increased; efavirenz reduces plasma concentration of rifabutin—increase dose of rifabutin; plasma concentration of efavirenz reduced by rifampicin—increase dose of efavirenz
Anticoagulants: efavirenz possibly affects plasma concentration of coumarins
Antidepressants: plasma concentration of efavirenz reduced by St John’s wort—avoid concomitant use
Antiepileptics: plasma concentration of both drugs reduced when efavirenz given with carbamazepine
Antifungals: efavirenz reduces plasma concentration of itraconazole and posaconazole; efavirenz reduces plasma concentration of voriconazole, also plasma concentration of efavirenz increased (increase voriconazole dose and reduce efavirenz dose); efavirenz possibly reduces plasma concentration of caspofungin—consider increasing dose of caspofungin
Antimalarials: efavirenz reduces plasma concentration of artemether with lumefantrine; efavirenz possibly affects plasma concentration of proguanil
Antipsychotics: efavirenz possibly reduces plasma concentration of aripiprazole (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); efavirenz possibly increases plasma concentration of ziprasidone (increased risk of ventricular arrhythmias—avoid concomitant use)
Antivirals: avoidance of efavirenz advised by manufacturer of atazanavir (plasma concentration of atazanavir reduced); efavirenz reduces plasma concentration of dolutegravir (see Dose under Dolutegravir, p. 421); avoidance of efavirenz advised by manufacturer of elvitegravir; efavirenz possibly reduces plasma concentration of etravirine—avoid concomitant use; efavirenz reduces plasma concentration of indinavir; efavirenz reduces plasma concentration of lopinavir—consider increasing dose of lopinavir; efavirenz possibly reduces plasma concentration of maraviroc—consider increasing dose of maraviroc; plasma concentration of efavirenz reduced by nelfinavir—avoid concomitant use; toxicity of efavirenz increased by ritonavir, monitor liver function tests—manufacturer of Atripla® advises avoid concomitant use with high-dose ritonavir; efavirenz significantly reduces plasma concentration of saquinavir; efavirenz reduces plasma concentration of telaprevir—increase dose of telaprevir
Antisieptics and Hypnotics: increased risk of prolonged sedation when efavirenz given with midazolam—avoid concomitant use
Atovaquone: efavirenz reduces plasma concentration of atovaquone—avoid concomitant use
Avanafil: efavirenz possibly reduces plasma concentration of avanafil—manufacturer of avanafil advises avoid concomitant use
Bupropion: efavirenz accelerates metabolism of bupropion (reduced plasma concentration)
Calcium-channel Blockers: efavirenz reduces plasma concentration of diltiazem
Ciclosporin: efavirenz possibly reduces plasma concentration of ciclosporin

efavirenz (continued)

Cytotoxics: efavirenz possibly reduces plasma concentration of busulfan—manufacturer of busulfan advises avoid concomitant use
Ergot Alkaloids: increased risk of ergotism when efavirenz given with ergot alkaloids—avoid concomitant use
Grapefruit Juice: plasma concentration of efavirenz possibly increased by grapefruit juice
Lipid-regulating Drugs: efavirenz reduces plasma concentration of atorvastatin, pravastatin and simvastatin
Orlistat: absorption of efavirenz possibly reduced by orlistat
Progestogens: efavirenz possibly reduces contraceptive effect of progestogens
Tacrolimus: efavirenz possibly affects plasma concentration of tacrolimus

Eletiptan see SHT-receptor Agonists (under HT)

Eltrombopag
Antacids: absorption of eltrombopag reduced by antacids (give at least 4 hours apart)
Antivirals: plasma concentration of eltrombopag possibly reduced by lopinavir
Calcium Salts: absorption of eltrombopag possibly reduced by calcium salts (give at least 4 hours apart)
Dairy Products: absorption of eltrombopag possibly reduced by dairy products (give at least 4 hours apart)
Iron: absorption of eltrombopag possibly reduced by oral iron (give at least 4 hours apart)
Lipid-regulating Drugs: eltrombopag increases plasma concentration of rosuvastatin—adjust dose of rosuvastatin (consult product literature)
Selenium: absorption of eltrombopag possibly reduced by selenium (give at least 4 hours apart)
Zinc: absorption of eltrombopag possibly reduced by zinc (give at least 4 hours apart)

Elvitegravir
Antacids: absorption of elvitegravir reduced by antacids (give at least 4 hours apart)
Antibacterials: plasma concentration of elvitegravir reduced by rifabutin also plasma concentration of active metabolite of rifabutin increased—reduce dose of rifabutin; manufacturer of elvitegravir advises avoid concomitant use with rifampicin
Antidepressants: manufacturer of elvitegravir advises avoid concomitant use with St John’s wort
Antiepileptics: manufacturer of elvitegravir advises avoid concomitant use with carbamazepine, phenobarbital and phenytoin
Antivirals: plasma concentration of elvitegravir increased by atazanavir and lopinavir boosted with ritonavir (reduce dose of elvitegravir); manufacturer of elvitegravir advises avoid concomitant use with efavirenz and nevirapine
Bosantan: manufacturer of elvitegravir advises avoid concomitant use with bosantan
Orlistat: absorption of elvitegravir possibly reduced by orlistat
Progestogens: elvitegravir increases plasma concentration of norgestimatte

Emtricitabine
Antivirals: manufacturer of emtricitabine advises avoid concomitant use with lamivudine
Orlistat: absorption of emtricitabine possibly reduced by orlistat

Enalapril see ACE Inhibitors

Enfuvirtide
Orlistat: absorption of enfuvirtide possibly reduced by orlistat

Enoxaparin see Heparins

Enoximone see Phosphodiesterase Inhibitors
Appendix 1: Interactions

Entacapone
- Anticoagulants: entacapone enhances anticoagulant effect of warfarin
- Antidepressants: manufacturer of entacapone advises caution with moclobemide, tricyclics and venlafaxine; avoid concomitant use of entacapone with non-selective MAOIs

Dopaminergics: entacapone possibly enhances effects of apomorphine; entacapone possibly reduces plasma concentration of rasagiline; manufacturer of entacapone advises max. dose of 10mg selegiline if used concomitantly
- Iron: absorption of entacapone reduced by oral iron

Ergot Alkaloids
- see Eptifibatide
- see Eplerenone

Ulcer-healing Drugs:
- see Eptifibatide
- see Eplerenone

Antipsychotics:
- see Epinephrine (adrenaline)

Ephedrine see Sympathomimetics
Epinephrine (adrenaline) see Sympathomimetics
Eripiricin
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Ciclosporin: plasma concentration of eripiricin increased by ciclosporin
- Ulcer-healing Drugs: plasma concentration of eripiricin increased by cimetidine

Eplerenone see Diuretics
Eprosartan see Angiotensin-II Receptor Antagonists
Epflibatide
- Iloprost: increased risk of bleeding when epflibatide given with iloprost

Ergometrine see Ergot Alkaloids
Ergot Alkaloids
- Antibacterials: increased risk of ergotism when ergotamine given with tetracyclines; avoid concomitant use with reboxetine
- Antifungals: avoidance of ergometrine advised by manufacturer of itraconazole (increased risk of ergotism)
- Antidepressants: possible risk of hypertension when ergotamine given with reboxetine
- Antivirals: plasma concentration of ergot alkaloids possibly increased by stavudine; avoid concomitant use; avoidance of ergot alkaloids advised by manufacturer of abacavir and efavirenz; increased risk of ergotism when ergot alkaloids given with efavirenz; avoid concomitant use; increased risk of ergotism when ergot alkaloids given with fosamprenavir, indinavir, ritonavir or saquinavir—avoid concomitant use

Ergot Alkaloids (continued)
- Blockers: increased peripheral vasoconstriction when ergotamine given with beta-blockers
- Cobicistat: plasma concentration of ergot alkaloids possibly increased by cobicistat—manufacturer of cobicistat advises avoid concomitant use
- Cytotoxics: caution with ergot alkaloids advised by manufacturer of crizotinib
- 5HT1-receptor Agonists: increased risk of vasospasm when ergotamine given with almotryptan, zolmitriptan, sumatriptan or zolmitriptan (avoid ergotamine for 6 hours after almotryptan, zolmitriptan, sumatriptan or zolmitriptan, avoid almotryptan, rizatriptan, sumatriptan or zolmitriptan for 24 hours after ergotamine); increased risk of vasospasm when ergotamine given with eletriptan, frovatriptan or naratriptan, avoid eletriptan, frovatriptan or naratriptan for 24 hours after ergotamine

Sympathomimetics: increased risk of ergotism when ergotamine given with sympathomimetics
- Ticagrelor: plasma concentration of ergot alkaloids possibly increased by ticagrelor
- Ulcer-healing Drugs: increased risk of ergotism when ergotamine given with emetidine—avoid concomitant use

Ergotamine see Ergot Alkaloids
Eribulin
- Antibacterials: plasma concentration of eribulin possibly reduced by rifampicin
- Antidepressants: plasma concentration of eribulin possibly reduced by St John’s wort
- Antiepileptics: plasma concentration of eribulin possibly reduced by carbamazepine and phenytoin
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)

Erlotinib
- Analgesics: increased risk of bleeding when erlotinib given with NSAIDs
- Antacids: plasma concentration of erlotinib possibly reduced by antacids—give antacids at least 4 hours before or 2 hours after erlotinib
- Antibacterials: plasma concentration of erlotinib increased by ciprofloxacin; metabolism of erlotinib accelerated by rifampicin (reduced plasma concentration)
- Anticoagulants: increased risk of bleeding when erlotinib given with coumarins
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Antivirals: avoidance of erlotinib advised by manufacturer of boceprevir
- Cytotoxics: plasma concentration of erlotinib possibly increased by capcetabine
- Ulcer-healing Drugs: manufacturer of erlotinib advises avoid concomitant use with capcetabine, esomeprazole, famotidine, lansoprazole, nitazidine, pantoprazole and rabeprazole; plasma concentration of erlotinib reduced by ranitidine—manufacturer of erlotinib advises give at least 2 hours before or 10 hours after ranitidine; plasma concentration of erlotinib reduced by omeprazole—manufacturer of erlotinib advises avoid concomitant use

Ertapenem
- Antiepileptics: carbapenem reduces plasma concentration of valproate—avoid concomitant use
- Vaccines: antibacterials inactivate oral typhoid vaccine—see page 850

Erythromycin see Macrolides
Escitalopram see Antidepressants, SSRI
Esilcarbazepine
- Anticoagulants: esilcarbazepine reduces plasma concentration of warfarin
Antimalarials: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and \textit{tricyclic-related antidepressants} (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by \textit{SSRIs} and \textit{tricyclics} (convulsive threshold lowered)

Antiepileptics: plasma concentration of eslicarbazepine possibly reduced by \textit{carbamazepine} but risk of side-effects increased; manufacturer of eslicarbazepine advises concomitant use with \textit{oxyphenbutazone}; plasma concentration of eslicarbazepine reduced by \textit{phenytoin}, also plasma concentration of phenytoin increased

Antimalarials: anticonvulsant effect of antiepileptics antagonised by \textit{emefloquine}

Antipsychotics: anticonvulsant effect of antiepileptics antagonised by \textit{amantadine}; \textit{tricyclics} (convulsive threshold lowered)

Lipid-regulating Drugs: eslicarbazepine reduces plasma concentration of \textit{rosuvastatin}; eslicarbazepine reduces plasma concentration of \textit{simvastatin}—consider increasing dose of simvastatin

Oestrogens: eslicarbazepine accelerates metabolism of \textit{oestradiol} (reduced contraceptive effect—see p. 536)

Orlistat: possible increased risk of convulsions when antiepileptics given with \textit{orlistat}

Progestogens: eslicarbazepine accelerates metabolism of \textit{progesterone} (reduced contraceptive effect—see p. 536)

\textbf{Esmolol} see Beta-blockers

\textbf{Esomeprazole} see Proton Pump Inhibitors

\textbf{Estradiol} see Oestrogens

\textbf{Estramustine} Anticancer: absorption of estramustine possibly reduced by \textit{aluminium hydroxide} and \textit{oral magnesium salts}—manufacturer of estramustine advises avoid concomitant administration

Antipsychotics: avoid concomitant use of cytoxotics with \textit{clozapine} (increased risk of agranulocytosis)

Bisphosphonates: plasma concentration of estramustine increased by \textit{calcium chloride}

Calcium Salts: absorption of estramustine reduced by \textit{calcium salts} (manufacturer of estramustine advises avoid concomitant administration)

\textbf{Estradiol} see Oestrogens

\textbf{Estrone} see Oestrogens

\textbf{Etnacept} • Abatacept: avoid concomitant use of etnacept with \textit{abatacept}

• Anakinra: avoid concomitant use of etnacept with \textit{anakinra}

• Vaccines: avoid concomitant use of etnacept with live \textit{vaccines} (see p. 828)

\textbf{Ethinylestradiol} see Oestrogens

\textbf{Ethosuximide} • Antibacterials: metabolism of ethosuximide inhibited by \textit{isoniazid} (increased plasma concentration and risk of toxicity)

• Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by \textit{MAOIs} and \textit{tricyclic-related antidepressants} (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by \textit{SSRIs} and \textit{tricyclics} (convulsive threshold lowered)

• Antiepileptics: plasma concentration of ethosuximide possibly reduced by \textit{phenytoin}, also plasma concentration of phenytoin possibly increased; plasma concentration of ethosuximide possibly increased by \textit{valproate}

• Antimalarials: anticonvulsant effect of antiepileptics antagonised by \textit{emefloquine}

\textbf{Ethosuximide (continued)} • Antipsychotics: anticonvulsant effect of antiepileptics antagonised by \textit{antipsychotics} (convulsive threshold lowered)

• Orlistat: possible increased risk of convulsions when antiepileptics given with \textit{orlistat}

\textbf{Etidronate Disodium} see Bisphosphonates

\textbf{Etodolac} see NSAIDs

\textbf{Etomodate} see Anaesthetics, General

\textbf{Etonogestrel} see Progestogens

\textbf{Etoposide} • Anticoagulants: etoposide possibly enhances anti-coagulant effect of \textit{oxandrolone}

Antiepileptics: plasma concentration of etoposide possibly reduced by \textit{phenobarbital} and \textit{phenytoin}

• Antipsychotics: avoid concomitant use of cytoxotics with \textit{clozapine} (increased risk of agranulocytosis)

Atovalumone: plasma concentration of etoposide possibly increased by \textit{atovaquone}

Cislopin: plasma concentration of etoposide possibly increased by \textit{cislopin} (increased risk of toxicity)

\textbf{Etoricoxib} see NSAIDs

\textbf{Etravirine} • Antibacterials: etravirine reduces plasma concentration of \textit{eclathromycin} (but concentration of an active metabolite increased), also plasma concentration of etravirine increased; plasma concentration of both drugs reduced when etravirine given with \textit{efavirenz}; manufacturer of etravirine advises avoid concomitant use with \textit{rifampicin}

Antidepressants: manufacturer of etravirine advises avoid concomitant use with \textit{St John's wort}

Antiepileptics: manufacturer of etravirine advises avoid concomitant use with \textit{carbamazepine}, \textit{phenobarbital} and \textit{phenytoin}

Antimalarials: etravirine reduces plasma concentration of \textit{artemether} with \textit{lumefantrine}

• Antivirals: effects of both drugs possibly reduced when etravirine given with \textit{boceprevir}; etravirine reduces the plasma concentration of \textit{dolutegravir} (see Cautions under Dolutegravir, p. 421); plasma concentration of etravirine possibly reduced by \textit{efavirenz} and \textit{efavirazine}—avoid concomitant use; etravirine decreases plasma concentration of \textit{fosamprenavir} (consider reducing dose of fosamprenavir); etravirine possibly reduces plasma concentration of \textit{indinavir}—avoid concomitant use; etravirine possibly reduces plasma concentration of \textit{maraviroc}; plasma concentration of etravirine reduced by \textit{pranavir}, also plasma concentration of tipranavir increased (avoid concomitant use)

Cardiac Glycosides: etravirine increases plasma concentration of \textit{digoxin}

• Clobidogrel: etravirine possibly reduces antplatelet effect of \textit{clopidogrel}

• Cytotoxic: etravirine possibly reduces plasma concentration of \textit{bosutinib}—manufacturer of bosutinib advises avoid concomitant use

Lipid-regulating Drugs: etravirine possibly reduces plasma concentration of \textit{atorvastatin}

• Orlistat: absorption of etravirine possibly reduced by \textit{orlistat}

Sildenafl: etravirine reduces plasma concentration of \textit{sildenafil}

\textbf{Everolimus} • Antibacterials: plasma concentration of everolimus possibly increased by \textit{clarithromycin} and \textit{ethionamycin}—manufacturer of everolimus advises avoid concomitant use; plasma concentration of everolimus possibly reduced by \textit{erythromycin} (consider reducing the dose of everolimus —consult everolimus product literature); plasma concentration of everolimus reduced by \textit{rifampicin} (avoid concomitant use or consider increasing the dose of everolimus —consult everolimus product literature)
Appendix 1: Interactions

Antidepressants: plasma concentration of everolimus possibly reduced by St John’s wort—manufacturer of everolimus advises avoid concomitant use

Antineoplastics: plasma concentration of everolimus possibly increased by irinotecan, oxaliplatin and vencatimum—manufacturer of everolimus advises avoid concomitant use

Anxiolytics: avoid concomitant use of cytoprotective drugs with ciclosporin (consider reducing the dose of everolimus—consult everolimus product literature)

Calcium-channel Blockers: plasma concentration of both drugs may increase when everolimus given with verapamil (consider reducing the dose of everolimus—consult everolimus product literature)

Ciclosporin: plasma concentration of everolimus increased by tacrolimus (consider reducing the dose of everolimus—consult everolimus product literature)

Cytoxotics: plasma concentration of everolimus increased by matumib (consider reducing the dose of everolimus—consult everolimus product literature)

Exemestane—manufacturer of exemestane advises avoid concomitant use with grapefruit juice

Ezetimibe: ezetimibe possibly enhanced anti-cholesterolemic effect of colestipol

Famciclovir: excretion of famciclovir possibly reduced by probenecid

Famotidine see Histamine H2-antagonists

Firoceptide

Fibrates

Flavoxate see Antimuscarinics

Flecainide

Flucytosine: increased risk of renal impairment when bezafibrate or fenofibrate given with ciclosporin

Fungal growth: increased risk of myopathy when fibrates given with colchicine

Corticosteroids: increased risk of myopathy when cyclosporin given with everolimus

Hormone Antagonists: increased risk of myopathy when fibrates given with bexarotene—avoid concomitant use

Lipid-regulating Drugs: ezetimibe increases plasma concentration of both drugs may increase when everolimus given with ezetimibe—discontinue if suspected; reduce maximum dose of fenofibrate when given with fenofibrate, p. 176; increased risk of myopathy when fibrates given with tamoxifen—avoid concomitant use

Flavoxate see Antimuscarinics

Ciclosporin: plasma concentration of everolimus increased by itraconazole, ketoconazole and voriconazole—manufacturer of everolimus advises avoid concomitant use

Calcium-channel Blockers: plasma concentration of both drugs may increase when everolimus given with verapamil (consider reducing the dose of everolimus—consult everolimus product literature)

Ciclosporin: plasma concentration of everolimus increased by ciclosporin (consider reducing the dose of everolimus—consult everolimus product literature)

Cytoxotics: plasma concentration of everolimus increased by matumib (consider reducing the dose of everolimus—consult everolimus product literature)

Famciclovir: excretion of famciclovir possibly reduced by probenecid

Ciclosporin: plasma concentration of everolimus increased by matumib (consider reducing the dose of everolimus—consult everolimus product literature)

Grapefruit juice: manufacturer of everolimus advises avoid concomitant use with grapefruit juice

Exemestane—manufacturer of exemestane advises avoid concomitant use with rifampicin

Exenatide see Antidiabetics

Famciclovir: excretion of famciclovir possibly reduced by probenecid (increased plasma concentration)

Famotidine see Histamine H2-antagonists

Fampridine—manufacturer of fampridine advises avoid concomitant use with timetidine

Fidaxomicin

Flibustat

Fingolimod

Fibrate

Fluconazole see Antifungals

Fluoxetine increased risk of ventricular arrhythmias when flecainide given with ticagrelor

Fluoxetine: increased risk of ventricular arrhythmias when flecainide given with ticagrelor—avoid concomitant use

Fluoxetine: increased risk of ventricular arrhythmias when flecainide given with ticagrelor.

Fluoxetine increased risk of ventricular arrhythmias when flecainide given with ticagrelor—avoid concomitant use

Fluticasone

Formoterol

Fenofibrate

Fenobutone see NSAIDs

Fentanyl see Opioid Analgesics

Ferrous Sulfate see Iron

Fesoterodine see Antimuscarinics

Fexofenadine see Antihistamines

Fibrate

Antiarrhythmics: increased risk of myopathy when fibrates given with lansoprazole (preferably avoid concomitant use)

Anticoagulants: fibrates enhance anticoagulant effect of warfarin and possibly enhanced hypoglycemic effect of nateglinide; increased risk of severe hypoglycemia when gemfibrozil given with repaglinide—avoid concomitant use

Colchicine: possible increased risk of myopathy when fibrates given with colchicine

Cytotoxic: gemfibrozil increases plasma concentration of bexarotene—avoid concomitant use

Hormone Antagonists: gemfibrozil increases plasma concentration of enzalutamide—manufacturer of enzalutamide advises avoid concomitant use or halve dose of enzalutamide

Leukotriene Receptor Antagonists: gemfibrozil increases plasma concentration of montelukast

Lipid-regulating Drugs: increased risk of myopathy when gemfibrozil given with atorvastatin, simvastatin or pravastatin (preferably avoid concomitant use); increased risk of myopathy when fibrates given with rosuvastatin (see Dose under Rosuvastatin, p. 173); possible increased risk of myopathy when bezafibrate and ciprofibrate given with simvastatin (see Dose under Simvastatin, p. 173); increased risk of myopathy when gemfibrozil given with simvastatin (avoid concomitant use); increased risk of cholelithiasis and gallbladder disease when fibrates given with ezetimibe—discontinue if suspected; reduce maximum dose of fenofibrate when given with statins—see Dose under Fenofibrate, p. 176; increased risk of myopathy when fibrates given with statins

Fidaxomicin

Anti-arrhythmics: manufacturer of fidaxomicin advises avoid concomitant use with amiodarone and dronedarone

Sodium channel blockers: manufacturer of fidaxomicin advises avoid concomitant use with verapamil

Ciclosporin: manufacturer of fidaxomicin advises avoid concomitant use with ciclosporin

Flubazim: plasma concentration of everolimus possibly enhanced by probenecid (increased plasma concentration)

Flurbiprofen see NSAIDs

Fluticasone see Opioid Analgesics

Flumoxef see Beta-lactam Antibiotics

Flumoxef see Beta-lactam Antibiotics

Flufyroxine see Antihistamines

Fluphenazine

Fluticasone

Flurbiprofen see NSAIDs

Flumoxef see Beta-lactam Antibiotics

Fluphenazine

Flurbiprofen see NSAIDs

Flumoxef see Beta-lactam Antibiotics

Fluphenazine
Flupentixol see Antipsychotics
Fluoxetine see Antidepressants, SSRI
Flutamide
- Anticoagulants: flutamide enhances anticoagulant effect of coumarins
Fluticasone see Corticosteroids
Fluvastatin see Statins
Fluvoxamine see Antidepressants, SSRI
Folic Acid see Folic Acid
Polyfructosán see Antidiabetic Agents
Folates
- Aminosalicylates: absorption of folic acid possibly reduced by sulfasalazine
- Antiepileptics: folates possibly reduce plasma concentration of phenobarbital and phenytoin

Flecainide
- Antimalarials: increased risk of ventricular arrhythmias when anti-arrrhythmics are used concomitantly
- Calcium-channel Blockers: increased risk of myocardial depression when anti-arrrhythmics are used concomitantly
- Diuretics: increased cardiac toxicity with flecainide if given concomitantly
- Antipsychotics: increased risk of ventricular arrhythmias when flecainide given with citalopram
- Antivirals: plasma concentration of flecainide possibly increased by fosamprenavir, indinavir, lopinavir and ritonavir (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when flecainide given with telaprevir (risk of ventricular arrhythmias)
- Beta-blockers: increased risk of myocardial depression and bradycardia when flecainide given with beta-blockers; increased myocardial depression when anti-arrrhythmics given with beta-blockers
- Calcium-channel Blockers: increased risk of myocardial depression and asystole when flecainide given with verapamil
- Diuretics: increased cardiac toxicity with flecainide if hypokalaemia occurs with aceclofenac, looip diuretics or thiazides and related diuretics
- Ulcer-healing Drugs: metabolism of flecainide inhibited by cimetidine (increased plasma concentration)

Fluoxacinil see Penicillins
Fluconazole see Antifungals, Triazole
Flucytosine
- Antifungals: renal excretion of flucytosine decreased by cimetidine (increased toxicity possibly increased)
- Cytotoxics: plasma concentration of flucytosine possibly reduced by cytarabine

Fludarabine
- Antipsychotics: avoid concomitant use of cytopotoxic with clozapine (increased risk of agranulocytosis)
- Cytotoxics: fludarabine increases intracellular concentration of cytarabine; increased pulmonary toxicity when fludarabine given with pentostatin (unacceptably high incidence of fatalities)
- Dipyridamole: effects of fludarabine possibly reduced by dipyridamole

Fludrocortisone see Corticosteroids
Fluorides
- Calcium Salts: absorption of fluorides reduced by calcium salts

Fluorouracil
- Antimalarials: (continued) of ventricular arrhythmias; plasma concentration of flecainide increased by quinine
- Antimuscarnics: increased risk of ventricular arrhythmias when anti-arrrhythmics that prolong the QT interval given with antipsychotics that prolong the QT interval; increased risk of arrhythmias when flecainide given with clozapine
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrrhythmics that prolong the QT interval given with antipsychotics that prolong the QT interval; increased risk of arrhythmias when flecainide given with clozapine
- Antivirals: plasma concentration of flecainide possibly increased by fosamprenavir, indinavir, lopinavir and ritonavir (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when flecainide given with saquinavir—avoid concomitant use; caution with flecainide advised by manufacturer of telaprevir (risk of ventricular arrhythmias)
- Beta-blockers: increased risk of myocardial depression and bradycardia when flecainide given with beta-blockers; increased myocardial depression when anti-arrrhythmics given with beta-blockers
- Calcium-channel Blockers: increased risk of myocardial depression and asystole when flecainide given with verapamil
- Diuretics: increased cardiac toxicity with flecainide if hypokalaemia occurs with aceclofenac, looip diuretics or thiazides and related diuretics
- Ulcer-healing Drugs: metabolism of flecainide inhibited by cimetidine (increased plasma concentration)

Fluorouracil
- Anticancer Drugs: metabolism of fluorouracil inhibited by metronidazole (increased toxicity)
- Anticoagulants: fluoroouracil enhances anticoagulant effect of coumarins
- Antiepileptics: fluorouracil possibly inhibits metabolism of phenytoin (increased risk of toxicity)
- Antipsychotics: avoid concomitant use of clozapine (increased risk of agranulocytosis)
- Cytotoxics: increased pulmonary toxicity when fludarabine given with pentostatin (unacceptably high incidence of fatalities)
- Antiparkinsonian Agents: metabolism of clozapine inhibited by cimetidine (increased plasma concentration)

Flutamide see Antiandrogens
Flutamide see Anticoagulants
Flutamide see Anticoagulants
Flutamide see Anticoagulants
Flutamide see Anticoagulants
Flutamide see Anticoagulants
Flutamide see Anticoagulants
Flutamide see Anticoagulants
Fosamprenavir
- Antivirals (continued) tant use; plasma concentration of fosamprenavir possibly reduced by nevirapine—avoid unboosted fosamprenavir; manufacturers advise avoid concomitant use of fosamprenavir with elaprevir; plasma concentration of fosamprenavir reduced by tipranavir
- Anxiolytics and Hypnotics: fosamprenavir possibly increases plasma concentration of midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam)
- Avanaflu: fosamprenavir possibly increases plasma concentration of avanaflu—see Dose under Avanaflu, p. 559
- Ciclosporin: fosamprenavir increases plasma concentration of ciclosporin.
- Cytotoxics: fosamprenavir possibly increases the plasma concentration of fosamprenavir increases plasma concentration of ciclosporin.
- Cytoxics: fosamprenavir possibly increases the plasma concentration of ciclosporin.
- Dapoxetine: manufacturer of daptoxetine advises dose reduction when fosamprenavir given with dapoxetine (see Dose under Dapoxetine, p. 560).
- Ergot Alkaloids: increased risk of ergotism when fosamprenavir given with ergotamine—avoid concomitant use.
- Lipid-regulating Drugs: possible increased risk of myopathy when fosamprenavir given with atorvastatin; possible increased risk of myopathy when fosamprenavir given with rosuvastatin advises avoid or consider reducing dose of rosuvastatin.
- Fusidic Acid: possibly reduces response to fusidic acid dose.
- Gabapentin
  Antiepileptics: bioavailability of gabapentin increased by morphine
  Antidepressants: absorption of gabapentin reduced by antacids
  Antidepressants: possibly antagonised by MAOIs and tricyclic-related antidepresants (convulsive threshold lowered); anticonvulsant effect of gabapentin antagonised by SSRI and SSNEs (convulsive threshold lowered)
  Antiemetics: possibly antagonised by antipsychotics (convulsive threshold lowered)
  Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat.
- Galantamine
  Note Increased risk of myelosuppression with other myelosuppressive drugs—consult product literature
  Note Valganciclovir interactions as for ganciclovir
- Antiinfectives: increased risk of convulsions when ganciclovir given with minipenem with cilastatin
- Antivirals: ganciclovir possibly increases plasma concentration of didanosine; profound myelosuppression when ganciclovir given with zidovudine (if possible avoid concomitant administration, particularly during initial ganciclovir therapy).
- MCophenolate: plasma concentration of ganciclovir possibly increased by mycophenolate, also plasma concentration of inactive metabolite of mycophenolate possibly increased.
- Probencid: excretion of ganciclovir reduced by probenecid (increased plasma concentration and risk of toxicity)
- Tacrolimus: possible increased risk of nephrotoxicity when ganciclovir given with tacrolimus.
- Gefitinib
  Antidepressants: bioavailability of gefitinib reduced by tricyclic antidepressants.
  Anticoagulants: gatifloxacin possibly increases anticoagulant effect of warfarin.
  Antidepressants: manufacturer of gefitinib advises avoid concomitant use with St John’s wort
  Antiepileptics: manufacturer of gefitinib advises avoid concomitant use with carbamazepine, phenytoin and phenytoin.
  Antifungals: plasma concentration of gefitinib increased by itraconazole.
  Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis).
  Antivirals: avoidance of gefitinib advised by manufacturer of boceprevir.
  Ucer-healing Drugs: plasma concentration of gefitinib reduced by ranitidine.
- Gemcitabine
  Anticoagulants: gemcitabine possibly enhances anticoagulant effect of warfarin.
  Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis).
- Gemeprost
  Gentamicin—see Aminoglycosides
  Gentamycin
  Gilbenclamide—see Antidiabetics
  Gilclicase—see Antidiabetics
  Gilipride—see Antidiabetics
  Glimepiride—see Antidiabetics
  Glipizide—see Antidiabetics
  Glucosamine
  Anticoagulants: glucosamine enhances anticoagulant effect of warfarin (avoid concomitant use).
- Glycercyl Trinitrate
- Glycopyrronium—see Antimuscarinics

Orlistat
- Glucosamine
- Glipizide: possibly increased risk of convulsions when antiepileptics given with orlistat.
- Galantamine
- Orlistat
- Fusidic Acid
- Fusinapril
- Procainapril
- Sildenafil
- Vardenafil
- Foscarnet
- Fosaprepitant
- Aprepitant
- Foscarnet
- Gentamicin
- Gilbenclamide
- Gilclicase
- Gilipride
- Glimepiride
- Glipizide
- Glucosamine
- Glycercyl Trinitrate
- Glycopyrronium

938 Appendix 1: Interactions BNF 68
Grapefruit Juice (continued)

- Sirolimus: grapefruit juice increases plasma concentration of sirolimus—avoid concomitant use
- Tacrolimus: grapefruit juice increases plasma concentration of tacrolimus
- Tadalafil: grapefruit juice possibly increases plasma concentration of tadalafil
- Tolvaptan: grapefruit juice increases plasma concentration of tolvaptan—avoid concomitant use
- Ulipristal: avoidance of grapefruit juice advised by manufacturer of ulipristal
- Vardenafil: grapefruit juice possibly increases plasma concentration of vardenafil—avoid concomitant use

Grapefruit Juice

- Aliskiren: grapefruit juice reduces plasma concentration of aliskiren—avoid concomitant use
- Anti-arrhythmics: grapefruit juice increases plasma concentration of amiodarone; grapefruit juice increases plasma concentration of dronedarone—avoid concomitant use
- Antidepressants: grapefruit juice possibly increases plasma concentration of sertraline
- Antihistamines: grapefruit juice reduces plasma concentration of bilastine; grapefruit juice increases plasma concentration of fupatadine—avoid concomitant use
- Antimalarials: avoidance of grapefruit juice advised by manufacturer of piperazine with arteminol; grapefruit juice possibly increases plasma concentration of artemether with lumefantrine
- Antipsychotics: grapefruit juice possibly increases plasma concentration of aripiprazole; manufacturer of quetiapine advises avoid concomitant use
- Antivirals: grapefruit juice possibly increases plasma concentration of efavirenz

Guanethidine see Adrenergic Neurone Blockers

Haloperidol see Antipsychotics

Heparins see Heparins

Hepatotoxicity

- ACE Inhibitors: increased risk of hyperkalaemia when heparins given with ACE inhibitors
- Aliskiren: increased risk of hyperkalaemia when heparins given with aliskiren
- Analgesics: possible increased risk of bleeding when heparins given with NSAIDs; increased risk of haemorrhage when anticoagulants given with intra- venous diclofenac (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with ketorolac (avoid concomitant use, including low-dose heparins); anticoagulant effect of heparin enhanced by aspirin
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when heparins given with angiotensin-II receptor antagonists
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with apixaban, dabigatran and rivaroxaban (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); Clopidogrel: increased risk of bleeding when heparins given with clopidogrel
- Dipyridamole: anticoagulant effect of heparins enhanced by dipyridamole
- Iloprost: anticoagulant effect of heparins possibly enhanced by iloprost
- Nitrate: anticoagulant effect of heparins reduced by infusion of glyceryl trinitrate

Histamine Antagonists: manufacturer of histamine advises avoid concomitant use with MAOIs; effects of histamine theoretically antagonised by tricyclics—manufacturer of histamine advises avoid concomitant use

- Antihistamines: effects of histamine theoretically antagonised by antihistamines—manufacturer of histamine advises avoid concomitant use
- Antimalarials: manufacturer of histamine advises avoid concomitant use with antimalarials
- Antipsychotics: effects of histamine theoretically antagonised by antipsychotics—manufacturer of histamine advises avoid concomitant use
Appendix 1: Interactions

Histamine (continued)

Ato伐quone: manufacturer of histamine advises avoid concomitant use with atovaquone
Clonidine: manufacturer of histamine advises avoid concomitant use with clonidine
Corticosteroids: manufacturer of histamine advises avoid concomitant use with corticosteroids
Ulcer-healing Drugs: effects of histamine theoretically antagonised by histamine H2-antagonists—manufacturer of histamine advises avoid concomitant use

Histamine H2-antagonists

- Alpha-blockers: cimetidine and ranitidine antagonise effects of tolazoline
- Analgesics: cimetidine inhibits metabolism of opioid analgesics (increased plasma concentration)
- Anti-arrhythmics: cimetidine increases plasma concentration of amiodarone and propafenone; cimetidine inhibits metabolism of flecainide (increased plasma concentration); cimetidine increases plasma concentration of lidocaine (increased risk of toxicity)
- Antibacterials: cimetidine increases plasma concentration of erythromycin (increased risk of toxicity, including deafness); cimetidine inhibits metabolism of metronidazole (increased plasma concentration); metabolism of cimetidine accelerated by rifampicin (reduced plasma concentration)
- Analgesics: cimetidine inhibits metabolism of coumarins (enhanced anticoagulant effect)
- Anti-depressants: cimetidine increases plasma concentration of catalpol, esctalam, mirtazapine and sertraline; cimetidine inhibits metabolism of amitriptyline, doxepin, imipramine and nortriptyline (increased plasma concentration); cimetidine increases plasma concentration of moclobemide (halve dose of moclobemide); cimetidine possibly increases plasma concentration of tricyclics
- Antidiabetics: cimetidine reduces excretion of metformin (increased plasma concentration); cimetidine increases plasma concentration of hypoglycaemic agents
- Anti-epileptics: cimetidine inhibits metabolism of carbamazepine, ephentoin and valproate (increased plasma concentration)
- Antifungals: histamine H2-antagonists reduce absorption of itraconazole; cimetidine reduces plasma concentration of posaconazole—manufacturer of posaconazole suspension advises avoid concomitant use; famotidine, nizatidine and ranitidine possibly reduce plasma concentration of posaconazole—manufacturer of posaconazole suspension advises avoid concomitant use; cimetidine increases plasma concentration of terbinafine
- Antihistamines: manufacturer of loratadine advises cimetidine possibly increases plasma concentration of loratadine; cimetidine increases plasma concentration of hydroxyzine
- Antimalarias: avoidance of cimetidine advised by manufacturer of artemether with lumefantrine; cimetidine inhibits metabolism of chloroquine and hydroxychloroquine and quinine (increased plasma concentration)
- Antipsychotics: cimetidine possibly enhances effects of antipsychotics, chlorpromazine and clozapine
- Antivirals: famotidine and ranitidine reduce the plasma concentration of atazanavir (adjust doses of both drugs—consult atazanavir product literature); manufacturer of atazanavir advises adjust doses of both drugs when cimetidine and nizatidine given with atazanavir—consult atazanavir product literature; famotidine increases plasma concentration of raltegravir; avoidance of histamine H2-antagonists for 12 hours before or 4 hours after rilpivirine advised by manufacturer of rilpivirine—consult product literature; cimetidine possibly increases plasma concentration of saquinavir
- Anxiolytics and Hypnotics: cimetidine inhibits metabolism of benzodiazepines, clomethiazole and zopiclone (increased plasma concentration)
- Anxiolytics and Hypnotics (continued)
- Benzodiazepines: manufacturer of alprazolam advises avoid concomitant use; cimetidine possibly reduces plasma concentration of alprazolam
- Benzodiazepines (continued)
- Clonazepam: manufacturer of clonazepam advises give at least 2 hours before or 10 hours after ranitidine; ranitidine possibly reduces plasma concentration of clonazepam
- Clobazam: manufacturer of clobazam advises give at least 2 hours before or 10 hours after ranitidine; ranitidine possibly reduces plasma concentration of clobazam
- Clobazam (continued)
- Lamotrigine: manufacturer of lamotrigine advises give at least 2 hours before or 10 hours after ranitidine; ranitidine possibly reduces plasma concentration of lamotrigine
- Lorazepam: manufacturer of lorazepam advises give at least 2 hours before or 10 hours after ranitidine; ranitidine possibly reduces plasma concentration of lorazepam
- Midazolam: manufacturer of midazolam advises give at least 2 hours before or 10 hours after ranitidine; ranitidine possibly reduces plasma concentration of midazolam
- Nitrazepam: manufacturer of nitrazepam advises give at least 2 hours before or 10 hours after ranitidine; ranitidine possibly reduces plasma concentration of nitrazepam
- Oxazepam: manufacturer of oxazepam advises give at least 2 hours before or 10 hours after ranitidine; ranitidine possibly reduces plasma concentration of oxazepam
- Prazepam: manufacturer of prazepam advises give at least 2 hours before or 10 hours after ranitidine; ranitidine possibly reduces plasma concentration of prazepam
- Stevadine: manufacturer of stevadine advises give at least 2 hours before or 10 hours after ranitidine; ranitidine possibly reduces plasma concentration of stevadine
- Temazepam: manufacturer of temazepam advises give at least 2 hours before or 10 hours after ranitidine; ranitidine possibly reduces plasma concentration of temazepam
- Zolpidem: manufacturer of zolpidem advises give at least 2 hours before or 10 hours after ranitidine; ranitidine possibly reduces plasma concentration of zolpidem
- Xanax: manufacturer of xanax advises give at least 2 hours before or 10 hours after ranitidine; ranitidine possibly reduces plasma concentration of xanax

Histamine H2-antagonists

Anxiolytics and Hypnotics (continued)
- Zaleplon: manufacturer of zaleplon advises give at least 2 hours before or 10 hours after ranitidine; ranitidine possibly reduces plasma concentration of zaleplon

Beta-blockers: cimetidine increases plasma concentration of atenolol, metoprolol and propranolol
- Caffeine citrate: cimetidine increases plasma concentration of caffeine citrate
- Calcium-channel Blockers: cimetidine possibly inhibits metabolism of calcium-channel blockers (increased plasma concentration)
- Ciclosporin: manufacturer of ciclosporin advises avoid concomitant use
- Ciclosporin (continued)
- Ciclosporin (continued)
5HT1-receptor Agonists (continued)

- Antidepressants: increased risk of CNS toxicity when SHT1 agonists given with citalopram (manufacturer of citalopram advises avoid concomitant use); increased risk of CNS toxicity when sumatriptan given with citalopram, escitalopram, fluoxetine, fluvoxamine or paroxetine; metabolism of frovatriptan inhibited by fluvoxamine; metabolism of zolmitriptan possibly inhibited by fluoxetine; increased risk of vasospasm when sumatriptan given with sertraline; possible increased serotoninergic effects when SHT1 agonists given with duloxetine or venlafaxine; risk of CNS toxicity when zolmitriptan given with MAOIs or moclobemide (reduce dose of zolmitriptan); risk of CNS toxicity when rizatriptan or sumatriptan given with MAOIs (avoid rizatriptan or sumatriptan for 2 weeks after MAOIs); risk of CNS toxicity when rizatriptan or sumatriptan given with moclobemide (avoid rizatriptan or sumatriptan for 2 weeks after moclobemide); possible increased serotoninergic effects when naratriptan given with SSRIs; increased serotoninergic effects when SHT1 agonists given with St John’s wort—avoid concomitant use

- Antifungals: plasma concentration of eletriptan increased by itraconazole (risk of toxicity)—avoid concomitant use

- Antivirals: plasma concentration of eletriptan increased by indinavir and ritonavir (risk of toxicity)—avoid concomitant use

Beta-blockers: plasma concentration of rizatriptan increased by propranolol (manufacturer of rizatripan advises halve dose and avoid within 2 hours of propranolol)

Dapoxetine: possible increased risk of serotoninergic effects when SHT1 agonists given with dapoxetine (manufacturer of dapoxetine advises SHT1 agonists should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping SHT1 agonists)

Dopaminergics: avoidance of SHT1 agonists advised by manufacturer of selegiline

Ergot Alkaloids: increased risk of vasospasm when almotriptan, rizatriptan, sumatriptan or zolmitriptan given with ergotamine (avoid ergotamine for 6 hours after almotriptan, rizatriptan, sumatriptan or zolmitriptan, avoid almotriptan, rizatriptan, sumatriptan or zolmitriptan for 24 hours after ergotamine); increased risk of vasospasm when eleetrotipran, furoatriptan or naratriptan given with ergotamine (avoid ergotamine for 24 hours after eleetrotipran, furoatriptan or naratriptan, avoid eleetrotipran, furoatriptan or naratriptan for 24 hours after ergotamine)

Lithium: possible risk of toxicity when sumatriptan given with lithium

Ulcer-healing Drugs: metabolism of zolmitriptan inhibited by cimetidine (reduce dose of zolmitriptan)

SHT2-receptor Antagonists

Analgesics: ondansetron possibly antagonises effects of tramadol

Antibacterials: metabolism of ondansetron accelerated by rifampicin (reduced effect)

Antiepileptics: metabolism of ondansetron accelerated by carbamazepine and phenytoin (reduced effect)

Cytotoxics: increased risk of ventricular arrhythmias when ondansetron given with vancomycin—avoid concomitant use

Dopaminergics: increased possible hypertensive effect when ondansetron given with dopamine—avoid concomitant use

Hydralazine see Vasodilator Antihypertensives

Hydrochlorothiazide see Diuretics

Hydrocortisone see Corticosteroids

Hydroflumethiazide see Diuretics

Hydromorphone see Opioid Analgesics
Appendix 1: Interactions

**Imipenem with Cilastatin**
- Antiepileptics: carbamazepine reduce plasma concentration of valproate—avoid concomitant use
- Antivirals: increased risk of convulsions when imipenem with cilastatin given with penciclovir
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

**Imipramine** see Antidepressants, Tricyclic Immunoglobulins

Note For advice on immunoglobulins and live virus vaccines, see under Normal Immunoglobulin, p. 852

**Indacaterol** see Sympathomimetics, Beta₂

**Indapamide** see Diuretics

**Indinavir**
- Aidesleukin: plasma concentration of indinavir possibly increased by aidesleukin
- Anti-arhythmics: indinavir possibly increases plasma concentration of amiodarone—avoid concomitant use; indinavir possibly increases plasma concentration of econazole (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antibacterials: indinavir increases plasma concentration of rifabutin (also plasma concentration of indinavir reduced) —reduce rifabutin dose; metabolism of indinavir accelerated by rifampicin (reduced plasma concentration—avoid concomitant use); avoidance of concomitant indinavir in severe renal and hepatic impairment advised by manufacturer of etelithromycin
- Anticoagulants: avoidance of indinavir advised by manufacturer of apixaban and rivaroxaban
- Antidepressants: plasma concentration of indinavir reduced by St John’s wort—avoid concomitant use
- Antiepileptics: plasma concentration of indinavir possibly reduced by carbamazepine and phenytoin, also plasma concentration of carbamazepine and phenytoin possibly increased; plasma concentration of indinavir possibly reduced by phenobarbital
- Antiulcer agents: plasma concentration of indinavir increased by tracazolazone (consider reducing dose of indinavir)
- Antimalarials: caution with indinavir advised by manufacturer of artemether with lumefantrine; indinavir possibly increases plasma concentration of quinine (increased risk of toxicity)
- Antimycotics: avoidance of indinavir advised by manufacturer of darifenacin and tolterodine; manufacturer of fosoterodine advises dose reduction when indinavir given with fosoterodine—consult fosoterodine product literature
- Antipsychotics: indinavir possibly increases plasma concentration of aripiprazole (reduce dose of aripiprazole—consult aripiprazole product literature); indinavir possibly increases plasma concentration of pimozone (increased risk of ventricular arrhythmias—avoid concomitant use); indinavir possibly increases plasma concentration of quetiapine—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: avoid concomitant use of indinavir with atazanavir; plasma concentration of both drugs increased when indinavir given with darunavir; absorption of indinavir reduced by didanosine tablets (give at least 1 hour apart); plasma concentration of indinavir reduced by efavirenz and nevirapine; plasma concentration of indinavir possibly reduced by etravirine—avoid concomitant use; indinavir increases plasma concentration of maraviroc (consider reducing dose of maraviroc); plasma concentration of indinavir increased by ritonavir; indinavir increases plasma concentration of saquinavir
- Anxiolytics and Hypnotics: increased risk of prolonged sedation when indinavir given with alprazolam—avoid concomitant use; indinavir possibly increases plasma concentration of midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam)
- Atovaquone: plasma concentration of indinavir possibly reduced by atovaquone
- Avanafil: indinavir possibly increases plasma concentration of avanafil—manufacturer of avanafil advises avoid concomitant use
- Bosentan: plasma concentration of indinavir possibly reduced by bosentan
- Ciclosporin: indinavir increases plasma concentration of ciclosporin
- Colchicine: indinavir possibly increases risk of colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: plasma concentration of indinavir possibly reduced by dexamethasone
- Cytotoxics: indinavir possibly increases plasma concentration of axitinib (reduced dose of axitinib—consult axitinib product literature); indinavir possibly increases the plasma concentration of bosutinib and cabazitaxel—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; indinavir possibly increases plasma concentration of erlotinib and everolimus—manufacturer of crizotinib and everolimus advises avoid concomitant use; indinavir possibly increases plasma concentration of pazopanib (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when indinavir given with ruxolitinib—consult ruxolitinib product literature
- Ergot Alkaloids: increased risk of ergotism when indinavir given with ergotamine—avoid concomitant use
- 5HT₃-receptor Agonists: indinavir increases plasma concentration of eletriptan (risk of toxicity)—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when indinavir given with atorvastatin; possible increased risk of myopathy when indinavir given with rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when indinavir given with simvastatin—avoid concomitant use; avoidance of indinavir advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased)
- Oralistat: absorption of indinavir possibly reduced by orlistat
- Ranolazine: indinavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: manufacturer of sildenafil—reduce initial dose of sildenafil
- Tadalafil: indinavir possibly increases plasma concentration of tadalafil
- Anakinra: avoid concomitant use of infliximab with anakinra
- Vaccines: avoid concomitant use of infliximab with live vaccines (see p. 828)

**Indinavir**
- Anxiolytics and Hypnotics (continued)
- Antiepileptics: carbamazepine reduce plasma concentration of midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam)
- Atovaquone: plasma concentration of indinavir possibly reduced by atovaquone
- Avanafil: indinavir possibly increases plasma concentration of avanafil—manufacturer of avanafil advises avoid concomitant use
- Bosentan: plasma concentration of indinavir possibly reduced by bosentan
- Ciclosporin: indinavir increases plasma concentration of ciclosporin
- Colchicine: indinavir possibly increases risk of colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: plasma concentration of indinavir possibly reduced by dexamethasone
- Cytotoxics: indinavir possibly increases plasma concentration of axitinib (reduced dose of axitinib—consult axitinib product literature); indinavir possibly increases the plasma concentration of bosutinib and cabazitaxel—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; indinavir possibly increases plasma concentration of erlotinib and everolimus—manufacturer of crizotinib and everolimus advises avoid concomitant use; indinavir possibly increases plasma concentration of pazopanib (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when indinavir given with ruxolitinib—consult ruxolitinib product literature
- Ergot Alkaloids: increased risk of ergotism when indinavir given with ergotamine—avoid concomitant use
- 5HT₃-receptor Agonists: indinavir increases plasma concentration of eletriptan (risk of toxicity)—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when indinavir given with atorvastatin; possible increased risk of myopathy when indinavir given with rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when indinavir given with simvastatin—avoid concomitant use; avoidance of indinavir advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased)
- Oralistat: absorption of indinavir possibly reduced by orlistat
- Ranolazine: indinavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: manufacturer of sildenafil—reduce initial dose of sildenafil
- Tadalafil: indinavir possibly increases plasma concentration of tadalafil
- Anakinra: avoid concomitant use of infliximab with anakinra
- Vaccines: avoid concomitant use of infliximab with live vaccines (see p. 828)
Interferons
Note Peginterferon alfa interactions as for interferon alfa
• Antivirals: caution with peginterferon alfa advised by manufacturer of adefovir; increased risk of peripheral neuropathy when interferon alfa given with adefovir
• Theophylline: interferon alfa inhibit metabolism of theophylline (consider reducing dose of theophylline)
Vaccines: manufacturer of interferon gamma advises avoid concomitant use with vaccines
Ipilimumab
• Antipsychotics: avoid concomitant use of cytoxicysts with clozapine (increased risk of agranulocytosis)
Cytotoxic: manufacturer of ipilimumab advises avoid concomitant use with vemurafenib
Ipratropium see Antimuscarinics
Irbesartan see Angiotensin-II Receptor Antagonists
Irinotecan
• Antidepressants: metabolism of irinotecan accelerated by St John’s wort (reduced plasma concentration—avoid concomitant use) Antiepileptics: plasma concentration of irinotecan and its active metabolites reduced by carbamazepine, phenobarbital and phenytoin
• Antifungals: increased risk of toxicity when irinotecan given with triazolam—avoid concomitant use
• Antipsychotics: avoid concomitant use of cytoxicysts with clozapine (increased risk of agranulocytosis)
• Antitubercular: isoniazid increases plasma concentration and risk of toxicity; isoniazid possibly inhibits metabolism of phenytoin (increased risk of toxicity) Anxiolytics and Hypnotics: isoniazid inhibits the metabolism of diazepam Corticosteroids: plasma concentration of isoniazid possibly reduced by corticosteroids Disulfram: isoniazid possibly increases CNS effects of disulfram Dopaminergics: isoniazid possibly reduces effects of levodopa Theophylline: isoniazid possibly increases plasma concentration of theophylline Vaccines: antibiotics inactivate oral typhoid vaccine—see p. 850
Isosorbide Dinitrate see Nitrates
Isosorbide Mononitrate see Nitrates
Isotretinoin see Retinoids
Itraconazole see Antifungals, Triazole
Ivabradine
• Anti-arrhythmics: increased risk of ventricular arrhythmias when ivabradine given with amisulpride or disopyramide
• Antihypertensives: plasma concentration of ivabradine possibly increased by clarithromycin and telithromycin—avoid concomitant use; increased risk of ventricular arrhythmias when ivabradine given with erythromycin—avoid concomitant use Antidepressants: plasma concentration of ivabradine reduced by St John’s wort—avoid concomitant use
• Antifungals: plasma concentration of ivabradine increased by fluconazole—reduce initial dose of ivabradine; plasma concentration of ivabradine possibly increased by itraconazole—avoid concomitant use
• Antimalarials: increased risk of ventricular arrhythmias when ivabradine given with eflornithine
• Antipsychotics: increased risk of ventricular arrhythmias when ivabradine given with risperidone
• Antitumor agents: plasma concentration of ivabradine possibly reduced by ritonavir—avoid concomitant use
• Beta-blockers: increased risk of ventricular arrhythmias when ivabradine given with sotalol
• Calcium-channel Blockers: plasma concentration of ivabradine increased by verapamil—avoid concomitant use
• Grapefruit juice: plasma concentration of ivabradine increased by grapefruit juice
• Pentamidine isethionate: increased risk of ventricular arrhythmias when ivabradine given with pentamidine isethionate
Ivacaftor
• Antimicrobials: plasma concentration of ivacaftor possibly increased by clarithromycin, erythromycin and telithromycin (see Dose under Ivacaftor, p. 216); plasma concentration of ivacaftor possibly reduced by rifampicin—manufacturer of ivacaftor advises avoid concomitant use; plasma concentration of ivacaftor reduced by rifampicin—manufacturer of ivacaftor advises avoid concomitant use
• Antiepileptics: plasma concentration of ivacaftor possibly reduced by St John’s wort—manufacturer of ivacaftor advises avoid concomitant use
• Antipsychotics: plasma concentration of ivacaftor possibly reduced by carbamazepine, phenobarbital and phenytoin—manufacturer of ivacaftor advises avoid concomitant use
• Antifungals: plasma concentration of ivacaftor reduced by fluconazole (see Dose under Ivacaftor, p. 216)
Appendix 1: Interactions

**Antipsychotics:**
- Etracozole
- Cypaconazole
- Voriconazole

**Antidepressants:**
- Lamotrigine

**Lactulose:**
- Possible increased risk of convulsions when antiepileptics given with
- Increased risk of toxicity—reduce lamotrigine dose

**Anxiolytics and Hypnotics:**
- Ivacaftor increases plasma concentration of
- Plasma concentration of lamotrigine reduced by

**Anticoagulants:**
- Kaolin possibly reduces absorption of
- Rifaximin

**Corticosteroids:**
- Laronidase possibly inhibited

**Antibacterials:**
- Kaolin possibly reduces absorption of
- Lactulose possibly enhances anti-

**Antidiabetics:**
- Lapaftin increases plasma concentration of
- Antiinfective: laronidase possibly inhibited

**Antifungals:**
- Antirrhinum

**Antivirals:**
- Plasma concentration of lamotrigine possibly increased by
- Proportions of lamotrigine increased by
- Proportions of lamotrigine increased by

**Beta-blockers:**
- Labetalol
- Lesser reduction in plasma concentration of phenytoin

**NSAIDs:**
- Ketoprofen
- Ketorolac

**Antihistamines:**
- Beta-blockers

**Anaesthetics, General:**
- Lapatinib
- Lapatinib possibly reduces absorption of

**Antiepileptics:**
- Levetiracetam
- Levetiracetam—avoid concomitant use with

**Antimalarials:**
- Leflunomide possibly increases plasma concentration of
- Leflunomide possibly enhances anticoagulant effect of antiepileptics

**Antibiotics:**
- Macrolides
- Macrolides

**Antibacterials:**
- Ampicillin
- Ampicillin

**Anticoagulants:**
- Vitamin K antagonists
- Vitamin K antagonists

**Anticonvulsant effect of antiepileptics**
- Anticonvulsant effect of antiepileptics
- Anticonvulsant effect of antiepileptics
- Anticonvulsant effect of antiepileptics

**Antidiabetics:**
- Repaglinide
- Repaglinide

**Antifungals:**
- Antifungals
- Antifungals

**Antimalarials:**
- Leflunomide possibly increases plasma concentration of
- Leflunomide possibly enhances anticoagulant effect of antiepileptics

**Antiprotozoal:**
- Laronidase
- Laronidase

**Antibacterials:**
- Antibacterials
- Antibacterials

**Anticoagulants:**
- Anticoagulants
- Anticoagulants

Levodopamine

Cytotoxics: risk of toxicity when levodopamine given with methotrexate

Lipid-regulating Drugs: the effect of levodopamine is significantly decreased by colesteryamine (enhanced elimination)—avoid unless drug elimination desired

Antibacterials: plasma concentration of levodopamine possibly increased by clarithromycin (increased risk of toxicity)

Antifungals: plasma concentration of levodopamine possibly increased by itraconazole (increased risk of toxicity)

Calcium-channel Blockers: plasma concentration of levodopamine possibly increased by verapamil (increased risk of toxicity)

Cardiac Glycosides: levodopamine possibly increases plasma concentration of digoxin

Ciclosporin: plasma concentration of levodopamine possibly increased by ciclosporin (increased risk of toxicity)

Lercanidipine see Calcium-channel Blockers

Leukotriene Receptor Antagonists

Anticoagulants

Levamisole possibly increases plasma concentration of zafirlukast increased by aspirin

Anticoagulants: plasma concentration of zafirlukast reduced by warfarin

Antiepileptics: plasma concentration of montelukast reduced by phenobarbital

Lipid-regulating Drugs: plasma concentration of montelukast increased by gemfibrozil

Theophylline: zafirlukast possibly increases plasma concentration of theophylline, also plasma concentration of zafirlukast reduced

Levamisole

Alcohol: possibility of disulfiram-like reaction when levamisole given with alcohol

Anticoagulants: levamisole possibly enhances anti-coagulant effect of warfarin

Antiepileptics: levamisole possibly increases plasma concentration of phenytoin

Levetiracetam

Antiepileptics: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered)

Antiepileptics: levetiracetam possibly increases risk of carbamazepine toxicity

Antimalarials: anticonvulsant effect of antiepileptics antagonised by methohexital

Antiparkinsonian: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered)

Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat

Levobupivacaine see Beta-blockers

Levofolinic Acid

Dopaminergics: anticonvulsant effect of antiepileptics antago

nised by benzodiazepines

Beta-blockers: enhanced hypotensive effect when levofolinic acid given with beta-blockers

Bupropion: increased risk of side-effects when levodopa given with bupropion

Calcium-channel Blockers: enhanced hypotensive effect when levodopa given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when levodopa given with clonidine

Diazoxide: enhanced hypotensive effect when levodopa given with diazoxide

Diuretics: enhanced hypotensive effect when levodopa given with diuretics

Dopaminergics: enhanced effects and increased toxicity of levodopa when given with selegiline (reduce dose of levodopa)

Iron: absorption of levodopa possibly reduced by oral iron

Memantine: effects of dopaminergics possibly enhanced by memantine

Methyldopa: enhanced hypotensive effect when levodopa given with methyldopa; antiparkinsonian effect of dopaminergics antagonised by methyltyrosine

Moxonidine: enhanced hypotensive effect when levodopa given with moxonidine

Muscle Relaxants: possible agitation, confusion and hallucinations when levodopa given with baclofen

Nitrates: enhanced hypotensive effect when levodopa given with nitrates

Vasoconstrictor Antihypertensives: enhanced hypotensive effect when levodopa given with hydralazine, minoxidil or sodium nitroprusside

Vitamins: effects of levodopa reduced by pyridoxine when given without dopa-decarboxylase inhibitor

Levofloxacin see Quinolones

Levofolic Acid see Folate

Levomepromazine see Antipsychotics

Levonorgestrel see Progestogens

Levonorgestrel see Progestogens

Levotiroxine see Thyroid Hormones

Lidocaine

Note: Interactions less likely when lidocaine used topically

Antiepileptics, Local: increased myocardial depression when levodopa given with lidocaine

Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with lidocaine

Angiotensin-II Receptor Antagonists: antagonised by diuretics

Beta-blockers: enhanced hypotensive effect when levodopa given with beta-blockers

Bupropion: increased risk of side-effects when levodopa given with bupropion

Calcium-channel Blockers: enhanced hypotensive effect when levodopa given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when levodopa given with clonidine

Diazoxide: enhanced hypotensive effect when levodopa given with diazoxide

Diuretics: enhanced hypotensive effect when levodopa given with diuretics

Dopaminergics: enhanced effects and increased toxicity of levodopa when given with selegiline (reduce dose of levodopa)

Iron: absorption of levodopa possibly reduced by oral iron

Memantine: effects of dopaminergics possibly enhanced by memantine

Methyldopa: enhanced hypotensive effect when levodopa given with methyldopa; antiparkinsonian effect of dopaminergics antagonised by methyltyrosine

Moxonidine: enhanced hypotensive effect when levodopa given with moxonidine

Muscle Relaxants: possible agitation, confusion and hallucinations when levodopa given with baclofen

Nitrates: enhanced hypotensive effect when levodopa given with nitrates

Vasoconstrictor Antihypertensives: enhanced hypotensive effect when levodopa given with hydralazine, minoxidil or sodium nitroprusside

Vitamins: effects of levodopa reduced by pyridoxine when given without dopa-decarboxylase inhibitor

Levofloxacin see Quinolones

Levofolic Acid see Folate

Levomepromazine see Antipsychotics

Levonorgestrel see Progestogens

Levonorgestrel see Progestogens

Levotiroxine see Thyroid Hormones

Lidocaine

Note: Interactions less likely when lidocaine used topically

Antiepileptics, Local: increased myocardial depression when levodopa given with lidocaine

Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with lidocaine
Appendix 1: Interactions

Lidocaine (continued)

- Antipsychotics: increased risk of ventricular arrhythmias when given with antipsychotics that prolong the QT interval
- Antivirals: plasma concentration of lidocaine possibly increased by stavudine and zidovudine; plasma concentration of lidocaine possibly increased by tenofovir and lamivudine—avoid concomitant use; increased risk of ventricular arrhythmias when lidocaine given with saquinavir—avoid concomitant use; caution with intravenous lidocaine advised by manufacturer of telaprevir
- Beta-blockers: increased myocardial depression when given with beta-blockers; possible increased risk of lidocaine toxicity when given with propranolol; increased risk of lidocaine toxicity when given with nadolol; increased risk of lidocaine toxicity when given with methyldopa without increased plasma concentration
- Diuretics: action of lidocaine antagonised by hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics
- Muscle Relaxants: neuromuscular blockade enhanced and prolonged when lidocaine given with suxamethonium
- Ulcer-healing Drugs: plasma concentration of lidocaine increased by omeprazole (increased risk of toxicity)

Linagliptin see Antidiabetics

Linoleic Acid

Note Linoleic acid is a reversible, non-selective MAO inhibitor—see interactions of MAOIs

Antibacterials: plasma concentration of linoleic acid reduced by rifampicin (possible therapeutic failure of linoleic acid)
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

Liothyronine see Thyroid Hormones

Lipid-regulating Drugs see Colesevelam, Colestipol, Colesterylam, Ezetimibe, Fibrates, Lomitapide, Nicotinic Acid, and Statins

Liraglutide see Antidiabetics

Lisdexamfetamine see Sympathomimetics

Lisinopril see ACE Inhibitors

Lithium

- ACE Inhibitors: excretion of lithium reduced by ACE inhibitors (increased plasma concentration)
- Analgesics: excretion of lithium reduced by NSAIDs (increased risk of toxicity), excretion of lithium reduced by ketorolac (increased risk of toxicity)—avoid concomitant use
- Angiotensin-II Receptor Antagonists: excretion of lithium reduced by angiotensin-II receptor antagonists (increased plasma concentration)
- Antacids: excretion of lithium increased by sodium bicarbonate (reduced plasma concentration)
- Anti-arrrhythmics: avoidance of lithium advised by manufacturer of amiodarone (risk of ventricular arrhythmias)
Antibacterials: increased risk of lithium toxicity when given with metronidazole
- Antidepressants: possible increased serotonergic effects when lithium given with venlafaxine, increased risk of CNS effects when lithium given with SSRIs (lithium toxicity reported); risk of toxicity when lithium given with tricyclics
- Antiepileptics: neurotoxicity may occur when lithium given with carbamazepine or phenytoin without increased plasma concentration of lithium; plasma concentration of lithium possibly affected by toprimate
- Antipsychotics: increased risk of extrapyramidal side-effects and possibly neurotoxicity when lithium given with clozapine, flupentixol, haloperidol, phenothiazines, thioridazine or zuclopenthixol; possible risk of toxicity when lithium given with

Lithium (continued)

- Antipsychotics (continued): olanzapine; increased risk of extrapyramidal side-effects when lithium given with sulpiride
- Anxiolytics and Hypnotics: increased risk of neurotoxicity when lithium given with clonazepam
- Calcium-channel Blockers: neurotoxicity may occur when lithium given with diltiazem or verapamil without increased plasma concentration of lithium
- Cytotoxics: increased risk of ventricular arrhythmias when lithium given with arsenic trioxide
- Dapoxetine: possible increased risk of serotonergic effects when lithium given with dapsone (manufacturer of dapsone advises lithium should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping lithium)
- Diuretics: excretion of lithium reduced by acetazolamide; excretion of lithium reduced by loop diuretics and thiazides and related diuretics (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides; excretion of lithium reduced by potassium-sparing diuretics and aldosterone antagonists (increased plasma concentration and risk of toxicity)
- 5HT1-receptor Agonists: possible risk of toxicity when lithium given with sumatriptan
- Methyldopa: neurotoxicity may occur when lithium given with methyldopa without increased plasma concentration of lithium
- Muscle Relaxants: lithium enhances effects of muscle relaxants; hyperkinesia caused by lithium possibly aggravated by baclofen
- Parasymptomimetics: lithium antagonises effects of neostigmine
- Theophylline: excretion of lithium increased by theophylline (reduced plasma concentration)

Lixisenatide see Antidiabetics

Lofepramine see Antidepressants, Tricyclic

Lofexidine

Alcohol: increased sedative effect when lofexidine given with alcohol
- Anxiolytics and Hypnotics: increased sedative effect when lofexidine given with anxiolytics and hypnotics

Lomitapide

Alcohol: manufacturer of lomitapide advises avoid concomitant use with alcohol
- Antipsychotics: manufacturer of lomitapide advises avoid concomitant use with dexamfetamine (plasma concentration of lomitapide possibly increased)
- Antibacterials: manufacturer of lomitapide advises avoid concomitant use with clarithromycin, erythromycin and telithromycin (plasma concentration of lomitapide possibly increased)
- Anticoagulants: lomitapide possibly enhances anticoagulant effect of warfarin
- Antifungals: manufacturer of lomitapide advises avoid concomitant use with raltegravir
- Antivirals: manufacturer of lomitapide advises avoid concomitant use with darunavir, fosamprenavir, indinavir, lopinavir, ritonavir, saquinavir, telaprevir and tipranavir (plasma concentration of lomitapide possibly increased)
- Aprepitant: manufacturer of lomitapide advises dose reduction when lomitapide given with fosaprepitant (see Dose under Lomitapide, p. 177)
- Calcium-channel Blockers: manufacturer of lomitapide advises avoid concomitant use with diltiazem and verapamil (plasma concentration of lomitapide possibly increased)
- Grapefruit Juice: manufacturer of lomitapide advises avoid concomitant use with grapefruit juice
- Lipid-regulating Drugs: lomitapide increases plasma concentration of atorvastatin; lomitapide increases plasma concentration of simvastatin (see Dose
Lomitapide
- Lipid-regulating Drugs (continued)
  - under Simvastatin, p. 173); absorption of lomitapide possibly reduced by bile acid sequestrants (give at least 4 hours apart)
Ranolazine: manufacturer of lomitapide advises dose reduction when lomitapide given with ranolazine (see Dose under Lomitapide, p. 177)
Ulcer-healing Drugs: manufacturer of lomitapide advises dose reduction when lomitapide given with cimetidine (see Dose under Lomitapide, p. 177)

Lomustine
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Ulcer-healing Drugs: myelosuppressive effects of lomustine possibly enhanced by cimetidine

Loperamide
- Desmopressin: loperamide increases plasma concentration of oral desmopressin

Lopinavir
Note In combination with ritonavir as Kaletra (ritonavir is present to inhibit lopinavir metabolism and increase plasma-lopinavir concentration)—see also Ritonavir
- Anti-arrhythmics: lopinavir possibly increases plasma concentration of flecainide (increased risk of ventricular arrhythmias)—avoid concomitant use; lopinavir possibly increases plasma concentration of lidocaine
- Antibacterials: plasma concentration of lopinavir reduced by rifampicin—avoid concomitant use; avoidance of concomitant lopinavir in severe renal and hepatic impairment advised by manufacturer of oxbutynycin
Anticoagulants: avoidance of concomitant lopinavir advised by manufacturer of apixaban; manufacturers advise avoid concomitant use of lopinavir with rivaroxaban
- Antidepressants: plasma concentration of lopinavir reduced by St John's wort—avoid concomitant use
- Antiepileptics: plasma concentration of lopinavir possibly reduced by carbamazepine, phenobarbital and phenytoin
Antihistamines: lopinavir possibly increases plasma concentration of chlorphenamine
Antimalarials: caution with lopinavir advised by manufacturer of arteether with lumefantrine
Antimuscarnics: avoidance of lopinavir advised by manufacturer of darifenacin and tolterodine
- Antipsychotics: lopinavir possibly increases plasma concentration of aripiprazole (reduce dose of aripiprazole—consult aripiprazole product literature); lopinavir possibly increases plasma concentration of quetiapine—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: manufacturers advise avoid concomitant use of lopinavir with boceprevir and telaprevir; lopinavir reduces plasma concentration of eldaravir, also plasma concentration of lopinavir increased (avoid concomitant use); plasma concentration of lopinavir reduced by efavirenz—consider increasing dose of lopinavir; lopinavir boosted with ritonavir increases plasma concentration of elvitegravir (reduce dose of elvitegravir); lopinavir reduces plasma concentration of fosamprenavir, effect on lopinavir plasma concentration not predictable—avoid concomitant use; lopinavir increases plasma concentration of maraviroc (consider reducing dose of maraviroc); plasma concentration of lopinavir possibly reduced by nevirapine—consider increasing dose of lopinavir; increased risk of ventricular arrhythmias when lopinavir given with saquinavir—avoid concomitant use; lopinavir increases plasma concentration of tenofovir; plasma concentration of lopinavir reduced by tipranavir

Lopinavir (continued)
- Bosentan: lopinavir increases plasma concentration of bosentan (consider reducing dose of bosentan)
Corticosteroids: plasma concentration of lopinavir possibly reduced by dexamethasone
- Cytotoxics: manufacturer of ruxolitinib advises dose reduction when lopinavir given with ruxolitinib—consult ruxolitinib product literature
Etomoprazag: lopinavir possibly reduces plasma concentration of etomoprazag
- Lipid-regulating Drugs: possible increased risk of myopathy when lopinavir given with atorvastatin; lopinavir increases plasma concentration of rosuvastatin—adjust dose of rosuvastatin (consult product literature); possible increased risk of myopathy when lopinavir given with simvastatin—avoid concomitant use; avoidance of lopinavir advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased)
- Orlistat: absorption of lopinavir possibly reduced by orlistat
- Ranolazine: lopinavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use
Sirolimus: lopinavir possibly increases plasma concentration of sirolimus
- Sympathomimetics, Beta 2: manufacturer of lopinavir advises avoid concomitant use with salmeterol
- Loprazolam see Anxiolytics and Hypnotics
Loratadine see Antihistamines
Lorazepam see Anxiolytics and Hypnotics
Lormetazepam see Anxiolytics and Hypnotics
Losartan see Angiotensin-II Receptor Antagonists
Lumefantrine see Artemether with Lumefantrine
Lymecycline see Tetracyclines
Mcitentan
- Antibacterials: plasma concentration of maitentan reduced by rifampicin—avoid concomitant use
Antidepressants: manufacturer of maitentan advises avoid concomitant use with St John's wort
- Antiepileptics: manufacturer of maitentan advises avoid concomitant use with carbamazepine and phenytoin
- Macrogols
  - Note Some manufacturers suggest taking other oral medication 1 hour before or 1 hour after macrogols to reduce possible interference with absorption

Macrolides
Note See also Telithromycin
Note Interactions do not apply to small amounts of erythromycin used topically
Analgesics: erythromycin increases plasma concentration of alfentanil; clarithromycin possibly increases plasma concentration of fentanyl
Antacids: absorption of azithromycin reduced by antacids
- Anti-arrhythmics: increased risk of ventricular arrhythmias when parenteral erythromycin given with amiodarone—avoid concomitant use; erythromycin increases plasma concentration of disopyramide (increased risk of toxicity); clarithromycin possibly increases plasma concentration of disopyramide (increased risk of ventricular arrhythmias); azithromycin possibly increases plasma concentration of disopyramide (increased risk of toxicity); avoidance of clarithromycin advised by manufacturer of dronedarone (risk of ventricular arrhythmias); erythromycin increases plasma concentration of dronedarone (increased risk of ventricular arrhythmias)—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when parenteral erythromycin given with maxifloxacin—avoid concomitant use; increased risk of side-effects including neutropenia when azithromycin given with eritabutin; clarithromycin increases plasma concentration of...
Appendix 1: Interactions

Antibacterials: rifabutin (increased risk of toxicity—reduce rifabutin dose); erythromycin possibly increases plasma concentration of rifabutin (increased risk of toxicity—reduce rifabutin dose); plasma concentration of clarithromycin reduced by rifampicin.

Anticoagulants: coumarins; clarithromycin and erythromycin enhance anticoagulant effect of coumarins; possible increased risk of bleeding when clarithromycin given with dabigatran.

Antidepressants: avoidance of macrolides advised by manufacturer of escetoxetine; avoidance of intravenous erythromycin advised by manufacturer of citalopram and escitalopram (risk of ventricular arrhythmias); clarithromycin possibly increases plasma concentration of trazodone.

Antidiabetics: clarithromycin enhances effects of repaglinide.

Antileptics: erythromycin increases plasma concentration of carbamazepine; clarithromycin increases plasma concentration of carbamazepine (consider reducing dose of carbamazepine); clarithromycin inhibits metabolism of phenytoin (increased plasma concentration); erythromycin possibly inhibits metabolism of valproate (increased plasma concentration).

Antiinfectives: avoidance of erythromycin advised by manufacturer of flucloxacillin; clarithromycin increases plasma concentration of irtraconazole.

Antihistamines: manufacturer of loratadine advises erythromycin possibly increases plasma concentration of loratadine; macrolides possibly inhibit metabolism of mizolastine (avoid concomitant use); erythromycin inhibits metabolism of mizolastine—avoid concomitant use; erythromycin increases plasma concentration of rupatadine.

Antimalarials: avoidance of macrolides advised by manufacturer of fluconazole; clarithromycin increases plasma concentration of irtraconazole.

Antipsychotics: avoidance of macrolides advised by manufacturer of droperidol (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when parenteral erythromycin given with droperidol—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with amisulpride—avoid concomitant use; erythromycin possibly increases plasma concentration of clozapine (possible increased risk of convulsions); increased risk of ventricular arrhythmias when clarithromycin given with ziprasidone—avoid concomitant use; possible increased risk of ventricular arrhythmias when erythromycin given with ziprasidone—avoid concomitant use; increased risk of ventricular arrhythmias when clarithromycin given with ziprasidone—avoid concomitant use; increased risk of ventricular arrhythmias when parenteral erythromycin given with sulpiride.

Antivirals: plasma concentration of both drugs increased when clarithromycin given with stavudine, and administered in combination with efavirenz, also plasma concentration of active metabolite of clarithromycin increased; plasma concentra

Macrolides
- Antimicrobials (continued)
  - Rifampicin (increased risk of toxicity—reduce rifampicin dose); erythromycin possibly increases plasma concentration of rifampicin (increased risk of toxicity—reduce rifampicin dose); plasma concentration of clarithromycin reduced by rifampicin.
- Anticoagulants: azithromycin possibly enhances anticoagulant effect of coumarins; clarithromycin and erythromycin enhance anticoagulant effect of coumarins; possible increased risk of bleeding when clarithromycin given with dabigatran.
- Antidepressants: avoidance of macrolides advised by manufacturer of escetoxetine; avoidance of intravenous erythromycin advised by manufacturer of citalopram and escitalopram (risk of ventricular arrhythmias); clarithromycin possibly increases plasma concentration of trazodone.
- Antidiabetics: clarithromycin enhances effects of repaglinide.
- Antileptics: erythromycin increases plasma concentration of carbamazepine; clarithromycin increases plasma concentration of carbamazepine (consider reducing dose of carbamazepine); clarithromycin inhibits metabolism of phenytoin (increased plasma concentration); erythromycin possibly inhibits metabolism of valproate (increased plasma concentration).
- Antiinfectives: avoidance of erythromycin advised by manufacturer of flucloxacillin; clarithromycin increases plasma concentration of irtraconazole.
- Antihistamines: manufacturer of loratadine advises erythromycin possibly increases plasma concentration of loratadine; macrolides possibly inhibit metabolism of mizolastine (avoid concomitant use); erythromycin inhibits metabolism of mizolastine—avoid concomitant use; erythromycin increases plasma concentration of rupatadine.
- Antimalarials: avoidance of macrolides advised by manufacturer of fluconazole; clarithromycin increases plasma concentration of irtraconazole.
- Antipsychotics: avoidance of macrolides advised by manufacturer of droperidol (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when parenteral erythromycin given with droperidol—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with amisulpride—avoid concomitant use; erythromycin possibly increases plasma concentration of clozapine (possible increased risk of convulsions); increased risk of ventricular arrhythmias when clarithromycin given with ziprasidone—avoid concomitant use; possible increased risk of ventricular arrhythmias when erythromycin given with ziprasidone—avoid concomitant use; increased risk of ventricular arrhythmias when parenteral erythromycin given with sulpiride.
- Antivirals: plasma concentration of both drugs increased when clarithromycin given with stavudine, and administered in combination with efavirenz, also plasma concentration of active metabolite of clarithromycin increased; plasma concentration of clarithromycin reduced by efavirenz; plasma concentration of active metabolite of clarithromycin increased; plasma concentra

Macrolides
- Antimicrobials (continued)
  - Clarithromycin possibly increases plasma concentration of saquinavir (consider reducing dose of maraviroc); avoidance of clarithromycin and erythromycin advised by manufacturer of atazanavir—avoid concomitant use; possible increased risk of ventricular arrhythmias when erythromycin given with saquinavir—avoid concomitant use; plasma concentration of both drugs possibly increased when clarithromycin given with saquinavir and etravirine (increased plasma concentration with increased sedation); erythromycin increases plasma concentration of buspironone (reduce dose of buspironone); erythromycin inhibits the metabolism of zopiclone.
- Anxiolytics and Hypnotics: clarithromycin and erythromycin inhibit metabolism of midazolam (increased plasma concentration with increased sedation); erythromycin increases plasma concentration of buspironone (reduce dose of buspironone); erythromycin inhibits the metabolism of zopiclone.
- Aprepitant: clarithromycin possibly increases plasma concentration of aprepitant.
- Atomoxetine: increased risk of ventricular arrhythmias when parenteral erythromycin given with atomoxetine.
- Avanafil: clarithromycin possibly increases plasma concentration of avanafil—manufacturer of avanafil advises avoid concomitant use; erythromycin increases plasma concentration of avanafil—see Dose under Avanafil, p. 559.
- Calcium-channel Blockers: clarithromycin and erythromycin possibly inhibit metabolism of calcium-channel blockers (increased risk of side-effects); avoidance of erythromycin advised by manufacturer of lercanidipine.
- Cardiac Glycosides: macrolides increase plasma concentration of digoxin (increased risk of toxicity).
- Ciclosporin: macrolides possibly inhibit metabolism of ciclosporin (increased plasma concentration); clarithromycin and erythromycin inhibit metabolism of ciclosporin (increased plasma concentration).
- Cilostazol: clarithromycin possibly increases plasma concentration of cilostazol (see Dose under Cilostazol, p. 140); erythromycin increases plasma concentration of cilostazol (see Dose under Cilostazol, p. 140).
- Clotidiprel: erythromycin possibly reduces antiplatelet effect of clotidiprel.
- Colchicine: azithromycin, clarithromycin and erythromycin possibly increase risk of colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment).
- Corticosteroids: erythromycin possibly inhibits metabolism of corticosteroids; erythromycin inhibits the metabolism of methylprednisolone; clarithromycin possibly increases plasma concentration of methylprednisolone.
- Cyclosporin: erythromycin possibly increases the plasma concentration of afatinib—manufacturer of afatinib advises separating administration of erythromycin by 6 to 12 hours; clarithromycin and...
Macrolides
- Cytotoxicity (continued)
  erythromycin possibly increase plasma concentration of axitinib (reduce dose of axitinib—consult axitinib product literature); clarithromycin and erythromycin possibly increase the plasma concentration of bosutinib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; clarithromycin possibly increases plasma concentration of crizotinib and everolimus—manufacturer of crizotinib and everolimus advises avoid concomitant use; erythromycin increases plasma concentration of everolimus (consider reducing the dose of everolimus—consult everolimus product literature); avoidance of clarithromycin advised by manufacturer of nilotinib; clarithromycin possibly increases plasma concentration of pazopanib (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when clarithromycin given with ruxolitinib—consult ruxolitinib product literature; possible increased risk of ventricular arrhythmias when parenteral erythromycin given with vandetanib—avoid concomitant use; clarithromycin increases plasma concentration of cabazitaxel—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel; in vitro studies suggest a possible interaction between erythromycin and docetaxel (consult docetaxel product literature); increased risk of ventricular arrhythmias when erythromycin given with arsenic trioxide—erythromycin increases toxicity of vinblastine—avoid concomitant use; possible increased risk of neutropenia when clarithromycin given with vinorelbine.
Dapoxetine: manufacturer of dapoxetine advises dose reduction when clarithromycin and erythromycin given with dapoxetine (see Dose under Dapoxetine, p. 580).
- Diuretics: clarithromycin increases plasma concentration of eplerenone—avoid concomitant use; erythromycin increases plasma concentration of eplerenone (reduce dose of eplerenone).
- Domperidone: possible increased risk of ventricular arrhythmias when clarithromycin given with domperidone—avoid concomitant use; erythromycin increases plasma concentration of domperidone (increased risk of ventricular arrhythmias—avoid concomitant use).
Dopaminergics: macrolides possibly increase plasma concentration of bromocriptine and cabergoline (increased risk of toxicity).
- Ergot Alkaloids: increased risk of ergotism when macrolides given with ergotamine—avoid concomitant use.
Fidaxomicin: avoidance of clarithromycin and erythromycin advised by manufacturer of fidaxomicin.
- 5HT1-Receptor Agonists: clarithromycin and erythromycin increase plasma concentration of eletriptan (risk of toxicity)—avoid concomitant use.
- Ibradibrad: clarithromycin possibly increases plasma concentration of ibradibrad—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with ibradibrad—avoid concomitant use.
- Ivacaftor: clarithromycin and erythromycin possibly increase plasma concentration of ivacaftor (see Dose under Ivacaftor, p. 216).
- Lenalidomide: clarithromycin possibly increases plasma concentration of lenalidomide (increased risk of toxicity).
- Leukotriene Receptor Antagonists: erythromycin reduces plasma concentration of zafirlukast.
- Lipid-regulating Drugs: clarithromycin increases plasma concentration of atorvastatin and pravastatin.

Macrolides
- Lipid-regulating Drugs (continued)
  simvastatin; possible increased risk of myopathy when erythromycin given with atorvastatin; erythromycin increases plasma concentration of pravastatin; erythromycin reduces plasma concentration of rosuvastatin; increased risk of myopathy when clarithromycin or erythromycin given with simvastatin (avoid concomitant use); avoidance of clarithromycin and erythromycin advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased).
Mirabegron: when given with clarithromycin avoid or reduce dose of mirabegron in hepatic or renal impairment (see Mirabegron, p. 552).
Oestrogens: erythromycin increases plasma concentration of estradiol.
Parasympathomimetics: erythromycin increases plasma concentration of galantamine.
- Pentamidine isethionate: increased risk of ventricular arrhythmias when parenteral erythromycin given with pentamidine isethionate.
Progestogens: erythromycin increases plasma concentration of norethisterone.
- Ranolazine: clarithromycin possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use.
- Sildenafil: clarithromycin increases plasma concentration of sildenafil—consider reducing dose of sildenafil; erythromycin increases plasma concentration of sildenafil—reduce initial dose of sildenafil.
- Sirolimus: clarithromycin increases plasma concentration of sirolimus—avoid concomitant use; plasma concentration of both drugs increased when erythromycin given with sirolimus.
- Tacrolimus: clarithromycin and erythromycin increase plasma concentration of tacrolimus.
Tadalafil: clarithromycin and erythromycin possibly increase plasma concentration of tadalafil.
- Theophylline: clarithromycin possibly increases plasma concentration of theophylline; erythromycin increases plasma concentration of theophylline (also theophylline may reduce absorption of oral erythromycin).
- Ticagrelor: clarithromycin possibly increases plasma concentration of ticagrelor—manufacturer of ticagrelor advises avoid concomitant use; erythromycin possibly increases plasma concentration of ticagrelor.
- Ulcer-healing Drugs: plasma concentration of erythromycin increased by cinetidine (increased risk of toxicity, including deafness); plasma concentration of both drugs increased when clarithromycin given with omeprazole.
Ultrapristal: avoidance of clarithromycin advised by manufacturer of ultrapristal; erythromycin increases plasma concentration of ultrapristal—manufacturer of ultrapristal advises avoid concomitant use.
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850.
Vardenafil: clarithromycin possibly increases plasma concentration of vardenafil (consider reducing initial dose of vardenafil); erythromycin increases plasma concentration of vardenafil (reduce dose of vardenafil).

Magnesium (parenteral)
- Calcium-channel Blockers: profound hypotension reported with concomitant use of parenteral magnesium and nifedipine in pre-eclampsia.
- Muscle Relaxants: parenteral magnesium enhances effects of non-depolarising muscle relaxants and suxamethonium.

Magnesium Salts (oral) see Antacids.
Mannitol: Antibacterials: avoidance of mannitol advised by manufacturer of tobramycin.
Appendix 1: Interactions

Antidepressants:

**MAOIs**

Note: For interactions of reversible MAO-A inhibitors (RIMAs) see Moclobemide, and for interactions of MAO-B inhibitors see Rasagiline and Selegiline; the antibacterial Linezolid is a reversible, non-selective MAO inhibitor.

ACE inhibitors: MAOIs possibly enhance hypotensive effect of ACE inhibitors.

Adrenergic Neurone Blockers: enhanced hypotensive effect when MAOIs given with adrenergic neurone blockers.

- Alcohol: MAOIs interact with tyramine found in some beverages containing alcohol and some decaffeinated beverages (hypertensive crisis)—if no tyramine, enhanced hypotensive effect.
- Alpha2-adrenoceptor Stimulants: avoidance of MAOIs advised by manufacturer of apraclonidine and brimonidine.
- Alpha-blockers: avoidance of MAOIs advised by manufacturer of imidarin; enhanced hypotensive effect when MAOIs given with alpha-blockers.
- Analgesics: possible increased serotonergic effects when MAOIs given with fentanyl; CNS excitation or depression (hypertensive crisis) when MAOIs given with pethidine—avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased serotonergic effects and increased risk of convulsions when MAOIs given with tramadol—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; avoidance of MAOIs advised by manufacturer of nefopam; possible CNS excitation or depression (hypertensive crisis) when MAOIs given with aripiprazole—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; Angiotensin-II Receptor Antagonists: MAOIs possibly enhance hypotensive effect of angiotensin-II receptor antagonists.
- Antidepressants: increased risk of hypertension and CNS excitation when MAOIs given with reboxetine (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs); after stopping MAOIs do not start clotiapram, escitalopram, etilefrine, paroxetine or sertraline for 2 weeks, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, etilefrine, paroxetine or sertraline; after stopping MAOIs do not start etilefrine for 2 weeks, also MAOIs should not be started until at least 5 days after stopping etilefrine; enhanced CNS effects and toxicity when MAOIs given with venlafaxine (venlafaxine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine); increased risk of hypertension and CNS excitation when MAOIs given with other MAOIs (avoid for at least 2 weeks after stopping previous MAOIs and then start at a reduced dose); after stopping MAOIs do not start moclobemide for at least 1 week; MAOIs increase CNS effects of SSRIs (risk of serious toxicity); after stopping MAOIs do not start mirtazapine for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping mirtazapine; after stopping MAOIs do not start tricyclic-related antidepressants for 2 weeks, also MAOIs should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; increased risk of hypertension and CNS excitation when MAOIs given with tricyclics, tricycles should not be started until 2 weeks after stopping MAOIs (3
- MAOIs

Antidepressants (continued)

- weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine).
- Antidiabetics: MAOIs possibly enhance hypoglycaemic effect of antidiabetics; MAOIs enhance hypoglycaemic effect of insulin, metformin and sulfonylureas.
- Antiepileptics: MAOIs possibly antagonise anti-convulsant effect of antiepileptics (convulsive threshold lowered); avoidance for 2 weeks after stopping MAOIs advised by manufacturer of carbamazepine, also antagonism of anticonvulsant effect.
- Antihistamines: avoidance of MAOIs advised by manufacturer of hydroxyzine; avoidance of promethazine for 2 weeks after stopping MAOIs advised by manufacturer of promethazine, increased antimuscarinic and sedative effects when MAOIs given with antihistamines.
- Antimalarials: avoidance of antidepressants advised by manufacturer of arteether with lumefantrine and pyperaquadin with atovaquone.
- Antimuscarinics: increased risk of antimuscarinic side-effects when MAOIs given with antimuscarinics.
- Antipsychotics: CNS effects of MAOIs possibly increased by clozapine.
- Anxiolytics and Hypnotics: avoidance of MAOIs advised by manufacturer of buspirone; manufacturer of tranylcypromine advises avoid buspirone for 14 days after stopping tranylcypromine.
- Atomoxetine: after stopping MAOIs do not start atomoxetine for 2 weeks, also MAOIs should not be started for at least 2 weeks after stopping atomoxetine; possible increased risk of convulsions when antidepressants given with atomoxetine.
- Beta-blockers: enhanced hypotensive effect when MAOIs given with beta-blockers.
- Buspiron: avoidance of buspiron for 2 weeks after stopping MAOIs advised by manufacturer of buspiron.
- Calcium-channel Blockers: enhanced hypotensive effect when MAOIs given with calcium-channel blockers.
- Clonidine: enhanced hypotensive effect when MAOIs given with clonidine.
- Dapoxetine: increased risk of serotonergic effects when MAOIs given with dapoxetine (MAOIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping MAOIs).
- Diazoxide: enhanced hypotensive effect when MAOIs given with diazoxide.
- Diuretics: enhanced hypotensive effect when MAOIs given with diuretics.
- Dopaminergics: avoid concomitant use of non-selective MAOIs with entacapone; risk of hypertensive crisis when MAOIs given with levodopa, avoid levodopa for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when MAOIs given with rasagline, avoid MAOIs for at least 2 weeks after stopping rasagline; enhanced hypotensive effect when MAOIs given with selegiline—manufacturer of selegiline advises avoid concomitant use; avoid concomitant use of MAOIs with tolcapone.
- Doxapram: MAOIs enhance effects of doxapram.
- Histamine: avoidance of MAOIs advised by manufacturer of histamine.
- 5HT1-receptor Agonists: risk of CNS toxicity when MAOIs given with rizatriptan or sumatriptan (avoid rizatriptan or sumatriptan for 2 weeks after MAOIs); risk of CNS toxicity when MAOIs given with zolmitriptan (reduce dose of zolmitriptan).
### Appendix 1: Interactions

#### MAOIs (continued)
- **Methyldopa**: avoidance of MAOIs advised by manufacturer of *methyldopa*
- **Moxonidine**: enhanced hypotensive effect when MAOIs given with moxonidine
- **Muscle Relaxants**: phenelzine enhances effects of *suxamethonium*
- **Nicorandil**: enhanced hypotensive effect when MAOIs given with *nicorandil*
- **Nitrates**: enhanced hypotensive effect when MAOIs given with nitrates
- **Pholcodine**: avoidance of pholcodine for 2 weeks after stopping MAOIs advised by manufacturer of *pholcodine*
- **Sympathomimetics**: risk of hypertensive crisis when MAOIs given with *pseudoephedrine*, *ephedrine*, *isomethetpine*, *lidoxifemetamine*, *metaraminol*, *methylphenidate*, *ephephedrine* or *pseudoephedrine*, avoid dexamphetamine, ephedrine, isomethetine, lidoxifemetamine, metaraminol, methylphenidate, phentoline or pseudoephedrine for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when MAOIs given with *oxymetazoline*, some manufacturers advise avoid oxymetazoline for at least 2 weeks after stopping MAOIs
- **Tetrabenazine**: risk of CNS toxicity when MAOIs given with *tetrabenazine* (avoid tetrabenazine for 2 weeks after MAOIs)

#### Vasodilator Antihypertensives: enhanced hypotensive effect when MAOIs given with *hydralazine*, *minoxidil* or sodium nitroprusside

#### MAOIs, reversible see Moclobemide

#### Maraviroc
- **Antibacterials**: plasma concentration of maraviroc possibly increased by *clarithromycin* and *telithromycin* (consider reducing dose of maraviroc); plasma concentration of maraviroc reduced by *rifampicin*—consider increasing dose of maraviroc
- **Antidepressants**: plasma concentration of maraviroc possibly reduced by *St John’s wort*—avoid concomitant use
- **Antivirals**: plasma concentration of maraviroc increased by *atazanavir, boceprevir*, *darunavir, indinavir, etravirine* and *telaprevir* (consider reducing dose of maraviroc); plasma concentration of maraviroc possibly reduced by *efavirenz*—consider increasing dose of maraviroc; plasma concentration of maraviroc possibly reduced by *etravirine*; maraviroc reduces plasma concentration of *osaprenavir*—avoid concomitant use; plasma concentration of maraviroc increased by *ritonavir*
- **Cobicistat**: plasma concentration of maraviroc possibly increased by *cobicistat* (reduce dose of maraviroc)
- **Orlistat**: absorption of maraviroc possibly reduced by *orlistat*

#### Mebendazole
- **Ulcerc-Healing Drugs**: metabolism of mebendazole possibly inhibited by *cimetidine* (increased plasma concentration)

#### Medroxyprogesterone see Progestogens

#### Mefenamic Acid see NSAIDs

#### Mefloquine (continued)
- **Antidepressants**: avoidance of antidepressants advised by manufacturer of *citalopram* and *escitalopram* (risk of ventricular arrhythmias)
- **Antiepileptics**: possible increased risk of ventricular arrhythmias when mefloquine given with *cobicistat* (reduce dose of maraviroc)
- **Antimalarials**: avoidance of antimalarials advised by manufacturer of *trimethoprim with sulfamethoxazole*; increased risk of convulsions when mefloquine given with *chloroquine* and *hydroxychloroquine*; increased risk of convulsions when mefloquine given with *quinine* (but should not prevent the use of intravenous quinine in severe cases)
- **Antimeasles**: possible increased risk of ventricular arrhythmias when mefloquine given with *haloperidol*—avoid concomitant use; avoidance of mefloquine advised by manufacturer of *amisulpride*; increased risk of ventricular arrhythmias when mefloquine given with *ritonavir*—avoid concomitant use; manufacturer of risperidone advises possible risk of ventricular arrhythmias when mefloquine given with *risperidone*.
- **Antivirals**: mefloquine possibly reduces plasma concentration of *ritonavir*

#### Mefloquine (continued)
- **Atomoxetine**: increased risk of ventricular arrhythmias when mefloquine given with *atomoxetine*
- **Beta-blockers**: increased risk of bradycardia when mefloquine given with *beta-blockers*
- **Calcium-channel Blockers**: possible increased risk of bradycardia when mefloquine given with *calcium-channel blockers*
- **Cardiac Glycosides**: possible increased risk of bradycardia when mefloquine given with *digoxin* and *digoxigenin*; possible increased risk of bradycardia when mefloquine given with *crizotinib*
- **Histamine**: avoidance of antimalarials advised by manufacturer of *histamine*
- **Ivabradine**: increased risk of ventricular arrhythmias when mefloquine given with *ivabradine*
- **Vaccines**: antimalarials inactivate oral typhoid vaccine—see p. 850

#### Megestrol see Progestogens

#### Melatonin see Anxiolytics and Hypnotics

#### Meloxicam see NSAIDs

#### Melphalan
- **Antibacterials**: increased risk of melphalan toxicity when given with *nalidixic acid*
- **Antipsychotics**: avoid concomitant use of cytotoxics with *clozapine* (increased risk of agranulocytosis)
- **Cardiac Glycosides**: melphalan possibly reduces absorption of *digoxin tablets*
- **Ciclosporin**: increased risk of nephrotoxicity when melphalan given with *ciclosporin*

#### Memantine
- **Anaesthetics, General**: increased risk of CNS toxicity when memantine given with *ketamine* (manufacturer of memantine advises avoid concomitant use)
- **Anticoagulants**: increased risk of CNS toxicity when memantine given with *electromethophan* (manufacturer of memantine advises avoid concomitant use)
- **Antimuscarinics**: memantine possibly enhances anticoagulant effect of *warfarin*
- **Anmisuracines**: memantine possibly enhances effects of antimuscarinics
- **Antipsychotics**: memantine possibly reduces effects of *antipsychotics*
- **Dopaminergics**: memantine possibly enhances effects of *dopaminergics and selegiline*; increased risk of CNS toxicity when memantine given with *amantadine* (manufacturer of memantine advises avoid concomitant use)
- **Muscle Relaxants**: memantine possibly modifies effects of *baclofen and dantrolene*

#### Mepacrine
- **Antimalarials**: mepacrine increases plasma concentration of *primamique* (increased risk of toxicity)
Appendix 1: Interactions

Meprobamate see Anxiolytics and Hypnotics
Mepatrazinol see Opioid Analgesics
Mercaptopurine
- Alluporinol: enhanced effects and increased toxicity of mercaptopurine when given with allopurinol (reduce dose of mercaptopurine to one quarter of usual dose)
- Aminosalicylates: possible increased risk of leukopenia when mercaptopurine given with aminosalicylates
- Antibacterials: increased risk of haematological toxicity when mercaptopurine given with sulfamethoxazole (as co-trimoxazole); increased risk of haematological toxicity when mercaptopurine given with trimethoprim (also with co-trimoxazole)
- Anticoagulants: mercaptopurine possibly reduces anticoagulant effect of coumarins
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
Dairy Products: plasma concentration of mercaptopurine possibly reduced by dairy products—manufacturer of mercaptopurine advises give at least 1 hour before or 2 hours after dairy products
Febuxostat: avoidance of mercaptopurine advised by manufacturer of febuxostat
Meropenem
- Antiepileptics: carbapenems reduce plasma concentration of valproate—avoid concomitant use
- Probenecid: excretion of meropenem reduced by probenecid
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850
Mesalazine see Aminosalicylates
Mesrenol see Oestrogens
Metaraminol see Sympathomimetics
Metformin see Antidiabetics
Methadone see Opioid Analgesics
Methenamine
- Analgesics: antifolate effect of methotrexate increased by methenamine
- Diuretics: avoid concomitant use of methenamine with diuretics
- Potassium Salts: avoid concomitant use of methenamine with potassium citrate
- Sodium Citrate: avoid concomitant use of methenamine with sodium citrate
- Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850
Methocarbamol see Muscle Relaxants
Methotrexate (continued)

Antiepileptics: antifolate effect of methotrexate increased by phenytoin
- Antimarialas: antifolate effect of methotrexate increased by pyrimethamine
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
- Cardiac Glycosides: methotrexate possibly reduces absorption of digoxin tablets
- Ciclosporin: risk of toxicity when methotrexate given with ciclosporin
- Corticosteroids: possible increased risk of hepatotoxicity when high-dose methotrexate given with dexamethasone
- Cytotoxics: increased pulmonary toxicity when methotrexate given with cisplatin
- Diuretics: excretion of methotrexate increased by alkaline urine due to acetazolamide
- Leflunomide: risk of toxicity when methotrexate given with leflunomide
- Probenecid: excretion of methotrexate reduced by probenecid (increased risk of toxicity)
- Retinoids: plasma concentration of methotrexate increased by actretin (also increased risk of hepatotoxicity)—avoid concomitant use
- Theophylline: methotrexate possibly increases plasma concentration of theophylline
- Ulcer-healing Drugs: excretion of methotrexate possibly reduced by proton pump inhibitors (increased risk of toxicity)
Methoxamine see Sympathomimetics
Methylpodan
- ACE Inhibitors: enhanced hypotensive effect when methylpodan given with ACE inhibitors
- Adrenergic Neurone Blockers: enhanced hypotensive effect when methylpodan given with adrenergic neurone blockers
- Alcohol: enhanced hypotensive effect when methylpodan given with alcohol
- Aldesleukin: enhanced hypotensive effect when methylpodan given with aldesleukin
- Alpha-blockers: enhanced hypotensive effect when methylpodan given with alpha-blockers
- Anaesthetics, General: enhanced hypotensive effect when methylpodan given with general anaesthetics
- Analgesics: hypotensive effect of methylpodan antagonised by NSAIDs
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when methylpodan given with angiotensin-II receptor antagonists
- Antidepressants: manufacturer of methylpodan advises avoid concomitant use with MAOIs
- Antipsychotics: enhanced hypotensive effect when methylpodan given with antipsychotics (also increased risk of extrapyramidal effects)
- Anxiolytics and Hypnotics: enhanced hypotensive effect when methylpodan given with anxiolytics and hypnotics
- Beta-blockers: enhanced hypotensive effect when methylpodan given with beta-blockers
- Calcium-channel Blockers: enhanced hypotensive effect when methylpodan given with calcium-channel blockers
- Clonidine: enhanced hypotensive effect when methylpodan given with clonidine
- Corticosteroids: hypotensive effect of methylpodan antagonised by corticosteroids
- Diazoxide: enhanced hypotensive effect when methylpodan given with diazoxide
- Diuretics: enhanced hypotensive effect when methylpodan given with diuretics
- Dopaminergics: methylpodan antagonises anti-parkinsonian effect of dopaminergics; increased risk of extrapyramidal side effects when methylpodan given with amantadine; effects of methylpodan possi-
Methylthioninium

- Enhanced hypotensive effect when methylthioninium given with mirtazapine—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration).

Methylprednisolone

- see Methylprednisolone

Methyldopa

- Dopaminergic effects (continued) 
  - Enhanced hypotensive effect when methylthioninium given with levodopa
  - Enhanced hypotensive effect of metyldopa antagonised by oral iron
  - Lithium: neurotoxicity may occur when methylthioninium given with lithium without increased plasma concentration of lithium
  - Moxisylyte: enhanced hypotensive effect when metyldopa given with moxisylyte
  - Moxonidine: enhanced hypotensive effect when methylthioninium given with moxonidine
  - Muscle Relaxants: enhanced hypotensive effect when methylthioninium given with baclofen or tizanidine
  - Nitrates: enhanced hypotensive effect when methylthioninium given with nitrates
  - Oestrogens: enhanced hypotensive effect of methylthioninium antagonised by oestrogens
  - Prostaglandins: enhanced hypotensive effect when methylthioninium given with alprostadil
  - Sympathomimetics, Beta 2: acute hypotension reported when methylthioninium given with infusion of salbutamol

- Metoclopramide

- see Metoclopramide

Vasodilator Antihypertensives

- see Vasodilator Antihypertensives

Methylphenidate

- see Methylphenidate

Methyldopa

- see Methylprednisolone

Methyldopa

- Dopaminergic effects (continued) 
  - Enhanced hypotensive effect when methylthioninium given with levodopa
  - Enhanced hypotensive effect of metyldopa antagonised by oral iron

- Lithium: neurotoxicity may occur when methylthioninium given with lithium without increased plasma concentration of lithium

Antidepressants, Tricyclic (related)

- Metoclopramide

- Dopaminergic effects (continued) 
  - Effect of pergolide: avoidance of metoclopramide advised by manufacturer of ropinirole and rotigotine (agonist of effect)

Muscle Relaxants: metoclopramide enhances effects of suxamethonium

Tetrahydrozoline: increased risk of extrapyramidal side-effects when metoclopramide given with tetrahydrozoline

Metolazone

- see Diuretics

Metoprolol

- see Beta-blockers

Metronidazole

- see Metronidazole

Note: Interactions do not apply to topical metronidazole preparations.

- Alcohol: Disulfiram-like reaction when metronidazole given with alcohol

- Anticoagulants: metronidazole enhances anticoagulant effect of coumarins

Antiepileptics: metabolism of metronidazole accelerated by phenobarbital (reduced effect); metronidazole possibly inhibits metabolism of phenytoin (increased plasma concentration)

- Cytotoxics: metronidazole increases plasma concentration of busulfan (increased risk of toxicity); metronidazole inhibits metabolism of fluorouracil (increased toxicity)

Disulfiram: Psychotic reaction reported when metronidazole given with disulfiram

Lithium: Metronidazole increases risk of lithium toxicity

Mycophenolate: metronidazole possibly reduces bioavailability of mycophenolate

Ulcerc-Healing Drugs: metabolism of metronidazole inhibited by cimetidine (increased plasma concentration)

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

Mianserin

- see Antidepressants, Tricyclic (related)

Mifepristone

- see Mifepristone

Corticosteroids

- see Corticosteroids

Calcium-channel Blockers

- see Calcium-channel Blockers

Ciclosporin

- see Ciclosporin

Sirolimus: increased plasma concentration of sirolimus

Miconazole

- see Miconazole

Midazolam

- see Anxiolytics and Hypnotics

Mifepristone

- see Mifepristone

Corticosteroids

- see Corticosteroids

Tacrolimus: manufacturer of mifamurtide advises avoid concomitant use with tacrolimus

Miconazole

- see Miconazole

Alcohol: metoclopramide possibly increases absorption of alcohol

Antidepressants, General: metoclopramide enhances effects of thiopental

Analgesics: metoclopramide increases rate of absorption of aspirin (enhanced effect); effects of metoclopramide on gastro-intestinal activity antagonised by opioid analgesics; metoclopramide increases rate of absorption of paracetamol

Antidepressants: CNS toxicity reported when metoclopramide given with SSRI-related antidepressants, SSRIIs and -dopaminergic—avoid concomitant use (if avoidance not possible, use lowest possible dose of metyldopa and observe patient for up to 4 hours after administration)

- Bupropion: possible risk of CNS toxicity when metyldopa given with bupropion—avoid concomitant use (if avoidance not possible, use lowest possible dose of metyldopa and observe patient for up to 4 hours after administration)

Metoclopramide

- see Metoclopramide

Analgesics: manufacturer of mifamurtide advises avoid concomitant use with high doses of NSAIDs

Corticosteroids: manufacturer of mifamurtide advises avoid concomitant use with corticosteroids

Tacroliimus: manufacturer of mifamurtide advises avoid concomitant use with tacroliimus

Mefloquine

- see Mefloquine

Corticosteroids: mefloquine may reduce effect of corticosteroids (including inhaled corticosteroids) for 3–4 days

Mifepristone

- see Mifepristone

Phosphodiesterase Inhibitors

- see Phosphodiesterase Inhibitors

Minocycline

- see Minocycline

Minoxidil

- see Minoxidil

Mirtazapine—avoid concomitant use (if avoidance not possible, use lowest possible dose of mirtazapine and observe patient for up to 4 hours after administration)

Antidepressants, Tricyclic (related)
Appendix 1: Interactions

**Mirebebron (continued)**
Antivirals: avoid or reduce dose of mirebebron in hepatic or renal impairment when given with ritonavir—see Mirebebron, p. 552
Beta-blockers: mirebebron increases plasma concentration of metoprolol
Cardiac Glycosides: mirebebron increases plasma concentration of digoxin—reduce initial dose of digoxin

**Mirtazapine**
- Alcohol: increased sedative effect when mirtazapine given with alcohol
- Analgesics: possible increased serotoninergic effects when mirtazapine given with tramadol
- Anticoagulants: mirtazapine enhances anticoagulant effect of warfarin
- Antidepressants: possible increased serotoninergic effects when mirtazapine given with fluoxetine, fluvoxamine or venlafaxine; mirtazapine should not be started until 2 weeks after stopping MAOIs, also MAOIs should not be started until at least 2 weeks after stopping mirtazapine; after stopping mirtazapine do not start mirtazapine for at least 1 week
- Antiepileptics: plasma concentration of mirtazapine reduced by carbamazepine and phenytoin
- Antimalarials: avoidance of antidepressants advised by manufacturer of arteether with lumefantrine and piperaquine with artenimol
- Antioxidants and Hypnotics: increased sedative effect when mirtazapine given with anxiolytics and hypnotics

Atorvastatin: possible increased risk of convulsions when antidepressants given with atorvastatin
Clonidine: mirtazapine possibly antagonises hypoten sive effect of clonidine
Methylthioninium: possible risk of CNS toxicity when mirtazapine given with methylthioninium—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)

Ulcer-healing Drugs: plasma concentration of mirtazapine increased by cimetidine

**Mitomycin**

Antidepressants

Mirtazapine: avoidance of antidepressants advised when mirtazapine given with escitalopram, preferably avoid concomitant use; mirtazapine should not be started until 5 weeks

**Moxisylyte**

Antihypertensives: avoid concomitant use with ciclosporin

**Modafinil**

Antiepileptics: modafinil possibly increases plasma concentration of phenytoin
Ciclosporin: modafinil reduces plasma concentration of ciclosporin
Cytotoxics: modafinil possibly reduces plasma concentration of bosutinib—manufacturer of bosutinib advises avoid concomitant use
Oestrogens: modafinil accelerates metabolism of oestrogen (reduced contraceptive effect—see p. 536)

**Moxepril** see ACE Inhibitors

**Mometasone** see Corticosteroids

**Monobactams** see Aztreonam

**Montelukast** see Leukotriene Receptor Antagonists

**Morphine** see Opioid Analgesics

**Moxifloxacin** see Quinolones

**Moxisylyte**

Antihypertensives: avoid concomitant use with ciclosporin

**Moxepril** see ACE Inhibitors

**Mivacurium** see Muscle Relaxants

**Mizolastine** see Antihistamines

**Moclobemide**

Antidepressants (continued)

after stopping fluoxetine: possible increased serotoninergic effects when moclobemide given with fluoxetine

Antimalarias: avoidance of antidepressants advised by manufacturer of arteether with lumefantrine and piperaquine with artenimol
Atorvastatin: possible increased risk of convulsions when antidepressants given with atorvastatin
Bupropion: avoidance of moclobemide advised by manufacturer of bupropion
Clopidogrel: moclobemide possibly reduces anti-platelet effect of clopidogrel
Dopaminergics: caution with moclobemide advised by manufacturer of entacapone; increased risk of side-effects when moclobemide given with levodopa; avoid concomitant use of moclobemide with sele-giline
5HT1-receptor Agonists: risk of CNS toxicity when moclobemide given with rizatriptan or sumatriptan (avoid rizatriptan or sumatriptan for 2 weeks after moclobemide); risk of CNS toxicity when moclobemide given with zolmitriptan (reduce dose of zolmitriptan)
Sympathomimetics: risk of hypertensive crisis when moclobemide given with sympathomimetics
Ulcer-healing Drugs: plasma concentration of moclobemide increased by cimetidine (halve dose of moclobemide)

**Modafinil**

Antiepileptics: modafinil possibly increases plasma concentration of phenytoin
Ciclosporin: modafinil reduces plasma concentration of ciclosporin
Cytotoxics: modafinil possibly reduces plasma concentration of bosutinib—manufacturer of bosutinib advises avoid concomitant use
Oestrogens: modafinil accelerates metabolism of oestrogen (reduced contraceptive effect—see p. 536)

**Moxepril** see ACE Inhibitors

**Mometasone** see Corticosteroids

**Monobactams** see Aztreonam

**Montelukast** see Leukotriene Receptor Antagonists

**Morphine** see Opioid Analgesics

**Moxifloxacin** see Quinolones

**Moxisylyte**

Antihypertensives: avoid concomitant use with ciclosporin

**Moxepril** see ACE Inhibitors

**Mivacurium** see Muscle Relaxants

**Mizolastine** see Antihistamines

**Moclobemide**

Antidepressants (continued)

after stopping fluoxetine: possible increased serotoninergic effects when moclobemide given with fluoxetine

Antimalarias: avoidance of antidepressants advised by manufacturer of arteether with lumefantrine and piperaquine with artenimol
Atorvastatin: possible increased risk of convulsions when antidepressants given with atorvastatin
Bupropion: avoidance of moclobemide advised by manufacturer of bupropion
Clopidogrel: moclobemide possibly reduces anti-platelet effect of clopidogrel
Dopaminergics: caution with moclobemide advised by manufacturer of entacapone; increased risk of side-effects when moclobemide given with levodopa; avoid concomitant use of moclobemide with sele-giline
5HT1-receptor Agonists: risk of CNS toxicity when moclobemide given with rizatriptan or sumatriptan (avoid rizatriptan or sumatriptan for 2 weeks after moclobemide); risk of CNS toxicity when moclobemide given with zolmitriptan (reduce dose of zolmitriptan)
Sympathomimetics: risk of hypertensive crisis when moclobemide given with sympathomimetics
Ulcer-healing Drugs: plasma concentration of moclobemide increased by cimetidine (halve dose of moclobemide)

**Modafinil**

Antiepileptics: modafinil possibly increases plasma concentration of phenytoin
Ciclosporin: modafinil reduces plasma concentration of ciclosporin
Cytotoxics: modafinil possibly reduces plasma concentration of bosutinib—manufacturer of bosutinib advises avoid concomitant use
Oestrogens: modafinil accelerates metabolism of oestrogen (reduced contraceptive effect—see p. 536)

**Moxepril** see ACE Inhibitors

**Mometasone** see Corticosteroids

**Monobactams** see Aztreonam

**Montelukast** see Leukotriene Receptor Antagonists

**Morphine** see Opioid Analgesics

**Moxifloxacin** see Quinolones

**Moxisylyte**

Antihypertensives: avoid concomitant use with ciclosporin

**Moxepril** see ACE Inhibitors

**Mivacurium** see Muscle Relaxants

**Mizolastine** see Antihistamines

**Moclobemide**

Antidepressants (continued)

after stopping fluoxetine: possible increased serotoninergic effects when moclobemide given with fluoxetine

Antimalarias: avoidance of antidepressants advised by manufacturer of arteether with lumefantrine and piperaquine with artenimol
Atorvastatin: possible increased risk of convulsions when antidepressants given with atorvastatin
Bupropion: avoidance of moclobemide advised by manufacturer of bupropion
Clopidogrel: moclobemide possibly reduces anti-platelet effect of clopidogrel
Dopaminergics: caution with moclobemide advised by manufacturer of entacapone; increased risk of side-effects when moclobemide given with levodopa; avoid concomitant use of moclobemide with sele-giline
5HT1-receptor Agonists: risk of CNS toxicity when moclobemide given with rizatriptan or sumatriptan (avoid rizatriptan or sumatriptan for 2 weeks after moclobemide); risk of CNS toxicity when moclobemide given with zolmitriptan (reduce dose of zolmitriptan)
Sympathomimetics: risk of hypertensive crisis when moclobemide given with sympathomimetics
Ulcer-healing Drugs: plasma concentration of moclobemide increased by cimetidine (halve dose of moclobemide)
Muscle Relaxants

- Anaesthetics, General (continued)
  - Anaesthetic, General: in bradycardia when suxamethonium given with propofol; effects of non-depolarising muscle relaxants and suxamethonium enhanced by volatile liquid general anaesthetics
  - Analgesics: excretion of baclofen possibly reduced by NSAIDs (increased risk of toxicity); excretion of baclofen reduced by ibuprofen (increased risk of toxicity); increased sedative effect when baclofen given with fentanyl or morphine
  - Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when baclofen or tizanidine given with angiotensin-II receptor antagonists
  - Anti-arrhythmics: neuromuscular blockade enhanced and prolonged when suxamethonium given with lidocaine
  - Antibacterials: effects of non-depolarising muscle relaxants and suxamethonium enhanced by piperacillin; plasma concentration of tizanidine increased by ciprofloxacin (increased risk of toxicity)—avoid concomitant use; plasma concentration of tizanidine possibly increased by norfloxacin (increased risk of toxicity); plasma concentration of tizanidine possibly reduced by rifampicin; effects of non-depolarising muscle relaxants and suxamethonium enhanced by aminoglycosides; effects of non-depolarising muscle relaxants and suxamethonium enhanced by clindamycin; effects of suxamethonium enhanced by vancomycin
  - Antidepressants: plasma concentration of tizanidine increased by fluvoxamine (increased risk of toxicity)—avoid concomitant use; effects of suxamethonium enhanced by phenelzine; muscle relaxant effect of baclofen enhanced by tricyclics
  - Antihypertensives: muscle relaxant effect of non-depolarising muscle relaxants antagonised by carbamazepine (accelerated recovery from neuromuscular blockade); effects of non-depolarising muscle relaxants might be increased by acute use of phenytoin
  - Antimalarials: effects of suxamethonium possibly enhanced by quinine
  - Antipsychotics: effects of suxamethonium possibly enhanced by promazine
  - Anxiolytics and Hypnotics: increased sedative effect when baclofen or tizanidine given with anxiolytics and hypnotics
  - Beta-blockers: enhanced hypotensive effect when baclofen given with beta-blockers; possible enhanced hypotensive effect and bradycardia when tizanidine given with beta-blockers; effects of muscle relaxants enhanced by propranolol
  - Calcium-channel blockers: enhanced hypotensive effect when baclofen or tizanidine given with calcium-channel blockers; effects of non-depolarising muscle relaxants possibly enhanced by calcium-channel blockers; possible increased risk of ventricular arrhythmias when intravenous dantrolene given with dilantin—manufacturer of dilantin advises avoid concomitant use; effects of non-depolarising muscle relaxants and suxamethonium enhanced by verapamil; avoidance of intravenous dantrolene advised by manufacturer of verapamil
  - Cardiac Glycosides: possible increased risk of bradycardia when tizanidine given with cardiac glycosides; risk of ventricular arrhythmias when suxamethonium given with cardiac glycosides
  - Corticosteroids: enhanced hypotensive effect when baclofen or tizanidine given with corticosteroids

Muscle Relaxants

- Anaesthetics, General: effects of atracurium enhanced by ketamine; increased risk of myocardial depre-
Appendix 1: Interactions

**Muscle Relaxants (continued)**

Cytotoxics: effects of suxamethonium enhanced by cyclophosphamide and thiopeta

Deferasirox: avoidance of tizanidine advised by manufacturer of deferasirox

Diazoxide: enhanced hypotensive effect when baclofen or tizanidine given with diazoxide

Diuretics: enhanced hypotensive effect when baclofen or tizanidine given with diuretics

Dopaminergic: possible agitation, confusion and hallucinations when baclofen given with levodopa

Lithium: effects of muscle relaxants enhanced by lithium; baclofen possibly aggravates hyperkinesia caused by lithium

Magnesium (parenteral): effects of non-depolarising muscle relaxants and suxamethonium enhanced by parenteral magnesium

Memantine: effects of baclofen and dantrolene possibly modified by memantinex

Methyldopa: enhanced hypotensive effect when baclofen or tizanidine given with methyldopa

Metoclopramide: effects of suxamethonium enhanced by metoclopramide

Moxonidine: enhanced hypotensive effect when baclofen or tizanidine given with moxonidine

Nitrates: enhanced hypotensive effect when baclofen or tizanidine given with nitrates

Oestrogens: plasma concentration of tizanidine possibly increased by oestrogens (increased risk of toxicity)

Parasympathomimetics: effects of non-depolarising muscle relaxants possibly antagonised by donepezil; effects of suxamethonium possibly enhanced by donepezil; effects of non-depolarising muscle relaxants antagonised by edrophonium, neostigmine, pyridostigmine and rivastigmine; effects of suxamethonium by edrophonium, galantamine, neostigmine, pyridostigmine and rivastigmine

Progestogens: plasma concentration of tizanidine possibly increased by progestogens (increased risk of toxicity)

Sympathomimetics, Beta-: effects of suxamethonium enhanced by bumberetox

Vasodilator Antihypertensives: enhanced hypotensive effect when baclofen or tizanidine given with hydralazine; enhanced hypotensive effect when baclofen or tizanidine given with minoxidil; enhanced hypotensive effect when baclofen or tizanidine given with sodium nitroprusside

**Muscle Relaxants, depolarising** see Muscle Relaxants

**Muscle Relaxants, non-depolarising** see Muscle Relaxants

**Mycophenolate**

Antacids: absorption of mycophenolate reduced by antacids

Antibacterials: plasma concentration of mycophenolate possibly reduced by co-amoxiclav; bioavailability of mycophenolate possibly reduced by metronidazole and norfloxacin; plasma concentration of active metabolite of mycophenolate reduced by rifampicin

Antivirals: mycophenolate increases plasma concentration of aciclovir, also plasma concentration of inactive metabolite of mycophenolate increased; mycophenolate possibly increases plasma concentration of ganciclovir, also plasma concentration of inactive metabolite of mycophenolate possibly increased

Colestilan: manufacturer of colestilan advises give mycophenolate at least 1 hour before or 3 hours after colestilan

Iron: absorption of mycophenolate reduced by oral iron

Lipid-regulating Drugs: absorption of mycophenolate reduced by colestyramine

**Mycophenolate (continued)**

Sevelamer: plasma concentration of mycophenolate possibly reduced by sevelamer

**Mycophenolate Mofetil** see Mycophenolate

**Mycophenolate Sodium** see Mycophenolate

**Mycophenolic Acid** see Mycophenolate

**Nabumetone** see NSAIDs

**Nadolol** see Beta-blockers

**Nalidixic Acid** see Quinolones

**Nalmefene**

- Analgesics: manufacturer of nalmefene advises avoid concomitant use with opioid analgesics

**Nandrolone** see Anabolic Steroids

**Naproxen** see NSAIDs

**Naratipran** see 5HT1-receptor Agonists (under 5HT

**Nateglinide** see Antidiabetics

**Nebivolol** see Beta-blockers

**Nefopam**

- Antidepressants: manufacturer of nefopam advises avoid concomitant use with MAOIs; side-effects possibly increased when nefopam given with tricyclics

**Antimuscarinics: increased risk of antimuscarinic side-effects when nefopam given with antimuscarinics

**Neomycin** see Aminoglycosides

**Neostigmine** see Parasympathomimetics

**Nevirapine**

- Analgesics: nevirapine possibly reduces plasma concentration of methadone

- Antibacterials: nevirapine reduces plasma concentration of clarithromycin (but concentration of an active metabolite increased); also plasma concentration of nevirapine increased; nevirapine possibly increases plasma concentration of rifabutin; plasma concentration of nevirapine reduced by rifampicin—avoid concomitant use

- Anticoagulants: nevirapine may enhance or reduce anticoagulant effect of warfarin

- Antidepressants: plasma concentration of nevirapine reduced by St John’s wort—avoid concomitant use

**Antiepileptics: plasma concentration of nevirapine reduced by carbamazepine

- Antifungals: plasma concentration of nevirapine increased by fluconazole; nevirapine possibly reduces plasma concentration of caspofungin and itraconazole—consider increasing dose of caspofungin and itraconazole

- Antipsychotics: nevirapine possibly reduces plasma concentration of aripiprazole (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature)

- Antivirals: nevirapine possibly reduces plasma concentration of atazanavir and etravirine—avoid concomitant use; manufacturer of nevirapine advises avoid concomitant use with boceprevir and telaprevir; nevirapine possibly reduces the plasma concentration of dolutegravir (see Dose under Dolutegravir, p. 421); nevirapine reduces plasma concentration of efavirenz—avoid concomitant use; avoidance of nevirapine advised by manufacturer of elvitegravir; nevirapine possibly reduces plasma concentration of fosamprenavir—avoid unboosted fosamprenavir; nevirapine reduces plasma concentration of indinavir; nevirapine possibly reduces plasma concentration of tipranavir and telaprevir—consider increasing dose of lopinavir and telaprevir; increased risk of granulocytopenia when nevirapine given with zidovudine

Cobicistat: manufacturer of nevirapine advises avoid concomitant use with cobicistat

Oestrogens: nevirapine accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 536)
Nitrates (continued)

- Anticoagulants: infusion of glyceryl trinitrate reduces anticoagulant effect of heparins
- Antidepressants: enhanced hypotensive effect when nitrates given with MAOIs; effects of sublingual tablets of nitrates possibly reduced by tricyclic-related antidepressants (failure to dissolve under tongue owing to dry mouth); effects of sublingual tablets of nitrates reduced by tricyclics (failure to dissolve under tongue owing to dry mouth)

Antimuscarinics: effects of sublingual tablets of nitrates possibly reduced by antimuscarinics (failure to dissolve under tongue owing to dry mouth)

Antipsychotics: enhanced hypotensive effect when nitrates given with phenothiazines

Anxiolytics and Hypnotics: enhanced hypotensive effect when nitrates given with anxiolytics and hypnotics

- Avanafil: hypotensive effect of nitrates significantly enhanced by avanafil (avoid concomitant use)
- Vardenafil: possible increased hypotensive effect when nitrates given with vardenafil—avoid concomitant use
- Tadalafil: possible increased hypotensive effect when nitrates given with tadalafil (avoid concomitant use)

Calcium-channel Blockers: enhanced hypotensive effect when nitrates given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when nitrates given with clonidine

Corticosteroids: hypotensive effect of nitrates antagonised by corticosteroids

Diazoxide: enhanced hypotensive effect when nitrates given with diazoxide

Diuretics: enhanced hypotensive effect when nitrates given with diuretics

Dopaminergics: enhanced hypotensive effect when nitrates given with levodopa

Methyldopa: enhanced hypotensive effect when nitrates given with methyldopa

Moxisylyte: enhanced hypotensive effect when nitrates given with moxisylyte

Moxonidine: enhanced hypotensive effect when nitrates given with moxonidine

Muscle Relaxants: enhanced hypotensive effect when nitrates given with alprostadil

Kicosquid: possible enhanced hypotensive effect when nitrates given with kicosquid—avoid concomitant use

Sildenafil: possible enhanced hypotensive effect when nitrates given with sildenafil—avoid concomitant use

Tadalafil: possible enhanced hypotensive effect when nitrates given with tadalafil—avoid concomitant use

Vardenafil: possible enhanced hypotensive effect when nitrates given with vardenafil—avoid concomitant use

Calcium-channel Blockers: enhanced hypotensive effect when nitrates given with Calcium-channel blockers

Nitrates (continued)

ACE Inhibitors: enhanced hypotensive effect when nitrates given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when nitrates given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when nitrates given with alcohol

Aldesleukin: enhanced hypotensive effect when nitrates given with aldesleukin

Alpha-blockers: enhanced hypotensive effect when nitrates given with alpha-blockers

Anaesthetics, General: enhanced hypotensive effect when nitrates given with general anaesthetics

Analgesics: hypotensive effect of nitrates antagonised by NSAIDs

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when nitrates given with angiotensin-II receptor antagonists

Anti-arrrhythmics: effects of sublingual tablets of nitrates reduced by disopyramide (failure to dissolve under tongue owing to dry mouth)

Nitrates (continued)

- Anticoagulants: infusion of glyceryl trinitrate reduces anticoagulant effect of heparins
- Antidepressants: enhanced hypotensive effect when nitrates given with MAOIs; effects of sublingual tablets of nitrates possibly reduced by tricyclic-related antidepressants (failure to dissolve under tongue owing to dry mouth); effects of sublingual tablets of nitrates reduced by tricyclics (failure to dissolve under tongue owing to dry mouth)

Antimuscarinics: effects of sublingual tablets of nitrates possibly reduced by antimuscarinics (failure to dissolve under tongue owing to dry mouth)

Antipsychotics: enhanced hypotensive effect when nitrates given with phenothiazines

Anxiolytics and Hypnotics: enhanced hypotensive effect when nitrates given with anxiolytics and hypnotics

- Avanafil: hypotensive effect of nitrates significantly enhanced by avanafil (avoid concomitant use)
- Vardenafil: possible increased hypotensive effect when nitrates given with vardenafil—avoid concomitant use
- Tadalafil: possible increased hypotensive effect when nitrates given with tadalafil (avoid concomitant use)

Calcium-channel Blockers: enhanced hypotensive effect when nitrates given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when nitrates given with clonidine

Corticosteroids: hypotensive effect of nitrates antagonised by corticosteroids

Diazoxide: enhanced hypotensive effect when nitrates given with diazoxide

Diuretics: enhanced hypotensive effect when nitrates given with diuretics

Dopaminergics: enhanced hypotensive effect when nitrates given with levodopa

Methyldopa: enhanced hypotensive effect when nitrates given with methyldopa

Moxisylyte: enhanced hypotensive effect when nitrates given with moxisylyte

Moxonidine: enhanced hypotensive effect when nitrates given with moxonidine

Muscle Relaxants: enhanced hypotensive effect when nitrates given with alprostadil

Kicosquid: possible enhanced hypotensive effect when nitrates given with kicosquid—avoid concomitant use

Sildenafil: possible enhanced hypotensive effect when nitrates given with sildenafil—avoid concomitant use

Tadalafil: possible enhanced hypotensive effect when nitrates given with tadalafil—avoid concomitant use

Vardenafil: possible enhanced hypotensive effect when nitrates given with vardenafil—avoid concomitant use

Calcium-channel Blockers: enhanced hypotensive effect when nitrates given with Calcium-channel blockers

Nitrates (continued)

ACE Inhibitors: enhanced hypotensive effect when nitrates given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when nitrates given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when nitrates given with alcohol

Aldesleukin: enhanced hypotensive effect when nitrates given with aldesleukin

Alpha-blockers: enhanced hypotensive effect when nitrates given with alpha-blockers

Anaesthetics, General: enhanced hypotensive effect when nitrates given with general anaesthetics

Analgesics: hypotensive effect of nitrates antagonised by NSAIDs

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when nitrates given with angiotensin-II receptor antagonists

Anti-arrrhythmics: effects of sublingual tablets of nitrates reduced by disopyramide (failure to dissolve under tongue owing to dry mouth)
Appendix 1: Interactions

Noradrenaline (norepinephrine) see Sympathomimetics
Norelgestromin see Progestogens
Norepinephrine (noradrenaline) see Sympathomimetics
Norethisterone see Progestogens
Norfloxacin see Quinolones
Norgestimate see Progestogens
Norgestrel see Progestogens
Noriptryptilne see Antidepressants, Tricyclic

NSAIDs
Note See also Aspirin. Interactions do not generally apply to topical NSAIDs.
ACE Inhibitors: increased risk of renal impairment when NSAIDs given with ACE inhibitors, also hyponatraemic effect antagonised
Adrenergic Neurone Blockers: NSAIDs antagonise hypotensive effect of adrenergic neurone blockers
Aliskiren: NSAIDs possibly antagonise hypotensive effect of aliskiren
Alpha-blockers: NSAIDs antagonise hypotensive effect of alpha-blockers
• Analgesics: avoid concomitant use of NSAIDs with • NSAIDs or • aspirin (increased side-effects); avoid concomitant use of NSAIDs with • ketorolac (increased side-effects and haemorrhage); ibuprofen possibly reduces antplatelet effect of aspirin
Angiotensin-II Receptor Antagonists: increased risk of renal impairment when NSAIDs given with angiotensin-II receptor antagonists, also hypotensive effect antagonised
Antacids: absorption of acemetacin possibly reduced by antacids
• Antibacterials: indomethacin possibly increases plasma concentration of amikacin and gentamicin in neonates; plasma concentration of cefoxacin, diclofenac and etoricoxib reduced by rifampicin; possible increased risk of convulsions when NSAIDs given with • ciprofloxacin
Anticoagulants: increased risk of haemorrhage when intravenous diclofenac given with • anticoagulants (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when ketorolac given with • anticoagulants (avoid concomitant use, including low-dose heparins); NSAIDs possibly enhance anticoagulant effect of • coumarins and • heparinoids; possible increased risk of bleeding when NSAIDs given with • dabigatran or heparins
Antidepressants: increased risk of bleeding when NSAIDs given with • SSRIs or • venlafaxine
Antidiabetics: NSAIDs possibly enhance effects of • sulfonylureas
Antiepileptics: acemetacin possibly reduces excursion of • phenytoin (increased risk of toxicity)
Antifungals: plasma concentration of parecoxib increased by • fluconazole (reduce dose of parecoxib); plasma concentration of celecoxib increased by • fluconazole (halve dose of celecoxib); plasma concentration of fluribiprofen and ibuprofen increased by • fluconazole; plasma concentration of diclofenac and ibuprofen increased by • voriconazole
Antipsychotics: possible severe drowsiness when acemetacin or indometacin given with haloperidol
Antivirals: plasma concentration of NSAIDs possibly increased by • ritonavir; plasma concentration of piroxicam increased by • ritonavir (risk of toxicity)—avoid concomitant use; increased risk of haematological toxicity when NSAIDs given with • zidovudine
Beta-blockers: NSAIDs antagonise hypotensive effect of beta-blockers
Calcium-channel Blockers: NSAIDs antagonise hypotensive effect of calcium-channel blockers
Cardiac Glycosides: NSAIDs possibly increase plasma concentration of cardiac glycosides, also possible

NSAIDs
Cardiac Glycosides (continued)
exacerbation of heart failure and reduction of renal function
• Ciclosporin: increased risk of nephrotoxicity when NSAIDs given with • ciclosporin; plasma concentration of diclofenac increased by • ciclosporin (halve dose of diclofenac)
Clonidine: NSAIDs antagonise hypotensive effect of clonidine
Clopidogrel: increased risk of bleeding when NSAIDs given with • clopidogrel
Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when NSAIDs given with corticosteroids
• Cytotoxics: NSAIDs probably reduce excretion of • methotrexate (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 718; diclofenac, ibuprofen, indometacin, ketoprofen, meloxicam and naproxen reduce excretion of • methotrexate (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 718; NSAIDs possibly reduce oral excretion of pemetrexed—consult product literature; increased risk of bleeding when NSAIDs given with • leotirudin; avoidance of methylenic acid advised by manufacturer of • regorafenib
Desmopressin: indometacin enhances effects of desmopressin
Diazoxide: NSAIDs antagonise hypotensive effect of diazoxide
• Diethyl sulfoxide: avoid concomitant use of sulindac with • diethyl sulfoxide
• Diuretics: risk of nephrotoxicity of NSAIDs increased by • diuretics, also antagonism of diuretic effect; indometacin and ketorolac antagonise effects of • diuretics; excretion of acemetacin possibly increased by • furosemide; NSAIDs possibly antagonise diuretic effect of • potassium canrenoate; occasional reports of reduced renal function when indometacin given with • triamterene—avoid concomitant use; increased risk of hyperkalaemia when indometacin given with • potassium-sparing diuretics and aldosterone antagonists; possible increased risk of hyperkalaemia when NSAIDs given with • potassium-sparing diuretics and aldosterone antagonists
Iloprost: increased risk of bleeding when NSAIDs given with • iloprost
Lipid-regulating Drugs: excretion of meloxicam increased by • colestyramine
• Lithium: NSAIDs reduce excretion of • lithium (increased risk of toxicity); ketorolac reduces excursion of • lithium (increased risk of toxicity)—avoid concomitant use
Methyldopa: NSAIDs antagonise hypotensive effect of • methyldopa
Mifamurtide: avoidance of high doses of NSAIDs advised by manufacturer of • mifamurtide
Moxonidine: NSAIDs antagonise hypotensive effect of • moxonidine
Muscle Relaxants: ibuprofen reduces excursion of • baclofen (increased risk of toxicity); NSAIDs possibly reduce excursion of • baclofen (increased risk of toxicity)
Nitrates: NSAIDs antagonise hypotensive effect of • nitrates
Oestrogens: etoricoxib increases plasma concentration of • ethinylestradiol
Penicillamine: possible increased risk of nephrotoxicity when NSAIDs given with • penicillamine
• Pentoxyfylline: possible increased risk of bleeding when NSAIDs given with • pentoxyfylline; increased risk of bleeding when ketorolac given with • pentoxyfylline (avoid concomitant use)
NSAIDs (continued)
Prasugrel: possible increased risk of bleeding when NSAIDs given with prasugrel
- Probenecid: excretion of acemetacin, dexketoprofen, indometacin, ketoprofen and naproxen reduced by probenecid (increased plasma concentration); excretion of ketorolac reduced by probenecid (increased plasma concentration)—avoid concomitant use
- Tacrolimus: possible increased risk of nephrotoxicity when NSAIDs given with tacrolimus; increased risk of nephrotoxicity when ibuprofen given with tacrolimus

Vasodilator Antihypertensives: NSAIDs antagonise hypotensive effect of hydralazine, minoxidil and sodium nitroprusside

Octreotide
Antidiabetics: octreotide possibly reduces requirements for antidiabetics
- Ciclosporin: octreotide reduces plasma concentration of ciclosporin
- Dopaminergics: octreotide increases plasma concentration of bromocriptine
- Ulcer-healing Drugs: octreotide possibly delays absorption of cimetidine

Oestrogens
Note: Interactions of combined oral contraceptives may also apply to combined contraceptive patches and vaginal rings, see p. 536
ACE Inhibitors: oestrogens antagonise hypotensive effect of ACE inhibitors
Adrenergic Neurone Blockers: oestrogens antagonise hypotensive effect of adrenergic neurone blockers
Alpha-blockers: oestrogens antagonise hypotensive effect of alpha-blockers
Analgesics: plasma concentration of ethylenesradiol increased by etoricoxib
Angiotensin-II Receptor Antagonists: oestrogens antagonise hypotensive effect of angiotensin-II receptor antagonists
- Antibacterials: plasma concentration of estradiol increased by erythromycin; metabolism of oestrogens accelerated by rifampicin (reduced contraceptive effect—see p. 536)
- Anticoagulants: oestrogens may enhance or reduce anticoagulant effect of coumarins; oestrogens antagonise anticoagulant effect of phenindione
- Antidepressants: contraceptive effect of oestrogens reduced by St John’s wort (avoid concomitant use); oestrogens antagonise antidepressant effect of tricyclics (but side-effects of tricyclics possibly increased due to increased plasma concentration)
Antidiabetics: oestrogens antagonise hypoglycaemic effect of antidiabetics
- Antiepileptics: metabolism of oestrogens accelerated by carbamazepine, oxcarbazepine, oxazepam and phenytoin; rifampicin and efavirenz (reduced contraceptive effect—see p. 536); oestrogens reduce plasma concentration of lamotrigine—consider increasing dose of lamotrigine; ethylenesradiol possibly reduces plasma concentration of valproate
- Antifungals: oestrogens increase plasma concentration of voriconazole; anecdotal reports of contraceptive failure and menstrual irregularities when oestrogens given with griseofulvin; anecdotal reports of contraceptive failure when oestrogens given with irinotecan; occasional reports of breakthrough bleeding when oestrogens (used for contraception) given with terbinafine
- Antivirals: plasma concentration of ethylenesradiol possibly increased by atazanavir; metabolism of oestrogens accelerated by nevirapine and efavirenz (reduced contraceptive effect—see p. 536); plasma concentration of ethylenesradiol possibly reduced by cilostazol; possible contraceptive failure of hormonal contraceptives containing oestrogens when given with aprepitant (alternative contraception recommended)

Beta-blockers: oestrogens antagonise hypotensive effect of beta-blockers
- Bosentan: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with bosentan (alternative contraception recommended)
- Calcium-channel Blockers: oestrogens antagonise hypotensive effect of calcium-channel blockers
- Ciclosporin: oestrogens possibly increase plasma concentration of ciclosporin
- Clonidine: oestrogens antagonise hypotensive effect of clonidine
- Cobicistat: metabolism of oestrogens accelerated by cobicistat (reduced contraceptive effect—see p. 536)
- Corticosteroids: oral contraceptives containing oestrogens increase plasma concentration of corticosteroids
- Cytotoxics: possible reduction in contraceptive effect of oestrogens advised by manufacturer of dabrafenib and vemurafenib; possible reduced contraceptive effect of hormonal contraceptives containing oestrogens advised by manufacturer of dabrafenib (alternative contraception recommended)
- Diuretics: oestrogens antagonise diuretic effect of diuretics
- Dopaminergics: oestrogens increase plasma concentration of ropinirole; oestrogens increase plasma concentration of selegiline—manufacturer of selegiline advises avoiding concomitant use
- Lipid-regulating Drugs: Absorption of ethylenesradiol reduced by colesevelam; plasma concentration of ethylenesradiol increased by atorvastatin and rosuvastatin
- Methyldopa: oestrogens antagonise hypotensive effect of methyldopa
- Modafinil: metabolism of oestrogens accelerated by modafinil (reduced contraceptive effect—see p. 536)
- Moxonidine: oestrogens antagonise hypotensive effect of moxonidine
- Muscle Relaxants: oestrogens possibly increase plasma concentration of tizanidine (increased risk of toxicity)
- Nitrate: oestrogens antagonise hypotensive effect of nitrates
- Somatropin: oestrogens (when used as oral replacement therapy) may increase dose requirements of somatropin
- Tacrolimus: ethylenesradiol possibly increases plasma concentration of tacrolimus
- Teriflunomide: plasma concentration of ethylenesradiol increased by teriflunomide
- Theophylline: oestrogens increase plasma concentration of theophylline (consider reducing dose of theophylline)

Thyroid Hormones: oestrogens may increase requirements for thyroid hormones in hypothyroidism
- Vasodilator Antihypertensives: oestrogens antagonise hypotensive effect of hydralazine, minoxidil and sodium nitroprusside

Oestrogens, conjugated see Oestrogens

Appendix 1: Interactions

BNF 68
Opioid Analgesics
- Antifungals (continued) possibly inhibited by itraconazole; plasma concentration of methadone possibly increased by itraconazole (increased risk of ventricular arrhythmias); plasma concentration of oxycodone increased by itraconazole and voriconazole; plasma concentration of alfentanil and methadone increased by voriconazole (consider reducing dose of alfentanil and methadone); plasma concentration of fentanyl possibly increased by triazoles.
- Antihistamines: sedative effects possibly increased when opioid analgesics given with sedating antihistamines.
- Antimalarials: avoidance of methadone advised by manufacturer of aprepitant with arteminol (possible risk of ventricular arrhythmias).
- Antimuscarinics: possible increased risk of antimuscarinic side-effects when codeine given with antimuscarinics.
- Antipsychotics: enhanced hypnotic and sedative effects when opioid analgesics given with antipsychotics; increased risk of ventricular arrhythmias when methadone given with antipsychotics that prolong the QT interval; increased risk of convulsions when tramadol given with antipsychotics; increased risk of ventricular arrhythmias when methadone given with amisulpride—avoid concomitant use.
- Antivirals: plasma concentration of methadone possibly reduced by abacavir, nevirapine and rifampirivim; plasma concentration of methadone possibly affected by boceprevir; possible increased risk of prolonged sedation and respiratory depression when buprenorphine given with boceprevir; methadone possibly reduces plasma concentration of didanosine; plasma concentration of methadone reduced by efavirenz, fosamprenavir and ritonavir; plasma concentration of morphine possibly reduced by ronivir; plasma concentration of alfentanil and fentanyl increased by ronivir; plasma concentration of dextroprophosphate increased by ronivir (risk of toxicity)—avoid concomitant use; plasma concentration of buprenorphine possibly increased by ronivir; plasma concentration of pethidine reduced by ronivir; but plasma concentration of toxic pethidine metabolite increased (avoid concomitant use); increased risk of ventricular arrhythmias when alfentanil, fentanyl or methadone given with saquinavir—avoid concomitant use; caution with methadone advised by manufacturer of telaprevir (risk of ventricular arrhythmias); buprenorphine possibly reduces plasma concentration of tipranavir; methadone possibly increases plasma concentration of zidovudine.
- Anxiolytics and Hypnotics: increased sedative effect when opioid analgesics given with anxiolytics and hypnotics; fentanyl possibly inhibits metabolism of midazolam.
- Atomoxetine: increased risk of ventricular arrhythmias when methadone given with atomoxetine; possible increased risk of convulsions when tramadol given with atomoxetine.
- Beta-blockers: morphine possibly increases plasma concentration of esmolol.

Calcium-channel Blockers: metabolism of alfentanil inhibited by diltiazem (risk of prolonged or delayed respiratory depression).
- Cytotoxics: possible increased risk of ventricular arrhythmias when methadone given with bosutinib; caution with alfentanil and fentanyl advised by manufacturer of crizotinib; possible increased risk of ventricular arrhythmias when methadone given with vandetanib—avoid concomitant use.
- Dapoxetine: possible increased risk of serotoninergic effects when tramadol given with

Appendix 1: Interactions
Opioid Analgesics
● Dapoxetine (continued)  
  ○ dapoxetine (manufacturer of dapoxetine advises tramadol should not be started until 1 week after stopping dapoxetine; avoid dapoxetine for 2 weeks after stopping tramadol)

Domperidone:  opioid analgesics antagonise effects of domperidone on gastro-intestinal activity  

Dopaminergics:  risk of CNS toxicity when pethidine given with rasagiline (avoid pethidine for 2 weeks after rasagiline); avoid concomitant use of dextromethorphan with rasagiline; hyperpyrexia and CNS toxicity reported when pethidine given with selegiline (avoid concomitant use); avoidance of opioid analgesics advised by manufacturer of selegiline

5HT3-receptor Antagonists:  effects of tramadol possibly antagonised by ondansetron  

Memantine:  increased risk of CNS toxicity when dextromethorphan given with memantine (manufacturer of memantine advises avoid concomitant use)

Metoclopramide:  opioid analgesics antagonise effects of metoclopramide on gastro-intestinal activity

Nalmefene:  avoidance of opioid analgesics advised by manufacturer of nalmefene

Sodium Oxylate:  opioid analgesics enhance effects of sodium oxylate (avoid concomitant use)

Uler-healing Drugs:  metabolism of opioid analgesics inhibited by cinmetidine (increased plasma concentration)

Orlistat  (continued)

Antiepileptics:
● Antiepileptics:  possible increased risk of convulsions when orlistat given with antiepileptics  
  ○ Antiepileptics given with fentanyl or morphine given with baclofen  
  ○ Nalmefene:  avoidance of opioid analgesics advised by manufacturer of nalmefene  
  ○ Sodium Oxylate:  opioid analgesics enhance effects of sodium oxylate (avoid concomitant use)  

Anticoagulants:
● Anticoagulants:  possible increased risk of convulsions when antiepileptics given with orlistat  

Memantine:  increased risk of CNS toxicity when dextromethorphan given with memantine (manufacturer of memantine advises avoid concomitant use)

Metoclopramide:  opioid analgesics antagonise effects of metoclopramide on gastro-intestinal activity

Nalmefene:  avoidance of opioid analgesics advised by manufacturer of nalmefene

Sodium Oxylate:  opioid analgesics enhance effects of sodium oxylate (avoid concomitant use)

Uler-healing Drugs:  metabolism of opioid analgesics inhibited by cinmetidine (increased plasma concentration)

Orlistat  (continued)

Antiepileptics:
● Antiepileptics:  possible increased risk of convulsions when orlistat given with antiepileptics  
  ○ Antiepileptics given with fentanyl or morphine given with baclofen  
  ○ Nalmefene:  avoidance of opioid analgesics advised by manufacturer of nalmefene  
  ○ Sodium Oxylate:  opioid analgesics enhance effects of sodium oxylate (avoid concomitant use)  

Anticoagulants:
● Anticoagulants:  possible increased risk of convulsions when antiepileptics given with orlistat  

Memantine:  increased risk of CNS toxicity when dextromethorphan given with memantine (manufacturer of memantine advises avoid concomitant use)

Metoclopramide:  opioid analgesics antagonise effects of metoclopramide on gastro-intestinal activity

Nalmefene:  avoidance of opioid analgesics advised by manufacturer of nalmefene

Sodium Oxylate:  opioid analgesics enhance effects of sodium oxylate (avoid concomitant use)

Uler-healing Drugs:  metabolism of opioid analgesics inhibited by cinmetidine (increased plasma concentration)

Orlistat  (continued)

Antiepileptics:
● Antiepileptics:  possible increased risk of convulsions when orlistat given with antiepileptics  
  ○ Antiepileptics given with fentanyl or morphine given with baclofen  
  ○ Nalmefene:  avoidance of opioid analgesics advised by manufacturer of nalmefene  
  ○ Sodium Oxylate:  opioid analgesics enhance effects of sodium oxylate (avoid concomitant use)  

Anticoagulants:
● Anticoagulants:  possible increased risk of convulsions when antiepileptics given with orlistat  

Memantine:  increased risk of CNS toxicity when dextromethorphan given with memantine (manufacturer of memantine advises avoid concomitant use)

Metoclopramide:  opioid analgesics antagonise effects of metoclopramide on gastro-intestinal activity

Nalmefene:  avoidance of opioid analgesics advised by manufacturer of nalmefene

Sodium Oxylate:  opioid analgesics enhance effects of sodium oxylate (avoid concomitant use)

Uler-healing Drugs:  metabolism of opioid analgesics inhibited by cinmetidine (increased plasma concentration)
### Paracetamol (continued)

Metoclopramide: rate of absorption of paracetamol increased by **metoclopramide**

### Paraldehyde

- Alcohol: increased sedative effect when paraldehyde given with **alcohol**
- Disulfiram: risk of toxicity when paraldehyde given with **disulfiram**

### Parasympathomimetics

- Anti-arrhythmics: effects of neostigmine and pyridostigmine possibly antagonised by **propafenone**
- Antibacterials: plasma concentration of galantamine increased by **erythromycin**; effects of neostigmine and pyridostigmine antagonised by **aminoglycosides**
- Antimuscarinics: effects of neostigmine and pyridostigmine antagonised by **clindamycin**; effects of neostigmine and pyridostigmine antagonised by **piperazines**
- Antidepressants: plasma concentration of galantamine increased by **paroxetine**
- Antimalarials: effects of neostigmine and pyridostigmine may be diminished because of potential for chloroquine and hydroxychloroquine to increase symptoms of myasthenia gravis
- Antimuscarinics: effects of parasympathomimetics antagonised by antimuscarinics
- Beta-blockers: increased risk of arrhythmias when pilocarpine given with beta-blockers; effects of neostigmine and pyridostigmine antagonised by **propranolol**
- Cytotoxics: possible increased risk of bradycardia when pilocarpine given with **crizotinib**
- Lithium: effects of neostigmine antagonised by **lithium**
- Muscle Relaxants: donepezil possibly enhances effects of **suxamethonium**; edrophonium, galantamine, neostigmine, pyridostigmine and rivastigmine enhance effects of **suxamethonium**; edrophonium, neostigmine, pyridostigmine and rivastigmine antagonise effects of non-depolarising muscle relaxants; donepezil possibly antagonises effects of non-depolarising muscle relaxants

**Parecoxib** see NSAIDs

### Paricalcitol

- See **paricalcitol**

### Parecoxib

- See **parecoxib**

### Paracetamol

- See **paracetamol**

### Paroxetine

- See **paroxetine**

### Paracetamol

- See **paracetamol**

### Pazopectin

- See **pazopectin**

### Pazopanib (continued)

- Grapefruit Juice: manufacturer of pazopanib advises avoid concomitant use with **grapefruit juice**
- Ulcer-healing Drugs: absorption of pazopanib possibly reduced by histamine H₂-antagonists—manufacturer of pazopanib advises give at least 2 hours before or 10 hours after histamine H₂-antagonists; absorption of pazopanib possibly reduced by **proton pump inhibitors**—manufacturer of pazopanib advises give at the same time as proton pump inhibitors

**Pfeglarstrim** see Făgărașt

### Peginterferon Alfa see Interferons

### Pentrexed

- Analgesics: renal excretion of pentrexed possibly reduced by **NSAIDs** and aspirin—consult product literature
- Antimalarials: antifolate effect of pentrexed increased by **pyrimethamine**
- Antipsychotics: avoid concomitant use of cytotoxics with **clozapine** (increased risk of agranulocytosis)

### Penicillamine

- Analgesics: possible increased risk of nephrotoxicity when penicillamine given with NSAIDs
- Antacids: absorption of penicillamine reduced by antacids
- Antipsychotics: avoid concomitant use of penicillamine with **clozapine** (increased risk of agranulocytosis)
- Cardiac Glycosides: penicillamine possibly reduces plasma concentration of **digoxin**
- Gold: manufacturer of penicillamine advises avoid concomitant use with sodium aurothiomolate (increased risk of toxicity)
- Iron: absorption of penicillamine reduced by **oral iron**
- Zinc: penicillamine reduces absorption of **zinc**, also absorption of penicillamine reduced by **zinc**

### Penicillins

- Allopurinol: increased risk of rash when amoxicillin or ampicillin given with **allopurinol**
- Antibacterials: absorption of phenoxymethylpenicillin reduced by neomycin; effects of penicillins possibly antagonised by tetracyclines
- Anticoagulants: an interaction between broad-spectrum penicillins and **coumarins** and **phenindione** has not been demonstrated in studies, but common experience in anticoagulant clinics is that INR can be altered
- Antiepileptics: manufacturer of pivmecillinam advises avoid concomitant use with **valproate**
- Cytotoxics: penicillins reduce excretion of methotrexate (increased risk of toxicity)
- Muscle Relaxants: piperacillin enhances effects of non-depolarising muscle relaxants and **suxamethonium**
- Mycopenolate: co-amoxiclav possibly reduces plasma concentration of **mycopenolate**
- Probencid: excretion of penicillins reduced by **probencid** (increased plasma concentration)
- Sulfinpyrazone: excretion of penicillins reduced by **sulfinpyrazone**
- Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

### Pentamidine Isentane

- Anti-arrhythmics: increased risk of ventricular arrhythmias when pentamidine isentane given with **sulfadiazine**—avoid concomitant use; possible increased risk of ventricular arrhythmias when pentamidine isentane given with **edisopramide**
- Antibacterials: increased risk of ventricular arrhythmias when pentamidine isentane given with **piperazine**; increased risk of ventricular arrhythmias when pentamidine isentane given with **moxifloxacin**—avoid concomitant use; possible increased risk of ventricular arrhythmias when...
Pentamidine Isetionate
- Antibacterials (continued) parenteral pentamidine isetionate given with tetracycline
- Antibacterials: avoidance of pentamidine isetionate advised by manufacturer of tetracycline and doxycycline (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when pentamidine isetionate given with tetracyclines
- Antifungals: possible increased risk of nephrotoxicity when pentamidine isetionate given with amphotericin
- Antimalarials: avoidance of pentamidine isetionate advised by manufacturer of proguanil with arte- nimol (possible risk of ventricular arrhythmias)
- Antipsychotics: increased risk of ventricular arrhythmias when pentamidine isetionate given with amisulpride or droperidol—avoid concomitant use; increased risk of ventricular arrhythmias when pentamidine isetionate given with clozapine—avoid concomitant use
- Cytotoxics: possible increased risk of ventricular arrhythmias when pentamidine isetionate given with pentostatin given with fludarabine (unacceptably high incidence of fatalities)
- Pentoxifylline
- Analgesics: possible increased risk of bleeding when pentoxifylline given with NSAIDs; increased risk of bleeding when pentoxifylline given with ketorolac (avoid concomitant use)
- Pentoxifylline: pentoxifylline increases plasma concentration of theophylline
- Perampanel
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclics (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIIs and tricyclines (convulsive threshold lowered)
- Antiepileptics: plasma concentration of perampanel reduced by carbamazepine, oxcarbazepine and phenytoin (see Dose under Perampanel, p. 307); plasma concentration of perampanel reduced by topiramate
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by emefloquine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered)
- Anxiolytics and Hypnotics: perampanel reduces plasma concentration of midazolam
- Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat
- Progestogens: perampanel accelerates metabolism of progestogens (reduced contraceptive effect—see p. 538)

Pergolide
- Antipsychotics: effects of pergolide antagonised by antipsychotics
- Memantine: effects of dopaminergics possibly enhanced by memantine

Appendix 1: Interactions

Pergolide (continued)
Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa
Metoclopramide: antiparkinsonian effect of pergolide antagonised by metoclopramide
Pericyazine see Antipsychotics
Perindopril see ACE Inhibitors
Perphenazine see Antipsychotics
Pethidine see Opioid Analgesics
Phenelzine see MAOIs
Phenindione
Note Change in patient’s clinical condition particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect anticoagulant control
- Alcohol: anticoagulant control with phenindione may be affected by major changes in consumption of alcohol
- Anticoagulants: anticoagulant effect of phenindione enhanced by anticoagulants
- Analgesics: anticoagulant effect of phenindione possibly enhanced by NSAIDs; increased risk of haemorrhage when anticoagulants given with intravenous cislofenac (avoid concomitant use, including low-dose heparin); increased risk of haemorrhage when anticoagulants given with ketorolac (avoid concomitant use, including low-dose heparin); increased risk of bleeding when phenindione given with aspirin (due to antiplatelet effect)
- Anti-arrhythmics: metabolism of phenindione inhibited by amiodarone (enhanced anticoagulant effect); anticoagulant effect of phenindione possibly enhanced by dronedarone
- Antibacterials: experience in anticoagulant clinics suggests that INR possibly altered when phenindione is given with enoxacin (given for local action on gut); anticoagulant effect of phenindione possibly enhanced by levofloxacin and tetracyclines; an interaction between phenindione and broad-spectrum penicillins has not been demonstrated in studies, but common experience in anticoagulant clinics is that INR can be altered; metabolism of phenindione possibly inhibited by sulphonamides
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with apixaban, dabigatran and rivaroxaban (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antivirals: anticonvulsant effect of phenindione possibly enhanced by ritonavir
- Clopidogrel: anticoagulant effect of phenindione enhanced due to antiplatelet action of clopidogrel
- Corticosteroids: anticoagulant effect of phenindione may be enhanced or reduced by corticosteroids
- Dipyriramole: anticoagulant effect of phenindione enhanced due to antiplatelet action of dipyriramole
- Enteral Foods: anticoagulant effect of phenindione antagonised by vitamin K (present in some enteral foods)
- Iloprofen: increased risk of bleeding when phenindione given with iloprost
- Lipid-regulating Drugs: anticoagulant effect of phenindione may be enhanced or reduced by colestryamine; anticoagulant effect of phenindione possibly enhanced by rosuvastatin; anticoagulant effect of phenindione enhanced by fibrates
- Oestrogens: anticoagulant effect of phenindione antagonised by oestrogens
- Prasugrel: possible increased risk of bleeding when phenindione given with prasugrel
- Progestogens: anticoagulant effect of phenindione antagonised by progestogens
Phenindione (continued)
- Testolactone: anticoagulant effect of phenindione enhanced by testolactone
- Testosterone: anticoagulant effect of phenindione enhanced by testosteron
- Thyroid Hormones: anticoagulant effect of phenindione enhanced by ebyroid hormones
- Vitamins: anticoagulant effect of phenindione antagonised by vitamin K

Phenobarbital
Note: Primidone interactions as for phenobarbital

Antiepileptics:
- Anticoagulants: phenobarbital accelerates metabolism of warfarin; phenobarbital possibly accelerates metabolism of oral anticoagulants (also isolated reports of hepatotoxicity)
- Anti-arrhythmics: phenobarbital accelerates metabolism of discopyramide (reduced plasma concentration); phenobarbital possibly reduces plasma concentration of dronedarone—avoid concomitant use; phenobarbital possibly accelerates metabolism of propafenone
- Antibacterials: phenobarbital accelerates metabolism of metronidazole (reduced effect); phenobarbital possibly reduces plasma concentration of rifampicin; phenobarbital accelerates metabolism of doxycycline (reduced plasma concentration); phenobarbital possibly accelerates metabolism of chloramphenicol (reduced plasma concentration); phenobarbital reduces plasma concentration of selatromycin (avoid during and for 2 weeks after phenobarbital)
- Anticoagulants: phenobarbital possibly reduces plasma concentration of apixaban; phenobarbital accelerates metabolism of coumarins (reduced anticoagulant effect); phenobarbital possibly reduces plasma concentration of rivaroxaban—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antidepressants: phenobarbital possibly reduces plasma concentration of reboxetine; phenobarbital reduces plasma concentration of paroxetine; phenobarbital accelerates metabolism of emianserin (reduced plasma concentration); anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSris and tricyclics (convulsive threshold lowered); plasma concentration of phenobarbital possibly reduced by St John's wort—avoid concomitant use; phenobarbital possibly accelerates metabolism of tricyclics (reduced plasma concentration)
- Antiepileptics: plasma concentration of phenobarbital possibly increased by carbamazepine; phenobarbital possibly reduces plasma concentration of ethosuximide, rufinamide and topiramate; phenobarbital reduces plasma concentration of lamotrigine, tiagabine and zonisamide; plasma concentration of phenobarbital increased by oxcarbazepine, also plasma concentration of an active metabolite of oxcarbazepine reduced; plasma concentration of phenobarbital often increased by phenytoin, plasma concentration of phenytoin often reduced but may be increased; plasma concentration of phenobarbital increased by stiripentol; plasma concentration of phenobarbital increased by valproate (also plasma concentration of valproate reduced)
- Antifungals: phenobarbital possibly reduces plasma concentration of itraconazole and posaconazole; phenobarbital possibly reduces plasma concentration of voriconazole—avoid concomitant use; phenobarbital reduces absorption of griseofulvin (reduced effect)

Phenobarbital (continued)
- Antimalarials: avoidance of phenobarbital advised by manufacturer of piperaquine with arteminol; anti-convulsant effect of antiepileptics antagonised by mefloquine
- Antipsychotics: convulsive threshold lowered; phenobarbital accelerates metabolism of haloperidol (reduced plasma concentration); plasma concentration of both drugs reduced when phenobarbital given with chlorpromazine; phenobarbital possibly reduces plasma concentration of aripiprazole (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); phenobarbital possibly reduces plasma concentration of clozapine
- Antivirals: phenobarbital possibly reduces plasma concentration of abacavir, darunavir, fosamprenavir, indinavir, lopinavir and saquinavir; avoidance of phenobarbital advised by manufacturer of atazanavir, darunavir and ritonavir (plasma concentration of boceprevir and rivipvirine possibly reduced); avoidance of phenobarbital advised by manufacturer of dolutegravir, elvitegravir, etravirine, fosfovir and telaprevir
- Anxiolytics and Hypnotics: increased sedative effect when phenobarbital given with anxiolytics and hypnotics; phenobarbital often reduces plasma concentration of clonazepam

Aprepitant: phenobarbital possibly reduces plasma concentration of aprepitant
- Avanafil: phenobarbital possibly reduces plasma concentration of avanafil—manufacturer of avanafil advises avoid concomitant use
- Beta-blockers: phenobarbital possibly reduces plasma concentration of propranolol
- Caffeine citrate: effects of phenobarbital possibly antagonised by caffeine citrate
- Calcium-channel Blockers: phenobarbital probably reduces effects of calcium-channel blockers; avoidance of phenobarbital advised by manufacturer of nimodipine (plasma concentration of nimodipine reduced)
- Ciclosporin: phenobarbital accelerates metabolism of ciclosporin (reduced plasma concentration)
- Cobicistat: phenobarbital possibly reduces plasma concentration of cobicistat—manufacturer of cobicistat advises avoid concomitant use
- Corticosteroids: phenobarbital possibly accelerates metabolism of corticosteroids (reduced effect)
- Cytoxotics: phenobarbital possibly decreases plasma concentration of axitinib (increase dose of axitinib—consult axitinib product literature); phenobarbital possibly reduces plasma concentration of bosutinib and crizotinib—manufacturer of bosutinib and crizotinib advises avoid concomitant use; avoidance of phenobarbital advised by manufacturer of abastaxel, dabrafenib and gefitinib; avoidance of phenobarbital advised by manufacturer of vandetanib (plasma concentration of vandetanib possibly reduced); phenobarbital possibly reduces plasma concentration of etoposide; phenobarbital reduces plasma concentration of irinotecan and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when phenobarbital given with procarbazine
- Diuretics: phenobarbital reduces plasma concentration of spironolactone—avoid concomitant use; increased risk of osteomalacia when phenobarbital given with carbonic anhydrase inhibitors
- Folate: plasma concentration of phenobarbital possibly reduced by folates
- Hormone Antagonists: phenobarbital possibly reduces plasma concentration of abiraterone—manufacturer of abiraterone advises avoid concomitant use;
Phenytoin

- Antibacterials (continued)
  - Plasma concentration of phenytoin possibly increased by sulphonamides; phenytoin reduces plasma concentration of trimethoprim (avoid during and for 2 weeks after phenytoin); plasma concentration of phenytoin increased by trimethoprim (also increased antifolate effect).

- Anticoagulants: phenytoin possibly reduces plasma concentration of apixaban; phenytoin accelerates metabolism of coumarins (possibility of reduced anticoagulant effect, but enhancement also reported); phenytoin possibly reduces plasma concentration of dabigatran—manufacturer of dabigatran advises avoid concomitant use; phenytoin possibly reduces plasma concentration of rivaroxaban—manufacturer of rivaroxaban advises monitor for signs of thrombosis.

- Antidepressants: plasma concentration of phenytoin increased by fluoxetine and bupropanol; phenytoin reduces plasma concentration of emianserin, mitrazapine and paroxetine; plasma concentration of phenytoin possibly increased by sertraline, also plasma concentration of sertraline possibly increased; phenytoin possibly reduces plasma concentration of St John’s wort—avoid concomitant use; phenytoin possibly reduces plasma concentration of tricyclics.

- Antidiabetics: plasma concentration of phenytoin transiently increased by tolbutamide (possibility of toxicity).

- Antiepileptics: plasma concentration of both drugs often reduced when phenytoin given with carbamazepine, also plasma concentration of carbamazepine may be increased; phenytoin reduces plasma concentration of eslicarbazepine, also plasma concentration of phenytoin increased; plasma concentration of phenytoin possibly increased by ethosuximide, also plasma concentration of ethosuximide possibly reduced; phenytoin reduces plasma concentration of lamotrigine, tiagabine and zonisamide; plasma concentration of phenytoin increased by oxcarbazepine, also plasma concentration of an active metabolite of oxcarbazepine reduced; phenytoin reduces plasma concentration of perampanel (see Dose under Perampanel, p. 307); phenytoin often increases plasma concentration of phenytoin often reduced but may be increased; phenytoin possibly reduces plasma concentration of retigabine; phenytoin possibly reduces plasma concentration of rufinamide, also plasma concentration of rufinamide possibly increased; plasma concentration of phenytoin increased by etirinipentol; plasma concentration of phenytoin increased by topiramate (also plasma concentration of topiramate reduced); plasma concentration of phenytoin increased or possibly reduced when given with valproate, also plasma concentration of valproate reduced; plasma concentration of phenytoin reduced by vigabatrin.

- Antifungals: anticonvulsant effect of phenytoin enhanced by posaconazole (plasma concentration of phenytoin increased); plasma concentration of phenytoin increased by fluconazole (consider reducing dose of phenytoin); phenytoin reduces plasma concentration of tinaconazole—avoid concomitant use; phenytoin reduces plasma concentration of posaconazole; plasma concentration of phenytoin increased by voriconazole, also phenytoin reduces...
Appendix 1: Interactions

Phenytoin

- Antifungals (continued)
  - Plasma concentration of voriconazole (increase dose of voriconazole and also monitor for phenytoin toxicity); phenytoin possibly reduces plasma concentration of caspofungin—consider increase dose of caspofungin
- Antimalarials: avoidance of phenytoin advised by manufacturer of piperaquine with artenmol; anticonvulsant effect of antimalarials antagonised by mefloquine; anticonvulsant effect of phenytoin antagonised by pyrimethamine, also increased antifolate effect
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by phenytoin; plasma concentration of phenytoin possibly reduced or decreased by phenytoin reduces plasma concentration of haloperidol; plasma concentration of phenytoin possibly increased or decreased by chlorpromazine; phenytoin possibly reduces plasma concentration of aripiprazole; plasma concentration of aripiprazole use or consider increasing the dose of aripiprazole—consult aripiprazole product literature; phenytoin accelerates metabolism of clozapine and quetiapine (reduced plasma concentration)
- Antivirals: phenytoin possibly reduces plasma concentration of abacavir, darunavir, lopinavir and saquinavir; avoidance of phenytoin advised by manufacturer of boceprevir and telaprevir; phenytoin possibly reduces plasma concentration of didanosine, also plasma concentration of phenytoin possibly increased by; phenytoin possibly reduces plasma concentration of ritonavir, also plasma concentration of phenytoin possibly affected; plasma concentration of phenytoin possibly increased or decreased by benzodiazepines
- Aripiprazole: phenytoin possibly reduces plasma concentration of aripiprazole; plasma concentration of phenytoin possibly increased or decreased by levetiracetam; plasma concentration of phenytoin possibly increased or decreased by valproic acid
- Bupropion: phenytoin reduces plasma concentration of bupropion
- Caffeine citrate: phenytoin reduces plasma concentration of caffeine citrate
- Calcium-channel Blockers: phenytoin reduces effects of felodipine and verapamil; avoidance of phenytoin advised by manufacturer of nimodipine (plasma concentration of nimodipine possibly reduced); plasma concentration of phenytoin possibly increased by; phenytoin possibly reduced plasma concentration of dihydralazine; plasma concentration of phenytoin possibly increased or decreased by diltiazem; plasma concentration of phenytoin possibly increased or decreased by benzodiazepines
- Aprepitant: phenytoin possibly reduces plasma concentration of aprepitant
- Bupropion: phenytoin reduces plasma concentration of bupropion
- Circulatory: phenytoin accelerates metabolism of clopidogrel (reduced plasma (avoid concomitant use); phenytoin possibly increases plasma concentration of diltiazem but possibly reduced
- Cardiac Glycosides: phenytoin possibly reduces plasma concentration of digoxin
- Ciclosporin: phenytoin reduces plasma concentration of ciclosporin (reduced plasma concentration)
- Cobicitstat: phenytoin possibly reduces plasma concentration of cobicitstat—manufacturer of cobicitstat advises avoid concomitant use
- Corticosteroids: phenytoin accelerates metabolism of corticosteroids (reduced effect)
- Corticosteroids: phenytoin possibly reduces plasma concentration of basilixan, eribulin and etoposide; metabolism of phenytoin possibly inhibited by fluorouracil (increased risk of toxicity); phenytoin increases antifolate effect of methotrexate; plasma concentration of phenytoin possibly reduced by cisplatin; phenytoin possibly decreases plasma concentration of axtinib (increase dose of axtinib—consult axtinib product literature); phenytoin possibly reduces plasma concentration of bosutinib and crizotinib—manufacturer of bosutinib and crizotinib advises avoid concomitant use; avoidance of phenytoin advised by manufacturer of bosutinib and crizotinib—avoid concomitant use; phenytoin reduces plasma concentration of imatinib and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when phenytoin given with procarbazine; avoidance of phenytoin advised by manufacturer of vismodegib (plasma concentration of vismodegib possibly reduced)
- Diazoxide: plasma concentration of phenytoin reduced by diazoxide, also effect of diazoxide may be reduced
- Disulfiram: metabolism of phenytoin inhibited by disulfiram (increased risk of toxicity)
- Diuretics: plasma concentration of phenytoin possibly increased by acetazolamide; phenytoin antagonises effects of furosemide; phenytoin reduces plasma concentration of spironolactone—avoid concomitant use; increased risk of osteomalacia when phenytoin given with carbonate anhydrase inhibitors
- Dopaminergics: phenytoin possibly reduces effects of levodopa
- Enteral Foods: absorption of phenytoin possibly reduced by enteral feeds
- Folates: plasma concentration of phenytoin possibly reduced by folates
- Hormone Antagonists: phenytoin possibly reduces plasma concentration of abiraterone—manufacturer of abiraterone advises avoid concomitant use; phenytoin possibly accelerates metabolism of toremifene
- 5HT1-receptor Antagonists: phenytoin accelerates metabolism of ondansetron (reduced effect)
- Icavacort: phenytoin possibly reduces plasma concentration of icavacort—manufacturer of icavacort advises avoid concomitant use
- Leflunomide: plasma concentration of phenytoin possibly increased by leflunomide
- Levamisole: plasma concentration of phenytoin possibly increased by levamisole
- Lipid-regulating Drugs: absorption of phenytoin possibly reduced by colesevelam; combination of phenytoin with rosvastatin may increase plasma concentration of either drug (or both)
- Lithium: neurotoxicity may occur when phenytoin given with lithium without increased plasma concentration of lithium
- Macitentan: avoidance of phenytoin advised by manufacturer of macitentan
- Modafinil: plasma concentration of phenytoin possibly increased by modafinil
- Muscle Relaxants: long-term use of phenytoin reduces effects of non-depolarising muscle relaxants (but acute use of phenytoin might increase effects of non-depolarising muscle relaxants)
- Oestrogens: phenytoin accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 536)
- Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat
- Pregestogens: phenytoin accelerates metabolism of pregestogens (reduced contraceptive effect—see p. 536)
- Roflumilast: phenytoin possibly inhibits effects of roflumilast (manufacturer of roflumilast advises avoid concomitant use)
- Sulfipyrazone: plasma concentration of phenytoin increased by sulfipyrazone
- Symptomonimetics: plasma concentration of phenytoin increased by methylphenidate

Phenytoin

- Cytotoxics (continued)
  - Plasma concentration of phenytoin advised by manufacturer of cabazitaxel, dabrafenib, gefitinib, lapatinib and vemurafenib; phenytoin reduces plasma concentration of emicizumab—avoid concomitant use; phenytoin reduces plasma concentration of imatinib and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when phenytoin given with procarbazine; avoidance of phenytoin advised by manufacturer of vismodegib (plasma concentration of vismodegib possibly reduced)
Antidepressants:

- Theophylline: plasma concentration of both drugs reduced when phenytoin given with theophylline

Thyroid Hormones: phenytoin accelerates metabolism of thyroid hormones (may increase requirements in hypothyroidism), also plasma concentration of phenytoin possibly increased

Ticlopidine: phenytoin accelerates metabolism of ticlopidine

Ticagrelor: phenytoin possibly reduces plasma concentration of ticagrelor

- Ulcer-healing Drugs: metabolism of phenytoin inhibited by esomeprazole; effects of phenytoin possibly reduced by omeprazole; absorption of phenytoin reduced by domperidone

- Ulipristal: avoidance of phenytoin by manufacturer of ulipristal (contraceptive effect of ulipristal possibly reduced)

Vaccines: effects of phenytoin by influenza vaccine

Pharmacological Interactions

Phenytoin (continued)

Vitamins: phenytoin possibly increases requirements for vitamin D

Phlocodine

Antidepressants: manufacturer of phlocodine advises for 2 weeks after stopping MAOIs

Phosphodiesterase Type-3 Inhibitors

- Anagrelide: avoidance of exonoxime and milrinone advised by manufacturer of anagrelide

Physostigmine see Parasympathomimetics

Pilocarpine see Parasympathomimetics

Pimozone see Antipsychotics

Pindolol see Beta-blockers

Piroglitazone see Antidiabetics

Piperacillin see Penicillins

Piperaque see Piperaque with Artennimal

Piperaque with Artennimal

Note Piperaque has a long half-life; there is a potential for drug interactions to occur for up to 3 months after treatment has been stopped

- Analgesics: manufacturer of piperaque with artennimal advises concomitant use with methadone (possible risk of ventricular arrhythmias)

- Anti-arrhythmics: manufacturer of piperaque with artennimal advises concomitant use with amiodarone and disopyramide (possible risk of ventricular arrhythmias)

- Antibacterials: manufacturer of piperaque with artennimal advises concomitant use with macrodides and mofloxicacin (possible risk of ventricular arrhythmias); manufacturer of piperaque with artennimal advises concomitant use with antidepressants

- Antiepileptics: manufacturer of piperaque with artennimal advises concomitant use with barbiturates, phenobarbital and phenytoin

- Antifungals: manufacturer of piperaque with artennimal advises concomitant use with azoles and itraazoles (possible risk of ventricular arrhythmias)

- Antihistamines: manufacturer of piperaque with artennimal advises concomitant use with azolasine (possible risk of ventricular arrhythmias)

- Antimalarials: avoidance of antimalarials advised by manufacturer of artemether with lumefantrine

- Antibacterials: manufacturer of piperaque with artennimal advises concomitant use with doxepin, haloperidol, pothoquinones and pyrazonies (possible risk of ventricular arrhythmias)

- Antivirals: manufacturer of piperaque with artennimal advises concomitant use with saquinavir (possible risk of ventricular arrhythmias)

- Beta-blockers: manufacturer of piperaque with artennimal advises concomitant use with betalol (possible risk of ventricular arrhythmias)

- Cytotoxic: manufacturer of piperaque with artennimal advises concomitant use with arsenic trioxide (possible risk of ventricular arrhythmias); manufacturer of piperaque with artennimal advises concomitant use with vinblastine, vincristine, vinflunine and vinorelbine

- Dopemidone: manufacturer of piperaque with artennimal advises concomitant use with domperidone (possible risk of ventricular arrhythmias)

Grapefruit juice: manufacturer of piperaque with artennimal advises concomitant use with grapefruit juice

Histamine: avoidance of antimalarials advised by manufacturer of histamine

- Pentamidine 1setionate: manufacturer of piperaque with artennimal advises concomitant use with pentamidine isetionate (possible risk of ventricular arrhythmias)

Vaccines: antimalarials inactivate oral typhoid vaccine—see p. 850

Pipotiazine see Antipsychotics

Pirenidone

- Antiarrhythmics: plasma concentration of pirenidone increased by ciprofloxacin—see Cautions under Pirenidone, p. 220

- Antidepressants: plasma concentration of pirenidone increased by fluvoxamine—manufacturer of pirenidone advises concomitant use with grapefruit juice

- Antiepileptics: manufacturer of piperaque with artennimal advises concomitant use with vigabatrin

Platinum Compounds

- Alesleukin: avoidance of cyclosporin advised by manufacturer of alesleukin

- Antibacterials: increased risk of nephrotoxicity and possibly of ototoxicity when platinum compounds given with aminoglycosides or polymyxins; increased risk of nephrotoxicity and ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and possibly of ototoxicity when platinum compounds given with vancomycin; increased risk of nephrotoxicity and possibly of ototoxicity when platinum compounds given with vinorelbine

- Antineoplastic: cyclosporin possibly reduces plasma concentration of phenytoin

- Antipsychotics: avoid concomitant use of cytoxics with olanzapine (increased risk of agranulocytosis)

- Antivirals: manufacturer of piperaque with artennimal advises concomitant use with zidovudine

- Bleomycin and methotrexate

Diuretics: increased risk of nephrotoxicity and ototoxicity when platinum compounds given with diuretics

Polymyxin B see Polymyxins

Polymyxins

- Antibacterials: increased risk of nephrotoxicity when colistimethate sodium or polymyxins given with...
Appendix 1: Interactions

Polymyxins
Antibacterials (continued)
aminoglycosides; increased risk of nephrotoxicity when colistimethate sodium or polymyxins given with capreomycin; increased risk of nephrotoxicity when polymyxins given with vancomycin; increased risk of nephrotoxicity and ototoxicity when colistimethate sodium given with vancomycin
Antifungals: increased risk of nephrotoxicity when polymyxins given with amphotericin B
- Ciclosporin: increased risk of nephrotoxicity when polymyxins given with ciclosporin
- Cytoxics: increased risk of nephrotoxicity and possibly of ototoxicity when polymyxins given with platinum compounds
- Diuretics: increased risk of ototoxicity when polymyxins given with loop diuretics
- Muscle Relaxants: polymyxins enhance effects of non-depolarising muscle relaxants and suxamethonium
- Parasympathomimetics: polymyxins antagonise effects of neostigmine and pyridostigmine
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

Polystyrene Sulfonate Resins
Antacids: risk of intestinal obstruction when polystyrene sulfonate resins given with aluminium hydroxide; risk of metabolic alkalosis when polystyrene sulfonate resins given with oral magnesium salts
Thyroid Hormones: polystyrene sulfonate resins reduce absorption of levothyroxine

Pomalidomide
- Antidepressants: plasma concentration of pomalidomide increased by bupropion

Ponatinib
- Antiplatelet drugs: increased risk of bleeding when ponatinib given with clopidogrel
- Antidepressants: possibly increased risk of bleeding when given with SSRIs
- Antipsychotics: possibly increased risk of bleeding when given with clozapine
- Anti-infectives: increased risk of bleeding when given with zidovudine

Pramipexole
- Antipsychotics: manufacturer of pramipexole advises avoid concomitant use of antipsychotics (agonist of effect)
- Memantine: effects of dopaminergics possibly enhanced by memantine
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa

Pramipexole (continued)
Ulcer-healing Drugs: excretion of pramipexole reduced by cimetidine (increased plasma concentration)

Prasugrel
- Analgesics: possibly increased risk of bleeding when prasugrel given with NSAI DS
- Anticoagulants: possibly increased risk of bleeding when prasugrel given with coumarins or phenindione
- Clopidogrel: possibly increased risk of bleeding when prasugrel given with clopidogrel

Pravastatin see Statins
Prazosin see Alpha-blockers
Prednisolone see Corticosteroids
Prednisone see Corticosteroids

Pregabalin
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered)
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by nefopam
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered)
- Orlitalat: possible increased risk of convulsions with antiepileptics given with olanzapine

Prilocaine
Anti-arrhythmics: increased myocardial depression when prilocaine given with anti-arrhythmics
Antibacterials: increased risk of methaemoglobinemia when prilocaine given with sulphonamides

Primaquine
- Antidepressants: avoidance of antimalarials advised by manufacturer of citalopram and escitalopram (risk of ventricular arrhythmias)
- Antimalarials: avoidance of antimalarials advised by manufacturer of arteether with lumezantrine
- Histamine: avoidance of antimalarials advised by manufacturer of histamine
- Mepacrine: plasma concentration of primaquine increased by mepacrine (increased risk of toxicity)
- Vaccines: antimalarial inactivate oral typhoid vaccine—see p. 850

Primidone see Phenobarbital

Probencid
ACE Inhibitors: probencid reduces excretion of captopril
Analgesics, General: probencid possibly enhances effects of thiopeptol
- Analgesics: probencid reduces excretion of acemetacin, dexketoprofen, indometacin, ketoprofen and naproxen (increased plasma concentration)—avoid concomitant use; effects of probencid antagonised by aspirin
- Antibacterials: probencid reduces excretion of mephenesin; probencid reduces excretion of cephalo sporins, ciprofloxacin, nalidixic acid, norfloxacin and penicillins (increased plasma concentration); probencid reduces excretion of dapsone and nitrofurantoin (increased risk of side-effects); effects of probenecid antagonised by pyrazinamide
- Antibivials: probenecid reduces excretion of aciclovir (increased plasma concentration); probenecid possibly reduces excretion of famciclovir (increased plasma concentration); probenecid reduces excretion of ganciclovir and vidarivir (increased plasma concentration and risk of toxicity)
- Anxiolytics and Hypnotics: probenicid reduces excretion of lorazepam (increased plasma concentration);
Antivirals

Antiepileptics:

Antibacterials:

Progestogens

Note

Anticoagulants:

Antipsychotics:

Procarbazine

Antidepressants:

Antibacterials:

Cardiac Glycosides:

Antifungals:

Note Interactions of combined oral contraceptives may also apply to combined contraceptive patches and vaginal rings, see p. 536. For further information on interactions of oral progestogen-only contraceptives, see also p. 539; parenteral progestogen-only contraceptives, see also p. 543, the intra-uterine progestogen-only device, see also p. 544; hormonal emergency contraception, see also p. 547

Antibacterials: plasma concentration of dienogest possibly reduced by sugammadex—manufacturer of sugammadex advises additional contraceptive precautions

Antidiabetics: progestogens antagonise hypoglycaemic effect of antidiabetics

Antipsychotics: metabolism of progestogens accelerated by rifampicin (reduced contraceptive effect—see p. 536)

Antidepressants: avoidance of antimalarials advised by manufacturer of proguanil with alcohol

Antimuscarinics:

Antidepressants:

Antifungals: progestogens possibly increase plasma concentration of voriconazole; anecdotal reports of breakthrough bleeding when progestogens used (for contraception) given with terbinafine

Antivirals: plasma concentration of norethisterone increased by atazanavir; plasma concentration of norgestimate increased by elvitegravir; concentration of active metabolite of norgestimate increased by ritonavir; increased antifolate effect when proguanil given with pyrimethamine

Antivirals: plasma concentration of voriconazole; anecdotal reports of breakthrough bleeding when progestogens used (for contraception) given with terbinafine

Antidepressants: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine

Antidepressants and Hypnotics: progestogens possibly enhance plasma concentration of chlor Diazoxide, diazepam and nitrazepam; progestogens possibly reduce plasma concentration of lorazepam, oxazepam and temazepam

Antihistamines

Probenecid

BNF 68

Appendix 1: Interactions

969

Antipsychotics: reduced contraceptive effect of progestogens advised by manufacturer of clozapine (increased risk of agranulocytosis)

Anticoagulants: plasma concentration of anticoagulant effect of warfarin

Antidysrhythmics: plasma concentration of dienogest possibly reduced by sugammadex—manufacturer of sugammadex advises additional contraceptive precautions

Antihistamines

Progestogens

Probenecid

BNF 68 Appendix 1: Interactions 969

Antivirals:

Antiepileptics:

Antibacterials:

Progestogens

Note Interactions of combined oral contraceptives may also apply to combined contraceptive patches and vaginal rings, see p. 536. For further information on interactions of oral progestogen-only contraceptives, see also p. 539; parenteral progestogen-only contraceptives, see also p. 543, the intra-uterine progestogen-only device, see also p. 544; hormonal emergency contraception, see also p. 547

Antibacterials: plasma concentration of dienogest possibly reduced by sugammadex—manufacturer of sugammadex advises additional contraceptive precautions

Antidiabetics: progestogens antagonise hypoglycaemic effect of antidiabetics

Antipsychotics: metabolism of progestogens accelerated by rifampicin (reduced contraceptive effect—see p. 536)

Antidepressants: avoidance of antimalarials advised by manufacturer of proguanil with alcohol

Antimuscarinics:

Antidepressants:

Antifungals: progestogens possibly increase plasma concentration of voriconazole; anecdotal reports of breakthrough bleeding when progestogens used (for contraception) given with terbinafine

Antivirals: plasma concentration of norethisterone increased by atazanavir; plasma concentration of norgestimate increased by elvitegravir; concentration of active metabolite of norgestimate increased by ritonavir; increased antifolate effect when proguanil given with pyrimethamine

Antivirals: plasma concentration of voriconazole; anecdotal reports of breakthrough bleeding when progestogens used (for contraception) given with terbinafine

Antidepressants: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine

Antidepressants and Hypnotics: progestogens possibly enhance plasma concentration of chlor Diazoxide, diazepam and nitrazepam; progestogens possibly reduce plasma concentration of lorazepam, oxazepam and temazepam

Antiparkinsonian: metabolism of progestogens possibly reduced by selegiline (alternative contraception recommended)

Antidepressants: avoidance of antimalarials advised by manufacturer of proguanil with alcohol

Antimuscarinics:

Antidepressants:

Antifungals: progestogens possibly increase plasma concentration of voriconazole; anecdotal reports of breakthrough bleeding when progestogens used (for contraception) given with terbinafine

Antivirals: plasma concentration of norethisterone increased by atazanavir; plasma concentration of norgestimate increased by elvitegravir; concentration of active metabolite of norgestimate increased by ritonavir; increased antifolate effect when proguanil given with pyrimethamine

Antivirals: plasma concentration of voriconazole; anecdotal reports of breakthrough bleeding when progestogens used (for contraception) given with terbinafine

Antidepressants: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine

Antidepressants and Hypnotics: progestogens possibly enhance plasma concentration of chlor Diazoxide, diazepam and nitrazepam; progestogens possibly reduce plasma concentration of lorazepam, oxazepam and temazepam

Antiparkinsonian: metabolism of progestogens possibly reduced by selegiline (alternative contraception recommended)

Antidepressants: avoidance of antimalarials advised by manufacturer of proguanil with alcohol

Antimuscarinics:

Antidepressants:

Antifungals: progestogens possibly increase plasma concentration of voriconazole; anecdotal reports of breakthrough bleeding when progestogens used (for contraception) given with terbinafine

Antivirals: plasma concentration of norethisterone increased by atazanavir; plasma concentration of norgestimate increased by elvitegravir; concentration of active metabolite of norgestimate increased by ritonavir; increased antifolate effect when proguanil given with pyrimethamine

Antivirals: plasma concentration of voriconazole; anecdotal reports of breakthrough bleeding when progestogens used (for contraception) given with terbinafine

Antidepressants: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine

Antidepressants and Hypnotics: progestogens possibly enhance plasma concentration of chlor Diazoxide, diazepam and nitrazepam; progestogens possibly reduce plasma concentration of lorazepam, oxazepam and temazepam

Antiparkinsonian: metabolism of progestogens possibly reduced by selegiline (alternative contraception recommended)
Appendix 1: Interactions

Propafenone (continued)

Antihistamines: avoidance of propafenone advised by manufacturer of mizolastine (possible risk of ventricular arrhythmias)
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with antipsychotics that prolong the QT interval
- Antivirals: plasma concentration of propafenone possibly increased by fosamprenavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of propafenone increased by ritonavir (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when propafenone given with saquinavir—avoid concomitant use; caution with propafenone advised by manufacturer of telaprevir (risk of ventricular arrhythmias)
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with beta-blockers; propafenone increases plasma concentration of metoprolol and propranolol
- Cardiac Glycosides: propafenone increases plasma concentration of digoxin
- Ciclosporin: propafenone possibly increases plasma concentration of ciclosporin
- Parasympathomimetics: propafenone possibly antagonises effects of neostigmine and pyridostigmine
- Theophylline: propafenone increases plasma concentration of theophylline
- Ulcer-healing Drugs: plasma concentration of propafenone increased by cimetidine

Propantheline see Antimuscarinics
Propofol see Anaesthetics, General
Propranolol see Beta-blockers
Prostaglandins

ACE Inhibitors: enhanced hypotensive effect when alprostadil given with ACE inhibitors
- Adrenergic Neurone Blockers: enhanced hypotensive effect when alprostadil given with adrenergic neurone blockers
- Alpha-blockers: enhanced hypotensive effect when alprostadil given with alpha-blockers
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alprostadil given with angiotensin-II receptor antagonists
- Beta-blockers: enhanced hypotensive effect when alprostadil given with beta-blockers
- Calcium-channel Blockers: enhanced hypotensive effect when alprostadil given with calcium-channel blockers
- Clonidine: enhanced hypotensive effect when alprostadil given with clonidine
- Dizoxide: enhanced hypotensive effect when alprostadil given with dizoxide
- Duretics: enhanced hypotensive effect when alprostadil given with diuretics
- Methyldopa: enhanced hypotensive effect when alprostadil given with methyldopa
- Moxonidine: enhanced hypotensive effect when alprostadil given with moxonidine
- Nitrate: enhanced hypotensive effect when alprostadil given with nitrates
- Oxytocin: prostaglandins potentiate uterotent effect of oxytocin
- Vasodilator Antihypertensives: enhanced hypotensive effect when alprostadil given with hydralazine, minoxidil or sodium nitroprusside

Protein Kinase Inhibitors see individual drugs
Proton Pump Inhibitors

Antacids: absorption of lansoprazole possibly reduced by antacids

Antibacterials: plasma concentration of both drugs increased when omeprazole given with clarithromycin

Proton Pump Inhibitors (continued)

- Anticoagulants: pantoprazole might enhance the anticoagulant effect of coumarins; esomeprazole and omeprazole possibly enhance anticoagulant effect of coumarins
- Antidepressants: omeprazole increases plasma concentration of escitalopram; plasma concentration of lansoprazole possibly increased by fluvoxamine; plasma concentration of omeprazole possibly reduced by St John’s wort
- Antiepileptics: omeprazole possibly enhances effects of phenytoin; esomeprazole enhances effects of phenytoin
- Antifungals: proton pump inhibitors reduce absorption of itraconazole; esomeprazole reduces plasma concentration of posaconazole—manufacturer of posaconazole suspension advises avoid concomitant use; lansoprazole, omeprazole, pantoprazole and rabeprazole possibly reduce plasma concentration of posaconazole—manufacturer of posaconazole suspension advises avoid concomitant use; plasma concentration of esomeprazole possibly increased by voriconazole; plasma concentration of omeprazole increased by voriconazole (consider reducing dose of omeprazole)
- Antipsychotics: omeprazole possibly reduces plasma concentration of clozapine
- Antivirals: proton pump inhibitors reduce plasma concentration of atazanavir—avoid or adjust dose of both drugs (consult product literature); omeprazole increases plasma concentration of raltegravir; omeprazole reduces plasma concentration of rilpivirine—avoid concomitant use; avoidance of esomeprazole, lansoprazole, pantoprazole and rabeprazole advised by manufacturer of rilpivirine (plasma concentration of rilpivirine possibly reduced); omeprazole increases plasma concentration of saquinavir—manufacturer of saquinavir advises avoid concomitant use; esomeprazole, lansoprazole, pantoprazole and rabeprazole possibly reduce plasma concentration of saquinavir—manufacturer of saquinavir advises avoid concomitant use; plasma concentration of esomeprazole and omeprazole reduced by rilpivirine
- Antiplatelets: enhanced antiplatelet effect of clopidogrel; lansoprazole, pantoprazole and rabeprazole possibly reduce antiplatelet effect of clopidogrel
- Cytotoxics: proton pump inhibitors possibly reduce excretion of methotrexate (increased risk of toxicity); lansoprazole reduces plasma concentration of bosutinib; esomeprazole and omeprazole reduce plasma concentration of dasatinib (plasma concentration of dasatinib possibly reduced); avoidance of esomeprazole, lansoprazole, pantoprazole and rabeprazole advised by manufacturer of erlotinib; omeprazole reduces plasma concentration of erlotinib—manufacturer of erlotinib advises avoid concomitant use; proton pump inhibitors possibly reduce absorption of lapatinib; proton pump inhibitors possibly reduce absorption of pazopanib—manufacturer of pazopanib advises give at the same time as proton pump inhibitors
- Tacrolimus: omeprazole possibly increases plasma concentration of tacrolimus

Antibacterials: plasma concentration of both drugs increased when omeprazole given with clarithromycin
Proton Pump Inhibitors (continued)

Ulcer-healing Drugs: absorption of lansoprazole possibly reduced by sucralfate
- Ulipristal: avoidance of proton pump inhibitors advised by manufacturer of high-dose ulipristal (contraceptive effect of ulipristal possibly reduced)

Pseudoephedrine see Symptomimetics

Antivirals:

- Osaprenavir, indinavir and tipranavir (increased risk of toxicity); plasma concentration of quinidine increased by osaprenavir (increased risk of toxicity); increased risk of ventricular arrhythmias when quinine given with osaprenavir—avoid concomitant use
- Cardiac Glycosides: quinidine increases plasma concentration of amiodarone

Dopaminergics: quinidine possibly increases plasma concentration of amantadine

Histamine: avoidance of antimalarials advised by manufacturer of histamine

Muscle Relaxants: quinidine possibly enhances effects of diazepam

Ulcero-healing Drugs: metabolism of quinidine inhibited by cimetidine (increased plasma concentration)

Vaccines: antimalarials inactivate oral typhoid vaccine—see p. 850

Quinolones

- Analgesics: possible increased risk of convulsions when quinolones given with NSAIDs
- Antacids: absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin reduced by antacids

Anti-arrhythmics: increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with amiodarone—avoid concomitant use; increased risk of ventricular arrhythmias when moxifloxacin given with disopyramide—avoid concomitant use

Antibacterials: increased risk of ventricular arrhythmias when moxifloxacin given with piperacillin

Antivirals: increased antifolate effect when pyrimethamine given with sulphonamides or trimethoprim

Anticonvulsants: plasma concentration of both drugs increased when quinine given with warfarin

Antidepressants: avoidance of antimalarials advised by manufacturer of eslicitalopram and escitalopram (risk of ventricular arrhythmias)

Antiallergics: avoidance of antimalarials advised by manufacturer of disopyramide—avoid concomitant use; plasma concentration of quinine reduced by rifampicin

Anticoagulants: plasma concentration of both drugs increased when quinine given with warfarin

Antidepressants: avoidance of antimalarials advised by manufacturer of eslicitalopram and escitalopram (risk of ventricular arrhythmias)

Antimalarials: avoidance of antimalarials advised by manufacturer of disopyramide—avoid concomitant use; plasma concentration of quinine reduced by rifampicin

Anticoagulants: plasma concentration of quinidine possibly increased by azaquinavir, edaravir, staripendone

Antipsychotics: ciprofloxacin increases or decreases plasma concentration of clozapine;
Appendix 1: Interactions

Quinolones

- Antipsychotics (continued)
  - Ciprofloxacin possibly increases plasma concentration of olanzapine
- Antivirals: manufacturer of norfloxacin advises give didanosine at least 2 hours before or after norfloxacin; increased risk of ventricular arrhythmias when moxifloxacin given with azithromycin—avoid concomitant use
- Atomoxetine: increased risk of ventricular arrhythmias when moxifloxacin given with atomoxetine
- Beta-blockers: increased risk of ventricular arrhythmias when moxifloxacin given with sotalol—avoid concomitant use
- Calcium Salts: absorption of ciprofloxacin reduced by calcium salts
- Ciclosporin: increased risk of nephrotoxicity when quinolones given with ciclosporin
- Clopidogrel: ciprofloxacin possibly reduces antplatelet effect of clopidogrel
- Corticosteroids: nalidixic acid increases risk of melphalan toxicity; ciprofloxacin possibly reduces excretion of methotrexate (increased risk of toxicity); possible increased risk of ventricular arrhythmias when moxifloxacin given with bosutinib; ciprofloxacin possibly increases the plasma concentration of bosutinib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; ciprofloxacin increases plasma concentration of erlotinib; possible increased risk of ventricular arrhythmias when moxifloxacin given with vanetupib—avoid concomitant use; increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with arsenic trioxide
- Dairy Products: absorption of ciprofloxacin and norfloxacin reduced by dairy products
- Dopaminergics: ciprofloxacin increases plasma concentration of rasagline; ciprofloxacin inhibits metabolism of ropinirole (increased plasma concentration)
- SHTR agonists: quinolones possibly inhibit metabolism of zolmitriptan (reduce dose of zolmitriptan)
- Iron: absorption of ciprofloxacin, levofloxacin, moxifloxacin and ofloxacin reduced by oral iron; absorption of norfloxacin reduced by oral iron (give at least 2 hours apart)
- Lanthanum: absorption of quinolones possibly reduced by lanthanum (give at least 2 hours before or 4 hours after lanthanum)
- Muscle Relaxants: ciprofloxacin increases plasma concentration of etizolamidine (increased risk of toxicity)—avoid concomitant use; norfloxacin possibly increases plasma concentration of tizanidine (increased risk of toxicity)
- Mycophenolate: norfloxacin possibly reduces bioavailability of mycophenolate
- Pentamidine isethionate: increased risk of ventricular arrhythmias when moxifloxacin given with pentamidine isethionate—avoid concomitant use
- Pirfenidone: ciprofloxacin increases plasma concentration of pirfenidone—see Cautions under Pirfenidone, p. 220
- Probenecid: excretion of ciprofloxacin, nalidixic acid and norfloxacin reduced by probenecid (increased plasma concentration)
- Sevelamer: bioavailability of ciprofloxacin reduced by sevelamer
- Strontium Ranelate: absorption of quinolones reduced by strontium ranelate (manufacturer of strontium ranelate advises avoid concomitant use)
- Theophylline: possible increased risk of convulsions when quinolones given with theophylline; ciprofloxacin and norfloxacin increase plasma concentration of theophylline
- Urinary Antiacids: absorption of quinolones possibly reduced by urinary antacids

Quinolones (continued)

- Ulcer-healing Drugs: absorption of ciprofloxacin, levofloxacin, moxifloxacin and ofloxacin reduced by sucralfate; absorption of norfloxacin reduced by sucralfate (give at least 2 hours apart)
- Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850
- Zinc: absorption of ciprofloxacin, levofloxacin, moxifloxacin and ofloxacin reduced by zinc; absorption of norfloxacin reduced by zinc (give at least 2 hours apart)

Rabeprazole see Proton Pump Inhibitors

Rabies Vaccine see Vaccines

Rifaxidine Anticoagulants: Rifaxidine antagonises anticoagulant effect of coumarins

Lipid-regulating Drugs: absorption of rifaxidine reduced by colestyramine (manufacturer of rifaxidine advises avoid concomitant administration)

Raltegravir

- Antacids: absorption of raltegravir possibly reduced by antacids (give at least 2 hours apart)
- Antibacterials: plasma concentration of raltegravir reduced by rifampicin—consider increasing dose of raltegravir
- Antivirals: increased risk of rash when raltegravir given with darunavir; avoidance of raltegravir advised by manufacturer of fosamprenavir
- Orlistat: absorption of raltegravir possibly reduced by orlistat

Ulcer-healing Drugs: plasma concentration of raltegravir increased by famotidine and omeprazole

Raltitrexed

- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Folates: manufacturer of raltitrexed advises avoid concomitant use with folates
- Ramipril see ACE Inhibitors
- Ranitidine see Histamine H2-antagonists

Ranolazine

- Anti-arrhythmics: manufacturer of ranolazine advises avoid concomitant use with disopyramide
- Antibacterials: plasma concentration of ranolazine possibly increased by clarithromycin and erythromycin—manufacturer of ranolazine advises avoid concomitant use; plasma concentration of ranolazine reduced by rifampicin—manufacturer of ranolazine advises avoid concomitant use
- Antidepressants: plasma concentration of ranolazine increased by paroxetine
- Antifungals: plasma concentration of ranolazine possibly increased by itraconazole, posaconazole and voriconazole—manufacturer of ranolazine advises avoid concomitant use
- Antivirals: plasma concentration of ranolazine possibly increased by atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, ritonavir, saquinavir and tipranavir—manufacturer of ranolazine advises avoid concomitant use
- Beta-blockers: manufacturer of ranolazine advises avoid concomitant use with sotalol
- Calcium-channel Blockers: plasma concentration of ranolazine increased by diltiazem and verapamil (consider reducing dose of ranolazine)
- Cardiac Glycosides: ranolazine increases plasma concentration of digoxin
- Ciclosporin: plasma concentration of both drugs may increase when ranolazine given with ciclosporin
- Grapefruit Juice: plasma concentration of ranolazine possibly increased by grapefruit juice—manufacturer of ranolazine advises avoid concomitant use
- Lipid-regulating Drugs: ranolazine increases plasma concentration of simvastatin (see Dose under Simvastatin, p. 173); manufacturer of lomitapide advises dose reduction when ranolazine given with lomitapide (see Dose under Lomitapide, p. 177)
Appendix 1: Interactions

BNF 68

Retigabine (continued)
Antiepileptics: plasma concentration of retigabine possibly reduced by carbamazepine and phenytoin
Antimalarials: anticonvulsant effect of antiepileptics antagonised by rifampicin
Antipsychotics: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered)
Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat

Ranolazine (continued)
- Tacrolimus: ranolazine increases plasma concentration of tacrolimus
Rasagiline
Note: Rasagiline is a MAO-B inhibitor
- Analgesics: avoid concomitant use of rasagiline with dextromethorphan: risk of CNS toxicity when rasagiline given with pethidine (avoid pethidine for 2 weeks after rasagiline)
Antibacterials: plasma concentration of rasagiline increased by ciprofloxacin
- Antidepressants: after stopping rasagiline do not start fluoxetine for 2 weeks, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; after stopping rasagiline do not start fluvoxamine for 2 weeks; risk of hypertensive crisis when rasagiline given with MAOIs, avoid MAOIs for at least 2 weeks after stopping rasagiline; increased risk of CNS toxicity when rasagiline given with SSRI or tricyclics
Dopaminergics: plasma concentration of rasagiline possibly reduced by entacapone
Methyl dopa: antiparkinsonian effect of dopaminergics antagonised by methyl dopa
- Sympathomimetics: avoid concomitant use of rasagiline with sympathomimetics
Reboxetine
- Antibacterials: manufacturer of reboxetine advises avoid concomitant use with macrolides
- Antidepressants: manufacturer of reboxetine advises avoid concomitant use with fluoxetine; fluvoxamine; paroxetine; sertraline; clomipramine; desvenlafaxine; tricyclics
- Lisinopril: possible increased risk of hypokalaemia when reboxetine given with lisinopril
- Antiepileptics: plasma concentration of reboxetine possibly reduced by carbamazepine and phenobarbital
- Antifungals: manufacturer of reboxetine advises avoid concomitant use with miconazole and itraconazole
- Antimalarials: avoidance of antidepressants advised by manufacturer of arteether with lumefantrine and piperaquine with arteninol
Atorvastatin: possible increased risk of convulsions when antidepressants given with atorvastatin
Diuretics: possible increased risk of hypokalaemia when reboxetine given with loop diuretics or thiazides and related diuretics
Ergot Alkaloids: possible risk of hypertension when reboxetine given with ergotamine
Regorafenib
Analgesics: manufacturer of regorafenib advises avoid concomitant use with mefenamic acid
- Antibacterials: plasma concentration of regorafenib reduced by rifampicin—manufacturer of regorafenib advises avoid concomitant use
- Anticoagulants: increased risk of bleeding when regorafenib given with warfarin
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Cytotoxics: regorafenib increases plasma concentration of irinotecan
Remifentanil see Opioid Analgesics
Ranolazine see Antidibetics
Retigabine
- Alcohol: increased risk of blurred vision when retigabine given with alcohol
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered)
Appendix 1: Interactions

Antimalarials: rifampicin possibly reduces plasma concentration of tinidazole and trimethoprim; rifampicin reduces plasma concentration of doxycline—consider increasing dose of doxycline; rifampicin accelerates metabolism of chloramphenicol (reduced plasma concentration); increased risk of hepatotoxicity when rifampicin given with triazoles; rifampicin reduces plasma concentration of linezolid (possible therapeutic failure of linezolid); rifampicin reduces plasma concentration of etothimycin (avoid during and for 2 weeks after rifampicin).

Antifungals: rifampicin reduces plasma concentration of itraconazole; rifampicin accelerates metabolism of echinocandins and nateglinide; rifampicin possibly reduces effects of linezolid; rifampicin possibly antagonises hypoglycaemic effect of repaglinide; rifampicin possibly accelerates metabolism of abacavir; plasma concentration of efavirenz—increase dose of efavirenz; rifampicin reduces plasma concentration of elvitegravir also plasma concentration of active metabolite of efavirenz—reduced dose of efavirenz; avoidance of rifampicin advised by manufacturer of elvitegravir, etravirine, sofosbuvir and zidovudine; plasma concentration of both drugs reduced when rifabutin given with elvitegravir; Rifampicin accelerates metabolism of indinavir (reduced plasma concentration—avoid concomitant use); plasma concentration of rifabutin increased by indinavir and saquinavir (also plasma concentration of indinavir and saquinavir reduced)—reduced rifabutin dose; rifampicin reduces plasma concentration of voriconazole—avoid concomitant use; plasma concentration of rifabutin possibly increased by nevirapine; rifabutin decreases plasma concentration of rifampicin (increase dose of rifapirin—consult rifapirin product literature); rifampicin reduces plasma concentration of ritonavir; plasma concentration of rifabutin increased by ritonavir (increased risk of toxicity—reduce rifabutin dose); rifampicin significantly reduces plasma concentration of saquinavir, also risk of hepatotoxicity—avoid concomitant use; avoidance of rifabutin advised by manufacturer of sofosbuvir and etelaprevir; rifampicin possibly reduces plasma concentration of etravirine—avoid concomitant use.

Antidiabetics: rifampicin accelerates metabolism of sitagliptin and metformin; rifampicin possibly reduces plasma concentration of rosiglitazone; plasma concentration of nor葛litazone increased—avoid concomitant use; plasma concentration of rosiglitazone increased—avoid concomitant use; plasma concentration of rosiglitazone increased—avoid concomitant use; plasma concentration of rosiglitazone increased—avoid concomitant use.

Antimuscarinics: rifampicin reduces plasma concentration of apixaban; rifampicins accelerates metabolism of omeprazole (reduced risk of uveitis—reduce rifabutin dose); rifampicin accelerates metabolism of atropine; plasma concentration of bucurine (consider increasing dose of caspofungin) plasma concentration of rifabutin possibly increased by triazoles (increased risk of uveitis—reduce rifabutin dose) Antihistamines: rifampicin possibly reduces effects of fexofenadine.

Antimalarials: avoidance of rifampicin advised by manufacturer of piperaquine with arteether; rifampicin reduces plasma concentration of mefloquine—avoid concomitant use; rifampicin reduces plasma concentration of quinine.

Antimuscarnics: rifampicin reduces plasma concentration of active metabolite of fesoterodine.

Antipsychotics: rifampicin accelerates metabolism of haloperidol (reduced plasma concentration); rifampicin reduces plasma concentration of aripiprazole (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); rifampicin possibly reduces plasma concentration of clozapine.

Antivirals: rifampicin possibly reduces plasma concentration of abacavir; plasma concentration of abacavir—consider increasing the dose of abacavir (possible significantly reduced plasma concentration); rifampicin reduces plasma concentration of stavudine, lamivudine and zidovudine; plasma concentration of abacavir—consider increasing the dose of abacavir (possible significantly reduced plasma concentration); rifampicin reduces plasma concentration of efavirenz increased dose of efavirenz; rifampicin reduces plasma concentration of elvitegravir also plasma concentration of active metabolite of efavirenz—reduced dose of efavirenz; avoidance of rifampicin advised by manufacturer of elvitegravir, etravirine, sofosbuvir and zidovudine; plasma concentration of both drugs reduced when rifabutin given with elvitegravir; rifampicin accelerates metabolism of indinavir (reduced plasma concentration—avoid concomitant use); plasma concentration of rifabutin increased by indinavir and saquinavir (also plasma concentration of indinavir and saquinavir reduced)—reduced rifabutin dose; rifampicin reduces plasma concentration of voriconazole—avoid concomitant use; plasma concentration of rifabutin possibly increased by nevirapine; rifabutin decreases plasma concentration of rifampicin (increase dose of rifapirin—consult rifapirin product literature); rifampicin reduces plasma concentration of ritonavir; plasma concentration of rifabutin increased by ritonavir (increased risk of toxicity—reduce rifabutin dose); rifampicin significantly reduces plasma concentration of saquinavir, also risk of hepatotoxicity—avoid concomitant use; avoidance of rifabutin advised by manufacturer of sofosbuvir and etelaprevir; rifampicin possibly reduces plasma concentration of etravirine—avoid concomitant use.

Anxiolytics and Hypnotics: rifampicin accelerates metabolism of diazepam and zaleplon (reduced plasma concentration); rifampicin possibly accelerates metabolism of benzodiazepines (reduced plasma concentration); rifampicin possibly accelerates metabolism of buspirone; rifampicin accelerates metabolism of zolpidem (reduced plasma concentration and reduced effect); rifampicin significantly reduces plasma concentration of zopiclone.

Aprepitant: rifampicin reduces plasma concentration of aprepitant.

Atovaquone: avoidance of concomitant rifabutin advised by manufacturer of atovaquone (plasma concentration of both drugs reduced); rifampicin reduces plasma concentration of atovaquone (and concentration of rifabutin increased)—avoid concomitant use.

Aranafil: rifampicin possibly reduces plasma concentration of avanafil; manufacturer of avanafil advises avoid concomitant use.

Beta-blockers: rifampicin accelerates metabolism of bisoprolol and propranolol (plasma concentration significantly reduced); rifampicin reduces plasma concentration of carvedilol, celiprolol and metoprolol.

Bosentan: rifampicin reduces plasma concentration of bosentan—avoid concomitant use.

Calcium-channel Blockers: rifampicin possibly reduces plasma concentration of felodipine; rifampicin possibly accelerates metabolism of nifedipine (possible significantly reduced plasma concentration); rifampicin accelerates metabolism of diltiazem,
Ciclosporin: rifamycin possibly reduces plasma concentration of digoxin.

Calcium-channel Blockers

BNF 68 Appendix 1: Interactions 975

Corticosteroids: rifamycin possibly reduces plasma concentration of deferasirox; rifampicin possibly reduces plasma concentration of tacrolimus; rifampicin possibly reduces plasma concentration of ciclosporin (reduced dose—consult product literature).

Ciclosporin: rifamycin accelerates metabolism of ciclosporin (reduced plasma concentration).

Cobicistat: rifabutin reduces plasma concentration of cobicistat (adjust dose—consult product literature); rifampicin possibly reduces plasma concentration of cobicistat—manufacturer of cobicistat advises avoid concomitant use.

Corticosteroids: rifamycins accelerate metabolism of corticosteroids (reduced effect).

Cytoxicodons: rifampicin reduces plasma concentration of atenolol, ruxolitinib and sorafenib; rifampicin possibly decreases plasma concentration of axitinib (increase dose of axitinib—consult axitinib product literature); rifampicin reduces plasma concentration of axitinib (increase dose of axitinib—consult axitinib product literature); rifabutin possibly reduces plasma concentration of brentuximab vedotin; rifampicin reduces plasma concentration of everolimus (avoid concomitant use); rifampicin reduces plasma concentration of erlotinib and sunitinib (reduced plasma concentration); rifampicin reduces plasma concentration of everolimus (reduced plasma concentration—avoid concomitant use); rifampicin reduces plasma concentration of everolimus (reduced plasma concentration—avoid concomitant use); rifampicin reduces plasma concentration of everolimus (reduced plasma concentration—avoid concomitant use); rifampicin possibly reduces plasma concentration of everolimus (reduced plasma concentration); rifampicin reduces plasma concentration of everolimus (reduced plasma concentration—avoid concomitant use); rifampicin reduces plasma concentration of everolimus (reduced plasma concentration—avoid concomitant use); rifampicin possibly reduces plasma concentration of everolimus (reduced plasma concentration). Rifampicin possibly reduces plasma concentration of tizanidine.

Macitentan: rifampicin reduces plasma concentration of macitentan—avoid concomitant use.

Muscle Relaxants: rifamycins accelerate metabolism of muscle relaxants and sunitinib (reduced plasma concentration); rifampicin reduces plasma concentration of sunitinib (reduced plasma concentration—avoid concomitant use); rifampicin possibly reduces plasma concentration of sunitinib (reduced plasma concentration); rifampicin reduces plasma concentration of sunitinib (reduced plasma concentration); rifampicin reduces plasma concentration of sunitinib (reduced plasma concentration—avoid concomitant use); rifampicin reduces plasma concentration of sunitinib (reduced plasma concentration). Rifampicin possibly reduces plasma concentration of tizanidine.

Myophenolate: rifamycin reduces plasma concentration of myophenolate.

Oestrogens: rifamycins accelerate metabolism of oestrogens (reduced contraceptive effect—see p. 536).

Progestogens: rifamycins accelerate metabolism of progestogens (reduced contraceptive effect—see p. 536).

Ranolazine: rifamycin reduces plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use.

Roflumilast: rifampicin inhibits effects of roflumilast (manufacturer of roflumilast advises avoid concomitant use).

Sirolimus: rifabutin and rifampicin reduce plasma concentration of sirolimus—avoid concomitant use.

Tacrolimus: rifampicin reduces plasma concentration of tacrolimus; rifampicin reduces plasma concentration of tacrolimus; rifampicin reduces plasma concentration of tacrolimus; rifampicin reduces plasma concentration of tacrolimus; rifampicin reduces plasma concentration of tacrolimus; rifampicin reduces plasma concentration of tacrolimus; rifampicin reduces plasma concentration of tacrolimus; rifampicin reduces plasma concentration of tacrolimus; rifampicin reduces plasma concentration of tacrolimus; rifampicin possibly reduces plasma concentration of tacrolimus.

Tadalafil: rifamycin reduces plasma concentration of tadalafil—manufacturer of tadalafil advises avoid concomitant use.

Teriflunomide: rifamycins reduce plasma concentration of teriflunomide.

Theophylline: rifamycin accelerates metabolism of theophylline (reduced plasma concentration).

Thyroid Hormones: rifamycin accelerates metabolism of levothyroxine (may increase requirements for levothyroxine in hypothyroidism).

Tibilexone: rifampicin accelerates metabolism of tiblexone (reduced plasma concentration).

Tylospirin: rifampicin reduces plasma concentration of tylospirin.

Vaccines: antibiotics inactivate oral typhoid vaccine—see p. 850.

Rilpivirine: Analgesics: rilpivirine possibly reduces plasma concentration of methadone.

Antacid: manufacturer of rilpivirine advises give antacids 2 hours before or 4 hours after rilpivirine.

Antibacterials: manufacturer of rilpivirine advises avoid concomitant use with clarithromycin and erythromycin (plasma concentration of rilpivirine possibly increased); plasma concentration of rilpivirine decreased by rifabutin (increase dose of rilpivirine—consult rilpivirine product literature); plasma concentration of rilpivirine reduced by rifampicin—avoid concomitant use.

Anticoagulants: rilpivirine possibly increases plasma concentration of dabigatran.

Antidepressants: manufacturer of rilpivirine advises avoid concomitant use with St John’s wort (plasma concentration of rilpivirine possibly reduced).

Antiepileptics: manufacturer of rilpivirine advises avoid concomitant use with carbamazepine, oxcarbazepine, phenobarbital and phenytoin (plasma concentration of rilpivirine possibly reduced).

Appendix 1: Interactions 975

Rifamycins (continued) Lipid-regulating Drugs: rifamycin possibly reduces plasma concentration of atorvastatin and simvastatin; rifamycin accelerates metabolism of fluvastatin (reduced effect).

Macitentan: rifampicin reduces plasma concentration of macitentan—avoid concomitant use.

Muscle Relaxants: rifampicin possibly reduces plasma concentration of tizanidine.

Myophenolate: rifamycin reduces plasma concentration of myophenolate.

Oestrogens: rifamycins accelerate metabolism of oestrogens (reduced contraceptive effect—see p. 536).

Progestogens: rifamycins accelerate metabolism of progestogens (reduced contraceptive effect—see p. 536).

Ranolazine: rifamycin reduces plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use.

Roflumilast: rifampicin inhibits effects of roflumilast (manufacturer of roflumilast advises avoid concomitant use).

Sirolimus: rifabutin and rifampicin reduce plasma concentration of sirolimus—avoid concomitant use.

Tacrolimus: rifampicin reduces plasma concentration of tacrolimus; rifampicin reduces plasma concentration of tacrolimus; rifampicin reduces plasma concentration of tacrolimus; rifampicin reduces plasma concentration of tacrolimus; rifampicin reduces plasma concentration of tacrolimus; rifampicin reduces plasma concentration of tacrolimus; rifampicin reduces plasma concentration of tacrolimus; rifampicin reduces plasma concentration of tacrolimus; rifampicin reduces plasma concentration of tacrolimus; rifampicin possibly reduces plasma concentration of tacrolimus.

Tadalafil: rifamycin reduces plasma concentration of tadalafil—manufacturer of tadalafil advises avoid concomitant use.

Teriflunomide: rifamycins reduce plasma concentration of teriflunomide.

Theophylline: rifamycin accelerates metabolism of theophylline (reduced plasma concentration).

Thyroid Hormones: rifamycin accelerates metabolism of levothyroxine (may increase requirements for levothyroxine in hypothyroidism).

Tibilexone: rifampicin accelerates metabolism of tiblexone (reduced plasma concentration).

Tylospirin: rifampicin reduces plasma concentration of tylospirin.

Vaccines: antibiotics inactivate oral typhoid vaccine—see p. 850.

Rilpivirine: Analgesics: rilpivirine possibly reduces plasma concentration of methadone.

Antacid: manufacturer of rilpivirine advises give antacids 2 hours before or 4 hours after rilpivirine.

Antibacterials: manufacturer of rilpivirine advises avoid concomitant use with clarithromycin and erythromycin (plasma concentration of rilpivirine possibly increased); plasma concentration of rilpivirine decreased by rifabutin (increase dose of rilpivirine—consult rilpivirine product literature); plasma concentration of rilpivirine reduced by rifampicin—avoid concomitant use.

Anticoagulants: rilpivirine possibly increases plasma concentration of dabigatran.

Antidepressants: manufacturer of rilpivirine advises avoid concomitant use with St John’s wort (plasma concentration of rilpivirine possibly reduced).

Antiepileptics: manufacturer of rilpivirine advises avoid concomitant use with carbamazepine, oxcarbazepine, phenobarbital and phenytoin (plasma concentration of rilpivirine possibly reduced).
Appendix 1: Interactions

Ritonavir (continued)

Antibacterials: manufacturer of ritonavir advises give didanosine 2 hours before or 4 hours after ritonavir; avoidance of ritonavir advised by manufacturer of nevirapine
Calcium Salts: manufacturer of ritonavir advises give calcium salts 2 hours before or 4 hours after ritonavir

- Corticosteroids: manufacturer of ritonavir advises avoid concomitant use with dexamethasone (except when given as a single dose)
- Oriostat: absorption of ritonavir possibly reduced by orlistat
- Ulcer-healing Drugs: manufacturer of ritonavir advises avoid concomitant use with esomeprazole, lansoprazole, pantoprazole and rabeprazole (plasma concentration of ritonavir possibly reduced); plasma concentration of ritonavir reduced by omeprazole—avoid concomitant use; manufacturer of ritonavir advises avoid histamine H₃-antagonists for 12 hours before or 4 hours after ritonavir—consult product literature

Riociguat

Antacids: absorption of riociguat reduced by antacids (reduce dose of aripiprazole—consult aripiprazole product literature); manufacturer of riociguat advises avoid concomitant use

Antihistamines: possible enhanced hypotensive effect when riociguat given with non-sedating antihistamines—avoid concomitant use

Sildenafil: possible enhanced hypotensive effect when riociguat given with sildenafil—avoid concomitant use

Bisphosphonates: reduced plasma concentration of riociguat (given at least 2 hours before or 1 hour after riociguat)

Antifungals: manufacturer of riociguat advises avoid concomitant use with itraconazole and voriconazole

Risedronate Sodium

Risperidone

- Alpha-blockers: riociguat possibly increases plasma concentration of alfuzosin—avoid concomitant use
- Analgesics: riociguat possibly increases plasma concentration of NSAIDs and buprenorphine; riociguat increases plasma concentration of dextropropoxyphene and piroxicam (risk of toxicity)—avoid concomitant use; ritonavir increases plasma concentration of alfentanil and fentanyl; ritonavir reduces plasma concentration of methadone; ritonavir possibly reduces plasma concentration of morphine; ritonavir reduces plasma concentration of pethidine, but increases plasma concentration of toxic metabolite of pethidine (avoid concomitant use)
- Anti-arrhythmics: ritonavir increases plasma concentration of amiodarone and propafenone (increased risk of ventricular arrhythmias—avoid concomitant use); ritonavir possibly increases plasma concentration of disopyramide (increased risk of toxicity); avoidance of ritonavir advised by manufacturer of tronodarone; ritonavir possibly increases plasma concentration of flecainide (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antibacterials: ritonavir possibly increases plasma concentration of azithromycin and erythromycin; ritonavir increases plasma concentration of clarithromycin (reduce dose of clarithromycin in renal impairment); ritonavir increases plasma concentration of rifabutin (increased risk of toxicity—reduce rifabutin dose); plasma concentration of ritonavir reduced when ritonavir given with fusidic acid—avoid concomitant use; avoidance of concomitant ritonavir in severe renal and hepatic impairment advised by manufacturer of etelribomycin
- Anticoagulants: ritonavir may enhance or reduce anti-coagulant effect of warfarin; avoidance of ritonavir advised by manufacturer of apixaban; ritonavir possibly enhances anticoagulant effect of coumarins and phenindione; ritonavir increases plasma concentration of rivaroxaban—avoid concomitant use
- Antidepressants: ritonavir possibly reduces plasma concentration of paroxetine; ritonavir increases plasma concentration of doxazosine (increased risk of toxicity); ritonavir possibly increases plasma concentration of SSRIs and tricyclics; plasma concentration of ritonavir reduced by St John’s wort—avoid concomitant use
- Analgesics: possible enhanced hypotensive effect when riociguat given with alfuzosin, piroxicam (risk of toxicity)—avoid concomitant use
- Antihistamines: possible enhanced hypotensive effect when riociguat given with vardenafil—avoid concomitant use
- Antidepressants: ritonavir possibly increases plasma concentration of tolbutamide
- Antiepileptics: ritonavir possibly increases plasma concentration of carbamazepine; ritonavir possibly reduces plasma concentration of lamotrigine and valproate; plasma concentration of ritonavir possibly reduced by phenytoin, also plasma concentration of phenytoin possibly affected
- Antifungals: plasma concentration of ritonavir increased by fluconazole; combination of ritonavir with itraconazole may increase plasma concentration of either drug (or both); ritonavir reduces plasma concentration of voriconazole—avoid concomitant use
- Antihistamines: ritonavir possibly increases plasma concentration of non-sedating antihistamines
- Antimalarials: caution with ritonavir advised by manufacturer of arteether with lumefantrine; plasma concentration of ritonavir possibly reduced by mefloquine; ritonavir reduces plasma concentration of quinine (increased risk of toxicity)
- Antimuscarinics: avoidance of ritonavir advised by manufacturer of darifenacin and tolterodine; manufacturer of fesoterodine advises dose reduction when given with fesoterodine consult fesoterodine product literature; ritonavir possibly increases plasma concentration of olanzapine—see Dose under Solifenacin, p. 553
- Antipsychotics: ritonavir possibly increases plasma concentration of antipsychotics; ritonavir possibly increases plasma concentration of aripiprazole (reduce dose of aripiprazole—consult aripiprazole product literature); manufacturer of ritonavir advises avoid concomitant use with clozapine (increased risk of toxicity); ritonavir increases plasma concentration of olanzapine—consider increasing dose of olanzapine; ritonavir increases plasma concentration of pimozide (increased risk of ventricular arrhythmias—avoid concomitant use); ritonavir possibly increases plasma concentration of quetiapine—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: plasma concentration of both drugs reduced when ritonavir given with boceprevir, manufacturer of ritonavir advises ritonavir and didanosine should be taken 2.5 hours apart; ritonavir increases the toxicity of efavirenz, monitor liver function tests —manufacturer of Atripla® advises avoid concomitant use with high-dose ritonavir; ritonavir increases plasma concentration of indinavir, maraviroc and saquinavir; ritonavir possibly reduces plasma concentration of telaprevir
**Ritonavir** (continued)
- Anxiolytics and Hypnotics: ritonavir possibly increases plasma concentration of anxiolytics and hypnotics; ritonavir possibly increases plasma concentration of alprazolam, diazepam, flurazepam and eszopiclomed (risk of extreme sedation and respiratory depression—avoid concomitant use); ritonavir possibly increases plasma concentration of midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam); ritonavir increases plasma concentration of buspirone (increased risk of toxicity)
- Aprepitant: ritonavir possibly increases plasma concentration of aprepitant
- Atovaquone: ritonavir possibly reduces plasma concentration of atovaquone—manufacturer of atovaquone advises avoid concomitant use
- Avanafil: ritonavir significantly increases plasma concentration of avanafil—avoid concomitant use
- Bosentan: ritonavir increases plasma concentration of bosentan (consider reducing dose of bosentan)
- Bupropion: ritonavir reduces plasma concentration of bupropion
- Calcium-channel Blockers: ritonavir possibly increases plasma concentration of calcium-channel blockers; avoidance of ritonavir advised by manufacturer of lercanidipine
- Cardiac Glycosides: ritonavir possibly increases plasma concentration of digoxin
- Ciclosporin: ritonavir possibly increases plasma concentration of ciclosporin
- Cilostazol: ritonavir possibly increases plasma concentration of cilostazol (see Dose under Cilostazol, p. 140)
- Colchicine: ritonavir possibly increases risk of colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: ritonavir possibly increases plasma concentration of corticosteroids—increased risk of adrenal suppression; ritonavir possibly increases plasma concentration of budesonide (including inhaled, intranasal, and rectal budesonide)—increased risk of adrenal suppression; ritonavir increases plasma concentration of inhaled and intranasal fluticasone—increased risk of adrenal suppression
- Cytotoxics: ritonavir increases the plasma concentration of afatinib—manufacturer of afatinib advises separating administration of ritonavir by 6 to 12 hours; ritonavir possibly increases plasma concentration of axitinib (reduce dose of axitinib—consult axitinib product literature); ritonavir possibly increases the plasma concentration of bosutinib and cabazitaxel—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; ritonavir possibly increases plasma concentration of crizotinib, everolimus, nilotinib and vinflunine—manufacturer of crizotinib, everolimus, nilotinib and vinflunine advises avoid concomitant use; avoidance of ritonavir advised by manufacturer of lapatinib; ritonavir possibly increases plasma concentration of pazopanib (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when ritonavir given with ruxolitinib—consult ruxolitinib product literature; ritonavir possibly increases plasma concentration of docetaxel (increased risk of toxicity); ritonavir increases plasma concentration of paclitaxel; ritonavir possibly increases plasma concentration of vincristine
- Dapoxetine; avoidance of ritonavir advised by manufacturer of dapoxetine (increased risk of toxicity)
- Diuretics: ritonavir increases plasma concentration of spironolactone—avoid concomitant use

**Ritonavir** (continued)
- Domperidone: possible increased risk of ventricular arrhythmias when ritonavir given with domperidone—avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when ritonavir given with ergotamine—avoid concomitant use
- 5HT1-receptor Agonists: ritonavir increases plasma concentration of eletriptan (risk of toxicity)—avoid concomitant use
- Ivabradine: ritonavir possibly increases plasma concentration of ivabradine—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when ritonavir given with atorvastatin; possible increased risk of myopathy when ritonavir given with rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when ritonavir given with simvastatin (avoid concomitant use); avoidance of ritonavir advised by manufacturer of clotrimazole (plasma concentration of lomitapide possibly increased)
- Mirabegron: when given with ritonavir avoid or reduce dose of mirabegron in hepatic or renal impairment—see Mirabegron, p. 552
- Oestrogens: ritonavir accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 536)
- Orlistat: absorption of ritonavir possibly reduced by orlistat
- Ranolazine: ritonavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Riociguat: avoidance of ritonavir advised by manufacturer of riociguat
- Sildenafil: ritonavir significantly increases plasma concentration of sildenafil—avoid concomitant use
- Symptomatics: ritonavir possibly increases plasma concentration of dexamethasone
- Sympathomimetics, Beta2—manufacturer of ritonavir advises avoid concomitant use with salmeterol
- Tacrolimus: ritonavir possibly increases plasma concentration of tacrolimus
- Tadalafil: ritonavir increases plasma concentration of tadalafil—manufacturer of tadalafil advises avoid concomitant use
- Theophylline: ritonavir accelerates metabolism of theophylline (reduced plasma concentration)
- Ticagrelor: ritonavir possibly increases plasma concentration of ticagrelor—manufacturer of ticagrelor advises avoid concomitant use
- Ulipristal: avoidance of ritonavir advised by manufacturer of ulipristal (contraceptive effect of ulipristal possibly reduced)
- Vardenafil: ritonavir increases plasma concentration of vardenafil—avoid concomitant use

**Rivaroxaban**
- Analgesics: increased risk of haemorrhage when antiocoagulants given with intravenous diclofenac (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with ketorolac (avoid concomitant use, including low-dose heparins)
- Anti-arrhythmics: manufacturer of rivaroxaban advises avoid concomitant use with dronedarone
- Antibacterials: plasma concentration of rivaroxaban reduced by rifampicin—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Anticoagulants: increased risk of haemorrhage when rivaroxaban given with other anticoagulants (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with apixaban and dabigatran (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
Appendix 1: Interactions

**Antidepressants:** plasma concentration of rivaroxaban possibly reduced by St John’s wort—manufacturer of rivaroxaban advises monitor for signs of thrombosis

**Antiepileptics:** plasma concentration of rivaroxaban possibly reduced by clarithromycin and telithromycin—consult rivaroxaban product literature; plasma concentration of rivaroxaban possibly increased by rupatadine—avoid concomitant use

**Antipsychotics:** possible increased by valproate (reduce dose of rufinamide)

**Anticholinergics:** anticholinergic effect of antipsychotics possibly increased by memantine—avoid concomitant use

**Anticoagulants:** St John’s wort possibly reduces plasma concentration of apixaban; St John’s wort possibly reduces plasma concentration of dabigatran—manufacturer of dabigatran advises avoid concomitant use; St John’s wort possibly reduces plasma concentration of rivaroxaban—manufacturer of rivaroxaban advises monitor for signs of thrombosis

**Antidepressants:** possible increased serotonergic effects when St John’s wort given with duloxetine or venlafaxine; St John’s wort reduces plasma concentration of amitriptyline; increased serotonergic effects when St John’s wort given with SSRIs—avoid concomitant use

**Antiepileptics:** St John’s wort possibly reduces plasma concentration of carbamazepine; St John’s wort possibly reduces plasma concentration of phenobarbital and phenytoin—avoid concomitant use

**Antifungals:** St John’s wort possibly reduces plasma concentration of fluconazole, itraconazole, posaconazole and voriconazole—consult ruxolitinib product literature

**Antihistamines:** increased risk of agranulocytosis

**Analgesics:** increased plasma concentration of methadone

**Antipsychotics:** convulsive threshold lowered

**Antidepressants:** convulsive threshold lowered

**Antiepileptics:** anticonvulsant effect of antipsychotics possibly increased by clobicitstat—avoid concomitant use

**Anticoagulants:** St John’s wort possibly reduces plasma concentration of dabigatran—manufacturer of dabigatran advises avoid concomitant use; St John’s wort possibly reduces plasma concentration of rivaroxaban—manufacturer of rivaroxaban advises monitor for signs of thrombosis

**Antidepressants:** possibly increased by memantine—avoid concomitant use

**Anticonvulsants:** convulsive threshold lowered

**Antidepressants:** convulsive threshold lowered

**Antiepileptics:** anticonvulsant effect of antipsychotics possibly increased by clobicitstat—avoid concomitant use

**Anticoagulants:** St John’s wort possibly reduces plasma concentration of dabigatran—manufacturer of dabigatran advises avoid concomitant use; St John’s wort possibly reduces plasma concentration of rivaroxaban—manufacturer of rivaroxaban advises monitor for signs of thrombosis

**Antidepressants:** possible increased serotonergic effects when St John’s wort given with duloxetine or venlafaxine; St John’s wort reduces plasma concentration of amitriptyline; increased serotonergic effects when St John’s wort given with SSRIs—avoid concomitant use

**Antiepileptics:** St John’s wort possibly reduces plasma concentration of carbamazepine; St John’s wort possibly reduces plasma concentration of phenobarbital and phenytoin—avoid concomitant use

**Antifungals:** St John’s wort reduces plasma concentration of voriconazole—avoid concomitant use

**Antibacterials:** effects of roflumilast inhibited by methyldopa—antiparkinsonian effect of dopaminergics possibly reduced when St John’s wort given with carbamazepine; plasma concentration of rifampicin possibly reduced when rufinamide given with carbamazepine, phenobarbital and phenytoin; also plasma concentration of phenytoin possibly increased; plasma concentration of rufinamide possibly increased by valproate (reduce dose of rufinamide)

**Antipsychotics:** anticonvulsant effect of antipsychotics possibly increased by memantine—avoid concomitant use

**Antipsychotics:** convulsive threshold lowered

**Anticoagulants:** rivaroxaban increased by rufinamide—reduce dose of rufinamide

**Antidepressants:** increased plasma concentration of rivaroxaban—manufacturer of rivaroxaban advises monitor for signs of thrombosis

**Antiepileptics:** manufac­turer of ruxolitinib advises dose reduction when ruxolitinib given with clarithromycin and telithromycin—consult ruxolitinib product literature; plasma concentration of ruxolitinib possibly reduced when rifampicin

**Antipsychotics:** anticonvulsant effect of antipsychotics possibly increased by valproate (reduce dose of rufinamide)

**Antidepressants:** convulsive threshold lowered

**Antipsychotics:** convulsive threshold lowered

**Antiepileptics:** anticonvulsant effect of antipsychotics possibly increased by clobicitstat—avoid concomitant use

**Anticoagulants:** St John’s wort possibly reduces plasma concentration of dabigatran—manufacturer of dabigatran advises avoid concomitant use; St John’s wort possibly reduces plasma concentration of rivaroxaban—manufacturer of rivaroxaban advises monitor for signs of thrombosis

**Antidepressants:** possible increased serotonergic effects when St John’s wort given with duloxetine or venlafaxine; St John’s wort reduces plasma concentration of amitriptyline; increased serotonergic effects when St John’s wort given with SSRIs—avoid concomitant use

**Antiepileptics:** St John’s wort possibly reduces plasma concentration of carbamazepine; St John’s wort possibly reduces plasma concentration of phenobarbital and phenytoin—avoid concomitant use

**Antifungals:** St John’s wort reduces plasma concentration of voriconazole—avoid concomitant use

**Antibacterials:** effects of roflumilast inhibited by methyldopa—antiparkinsonian effect of dopaminergics possibly reduced when St John’s wort given with carbamazepine; plasma concentration of rifampicin possibly reduced when rufinamide given with carbamazepine, phenobarbital and phenytoin; also plasma concentration of phenytoin possibly increased; plasma concentration of rufinamide possibly increased by valproate (reduce dose of rufinamide)

**Antipsychotics:** anticonvulsant effect of antipsychotics possibly increased by memantine—avoid concomitant use

**Antipsychotics:** convulsive threshold lowered

**Anticoagulants:** rivaroxaban increased by rufinamide—reduce dose of rufinamide

**Antidepressants:** increased plasma concentration of rivaroxaban—manufacturer of rivaroxaban advises monitor for signs of thrombosis

**Antiepileptics:** manufac­turer of ruxolitinib advises dose reduction when ruxolitinib given with clarithromycin and telithromycin—consult ruxolitinib product literature; plasma concentration of ruxolitinib possibly reduced when rifampicin

**Antipsychotics:** anticonvulsant effect of antipsychotics possibly increased by valproate (reduce dose of rufinamide)

**Antidepressants:** convulsive threshold lowered

**Antipsychotics:** convulsive threshold lowered

**Antiepileptics:** anticonvulsant effect of antipsychotics possibly increased by clobicitstat—avoid concomitant use

**Anticoagulants:** St John’s wort possibly reduces plasma concentration of dabigatran—manufacturer of dabigatran advises avoid concomitant use; St John’s wort possibly reduces plasma concentration of rivaroxaban—manufacturer of rivaroxaban advises monitor for signs of thrombosis

**Antidepressants:** possible increased serotonergic effects when St John’s wort given with duloxetine or venlafaxine; St John’s wort reduces plasma concentration of amitriptyline; increased serotonergic effects when St John’s wort given with SSRIs—avoid concomitant use

**Antiepileptics:** St John’s wort possibly reduces plasma concentration of carbamazepine; St John’s wort possibly reduces plasma concentration of phenobarbital and phenytoin—avoid concomitant use

**Antifungals:** St John’s wort reduces plasma concentration of voriconazole—avoid concomitant use
Calcium-channel Blockers:
• Aprepitant:
  - Avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature.
  - Avoid concomitant use, avoidance of St John’s wort advised by manufacturer of ivacaftor.

Antivirals:
• St John’s wort possibly reduces plasma concentration of enfuvirtide and ritonavir when given with atazanavir or ritonavir—avoid concomitant use; avoidance of St John’s wort advised by manufacturer of saquinavir—manufacturer of saquinavir advises avoidance of saquinavir.

Cardiac Glycosides:
• St John’s wort reduces plasma concentration of digoxin—avoid concomitant use.

Ciclosporin:
• St John’s wort possibly reduces plasma concentration of ciclosporin—avoid concomitant use.

Cobicistat:
• Avoid concomitant use; avoid concomitant use of St John’s wort.

Cytotoxics:
• St John’s wort possibly reduces plasma concentration of axitinib—consider increasing dose of axitinib; avoidance of St John’s wort advised by manufacturer of cobicistat.

Dapoxetine:
• Possible increased risk of serotoninergic effects when St John’s wort given with dapoxetine; defer dapoxetine for 2 weeks after stopping St John’s wort.

Diuretics:
• St John’s wort reduces plasma concentration of spironolactone—avoid concomitant use.

Fingolimod:
• St John’s wort possibly reduces plasma concentration of fingolimod—manufacturer of fingolimod advises avoid concomitant use.

Hormone Antagonists:
• St John’s wort possibly reduces plasma concentration of abiraterone—manufacturer of abiraterone advises avoid concomitant use.

5HT1-receptor Agonists:
• Increased serotonin effects when St John’s wort given with 5HT1 agonists—avoid concomitant use.

Ivabradine:
• St John’s wort reduces plasma concentration of ivabradine—avoid concomitant use.
Appendix 1: Interactions

Saquinavir (continued)

- Antipsychotics: increased risk of ventricular arrhythmias when saquinavir given with clozapine, haloperidol or omeprazole—avoid concomitant use; saquinavir possibly increases plasma concentration of omeprazole (reduce dose of omeprazole—consult omeprazole product literature); saquinavir possibly increases plasma concentration of pimozide (increased risk of ventricular arrhythmias—avoid concomitant use); saquinavir possibly increases plasma concentration of etravirine (consider reducing dose of etravirine); plasma concentration of saquinavir reduced by ipranavir—manufacturer of etravirine advises avoid concomitant use
- Antivirals: increased risk of ventricular arrhythmias when saquinavir given with etravirine or lopinavir—avoid concomitant use; saquinavir reduces plasma concentration of darunavir; plasma concentration of saquinavir significantly reduced by efavirenz; plasma concentration of saquinavir increased by indinavir and ritonavir; saquinavir increases plasma concentration of enaravir (consider reducing dose of maraviroc); plasma concentration of saquinavir reduced by ipranavir
- Anxiolytics and Hypnotics: saquinavir increases plasma concentration of midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam)
- Avanafil: saquinavir possibly increases plasma concentration of avanafil—manufacturer of avanafil advises avoid concomitant use
- Beta-blockers: increased risk of ventricular arrhythmias when saquinavir given with metoprolol—avoid concomitant use
- Ciclosporin: plasma concentration of both drugs increased when saquinavir given with ciclosporin
- Corticosteroids: saquinavir possibly increases plasma concentration of mepivacaine (consider reducing dose of mepivacaine); plasma concentration of saquinavir increased by dexamethasone
- Cytoxics: saquinavir possibly increases the plasma concentration of afatinib—manufacturer of afatinib advises separating administration of saquinavir by 6 to 12 hours; saquinavir possibly increases plasma concentration of afatinib (reduce dose of afatinib—consult afatinib product literature); saquinavir possibly increases the plasma concentration of bosutinib and cabazitaxel—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; saquinavir possibly increases plasma concentration of erlotinib and everolimus—manufacturer of erlotinib and everolimus advises avoid concomitant use; avoidance of saquinavir advised by manufacturer of axitinib; increased risk of ventricular arrhythmias when saquinavir given with ezetimibe—avoid concomitant use; manufacturer of ruxolitinib advises avoid concomitant use; manufacturer of ruxolitinib advises dose reduction when saquinavir given with ruxolitinib—consult ruxolitinib product literature
- Daiptone: avoidance of saquinavir advised by manufacturer of daiptone (increased risk of toxicity)
- Diuretics: saquinavir increases plasma concentration of furosemide (reduce dose of furosemide)
- Domperidone: possible increased risk of ventricular arrhythmias when saquinavir given with domperidone—manufacturer of domperidone advises avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when saquinavir given with ergotamine—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when saquinavir given with atorvastatin; possible increased risk of myopathy when saquinavir given with rosvastatin—manufacturer of rosvastatin advises avoid concomitant use; increased risk of myopathy when saquinavir given with simvastatin (avoid concomitant use); avoidance of saquinavir advised by manufacturer of lovastatin (plasma concentration of lovastatin possibly increased)
- Pentamidine isethionate: increased risk of ventricular arrhythmias when saquinavir given with pentamidine isethionate—avoid concomitant use
- Ranolazine: saquinavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: increased risk of ventricular arrhythmias when saquinavir given with sildenafil—avoid concomitant use
- Tacrolimus: saquinavir increases plasma concentration of tacrolimus (consider reducing dose of tacrolimus)
- Tadalafil: increased risk of ventricular arrhythmias when saquinavir given with tadalafil—avoid concomitant use
- Ulcer-healing Drugs: plasma concentration of saquinavir possibly increased by cimetidine; plasma concentration of saquinavir possibly increased byesomeprazole, lansoprazole, pantoprazole and rabeprazole—manufacturer of saquinavir advises avoid concomitant use; plasma concentration of saquinavir increased by omeprazole—manufacturer of saquinavir advises avoid concomitant use
- Vardenafil: increased risk of ventricular arrhythmias when saquinavir given with vardenafil—avoid concomitant use

Saxagliptin Note Saxagliptin is a DPP-4 inhibitor

- Analgesics: hydroxypropane and CNS toxicity reported when saxagliptin given with methadone (avoid concomitant use); manufacturer of saxagliptin advises avoid concomitant use with opioid analgesics
- Antidepressants: manufacturer of saxagliptin advises avoid concomitant use with citalopram and escitalopram; increased risk of hypertension and CNS excitation when saxagliptin given with fluoxetine (saxagliptin should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping saxagliptin); increased risk of hypertension and CNS excitation when saxagliptin given with lansoprazole, esomeprazole or omeprazole; saxagliptin possibly increased by cimetidine; plasma concentration of saxagliptin possibly increased by ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Enhanced hypotensive effect when saxagliptin given with MAOIs—manufacturer of saxagliptin advises avoid concomitant use; avoid concomitant use of saxagliptin with moclobemide; CNS toxicity reported when saxagliptin given with tricyclics
- Dopaminergic: max. dose of 10mg saxagliptin advised by manufacturer of entacapone if used concomitantly; saxagliptin enhances effects and increases toxicity of levodopa (reduce dose of levodopa) 5HT2 receptor Agonists: manufacturer of selegiline advises avoid concomitant use with 5HT2 receptor Agonists Mementine: effects of dopamineergic and selegiline possibly enhanced by memantine
- Methyldopa: antiparkinsonian effect of dopamineergic antagonised by methyldopa
- Oestrogens: plasma concentration of selegiline increased by oestrogens—manufacturer of selegiline advises avoid concomitant use
- Progestogens: plasma concentration of selegiline increased by progestogens—manufacturer of selegiline advises avoid concomitant use
- Sympathomimetics: manufacturer of selegiline advises avoid concomitant use with sympathomimetics; risk
BNF 68
Appendix 1: Interactions

Sildenafil (continued)
Ulcer-healing Drugs: plasma concentration of sildenafil increased by cimetidine (consider reducing dose of sildenafil)

Simvastatin see Statins

Sirolimus
Anti-arrhythmics: caution with sirolimus advised by manufacturer of dronedarone

Antibacterials: plasma concentration of sirolimus increased by clarithromycin and telithromycin—avoid concomitant use; plasma concentration of both drugs increased when sirolimus given with erythromycin—plasma concentration of sirolimus reduced by rifabutin and rifampicin—avoid concomitant use

Antifungals: plasma concentration of sirolimus possibly increased by miconazole and posaconazole; plasma concentration of sirolimus by
tracazonase and voriconazole—avoid concomitant use

Antivirals: plasma concentration of sirolimus possibly increased by saquinavir and lopinavir; plasma concentration of sirolimus by
telaprevir (increased risk of toxicity—reduce sirolimus dose); plasma concentration of both drugs increased when sirolimus given with
elaprevar (reduce dose of sirolimus)

Calcium-channel Blockers: plasma concentration of sirolimus increased by
tracazonase and voriconazole—avoid concomitant use

Antivirals: side-effects of sildenafil possibly increased by
trazanavir; plasma concentration of sildenafil reduced by etravirine; plasma concentration of sildenafil possibly increased by fosamprenavir; plasma concentration of sildenafil significantly increased by
telithromycin—reduce initial dose of sildenafil; plasma concentration of sildenafil possibly increased by
telithromycin—reduce initial dose of sildenafil

Antifungals: plasma concentration of sildenafil increased by
tracazonase—reduce initial dose of sildenafil

Antivirals: side-effects of sildenafil possibly increased by
trazanavir; plasma concentration of sildenafil reduced by etravirine; plasma concentration of sildenafil possibly increased by fosamprenavir; plasma concentration of sildenafil significantly increased by
telithromycin—reduce initial dose of sildenafil; plasma concentration of sildenafil possibly increased by
telithromycin—reduce initial dose of sildenafil

Sitagliptin see Antidiabetics
Sodium Aurothiomalate
ACE Inhibitors: flushing and hypotension reported when sodium aurothiomalate given with
tACE inhibitors
Penicillamine: avoidance of sodium aurothiomalate advised by manufacturer of penicillamine (increased risk of toxicity)

Sodium Benzoate
Antiepileptics: effects of sodium benzoate possibly reduced by
taliproto
Antipsychotics: effects of sodium benzoate possibly reduced by
dolapridol
Corticosteroids: effects of sodium benzoate possibly reduced by
corticosteroids
Probevased: excretion of conjugate formed by sodium benzoate possibly reduced by
talipoxide

Sodium Bicarbonate see Antacids

Sodium Citrate
Antibacterials: avoid concomitant use of sodium citrate with methenamine
Ulcer-healing Drugs: avoidance of sodium citrate advised by manufacturer of sucralfate

Sodium Clopidronate see Bisphosphonates
Sodium Nitroprusside see Vasodilator Anti-hypertensives

Sodium Oxoybate
Analgesics: effects of sodium oxoybate enhanced by
opioid analgesics (avoid concomitant use)
Antidepressants: increased risk of side-effects when sodium oxoybate given with tricyclics
Antiepileptics: manufacturer of sodium oxoybate advises avoid concomitant use with
tenobarbitals
Antipsychotics: effects of sodium oxoybate possibly enhanced by
antipsychotics
Appendix 1: Interactions

Sodium Oxybate (continued)
- Anxiolytics and Hypnotics: effects of sodium oxybate enhanced by benzodiazepines (avoid concomitant use).

Sodium Phenylbutyrate
- Antiepileptics: effects of sodium phenylbutyrate possibly reduced by valproate.
- Antipsychotics: effects of sodium phenylbutyrate possibly reduced by haloperidol.
- Corticosteroids: effects of sodium phenylbutyrate possibly reduced by corticosteroids.
- Probencid: excretion of conjugate formed by sodium phenylbutyrate possibly reduced by probenecid.

Sodium Stibogluconate
- Anti-inflammatories: possible increased risk of arrhythmias when sodium stibogluconate given before amphoterin—manufacturer of sodium stibogluconate advises giving 14 days apart.
- Sodium Valproate see Valproate.

Sofosbuvir
- Antibacterials: manufacturer of sofosbuvir advises avoid concomitant use of rifabutin and rifampicin.
- Antidepressants: manufacturer of sofosbuvir advises avoid concomitant use with St John’s wort.
- Antiepileptics: manufacturer of sofosbuvir advises avoid concomitant use with carbamazepine, oxcarbazepine, phenobarbital and phenytoin.

Solifenacin see Antimuscarinics.

Somatropin
- Corticosteroids: growth-promoting effect of somatropin may be inhibited by corticosteroids.
- Oestrogens: increased doses of somatropin may be needed when given with oestrogens (when used as oral replacement therapy).

Sorafenib
- Antibacterials: bioavailability of sorafenib reduced by neomycin; plasma concentration of sorafenib reduced by rifampicin.
- Anticoagulants: sorafenib possibly enhances anticoagulant effect of coumarins.
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis).
- Antivirals: avoidance of sorafenib advised by manufacturer of boceprevir.
- Cytotoxics: sorafenib possibly increases plasma concentration of doxorubicin and irinotecan; sorafenib increases plasma concentration of docetaxel.

Sotalol see Beta-blockers.

Spironolactone see Diuretics.

Statins
- Antacid: absorption of rosuvastatin reduced by antacids.
- Anti-arrhythmics: increased risk of myopathy when simvastatin given with amiodarone; plasma concentration of rosuvastatin increased by dronedarone; plasma concentration of rosuvastatin increased by dronedarone—adjust dose of rosuvastatin (consult product literature).
- Antibacterials: plasma concentration of atorvastatin and pravastatin increased by clarithromycin; increased risk of myopathy when simvastatin given with clarithromycin, erythromycin or telithromycin (avoid concomitant use); plasma concentration of rosuvastatin reduced by erythromycin; possible increased risk of myopathy when atorvastatin given with erythromycin; plasma concentration of pravastatin increased by erythromycin; plasma concentration of atorvastatin and simvastatin possibly reduced by rifampicin; metabolism of fluvasatin accelerated by rifampicin (reduced effect); increased risk of myopathy when statins given with amlodipine (preferably avoid concomitant use); risk of myopathy and rhabdomyolysis when statins given with fluvastatin.

Suden Oxidase (continued)
- Antihyperlipidaemics: increased risk of myopathy when atorvastatin given with telithromycin (avoid concomitant use); possible increased risk of myopathy when pravastatin given with telithromycin.
- Anticoagulants: atorvastatin may transiently reduce anticoagulant effect of warfarin; flavusatin and simvastatin enhance anticoagulant effect of coumarins; rosuvastatin possibly enhances anticoagulant effect of coumarins and phenindione.
- Antidepressants: plasma concentration of simvastatin reduced by St John’s wort.
- Antidiabetics: fluvasatin possibly increases plasma concentration of glibenclamide.
- Antiepileptics: plasma concentration of simvastatin reduced by carbamazepine and eslicarbazepine—consider increased dose of simvastatin; plasma concentration of rosuvastatin reduced by eslicarbazepine; combination of fluvasatin with phenytoin may increase plasma concentration of either drug (or both).
- Anti-inflammatories: possible increased risk of myopathy when simvastatin given with efavirenz or amlodipine; possible increased risk of myopathy when atorvastatin given with efavirenz or imidazoles; plasma concentration of fluvasatin increased by efavirenz—possible increased risk of myopathy; plasma concentration of rosuvastatin increased by efavirenz—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when atorvastatin given with efavirenz, posaconazole or voriconazole; increased risk of myopathy when simvastatin given with efavirenz or posaconazole or voriconazole (avoid concomitant use); increased risk of myopathy when simvastatin given with efavirenz or voriconazole.
- Antivirals: possible increased risk of myopathy when atorvastatin or pravastatin given with tipranavir—manufacturer of rosvastatin advises giving 14 days apart.

Statin (continued)
- Antibacterials: with fludic acid—avoid concomitant use and for 7 days after last fludic acid dose; increased risk of myopathy when atorvastatin given with telithromycin (avoid concomitant use); possible increased risk of myopathy when pravastatin given with telithromycin.
- Anticoagulants: atorvastatin may transiently reduce anticoagulant effect of warfarin; flavusatin and simvastatin enhance anticoagulant effect of coumarins; rosuvastatin possibly enhances anticoagulant effect of coumarins and phenindione.
- Antidepressants: plasma concentration of simvastatin reduced by St John’s wort.
- Antidiabetics: fluvasatin possibly increases plasma concentration of glibenclamide.
- Antiepileptics: plasma concentration of simvastatin reduced by carbamazepine and eslicarbazepine—consider increased dose of simvastatin; plasma concentration of rosuvastatin reduced by eslicarbazepine; combination of fluvasatin with phenytoin may increase plasma concentration of either drug (or both).
- Anti-inflammatories: possible increased risk of myopathy when simvastatin given with efavirenz or amlodipine; possible increased risk of myopathy when atorvastatin given with efavirenz or imidazoles; plasma concentration of fluvasatin increased by efavirenz—possible increased risk of myopathy; plasma concentration of rosuvastatin increased by efavirenz—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when atorvastatin given with efavirenz, posaconazole or voriconazole; increased risk of myopathy when simvastatin given with efavirenz, indinavir, ritonavir or saquinavir (avoid concomitant use); manufacturers advise avoid concomitant use of simvastatin with boceprevir and telaprevir; plasma concentration of pravastatin increased by boceprevir; plasma concentration of atorvastatin increased by boceprevir (reduce dose of atorvastatin); plasma concentration of pravastatin possibly increased by danuvir; possible increased risk of myopathy when atorvastatin given with danuvir, fosamprenavir, indinavir, lopinavir, ritonavir or saquinavir; plasma concentration of atorvastatin, pravastatin and simvastatin reduced by efavirenz; plasma concentration of atorvastatin possibly reduced by etravirine; possible increased risk of myopathy when rosuvastatin given with fosamprenavir, indinavir, ritonavir and saquinavir—manufacturer of rosuvastatin advises avoid concomitant use; possible increased risk of myopathy when simvastatin given with fosamprenavir or lopinavir—avoid concomitant use; avoid concomitant use of atorvastatin advised by manufacturer of telaprevir; plasma concentration of simvastatin possibly increased by tipranavir—avoid concomitant use; possible increased risk of myopathy when atorvastatin given with tipranavir (see Dose under Atorvastatin, p. 171).
- Anti-inflammatory: atorvastatin possibly increases plasma concentration of midazolam.
- Calcium-channel Blockers: possible increased risk of myopathy when simvastatin given with amlodipine.
Statins
- Calcium-channel Blockers (continued) and diltiazem (see Dose under Simvastatin, p. 173); plasma concentration of atorvastatin increased by diltiazem—possible increased risk of myopathy; increased risk of myopathy when simvastatin given with verapamil (see Dose under Simvastatin, p. 173)
- Cobicistat: plasma concentration of atorvastatin possibly increased by cobicistat—manufacturer of cobicistat advises reduce dose of atorvastatin; avoidance of simvastatin advised by manufacturer of cobicistat
- Colchicine: possible increased risk of myopathy when statins given with colchicine
- Cytotoxics: plasma concentration of simvastatin possibly increased by dexamethasone; plasma concentration of simvastatin increased by imatinib
- Eltrombopag: plasma concentration of rosuvastatin increased by eltrombopag—adjust dose of rosuvastatin (consult product literature)
- Grapefruit juice: plasma concentration of atorvastatin possibly increased by grapefruit juice; plasma concentration of simvastatin increased by grapefruit juice—avoid concomitant use
- Hormone Antagonists: possible increased risk of myopathy when statins given with danazol—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when simvastatin given with bezafibrate and cerivastatin (see Dose under Simvastatin, p. 173); when given with statins reduce maximum dose of fenofibrate—see Dose under Fenofibrate, p. 176; increased risk of myopathy when atorvastatin, fluvasatin or pravastatin given with gemfibrozil (preferably avoid concomitant use); increased risk of myopathy when atorvastatin given with gemfibrozil (avoid concomitant use); plasma concentration of rosuvastatin increased by ezetimibe—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when statins given with fibrates (see Dose under Rosuvastatin, p. 173); increased risk of myopathy when statins given with fibrates; plasma concentration of simvastatin increased by lomitapide (give at least 2 hours apart); plasma concentration of simvastatin increased by lomitapide (given at least 2 hours apart) (applies to lipid regulating doses of nicotinic acid) Oestrogens: atorvastatin and rosuvastatin increase plasma concentration of ethinyloestradiol

Progestogens: atorvastatin increases plasma concentration of norethisterone; rosuvastatin increases plasma concentration of active metabolite of norgestimate; rosuvastatin increases plasma concentration of norgestrel
- Ranolazine: plasma concentration of simvastatin increased by ranolazine (see Dose under Sildenafil, p. 173)
- Retinoids: plasma concentration of simvastatin reduced by altretinoin
- Teriflunomide: plasma concentration of rosuvastatin increased by teriflunomide (consider reducing dose of rosuvastatin)
- Ticagrelor: plasma concentration of simvastatin increased by ticagrelor (increased risk of toxicity)

Stavudine
- Antivirals: increased risk of side-effects when stavudine given with didanosine; increased risk of toxicity when stavudine given with efavirenz; effects of stavudine possibly inhibited by etravirine (manufacturers advise avoid concomitant use)
- Cytotoxics: effects of stavudine possibly inhibited by doxorubicin; increased risk of toxicity when stavudine given with hydroxyurea—avoid concomitant use
- Orlistat: absorption of stavudine possibly reduced by orlistat

Striptentol
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (conversive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (conversive threshold lowered)
- Antiepileptics: stiripentol increases plasma concentration of carbamazepine, phenobarbital and phenytoin
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by metloquine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by antipsychotics (conversive threshold lowered)
- Antiepileptics: stiripentol increases plasma concentration of clozabam
- Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat

Streptomycin see Aminoglycosides

Strontium Ranelate
Antibacterials: strontium ranelate reduces absorption of quinolones and tetracyclines (manufacturer of strontium ranelate advises avoid concomitant use)

Sucralfate
Antibacterials: sucralfate reduces absorption of ciprofloxacin, levofloxacin, moxifloxacin, ofloxacin and tetracyclines; sucralfate reduces absorption of norfloxacin (give at least 2 hours apart)
- Anticoagulants: sucralfate possibly reduces absorption of coumarins (reduced anticoagulant effect)
- Antiepileptics: sucralfate reduces absorption of phenytoin
- Antipsychotics: sucralfate reduces absorption of sulpiride
- Cardio Glycosides: sucralfate possibly reduces absorption of cardiac glycosides
- Potassium Salts: manufacturer of sucralfate advises avoid concomitant use with potassium citrate
- Sodium Citrate: manufacturer of sucralfate advises avoid concomitant use with sodium citrate
- Theophylline: sucralfate possibly reduces absorption of theophylline (give at least 2 hours apart)
- Thyroid Hormones: sucralfate reduces absorption of levothyroxine

Sucralfate possibly reduces absorption of lansoprazole

Sugammadex
Antibacterials: response to sugammadex possibly reduced by fusidic acid
- Progestogens: sugammadex possibly reduces plasma concentration of progestogens—manufacturer of sugammadex advises additional contraceptive precautions

Sulfadiazine see Sulfonamides
Sulfadoxine see Sulfonamides
Sulfamethoxazole see Sulfonamides
Sulfasalazine see Aminosalicylates
Sulfipyrazone
- Analgesics: effects of sulfipyrazone antagonised by aspirin
- Antibacterials: sulfapyrazone reduces excretion of nitrofurantoin (increased risk of toxicity); sulfapyra-
Appendix 1: Interactions

Sulfonpyrazone
Antibacterials (continued)
zone reduces excretion of penicillins; effects of sulfonpyrazone antagonised by pyrazinamide
† Anticoagulants: increased risk of bleeding when sulfonpyrazone given with apixaban; sulfonpyrazone enhances anticoagulant effect of *coumarins; possibly increased risk of bleeding when sulfonpyrazone given with dabigatran
† Antiadrenergics: sulfonpyrazone increases plasma concentration of *phenytoin
Calcium-channel Blockers: sulfonpyrazone reduces plasma concentration of verapamil
† Ciclosporin: sulfonpyrazone reduces plasma concentration of *ciclosporin
Theophylline: sulfonpyrazone reduces plasma concentration of theophylline

Sulfonamides
Anaesthetics, General: sulfonamides enhance effects of thiopental
† Anaesthetics, Local: effects of sulfonamides possibly inhibited by *chloroprocaine (manufacturer of chloroprocaine advises avoid concomitant use); increased risk of methaemoglobinemia when sulfonamides given with prilocaine
Anti-arrhythmics: possible increased risk of ventricular arrhythmias when sulfamethoxazole (as co-trimoxazole) given with amiiodarone—manufacturer of amiiodarone advises avoid concomitant use of co-trimoxazole
† Anti-bacterials: increased risk of crystalluria when sulfonamides given with *methotrexate
† Antiinfectives: sulfonamides increase haemodynamic toxicity of doxorubicin and cyclophosphamide
† Anti-infective: sulfonamides increase anticoagulant effect of *coumarins; sulfonamides possibly inhibit metabolism of phenindione
† Anti-idiopathic: sulfonamides rarely enhance the effects of sulfonyleureas
† Anti-idiopathic: sulfonamides possibly increase plasma concentration of phenytoin
† Antimalarias: increased antifolate effect when sulfonamides given with *pyrimethamine
† Antipsychotics: avoid concomitant use of sulfonamides with *clozapine (increased risk of agranulocytosis)
† Azathioprine: increased risk of haematological toxicity when sulfamethoxazole (as co-trimoxazole) given with *azathioprine
† Ciclosporin: increased risk of nephrotoxicity when sulfonamides given with *ciclosporin; sulfadiazine possibly reduces plasma concentration of *ciclosporin
† Cytoxotics: increased risk of haematological toxicity when sulfamethoxazole (as co-trimoxazole) given with *mercaptopurine or *methotrexate; sulfonamides increase risk of *methotrexate toxicity
Potassium Aminobenzoate: effects of sulfonamides inhibited by *potassium aminobenzoate
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850

Sulfonyureas see Antidiabetics

Sulindac see NSAIDs

Sulpiride see Antipsychotics

Sumatriptan see 5HT1-receptor Agonists (under HT)

Sunilinib
Antibacterials: metabolism of sunilinib accelerated by rifampicin (reduced plasma concentration)
† Antipsychotics: avoid concomitant use of cytoxotics with *clozapine (increased risk of agranulocytosis)
† Antivirals: avoidance of sunilinib advised by manufacturer of *boceprevir

Suxamethonium see Muscle Relaxants

Sympathomimetics
† Adrenergic Neurone Blockers: ephedrine, isomethepine, metaraminol, methyphenidate, noradren-
Sympathomimetics (continued)
Corticosteroids: ephedrine accelerates metabolism of 
dexamethasone

Dopaminergics: risk of toxicity when isometheptene given with 
• bromocriptine; effects of adrenaline (epinephrine), dobutamine, dopamine and noradren-
(norepinephrine) possibly enhanced by entac-
pone; avoid concomitant use of sympathomimetics with 
• rasagiline; risk of hypertensive crisis when dopamine given with 
• deprenyl; avoidance of sympathomimetics advised by manufacturer of 

doxapram:
Increased risk of hypertension when sympathomimetics given with 
doxapram
Ergot Alkaloids:
Increased risk of ergotism when sympathomimetics given with 
ergotamine
Oxytocin:
Risk of hypertension when vasoconstrictor sympathomimetics given with 
• oxytocin (due to enhanced vasopressor effect)

Sympathomimetics: effects of adrenaline (epinephrine) possibly enhanced by 
• dopexamine; dopamine possibly enhances effects of 
• norepinephrine (norepinephrine)
Theophylline:
Avoidance of ephedrine in children advised by 
manufacturer of theophylline

Sympathomimetics, Beta2
Antivirals:
Avoidance of salmeterol advised by 
manufacturer of lopinavir, ritonavir and tipranavir; avoidance 
of salmeterol advised by manufacturer of 
• etelaprevir (risk of ventricular arrhythmias)

Atomoxetine:
Increased risk of cardiovascular side-
effects when parenteral salbutamol given with 
• atomoxetine
Cardiac Glycosides: salbutamol possibly reduces 
plasma concentration of digoxin
Cobicistat:
Avoidance of salmeterol advised by 
manufacturer of cobicistat
Corticosteroids:
Increased risk of hypokalaemia when 
high doses of beta2 sympathomimetics given with 
corticosteroids—see Hypokalaemia, p. 186

Diuretics:
Increased risk of hypokalaemia when high 
doses of beta2 sympathomimetics given with 
• acetazolamide, loop diuretics or thiazides and related 
• diuretics—see Hypokalaemia, p. 186

• Methyldopa: acute hypotension reported when infusion 
of salbutamol given with 
• methyldopa

Muscle Relaxants: bumbuterol enhances effects of 
• suxamethonium

Theophylline:
Increased risk of hypokalaemia when high 
doses of beta2 sympathomimetics given with 
• theophylline—see Hypokalaemia, p. 186

Tacrolimus
Note
Interactions do not generally apply to tacrolimus used 
Topically; risk of facial flushing and skin irritation with 
alcohol consumption (p. 803) does not apply to tacrolimus 
taken systemically

Analgesics: possible increased risk of nephrotoxicity 
when tacrolimus given with 
• NSAIDs; increased risk of nephrotoxicity when tacrolimus given with 
• ibuprofen

Angiotensin-II Receptor Antagonists:
Increased risk of hyperkalaemia when tacrolimus given with 
• angiotensin-II receptor antagonists

Anti-arrhythmics: caution with tacrolimus advised by 
manufacturer of metoprolol

Antibacterials:
Plasma concentration of tacrolimus increased by 
• clarithromycin and • erythromycin; plasma concentration of tacrolimus possibly reduced by 
• rifabutin; plasma concentration of tacrolimus reduced by 
• trimethoprim; increased risk of nephrotoxicity when tacrolimus given with 
• amino-
glycosides; plasma concentration of tacrolimus pos-
sibly increased by 
• chloramphenicol and • telithro-

Tacrolimus
Antibacterials (continued)

mycin; possible increased risk of nephrotoxicity when 
tacrolimus given with 
• vancomycin

Anticoagulants: tacrolimus possibly increases plasma 
concentration of 
• dabigatran—manufacturer of dabigatran advises avoid concomitant use

Antidepressants: plasma concentration of tacrolimus reduced by 
• St John’s wort—avoid concomitant use

Antiepileptics: plasma concentration of tacrolimus reduced by 
• phenobarbital; plasma concentration of tacrolimus reduced by 
• phenytoin, also plasma concentration of phenytoin possibly increased

Antifungals: plasma concentration of tacrolimus possibly 
increased by 
• miconazole oral gel; increased risk of nephrotoxicity when tacrolimus given with 
• amphotericin; plasma concentration of tacrolimus increased by 
• fluconazole, itraconazole, posacon-
zole and voriconazole (consider reducing dose of 
tacrolimus); plasma concentration of tacrolimus reduced by 
• caspofungin

Antipsychotics: avoidance of tacrolimus advised by 
manufacturer of 
• droperidol (risk of ventricular arrhythmias)

Antivirals:
Possible increased risk of nephrotoxicity when 
tacrolimus given with 
• aciclovir or ganciclovir; plasma concentration of tacrolimus possibly increased by 
• etonogestrel and • ritonavir; plasma concentration of tacrolimus increased by 
• efavirenz; plasma concentration of tacrolimus increased by 
• fosamprenavir; plasma concentration of tacrolimus increased by 
• saquinavir (consider reducing dose of 
tacrolimus); plasma concentration of both drugs 
increased when tacrolimus given with 
• etelaprevir (reduce dose of tacrolimus)

Calcium-channel Blockers: plasma concentration of 
tacrolimus possibly increased by 
• felodipine, nicardipine and verapamil; plasma concentration of 
tacrolimus increased by 
• diltiazem and • nilodipine

Ciclosporin:
Tacrolimus increases plasma concentra-
tion of ciclosporin (increased risk of nephrotoxi-
ity)—avoid concomitant use

Colestilan:
Manufacturer of colestilan advises 
avoidance of tacrolimus at least 1 hour before or 3 hours after 
colestilan

Cystotoxics:
tacrolimus possibly increases the plasma 
concentration of 
• afatinib—manufacturer of afatinib 
advices separating administration of tacrolimus by 6 
to 12 hours; caution with tacrolimus advised by 
manufacturer of 
• erlotinib; plasma concentration of 
tacrolimus increased by 
• imatinib

Diuretics:
Increased risk of hyperkalaemia when 
tacrolimus given with 
• potassium-sparing diuretics and 
• aldosterone antagonists

Grapefruit juice:
Increased plasma concentration of tacrolimus increased by 
• grapefruit juice

Hormone Antagonists:
Plasma concentration of 
tacrolimus possibly increased by 
• danazol

Milamuride: avoidance of tacrolimus advised by 
manufacturer of milamuride

Diestrogens: plasma concentration of tacrolimus possi-
ibly increased by 
• ethinylestradiol

Potassium Salts: increased risk of hyperkalaemia 
when tacrolimus given with 
• potassium salts

Ranolazine:
Plasma concentration of tacrolimus increased by 
• ranolazine

Sevelamer: plasma concentration of 
tacrolimus possibly reduced by 
• sevelamer

Ulcet-healing Drugs: plasma concentration of 
tacrolimus possibly increased by 
• omeprazole

Tadalafil
Alpha-blockers: enhanced hypotensive effect when 
tadalafil given with 
• doxazosin—manufacturer of 

Appendix 1: Interactions

Tadalafil
- Alpha-blockers (continued)
tadalafil advises avoid concomitant use; enhanced hypotensive effect when tadalafil given with α-blockers—see also p. 558
- Anti-arrhythmics: avoidance of tadalafil advised by manufacturer of disopyramide (risk of ventricular arrhythmias)
- Anti-bacterials: plasma concentration of tadalafil possibly increased by clarithromycin and erythromycin; plasma concentration of tadalafil reduced by rifampicin—manufacturer of tadalafil advises avoid concomitant use
- Antifungals: plasma concentration of tadalafil possibly increased by itraconazole
- Antivirals: plasma concentration of tadalafil possibly increased by fosamprenavir and indinavir; plasma concentration of tadalafil increased by ritonavir—manufacturer of tadalafil advises avoid concomitant use; increased risk of ventricular arrhythmias when tadalafil given with saquinavir—avoid concomitant use; avoidance of high doses of tadalafil advised by manufacturer of telaprevir—consult product literature
- Bosentan: plasma concentration of tadalafil reduced by bosentan
- Cobicistat: plasma concentration of tadalafil possibly increased by cobicistat—manufacturer of cobicistat advises reduce dose of tadalafil (consult cobicistat product literature)
- Dapoxetine: avoidance of tadalafil advised by manufacturer of dapoxetine
- Grapefruit juice: plasma concentration of tadalafil possibly increased by grapefruit juice
- Nicorandil: tadalafil significantly enhances hypotensive effect of nicorandil (avoid concomitant use)
- Nitrates: tadalafil significantly enhances hypotensive effect of nitrates (avoid concomitant use)
- Riociguat: possible enhanced hypotensive effect when tadalafil given with riociguat—avoid concomitant use
- Tamoxifen
- Anti-bacterials: metabolism of tamoxifen accelerated by rifampicin (reduced plasma concentration)
- Anti-coagulants: tamoxifen enhances anti-coagulant effect of warfarin
- Anti-depressants: metabolism of tamoxifen to active metabolite possibly inhibited by fluoxetine and paroxetine (avoid concomitant use)
- Anti-psychotics: avoidance of tamoxifen advised by manufacturer of droperidol (risk of ventricular arrhythmias)
- Bupropion: metabolism of tamoxifen to active metabolite possibly inhibited by bupropion (avoid concomitant use)
- Cinacalcet: metabolism of tamoxifen to active metabolite possibly inhibited by cinacalcet (avoid concomitant use)

Tamsulosin see Alpha-blockers

Tenofovir
- Anti-bacterials: plasma concentration of tenofovir possibly increased when tadalafil given with clarithromycin, erythromycin and telithromycin (increased risk of ventricular arrhythmias); manufacturer of telaprevir advises avoid concomitant use with saquinavir; plasma concentration of telaprevir significantly reduced by rifampicin—avoid concomitant use
- Anti-coagulants: telaprevir possibly affects plasma concentration of warfarin; telaprevir possibly increases plasma concentration of dabigatran
- Antidepressants: telaprevir possibly increases plasma concentration of trazodone; manufacturer of telaprevir advises avoid concomitant use with St John’s wort
- Anti-epileptics: manufacturer of telaprevir advises avoid concomitant use with carbamazepine, phenobarbital and phenytoin
- Anti-fungals: telaprevir possibly increases plasma concentration of itraconazole; telaprevir possibly increases plasma concentration of posaconazole (increased risk of ventricular arrhythmias); telaprevir possibly affects plasma concentration of voriconazole (possible increased risk of ventricular arrhythmias)
- Anti-psychotics: manufacturer of telaprevir advises avoid concomitant use with pimozide; telaprevir possibly increases plasma concentration of equetapine—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: plasma concentration of telaprevir possibly reduced by atazanavir, also plasma concentration of atazanavir possibly avoided; avoid concomitant use of telaprevir with darunavir; plasma concentration of telaprevir reduced by efavirenz—increased dose of telaprevir; manufacturers advise avoid concomitant use of telaprevir with fosamprenavir and lopinavir; telaprevir increases plasma concentration of maraviroc (consider reducing dose of maraviroc); plasma concentration of telaprevir possibly reduced by nevirapine—consider increasing dose of telaprevir; plasma concentration of telaprevir possibly reduced by ritonavir; telaprevir increases plasma concentration of tenofovir
- Anxiolytics and Hypnotics: telaprevir possibly increases plasma concentration of midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam)
- Beta-blockers: manufacturer of telaprevir advises avoid concomitant use with isotalol (risk of ventricular arrhythmias)
- Bosentan: plasma concentration of telaprevir possibly reduced by bosentan, also plasma concentration of bosentan possibly increased
- Calcium-channel Blockers: telaprevir increases plasma concentration of amiodarone (consider reducing dose of amiodarone); manufacturer of telaprevir advises caution with diltiazem, felodipine, nicardipine, nifedipine and verapamil
- Cardiac Glycosides: telaprevir increases plasma concentration of digoxin
- Ciclosporin: plasma concentration of both drugs increased when telaprevir given with ciclosporin (reduce dose of ciclosporin)
- Cilostazol: telaprevir possibly increases plasma concentration of cilostazol (see Dose under Cilostazol, p. 140)
- Colchicine: telaprevir possibly increases risk of colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
Telaprevir (continued)
Corticosteroids: telaprevir possibly increases plasma concentration of *inhaled* and *intranasal* budesonide and *fluticasone*; plasma concentration of telaprevir possibly reduced by dexamethasone

- Cytotoxics: telaprevir possibly increases the plasma concentration of *bosutinib*—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; manufacturer of ruxolitinib advises dose reduction when telaprevir given with *bosutinib*—consult ruxolitinib product literature
- Domeridone: possible increased risk of ventricular arrhythmias when telaprevir given with *domperidone*—avoid concomitant use
- Ergot Alkaloids: manufacturer of telaprevir advises avoid concomitant use with *ergot alkaloids*
- Lipid-regulating Drugs: manufacturer of telaprevir advises avoid concomitant use with *atorvastatin*; manufacturers advise avoid concomitant use of telaprevir with *simvastatin*; avoidance of telaprevir advised by manufacturer of *lovastatin* (plasma concentration of lomitapide possibly increased)
- Oestrogens: telaprevir possibly reduces plasma concentration of *ethinyloestradiol*—manufacturer of telaprevir advises additional contraceptive precautions
- Sildenafil: manufacturer of telaprevir advises avoid concomitant use with *sildenafil*
- Sirolimus: plasma concentration of both drugs increased when telaprevir given with *sirolimus* (reduce dose of sirolimus)
- Sympathomimetics, Beta 2: manufacturer of telaprevir advises avoid concomitant use with *sympathomimetics*
- Telaprevir possibly increases plasma concentration of *paroxetine; possible increased risk of ventricular arrhythmias when telaprevir given with paroxetine* (consider reducing dose of maraviroc); manufacturer of telaprevir advises avoid concomitant use with *safinavir* (risk of ventricular arrhythmias); plasma concentration of both drugs possibly increased when telaprevir given with *telaprevir* (increased risk of ventricular arrhythmias)
- Antipsychotics: manufacturer of telaprevir advises avoid concomitant use with *antipsychotics*.
- Antiepileptics:
- *Corticosteroids*: telaprevir possibly increases plasma concentration of *prednisolone*; increased risk of myopathy when telaprevir given with *prednisolone* (reduce dose of prednisolone)
- *Ciclosporin*: telaprevir possibly increases plasma concentration of *cyclosporine*; increased risk of myopathy when telaprevir given with *cyclosporine* (reduce dose of ciclosporin)
- *Fosamprenavir*, *lopinavir*: telaprevir reduces plasma concentration of both drugs possibly increased when telaprevir given with *fosamprenavir, lopinavir* and *atazanavir*; telaprevir possibly increases plasma concentration of *maraviroc*; manufacturer of telaprevir advises avoid concomitant use with *maraviroc*; telaprevir increases plasma concentration of *atazanavir, ritonavir* and *saquinavir* (risk of ventricular arrhythmias); plasma concentration of both drugs possibly increased when telaprevir given with *atazanavir* (increased risk of ventricular arrhythmias)
- *Colchicine*: telaprevir possibly increases risk of *colchicine toxicity*—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- *Calcium-channel Blockers*: telaprevir possibly increases plasma concentration of *verapamil, diltiazem*; increased risk of myopathy when telaprevir given with *verapamil, diltiazem* (reduce dose of calcium-channel blockers)
- Telithromycin (see Dose under *Telithromycin* for 2 weeks after rifampicin)
- *Triazolam*: reduce dose of *triazolam* when telithromycin given with *triazolam* (increased plasma concentration of triazolam)
- *Midazolam*: increased plasma concentration of *midazolam* (increased risk of sedation)
### Appendix 1: Interactions

#### Telithromycin
- **(continued)**
  - Pentamidine isetionate: possible increased risk of ventricular arrhythmias when telithromycin given with [parenteral pentamidine isetionate](BNF 68).
  - Ranolazine: telithromycin possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use.
  - Sildenafil: telithromycin possibly increases plasma concentration of sildenafil—reduce initial dose of sildenafil.
  - Sirolimus: telithromycin increases plasma concentration of sirolimus—avoid concomitant use.
  - Tacrolimus: telithromycin possibly increases plasma concentration of tacrolimus—avoid concomitant use.
  - Temoporfin: telithromycin given with topical photodynamic therapy—see p. 850.
  - Telithromycin: possible increased risk of breakthrough bleeding when telithromycin given with oestrogens (when used for contraception).
  - Telithromycin: occasional reports of breakthrough bleeding when telithromycin given with progestogens (when used for contraception).
  - Telithromycin: possible increased risk of ventricular arrhythmias when telithromycin given with [parenteral pentamidine isetionate](BNF 68).

#### Teriflunomide
- **Antibacterials:** teriflunomide increases plasma concentration of cefaclor; plasma concentration of teriflunomide reduced by rifampicin.
- **Antidiabetics:** teriflunomide increases plasma concentration of repaglinide.
- **Lipid-regulating Drugs:** the effect of teriflunomide is significantly decreased by colestyramine (enhanced elimination)—avoid unless drug elimination desired; teriflunomide increases plasma concentration of rosuvastatin (consider reducing dose of rosuvastatin).
- **Oestrogens:** teriflunomide increases plasma concentration of ethinylestradiol.
- **Progestogens:** teriflunomide increases plasma concentration of levonorgestrel.
- **Anticoagulants:** avoid concomitant use of teriflunomide with live vaccines (see p. 828).
- **Testolactone:** anti-oestrogens: testolactone enhances anti-oestrogenic effect of aminoglutethimide and [phenindione](BNF 68).
- **Testosterone:** anti-oestrogens: testosterone enhances anti-oestrogenic effect of aminoglutethimide and [phenindione](BNF 68).
- **Testosterones**
  - Anti-oestrogens: testosterones enhance anti-oestrogenic effect of [aminoglutethimide](BNF 68) and [phenindione](BNF 68).
- **Tetrabenazine**
  - Antidepressants: risk of CNS toxicity when tetrabenazine given with [MAOIs](BNF 68) (avoid tetrabenazine for 2 weeks after MAOIs).
  - Antipsychotics: increased risk of extrapyramidal side-effects when tetrabenazine given with [antipsychotics](BNF 68).
  - Dopaminergics: increased risk of extrapyramidal side-effects when tetrabenazine given with metoclopramide.
  - **Tetracyclines** see Tetracyclines
  - **Tetramisole** see Angiotensin-II Receptor Antagonists
  - **Temazepam** see Anxiolytics and Hypnotics
  - **Tenofovir** see Penicillins
  - **Temodal** see Tetracyclines
  - **Tenofovir Disoproxil Fumarate** see Pentamidine Isetionate.
  - **Telithromycin** see Pentaerythritol Tetracarbamate.
  - **Telithromycin** see Pentaerythritol Tetracarbamate.

#### Terbutaline
- **Antihistamines:** terbutaline possibly increases plasma concentration of terbutaline.
- **Beta-2 Sympathomimetics** see Pentaerythritol Tetracarbamate.
- **Bromocriptine** see Pentaerythritol Tetracarbamate.
- **Calcium Salts** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
- **Calcium Urethan** see Pentaerythritol Tetracarbamate.
Tetracyclines (continued) Lipid-regulating Drugs: absorption of tetracycline possibly reduced by colestipol and colestyramine

- Retinoids: possible increased risk of benign intracranial hypertension when tetracyclines given with retinoids (avoid concomitant use)

Strontium Ranelate: absorption of tetracyclines reduced by strontium ranelate (manufacturer of strontium ranelate advises avoid concomitant use)

Ulcer-healing Drugs: absorption of tetracyclines reduced by sucralfate and tripotassium dicitrato-bismuthate

Vaccines: antibacterials inactive oral typhoid vaccine—see p. 850

Zinc: absorption of tetracyclines reduced by zinc, also absorption of zinc reduced by tetracyclines

Theophylline Allopurinol: plasma concentration of theophylline possibly increased by allopurinol

Anaesthetics, General: increased risk of convulsions when theophylline given with ketamine

Anti-arrhythmics: theophylline antagonises anti-arrhythmic effect of adenosine—manufacturer of adenosine advises avoid theophylline for 24 hours before adenosine; plasma concentration of theophylline increased by propafenone

- Antibacterials: plasma concentration of theophylline possibly increased by clarithromycin and isoniazid; plasma concentration of theophylline increased by erythromycin (also theophylline may reduce absorption of oral erythromycin); plasma concentration of theophylline increased by ciprofloxacin and merfloxacin; metabolism of theophylline accelerated by rifampicin (reduced plasma concentration); possible increased risk of convulsions when theophylline given with quinolones

- Antidepressants: plasma concentration of theophylline increased by fluvoxamine (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma-theophylline concentration); plasma concentration of theophylline possibly reduced by St John’s wort

- Antiepileptics: metabolism of theophylline accelerated by carbamazepine and phenobarbital (reduced effect); plasma concentration of both drugs reduced when theophylline given with phenytoin

- Antifungals: plasma concentration of theophylline possibly increased by fluconazole

- Antivirals: plasma concentration of theophylline possibly increased by aciclovir; metabolism of theophylline accelerated by ivermectin (reduced plasma concentration)

Anxiolytics and Hypnotics: theophylline possibly reduces effects of benzodiazepines

Caffeine citrate: avoidance of theophylline advised by manufacturer of caffeine citrate

- Calcium-channel Blockers: plasma concentration of theophylline possibly increased by calcium-channel blockers (enhanced effect); plasma concentration of theophylline increased by diltiazem; plasma concentration of theophylline increased by verapamil (enhanced effect)

- Corticosteroids: increased risk of hypokalaemia when theophylline given with corticosteroids

- Cytotoxics: plasma concentration of theophylline possibly increased by methotrexate

- Deferoxixos: plasma concentration of theophylline increased by deferasirox (consider reducing dose of theophylline)

- Disulfiram: metabolism of theophylline inhibited by disulfiram (increased risk of toxicity)

- Diuretics: increased risk of hypokalaemia when theophylline given with acetazolamide, loop diuretics or thiazides and related diuretics

- Droxapram: increased CNS stimulation when theophylline given with doxapram

Theophylline (continued) Interferons: metabolism of theophylline inhibited by interferon alfa (consider reducing dose of theophylline)

Leukotriene Receptor Antagonists: plasma concentration of theophylline possibly increased by zafirlukast, also plasma concentration of zafirlukast reduced

Lithium: theophylline increases excretion of lithium (reduced plasma concentration)

Oestrogens: plasma concentration of theophylline increased by oestrogens (consider reducing dose of theophylline)

Penicillamine: plasma concentration of theophylline increased by penicillamine

Roflumilast: avoidance of theophylline advised by manufacturer of roflumilast

Sulfinpyrazone: plasma concentration of theophylline reduced by sulfinpyrazone

Sympathomimetics: manufacturer of theophylline advises avoid concomitant use with ephedrine in children

Sympathomimetics, Beta2: increased risk of hypokalaemia when theophylline given with high doses of beta-sympathomimetics—see Hypokalaemia, p. 186

- Ulcer-healing Drugs: metabolism of theophylline inhibited by cimetidine (increased plasma concentration); absorption of theophylline possibly reduced by sucralfate (give at least 2 hours apart)

Vaccines: plasma concentration of theophylline possibly increased by influenza vaccine

Thiazolinediones see Anti-diabetics

Thiopental see Anaesthetics, General

Thiotepe Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)

Muscle Relaxants: thiotepe enhances effects of suxamethonium

Thioxanthenes see Anti-psychotics

Thyroid Hormones Antacids: absorption of levothyroxine possibly reduced by antacids

Anti-arrhythmics: for concomitant use of thyroid hormones and amiodarone see p. 97

Antibacterials: metabolism of levothyroxine accelerated by rifampicin (may increase requirements for levothyroxine in hypothyroidism)

- Anticoagulants: thyroid hormones enhance anti-coagulant effect of warfarins and phenindione

- Antidepressants: thyroid hormones enhance effects of amitryptiline and imipramine; thyroid hormones possibly enhance effects of ticlopidines

Antiepileptics: metabolism of thyroid hormones accelerated by carbamazepine and phenobarbital (may increase requirements for thyroid hormones in hypothyroidism); metabolism of thyroid hormones accelerated by phenytoin (may increase requirements in hypothyroidism), also plasma concentration of phenytoin possibly increased

Beta-blockers: levothyroxine accelerates metabolism of propranolol

Calcium Salts: absorption of levothyroxine reduced by calcium salts

Colestilan: manufacturer of colestilan advises give levothyroxine at least 1 hour before or 3 hours after colestilan

Cytotoxics: plasma concentration of levothyroxine possibly reduced by imatinib

Iron: absorption of levothyroxine reduced by oral iron (give at least 2 hours apart)

Lanthanum: absorption of levothyroxine reduced by lanthanum (give at least 2 hours apart)

Lipid-regulating Drugs: absorption of levothyroxine reduced by colesevelam; absorption of thyroid hormones reduced by colestipol and colestyramine
Appendix 1: Interactions

Thyroid Hormones (continued)
Oestrogens: requirements for thyroid hormones in hypothyroidism may be increased by oestrogens
Orlistat: possible increased risk of hypothyroidism when levothyroxine given with orlistat
Polystyrene Sulfonate Resins: absorption of levothyroxine reduced by polystyrene sulfonate resins
Sevelamer: absorption of levothyroxine possibly reduced by sevelamer
Ulcet-healing Drugs: absorption of levothyroxine reduced by cimetidine and sucralfate

Tiagabine
• Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIIs and tricyclics (convulsive threshold lowered)

Antiepileptics: plasma concentration of tiagabine reduced by carbamazepine, phenobarbital and phenytoin
• Antimalarials: anticonvulsant effect of antiepileptics antagonised by melfoquine
• Antipsychotics: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered)
Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat

Ticagrelor
Antibacterials: plasma concentration of ticagrelor possibly increased by erythromycin; plasma concentration of ticagrelor reduced by rifampicin
• Anticoagulants: ticagrelor increases plasma concentration of edbagatran
Antidepressants: possible increased risk of bleeding when ticagrelor given with citalopram, paroxetine or sertraline
Antiepileptics: plasma concentration of ticagrelor possibly reduced by carbamazepine, phenobarbital and phenytoin
• Antivirals: plasma concentration of ticagrelor possibly reduced by cobicistat
Ciclosporin: plasma concentration of ticagrelor increased by ciclosporin
Cardiac Glycosides: ticagrelor increases plasma concentration of digoxin
Corticosteroids: plasma concentration of ticagrelor possibly reduced by dexamethasone
• Ergot Alkaloids: ticagrelor possibly increases plasma concentration of ergot alkaloids
Lipid-regulating Drugs: ticagrelor increases plasma concentration of simvastatin (increased risk of toxicity)

Ticarcl clinicians see Penicillins
Tigecycline
Anticoagulants: tigecycline possibly enhances anticoagulant effect of coumarins
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850
Timolol see Beta-blockers
Tinidazole
Alcohol: possibility of disulfiram-like reaction when tinidazole given with alcohol

Tinidazole (continued)
Antibacterials: plasma concentration of tinidazole possibly reduced by rifampicin
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 850
Tinzaparin see Heparins

Tioguanine
• Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
Cytoxotics: increased risk of hepatotoxicity when tioguanine given with busulfan

Tiotropium see Antimuscarinics
Tirapavar
Analgesics: plasma concentration of tirapavar possibly reduced by buprenorphine
Antacids: absorption of tirapavar reduced by antacids
• Antibacterials: tirapavar increases plasma concentration of clarithromycin (reduced dose of clarithromycin in renal impairment), also plasma concentration of tirapavar increased by clarithromycin; tirapavar increases plasma concentration of rifabutin (reduce dose of rifabutin); plasma concentration of tirapavar possibly reduced by rifampicin—avoid concomitant use; avoidance of concomitant tirapavar in severe renal and hepatic impairment advised by manufacturer of rifabutin
Anticoagulants: avoidance of tirapavar advised by manufacturer of aspirin and rivaroxaban
• Antidepressants: plasma concentration of tirapavar possibly reduced by St John's wort—avoid concomitant use
Antiepileptics: plasma concentration of tirapavar possibly reduced by carbamazepine
Antifungals: plasma concentration of tirapavar increased by fluconazole
• Antimalarials: caution with tirapavar advised by manufacturer of arteether with lumefantrine; tirapavar possibly increases plasma concentration of quinine (increased risk of toxicity)
Antimuscarinics: avoidance of tirapavar advised by manufacturer of darifenac
• Antipsychotics: tirapavar possibly increases plasma concentration of saquinavir (increased risk of toxicity)
Antivirals: plasma concentration of tirapavar possibly increased by ritonavir—manufacturer of atazanavir advises avoid concomitant use
• Antibacterials: tirapavar reduces plasma concentration of abacavir, fosamprenavir, lopinavir, saquinavir and zidovudine; plasma concentration of tirapavar increased by atazanavir (also plasma concentration of atazanavir reduced); tirapavar reduces plasma concentration of didanosine—manufacturer of tirapavar advises tirapavar and didanosine capsules should be taken at least 2 hours apart; tirapavar reduces the plasma concentration of dolutegravir (see Dose under Dolutegravir, p. 421); tirapavar reduces plasma concentration of etravirine, also plasma concentration of tirapavar increased (avoid concomitant use)
• Beta-blockers: manufacturer of tirapavar advises avoid concomitant use with metoprolol for heart failure
Bosantan: manufacturer of tirapavar advises avoid concomitant use with bosantan
• Lipid-regulating Drugs: increased risk of myopathy when tirapavar given with atorvastatin—see Atorvastatin, p. 171; tirapavar increases plasma concentration of rosuvastatin—adjust dose of rosuvastatin (consult product literature); tirapavar possibly increases plasma concentration of simvastatin—avoid concomitant use; avoidance of tirapavar advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased)

Ulcer-healing Drugs:

Antibacterials:
Ticarcillin see Antimicrobials
Tipranavir (continued)

- Orlistat: absorption of tipranavir possibly reduced by orlistat

- Ranolazine: tipranavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use

- Sympathomimetcs, Beta 
  2; manufacturer of tipranavir advises avoid concomitant use with salmeterol

- Ulcer-healing Drugs: tipranavir reduces plasma concentration ofesomeprazole and rabeprazole

- Vardenafil: manufacturer of tipranavir advises caution with vardenafil

- Vitamins: increased risk of bleeding when tipranavir given with high doses of vitamin E

Tirofiban

- Iloprost: increased risk of bleeding when tirofiban given with iloprost

Tizanidine see Muscle Relaxants

Tobramycin see Aminoglycosides

Tolazoline

- Vaccines: avoid concomitant use of tolazoline with live vaccines (see p. 828)

Tolcapone

- Antiepileptics: increased risk of anticonvulsant effect of antiepileptics given with topiramate

Tolcapone see Antiepileptics

Tolcaponene

- Anticonvulsant effect of antiepileptics possibly antagonised by valproate

Tolcaponene see Antiepileptics

Tolvaptan

- Plasma concentration of tolvaptan possibly increases by grapefruit juice—avoid concomitant use

- Trimethoprim increases plasma concentration of tolvaptan (as co-trimoxazole)

Topiramate (continued)

- Progestogens: topiramate accelerates metabolism of progestogens (reduced contraceptive effect—see p. 536)

Torasemide see Diuretics

Toremifene

- Anticoagulants: toremifene possibly enhances anti-coagulant effect of warfarin

- Antiepileptics: metabolism of toremifene possibly accelerated by carbamazepine (reduced plasma concentration); metabolism of toremifene possibly accelerated by phenytoin

- Cytotoxic: increased possible increased risk of ventricular arrhythmias when toremifene given with vandetanib—avoid concomitant use

- Diuretics: increased risk of hypercalcaemia when toremifene given with thiazides and related diuretics

Trazedocin

- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)

- Angiotensin-II Receptor Antagonists: possible increased risk of hyperkalaemia when trazadone given with ACE inhibitors

- Anticoagulants: toremifene possibly enhances anticoagulant effect of warfarin

- Anti-AIDS: increased possible increased risk of ventricular arrhythmias when trimethoprim (as co-trimoxazole) given with amiodarone—manufacturer of amiodarone advises avoid concomitant use of co-trimoxazole

- Antiepileptics: increased risk of hyperkalaemia when trimethoprim given with dapsone

- Anticoagulants: trimethoprim possibly enhances anti-coagulant effect of warfarin

- Antidiabetics: trimethoprim possibly enhances antihyperglycaemic effect of repaglinide—manufacturer advises avoid concomitant use; trimethoprim rarely enhances the effects of sulfonylureas

- Antiparkinsonian effect of dopaminergics possibly antagonised by levodopa

- Anti-AIDS: increased possible increased risk of hyperkalaemia when trimethoprim given with dapsone

- Anticoagulants: trimethoprim possibly enhances anticoagulant effect of warfarin

- Antidiabetics: trimethoprim possibly enhances antihyperglycaemic effect of repaglinide—manufacturer advises avoid concomitant use; trimethoprim rarely enhances the effects of sulfonylureas

- Antiparkinsonian effect of dopaminergics possibly antagonised by levodopa

- Anticoagulants: toremifene possibly enhances anticoagulant effect of warfarin
Appendix 1: Interactions

Trimethoprim
- Ciclosporin (continued) concentration of ciclosporin reduced by *intravenous* trimethoprim
- Cytotoxics: increased risk of haematological toxicity when trimethoprim (also with *co-trimoxazole*) given with *mercapto purine* or *methotrexate*

Diuretics: increased risk of hyperkalaemia when trimethoprim given with *epilone*; possible increased risk of hyperkalaemia when trimethoprim given with *spironolactone*

Vaccines: antibacterials inactive oral *typhoid vaccine*—see p. 850

Trimipramine see Antidepressants, Tricyclic

Triptosium Dicitratobismuthate
- Antibacterials: triptosium dicitratobismuthate reduces absorption of *tetracyclines*

Tropicamid see Antimuscarinics

Tropium see Antimuscarinics

Typhoid Vaccine (oral) see Vaccines

Typhoid Vaccine (parenteral) see Vaccines

Ubidecarenone
- Anticoagulants: ubidecarenone may enhance or reduce anticoagulant effect of *warfarin*

Ulcer-healing Drugs see Histamine H₂-antagonists,
- Proton Pump Inhibitors, Sucralfate, and Tripotassium Dicitratobismuthate

Ulipristal
- Antacids: manufacturer of ulipristal advises give dabigatran at least 1.5 hours before or after ulipristal
- Antidepressants: manufacturer of ulipristal advises avoid concomitant use with *St John’s wort* (contraceptive effect of ulipristal possibly reduced)
- Antiepileptics: manufacturer of ulipristal advises avoid concomitant use with clarithromycin and telithromycin; plasma concentration of ulipristal increased by erythromycin—manufacturer of ulipristal advises avoid concomitant use; manufacturer of ulipristal advises avoid concomitant use with *lamipic* (contraceptive effect of ulipristal possibly reduced)
- Antifungals: manufacturer of ulipristal advises concomitant use with *itraconazole*
- Antihistamines: manufacturer of ulipristal advises give fexofenadine at least 1.5 hours before or after ulipristal
- Antivirals: manufacturer of ulipristal advises avoid concomitant use with *tenovar* (contraceptive effect of ulipristal possibly reduced)
- Calcium-channel Blockers: manufacturer of ulipristal advises avoid concomitant use with verapamil
- Cardiac Glycosides: manufacturer of ulipristal advises give digoxin at least 1.5 hours before or after ulipristal
- Grapefruit Juice: manufacturer of ulipristal advises avoid concomitant use with grapefruit juice
- Progestogens: ulipristal possibly reduces contraceptive effect of progestogens
- Ulcer-healing Drugs: manufacturer of high-dose ulipristal advises avoid concomitant use with *histamine H₂-antagonists* and *proton pump inhibitors* (contraceptive effect of ulipristal possibly reduced)

Ursodeoxycholic Acid see Bile Acids

Ustekinumab
- Vaccines: avoid concomitant use of ustekinumab with live *vaccines* (see p. 828)

Vaccines
Note For a general warning on live vaccines and high doses of corticosteroids or other immunosuppressive drugs, see p. 828; for advice on live vaccines and immunoglobulins, see under Normal Immunoglobulin, p. 852
- Abatacept: avoid concomitant use of live vaccines with *abatacept* (see p. 828)
- Adalimumab: avoid concomitant use of live vaccines with *adalimumab* (see p. 828)
- Alemtuzumab: avoid concomitant use of live vaccines with *alemtuzumab* (see p. 828)
- Anakinra: avoid concomitant use of live vaccines with *anakinra* (see p. 828)
- Antibacterials: oral *typhoid vaccine* inactivated by *antibacterials*—see p. 850
- Anticoagulants: influence vaccine possibly enhances anticoagulant effect of *warfarin*
- Antiepileptics: influence vaccine enhances effects of *phenytoin*
- Antimalarials: oral *typhoid vaccine* inactivated by *antimalarials*—see p. 850
- Belimumab: avoid concomitant use of live vaccines with *belimumab* (see p. 828)
- Ceftriaxone: avoid concomitant use of live vaccines with *ceftriaxone* (see p. 828)
- Certolizumab pegol: avoid concomitant use of live vaccines with *certolizumab pegol* (see p. 828)
- Corticosteroids: immune response to vaccines impaired by high doses of *corticosteroids*, avoid concomitant use with live vaccines (see p. 828)
- Cytotoxics: avoid concomitant use of live vaccines with *poxaprene* (see p. 828)
- Etanercept: avoid concomitant use of live vaccines with *etanercept* (see p. 828)
- Golimumab: avoid concomitant use of live vaccines with *golimumab* (see p. 828)
- Infliximab: avoid concomitant use of live vaccines with *infliximab* (see p. 828)
- Interferons: avoidance of vaccines advised by manufacturer of *interferon gamma*
- Leflunomide: avoid concomitant use of live vaccines with *leflunomide* (see p. 828)
- Teriflunomide: avoid concomitant use of live vaccines with *teriflunomide* (see p. 828)
- Theophylline: influence vaccine possibly increases plasma concentration of *theophylline*
- Tolizumab: avoid concomitant use of live vaccines with *tolizumab* (see p. 828)
- Ustekinumab: avoid concomitant use of live vaccines with *ustekinumab* (see p. 828)

Valaciclovir see Aciclovir

Valganciclovir see Ganciclovir

Valproate
Analgesics: effects of valproate enhanced by *aspirin*
- Antibacterials: metabolism of valproate possibly inhibited by *erythromycin* (increased plasma concentration); avoidance of valproate advised by manufacturer of *pivmecillinam*; plasma concentration of valproate reduced by *carbapenems*—avoid concomitant use
- Anticoagulants: valproate possibly enhances anticoagulant effect of *coumarins*
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and *cyclic*-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by *SSRIs* and *cyclics* (convulsive threshold lowered)
- Antiepileptics: plasma concentration of valproate reduced by *carbamazepine*, also plasma concentration of active metabolite of carbamazepine increased; valproate possibly increases plasma concentration of *ethosuximide*; valproate increases plasma concentration of lamotrigine (increased risk of toxicity—reduce lamotrigine dose); valproate sometimes reduces plasma concentration of an active metabolite of oxcarbazepine; valproate increases plasma concentration of...
Valproate
- Antiepileptics (continued)
  phenobarbital (also plasma concentration of valproate reduced); valproate increases or possibly decreases plasma concentration of phenytoin, also plasma concentration of valproate reduced; valproate possibly increases plasma concentration of rufinamide (reduce dose of rufinamide); hyperammonaemia and CNS toxicity reported when valproate given with topiramate
- Antimalarials: anticonvulsant effect of antiepileptics antagonised byemetine, quinine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised byclozapine, haloperidol, pimozide, sulpiride or zuclopenthixol—avoid concomitant use
- Antipsychotics: possible increased risk of ventricular arrhythmias when valproate given with amitriptyline, clozapine, haloperidol, pimozide, sulpiride or zuclopenthixol—avoid concomitant use
- Antipsychotics: possible increased risk of ventricular arrhythmias when valproate given with amitriptyline, chlorpromazine, clozapine (increased risk of agranulocytosis)
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when valproate given with amiodarone ordisopyramide—avoid concomitant use
- Antihistamines: possible increased risk of ventricular arrhythmias when valproate given with azathioprine, erythromycin—avoid concomitant use; possible increased risk of ventricular arrhythmias when valproate given with clarithromycin, macrolides—avoid concomitant use; plasma concentration of vardenafil reduced byrifampicin—manufacturer of vandetanib advises avoid concomitant use
- Antiarrhythmics: manufacturer of vandetanib advises avoid concomitant use with St John's wort (plasma concentration of vandetanib possibly reduced)
- Antiarrhythmics: vandetanib possibly increases plasma concentration of metformin (consider reducing dose of metformin)
- Antiepileptics: manufacturer of vandetanib advises avoid concomitant use with carbamazepine and phenobarbital (plasma concentration of vandetanib possibly reduced)
- Antihistamines: possible increased risk of ventricular arrhythmias when valproate given with azathioprine, clarithromycin, erythromycin—avoid concomitant use
- Antihistamines: possible increased risk of ventricular arrhythmias when valproate given withclozapine, haloperidol, pimozide, sulpiride or zuclopenthixol—avoid concomitant use
- Antipsychotics: possible increased risk of ventricular arrhythmias when valproate given withamitriptyline, chlorpromazine, clozapine (increased risk of agranulocytosis)
- Beta-blockers: possible increased risk of ventricular arrhythmias when valproate given withbetaxolol—avoid concomitant use
- Antidiabetics: vandetanib increases plasma concentration of digoxin—possible increased risk of bradycardia
- Anticoagulants: possible increased risk of ventricular arrhythmias when valproate given withacenocoumarol, warfarin (increased risk of bleeding)

Vandetanib (continued)
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when vandetanib given with amiodarone or disopyramide—avoid concomitant use
- Antibacterials: possible increased risk of ventricular arrhythmias when vandetanib given with piperacillin
- Antibacterials: possible increased risk of ventricular arrhythmias when vandetanib given with piperacillin, tazobactam—avoid concomitant use; possible increased risk of ventricular arrhythmias when vandetanib given with clarithromycin, erythromycin—avoid concomitant use
- Antidepressants: manufacturer of vandetanib advises avoid concomitant use with St John's wort (plasma concentration of vandetanib possibly reduced)
- Antiarrhythmics: vandetanib possibly increases plasma concentration of metformin (consider reducing dose of metformin)
- Antiepileptics: manufacturer of vandetanib advises avoid concomitant use with carbamazepine and phenobarbital (plasma concentration of vandetanib possibly reduced)
- Antihistamines: possible increased risk of ventricular arrhythmias when valproate given with azathioprine, clarithromycin, erythromycin—avoid concomitant use
- Antihistamines: possible increased risk of ventricular arrhythmias when valproate given withclozapine, haloperidol, pimozide, sulpiride or zuclopenthixol—avoid concomitant use
- Antipsychotics: possible increased risk of ventricular arrhythmias when valproate given withamitriptyline, chlorpromazine, clozapine (increased risk of agranulocytosis)
- Beta-blockers: possible increased risk of ventricular arrhythmias when valproate given withbetaxolol—avoid concomitant use
- Antidiabetics: vandetanib increases plasma concentration of digoxin—possible increased risk of bradycardia
- Anticoagulants: possible increased risk of ventricular arrhythmias when valproate given withacenocoumarol, warfarin (increased risk of bleeding)
Appendix 1: Interactions

Vasodilator Antihypertensives

ACE Inhibitors: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with alcohol

Aldesleukin: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with aldesleukin

Alpha-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with alpha-blockers

Anaesthetics, General: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with general anaesthetics

Analgesics: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by NSAIDs

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with angiotensin-II receptor antagonists

Antidepressants: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with MAOIs; enhanced hypotensive effect when hydralazine or sodium nitroprusside given with tricyclic-related antidepressants

Antipsychotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with phenothiazines

Anxiolytics and Hypnotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with anxiolytics and hypnotics

Beta-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with clonidine

Corticosteroids: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by corticosteroids

Vardenafil

● Antivirals (continued) caution with vardenafil advised by manufacturer of tipranavir

Calcium-channel Blockers: enhanced hypotensive effect when vardenafil given with nilidine

Cobicistat: plasma concentration of vardenafil possibly increased by cobicistat—manufacturer of cobicistat advises reduce dose of vardenafil (consult cobicistat product literature)

Dapoxetine: avoidance of vardenafil advised by manufacturer of dapoxetine

Grapefruit Juice: plasma concentration of vardenafil possibly increased by grapefruit juice—avoid concomitant use

Nicorandil: possible increased hypotensive effect when vardenafil given with nicorandil—avoid concomitant use

Nitrites: possible increased hypotensive effect when vardenafil given with nitrites—avoid concomitant use

Riociguat: possible enhanced hypotensive effect when vardenafil given with riociguat—avoid concomitant use

Varicella-zoster Vaccine see Vaccines

Vemurafenib

Antibacterials: manufacturer of vemurafenib advises avoid concomitant use with rifampicin and rifabutin

Anticoagulants: vemurafenib possibly enhances anti-coagulant effect of warfarin

Antidepressants: manufacturer of vemurafenib advises avoid concomitant use with St John’s wort

Antiepileptics: manufacturer of vemurafenib advises avoid concomitant use with carbamazepine and phenytoin

Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)

Cytotoxics: avoidance of vemurafenib advised by manufacturer of ipilimumab

Oestrogens: manufacturer of vemurafenib advises contraceptive effect of oestrogens possibly reduced

Progestogens: manufacturer of vemurafenib advises contraceptive effect of progestogens possibly reduced

Venlafaxine

Analgesics: increased risk of bleeding when venlafaxine given with NSAIDs or aspirin; possible increased serotonergic effects when SSRI-related antidepressants given with fentanyl; possible increased serotonergic effects when venlafaxine given with tramadol

Anticoagulants: venlafaxine possibly enhances anti-coagulant effect of warfarin; possible increased risk of bleeding when SSRI-related antidepressants given with dabigatran

Antidepressants: possible increased serotonergic effects when venlafaxine given with St John’s wort, duloxetine or mirtazapine; enhanced CNS effects and toxicity when venlafaxine given with
**Antifungals**
- Vincristine

**Antipsychotics**
- Antiemetics: possible increased risk of convulsions when antidepressants are given with **atropine**
- Dopaminergics: caution with venlafaxine advised by **manufacturers of apomorphine, ropinirole, and bromocriptine**
- Dopaminergics: caution with venlafaxine advised by **manufacturers of entacapone**
- Dopaminergics: caution with venlafaxine advised by **manufacturers of entacapone**; increased risk of hypertension and CNS excitation when venlafaxine given with **apomorphine**, **ropinirole**, or **bromocriptine** (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)

**Verapamil** see Calcium-channel Blockers

**Vigabatrin**
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered)
- Antiepileptics: vigabatrin reduces plasma concentration of **phenytoin**
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by **emtricitabine**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **antipsychotics** (convulsive threshold lowered)
- Orlisat: possible increased risk of convulsions when antiepileptics given with **orlistat**

**Vilablastin** see AntiTB Drugs

**Vildagliptin** see AntiDiabetics

**Venlafaxine**
- Antidepressants (continued)
  - **MAOIs** (venlafaxine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine); after stopping SSRI-related antidepressants do not start **emtricitabine** for at least 1 week
- Antimalarials: avoidance of antidepressants advised by **manufacturers of artemether with lumefantrine and piperaquine with artenimol**
- Antipsychotics: venlafaxine increases plasma concentration of **haloperidol**
- Atomoxetine: possible increased risk of convulsions when antidepressants are given with **atomoxetine**
- Dopaminergics: caution with venlafaxine advised by **manufacturers of dopaminergic agents** (if avoidance not possible, use lowest possible dose of dopaminergic agents and observe patient for up to 4 hours after administration)
- Dopaminergics: caution with venlafaxine advised by **manufacturers of entacapone**; increased risk of hypertension and CNS excitation when venlafaxine given with **apomorphine**, **ropinirole**, or **bromocriptine** (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)

**Appendix 1: Interactions**

**Antipsychotics**
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered)
- Antiepileptics: caution with venlafaxine advised by **manufacturers of entacapone**; increased risk of hypertension and CNS excitation when venlafaxine given with **apomorphine**, **ropinirole**, or **bromocriptine** (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)

**Antidepressants**
- Antipsychotics: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered)
- Antiepileptics: caution with venlafaxine advised by **manufacturers of entacapone**; increased risk of hypertension and CNS excitation when venlafaxine given with **apomorphine**, **ropinirole**, or **bromocriptine** (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)

**Antiepileptics**
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered)
- Antiepileptics: caution with venlafaxine advised by **manufacturers of entacapone**; increased risk of hypertension and CNS excitation when venlafaxine given with **apomorphine**, **ropinirole**, or **bromocriptine** (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)

**Antipsychotics**
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **tricyclic-related antidepressants** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **tricyclics** (convulsive threshold lowered)
Appendix 1: Interactions

Vitamins (continued)

Ciclosporin: vitamin E possibly affects plasma concentration of ciclosporin

Diarhoea: increased risk of hypercalcaemia when vitamin D given with thiazides and related diuretics

Dopaminergic drugs: pyridoxine reduces effects of levodopa when given without dopa-decarboxylase inhibitor

Lipid-regulating drugs: absorption of calcitriol possibly reduced by colestevarol (give at least 1 hour before or 4 to 6 hours after colestevarol)

Retinoids: risk of hypervitaminosis A when vitamin A given with retinoids—avoid concomitant use

Selenium: ascorbic acid possibly reduces absorption of selenium (give at least 4 hours apart)

Voriconazole see Antifungals, Triazole

Zidovudine

Note Increased risk of toxicity with nephrotoxic and myelosuppressive drugs—for further details consult product literature

Analgesics: increased risk of haematological toxicity when zidovudine given with NSAIDs; plasma concentration of zidovudine possibly increased by methadone

Antibacterials: absorption of zidovudine reduced by clarithromycin tablets (give at least 2 hours apart); manufacturer of zidovudine advises avoid concomitant use with rifampicin

Antiepileptics: zidovudine increases or decreases plasma concentration of phenytoin; plasma concentration of zidovudine possibly increased by valproate (increased risk of toxicity)

Antifungals: plasma concentration of zidovudine increased by fluconazole (increased risk of toxicity)

Antimalarials: increased antifolate effect when zidovudine given with pyrimethamine

Antivirals: profound myelosuppression when zidovudine given with ganciclovir (if possible avoid concomitant administration, particularly during initial ganciclovir therapy); increased risk of granulocytopenia when zidovudine given with nevirapine; increased risk of anaemia when zidovudine given with ribavirin—avoid concomitant use; zidovudine possibly inhibits effects of stavudine (manufacturers advise avoid concomitant use); plasma concentration of zidovudine reduced by ritonavir

Atovaquone: plasma concentration of zidovudine increased by atovaquone (increased risk of toxicity)

Orlistat: absorption of zidovudine possibly reduced by orlistat

Probencid: excretion of zidovudine reduced by probenecid (increased plasma concentration and risk of toxicity)

Zinc

Antibacterials: zinc reduces absorption of ciprofloxacin, levofloxacin, moxifloxacin and ofloxacin; zinc reduces absorption of norfloxacin (give at least 2 hours apart); zinc reduces absorption of tetracyclines, also absorption of zinc reduced by tetracyclines

Calcium salts: absorption of zinc reduced by calcium salts

Eltrombopag: zinc possibly reduces absorption of eltrombopag (give at least 4 hours apart)

Iron: absorption of zinc reduced by oral iron, also absorption of oral iron reduced by zinc

Penicillamine: absorption of zinc reduced by penicillamine, also absorption of penicillamine reduced by zinc

Trientine: absorption of zinc reduced by trientine, also absorption of trientine reduced by zinc

Zoledronic Acid see Bisphosphonates

Zolmitriptan see 5HT1-receptor Agonists (under HT)

Zolpidem see Anxiolytics and Hypnotics

Zonisamide

Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and cyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered)

Antiepileptics: plasma concentration of zonisamide reduced by carbamazepine, phenobarbital and phenytoin

Antimalarials: anticonvulsant effect of antiepileptics antagonised by mefloquine

Antipsychotics: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered)

Diuretics: manufacturer of zonisamide advises avoid concomitant use with carbonic anhydrase inhibitors in children

Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat

Zopiclone see Anxiolytics and Hypnotics

Zuclopenthixol see Antipsychotics
A2 Borderline substances

A2.1 Enteral feeds (non-disease specific) 998
A2.1.1 Enteral feeds (non-disease specific): less than 5 g protein/100 mL 998
A2.1.2 Enteral feeds (non-disease specific): 5 g (or more) protein/100 mL 1000
A2.1.3 Enteral feeds (non-disease specific): Child under 12 years 1004
A2.2 Nutritional supplements (non-disease specific) 1004
A2.2.1 Nutritional supplements: less than 5 g protein/100 mL 1004
A2.2.2 Nutritional supplements: 5 g (or more) protein/100 mL 1005
A2.3 Specialised formulas 1010
A2.3.1 Specialised formulas: Infant and child 1010
A2.3.2 Specialised formulas for specific clinical conditions 1010
A2.4 Feed supplements 1015
A2.4.1 High-energy supplements 1015
A2.4.2 Fibre, vitamin, and mineral supplements 1020
A2.5 Feed additives 1021
A2.5.1 Special additives for conditions of intolerance 1021
A2.5.2 Feed thickeners and pre-thickened drinks 1021
A2.5.3 Flavouring preparations 1021
A2.6 Foods for special diets 1022
A2.6.1 Gluten-free foods 1022
A2.6.2 Low-protein foods 1024
A2.7 Nutritional supplements for metabolic diseases 1025

In certain conditions some foods (and toilet preparations) have characteristics of drugs and the Advisory Committee on Borderline Substances (ACBS) advises as to the circumstances in which such substances may be regarded as drugs. Prescriptions issued in accordance with the Committee’s advice and endorsed ‘ACBS’ will normally not be investigated.

General Practitioners are reminded that the ACBS recommends products on the basis that they may be regarded as drugs for the management of specified conditions. Doctors should satisfy themselves that the products can safely be prescribed, that patients are adequately monitored and that, where necessary, expert hospital supervision is available.

Foods which may be prescribed on FP10, GP10 (Scotland), or WP10 (Wales) All the food products listed in this appendix have ACBS approval. The clinical condition for which the product has been approved is included with each entry.

Note Foods included in this appendix may contain cariogenic sugars and patients should be advised to take appropriate oral hygiene measures.

Enteral feeds and supplements For most enteral feeds and nutritional supplements, the main source of carbohydrate is either maltodextrin or glucose syrup; other carbohydrate sources are listed in the relevant table, below. Feeds containing residual lactose (less than 1 g lactose/100 mL formula) are described as ‘clinically lactose-free’ or ‘lactose-free’ by some manufacturers.

The presence of lactose (including residual lactose) in feeds is indicated in the relevant table, below. The primary sources of protein or amino acids are included with each product entry. The fat or oil content is derived from a variety of sources such as vegetables, soya bean, corn, palm nuts, and seeds; where the fat content is derived from animal or fish sources, this information is included in the relevant table, below. The presence of medium chain triglycerides (MCT) is also noted where the quantity exceeds 30% of the fat content.

Enteral feeds and nutritional supplements can contain varying amounts of vitamins, minerals, and trace elements—the manufacturer’s product literature should be consulted for more detailed information. For further information on enteral nutrition, see section 9.4.2.

Foods containing vitamin K may affect the INR in patients receiving warfarin; see Interactions: Appendix 1 (vitamins).

The suitability of food products for patients requiring a vegan, kosher, halal, or other compliant diet should be confirmed with individual manufacturers.

For details of enteral feeds, nutritional supplements, and specialised formulas suitable for infants and children under 12 years see BNF for Children.

Note Feeds containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be avoided in children unless recommended by an appropriate specialist or dietician.

Standard ACBS indications
Disease-related malnutrition, intractable malabsorption, pre-operative preparation of malnourished patients, dysphagia, proven inflammatory bowel disease, following total gastrectomy, short-bowel syndrome, bowel fistula

Prices quoted in Appendix 2 are basic NHS net prices; for further information see Prices in the BNF.
## A2.1 Enteral feeds (non-disease specific)

### A2.1.1 Enteral feeds (non-disease specific): less than 5 g protein/100 mL

Not suitable for use in child under 1 year unless otherwise stated; not recommended for child 1–6 years

Powder provides: protein 15 g, carbohydrate 58 g, fat 17.5 g, energy 1889 kJ (450 kcal)/100 g
### Forticare®
(Nutricia Clinical)
**Liquid (sip feed) per 100 mL**
- **Energy:** 675 kJ (160 kcal)
- **Protein:** 9 g (cows' milk)
- **Carbohydrate:** 19.1 g (sugars 13.6 g)
- **Fat:** 5.3 g
- **Gluten-free**
- **Residual lactose**
- **Contains fish oil**
- **Nutritional supplement in patients with lung cancer undergoing chemotherapy, or with pancreatic cancer**
- **Not suitable in children under 3 years**
- **Bottle:** 4 x 125 mL = £8.84
- **Flavours:** Cappuccino, orange-lemon, peach-ginger

### Generaid®
(SHS)
**Powder per 100 g**
- **Energy:** 1586 kJ (374 kcal)
- **Protein equivalent:** 76 g (whey protein, plus branched chain amino acids)
- **Carbohydrate:** 5 g (sugars 5 g)
- **Nil**
- **Electrolytes/100 g:**
  - Na⁺ 6.1 mmol
  - K⁺ 10.8 mmol
  - Ca²⁺ 6.5 mmol
  - P⁺ 6.45 mmol
- **Nutritional supplement for use in chronic liver disease and/or porto-hepatic encephalopathy**
- **Tub:** 400 g = £58.32
- **Unflavoured**

### Generaid® Plus
(SHS)
**Standard dilution (22%) of powder per 100 mL**
- **Energy:** 428 kJ (102 kcal)
- **Protein equivalent:** 2.4 g (whey protein, branched chain amino acids)
- **Carbohydrate:** 13.6 g (sugars 1.4 g)
- **Nil**
- **Electrolytes/100 mL:**
  - Na⁺ 0.7 mmol
  - K⁺ 2.7 mmol
  - Ca²⁺ 1.72 mmol
  - P⁺ 1.67 mmol
- **Enteral feed or nutritional supplement in children over 1 year with hepatic disorders**
- **Can:** 400 g = £20.86
- **Unflavoured**

### Heparon® Junior
(SHS)
**Standard dilution (18%) of powder per 100 mL**
- **Energy:** 363 kJ (86 kcal)
- **Protein:** 2 g (cows' milk)
- **Carbohydrate:** 11.6 g (sugars 2.9 g)
- **Nil**
- **Contains lactose**
- **Electrolytes/100 mL:**
  - Na⁺ 0.56 mmol
  - K⁺ 1.9 mmol
  - Ca²⁺ 2.3 mmol
  - P⁺ 1.6 mmol
- **Enteral feed or nutritional supplement for children with acute or chronic liver failure**
- **Can:** 400 g = £20.63

### KetoCal®
(SHS)
**Standard dilution (20%) of powder per 100 mL**
- **Energy:** 602 kJ (146 kcal)
- **Protein:** 3.1 g (cows' milk with additional amino acids)
- **Carbohydrate:** 600 mg (sugars 120 mg)
- **Fat:** 14.6 g (LCT 100%)
- **Nil**
- **Electrolytes/100 mL:**
  - Na⁺ 4.3 mmol
  - K⁺ 4.1 mmol
  - Ca²⁺ 2.15 mmol
  - P⁺ 2.77 mmol
- **Enteral feed or nutritional supplement as part of ketogenic diet in management of epilepsy resistant to drug therapy, in children over 1 year, only on the advice of secondary care physician with experience of ketogenic diet**
- **Can:** 300 g = £29.04
- **Vanilla, Unflavoured**

## A2.4 Feed supplements

### A2.4.1 High-energy supplements

#### A2.4.1.1 High-energy supplements: carbohydrate

Flavoured carbohydrate supplements are not suitable for children under 1 year; liquid supplements should be diluted before use in children under 5 years.

**ACBS Indications:** Disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a high or readily available carbohydrate supplement.

A2.5 Feed additives

A2.5.1 Special additives for conditions of intolerance

Colieff® (Forum)
Liquid, lactase 50,000 units/g. Net price 7-mL dropper bottle = £8.40
For the relief of symptoms associated with lactose intolerance in infants, provided that lactose intolerance is confirmed by the presence of reducing substances and/or excessive acid in stools, a low concentration of the corresponding disaccharide enzyme on intestinal biopsy or by breath hydrogen test or lactose intolerance test. For dosage and administration details, consult product literature

Fructose
(Laevulose)
For proven glucose/galactose intolerance

Glucose
(Dextrose monohydrate)
Net price 500 g = £1.53
For use as an energy supplement in sucrase-isomaltase deficiency

VSL#3® (Ferring)
Powder, containing 8 strains of live, freeze-dried, lactic acid bacteria. Contains traces of soya, gluten, and lactose. Net price 30  x  4.4-g sachets = £32.98
Nutritional supplement for use under the supervision of a physician, for the maintenance of remission of ileoanal pouchitis induced by antibacterials in adults. For dosage and administration details, consult product literature

A2.5.2 Feed thickeners and pre-thickened drinks

For pre-thickened infant feeds see BNF for Children.

Carobel, Instant® (Cow & Gate)
Powder, carob seed flour. Net price 135 g = £2.80
For thickening feeds in the treatment of vomiting

Multi-thick® (Abbott)
Powder, modified maize starch, gluten- and lactose-free, net price 250 g = £4.83
For thickening of liquids or foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

Nutilis® Clear (Nutricia Clinical)
Powder, maltodextrin, xanthan gum, guar gum, gluten- and lactose-free, net price 175 g = £8.46
For thickening of liquids or foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

Nutilis® Powder (Nutricia Clinical)
Powder, modified maize starch, gluten- and lactose-free, net price 20  x  12-g sachets = £6.40; 300 g = £4.92
For thickening of foods in dysphagia. Not suitable for children under 1 year

Resource® Thickened Drink (Nestlé)
Liquid, carbohydrate 22.4 g, energy: orange 382 kJ (90 kcal); apple 375 kJ (89 kcal)/100 mL. Syrup and custard consistencies. Gluten- and lactose-free, net price 12  x  114-mL cups = £7.80
For dysphagia. Not suitable for children under 1 year

A2.5.3 Flavouring preparations

Flavour Mix® (Nestlé)
Powder, flavours: banana, chocolate, coffee, lemon-lime, strawberry. Net price 60 g = £7.17

Flavour Pac® (Vitafo)
Powder, flavours: black currant, lemon, orange, tropical or raspberry, net price 30  x  4-g sachets = £13.29
For use with Vitafo’s range of unflavoured protein substitutes for metabolic diseases; not suitable for child under 1 year

Modjul® Flavour System (SHS)
Powder, flavours: black currant, orange, pineapple, 100 g = £11.60; cherry-vanilla, grapefruit, lemon-lime, 20  x  5-g sachets = £11.60
For use with unflavoured SHS products based on peptides or amino acids; not suitable for child under 6 months

Resource® ThickenedUp® (Nestlé)
Powder, modified maize starch. Gluten- and lactose-free, net price 227 g = £4.55; 75  x  4.5-g sachet = £17.44
For thickening of foods in dysphagia. Not suitable for children under 1 year

Resource® ThickenedUp Clear (Nestlé)
Powder, maltodextrin, xantham gum, gluten- and lactose-free, net price 125 g = £8.46; 24  x  1.2-g sachets = £5.28
For thickening of liquids or foods in dysphagia. Not suitable for children under 3 years

SLO Drinks® (SLO Drinks)
Powder, carbohydrate content varies with flavour and chosen consistency (3 consistencies available), see product literature. Flavours: black currant, lemon, orange; (hot drinks) chocolate, white coffee, tea, white tea, net price 25  x  115 mL = £7.50.
Nutritional supplement for patient hydration in the dietary management of dysphagia. Not suitable for children under 3 years

Thick and Easy® (M & A Pharmachem)
Powder, modified maize starch, net price 225-g can = £4.93; 100  x  9-g sachets = £30.00; 4.54 kg = £82.56.
For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

Thicken Aid® (Vitaquick)
Powder, modified maize starch, maltodextrin, gluten- and lactose-free, net price 225 g = £3.71; 100  x  9-g sachets = £22.40
For thickening of foods in dysphagia. Not suitable for children under 1 year

Thixo-D® (Sutherland)
Powder, modified maize starch, gluten-free. Net price 7-mL dropper bottle = £8.40
For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

Vitaquick® (Vitafo)
Powder. Modified maize starch. Net price 300-g tub = £7.15.
For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

Appendix 2: Borderline substances
A2.6 Foods for special diets

A2.6.1 Gluten-free foods

**ACBS indications:** established gluten-sensitive enteropathies including steatorrhoea due to gluten sensitivity, coeliac disease, and dermatitis herpetiformis.

### Bread

#### Loaves

**Barkat** (Gluten Free Foods Ltd)

**Gluten-free.** Loaf, multigrain 500 g = £5.73; Loaf, sliced, wholemeal 500 g = £3.98. Loaf, sliced, part-baked, country-style 250 g = £4.35. Loaf, sliced, part-baked, white 300 g = £4.13; 550 g = £5.78. Rice bread, brown 500 g = £5.73; white 500 g = £5.73.

**Dietary Specials** (Nutrition Point)

**Gluten-free.** Loaf, sliced, multigrain, brown 400 g = £3.10; white 400 g = £3.10.

**Ener-G** (General Dietary)

**Gluten-free.** Loaf, sliced Seattle brown 600 g = £6.04. Rice bread, sliced, brown 474 g = £5.41; white 456 g = £5.41. Rice loaf, sliced 612 g = £5.41. Tapioca bread, sliced 480 g = £5.41.

**Genius Gluten Free** (Genius Foods)

**Gluten-free.** Loaf, unsliced, brown 400 g = £2.59; white 400 g = £2.59. Loaf, sliced, brown 400 g = £2.69; white 400 g = £2.69. Sandwich bread, sliced, brown 535 g = £3.48; white 535 g = £3.48.

**Glutafin** (Nutrition Point)

**Gluten-free.** Loaf, sliced, fibre 400 g = £3.77; white 400 g = £3.77.

**Glutafin Select** (Nutrition Point)

**Gluten-free.** Loaf, sliced, fresh, brown 400 g = £3.43; white 400 g = £3.43. Loaf, sliced, fibre 400 g = £3.36; white 400 g = £3.36. Loaf, seeded 400 g = £3.65.

**Juvela** (Juvela)

**Gluten-free.** Loaf, sliced, fresh, fibre 400 g = £3.39; white 400 g = £3.69. Loaf, sliced, fibre 400 g = £3.59; fibre 400 g = £3.54. Loaf, white 400 g = £3.54; fibre 400 g = £3.54. Loaf, part-baked, fibre 400 g = £3.80; white 400 g = £3.95.

**Lifestyle** (Ultrapharm)

**Gluten-free.** Loaf, sliced, brown 400 g = £2.82; high fibre 400 g = £2.82; white 400 g = £2.82. Loaf, brown 400 g = £2.82; high fibre 400 g = £2.82; white 400 g = £2.82.

**Livwell** (Livwell)

**Gluten-free.** Loaf, sliced, brown (seeded) 200 g = £2.25; white 200 g = £2.25.

**Proceli** (Proceli)

**Gluten-free.** Loaf, sliced, white 165 g = £2.30; sandwich 155 g = £2.32. Rice bread, brown 220 g = £2.30; sandwich 220 g = £2.30.

### Baguettes, buns and rolls

**Barkat** (Gluten Free Foods Ltd)

**Gluten-free.** Baguette, part-baked 200 g = £4.35. Rolls, part-baked 2 x 100 g = £3.98; 6 x 50 g = £4.35

**Ener-G** (General Dietary)

**Gluten-free.** Rolls, dinner × 6 = £3.67; white, long 4 × 55 g = £2.95; round 4 × 55 g = £2.95.

**Glutafin** (Nutrition Point)

**Gluten-free.** Baguette 2 × 175 g = £3.44. Rolls, fibre 4 × 50 g = £3.61; white 4 × 50 g = £3.61.

**Glutafin Select** (Nutrition Point)

**Gluten-free.** Rolls, part-baked, white 4 × 50 g = £3.61; long 2 × 75 g = £2.76

**Juvela** (Juvela)

**Gluten-free.** Rolls, fresh, fibre 5 × 85 g = £4.42; white 5 × 85 g = £4.42. Rolls, fibre 5 × 85 g = £4.77; white 5 × 85 g = £4.77. Rolls, part-baked, fibre 5 × 75 g = £4.94; white 5 × 75 g = £4.94.

**Lifestyle** (Ultrapharm)

**Gluten-free.** Rolls, brown 5 × 80 g = £2.82; high fibre 5 × 80 g = £2.82. Loaf, white 5 × 80 g = £2.82.

**Livwell** (Livwell)

**Gluten-free.** Baguette, white 140 g = £2.15. Buns, toasting 4 × 45 g = £2.40. Rolls, white 4 × £2.25. Rolls, part-baked, circle (bagel) 2 × 70 g = £2.30; dinner (square) 2 × 80 g = £2.09.

**Proceli** (Proceli)

**Gluten-free.** Baguette, part-baked 2 × 125 g = £3.24. Buns 4 × 50 g = £3.41. Lunch rolls, white 8 × 34 g = £3.26. Rolls, hotdog 3 × 35 g = £2.24

**Warburtons** (Warburtons)

**Gluten-free.** Baguette, 2 × 75 g = £2.79; Rolls, brown 3 × 100 g = £2.49; white 3 × 100 g = £2.49

**Wellfoods** (Wellfoods)

**Gluten-free.** Burger buns 4 × 75 g = £3.95. Rolls 4 × 70 g = £3.65.

### Speciality breads

**Livwell** (Livwell)

**Gluten-free.** Flat bread (pitta) 4 = £3.00. Tear-drop shape (naan) 2 × 90 g = £3.00.

### Cereals

**Juvela** (Juvela)

**Gluten-free.** Fibre flakes 300 g = £2.78; flakes 300 g = £2.78; pure oats 500 g = £2.78

**Nairns** (Nairns)

**Gluten-free.** Oat porridge 500 g = £2.89
Cookies and biscuits

**Barkat** (Gluten Free Foods Ltd)
- Gluten-free. Biscuits, coffee-style 200 g = £3.38; digestive 175 g = £2.61

**Ener-G** (General Dietary)
- Gluten-free. Cookies, vanilla 435 g = £6.16

**Glutafin** (Nutrition Point)
- Gluten-free. Biscuits, plain 200 g = £4.06; digestive 150 g = £2.09; savoury shorts 150 g = £2.75; shortbread 150 g = £2.09; tea 150 g = £2.05

**Juvela** (Juvela)
- Gluten-free. Biscuits, digestive 150 g = £3.05; savoury 150 g = £3.82; sweet 150 g = £2.88; tea 150 g = £3.05

Crackers, crispbreads, and breadsticks

**Barkat** (Gluten Free Foods Ltd)
- Gluten-free. Crackers, round (matzo) 200 g = £3.52

**Dietary Specials** (Nutrition Point)
- Gluten-free. Cracker bread 150 g = £2.09

**Glutafin** (Nutrition Point)
- Gluten-free. Crackers, high fibre 200 g = £2.84; plain 200 g = £3.39; mini 175 g = £2.90.

**Juvela** (Juvela)
- Gluten-free. Crispbread, plain 200 g = £4.64

**Ultra** (Ultrapharm)
- Gluten-free. Crackerbread 200 g = £1.77

**Warburtons** (Warburtons)
- Gluten-free. Crackers, bran 150 g = £2.29

Flour mixes and xanthan gum

**Flour mixes**

**Barkat** (Gluten Free Foods Ltd)
- Gluten-free. Flour mix, bread 500 g = £6.81. Plain 750 g = £6.98

**Finax** (Drossa)
- Gluten-free. Flour mix, bread, fibre 1 kg = £9.92. Flour mix 900 g = £8.66; coarse 900 g = £8.66

**Glutafin** (Nutrition Point)
- Gluten-free. Flour mix, fibre 500 g = £6.53; white 500 g = £6.53

**Glutafin Select** (Nutrition Point)
- Gluten-free. Flour mix, bread 500 g = £6.53; white 500 g = £6.53. Fibre 500 g = £6.53; white 500 g = £6.53

**Heron Foods** (Gluten Free Foods Ltd)
- Gluten-free. Flour mix, organic, bread, standard 500 g = £8.96; high fibre 500 g = £8.96

**Juvela** (Juvela)
- Gluten-free. Flour mix, fibre 500 g = £7.35; plain 500 g = £7.35; harvest 500 g = £7.35

**Mrs Crimbles** (Stiletto Foods)
- Gluten-free. Bread mix, net price 275 g = £1.04. Pastry mix, net price 200 g = £1.04

**Orgran** (Community)
- Gluten-free. Flour mix, bread 500 g = £3.10. Self-raising 500 g = £3.10. Pastry and pizza 375 g = £3.80

**Proceil** (Proceil)
- Gluten-free. Flour mix, white 1 kg = £9.95

**Pure** (Innovative)
- Gluten-free. Flour mix, blended 1 kg = £4.23. Potato starch 500 g = £1.68. Rice, brown 500 g = £1.58; white 500 g = £1.68. Tapioca starch 500 g = £2.26. Teff, brown 1 kg = £4.77; white 1 kg = £4.77

**Tobia** (Tobia Teff)
- Gluten-free. Flour mix, teff, brown 1 kg = £3.30; white 1 kg = £3.30

**Tritamyl** (Gluten Free Foods Ltd)
- Gluten-free. Flour mix, white 500 g = £6.53; white 500 g = £6.53. Fibre 500 g = £6.53; white 500 g = £6.53

**Wellfoods** (Wellfoods)
- Gluten-free. Flour mix, plain 1 kg = £7.65

**Xanthan gum**

**Ener-G** (General Dietary)
- Gluten-free. Xanthan gum 170 g = £8.53

**Pure** (Innovative)
- Gluten-free. Xanthan gum 100 g = £6.66

Pasta

**Barkat** (Gluten Free Foods Ltd)
- Gluten-free. Pasta, animal shapes 500 g = £5.88; macaroni 500 g = £5.88; spaghetti 500 g = £5.88; spirals 500 g = £5.88; tagliatelle 500 g = £5.88. Buckwheat, penne 250 g = £2.93; spirals 250 g = £2.93

**BiAlimenta** (Drossa)
- Gluten-free. Pasta, acini di pepe 500 g = £5.97; formati misti 500 g = £5.97; penne 500 g = £5.97; sagetette 500 g = £5.97; spirali 500 g = £5.97; tubetti 500 g = £5.90; potato-based, gnocchi 500 g = £5.59; perle di gnocchi 500 g = £5.60.

**Dietary Specials** (Nutrition Point)
- Gluten-free. Pasta, fusilli 500 g = £3.54; penne 500 g = £3.54; spaghetti 500 g = £3.54; tagliatelle 250 g = £3.46

**BiAlimenta** (Drossa)
- Gluten-free. Pasta, acini di pepe 500 g = £5.97; formati misti 500 g = £5.97; penne 500 g = £5.97; sagetette 500 g = £5.97; spirali 500 g = £5.97; tubetti 500 g = £5.90; potato-based, gnocchi 500 g = £5.59; perle di gnocchi 500 g = £5.60.

Rice pudding imitation, apple 4 × 69 g = £6.18; banana 4 × 69 g = £6.18; original 4 × 69 g = £6.18; strawberry 4 × 69 g = £6.18

---

### Flour mixes and egg substitutes

**Ener-G® (General Dietary)**

- **Low-protein.** Egg replacer 454 g = £5.11

**Fate® (Fate)**

- **Low protein.** All purpose mix 500 g = £6.97. Cake mix, 2 × 250 g = £6.97; chocolate-flavour 2 × 250 g = £6.97

**Juvela® (Juvela)**

- **Low-protein.** Mix 500 g = £7.79

**Loprofin® (SHS)**

- **Low-protein.** Mix, plain 500 g = £8.03; chocolate 500 g = £8.50; lemon 500 g = £8.50. Egg replacer 2 × 250 g = £14.78. Egg-white replacer 100 g = £9.50

**PK Foods®** (Gluten Free Foods Ltd)

- **Low-protein.** Flour mix 750 g = £10.71. Egg replacer 350 g = £5.04

---

### Pasta

**Loprofin® (SHS)**

- **Low-protein.** Pasta, animal shapes 500 g = £8.09; spirals 500 g = £8.41; lasagne 250 g = £4.09; macaroni elbows 250 g = £4.04; penne 500 g = £8.41; spaghetti 500 g = £8.41; tagliatelle 250 g = £4.04; vermicelli 250 g = £4.17. Rice, imitation 500 g = £8.16

**Promin® (Firstplay Dietary)**

- **Low-protein.** Pasta, alphabet shapes 500 g = £6.80; lasagne sheets 200 g = £2.95; macaroni 500 g = £8.80; noodles, flat 500 g = £8.80; shells 500 g = £8.80; spaghetti, short-cut 500 g = £8.80; spirals 500 g = £8.80. Rice, imitation 500 g = £6.80. Tricolour pasta, alphabet shapes 500 g = £6.80; shells 500 g = £6.80; spirals 500 g = £6.80.

---

### Pizza bases

**Juvela® (Juvela)**

- **Low-protein.** Pizza base 2 × 180 g = £8.61

---

**Savoury meals and mixes**

**Promin® (Firstplay Dietary)**

- **Low-protein.** Burger mix 2 × 62 g = £6.18; lamb & mint 2 × 62 g = £6.18. Couscous 500 g = £6.80. Pasta elbows in cheese and broccoli sauce 4 × 66 g = £8.08. Pasta meal 500 g = £6.80. Pasta shells in tomato, pepper, and herb sauce 4 × 72 g = £8.08. Pasta spirals in Moroccan sauce 4 × 72 g = £8.08. Sausage mix, apple & sage 4 × 30 g = £6.95; original 4 × 30 g = £6.95; tomato & basil 4 × 30 g = £6.95. Mac pot, cheese 4 × 61 g = £18.60; tomato 4 × 61 g = £18.60. Potato pot, cabbage and bacon 4 × 50 g = £15.95; onion 4 × 50 g = £15.95; sausage 4 × 50 g = £15.95. Xpot, all day scramble 4 × 60 g = £20.36; beef and tomato 4 × 60 g = £20.36; chip shop curry 4 × 60 g = £20.36; rogan style curry 4 × 60 g = £20.36

**Spreads**

**Taranis® (Firstplay Dietary)**

- **Low-protein.** Spread, hazelnut 230 g = £7.65

---

**Glutaric aciduria (type 1)**

**GA1 Anamix® Infant (SHS)**

- **Powder,** protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; **standard dilution** (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)

**Nutritional supplement for the dietary management of proven glutaric aciduria (type 1) in children from birth to 3 years**

**GA Gel® (Vitafo)**

- **Gel,** protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 10 g, carbohydrate 10.3 g, fat trace, energy 339 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see FlavourPac®). Unflavoured, net price 200 g = £72.30 (50-g sachets provided)

**Nutritional supplement for the dietary management of type 1 glutaric aciduria in children 6 months–18 years**

**XLYS, Low TRY, Maxamaid® (SHS)**

- **Powder,** protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see Modju®, Flavour System, p. 1021), net price 500 g = £93.59

**Nutritional supplement for the dietary management of type 1 glutaric aciduria**

1. Maxamaid products are generally intended for use in children 1–8 years

**Corn flour and corn starch**

*HCU Express*®

Powder, 200 g, protein equivalent (essential and non-essential amino acids except lysine and tryptophan) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements. Standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided).

Nutritional supplement for the dietary management of proven vitamin B6 non-responsive homocystinuria or hypermethioninaemia in children from birth to 3 years.

**Glycosade**® (Vitaflo)

Powder, 200 mg, carbohydrate (maize starch) 47.6 g, fat 100 mg, fibre less than 600 mg, energy 803 kJ (192 kcal)/60 g, net price 30 × 60-g sachets = £107.64.

Nutritional supplement for use in the dietary management of glycogen storage disease and other metabolic conditions where a constant supply of glucose is essential. Not suitable for children under 2 years.

**Glycogen storage disease**

**Homocystinuria or hypermethioninaemia**

**HCU Anamix**® Infant (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided).

Nutritional supplement for the dietary management of proven vitamin B6 non-responsive homocystinuria or hypermethioninaemia in children from birth to 3 years.

**HCU cooler**® 15 (Vitaflo)

Liquid, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 7 g, fat 500 mg, energy 590 kJ (139 kcal)/130 mL, with vitamins, minerals, and trace elements. Orange or red flavour, net price 30 × 130-mL pouch = £289.80. A methionine-free protein substitute for use as a nutritional supplement in patients over 3 years of age with homocystinuria.

**HCU Express**® 15 (Vitaflo)

Powder, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 3.8 g, fat 30 mg, energy 315 kJ (75.3 kcal)/25 g with vitamins, minerals, and trace elements. Unflavoured (flavouring: see FlavourPac®, p. 1021), net price 30 × 25-g sachets = £118.03. A methionine-free protein substitute for use as a nutritional supplement in patients over 8 years of age with homocystinuria.

**HCU Express**® 20 (Vitaflo)

Powder, protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 4.7 g, fat 70 mg, energy 416 kJ (99 kcal)/34 g with vitamins, minerals, and trace elements. Unflavoured (flavouring: see FlavourPac®, p. 1021), net price 30 × 34-g sachets = £410.89. A methionine-free protein substitute for use as a nutritional supplement in patients over 8 years with homocystinuria.

**HCU gel**® (Vitaflo)

Powder, protein (essential and non-essential amino acids except methionine) 10 g, carbohydrate 10.5 g, fat 20 mg, energy 339 kJ (81 kcal)/24 g with vitamins, minerals, and trace elements. Unflavoured (flavouring: see FlavourPac®, p. 1021), net price 30 × 24-g sachets = £204.76. A methionine-free protein substitute for use as a nutritional supplement for the dietary management of type 1 glutaric aciduria in children and adults; requires additional source of vitamins, minerals, and trace elements.

**HCU Lophlex**® LQ 20 (Nutricia Clinical)

Liquid, protein equivalent (essential and non-essential amino acids except methionine) 20 g, carbohydrate 8.8 g, fat 440 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements. Juicy berries flavour, net price 125 mL = £15.29.

Nutritional supplement for the dietary management of homocystinuria in patients over 3 years.

**HCU LV**® (SHS)

Powder, protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 2.5 g, fat 190 mg, energy 390 kJ (92 kcal)/27.8-g sachet, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see Modjul® Flavour System, p. 1021) or tropical flavour (formulation varies slightly), net price 30 × 27.8-g sachets = £469.80. A nutritional supplement for the dietary management of hypermethioninaemia or vitamin B6 non-responsive homocystinuria in patients over 8 years.

**XMET Homidon**® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured (flavouring: see Modjul® Flavour System, p. 1021), net price 500 g = £171.63. 

Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria in children and adults.

**XMET Maxamaid**® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine) 25 g, carbohydrate 5.1 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see Modjul® Flavour System, p. 1021), net price 500 g = £93.59.

Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria.

**XMET Maxamain**® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see Modjul® Flavour System, p. 1021), net price 500 g = £150.02. Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria.

1. Maxamaid products are generally intended for use in children 1–8 years.
2. Maxamain products are generally intended for use in children over 8 years and adults.
Hyperlysinaemia

HYPER LYS Anamix® Infant (SHS)
Powder, protein equivalent (essential and non-essential amino acids except lysine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)
Nutritional supplement for the dietary management of proven hyperlysinaemia in children from birth to 3 years

Isovaleric acidaemia

IVA Anamix® Infant (SHS)
Powder, protein equivalent (essential and non-essential amino acids except leucine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see Modjul® Flavour System, p. 1021), net price 500 g = £93.59
Nutritional supplement for the dietary management of hyperlysinaemia

MSUD Aid III® (SHS)
Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)
Nutritional supplement for the dietary management of proven maple syrup urine disease and related conditions in children and adults where it is necessary to limit the intake of branched chain amino acids

1. Maxamaid products are generally intended for use in children 1–8 years

Isovaleric acidaemia

XLEU Maxamaid® (SHS)
Powder, protein equivalent (essential and non-essential amino acids except leucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see Modjul® Flavour System, p. 1021), net price 500 g = £93.59
Nutritional supplement for the dietary management of isovaleric acidaemia

1. Maxamaid products are generally intended for use in children 1–8 years
Appendix 2: Borderline substances

**MSUD express® 20 (Vitaflor)**
**Powder**, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/34 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see FlavourPac®, p. 1021), net price 30 x 34-g sachets = £410.89
Nutritional supplement for the dietary management of maple syrup urine disease in children over 8 years and adults

**MSUD Gel® (Vitaflor)**
**Powder**, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 10 g, carbohydrate 10.5 g, fat less than 500 mg, energy 339 kJ (81 kcal)/24 g with vitamins, minerals, and trace elements. Unflavoured (flavouring: see FlavourPac®, p. 1021), net price 30 x 24-g sachets = £207.15
Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years

**MSUD Lophlex® LQ 20 (Nutricia Clinical)**
**Liquid**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 20 g, carbohydrate 8.8 g, fat less than 500 mg, energy 339 kJ (81 kcal)/24/mL, with vitamins, minerals, and trace elements. Juicy berries flavour, net price 125 mL = £15.29
Nutritional supplement for the dietary management of maple syrup urine disease in children over 3 years and adults

**1 MSUD Maxamaid® (SHS)**
**Powder**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 25 g, carbohydrate 4.5 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see Modjul® Flavour System, p. 1021), net price 500 g = £93.59
Nutritional supplement for the dietary management of maple syrup urine disease

**2 MSUD Maxamum® (SHS)**
**Powder**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Orange flavour or unflavoured (flavouring: see Modjul® Flavour System, p. 1021), net price 500 g = £150.02
Nutritional supplement for the dietary management of maple syrup urine disease

1. Maxamaid products are generally intended for use in children 1–8 years
2. Maxamum products are generally intended for use in children over 8 years and adults

**Methylmalonic or propionic acidaemia**

**MMA/PA Anamix® Infant (SHS)**
**Powder**, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 13.1 g, carbohydrate 40.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.
Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)
Nutritional supplement for the dietary management of proven methylmalonic acidaemia or propionic acidaemia in children from birth to 3 years

**1 XMTVI Asadon® (SHS)**
**Powder**, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g.
Unflavoured, (flavouring: see Modjul® Flavour System, p. 1021), net price 200 g = £70.91
Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia in children and adults

**2 XMTVI Maxamum® (SHS)**
**Powder**, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see Modjul® Flavour System, p. 1021), net price 500 g = £93.59
Nutritional supplement for the dietary management of methylmalonic acidaemia or propionic acidaemia

**Other inborn errors of metabolism**

**Cystine500® (Vitaflor)**
**Powder**, cystine 500 mg, carbohydrate 3.3 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 x 4-g sachets = £52.03
Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth

**DocOmega® (Vitaflor)**
**Powder**, protein (cows’ milk, soya protein) 100 mg, carbohydrate 3.2 g, fat 500 mg (of which docosahexaenoic acid 200 mg), fibre nil, energy 74 kJ (18 kcal)/4 g, with minerals, net price 30 x 4-g sachets = £37.66
Nutritional supplement for the dietary management of inborn errors of metabolism for adults and children from birth
**BNF 68**  
**A2.7 Nutritional supplements for metabolic diseases**  

---

### EAA® Supplement (Vitaflo)
**Powder**, protein equivalent (essential amino acids)  
5 g, carbohydrate 4 g, fat nil, energy 151 kJ (36 kcal)/12.5 g, with vitamins, minerals, and trace elements. Tropical flavour, net price 50 x 12.5-g sachets = £196.32  
Nutritional supplement for the dietary management of disorders of protein metabolism including urea cycle disorders. Not suitable for children under 3 years

### Isoleucine50® (Vitaflo)
**Powder**, isoleucine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 x 4-g sachets = £52.03  
Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth

### KeyOmega® (Vitaflo)
**Powder**, protein (cows’ milk, soya) 170 mg, carbohydrate 2.8 g, fat 800 mg (of which arachidonic acid 200 mg, docosahexaenoic acid 100 mg), energy 80 kJ (19 kcal)/4 g, net price 30 x 4-g sachets = £38.50  
A nutritional supplement for the dietary management of inborn errors of metabolism

### Leucine100® (Vitaflo)
**Powder**, leucine 100 mg, carbohydrate 3.7 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 x 4-g sachets = £52.03  
Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth

### Low protein drink (Milupa)
**Powder**, protein (cows’ milk) 4.5 g (phenylalanine 100 mg), carbohydrate 59.5 g, fat 29.9 g, fibre nil, energy 2194 kJ (528 kcal)/100 g, with vitamins, minerals, and trace elements. Contains lactose. Net price 400 g = £8.80 (5-g measuring scoop provided)  
Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children over 1 year  
**Note** Termed Milupa® lp-drink by manufacturer

### Phenylalanine50® (Vitaflo)
**Powder**, phenylalanine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 x 4-g sachets = £50.52  
Nutritional supplement for use in the dietary management of inborn errors of metabolism in adults and children from birth

### ProZero® (Vitaflo)
**Liquid**, carbohydrate 8.1 g (of which sugars 3.5 g), fat 3.8 g, energy 278 kJ (66 kcal)/100 mL. Contains lactose. Net price 18 x 250 mL = £22.68; 6 x 1 litre = £30.30  
A protein-free nutritional supplement for the dietary management of inborn errors of metabolism in children over 6 months and adults

### Tyrosine1000® (Vitaflo)
**Powder**, tyrosine 1 g, carbohydrate 2.9 g, fat nil, energy 63 kJ (15 kcal)/A-g sachet, net price 30 x 4-g sachets = £4.77  
Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth

### Valine50® (Vitaflo)
**Powder**, valine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 x 4-g sachets = £52.03  
Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth

---

### Phenylketonuria

#### Add-Ins® (SHS)
**Powder**, protein equivalent (containing essential and non-essential amino acids except phenylalanine)  
10 g, carbohydrate nil, fat 5.1 g, energy 359 kJ (86 kcal)/18.2-g sachet, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see Modjul® Flavour System, p. 1021), net price 60 x 18.2-g sachets = £357.60  
Nutritional supplement for the dietary management of proven phenylketonuria. Not suitable for children under 4 years

### Easiphen® (SHS)
**Liquid**, protein equivalent (containing essential and non-essential amino acids except phenylalanine)  
6.7 g, carbohydrate 5.1 g, fat 2 g, energy 275 kJ (65 kcal)/100 mL with vitamins, minerals, and trace elements. Flavours: berry, orange or unflavoured, net price 30 x 27.8-g sachets = £276.00  
Nutritional supplement for the dietary management of proven phenylketonuria. Not suitable for children under 8 years

### Lophlex® (SHS)
**Powder**, protein equivalent (containing essential and non-essential amino acids except phenylalanine)  
20 g, carbohydrate 2.5 g, fat 60 mg, fibre 220 mg, energy 385 kJ (91 kcal)/27.8-g sachet, with vitamins, minerals, and trace elements. Flavours: berry, orange or unflavoured, net price 30 x 27.8-g sachets = £276.00  
Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years and adults including pregnant women

### Loprofin® PKU Drink (SHS)
**Liquid**, protein (cows’ milk) 400 mg (phenylalanine 10 mg), lactose 9.4 g, fat 2 g, energy 165 kJ (40 kcal)/100 mL. Net price 200-mL carton = 72p.  
Nutritional supplement for the dietary management of phenylketonuria in children over 1 year and adults

### Loprofin® Sno-Pro (SHS)
**Liquid**, protein (cows’ milk) 220 mg (phenylalanine 12.5 mg), carbohydrate 8 g, fat 3.8 g, energy 273 kJ (65 kcal)/100 mL. Contains lactose. Net price 200 mL = £1.19p  
Nutritional supplement for the dietary management of phenylketonuria, chronic renal failure, and other inborn errors of amino acid metabolism

### Milupa PKU 2-prima® (Milupa)
**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 60 g, carbohydrate 10 g, fat nil, energy 1190 kJ (280 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £149.25  
Nutritional supplement for the dietary management of phenylketonuria in children 1–8 years

---

1. Nutritional values vary with flavour—consult product literature
### Milupa PKU 2-secunda® (Milupa)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 70 g, carbohydrate 6.8 g, fat nil, energy 1306 kJ (307 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £174.12

**Nutritional supplement for the dietary management of phenylketonuria in children 9–14 years**

### Milupa PKU 3-advanta® (Milupa)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 70 g, carbohydrate 4.7 g, fat nil, energy 1270 kJ (290 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £174.12

**Nutritional supplement for the dietary management of phenylketonuria in patients 15 years and over**

### Phlexy-Vits® (SHS)

**Capsules**, protein equivalent (essential and non-essential amino acids except phenylalanine) 415 mg/capsule, net price 200-cap pack = £40.55

**Tablets**, protein equivalent (essential and non-essential amino acids except phenylalanine), 833 mg/tablet, net price 75-tab pack = £26.26

**Drink Mix**, powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.33 g, carbohydrate 8.8 g/20-g sachet. Apple-black currant, citrus, or tropical flavour, net price 30 x 20-g sachet = £122.40

**Nutritional supplement for the dietary management of phenylketonuria**

### Phlexy-10® Exchange System (SHS)

**Capsules**, protein equivalent (essential and non-essential amino acids except phenylalanine) 19.15 mg/capsule, net price 750-cap pack = £68.10

**Tablets**, vitamins, minerals, and trace elements, net price 180-tab pack = £77.35

For use as a vitamin and mineral component of restricted therapeutic diets in children 11 years and over and adults with phenylketonuria and similar amino acid abnormalities

### PK Aid-4® (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 79 g, carbohydrate 4.5 g, fat nil, energy 1420 kJ (334 kcal)/100 g. Unflavoured, (flavouring: see Modju® Flavour System, p. 1021), net price 500 g = £136.28 (5-g measuring scoop provided).

**Nutritional supplement for the dietary management of phenylketonuria in children and adults**

### PKU Anamix® Infant (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £33.69 (5-g measuring scoop provided).

**Nutritional supplement for the dietary management of proven phenylketonuria in children from birth to 3 years**

### PKU Anamix® Junior (SHS)

**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.4 g, carbohydrate 9.9 g, fat 3.9 g, energy 455 (108 kcal)/29-g sachet, with vitamins, minerals, and trace elements. Chocolate, pineapple-vanilla. Unflavoured (carbohydrate 11 g, energy 474 kJ (113 kcal)/29-g sachet), net price 30 x 29-g sachets = £120.30

**Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years**

### PKU Anamix® Junior LQ (SHS)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL with vitamins, minerals, and trace elements. Lactose-free. Flavours: Berry, orange, or unflavoured, net price 125-mL carton = £5.55

**Nutritional supplement for the dietary management of phenylketonuria**

### PKU Anamix® Junior LX (SHS)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 7.8 g, energy 386 kJ (92 kcal)/87-mL pouch with vitamins, minerals, and trace elements. Unflavoured (white) or flavoured (orange, purple, or red), net price 30 x 87 mL = £117.90

**Nutritional supplement for the dietary management of phenylketonuria**

### PKU cooler10® (Vitañio)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 2.4 g, energy 517 kJ (124 kcal)/174-mL pouch, with vitamins, minerals, and trace elements. Unflavoured (white) or flavoured (orange, purple, or red), net price 30 x 174 mL = £175.80

**Nutritional supplement for the dietary management of phenylketonuria**

### PKU cooler15® (Vitañio)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 10.2 g, energy 571 kJ (142 kcal)/174-mL pouch, with vitamins, minerals, and trace elements. Unflavoured (white) or flavoured (orange, purple, or red), net price 30 x 174 mL = £236.10

**Nutritional supplement for the dietary management of phenylketonuria**

### PKU express15® (Vitañio)

**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 2.4 g, energy 310 kJ (74 kcal)/25 g, (flavouring: see FlavourPac®), p. 1021), net price 30 x 25-g sachets = £192.81

**Nutritional supplement for the dietary management of phenylketonuria**

Not recommended for children under 3 years
PKU express® (Vitaflor)
**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 3.3 g, energy 389 kJ (93 kcal)/34-g sachet, with vitamins, minerals, and trace elements. Lemon, orange, tropical, or unflavoured (carbohydrate 4.7 g, energy 416 kJ (99 kcal)/34 g), (flavouring: see FlavourPac®, p. 1021), net price 30 × 34-g sachets = £249.10
Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years

PKU gel® (Vitaflor)
**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.9 g, fat less than 100 mg, energy 318 kJ (76 kcal)/24-g sachet, with vitamins, minerals, and trace elements. Orange, raspberry, or unflavoured (carbohydrate 10.3 g, energy 339 kJ (81 kcal)/24 g), (flavouring: see FlavourPac®, p. 1021), net price 30 × 24-g sachets = £133.39
Nutritional supplement for use as part of the low-protein dietary management of phenylketonuria in children 1–10 years

PKU Lophlex® LQ 10 (SHS)
**Liquid**, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 4.4 g, fibre 250 mg, energy 245 kJ (58 kcal)/62.5 mL, with vitamins, minerals, and trace elements. Flavours: berry, citrus, orange, or tropical, net price 62.5-mL carton = £4.93; juicy berries, juicy orange (energy 246 kJ (58 kcal)/62.5 mL), 62.5-mL carton = £4.93
Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women

PKU Lophlex® LQ 20 (SHS)
**Liquid**, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 8.6 g, fibre 340 mg, energy 490 kJ (115 kcal)/125 mL, with vitamins, minerals, and trace elements. Flavours: berry, citrus, orange, or tropical, net price 125-mL carton = £9.84; juicy berries, juicy orange (fibre 500 mg, energy 493 kJ (116 kcal)/125 mL), 125-mL carton = £9.84
Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women

PKU Lophlex® Sensation 20 (SHS)
**Semi-solid**, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 20.2 g, fibre 1 g, energy 706 kJ (166 kcal)/109 g, with vitamins, minerals, and trace elements. Flavours: berry or orange, net price 3 × 109-g pot = £31.44
Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women

PKU squeezie® (Vitaflor)
**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 22.5 g, fat 500 mg, energy 565 kJ (135 kcal)/85 g, with vitamins, minerals, and trace elements. Flavour: apple-banana, net price 30 × 85-g pouch = £127.52
Nutritional supplement for the dietary management of phenylketonuria in children from 6 months to 10 years

PKU Start® (Vitaflor)
**Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 2 g, carbohydrate 8.3 g, fat 2.9 g, energy 286 kJ (68 kcal)/100 mL with vitamins, minerals, and trace elements. Contains lactose and fish oil. Net price 500-mL bottle = £65.53
Nutritional supplement for the dietary management of phenylketonuria in children under 1 year

L-Tyrosine (SHS)
**Powder**, L-tyrosine 20 g, carbohydrate 76.8 g, fat nil, energy 1612 kJ (379 kcal)/100 g, net price 100 g = £20.87
Nutritional supplement for the dietary management of phenylketonuria in pregnant women with low plasma tyrosine concentrations

1XP Maxamum® (SHS)
**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Flavours: orange, unflavoured (flavouring: see Modjul® Flavour System, p. 1021). Net price 500 g = £55.37
Nutritional supplement for the dietary management of phenylketonuria in children 1–8 years

2XP Maxamum® (SHS)
**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Flavours: orange, tropical (flavouring: see Modjul® Flavour System, p. 1021). Net price 30 × 50-g sachets = £256.80, 500 g = £85.63
Nutritional supplement for the dietary management of phenylketonuria in children over 8 years and adults

Tyrosinaemia

Methionine-free TYR Anamix® Infant (SHS)
**Powder**, protein equivalent (essential and non-essential amino acids except methionine, phenylalanine, and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL
Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)
Nutritional supplement for the dietary management of proven tyrosinaemia type 1 in children from birth to 3 years

TYR Anamix® Infant (SHS)
**Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine, and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; *standard dilution* (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL
Unflavoured, net price 400 g = £37.07 (5-g measuring scoop provided)
Nutritional supplement for the dietary management of proven tyrosinaemia where plasma-methionine concentrations are normal in children from birth to 3 years

1. Maxamaid products are generally intended for use in children 1–8 years
2. Maxamum products are generally intended for use in children over 8 years and adults
Appendix 2: Borderline substances

TYR Anamix® Junior (SHS)
Powder, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 8.4 g, carbohydrate 11.1 g, fat 3.9 g, energy 475 kJ (113 kcal)/29-g sachet, with vitamins, minerals, and trace elements. Unflavoured, net price 30 x 29-g sachets = £196.50
Nutritional supplement for the dietary management of proven tyrosinaemia in children 1–10 years

TYR Anamix® Junior LQ (SHS)
Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 500 kJ (119 kcal)/125 mL, with vitamins, minerals, and trace elements. Orange flavour, net price 36 x 125-mL bottle = £272.79
Nutritional supplement for the dietary management of tyrosinaemia type I (when nitisinone (NTBC) is used, see section 9.8.1), type II, and type III, in children over 1 year

TYR express15® (Vitaflor)
Liquid, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 7 g, fat 500 mg, energy 393 kJ (92 kcal)/130 mL, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see FlavourPac®, p. 1021), net price 30 x 130-mL pouch = £288.80
Nutritional supplement for the dietary management of tyrosinaemia in children over 3 years and adults

TYR express15® Junior LQ (Vitaflor)
Powder, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 3.4 g, fat less than 100 mg, energy 310 kJ (74 kcal)/25 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see FlavourPac®, p. 1021), net price 30 x 25-g sachets = £318.03
Nutritional supplement for the dietary management of tyrosinaemia in children over 3 years and adults

TYR express20® (Vitaflor)
Powder, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/34 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see FlavourPac®, p. 1021), net price 30 x 34-g sachets = £410.89
Nutritional supplement for the dietary management of tyrosinaemia. Not recommended for children under 8 years

TYR Gel® (Vitaflor)
Gel, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 10 g, carbohydrate 10.3 g, fat less than 100 mg, energy 359 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see FlavourPac®, p. 1021), net price 30 x 24-g sachets = £204.75
Nutritional supplement for the dietary management of tyrosinaemia in children 1–10 years

TYR Lophlex® LQ 20 (Nutricia Clinical)
Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 20 g, carbohydrate 8.8 g, fat less than 500 mg, fibre 500 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements. Juicy berries flavour, net price 125 mL = £15.29
Nutritional supplement for the dietary management of tyrosinaemia in children over 3 years and adults

XPHEN TYR Maxamaid® (SHS)
Powder, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311kJ (309 kcal)/100 g with vitamins, minerals, and trace elements. Unflavoured (flavouring: see Modjul® Flavour System, p. 1021). Net price 500 g = £177.29
Nutritional supplement for the dietary management of tyrosinaemia in children 1–8 years

XPHEN TYR Tyrosidon® (SHS)
Powder, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured (flavouring: see Modjul® Flavour System, p. 1021). Net price 500 g = £85.82
Nutritional supplement for the dietary management of tyrosinaemia in children and adults where plasma-methionine concentrations are normal

XPTM Tyrosidon® (SHS)
Powder, protein equivalent (essential and non-essential amino acids except phenylalanine, tyrosine, and methionine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured (flavouring: see Modjul® Flavour System, p. 1021). Net price 500 g = £85.82
Nutritional supplement for the dietary management of tyrosinaemia type 1 in children and adults where plasma-methionine concentrations are above normal

Conditions for which ACBS products can be prescribed

Birthmarks  See Disfiguring skin lesions, below

Dermatitis  Aveeno® Bath Oil; Aveeno® Cream; Aveeno® Lotion; E45® Emollient Bath Oil; E45® Emollient Wash Cream; E45® Lotion
For details of preparations see section 13.2.1, p. 781

Dermatitis herpetiformis  See also Gluten-free foods, p. 1022

Disfiguring skin lesions (birthmarks, mutilating lesions, scars, vitiligo)  Covermark® corrective foundation; Dermacolor® camouflage cream and fixing powder; Keromask® masking cream and finishing powder; Veil® cover cream and Finishing Powder. (Cleansing Creams, Cleansing Milks, and Cleansing Lotions are excluded)
For details of preparations see section 13.8.2, p. 814

Disinfectants (antiseptics)  May be prescribed on an FP10 only when ordered in such quantities and with such directions as are appropriate for the treatment of patients, but not for general hygenic purposes.

Dry mouth (xerostomia)  For patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sica syndrome.
AS Saliva Orthana®; Bioxtra®; Glansone®; Salivex®
For details of preparations see section 12.3.5, p. 778

1. Maxamaid products are generally intended for use in children 1–8 years
Eczema  See Dermatitis, above

Photodermatoses (skin protection in)  Anthe-
lia® XL SPF 50+ Melt-in cream; Sunsense® Ultra; Uvistat® Lipscreen SPF 50, Uvistat® Suncream SPF 30 and 50.

For details of preparations see section 13.8.1, p. 812

Pruritus  See Dermatitis, above
Appendix 3: Cautionary and advisory labels

**Scope of labels**

In general no label recommendations have been made for injections on the assumption that they will be administered by a healthcare professional or a well-instructed patient. The labelling is not exhaustive and pharmacists are recommended to use their professional discretion in labelling new preparations and those for which no labels are shown.

Individual labelling advice is not given on the administration of reconstituted liquid preparations, while ‘Keep out of the reach of children’ is a legal requirement on external preparations. Care should be taken not to obscure other relevant information with adhesive labelling.

It is the usual practice for patients to take standard tablets with water or other liquid and for this reason no separate label has been recommended. The label wordings recommended by the BNF apply to medicines dispensed against a prescription. Patients should be aware that a dispensed medicine should never be taken by, or shared with, anyone other than for whom the prescriber intended it. Therefore, the BNF does not include warnings against the use of a dispensed medicine by persons other than for whom it was specifically prescribed.

The label or labels for each preparation are recommended after careful consideration of the information available. However, it is recognised that in some cases this information may be either incomplete or open to a different interpretation. The BNF will therefore be grateful to receive any constructive comments on the labelling suggested for any preparation.

**Recommended label wordings**

For BNF 61 (March 2011), a revised set of cautionary and advisory labels were introduced. All of the existing labels were user-tested, and the revised wording selected reflects terminology that is better understood by patients.

Wordings which can be given as separate warnings are labels 1–19, 29–30, and 32. Wordings which can be incorporated in an appropriate position in the directions for dosage or administration are labels 21–28. A label has been omitted for number 20; labels 31 and 33 no longer apply to any medicines in the BNF and have therefore been deleted.

If separate labels are used it is recommended that the wordings be used without modification. If changes are made to suit computer requirements, care should be taken to retain the sense of the original.

---

1 **Warning: This medicine may make you sleepy**

To be used on preparations for children containing antihistamines, or other preparations given to children where the warnings of label 2 on driving or alcohol would not be appropriate.
2 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol.

To be used on preparations for adults that can cause drowsiness, thereby affecting coordination and the ability to drive and operate hazardous machinery, label 1 is more appropriate for children. It is an offence to drive while under the influence of drink or drugs.

Some of these preparations only cause drowsiness in the first few days of treatment and some only cause drowsiness in higher doses.

In such cases the patient should be told that the advice applies until the effects have worn off. However many of these preparations can produce a slowing of reaction time and a loss of mental concentration that can have the same effects as drowsiness.

Avoidance of alcoholic drink is recommended because the effects of CNS depressants are enhanced by alcohol. Strict prohibition however could lead to some patients not taking the medicine. Pharmacists should therefore explain the risk and encourage compliance, particularly in patients who may think they already tolerate the effects of alcohol (see also label 3). Queries from patients with epilepsy regarding fitness to drive should be referred back to the patient’s doctor.

Side-effects unrelated to drowsiness that may affect a patient’s ability to drive or operate machinery safely include blurred vision, dizziness, or nausae. In general, no label has been recommended to cover these cases, but the patient should be suitably counselled.

3 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines.

To be used on preparations containing monoamine-oxidase inhibitors; the warning to avoid alcohol and dealkoholised (low alcohol) drink is covered by the patient information leaflet. Also to be used as for label 2 but where alcohol is not an issue.

4 Warning: Do not drink alcohol.

To be used on preparations where a reaction such as flushing may occur if alcohol is taken (e.g. metronidazole). Alcohol may also enhance the hypoglycaemia produced by some oral antidiabetic drugs but routine application of a warning label is not considered necessary.

Patients should be advised not to drink alcohol for as long as they are receiving/using a course of medication, and in some cases for a period of time after the course is finished.

5 Do not take indigestion remedies 2 hours before or after you take this medicine.

To be used with label 25 on preparations coated to resist gastric acid (e.g. enteric-coated tablets). This is to avoid the possibility of premature dissolution of the coating in the presence of an alkaline pH.

Label 5 also applies to drugs such as gabapentin where the absorption is significantly affected by antacids. Pharmacists will be aware (from a knowledge of physiology) that the usual time during which indigestion remedies should be avoided is at least 2 hours before and after the majority of medicines have been taken, when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

6 Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine.

To be used on preparations containing olsalazine and some other quinolones, doxycycline, lymecycline, minocycline, and penicillinam. These drugs chelate calcium, iron, and zinc and are less well absorbed when taken with calcium-containing antacids or preparations containing iron or zinc. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

7 Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine.

To be used on preparations containing ciprofloxacin, norfloxacin, or tetracyclines that chelate calcium, iron, magnesium, and zinc, and are thus less available for absorption. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient. Doxycycline, lymecycline, and minocycline are less liable to form chelates and therefore only require label 6 (see above).

8 Warning: Do not stop taking this medicine unless your doctor tells you to stop.

To be used on preparations that contain a drug which is required to be taken over long periods without the patient necessarily perceiving any benefit (e.g. antituberculous drugs).

Also to be used on preparations that contain a drug whose withdrawal is likely to be a particular hazard (e.g. clonidine for hypertension). Label 10 (see below) is more appropriate for corticosteroids.

9 Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop.

To be used on preparations where a course of treatment should be completed to reduce the incidence of relapse or failure of treatment. The preparations are antimicrobial drugs given by mouth. Very occasionally, some may have severe side-effects (e.g. diarrhoea in patients receiving clindamycin) and in such cases the patient may need to be advised of reasons for stopping treatment quickly and returning to the doctor.

10 Warning: Read the additional information given with this medicine.

To be used particularly on preparations containing anticoagulants, lithium, and oral corticosteroids. The appropriate treatment card should be given to the patient and any necessary explanations given.

This label may also be used on other preparations to remind the patient of the instructions that have been given.

11 Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds.

To be used on preparations that may cause photosensitive or phototoxic reactions if the patient is exposed to ultraviolet radiation. Many drugs other than those listed in Appendix 3 (e.g. phenothiazines and sulfonamides) may, on rare occasions, cause reactions in susceptible patients. Exposure to high intensity ultraviolet radiation from sun-ray lamps and sunbeds is particularly likely to cause reactions.

12 Do not take anything containing aspirin while taking this medicine.

To be used on preparations containing probenecid and sulfipyrazone, whose activity is reduced by aspirin. Label 12 should not be used for anticoagulants since label 10 is more appropriate.

13 Dissolve or mix with water before taking.

To be used on preparations that are intended to be dissolved in water (e.g. soluble tablets) or mixed with water (e.g. powders, granules) before use. In a few cases other liquids such as fruit juice or milk may be used.

14 This medicine may colour your urine. This is harmless.

To be used on preparations that may cause the patient’s urine to turn a unusual colour. These include triamterene (blue under some lights), levodopa (dark reddish), and rifampicin (red).

15 Caution: flammable. Keep your body away from fire or flames after you have put on the medicine.

To be used on preparations containing sufficient flammable solvent to render them flammable if exposed to a naked flame.

16 Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening.

To be used on glyceryl trinitrate tablets to remind the patient not to transfer the tablets to plastic or less suitable containers.

17 Do not take more than . . . in 24 hours.

To be used on preparations for the treatment of acute migraine except those containing ergotamine, for which label 18 is used. The dose form should be specified, e.g.
Appendix 3: Cautionary and advisory labels

18 Do not take more than . . . in 24 hours. Also, do not take more than . . . in any one week
To be used on preparations containing ergotamine. The dose form should be specified, e.g. tablets or suppositories.

19 Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol.
To be used on preparations containing hypnotics (or some other drugs with sedative effects) prescribed to be taken at night. On the rare occasions when hypnotics are prescribed for daytime administration (e.g. nitrazepam in epilepsy), this label would clearly not be appropriate. Also to be used as an alternative to the label 2 wording (the choice being at the discretion of the pharmacist) for anxieties prescribed to be taken at night.

It is hoped that this wording will convey adequately the problem of residual morning sedation after taking ‘sleeping tablets’.

21 Take with or just after food, or a meal
To be used on preparations that are liable to cause gastric irritation, or those that are better absorbed with food.
Patients should be advised that a small amount of food is sufficient.

22 Take 30 to 60 minutes before food
To be used on some preparations whose absorption is thereby improved.
Most oral antibacterials require label 23 instead (see below).

23 Take this medicine when your stomach is empty.
This means an hour before food or 2 hours after food.
To be used on oral antibacterials whose absorption may be reduced by the presence of food and acid in the stomach.

24 Suck or chew this medicine
To be used on preparations that should be sucked or chewed. The pharmacist should use discretion as to which of these words is appropriate.

25 Swallow this medicine whole. Do not chew or crush
To be used on preparations that are enteric-coated or designed for modified-release.

Also to be used on preparations that taste very unpleasant or may damage the mouth if not swallowed whole.
Patients should be advised (where relevant) that some modified-release preparations can be broken in half, but that the halved tablet should still be swallowed whole, and not chewed or crushed.

26 Dissolve this medicine under your tongue
To be used on preparations designed for sublingual use.
Patients should be advised to hold under the tongue and avoid swallowing until dissolved. The buccal mucosa between the gum and cheek is occasionally specified by the prescriber.

27 Take with a full glass of water
To be used on preparations that should be well diluted (e.g. chloral hydrate), where a high fluid intake is required (e.g. sulfonamides), or where water is required to aid the action (e.g. methylcellulose). The patient should be advised that ‘a full glass’ means at least 150 mL. In most cases fruit juice, tea, or coffee may be used.

28 Spread thinly on the affected skin only
To be used on external preparations that should be applied sparingly (e.g. corticosteroids, dithranol).

29 Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
To be used on containers of dispersed solid dose preparations containing paracetamol for adults when the instruction on the label indicates that the dose can be taken on an ‘as required’ basis. The dose form should be specified, e.g. tablets or capsules.

This label has been introduced because of the serious consequences of overdosage with paracetamol.

30 Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine.
Talk to a doctor at once if you take too much of this medicine, even if you feel well.
To be used on all containers of dispersed preparations containing paracetamol.

32 Contains aspirin. Do not take anything else containing aspirin while taking this medicine.
To be used on containers of dispersed preparations containing aspirin where the name on the label does not include the word ‘aspirin’.

Co-careldopa intestinal gel, 10, 14, (urine red), 25, C, driving, see BNF
Co-careldopa m/r, 10, 14, (urine red), 25, C, driving, see BNF
Co-codamol, see preps
Co-codaprin dispersible tabs, 13, 21, 32
Co-danthismer, 14, (urine red)
Co-danthismer, 14, (urine red)
Diclofenac sodium spray, C, photosensitivity, see BNF
Dicyclomax 75 mg SR and Retard, 21, 25
Didanosine e/c caps, 25, C, administration
Didanosine tabs, 23, C, administration
Didronel, C, food and calcium, see BNF
Differin, 11
Diflucan 50 and 200 mg, 9
Diflucan susp, 9
Diducate external preps, 28, C, application, see BNF
Dihydrocodeine m/r, 2, 25
Dihydrocodeine, 2
Digoxin elixir, C, posture, see BNF
Diltiazem, 25
Dilcardia SR
Dihydrocodeine m/r, 25
Dipyridamole, 22
Diprosone
Diprosalic
Dipentum
Dioderm
Dimethyl fumarate, 21, 25
Diltiazem, 25
Dilcardia SR
Dihydrocodeine m/r, 2, 25
Dipyridamole, 22
Diprosone
Diprosalic
Dipentum
Dioderm
Dimethyl fumarate, 21, 25
Diltiazem, 25
Dilcardia SR
Dihydrocodeine m/r, 2, 25
Dipyridamole, 22
Diprosone
Diprosalic
Dipentum
Dioderm
Dimethyl fumarate, 21, 25
Diltiazem, 25
Etanercept, 10, Alert card, C, tuberculosis, blood disorders, see BNF
Ethambutol, 8
Ethibide XL, 25
Ethosuximide, 8, C, blood disorder symptoms, driving, see BNF
Etidronate disodium, C, food and calcium, see BNF
Etdoloc m/r, 25
Etonogestrel implant, C, see patient information leaflet
Etoposide caps, 23
Etravitine, 21, C, rash and hypersensitivity reactions
Etrivex, 28, C, application, see BNF
Eucerin, 21
Eumovate external preps, 28, C, application, see BNF
Eurartesim
Eumovate external preps, 28, C, application, see BNF
Evorel preps
Eviplera
Everolimus, 25, C, pneumonitis, see BNF
Eurartesim
Eumovate external preps, 28, C, administration, see BNF
Exenatide, 10, C, administration, see BNF
Exemestane, 21
Exjade
Exenatide, 10, C, administration, see BNF

Appendix 3: Cautionary and advisory labels for dispensed medicines

Appendix 3: Cautionary and advisory labels

Metronidazole mixt, 4, 9
Metronidazole supps, 4, 9
Metronidazole tabs, 4, 9, 21, 25, 27
Metyrapone, 21, C, driving
Mexitil, 21, 25, C, blood disorder symptoms, see BNF
Mianserin, 2, 25
Minicortin
Minocin MR
Minocycline m/r, 6, 25
Minocycline, 6, 9, C, posture, see BNF
Mirtazapine tabs, 2, 25
Mirtazapine orodispersible tablets, 2, C, administration, see BNF
Mivacron
Mizolastine, 2, C, administration
Mizolastine, 2, C, nasal decongestants, see BNF
Moxifloxacin, 6, 9, C, driving
Moxonidine, 3
MST Continus caps, 2, 13
MST Continus tabs, 2, 25
Multaq, 21, C, hepatic disorders, heart failure, see BNF
Mux, 2, C, administration, see BNF
Mycobutin, 2, 14, (urine orange-red), C, soft lenses
Myeloidosis, 25
Myelofascin, 11, C, blood disorder symptoms, see BNF
Mytoprine Chloride, 22
Nabilone, 2, C, behavioural effects, see BNF
Nabumetone, 21
Nabumetone tabs, 21
Nadolol, 8
Nafarelin spray, 10, patient information leaflet, C, nasal decongestants, see BNF
Nalidixic acid, 9, 11
Namefene, 25
Napratec, 21
Naprosyn EC, 5, 25
Naprosyn tabs, 21
Naproxen e/c, 5, 25
Naproxen tabs, 21
Naramig, 3
Naratriptan, 3
Nardil, 3, 10, patient information leaflet
Nategic D3, 24
NatriX SR, 25
Navelbine caps, 21, 25
Nebilet, 8
NebivoloL, 8
Nedocromil sodium inhalation, 8, C, administration
Nefopam, 2, 14, (urine pink)
Necolanta, C, driving
Neoral, 25
Neotigason, 10, patient information leaflet, 11, 21
Nerisone, 28, C, application, see BNF
Nerisone Forte, 28, application, see BNF
Neflin, 2
Neupro, 10, C, driving
NeuroBloc, C, side-effects, see BNF
Neurontin, 3, 5, 8, C, driving, see BNF
Nevirapine, C, hypersensitivity reactions
Nevirapine m/r, 25, C, hypersensitivity reactions
Nexavar, 23
Nexium granules, 25, C, administration
Nexium tabs, C, administration
Niaspan, 21, 25
Nicardipine m/r, 25
Nicorette gum, C, administration, see BNF
Nicorette Inhalator, C, administration, see BNF
Nicorette Lozenges, C, administration, see BNF
Nicorette Microtab, 26, C, administration, see BNF
Nicorette nasal spray, C, administration, see BNF
Nicorette patches, C, administration, see BNF
Nicorette Quickmist oral spray, C, administration, see BNF
Nicotine (inhaled), C, administration, see BNF
Nicotine (lozenges), C, administration, see BNF
Nicotine (patches), C, administration, see BNF
Nicotine (sublingual), 26, C, administration, see BNF
Nicotinell gum, C, administration, see BNF
Nicotinell lozenges, C, administration, see BNF
Nicotinell patches, C, administration, see BNF
Nicotinell tablets, C, administration, see BNF
Nifedipine m/r, see preps
Nifedipress MR, 25
Niferex elixir, C, infants, use of dropper
Nilotinib, 23, 25, 27
Nipatra chewable tabs, 24
Niqutin gum, C, administration, see BNF
Niqutin lozenges, C, administration, see BNF
Niqutin patches, C, administration, see BNF
Nicotinic acid m/r, see preps
Nifuress press MR, 25
Nijerex elixir, C, infants, use of dropper
Nitrofurantoin, 9, 14, (urine yellow or brown), 21
Nitrofurantoin m/r, 9, 14, (urine yellow or brown), 21, 25

Appendix 3: Cautionary and advisory labels
Nivaquine, 5, C, malaria prophylaxis, see BNF
Nootropil, 3
Norfloxacin, 7, 9, 23, C, driving
Normacol preps, 25, 27, C, administration, see BNF
Normax, 14, (urine red)
Norpraloc, 10, 21, C, driving, see BNF
Nortriptyline, 2
Norvir oral solution, 3, 8, C, driving, see BNF
Nudil, 21, 25
NU-SEALS Aspirin, 21, 25
Nutrizym 22, C, administration
Omeprazole tabs, 25
Omacor
Olsalazine, 21, C, blood disorder symptoms, see BNF
Olbe tam
Olanzapine orodispersible tabs, 21, 25
Oestrogel
Octim
Octasa, 25, C, blood disorder symptoms, see BNF
Octin, C, fluid intake, see BNF
Odestrogel, C, administration, see BNF
Oflloxacin, 6, 9, 11, C, driving
Olanzapine orodispersible tabs, 2, C, administration, see BNF
Olanzapine orodispersible film, see BNF
Olanzapine orodispersible film, see BNF
Omeprazole tabs, 2
Olibetam, 21
Olsalazine, 21, C, blood disorder symptoms, see BNF
Omacor, 21
Omega-3-acid ethyl esters, 21
Omeprazole caps, C, administration, see BNF
Omeprazole tabs, 25
Onbrez Breezhaler, C, administration
Ondansetron oral lyophilisates, C, administration, see BNF
Ondansetron orodispersible film, C, administration, see BNF
Opilin, 21
Opsumont, C, hepatotoxicity, patient card, see BNF
Oramorph preps, 2
Oramorph SR, 2, 25
Orop, 2
Orphenadrine, C, driving
Oridis caps, 21
OraVail caps, 21, 25
OraVail gel, C, photosensitivity, see BNF
Oseltamivir, 9
OsmoPrep, 10, patient information leaflet, C, administration
Appendix 3: Cautionary and advisory labels for dispensed medicines BNF 68

Podophyllin paint cdp, 15, C, application, see BNF
Pomalidomide, 3, 25, C, pregnancy and contraception, symptoms of thromboembolism, neutropenia, and thrombocytopenia, see BNF
Ponatinib, 3, 25
Ponstan, 21
Posaconazole susp, 3, 9, 21
Posaconazole e/c, 3, 9, 25
Potaba caps, 21
Potaba Enules, 13, 21
Potassium chloride m/r, see BNF
Potassium citrate mixt, 27
Potassium chloride m/r, see BNF
Prazosin, C, initial dose, driving, see BNF
Pravastatin, C, muscle effects, see BNF
Prezista
Prestylon
Prestim
Preservex
Pregabalin
Prednisolone tabs, 10, steroid card
Prednisolone soluble, 10, steroid card
Prednisolone e/c, 3, 9, 25
Prednisolone m/r, 2, 10, 25, C, with meals, avoid other drugs at the same time, see BNF
Prednizolone, 3, 21, 25
Prednisolone preps
Prednisone m/r, 2, 10, steroid card
Prednisolone inj, 10, steroid card
Prednisolone m/r, 10, steroid card, 21, 25
Prednisolone soluble, 10, steroid card, 13, 21
Prednisolone tabs, 10, steroid card, 21
Pregabalin, 3, 8, C, driving
Preservex, 21
Prestim, 8
Prestylons, 21
Prezista, 21, C, missed dose, see BNF
Priadel liq, 10, lithium card, C, driving, fluid and salt intake, toxicity symptoms, see BNF
Priadel tabs, 10, lithium card, 25, C, driving, fluid and salt intake, toxicity symptoms, see BNF
Priligy, 2, 25, C, postural hypotension, see BNF
Primidone, 2, 8, C, driving, see BNF
Pro-Banthine, 23
Probenedicid, 12, 21, 27
Procainamide, 4
Procainamide, 2
Procainamide buccal tabs, 2, C, administration, see BNF
Procyclidine, C, driving
Progesterone (micronised), C, administration, see BNF
Prograf, 23, C, driving, see BNF
Progynil, 21, C, malaria prophylaxis, see BNF
Proglycine T5 preps, C, administration, see BNF
Promazine, 2
Promethazine, 2
Propafenone, 21, 25, C, driving
Propantheline, 23
Propiverine hydrochloride, 3
Propiverine hydrochloride m/r, 3, 25
Propranolol m/r, 8, 25
Propranolol oral solution and tabs, 8
Protoni, 5, 13, C, administration, see BNF
Prothiaden, 2
Protopic, 4, 11, 28
Prozac, C, driving, see BNF
Psorin, 21
Pulmicort, 8, C, administration; with high doses, 10, steroid card
Pulmicort Resuples, 8, 10, steroid card, C, dose
Pulvinal Salbutamol, C, administration
Pyrazinamide, 8
Quesan preps, 13, C, avoid other drugs at same time, see BNF
Quetiapine, 2
Quetiapine m/r, 2, 23, 25
Quinagolide, 10, 21, C, driving, see BNF
Qvar preps, 8, 10, C, administration; with high doses, 10, steroid card
Rabeprazole, 25
Racecadotril gran, C, administration
Raltegravir chewable, 24
Raltegravir tabs, 25
Ranexa, 25, patient alert card
Ranitidine effervescent tabs, 13
Ranolazine, 25, patient alert card
Rapamune, C, administration
Rasilaz, 21
Rebetol, 21
Recivil, 2, 26, C, administration, see BNF
Reboxetine, C, driving
Regorafenib, 21, C, administration, see BNF
Regulan, 13, C, administration, see BNF
Regurin, 23
Regurin XL, 23, 25
Relifex, 21
Relifex susp, 21
Relox, 3
Relvar Ellipta, 8, C, administration, 10, steroid card
Remedeine, 2, 29, 30
Remicade, 10, Alert card, C, tuberculosis, blood disorders, and hypersensitivity reactions
Reminf, 3, 21
Remiryn XL, 3, 21, 25
Renacet, 25, C, with meals, avoid other drugs at the same time, see BNF
Renagel, 25, C, with meals
Renvela sachets, 13, C, with meals
Renvela tabs, 25, C, with meals
Repinex XL, 10, 25, C, driving, see BNF
Requip, 10, 21, C, driving, see BNF
Requip XL, 10, 25, C, driving, see BNF
Resonium A, 13
Restandol, 21, 25
Retapamulin, 28
Retigabine, 8, 14, 25 C, driving, see BNF
Retovir oral solution, C, use of oral syringe
Rivastigmine oral solution, C, use of oral syringe
Rivastigmine oral solution, C, use of oral syringe
Rilpivirine, 21, 25, C, antacids
Rilutek
Ritonavir oral solution, 21, C, blood disorders, driving, see BNF
Rivastigmine caps, and syrup, 8, 14, (urine orange-red), 22, C, soft lenses
Rilampicin caps and syrup, 8, 14, (urine orange-red), 22, C, soft lenses
Rifabutin, 8, 14, (urine orange-red), 22, C, soft lenses
Rifampicin caps, and syrup, 8, 14, (urine orange-red), 22, C, soft lenses
Rifater, 8, 14, (urine orange-red), 22, C, soft lenses
Rifaximin, see individual preparations
Rifinah, 8, 14, (urine orange-red), 22, C, soft lenses
Rilutek, C, blood disorders, driving
Rilpirvivir, 21, 25, C, antacids
Rimactane, 8, 14, (urine orange-red), 22, C, soft lenses
Risedronate sodium, C, administration, food and calcium, see BNF
Risperidone orodispersible tabs, 2, C, administration, see BNF
Risperidone orodispersible tabs, 2, C, administration, see BNF
Risperidone liquid, 2, C, use of dose syringe
Risperidone orodispersible tabs, 2, C, administration, see BNF
Risperidone orodispersible tabs, 2, C, administration, see BNF
Ritonavir oral solution, 21, C, administration, see BNF
Ritonavir tabs, 21, 25
Rivastigmine caps, 21, 25
Rivastigmine oral solution, 21, C, administration, see BNF

Intravenous additives

Intravenous additives policies  A local policy on the addition of drugs to intravenous fluids should be drawn up by a multi-disciplinary team in each Strategic Health Authority (or equivalent) and issued as a document to the members of staff concerned.

Centralised additive services are provided in a number of hospital pharmacy departments and should be used in preference to making additions on wards.

The information that follows should be read in conjunction with local policy documents.

Guidelines

1. Drugs should only be added to infusion containers when constant plasma concentrations are needed or when the administration of a more concentrated solution would be harmful.
2. In general, only one drug should be added to any infusion container and the components should be compatible. Ready-prepared solutions should be used whenever possible. Drugs should not normally be added to blood products, mannitol, or sodium bicarbonate. Only specially formulated additives should be used with fat emulsions or amino-acid solutions (section 9.3).
3. Solutions should be thoroughly mixed by shaking and checked for absence of particulate matter before use.
4. Strict asepsis should be maintained throughout and in general the giving set should not be used for more than 24 hours (for drug admixtures).
5. The infusion container should be labelled with the patient’s name, the name and quantity of additives, and the date and time of addition (and the new expiry date or time). Such additional labelling should not interfere with information on the manufacturer’s label that is still valid. When possible, containers should be retained for a period after use in case they are needed for investigation.
6. It is good practice to examine intravenous infusions from time to time while they are running. If cloudiness, crystallisation, change of colour, or any other sign of interaction or contamination is observed the infusion should be discontinued.

Problems

Microbial contamination  The accidental entry and subsequent growth of micro-organisms converts the infusion fluid pathway into a potential vehicle for the introduction of micro-organisms. Ready-prepared infusions containing the additional drugs, or infusions prepared by an additive service (when available) should therefore be used in preference to making extemporaneous additions to infusion containers on wards etc. However, when this is necessary strict aseptic procedure should be followed.

Incompatibility  Physical and chemical incompatibilities may occur with loss of potency, increase in toxicity, or other adverse effect. The solutions may become opalescent or precipitation may occur, but in many instances there is no visual indication of incompatibility. Interaction may take place at any point in the infusion fluid pathway, and the potential for incompatibility is increased when more than one substance is added to the infusion fluid.

Common incompatibilities  Precipitation reactions are numerous and varied and may occur as a result of pH, concentration changes, ‘salting-out’ effects, complexation or other chemical changes. Precipitation or other particle formation must be avoided since, apart from lack of control of dosage on administration, it may initiate or exacerbate adverse effects. This is particularly important in the case of drugs which have been implicated in thrombophlebitis. Other thrombophlebitis (e.g. dextran) or in skin sloughing or necrosis caused by extravasation (e.g. sodium bicarbonate and certain cytotoxic drugs). It is also especially important to effect solution of colloidal drugs and to prevent their subsequent precipitation in order to avoid a pyrogenic reaction (e.g. amphotericin).

A number of preparations undergo significant loss of potency when added singly or in combination to large volume infusions. Examples include ampicillin in infusions that contain glucose or lactates. The breakdown products of dacarbazine have been implicated in adverse effects.

Blood  Because of the large number of incompatibilities, drugs should not normally be added to blood and blood products for infusion purposes. Examples of incompatibility with blood include hypertonic mannitol solutions (irreversible crenation of red cells), dextran solutions (rouleaux formation and interference with cross-matching), glucose (clumping of red cells), and oxytocin (inactivated).

If the giving set is not changed after the administration of blood, but used for other infusion fluids, a fibrin clot may form which, apart from blocking the set, increases the likelihood of microbial growth.

Intravenous fat emulsions  These may break down with coalescence of fat globules and separation of phases when additions such as antibacterials or electrolytes are made, thus increasing the possibility of embolism. Only specially formulated products such as Vitlipid N® (section 9.3) may be added to appropriate intravenous fat emulsions.

Other infusions  Infusions that frequently give rise to incompatibility include amino acids, mannitol, and sodium bicarbonate.

Bactericides  Bactericides such as chlorocresol 0.1% or phenylmercuric nitrate 0.001% are present in some injection solutions. The total volume of such solutions...
Intravenous additives

Appendix 4: Intravenous additives

**Method**

Ready-prepared infusions should be used whenever available. Potassium chloride is usually available in concentrations of 20, 27, and 40 mmol/litre in sodium chloride intravenous infusion (0.9%), glucose intravenous infusion (5%) or sodium chloride and glucose intravenous infusion. Lidocaine hydrochloride is usually available in concentrations of 0.1 or 0.2% in glucose intravenous infusion (5%).

When addition is required to be made extemporaneously, any product reconstitution instructions such as those relating to concentration, vehicle, mixing, and handling precautions should be strictly followed using an aseptic technique throughout. Once the product has been reconstituted, addition to the infusion fluid should be made immediately in order to minimise microbial contamination and, with certain products, to prevent degradation or other formulation change which may occur; e.g. reconstituted ampicillin injection degrades rapidly on standing, and also may form polymers which could cause sensitivity reactions.

It is also important in certain instances that an infusion fluid of specific pH be used (e.g. furosemide injection requires dilution in infusions of pH greater than 5.5).

When drug additions are made it is important to mix thoroughly; additions should not be made to an infusion container that has been connected to a giving set, as mixing is hampered. If the solutions are not thoroughly mixed a concentrated layer of the additive may form owing to differences in density. Potassium chloride is particularly prone to this 'layering' effect when added without adequate mixing to infusions packed in non-rigid infusion containers; if such a mixture is administered it may have a serious effect on the heart.

A time limit between addition and completion of administration must be imposed for certain admixtures to guarantee satisfactory drug potency and compatibility. For admixtures in which degradation occurs without the formation of toxic substances, an acceptable limit is the time taken for 10% decomposition of the drug. When toxic substances are produced stricter limits may be imposed. Because of the risk of microbial contamination a maximum time limit of 24 hours may be appropriate for additions made elsewhere than in hospital pharmacies offering central admixture service.

Certain injections must be protected from light during continuous infusion to minimise oxidation, e.g. dacarbazine and sodium nitroprusside.

Dilution with a small volume of an appropriate vehicle and administration using a motorised infusion pump is advocated for preparations such as unfractionated heparin where strict control over administration is required. In this case the appropriate dose may be dissolved in a small volume of infusion over a short period of time, e.g. 100 mL in 30 minutes. The method is used if the product is incompatible or unstable over the period necessary for continuous infusion; the limited stability of ampicillin or amoxicillin in large volume glucose or lactate infusions may be overcome in this way.

Intermittent infusion is also used if adequate plasma and tissue concentrations are not produced by continuous infusion because of stability problems and because adequate plasma and tissue concentrations are best obtained by intermittent infusion. Where it is necessary to administer them by continuous infusion, detailed literature should be consulted.

Drugs that are both compatible and clinically suitable may be given by intermittent infusion in a relatively small volume of infusion over a short period of time, e.g. 100 mL in 30 minutes. The method is used if the product is incompatible or unstable over the period necessary for continuous infusion; the limited stability of ampicillin or amoxicillin in large volume glucose or lactate infusions may be overcome in this way.

**Use of table**

The table lists preparations given by three methods:

- continuous infusion;
- intermittent infusion;
- addition via the drip tubing.

**Drugs for continuous infusion** must be diluted in a large volume infusion. Penicillins and cephalosporins are not usually given by continuous infusion because of stability problems and because adequate plasma and tissue concentrations are best obtained by intermittent infusion. Where it is necessary to administer them by continuous infusion, detailed literature should be consulted.

**Addition via the drip tubing** is indicated for a number of cytotoxic drugs in order to minimise extravasation. The preparation is added aseptically via the rubber septum of the injection site of a fast-running infusion. In general, drug preparations intended for a bolus effect should be given directly into a separate vein where possible. Failing this, administration may be made via the drip tubing provided that the preparation is compatible with the infusion fluid when given in this manner.

**Table of drugs given by intravenous infusion**

Covers addition to Glucose intravenous infusion 5 and 10%, and Sodium chloride intravenous infusion 0.9%. Compatibility with glucose 5% and with sodium chloride 0.9% indicates compatibility with Sodium chloride and glucose intravenous infusion. Infusion of a large volume of hypotonic solution should be avoided therefore care should be taken if water for injections is used. The information in the Table relates to the proprietary preparations indicated; for other preparations suitability should be checked with the manufacturer.

**Abatacept (Orencia®)**

Intermittent in Sodium chloride 0.9%

Reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided; dilute requisite dose in infusion fluid to 100 mL (using the same silicone-free syringe); give over 30 minutes through a low protein-binding filter (pore size 0.2–1.2 micron)

**Abciximab (ReoPro®)**

Continuous in Glucose 5% or Sodium chloride 0.9%

Dilute requisite dose in infusion fluid and give via infusion pump; filter upon dilution with infusion fluid through a non-pyrogenic low protein-binding 0.2, 0.22, or 5 micron filter or upon administration through an in-line non-pyrogenic low protein-binding 0.2 or 0.22 micron filter
Acetylcysteine (Parvolex®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Glucose 5% is preferable—see Emergency Treatment of Poisoning

Aciclovir (as sodium salt) (Zovirax IV®, Aciclovir IV, Hospira; Aciclovir IV, Genus; Aciclovir Sodium, Zurich)
Intermittent in Sodium chloride 0.9% or Sodium chloride and glucose
For Zovirax IV®, Aciclovir IV (Genus) initially reconstitute to 25 mg/mL in water for injections or sodium chloride 0.9%; then dilute to not more than 5 mg/mL with the infusion fluid; to be given over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and given over 1 hour; for Aciclovir IV (Hospira) dilute to not more than 5 mg/mL with infusion fluid; give over 1 hour

Agalsidase alfa (Replagal®)
Intermittent in Sodium chloride 0.9%
Dilute requisite dose with 100 mL infusion fluid and give over 40 minutes using an in-line filter; use within 3 hours of dilution

Agalsidase beta (Fabrazyme®)
Intermittent in Sodium chloride 0.9%
Reconstitute with water for injections (35 mg in 7.2 mL, 5 mg in 1.1 mL) to produce a solution containing 5 mg/mL; dilute with infusion fluid (for doses less than 35 mg dilute with at least 50 mL; doses 35–70 mg dilute with at least 100 mL; doses 70–100 mg dilute with at least 250 mL; doses greater than 100 mg dilute with 500 mL) and give through an in-line low protein-binding 0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established

Alfentanil (as hydrochloride) (Rapifen®)
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%

Alguclosidase alfa (Myozyme®)
Intermittent in Sodium chloride 0.9%
Reconstitute 50 mg with 10.3 mL water for injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with infusion fluid to give a final concentration of 0.5–4 mg/mL; give through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour

Alteplase (Actilyse®)
Continuous or intermittent in Sodium chloride 0.9%
Dissolve in water for injections to a concentration of 1 mg/mL or 2 mg/mL and infuse intravenously; alternatively dilute the solution further in the infusion fluid to a concentration of not less than 200 micrograms/mL, not to be infused in glucose solution

Amifostine (Ethyl®)
Intermittent in Sodium chloride 0.9%
Reconstitute 500-mg vial with 9.7 mL sodium chloride 0.9% to produce a 50 mg/mL solution

Amikacin sulfate (Amikin®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
To be given over 30 minutes

Aminophylline Continuous in Glucose 5% or Sodium chloride 0.9%

Amiodarone hydrochloride (Cordarone X®)
Continuous or intermittent in Glucose 5%
Suggested initial infusion volume 250 mL given over 20–120 minutes; for repeat infusions up to 1.2 g in max. 500 mL; infusion in extreme emergency see section 2.7.3; should not be diluted to less than 600 micrograms/mL; incompatible with sodium chloride infusion, avoid equipment containing the plasticizer di-2-ethylhexylphthalate (DEHP)

Amoxicillin (as sodium salt) (Amoxil®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes via drip tubing in Glucose 5% or Sodium chloride 0.9%
Continuous infusion not usually recommended

Amphotericin (liposomal) (Ambisome®)
Intermittent in Glucose 5% or 10%
Reconstitute each vial with 12 mL water for injections and shake vigorously to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into infusion fluid through the 5 micron filter provided to produce a final concentration of 0.2–2 mg/mL; infuse over 30–60 minutes, or if non-anaphylactic infusion-related reactions occur infuse over 2 hours (initial test dose 1 mg over 10 minutes), an in-line filter (pore size no less than 1 micron) may be used, incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or 10%, or use separate line

Amphotericin (liposomal) (Fungizone®)
Intermittent in Glucose 5%
Reconstitute each vial with 10 mL water for injections and shake immediately to produce a 5 mg/mL colloidal solution, dilute further in infusion fluid to a concentration of 100 micrograms/mL, pH of the glucose must not be below 4.2 (check each container—consult product literature for details of buffer); infuse over 2–4 hours, or longer if not tolerated (initial test dose 1 mg over 20–30 minutes); begin infusion immediately after dilution and protect from light; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or use separate line, an in-line filter (pore size no less than 1 micron) may be used

Ampicillin sodium (Penbritin®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes via drip tubing in Glucose 5% or Sodium chloride 0.9%
Continuous infusion not usually recommended

Anidulafungin (Encata®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute each 100 mg with 30 mL water for injections, allow up to 5 minutes for reconstitution; dilute dose in infusion fluid to a concentration of 770 micrograms/mL, give at a rate not exceeding 1.1 mg/minute
Note: Follow product information if using stock supplied with ethanol solvent

Antithymocyte immunoglobulin (Thymoglobuline®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL, gently rotate to dissolve. Dilute requisite dose with infusion fluid to a total volume of 50–500 mL (usually 50 mL/vial), begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron) or not; given with unfractionated heparin and hydrocortisone in glucose infusion as precipitation reported
Appendix 4: Intravenous additives

Argatroban monohydrate (Exembo®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute each 2.5-mL vial with 250 mL infusion fluid

Atenolol (Tenormin®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Suggested infusion time 20 minutes

Atosiban (Tractocile® concentrate for intravenous infusion)
Continuous in Glucose 5% or Sodium chloride 0.9%
Withdraw 10 mL infusion fluid from 100-mL bag and replace with 10 mL atosiban concentrate (7.5 mg/mL) to produce a final concentration of 750 micrograms/mL.

Atracurium besilate (Tracrium®, Atracurium besilate injection, Hospira; Atracurium injection/infusion, Genus)
Continuous in Glucose 5% or Sodium chloride 0.9%
Stability varies with diluent; dilute requisite dose with infusion fluid to a concentration of 0.5–5 mg/mL.

Azathioprine (as sodium salt) (Imuran®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute 50 mg with 5–15 mL water for infusions; dilute requisite dose to a volume of 20–200 mL with infusion fluid

Aztreonam (Azactam®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dissolve initially in water for injections (1 g per 3 mL) then dilute to a concentration of less than 20 mg/mL, to be given over 20–60 minutes

Basiliximab (Simulect®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute 10 mg with 2.5 mL water for infusions then dilute to at least 25 mL with infusion fluid; reconstitute 20 mg with 5 mL water for infusions then dilute to at least 50 mL with infusion fluid; give over 20–30 minutes

Betamethasone (as sodium phosphate) (Betnesol®)
Continuous or intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%

Bivalirudin (Angiox®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Reconstitute each 250-mg vial with 5 mL water for injections then withdraw 5 mL and dilute to 50 mL with infusion fluid

Bumetanide
Intermittent in Glucose 5% or Sodium chloride 0.9%
Suggested volume 500 mL given over 30–60 minutes; concentrations above 25 micrograms/mL may cause precipitation

Calcitonin (salmon) (Miacalcic®)
Intermittent in Sodium chloride 0.9%
Diluted solution given without delay; dilute in 500 mL and give over at least 6 hours; glass or hard plastic containers should not be used; some loss of potency on dilution and administration

Calcium gluconate
Continuous in Glucose 5% or Sodium chloride 0.9%
Avoid bicarbonates, phosphates, or sulfates

Caspofungin (Cancidas®)
Intermittent in Sodium chloride 0.9%
Allow vial to reach room temperature; initially reconstitute each vial with 10.5 mL water for injections, mixing gently to dissolve then dilute requisite dose in 250 mL infusion fluid (35–or 50-mg doses may be diluted in 100 mL infusion fluid if necessary); give over 60 minutes; incompatible with glucose solutions

Cefotaxime (as sodium salt)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Suggested volume 40–100 mL given over 20–60 minutes; incompatible with alkaline solutions

Ceftaroline fosamil (Zinforo®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute 600 mg with 20 mL water for infusions, then dilute with 250 mL infusion fluid (in fluid restriction, may be diluted with 50–100 mL infusion fluid); give over 60 minutes

Ceftazidime (as pentahydrate) (Fortum®, Kefadim®)
Intermittent or via drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%
Dissolve 2 g initially in 10 mL (3 g in 15 mL) infusion fluid, for Fortum® dilute further to a concentration of 40 mg/mL, for Kefadim® dilute further to a concentration of 20 mg/mL; give over up to 30 minutes

Ceftriaxone (as sodium salt) (Rocephin®, Ceftriaxone Injection, Genus)
Intermittent or via drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%
Reconstitute 2-g vial with 40 mL infusion fluid, give intermittent infusion over at least 30 minutes (60 minutes in neonates); not to be given simultaneously with total parenteral nutrition or infusion fluids containing calcium, even by different infusion lines; may be infused sequentially with infusion fluids containing calcium if flush with sodium chloride 0.9% between infusions or give infusions by different infusion lines at different sites

Cefuroxime (as sodium salt) (Zinacef®)
Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%
Dissolve initially in water for injections (at least 2 mL for each 250 mg, 15 mL for 1.5 g); suggested volume 50–100 mL given over 30 minutes

Chloramphenicol (as sodium succinate) (Remicete®)
Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%

Ciclosporin (Sandimmune®)
Intermittent or continuous in Glucose 5% or Sodium chloride 0.9%

Cidofovir (Vistide®)
Intermittent in Sodium chloride 0.9%
Dilute requisite dose with 100 mL infusion fluid; infuse over 1 hour

Cisatracurium (Nimbex®, Nimbex Forte®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Solutions of 2 mg/mL and 5 mg/mL may be infused undiluted; alternatively dilute with infusion fluid to a concentration of 0.1–2 mg/mL

Clarithromycin (Klaricid® I.V.)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dissolve initially in water for injections (500 mg in 10 mL) then dilute to a concentration of 2 mg/mL; give over 60 minutes
Appendix 4: Intravenous additives

Clindamycin (as phosphate) (Dolacin® C Phosphate)
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute to not more than 18 mg/mL and give over 10–60 minutes at a rate not exceeding 30 mg/min (1.2 g over at least 60 minutes, higher doses by continuous infusion).

Co-amoxiclav (Augmentin®)
Continuous in Sodium chloride 0.9%
Reconstitute 600 mg initially with 10 mL water for injections, then dilute with 50 mL infusion fluid, reconstitute 1.2 g initially with 20 mL water for injections, then dilute with 100 mL infusion fluid, give over 30–40 minutes via drip tubing in Sodium chloride 0.9%.

Co-fluampicil (as sodium salts) (Magnapen®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes via drip tubing in Glucose 5% or Sodium chloride 0.9%.

Cyclophosphamide (Cyclophosphamide injection, Baxter)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL sodium chloride 5% and infused over max. 60 minutes.

Cyclophosphamide (Cyclophosphamide injection, Hospira; Dexamethasone chloride 0.9%)
Continuous in Sodium chloride 0.9%
Reconstitute 500 mg with 25 mL sodium chloride 0.9%; gently rotate vial without shaking; allow to reconstitute 1 g with 50 mL sodium chloride 0.9%.

Danaparoid sodium (Orgaran®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilated to a concentration of 4 micrograms/mL.

Daptomycin (Cubicin®)
Continuous in Sodium chloride 0.9%
Reconstitute with sodium chloride 0.9% (350 mg in 7 mL, 500 mg in 10 mL); gently rotate vial without shaking; allow to stand for at least 10 minutes then rotate gently to dissolve dilute requisite dose in 50 mL infusion fluid and give over 30 minutes.

Desferrioxamine mesilate (Desferal®)
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute with water for injections to a concentration of 100 mg/mL, dilute with infusion fluid.

Desmopressin (DDAVP®, Octim®)
Continuous or intermittent in Sodium chloride 0.9%
Dilute with 50 mL and give over 20 minutes.

Dexamethasone sodium phosphate (Dexamethasone, Hospira; Dexamethasone, Organon)
Continuous or intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 4 micrograms/mL.

Dexamethasone sodium phosphate (Dexodor®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 4 micrograms/mL.

Dexmedetomidine (as hydrochloride) (Dexdor®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 4 micrograms/mL.

Dexrazoxane (Cardoxane®)
Continuous in Compound sodium lactate
Reconstitute each vial with 25–100 mL infusion fluid, give requisite dose over 15 minutes.

Doxazoxone (Savene®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 25 mg/mL (1 mg/mL); 500 mL Savene® diluent, give over 2–4 hours in a large vein in an area other than the one affected.

Dopamine hydrochloride
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 3 mg/mL, incompatible with bicarbonate.

Dopexamine hydrochloride (Dopacard®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 400 or 800 micrograms/mL, max. concentration via large peripheral vein 1 mg/mL, concentrations up to 4 mg/mL may be infused via central vein, give via infusion pump or other device which provides accurate control of rate, contact with metal should be minimised; incompatible with bicarbonate.
Eculizumab  (Soliris®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute requisite dose to a concentration of 5 mg/mL and mix gently, give over 25–45 minutes (infusion time may be increased to 2 hours if infusion-related reactions occur)

Enoximone (Perfan®)
Continuous or intermittent in Sodium chloride 0.9%
or Water for injections
Dilute to a concentration of 2.5 mg/mL, incompatible with glucose solutions; use only plastic containers or syringes

Epoprostenol (Floitan®)
Continuous in Sodium chloride 0.9% (but see also below)
Reconstitute using the filter and solvent (glycine buffer diluent) provided to make a concentrate; may be diluted further (consult product literature); for pulmonary hypertension dilute further with glycine buffer diluent only, for renal dialysis may be diluted further with sodium chloride 0.9%

Ertapecm (Invanz®)
Intermittent in Sodium chloride 0.9%
Reconstitute 1 g with 10 mL water for injections or sodium chloride 0.9%, dilute requisite dose in infusion fluid to a final concentration not exceeding 20 mg/mL; give over 30 minutes; incompatible with glucose solutions

Esomeprazole (as sodium salt)
Continuous or intermittent in Sodium chloride 0.9%
Dissolve initially in water for injections (1 g in 20 mL) then dilute to a concentration of 1–5 mg/mL; give over 20–60 minutes

Erythromycin (as lactobionate)
Continuous or intermittent in Sodium chloride 0.9%
Reconstitute 40–80 mg with up to 100 mL infusion fluid, for intermittent infusion, give requisite dose over 10–30 minutes; stable for 12 hours in sodium chloride 0.9%

Ethanol
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 5–10%

Fentanyl  (Sublimaze®)
Continuous or intermittent in Glucose 5% or Sodium bicarbonate or Sodium chloride 0.9%

Ferric carboxymaltose (Ferinject®)
Intermittent in Sodium chloride 0.9%
Dilute 200–500 mg in up to 100 mL infusion fluid and give over at least 6 minutes; dilute 0.5–1 g in up to 250 mL infusion fluid and give over at least 15 minutes

Filgrastim (Neupogen®; Nivestim®, Ratiogranstim®; Zarzio®)
Continuous or intermittent in Glucose 5%
For a filgrastim concentration of less than 1 500 000 units/mL (15 micrograms/mL) albumin solution (human albumin solution) is added to produce a final albumin concentration of 2 mg/mL; should not be diluted to a filgrastim concentration of less than 200 000 units/mL (2 micrograms/mL) and should not be diluted with sodium chloride solution

Flecainide acetate (Tambocor®)
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Minimum volume in infusion fluids containing chlorides 500 mL

Fluocoxacin (as sodium salt) (Floxapen®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Suggested volume 100 mL given over 30–60 minutes via drip tubing in Glucose 5% or Sodium chloride 0.9%
Continuous infusion not usually recommended

Flumazenil
Continuous in Glucose 5% or Sodium chloride 0.9%

Fondaparinux (Arixtra®)
Intermittent in Sodium chloride 0.9%
For ST-segment elevation myocardial infarction, add requisite dose to 25–50 mL infusion fluid and give over 1–2 minutes

Fosaprepitant (I vemend®)
Intermittent in Sodium chloride 0.9%
Reconstitute each 150-mg vial with 5 mL sodium chloride 0.9% gently without shaking to avoid foaming, then dilute in 145 mL infusion fluid, give over 20–30 minutes

Foscarnet sodium (Foscavir®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 1.5–25 mg (foscarnet sodium equivalent)/mL

Furosemide (as sodium salt) (Lasix®)
Continuous in Sodium chloride 0.9%
Infusion pH must be above 5.5 and rate should not exceed 4 mg/minute; glucose solutions are unsuitable

Galsulfase (Naglazyme®)
Intermittent in Sodium chloride 0.9%
Dilute requisite dose with infusion fluid to final volume of 250 mL and mix gently, infuse through a 0.2 micron in-line filter, give approx. 2.5% of the total volume over 1 hour, then infuse remaining volume over next 3 hours, if body-weight under 20 kg and at risk of fluid overload, dilute requisite dose in 100 mL infusion fluid and give over at least 4 hours

Ganciclovir (as sodium salt) (Cymev®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute initially in water for injections (500 mg/10 mL) then dilute to not more than 10 mg/mL with infusion fluid (usually 100 mL); give over 1 hour

Gentamicin (as sulfate) (Cidomycin®, Gentamicin Paediatric Injection, Beacon; Gentamicin Injection, Hospira)
Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%
Suggested volume for intermittent infusion 50–100 mL given over 20–30 minutes (given over 60 minutes for once daily dose regimen)

Glyceril trinitrate (Nitrocin®; Nitronal®)
Continuous in Glucose 5% or Sodium chloride 0.9%
For Nitrocin® suggested infusion concentration 100 micrograms/mL, incompatible with polyvinyl chloride infusion containers such as Viflex® or Steriflex®, use glass or polyethylene containers or give via a syringe pump

Granisetron (as hydrochloride)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute up to 3 mL in 20–50 mL infusion fluid (up to 3 mL in a total volume of 10–30 mL for children); give over 5 minutes

Haem arginate (Normosang®)
Intermittent in Sodium chloride 0.9%
Dilute requisite dose in 100 mL infusion fluid in glass bottle and give over at least 30 minutes through a filter via large antebrachial or central vein; administer within 1 hour after dilution

Heparin sodium
Continuous in Glucose 5% or Sodium chloride 0.9%
Administration with a motorised pump advisable

Heparin sodium (as sodium salt) (Normosang®)
Intermittent in Sodium chloride 0.9%
Dilute requisite dose in 100 mL infusion fluid in glass bottle and give over at least 30 minutes through a filter via large antebrachial or central vein; administer within 1 hour after dilution

Hepes sodium
Continuous in Glucose 5% or Sodium chloride 0.9%
Administration with a motorised pump advisable

Heparin sodium (as sodium salt) (Normosang®)
Intermittent in Sodium chloride 0.9%
Dilute requisite dose in 100 mL infusion fluid in glass bottle and give over at least 30 minutes through a filter via large antebrachial or central vein; administer within 1 hour after dilution

Hepes sodium
Continuous in Glucose 5% or Sodium chloride 0.9%
Administration with a motorised pump advisable

Heparin sodium (as sodium salt) (Normosang®)
Intermittent in Sodium chloride 0.9%
Dilute requisite dose in 100 mL infusion fluid in glass bottle and give over at least 30 minutes through a filter via large antebrachial or central vein; administer within 1 hour after dilution

Hepes sodium
Continuous in Glucose 5% or Sodium chloride 0.9%
Administration with a motorised pump advisable

Heparin sodium (as sodium salt) (Normosang®)
Intermittent in Sodium chloride 0.9%
Dilute requisite dose in 100 mL infusion fluid in glass bottle and give over at least 30 minutes through a filter via large antebrachial or central vein; administer within 1 hour after dilution

Hepes sodium
Continuous in Glucose 5% or Sodium chloride 0.9%
Administration with a motorised pump advisable

Heparin sodium (as sodium salt) (Normosang®)
Intermittent in Sodium chloride 0.9%
Dilute requisite dose in 100 mL infusion fluid in glass bottle and give over at least 30 minutes through a filter via large antebrachial or central vein; administer within 1 hour after dilution

Hepes sodium
Continuous in Glucose 5% or Sodium chloride 0.9%
Administration with a motorised pump advisable

Heparin sodium (as sodium salt) (Normosang®)
Intermittent in Sodium chloride 0.9%
Dilute requisite dose in 100 mL infusion fluid in glass bottle and give over at least 30 minutes through a filter via large antebrachial or central vein; administer within 1 hour after dilution

Hepes sodium
Continuous in Glucose 5% or Sodium chloride 0.9%
Administration with a motorised pump advisable
Hydralazine hydrochloride (Apresoline®)
Continuous in Sodium chloride 0.9%
Suggested infusion volume 500 mL

Hydrocortisone (as sodium phosphate) (Ectocort®)
Continuous or intermittent via drip tubing in
Glucose 5% or Sodium chloride 0.9%

Hydrocortisone (as sodium succinate) (SoluCort®)
Continuous or intermittent via drip tubing in
Glucose 5% or Sodium chloride 0.9%

Hydrococobalamin (CyanoKit®)
Continuous in Sodium chloride 0.9%
Reconstitute each 5 g vial with 200 mL infusion fluid; gently
invert vial for at least 1 minute to mix; do not shake

Ibandronic acid (Bonodronat®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute requisite dose in 500 mL infusion fluid and give over
1–2 hours

Idursulfase (Elatop®)
Continuous in Sodium chloride 0.9%
Dilute requisite dose in 100 mL infusion fluid and mix gently
(do not shake); give over 3 hours (gradually reduced to 1
hour if no infusion-related reactions)

Imiglucerase (Cerezyme®)
Continuous in Sodium chloride 0.9%
Initially reconstitute with water for injections (200 units in
5.1 L, 400 units in 10.2 L) to give 40 units/mL solution;
dilute requisite dose with infusion fluid to a final volume of
100–200 mL and give initial dose at a rate not exceeding
0.5 units/kg/hour, subsequent doses to be given at a rate not
exceeding 1 unit/kg/hour, administer within 3 hours
after reconstitution

Imipenem with cilastatin (as sodium salt)
(Primaxin®)
Continuous in Sodium chloride 0.9%
Dilute to a concentration of 5 mg (as imipenem)/mL, infuse
500 mg (as imipenem) over 20–30 minutes, dose greater than
500 mg (as imipenem) over 40–60 minutes

Infliximab (Remicade®)
Continuous in Sodium chloride 0.9%
Reconstitute each 100 mg vial with 10 mL water for
injections using a 21-gauge or smaller needle; gently swirl
vial without shaking to dissolve; allow to stand for 5 minutes;
dilute requisite dose with infusion fluid to a final volume of
250 mL and give through a low protein-binding filter
(1.2 micron or less) over at least 2 hours (adults over 18 years
who have tolerated 3 initial 2-hour infusions may be given
250 mL; adjust rate with in-line burette)

Insulin (soluble)
Continuous in Sodium chloride 0.9%
AdSORbed to some extent by plastics of infusion set; see also
section 6.1.3; ensure insulin is not injected into ‘dead space’
of injection port of the infusion bag

Insulin aspart
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to 0.05–1 unit/mL with infusion fluid; adsorbed to
some extent by plastics of infusion set

Insulin glulisine (Apidra®)
Continuous in Sodium chloride 0.9%
Dilute to 1 unit/mL with infusion fluid; use a co-extruded
polyolefin/polyamide plastic infusion bag with a dedicated
infusion line

Insulin lispro
Continuous in Glucose 5% or Sodium chloride 0.9%
Adsorbed to some extent by plastics of infusion set

Iron dextran (Cosmofer®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute 100–200 mg/m in 100 mL infusion fluid, give 25 mg over
15 minutes initially, then give at a rate not exceeding
6.67 mg/minute; total dose infusion diluted in 500 mL infusion
fluid and given over 4–6 hours (initial dose 25 mg over 15
minutes)

Iron isomaltoside 1000 (Monofer®)
Continuous in Sodium chloride 0.9%
For details consult product literature

Iron sucrose (Venoferr®)
Continuous in Sodium chloride 0.9%
Dilute 100 mg in up to 100 mL infusion fluid; give 25 mg over
15 minutes initially, then give at a rate not exceeding
3.33 mg/minute

Isosorbide dinitrate (Isoket 0.05%, Isoket 0.1%®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Adsorbed to some extent by polyvinyl chloride infusion
containers; preferably use glass or polyethylene containers
or give via a syringe pump. Isoket 0.05%® can alternatively
be administered undiluted using a syringe pump with a glass
or rigid plastic syringe

Itraconazole (Sporanox®)
Continuous in Sodium chloride 0.9%
Dilute 25 mg in 50 mL infusion fluid and infuse only 60 mL
through an in-line filter (0.2 micron) over 60 minutes

Ketamine (as hydrochloride) (Ketalar®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to 1 mg/mL, microdrip infusion for maintenance of
anaesthesia

Labeltalol hydrochloride
Continuous in Glucose 5% or Sodium chloride and
glucose
Dilute to a concentration of 1 mg/mL; suggested volume
200 mL; adjust rate with in-line burette

Lacosamide (Vimpat®)
Continuous in Glucose 5% or Sodium chloride 0.9%
May be administered undiluted

Laronidase (Aldurazyme®)
Continuous in Sodium chloride 0.9%
Body-weight under 20 kg, use 100 mL infusion fluid; body-
weight over 20 kg use 250 mL infusion fluid, withdraw
volume of infusion fluid equivalent to volume of laronidase
concentrate being added; give through an in-line filter
(0.2 micron) at an initial rate of 2 units/kg/hour then
increasing gradually every 15 minutes to max. 43 units/kg/
hour

Lenograstim (Granocyte®)
Continuous in Sodium chloride 0.9%
Initially reconstitute with 1 mL water for injection provided
(don’t shake vigorously) then dilute with up to 50 mL
infusion fluid for each vial of Granocyte-13 or up to 100 mL
infusion fluid for Granocyte-34; give over 30 minutes

Levetiracetam (Keppra®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute requisite dose with at least 100 mL of infusion fluid;
give over 15 minutes

Magnesium sulfate injection, BP
Continuous in Glucose 5% or Sodium chloride 0.9%
Suggested concentration up to 200 mg/mL (20%) (0.8 mmol/mL/Mg2+) magnesium sulfate heptahydrate, max.
rate 150 mg/minute (0.6 mmol/minute Mg2+)

Meropenem (Meronem®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute dose in infusion fluid to a final concentration of 1–
20 mg/mL; give over 15–30 minutes
Appendix 4: Intravenous additives

**Noradrenaline/Norepinephrine**
Continuous or via drip tubing in Glucose 5% or Sodium chloride 0.9%
Suggested volume 500 mL

**Methylprednisolone (as sodium succinate) (Solu-Medrone®)**
Continuous or intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%
Reconstitute initially with water for injections; doses up to 250 mg should be given over at least 5 minutes, high doses over at least 30 minutes

**Midazolam (Hypnovel®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of up to 200 micrograms/mL, protect infusion from light; give over 60 minutes

**Micafungin (Mycamine®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Reconstitute each vial with 5 mL infusion fluid; gently rotate vial, without shaking, to dissolve; dilute requisite dose with infusion fluid to 100 mL (final concentration 0.5–2 mg/mL); protect infusion from light; give over 60 minutes

**Mivacurium (as chloride) (Mivacron®)**
Continuous or intermittent via drip tubing in Glucose 5% or Sodium chloride 0.9%
Dilute to a suggested concentration of 200 micrograms/mL

**Miochol® (Primacor®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of up to 200 micrograms/mL, protect infusion from light; give over 60 minutes

**Mivacurium (as chloride) (Mivacron®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of up to 200 micrograms/mL

**Mycophenolate mofetil (as hydrochloride) (CellCept®)**
Continuous in Glucose 5%
Reconstitute each 500-mg vial with 14 mL glucose 5% and NaCl 0.9%; give at a rate not exceeding 1 mg/minute; not to be given undiluted

**Naloxone (Minijet® Naloxone Hydrochloride)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of up to 200 micrograms/mL, and administer via an infusion pump, see Emergency Treatment of Poisoning

**Natalizumab (Tysabri®)**
Continuous in Sodium chloride 0.9%
Dilute 300 mg in 100 mL infusion fluid; gently invert to mix, do not shake. Use within 8 hours of dilution and give over 1 hour

**Nimodipine (Nimotop®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute 300 mg in 100 mL infusion fluid; gently invert to mix, do not shake. Use within 8 hours of dilution and give over 1 hour

**Nizatidine (Axid®)**
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
For continuous infusion, dilute 300 mg in 150 mL and give at a rate of 10 mg/hour; for intermittent infusion, dilute 100 mg in 50 mL and give over 15 minutes

**Noradrenaline/Norepinephrine**
Continuous in Glucose 5% or Sodium chloride and glucose
Give via controlled infusion device; for administration via syringe pump, dilute 2 mg (2 mL of solution) noradrenaline base with 48 mL infusion fluid, for administration via drip counter dilute 20 mg (20 mL of solution) noradrenaline base with 480 mL infusion fluid; give through a central venous catheter; incompatible with alkalai

1 mg of noradrenaline base is equivalent to 2 mg noradrenaline acid tartrate

**Omeprazole (as sodium salt) (Losec®)**
Intermittent or continuous in Glucose 5% or Sodium chloride 0.9%
Reconstitute each 40 mg vial with infusion fluid and dilute to 100 mL; for intermittent infusion, give 40 mg over 20–30 minutes; stable for 3 hours in glucose 5% or 12 hours in sodium chloride 0.9%

**Ondansetron (as hydrochloride) (Zofran®)**
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Continuous or intermittent infusion in 50–100 mL of infusion fluid and give over at least 15 minutes

**Oxycodeine hydrochloride (Oxynorm®)**
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 1 mg/mL

**Oxytocin (Syntocinon®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Preferably given via a variable-speed infusion pump in a concentration appropriate to the pump; if given by drip infusion for induction or enhancement of labour, dilute 5 units in 500 mL infusion fluid or for higher doses, 10 units in 500 mL; for treatment of postpartum uterine haemorrhage dilute 40 units in 500 mL, if high doses given for prolonged period (e.g. for inevitable or missed abortion or for postpartum haemorrhage), use low volume of an electrolyte-containing infusion fluid (not Glucose 5%) given at higher concentration than for induction or enhancement of labour; close attention to patient’s fluid and electrolyte status essential

**Pamidronate disodium (Aredia®; Pamidronate disodium, Hospira, Medac, Wockhardt)**
Continuous in Glucose 5% or Sodium chloride 0.9%
For Aredia®, reconstitute initially with water for injections (15 mg in 5 mL, 30 mg or 90 mg in 10 mL); for Pamidronate disodium (Wockhardt), dilute with infusion fluid to a concentration of not more than 60 mg in 250 mL; for Aredia®, Pamidronate disodium (Medac, Hospira) dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium

**Pantoprazole (as sodium sesquihydrate) (Protium®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Reconstitute 40 mg with 10 mL sodium chloride 0.9% and dilute with 100 mL of infusion fluid, give 40 mg over 15 minutes

**Paracetamol (Pefalgan®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of not less than 1 mg/mL and use within 1 hour; may also be given undiluted

**Pentamidine isetionate (Pentacarinat®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Dissolve initially in water for injections (300 mg in 3–5 mL) then dilute in 50–250 mL; give over at least 60 minutes

**Phenoxybenzamine hydrochloride**
Continuous in Sodium chloride 0.9%
Dilute in 200–500 mL infusion fluid; give over at least 2 hours; max. 4 hours between dilution and completion of administration

**Phenytoin hydrochloride**
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute 10 mg in 500 mL infusion fluid
Phenytoin sodium (Epanutin®)
Intermittent in Sodium chloride 0.9%
Flush intravenous line with Sodium chloride 0.9% before and after infusion, dilute in 50–100 mL infusion fluid (final concentration not to exceed 10 mg/mL) and give into a large vein through an in-line filter (0.22–0.50 micron) at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute); complete administration within 1 hour of preparation

Phytonadione (in mixed micelles vehicle)
(Konakion® MM)
Intermittent in Glucose 5%
Dilute with 55 mL, may be injected into lower part of infusion apparatus

Piperacillin with tazobactam (as sodium salts)
Reconstitute initially with water for injections provided; dilute concentrate in infusion fluid to a final concentration of 1–4 mg/mL; give over 30–40 minutes

Potassium chloride
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute in a large-volume infusion; mix thoroughly to avoid ‘layering’, especially in non-rigid infusion containers; use ready-prepared solutions when possible

Propofol (emulsion) (Diprivan®, Propofol-Lipuro®)
Shake before use; microbiological filter not recommended; may be administered via a Y-piece close to injection site co-administered with Glucose 5% or Sodium chloride 0.9%
0.5% emulsion
Intermittent
May be administered undiluted, or diluted with Glucose 5% or Sodium chloride 0.9%; dilute to a concentration not less than 1 mg/mL
1% emulsion
Continuous or intermittent
May be administered undiluted, or diluted with Sodium Chloride 0.9% (Propofol-Lipuro® only) or Glucose 5%; dilute to a concentration not less than 2 mg/mL, use within 6 hours of preparation
2% emulsion
Continuous
Do not dilute

Quinine dihydrochloride
Continuous in Glucose 5% or Sodium chloride 0.9%
To be given over 4 hours; see also section 5.4.1

Ranitidine (as hydrochloride) (Zantac®)
Intermittent in Glucose 5% or Sodium chloride 0.9%

Rasburicase (Fasturtex®)
Intermittent in Sodium chloride 0.9%
Reconstitute with solvent provided; gently swirl vial without shaking to dissolve; dilute requisite dose to 50 mL with infusion fluid and give over 30 minutes

Remifentanil (Ultiva®)
Continuous in Glucose 5% or Sodium chloride 0.9%
or Water for injections
Reconstitute with infusion fluid to a concentration of 1 mg/mL, then dilute further to a concentration of 20–250 micrograms/mL (50 micrograms/mL recommended for general anaesthesia, 20–25 micrograms/mL recommended for children 1–12 years; 20–50 micrograms/mL recommended when used with target controlled infusion (TCI) device)

Rifampicin (Rifadin®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute with solvent provided then dilute with 500 mL infusion fluid, give over 2–3 hours

Rituximab (MabThera®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Infuse at a rate of 1–5 mg/mL and gently invert bag to avoid foaming

Rocuronium bromide (Esmeron®)
Continuous or via drip tubing in Glucose 5% or Sodium chloride 0.9%

Salbutamol (as sulfate) (Ventolin® For Intravenous Infusion)
Continuous in Glucose 5%
For bronchodilatation dilute to a concentration of 200 micrograms/mL with glucose 5% or sodium chloride 0.9%; for premature labour dilute with glucose 5% to a concentration of 200 micrograms/mL for use in a syringe pump or for other infusion methods (preferably via controlled infusion device), dilute to a concentration of 20 micrograms/mL, close attention to patient’s fluid and electrolyte status essential

Sodium nitroprusside
Continuous in Glucose 5%
Infuse no infusion device to allow precise control; protect infusion from light. For further details consult product literature

Sodium valproate (Epilim®, Episenta®)
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute Epilim® with solvent provided then dilute with infusion fluid

Streptokinase (Streptase®)
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute with sodium chloride 0.9%, then dilute further with infusion fluid

Tacrolimus (Prograf®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute concentrate in infusion fluid to a final concentration of 4–100 micrograms/mL; give over 24 hours; incompatible with PVC

Teicoplanin (Targocid®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute initially with water for injections provided; infuse over 30 minutes
Continuous infusion not usually recommended

Temocillin (Negaban®)
Intermittent in Glucose 5% or 10% or Sodium chloride 0.9%
Reconstitute 1 g with 10 mL water for injections then dilute with 50–150 mL infusion fluid, give over 30–40 minutes

Terbutaline sulfate (Brincanyl®)
Continuous in Glucose 5%
For bronchodilatation dilute 1.5–2.5 mg with 500 mL glucose 5% or sodium chloride 0.9% and give over 8–10 hours; for premature labour dilute in glucose 5% and give via controlled infusion device preferably a syringe pump, if syringe pump available dilute to a concentration of 100 micrograms/mL, if syringe pump not available dilute to a concentration of 10 micrograms/mL; close attention to patient’s fluid and electrolyte status essential

Ticarcillin sodium with clavulanic acid (Timentin®)
Intermittent in Glucose 5%
Suggested volume (depending on dose) 100–150 mL; give over 30–40 minutes

Tigecycline (Tigazol®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute each vial with 5.3 mL infusion fluid to produce a 10 mg/mL solution; dilute requisite dose in 100 mL infusion fluid, give over 30–60 minutes
Tirofiban (Aggrastat®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Withdraw 50 mL infusion fluid from 250-mL bag and replace with 50 mL tirofiban concentrate (250 micrograms/mL) to give a final concentration of 50 micrograms/mL

Tobramycin (as sulfate) (Nebcin®)
Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%
For adult intermittent infusion suggested volume 50–100 mL (children proportionately smaller volume) given over 20–60 minutes

Tocilizumab (RoActemra®)
Intermittent in Sodium chloride 0.9%
Dilute requisite dose to a volume of 100 mL with infusion fluid and give over 1 hour

Tramadol hydrochloride (Zydol®)
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%

Tranexamic acid (Cyklokapron®)
Continuous in Glucose 5% or Sodium chloride 0.9%

Urokinase (Syner-KINASE®)
Continuous or intermittent in Sodium chloride 0.9%

Vancomycin (as hydrochloride) (Vancocin®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute each 500 mg with 10 mL water for injections and dilute with infusion fluid to a concentration of up to 5 mg/mL (10 mg/mL in fluid restriction but increased risk of infusion-related effects); give over at least 60 minutes (rate not to exceed 10 mg/minute for doses over 500 mg); use continuous infusion only if intermittent not feasible

Vasopressin, synthetic (argipressin)
Intermittent in Glucose 5%
Suggested concentration 20 units/100 mL given over 15 minutes

Vecuronium bromide (Norcuron®)
Continuous or via drip tubing in Glucose 5% or Sodium chloride 0.9%
Reconstitute each vial with 5 mL water for injections to give 2 mg/mL solution; alternatively reconstitute with up to 10 mL glucose 5% or sodium chloride 0.9% or water for injections—unsuitable for further dilution if not reconstituted with water for injections. For continuous intravenous infusion, dilute to a concentration up to 40 micrograms/mL

Velaglucerase alfa (VPRIV®)
Intermittent in Sodium chloride 0.9%
Reconstitute each 400-unit vial with 4.3 mL water for injections to produce a 100 units/mL solution; dilute requisite dose in 100 mL infusion fluid, give over 60 minutes through a 0.22 micron filter; start infusion within 24 hours of reconstitution

Verteporfin (Visudyne®)
Intermittent in Glucose 5%
Reconstitute each 15 mg with 7 mL water for injections to produce a 2 mg/mL solution then dilute requisite dose with infusion fluid to a final volume of 30 mL and give over 10 minutes; protect infusion from light and administer within 4 hours of reconstitution. Incompatible with sodium chloride infusion

Vitamins B & C (Pabrinex® I/V High potency)
Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%
Ampoule contents should be mixed, diluted, and administered without delay, give over 30 minutes (see MHRA/CHM advice, section 9.6.2)

### Wound dressings
The correct dressing for wound management depends not only on the type of wound but also on the stage of the healing process. The principal stages of healing are:

- cleansing, removal of debris;
- granulation, vascularisation;
- epithelialisation.

The ideal dressing for moist wound healing needs to ensure that the wound remains:

- moist with exudate, but not macerated;
- free of clinical infection and excessive slough;
- free of toxic chemicals, particles or fibres;
- at the optimum temperature for healing;
- undisturbed by the need for frequent changes;
- at the optimum pH value.

As wound healing passes through its different stages, different types of dressings may be required to satisfy better one or other of these requirements. Under normal circumstances, a moist environment is a necessary part of the wound healing process; exudate provides a moist environment and promotes healing, but excessive exudate can cause maceration of the wound and surrounding healthy tissue. The volume and viscosity of exudate changes as the wound heals. There are certain circumstances where moist wound healing is not appropriate (e.g. gangrenous toes associated with vascular disease).

Advanced wound dressings, (section A5.2) are designed to control the environment for wound healing, for example to donate fluid (hydrogels), maintain hydration (hydrocolloids), or to absorb wound exudate (alginates, foams).
Practices such as the use of irritant cleansers and desloughing agents may be harmful and are largely obsolete; removal of debris and dressing remnants should need minimal irrigation with lukewarm sterile sodium chloride 0.9% solution or water.

Hydrogel, hydrocolloid, and medical grade honey dressings can be used to deslough wounds by promoting autolytic debridement; there is insufficient evidence to support any particular method of debridement for difficult-to-heal surgical wounds. Sterile larvae (maggots) are also available for biosurgical removal of wound debris.

There have been few clinical trials able to establish a clear advantage for any particular product. The choice between different dressings depends not only on the type and stage of the wound, but also on patient preference or tolerance, site of the wound, and cost. For further information, see Buyers’ Guide: Advanced wound dressings (October 2008); NHS Purchasing and Supply Agency, Centre for Evidence-based Purchasing.

The table below gives suggestions for choices of primary dressing depending on the type of wound (a secondary dressing may be needed in some cases).

### A5.1 Basic wound contact dressings

#### A5.1.1 Low adherence dressings

Low adherence dressings are used as interface layers under secondary absorbent dressings. Placed directly on the wound bed, non-absorbent, low adherence dressings are suitable for clean, granulating, lightly exuding wounds without necrosis, and protect the wound bed from direct contact with secondary dressings. Care must be taken to avoid granulation tissue growing into the weave of these dressings.

Tulle dressings are manufactured from cotton or viscose fibres which are impregnated with white or yellow soft paraffin to prevent the fibres from sticking, but this

**Note:** In each section of this table the dressings are listed in order of increasing absorbency. Some wound contact (primary) dressings require a secondary dressing.
A5.1.2 Absorbent dressings

Perforated film absorbent dressings are suitable only for wounds with mild to moderate amounts of exudate; they are not appropriate for leg ulcers or for other lesions that produce large quantities of viscous exudate. Dressings with an absorbent cellulose or polymer wadding layer are suitable for use on moderately to heavily exuding wounds.

For lightly exuding wounds

Absorbent Perforated Dressing with Adhesive Border

Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Adpore®, 7 cm × 8 cm = 8p, 10 cm × 10 cm = 10p, 10 cm × 15 cm = 16p, 10 cm × 20 cm = 30p, 10 cm × 25 cm = 34p, 10 cm × 30 cm = 42p, 10 cm × 35 cm = 50p (Medicareplus International)

Cosmopor® E®, 5 cm × 7.2 cm = 8p, 8 cm × 10 cm = 16p, 8 cm × 15 cm = 26p, 10 cm × 20 cm = 43p, 10 cm × 25 cm = 53p, 10 cm × 35 cm = 74p (Hartmann)

Cutiplast® Steril, 5 cm × 7.2 cm = 5p, 8 cm × 10 cm = 10p, 8 cm × 15 cm = 23p, 10 cm × 20 cm = 29p, 10 cm × 25 cm = 30p, 10 cm × 30 cm = 40p (S&N Hlth.)

Leukomed®, 7.2 cm × 5 cm = 8p, 8 cm × 10 cm = 17p, 8 cm × 15 cm = 30p, 10 cm × 20 cm = 40p, 10 cm × 25 cm = 46p, 10 cm × 30 cm = 59p, 10 cm × 35 cm = 68p (BSN Medical)

Mepitape® + Pad, 5 cm × 7.2 cm = 7p, 10 cm × 10 cm = 15p, 10 cm × 15 cm = 24p, 10 cm × 20 cm = 36p, 10 cm × 25 cm = 45p, 10 cm × 35 cm = 62p (3M)

Medisafe®, 6 cm × 8 cm = 8p, 8 cm × 10 cm = 13p, 8 cm × 12 cm = 23p, 9 cm × 15 cm = 28p, 9 cm × 20 cm = 34p, 9 cm × 25 cm = 36p (Neomedic)

Mepore®, 7 cm × 8 cm = 10p, 10 cm × 11 cm = 21p, 11 cm × 15 cm = 34p, 9 cm × 20 cm = 42p, 9 cm × 25 cm = 58p, 9 cm × 30 cm = 67p, 9 cm × 35 cm = 73p (Molnlycke)

PremierPore®, 5 cm × 7 cm = 5p, 10 cm × 10 cm = 12p, 10 cm × 15 cm = 18p, 10 cm × 20 cm = 32p, 10 cm × 25 cm = 36p, 10 cm × 30 cm = 45p, 10 cm × 35 cm = 52p (Shermodon)

Primapore®, 6 cm × 8.3 cm = 17p, 8 cm × 10 cm = 18p, 8 cm × 15 cm = 31p, 10 cm × 20 cm = 41p, 10 cm × 25 cm = 47p, 10 cm × 30 cm = 59p, 10 cm × 35 cm = 91p (S&N Hlth)

Softpore®, 6 cm × 7 cm = 6p, 10 cm × 10 cm = 13p, 10 cm × 15 cm = 20p, 10 cm × 20 cm = 35p, 10 cm × 25 cm = 40p, 10 cm × 30 cm = 49p, 10 cm × 35 cm = 58p (Richardson)

Sterifix®, 5 cm × 7 cm = 19p, 7 cm × 10 cm = 31p, 10 cm × 14 cm = 55p (Hartmann)

Telfa® Island, 5 cm × 10 cm = 8p, 10 cm × 12.5 cm = 27p, 10 cm × 20 cm = 35p, 10 cm × 25.5 cm = 44p, 10 cm × 35 cm = 61p (Covidien)

Absorbent Perforated Plastic Film Faced Dressing

Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophilic backing. Where no size specified by the prescriber, the 5 cm size to be supplied

Absopad®, 5 cm × 5 cm = 7p, 10 cm × 10 cm = 13p, 20 cm × 10 cm = 28p, (Medicareplus International)

Askina® Pad, 10 cm × 10 cm = 20p, (B. Braun)

Cutosorb® LA, 5 cm × 5 cm = 8p, 10 cm × 10 cm = 14p, 10 cm × 20 cm = 29p (BSN Medical)

Interpose®, 5 cm × 5 cm = 9p, 10 cm × 10 cm = 15p, 10 cm × 20 cm = 32p (Frontier)

Melolin®, 5 cm × 5 cm = 16p, 10 cm × 10 cm = 26p, 20 cm × 10 cm = 51p (S&N Hlth)

Release®, 5 cm × 5 cm = 14p, 10 cm × 10 cm = 23p, 20 cm × 10 cm = 44p (Systagenix)

Skintact®, 5 cm × 5 cm = 10p, 10 cm × 10 cm = 17p, 20 cm × 10 cm = 34p (Robinson)

Solvaline N®, 5 cm × 5 cm = 9p, 10 cm × 10 cm = 15p, 10 cm × 20 cm = 34p (Activa)

Telfa®, 5 cm × 7.5 cm = 12p, 10 cm × 7.5 cm = 15p, 15 cm × 7.5 cm = 17p, 20 cm × 7.5 cm = 29p (Covidien)

For moderately to heavily exuding wounds

Absorbent Cellulose Dressing with Fluid RepellentBacking

CelluDress®, 10 cm × 10 cm = 19p, 10 cm × 15 cm = 20p, 10 cm × 20 cm = 22p, 15 cm × 20 cm = 30p, 20 cm × 25 cm = 40p, 20 cm × 30 cm = 85p (Medicareplus International)

BNF 68

is only partly successful and it may be necessary to change the dressings frequently. The paraffin reduces absorency of the dressing. Dressings with a reduced content (light loading) of soft paraffin are less liable to interfere with absorption; dressings with ‘normal loading’ (such as Jelonet®) have been used for skin graft transfer.

Knitted viscose primary dressing is an alternative to tulle dressings for exuding wounds; it can be used as the initial layer of multi-layer compression bandaging in the treatment of venous leg ulcers.

Knitted Viscose Primary Dressing, BP 1993

Warp knitted fabric manufactured from a bright viscose monofilament:

N-A Dressing®, 9.5 cm × 9.5 cm = 35p, 9.5 cm × 19 cm = 67p (Systagexin)

N-A Ultra®, (silicone-coated), 9.5 cm × 9.5 cm = 33p, 9.5 cm × 19 cm = 63p (Systagexin)

Profore®, 14 cm × 20 cm = 30p (S&N Hlth.)

Tricotex®, 9.5 cm × 9.5 cm = 32p (S&N Hlth.)

Paraffin Gauze Dressing, BP 1993

(Tulle Graa). Fabric of lino weave, wet and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin, 10 cm × 10 cm, (light loading) = 25p; (normal loading) = 37p (most suppliers including Synergy Healthcare—Paranet® (light loading); BSN Medical—Cancile® Classic (normal loading); S&N Hlth.—Jelonet® (normal loading); Neomedic—Neotulle® (normal loading); C D Medical—Paragauze® (normal loading))

Atrauman® (Hartmann)
Non-adherent knitted polyester primary dressing impregnated with neutral triglycerides, 5 cm × 5 cm = 24p, 7.5 cm × 10 cm = 26p, 10 cm × 20 cm = 59p, 20 cm × 30 cm = £1.63

Appendix 5: Wound Management
A5.2 Advanced wound dressings

Hydrogel dressings

Hydrogel dressings are most commonly supplied as an amorphous, cohesive topical application that can take up the shape of a wound. A secondary, non-absorbent dressing is needed. These dressings are generally used to donate liquid to dry sloughy wounds and facilitate autolytic debridement of necrotic tissue; some also have the ability to absorb very small amounts of exudate. Hydrogel products that do not contain propylene glycol should be used if the wound is to be treated with larval therapy.

Hydrogel sheets have a fixed structure and limited fluid-handling capacity; hydrogel sheet dressings are best avoided in the presence of infection, and are unsuitable for heavily exuding wounds.

For heavily exuding wounds

Curea® (Bullen)
Super absorbent cellulose and polymer primary dressing
Curea P1®, 7.5 cm × 7.5 cm = £1.68, 10 cm × 10 cm = £2.10, 10 cm × 20 cm = £3.56, 10 cm × 30 cm = £5.09, 20 cm × 20 cm = £6.74, 20 cm × 30 cm = £9.81, 12 cm × 12 cm (drain) = £2.59
Curea P2®, (non-adherent) 10 cm × 20 cm = £9.52, 11 cm × 11 cm = £5.70, 20 cm × 20 cm = £16.51, 20 cm × 30 cm = £24.77

Cutisorb® Ultra (BSN Medical)
Super absorbent cellulose and polymer primary dressing, 10 cm × 10 cm = £2.01, 20 cm × 20 cm = £6.32, 10 cm × 20 cm = £3.37, 20 cm × 30 cm = £9.53

Drawtex® (Martindale)
Super absorbent hydroconductive dressing with absorbent, cross-action structures of viscose, polyester and cotton, 5 cm × 5 cm = £9.5p, 7.5 cm × 7.5 cm = £1.77, 10 cm × 10 cm = £2.24, 15 cm × 20 cm = £6.00, 20 cm × 20 cm = £6.98, 7.5 cm × 1 m = £15.50, 10 cm × 1 m = £16.00, 10 cm × 1.3 m = £16.00, 20 cm × 1 m = £25.00

DryMax® Extra (Aspen Medical)
Super absorbent cellulose and polymer primary dressing, 10 cm × 10 cm = £1.80, 20 cm × 20 cm = £4.20, 10 cm × 20 cm = £2.38, 20 cm × 30 cm = £4.80

ELECT Superabsorber® (S&N)
Super absorbent cellulose and polymer primary dressing, 10 cm × 10 cm = £1.93p, 10 cm × 20 cm = £1.10, 20 cm × 20 cm = £1.96, 20 cm × 30 cm = £4.47

Zetuvit® Plus (Hartmann)
Super absorbent cellulose primary dressing, 10 cm × 10 cm = £0.69, 10 cm × 20 cm = £8.3p, 15 cm × 20 cm = £9.5p, 20 cm × 25 cm = £1.30, 20 cm × 40 cm = £2.00

Advanced wound dressings can be used for both acute and chronic wounds. Categories for dressings in this section (A5.2) start with the least absorptive, moisture-donating hydrogel dressings, followed by increasingly more absorptive dressings. These dressings are classified according to their primary component; some dressings are comprised of several components.

A5.2.1 Hydrogel dressings

Hydrogel sheets have a fixed structure and limited fluid-handling capacity; hydrogel sheet dressings are best avoided in the presence of infection, and are unsuitable for heavily exuding wounds.

ActiForm Cool® (Activa)
Hydrogel dressing, 5 cm × 6.5 cm = £1.70, 10 cm × 10 cm = £2.49, 20 cm × 20 cm = £7.51, 10 cm × 15 cm = £3.58

Aquaflo® (Covidien)
Hydrogel dressing, 7.5 cm diameter = £2.55, 12 cm diameter = £5.26

Coolie® (Zeroderm)
Hydrogel dressing (without adhesive border), disc 7 cm diameter = £1.96

Gel FX® (Synergy Healthcare)
Hydrogel dressing (without adhesive border) 10 cm × 10 cm = £1.60, 15 cm × 15 cm = £3.20

Geliperm® (Geistlich)
Hydrogel sheets, 10 cm × 10 cm = £2.48

Hydrosorb® (Hartmann)
Absorbent, transparent, hydrogel sheets containing polyurethane polymers covered with a semi-permeable film, 5 cm × 7.5 cm = £1.49, 10 cm × 10 cm = £2.12, 20 cm × 20 cm = £6.37

Hydrosorb® Comfort (with adhesive border, waterproof, 4.5 cm × 6.5 cm = £1.76, 7.5 cm × 10 cm = £2.33, 12.5 cm × 12.5 cm = £3.40

Intrasite Conformable® (S&N Hlth.)
Soft non-woven dressing impregnated with Intrasite® gel, 10 cm × 10 cm = £1.70, 10 cm × 20 cm = £2.30, 10 cm × 40 cm = £4.10

Novogel® (Ford)
Glycerol-based hydrogel sheets, 10 cm × 10 cm = £3.07, 20 cm × 20 cm = £6.74, 30 cm × 30 cm, standard = £13.00, thin = £12.27, 5 cm × 7.5 cm = £1.95, 15 cm × 20 cm = £5.86, 20 cm × 40 cm = £11.16, 7.5 cm diameter = £2.79

Appendix 5: Wound Management

1064
**SanoSkin® NET (SanoMed)**
Hydrogel sheet (without adhesive border), 8.5 cm × 12 cm = £2.28

**Vacunet®** (Protex)
Non-adherent, hydrogel coated polyester net dressing, 10 cm × 10 cm = £1.93, 10 cm × 15 cm = £2.86

### Hydrogel application (amorphous)

**ActiHeal® Hydrogel** (MedLogic)
Hydrogel containing guar gum and propylene glycol, 8 g = £1.23, 15 g = £1.41

**Aquaform®** (Protex)
Hydrogel containing modified starch copolymer, 8 g = £1.61, 15 g = £1.96

**Askina® Gel** (B. Braun)
Hydrogel containing modified starch and glycerol, 15 g = £1.92

**Cutimed®** (BSN Medical)
Hydrogel, 8 g = £1.58, 15 g = £1.92, 25 g = £2.83

**Flexigran®** (Aspen Medical)
Hydrogel containing starch polymer and glycerol, 15 g = £1.90

**GranuGel®** (Convatec)
Hydrogel containing carboxymethylcellulose, pectin, and propylene glycol, 15 g = £2.19

**Intrasite® Gel** (S&N Hlth.)
Hydrogel containing modified carrageenan polymer and propylene glycol, 8 g sachet = £1.70, 15-g sachet = £2.28, 25-g sachet = £3.38

**Nu-Gel®** (Systagenix)
Hydrogel containing alginate and propylene glycol, 15 g = £2.09

**Purilon® Gel** (Coloplast)
Hydrogel containing carboxymethylcellulose and calcium alginate, 8 g = £1.64, 15 g = £2.14

### A5.2.1 Sodium hyaluronate dressings

The hydrating properties of sodium hyaluronate promote wound healing, and dressings can be applied directly to the wound, or to a primary dressing (a secondary dressing should also be applied). The iodine and potassium iodide in these dressings prevent the bacterial decay of sodium hyaluronate in the wound.

**Hyloide®** (H&H)
Sodium hyaluronate 1.5%, potassium iodide 0.15%, iodine 0.1%, in a viscous solution, 22-g = £19.95, 50-g = £35.00

**Cautions** thyroid disorders

### A5.2.2 Vapour-permeable films and membranes

Vapour-permeable films and membranes allow the passage of water vapour and oxygen but are impermeable to water and micro-organisms, and are suitable for lightly exuding wounds. They are highly conformable, provide protection, and a moist healing environment; transparent film dressings permit constant observation of the wound. Water vapour loss can occur at a slower rate than exudate is generated, so that fluid accumulates under the dressing, which can lead to tissue maceration and to wrinkling at the adhesive contact site (with risk of bacterial entry). Newer versions of these dressings have increased moisture vapour permeability. Despite these advances, vapour-permeable films and membranes are unsuitable for infected, large heavily exuding wounds, and chronic leg ulcers.

Vapour-permeable films and membranes are suitable for partial-thickness wounds with minimal exudate, or wounds with eschar. Most commonly, they are used as a secondary dressing over alginates or hydrogels; film dressings can also be used to protect the fragile skin of patients at risk of developing minor skin damage caused by friction or pressure.

### Vapour-permeable Adhesive Film Dressing (Semi-permeable Adhesive Dressing)

Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

**Askina® Derm** (B. Braun)
Film dressing, 6 cm × 7 cm = 36p, 10 cm × 12 cm = £1.04, 10 cm × 20 cm = £1.97, 15 cm × 20 cm = £2.39, 20 cm × 30 cm = £4.27

**BioClusive®** (Systagenix)
Film dressing, 10.2 cm × 12.7 cm = £1.54

**C-View®** (Aspen Medical)
Film dressing, 6 cm × 7 cm = 38p, 10 cm × 12 cm = £1.02, 12 cm × 12 cm = £1.09, 15 cm × 20 cm = £2.36

**Dressfil®** (St George’s Medical)
Film dressing, 6 cm × 7 cm = 30p, 12 cm × 12 cm = 93p, 15 cm × 20 cm = £1.90

**Hydrofilm®** (Hartmann)
Film dressing, 6 cm × 7 cm = 21p, 10 cm × 12.5 cm = 40p, 10 cm × 15 cm = 50p, 10 cm × 25 cm = 77p, 12 cm × 25 cm = 81p, 15 cm × 20 cm = 92p, 20 cm × 30 cm = £1.52

**Hypafix® Transparent** (BSN Medical)
Film dressing, 10 cm × 2 m = £8.24

**Leukomed T** (BSN Medical)
Film dressing, 7.2 cm × 5 cm = 35p, 8 cm × 10 cm = 66p, 10 cm × 12.5 cm = 96p, 11 cm × 14 cm = £1.16, 15 cm × 20 cm = £2.23, 15 cm × 25 cm = £2.38

**Mepitel® Film** (Mölnlycke)
Film dressing, 6.5 cm × 7 cm = 49p, 10.5 cm × 12 cm = £1.31, 10.5 cm × 25 cm = £2.55, 15.5 cm × 20 cm = £3.24

**Mepore® Film** (Mölnlycke)
Film dressing, 6 cm × 7 cm = 44p, 10 cm × 12 cm = £1.18, 10 cm × 25 cm = £2.29, 15 cm × 20 cm = £2.91

**OpSite® Flexifix** (S&N Hlth.)
Film dressing, 5 cm × 1 m = £6.22, OpSite® Flexigrid, 6 cm × 7 cm = 37p, 12 cm × 12 cm = £1.06, 15 cm × 20 cm = £2.69

**Polyskin® II** (Covidien)
Film dressing, 4 cm × 4 cm = 36p, 5 cm × 7 cm = 39p, 10 cm × 12 cm = £1.01, 10 cm × 20 cm = £2.00, 15 cm × 20 cm = £2.31, 20 cm × 25 cm = £4.03

### A5.2.3 Soft polymer dressings

Dressings with soft polymer, often a soft silicone polymer, in a non-adherent or gently adherent layer are suitable for use on lightly to moderately exuding wounds. For moderately to heavily exuding wounds, an absorbent secondary dressing can be added, or a soft polymer dressing with an absorbent pad can be used.

Wound contact dressings coated with soft silicone have gentle adhesive properties and can be used on fragile skin areas or where it is beneficial to reduce the frequency of primary dressing changes. Soft polymer dressings should not be used on heavily bleeding wounds; blood clots can cause the dressing to adhere to the wound surface.

For silicone keloid dressings see section A5.4.2.

#### Without absorbent pad

**Adaptic® Touch** (Systagenix)
- Non-adherent soft silicone wound contact dressing, 5 cm x 7.6 cm = £1.13, 7.6 cm x 11 cm = £2.25, 12.7 cm x 15 cm = £4.65, 20 cm x 32 cm = £12.50

**Askina® SilNet** (B. Braun)
- Soft silicone-coated wound contact dressing, 5 cm x 7.5 cm = £1.08, 7.5 cm x 10 cm = £2.20, 10 cm x 18 cm = £4.80, 20 cm x 30 cm = £11.75

**Mepitex®** (Mölnlycke)
- Soft silicone, semi-transparent wound contact dressing, 5 cm x 7 cm = £1.57, 8 cm x 10 cm = £3.13, 12 cm x 15 cm = £6.34, 20 cm x 30 cm = £16.61
- **Mepitex® One**, soft silicone, thin, transparent wound contact dressing, 6 cm x 7 cm = £1.79, 9 cm x 10 cm = £3.36, 13 cm x 15 cm = £6.54, 24 cm x 27.5 cm = £16.79

**Physiotulle®** (Coloplast)
- Non-adherent soft polymer wound contact dressing, 10 cm x 10 cm = £2.13, 15 cm x 20 cm = £6.50

**Siliflex®** (Advancis)
- Soft silicone-coated polyester wound contact dressing, 5 cm x 7 cm = £1.25, 8 cm x 10 cm = £2.55, 12 cm x 15 cm = £5.15, 20 cm x 30 cm = £13.25, 35 cm x 60 cm = £39.54

**Silon-TSR®** (obskin)
- Soft silicone polymer wound contact dressing, 13 cm x 13 cm = £3.52, 13 cm x 25 cm = £5.47, 28 cm x 30 cm = £7.37
Appendix 5: Wound Management

Sorbion® Mepilex
- 15 cm = £4.82, 20 cm = £4.89
- 11 cm = £2.66, 10 cm = £2.00, 15 cm = £3.30
Cutimed® Siltec B, with adhesive border, for lightly to moderately exuding wounds, 7.5 cm × 7.5 cm = £1.45, 12.5 cm × 12.5 cm = £3.06, 15 cm × 15 cm = £4.97, 22.5 cm × 22.5 cm = £8.16
Cutimed® Siltec I, for lightly to moderately exuding wounds, 5 cm × 6 cm = 99p, 10 cm × 10 cm = £2.00, 15 cm × 15 cm = £3.30

Eclipse® Adherent (Advancis)
- Soft silicone wound contact layer with absorbent pad and film-backing, 10 cm × 10 cm = £2.99, 20 cm × 20 cm = £6.80, 10 cm × 20 cm = £3.61, 20 cm × 30 cm = £9.62

Flivasorb® (Activa)
- Absorbent polymer dressing with non-adherent wound contact layer and adhesive border, 12 cm × 12 cm = £3.25, 15 cm × 15 cm = £4.45

Mepilex® (Mölnlycke)
- Absorbent soft silicone dressing with polyurethane foam film backing, 5 cm × 5 cm = £1.21, 10 cm × 11 cm = £2.66, 11 cm × 20 cm = £4.39, 15 cm × 16 cm = £4.82, 20 cm × 21 cm = £7.28, 20 cm × 50 cm = £28.74, 13 cm × 20 cm (heel) = £5.41, 15 cm × 22 cm (heel) = £6.22
- Mepilex® Border, absorbent soft silicone dressing with polyurethane foam and adhesive border, 7 cm × 7.5 cm = £1.39, 10 cm × 12.5 cm = £2.72, 10 cm × 20 cm = £3.69, 10 cm × 30 cm = £5.55, 15 cm × 17.5 cm = £4.74, 17 cm × 20 cm = £6.07, 15 cm × 15 cm (sacrum) = £3.34, 18 cm × 18 cm (sacrum) = £4.85, 23 cm × 23 cm (sacrum) = £7.91, 18.5 cm × 24 cm (heel) = £6.63
- Mepilex® Border Lite, thin absorbent soft silicone dressing with polyurethane foam and adhesive border, 4 cm × 5 cm = 92p, 7.5 cm × 7.5 cm = £1.39, 5 cm × 12.5 cm = £2.01, 10 cm × 10 cm = £2.53, 15 cm × 15 cm = £4.13
- Mepilex® Lite, thin absorbent soft silicone dressing with polyurethane foam, 6 cm × 8.5 cm = £1.82, 10 cm × 10 cm = £2.17, 15 cm × 15 cm = £4.22, 20 cm × 50 cm = £26.66
- Mepilex® Transfer, soft silicone exudate transfer dressing, 7.5 cm × 8.5 cm = £2.23, 10 cm × 12 cm = £3.51, 15 cm × 20 cm = £10.64, 20 cm × 50 cm = £27.20

Sorbian® Sana (H&R)
- Non-adherent polyethylene wound contact dressing with absorbent core, 8.5 cm × 8.5 cm = £5.00, 12 cm × 12 cm = £6.78, 12 cm × 22 cm = £12.56, 22 cm × 22 cm = £20.14

Urgotul® Duo (Urgo)
- Non-adherent, soft polymer wound contact dressing with absorbent pad, 5 cm × 10 cm = £2.33, 10 cm × 12 cm = £3.61, 15 cm × 20 cm = £8.38
- Urgotul® Duo Border, soft polymer wound contact dressing with absorbent pad and adhesive polyurethane film backing, 8.5 cm × 8 cm = £2.27, 10 cm × 12 cm = £3.52, 15 cm × 20 cm = £8.17

Cellulose dressings

Sorbion® Sachet (H&R)
- Sorbion® Sachet Border, absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope, with adhesive border (for moderately to heavily exuding wounds), 10 cm × 10 cm = £2.95, 15 cm × 15 cm = £4.49, 15 cm × 25 cm = £6.99, 25 cm × 25 cm = £11.99
- Sorbion® Sachet Drainage, absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope (‘V’ shaped dressing), 10 cm × 10 cm = £2.64
- Sorbion® Sachet EXTRA, absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope (for moderately to heavily exuding wounds), 5 cm × 5 cm = £1.65, 7.5 cm × 7.5 cm = £1.78, 10 cm × 10 cm = £2.25, 10 cm × 20 cm = £3.73, 20 cm × 20 cm = £7.00, 30 cm × 20 cm = £9.99
- Sorbion® Sachet Multi Star, absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope (for moderately to heavily exuding wounds), 8 cm × 8 cm = £2.99, 14 cm × 14 cm = £4.89

Suprasorb® X (Activa)
- Biosynthetic cellulose fibre dressing (for lightly to moderately exuding wounds), 5 cm × 5 cm = £1.93, 9 cm × 9 cm = £4.02, 14 cm × 20 cm = £7.96, 2 cm × 21 cm (rope) = £6.19

A5.2.4 Hydrocolloid dressings

Hydrocolloid dressings are usually presented as a hydrocolloid layer on a vapour-permeable film or foam pad. Semi-permeable to water vapour and oxygen, these dressings form a gel in the presence of exudate to facilitate rehydration in lightly to moderately exuding wounds and promote autolytic debridement of dry, sloughy, or necrotic wounds; they are also suitable for promoting granulation. Hydrocolloid-fibrous dressings made from modified carmellese fibres resemble alginate dressings; hydrocolloid-fibrous dressings are more absorptive and suitable for moderately to heavily exuding wounds.

Without adhesive border

ActivHeal® Hydrocolloid (MedLogic)
- Semi-permeable polyurethane film backing, hydrocolloid wound contact layer, 5 cm × 7.5 cm = £7.64, 10 cm × 10 cm = £1.55, 15 cm × 15 cm = £3.37, 15 cm × 18 cm (sacrum) = £3.91; with polyurethane foam layer, 5 cm × 7.5 cm = £9.50, 10 cm × 10 cm = £1.52, 15 cm × 15 cm = £2.86, 15 cm × 18 cm (sacrum) = £3.30

Appendix 5: Wound Management

Polyurethane matrix dressing

Cutinova® Hydro (S&N Hlth.)
Polyurethane matrix with absorbent particles and waterproof polyurethane film, 5 cm × 6 cm = £1.19, 10 cm × 10 cm = £2.40, 15 cm × 20 cm = £5.07

A5.2.5 Foam dressings

Dressings containing hydrophilic polyurethane foam (adhesive or non-adhesive), or with or without plastic film-backing, are suitable for all types of exuding wounds, but not for dry wounds; some foam dressings have a moisture-sensitive film backing with variable permeability dependent on the level of exudate.

Foam dressings vary in their ability to absorb exudate; some are suitable only for lightly to moderately exuding wounds, others have greater fluid-handling capacity and are suitable for heavily exuding wounds. Saturated foam dressings can cause maceration of healthy skin if left in contact with the wound. Foam dressings can be used in combination with other primary wound contact dressings. If used under compression bandaging or compression garments, the fluid-handling capacity of the foam dressing may be reduced. Foam dressings can also be used to provide a protective cushion for fragile skin. A foam dressing containing isoprofen is available and may be useful for treating painful exuding wounds.

For lightly exuding wounds

Polyurethane Foam Film Dressing with Adhesive Border

PolyMem®, 5 cm × 5 cm = 50p (Aspen Medical)
Tielie® Lite, 11 cm × 11 cm = £2.28, 7 cm × 9 cm = £1.21, 8 cm × 15 cm = £2.81, 8 cm × 20 cm = £2.97 (Systagenix)

Foam dressings can be used in combination with other primary wound contact dressings. If used under compression bandaging or compression garments, the fluid-handling capacity of the foam dressing may be reduced. Foam dressings can also be used to provide a protective cushion for fragile skin. A foam dressing containing isoprofen is available and may be useful for treating painful exuding wounds.

For lightly to moderately exuding wounds

Polyurethane Foam Dressing, BP 1993
Lyfoam®, 7.5 cm × 7.5 cm = £0.05, 10 cm × 10 cm = £1.20, 10 cm × 17.5 cm = £1.94, 15 cm × 20 cm = £2.61 (Molnlycke)

Polyurethane Foam Film Dressing with Adhesive Border

Tielie®, 11 cm × 11 cm = £2.38, 15 cm × 15 cm = £3.89, 18 cm × 18 cm = £4.95, 7 cm × 9 cm = £1.28, 15 cm × 20 cm = £4.87, 18 cm × 18 cm (sacral) = £3.60 (Systagenix)

For moderately to heavily exuding wounds

Polyurethane Foam Film Dressing with Adhesive Border

ActivHeal® Foam Adhesive, 7.5 cm × 7.5 cm = £1.18, 10 cm × 10 cm = £1.60, 12.5 cm × 12.5 cm = £1.68, 15 cm × 15 cm = £2.15, 20 cm × 20 cm = £4.42 (MedLogic)
Allevyn® Adhesive, 7.5 cm × 7.5 cm = £1.43, 10 cm × 10 cm = £2.10, 12.5 cm × 12.5 cm = £2.57, 17.5 cm × 17.5 cm = £5.07, 12.5 cm × 22.5 cm = £4.00, 22.5 cm × 22.5 cm = £7.38; (sacral) 17 cm × 17 cm = £3.80, 22 cm × 22 cm = £5.47 (Systagenix)
Allevyn® Plus Adhesive, 12.5 cm × 12.5 cm = £3.16; 17.5 cm × 17.5 cm = £6.10; 12.5 cm × 22.5 cm = £5.60; (sacral) 17 cm × 17 cm = £4.61, 22 cm × 22 cm = £6.67 (Systagenix)
Biatain® Adhesive, 10 cm × 10 cm = £1.65, 12.5 cm × 12.5 cm = £2.41, 18 cm × 18 cm = £4.86, 18 cm × 28 cm = £7.20, 23 cm × 23 cm (sacral) = £4.16, 19 cm × 20 cm (heel) = £4.85; 17 cm diameter (contour) = £4.67 (Coloplast)
Biatain® Silicone, 7.5 cm × 7.5 cm = £1.41, 10 cm × 10 cm = £2.27, 12.5 cm × 12.5 cm = £2.90, 15 cm × 15 cm = £3.98, 17.5 cm × 17.5 cm = £5.49 (Coloplast)
Kendall® Island, 10 cm × 10 cm = £1.51, 15 cm × 15 cm = £2.84, 20 cm × 20 cm = £5.36 (Covidien)
PermaFoam®, 16.5 cm × 18 cm (concave) = £3.82, 18 cm × 18 cm (sacral) = £3.14, 22 cm × 22 cm (sacral) = £3.61; PermaFoam Comfort®, 8 cm × 8 cm = £1.06, 10 cm × 20 cm = £3.18, 11 cm × 11 cm = £2.02, 15 cm × 15 cm = £3.29, 20 cm × 20 cm = £4.78 (Hartmann)
PolyMem®, 5 cm × 7.6 cm = £1.12, 8.8 cm × 12.7 cm = £1.99, 10 cm × 13 cm = £2.11, 15 cm × 15 cm = £2.84, 16.5 cm × 20.9 cm = £6.54, 18.4 cm × 20 cm (sacral) = £4.39 (Aspen Medical)
Tegaderm® Foam Adhesive, 6.9 cm × 7.6 cm = £1.42, 10 cm × 11 cm = £2.33, 14.3 cm × 14.3 cm = £3.44, 14.3 cm × 15.6 cm = £4.12, 19 cm × 22.5 cm = £6.76, 19 cm × 6.9 cm (soft cloth border) = £1.66, 13 cm × 13 cm (heel) = £4.14 (3M)
Tielie® Plus, 11 cm × 11 cm = £2.63, 15 cm × 15 cm = £4.30, 15 cm × 20 cm = £5.39, 15 cm × 15 cm (sacrum) = £3.13, 20 cm × 26.5 cm (heel) = £4.45 (Systagenix)
Polyurethane Foam Film Dressing without Adhesive Border

ActivHeal® Non-Adhesive, 5 cm x 5 cm = £9.75, 10 cm x 10 cm = £11.13, 10 cm x 17.8 cm = £23.42, 10 cm x 20 cm = £23.44, 20 cm x 20 cm = £39.92, 18 cm x 12 cm (heel) = £3.48 (MedLogic)

Advazorb®, 5 cm x 5 cm = £0.65, 7.5 cm x 7.5 cm = £0.78, 10 cm x 10 cm = £1.08, 10 cm x 20 cm = £3.35, 12.5 cm x 12.5 cm = £1.59, 15 cm x 15 cm = £2.10, 20 cm x 20 cm = £3.75, 17 cm x 21 cm (heel) = £4.75 (Advancis)

Allevyn® Cavity, circular, 5 cm diameter = £3.97, 10 cm diameter = £9.46; tubular, 9 cm x 2.5 cm = £3.85, 12 cm x 4 cm = £6.78 (S&N Hlth.)

Allevyn® Compression, 5 cm x 6 cm = £1.18, 10 cm x 10 cm = £2.43, 15 cm x 15 cm = £4.12, 15 cm x 20 cm = £4.62 (S&N Hlth.)

Allevyn® Non-Adhesive, 5 cm x 5 cm = £1.21, 10 cm x 10 cm = £2.40, 10 cm x 20 cm = £3.86, 20 cm x 20 cm = £6.44, 10.5 cm x 13.5 cm (heel) = £4.81 (S&N Hlth.)

Allevyn® Plus Cavity, 5 cm x 6 cm = £1.78, 10 cm x 10 cm = £2.97, 15 cm x 20 cm = £5.95 (S&N Hlth.)

Askina® Foam, 10 cm x 10 cm = £2.10, 10 cm x 20 cm = £3.31, 20 cm x 20 cm = £5.53, 12 cm x 20 cm (heel) = £4.48; cavity dressing, 2.4 cm x 40 cm = £2.34 (B. Braun)

Biatain® -Bufo Non-Adhesive, impregnated with ibuprofen 0.5 mg/cm², 5 cm x 7 cm = £1.62, 10 cm x 12 cm = £3.12, 10 cm x 22.5 cm = £4.91, 15 cm x 15 cm = £4.91, 20 cm x 20 cm = £8.34 (Coloplast)

Note for cautions and contra-indications of ibuprofen see section 10.1

Biatain® -Bufo Soft-Hold, impregnated with ibuprofen 0.5 mg/cm², 10 cm x 12 cm = £3.12, 10 cm x 22.5 cm = £4.91, 15 cm x 15 cm = £4.91, 20 cm x 20 cm = £8.34 (Coloplast)

Note for cautions and contra-indications of ibuprofen see section 10.1

Biatain® Non-Adhesive, 10 cm x 10 cm = £2.24, 10 cm x 20 cm = £3.70, 15 cm x 15 cm = £4.13, 20 cm x 20 cm = £6.13, 5 cm x 7 cm = £1.23, Biatain® Soft-Hold, 10 cm x 10 cm = £2.44, 15 cm x 15 cm = £4.05, 5 cm x 7 cm = £1.22, 10 cm x 20 cm = £3.70 (Coloplast)

Kendall® Plus, 5 cm x 5 cm = 80p, 7.5 cm x 7.5 cm = £1.39, 10 cm x 10 cm = £1.44, 15 cm x 15 cm = £3.32, 20 cm x 20 cm = £3.96, 10 cm x 20 cm = £2.64, 8.5 cm x 7.5 cm (fenestrated) = £1.22 (Covidien)

Kerraboot®, (clear or white), foot-shaped, extra small = £14.54, small = £14.83, large = £14.83, extra large = £14.54 (Crawford)

Lyfoam® Extra, 10 cm x 10 cm = £2.08, 17.5 cm x 10 cm = £3.52, 20 cm x 15 cm = £4.56 (Molnlycke)

Lyfoam® Max, 7.5 cm x 8.5 cm = £1.05, 10 cm x 10 cm = £1.10, 10 cm x 20 cm = £1.94, 15 cm x 15 cm = £2.07, 15 cm x 20 cm = £2.61, 20 cm x 20 cm = £3.84 (Molnlycke)

PermaFoam®, 10 cm x 10 cm = £2.02, 10 cm x 20 cm = £3.45, 15 cm x 15 cm = £3.82, 20 cm x 20 cm = £5.84, 6 cm diameter = £1.04, 8 cm x 8 cm (fenestrated) = £1.19; cavity dressing, 10 cm x 10 cm = £1.91 (Hartmann)

Cavi-Care® (S&N Hlth.)

Soft, conforming cavity wound dressing prepared by mixing thoroughly for 15 seconds immediately before use and allowing to expand its volume within the cavity. 20 g = £18.62

A5.2.6 Alginate dressings

Non-woven or fibrous, non-occlusive, alginate dressings, made from calcium alginate, or calcium sodium alginate, derived from brown seaweed, form a soft gel in contact with wound exudate.

Alginate dressings are highly absorbent and suitable for use on exuding wounds, and for the promotion of autolytic debridement of debris in very moist wounds. Alginate dressings also act as a haemostatic, but caution is needed because blood clots can cause the dressing to adhere to the wound surface. Alginate dressings should not be used if bleeding is heavy and extreme caution is needed if used for tumours with friable tissue.

Alginate sheets are suitable for use as a wound contact dressing for moderately to heavily exuding wounds and can be layered into deep wounds; alginate rope can be used in sinus and cavity wounds to improve absorption of exudate and prevent maceration. If the dressing does not have an adhesive border or integral adhesive plastic film backing, a secondary dressing will be required.

ActivHeal® (MedLogic)

ActivHeal® Algin, calcium sodium alginate dressing, 5 cm x 5 cm = 58p, 10 cm x 10 cm = £1.13, 10 cm x 20 cm = £2.78; cavity dressing, 2 cm x 30 cm = £2.09

ActivHeal® Aquafiber®, non-woven, calcium sodium alginate dressing, 5 cm x 5 cm = 74p, 10 cm x 10 cm = £1.77, 15 cm x 15 cm = £3.34; cavity dressing, 2 cm x 42 cm = £1.78

Algiste® M (S&N Hlth.)

Calcium alginate fibre, non-woven dressing, 5 cm x 5 cm = 87p, 10 cm x 10 cm = £1.80, 15 cm x 20 cm = £4.84; cavity dressing, 2 cm x 30 cm = £3.27

Algosteril® (S&N Hlth.)

Calcium alginate dressing, 5 cm x 5 cm = 87p, 10 cm x 10 cm = £1.98, 10 cm x 20 cm = £3.34; cavity dressing, 2 g, 30 cm = £3.57
Appendix 5: Wound Management

A5.2.7 Capillary-action dressings

Capillary-action dressings consist of an absorbent core of hydrophilic fibres sandwiched between two low-adherent wound-contact layers to ensure no fibres are shed on to the wound surface. Wound exudate is taken up by the dressing and retained within the highly absorbent central layer.

The dressing may be applied intact to relatively superficial areas, but for deeper wounds or cavities it may be cut to shape to ensure good contact with the wound base. Multiple layers may be applied to heavily exuding wounds to further increase the fluid-absorbing capacity of the dressing. A secondary adhesive dressing is necessary.

Capillary-action dressings are suitable for use on all types of exuding wounds, but particularly on sloughy wounds where removal of fluid from the wound aids debridement; capillary-action dressings are contra-indicated for heavily bleeding wounds or arterial bleeding.

Advadraw® (Advancis)
Non-adherent dressing consisting of a soft viscose and polyester absorbent pad with central wicking layer between two perforated permeable wound contact layers. 5 cm × 7.5 cm = 57p, 10 cm × 10 cm = 88p, 10 cm × 15 cm = £1.19, 15 cm × 20 cm = £1.57

Advadraw Spiral®, 0.5 cm × 40 cm = 82p

Cerdak® Basic (CliniMed)
Non-adhesive wound contact sachet containing ceramic spheres, 5 cm × 5 cm = 70p, 10 cm × 10 cm = £1.56, 10 cm × 15 cm = £2.08; cavity dressing, 10 cm × 10 cm = £2.10, 10 cm × 15 cm = £2.63

Cerdak® Aerocloth, non-adhesive wound contact sachet containing ceramic spheres, with non-woven fabric adhesive backing, 5 cm × 5 cm = £1.37, 5 cm × 10 cm = £1.94

Cerdak® Aerofilm, non-adhesive wound contact sachet containing ceramic spheres, with waterproof transparent adhesive film backing, 5 cm × 5 cm = £1.51, 5 cm × 10 cm = £2.07

Sumar® (Lantor)
Sumar® Lite, for light to moderately exuding wounds and cavities, 5 cm × 5 cm = 93p, 10 cm × 10 cm = £1.59, 10 cm × 15 cm = £2.12

Sumar® Max, for heavily exuding wounds, 5 cm × 5 cm = 95p, 10 cm × 10 cm = £1.61, 10 cm × 15 cm = £2.15

Sumar® Spiral, 0.5 cm × 40 cm = £1.57

Vacutex® (Protex)
Low-adherent dressing consisting of two external polyester wound contact layers with central wicking polyester/cotton mix absorbent layer. 5 cm × 5 cm = 94p, 10 cm × 10 cm = £1.66, 10 cm × 15 cm = £2.23, 10 cm × 20 cm = £2.68, 15 cm × 20 cm = £3.14, 20 cm × 20 cm = £4.28

A5.2.8 Odour absorbent dressings

Dressings containing activated charcoal are used to absorb odour from wounds. The underlying cause of wound odour should be identified. Wound odour is most

Biatain® Alginate (Coloplast)
Alginate and carboxymethylcellulose dressing, highly absorbent, gelling dressing, 5 cm × 5 cm = 96p, 10 cm × 10 cm = £2.28, 15 cm × 15 cm = £4.32; gelling filler, 4 cm = £2.69

Cutimed® Alginate (BSN Medical)
Calcium sodium alginate dressing, 5 cm × 5 cm = 73p, 10 cm × 10 cm = £1.54, 10 cm × 20 cm = £2.89

Kaltostat® (ConvaTec)
Calcium alginate fibre, non-woven, 5 cm × 5 cm, 90p, 7.5 cm × 12 cm = £1.96, 10 cm × 20 cm = £3.84, 15 cm × 25 cm = £8.81; cavity dressing, 2 g = £3.60

Kendall® (Covidien)
Calcium alginate dressing, 5 cm × 5 cm = 70p, 10 cm × 10 cm = £1.49, 10 cm × 14 cm = £2.41, 10 cm × 20 cm = £2.93, 15 cm × 25 cm = £5.15, 30 cm × 61 cm = £27.03; cavity dressing, 30 cm = £2.94, 61 cm = £4.96, 91 cm = £5.36

Kendall® Plus, calcium alginate dressing, 10 cm × 10 cm = £2.04

Kendall® Zn, calcium alginate and zinc dressing, 5 cm × 5 cm = 80p, 10 cm × 10 cm = £1.68, 10 cm × 20 cm = £3.30

Melgisor® (Mölnlycke)
Calcium sodium alginate fibre, highly absorbent, gelling dressing, non-woven, 5 cm × 5 cm = 86p, 10 cm × 10 cm = £1.79, 10 cm × 20 cm = £3.36; cavity dressing, 32 cm × 2.2 cm, (2 g) = £3.90

Sorbalgon® (Hartmann)
Calcium alginate dressing, 5 cm × 5 cm = 77p, 10 cm × 10 cm = £1.62, Sorbalgon® T, cavity dressing, 2 g, 30 cm = £3.30

Sorbsan® (Aspen Medical)
Sorbsan® Flat, calcium alginate fibre, highly absorbent, flat non-woven pads, 5 cm × 5 cm = 80p, 10 cm × 10 cm = £1.68, 10 cm × 20 cm = £3.15

Sorbsan® Plus, alginate dressing bonded to a secondary absorbent viscose pad, 7.5 cm × 10 cm = £1.70, 10 cm × 15 cm = £3.01, 10 cm × 20 cm = £3.84, 15 cm × 20 cm = £5.33

Sorbsan® Ribbon, 40 cm (with probe) = £2.04

Sorbsan® Surgical Packing, 30 cm (2 g, with probe) = £3.47

Suprasorb® A (Activa)
Calcium alginate dressing, 5 cm × 5 cm = 59p, 10 cm × 10 cm = £1.16; cavity dressing, 30 cm (2 g) = £2.15

Tegaderm® Alginate (3M)
Calcium alginate dressing, 5 cm × 5 cm = 78p, 10 cm × 10 cm = £1.64; cavity dressing, 2 cm × 30.4 cm = £2.74

Urgosorb® (Urgo)
Alginate and carboxymethylcellulose dressing without adhesive border, 5 cm × 5 cm = 83p, 10 cm × 10 cm = £1.99, 10 cm × 20 cm = £3.64; cavity dressing, 30 cm = £2.65
effectively reduced by debridement of slough, reduction in bacterial levels, and frequent dressing changes. Fungating wounds and chronic infected wounds produce high volumes of exudate which can reduce the effectiveness of odour absorbent dressings. Many odour absorbent dressings are intended for use in combination with other dressings; odour absorbent dressings with a suitable wound contact layer can be used as a primary dressing.

**Askina® Carbosorb** (B. Braun)
Activated charcoal and non-woven viscose rayon dressing, 10 cm × 10 cm = £2.77, 10 cm × 20 cm = £5.34

**CarboFLEX®** (Convatec)
Dressing in 5 layers: wound-facing absorbent layer containing alginate and hydrocolloid; water-resistant second layer; third layer containing activated charcoal; non-woven absorbent fourth layer; water-resistant backing layer. 10 cm × 10 cm = £3.01, 8 cm × 15 cm = £3.61, 15 cm × 20 cm = £6.85

**Carbopad® VC** (Synergy Healthcare)
Activated charcoal non-absorbent dressing, 10 cm × 10 cm = £1.59, 10 cm × 20 cm = £2.15

**CliniSorb® Odour Control Dressings** (CliniMed)
Activated charcoal cloth enclosed in viscose rayon with outer polyamide coating. 10 cm × 10 cm = £1.78, 10 cm × 20 cm = £2.37, 15 cm × 25 cm = £3.81

**Sorbsan® Plus Carbon** (Aspen Medical)
Alginate dressing with activated carbon, 7.5 cm × 10 cm = £2.48, 10 cm × 15 cm = £4.81, 10 cm × 20 cm = £5.76, 15 cm × 20 cm = £6.63

### Antimicrobial dressings

Spreading infection at the wound site requires treatment with systemic antibacterials. For local wound infection, a topical antimicrobial dressing can be used to reduce the level of bacteria at the wound surface but will not eliminate a spreading infection. Some dressings are designed to release the antimicrobial into the wound, others act upon the bacteria after absorption from the wound. The amount of exudate present and the level of infection should be taken into account when selecting an antimicrobial dressing.

**Medical grade honey** (section A5.3.1), has antimicrobial and anti-inflammatory properties. Dressings impregnated with iodine (section A5.3.2), can be used to treat clinically infected wounds. Dressings containing silver (section A5.3.3), should be used only when clinical signs or symptoms of infection are present.

Dressings containing other antimicrobials (section A5.3.4) such as polihexanide (polyhexamethylene biguanide) or dialkyldimethylammonium chloride are available for use on infected wounds. Although hypersensitivity is unlikely with chlorhexidine impregnated tulle dressing, the antibacterial efficacy of these dressings has not been established.

### Honey

**Medical grade honey** has antimicrobial and anti-inflammatory properties and can be used for acute or chronic wounds. Medical grade honey has osmotic properties, producing an environment that promotes autolytic debridement; it can help control wound malodour. Honey dressings should not be used on patients with extreme sensitivity to honey, bee stings or bee products. Patients with diabetes should be monitored for changes in blood-glucose concentrations during treatment with topical honey or honey-impregnated dressings.

#### Sheet dressing

**Actilite®** (Advancis)
Knitted viscose impregnated with medical grade manuka honey and manuka oil, 10 cm × 10 cm = £1.82, 10 cm × 10 cm = £3.06

**Activon Tulle®** (Advancis)
Knitted viscose impregnated with medical grade manuka honey, 5 cm × 5 cm = £1.96, 10 cm × 10 cm = £3.36

**Algivon®** (Advancis)
Absorbent, non-adherent calcium alginate dressing impregnated with medical grade manuka honey, 5 cm × 5 cm = £2.13, 10 cm × 10 cm = £3.59

**Medihoney®** (Derma Sciences Europe)
Antibacterial Honey Tulle, woven fabric impregnated with medical grade manuka honey, 10 cm × 10 cm = £2.98

**Gel sheet**, sodium alginate dressing impregnated with medical grade honey, 5 cm × 5 cm = £1.75, 10 cm × 10 cm = £4.20

**Antibacterial Honey Apinate®**, non-adherent calcium alginate dressing, impregnated with medical grade honey, 5 cm × 5 cm =£2.00, 10 cm × 10 cm = £3.40, 19 cm × 30 cm (rope) = £4.20

**Melladerm® Plus Tulle** (Danetre)
Knitted viscose impregnated with medical grade honey (Bulgarian, mountain flower) 45% in a basis containing polyethylene glycol, 10 cm × 10 cm = £2.10

**MelMax®** (CliniMed)
Acetate wound contact layer impregnated with buckwheat honey 75% in ointment basis, 5 cm × 6 cm = £4.92, 8 cm × 10 cm = £9.90, 8 cm × 20 cm = £19.79

**Mesitran®** (Aspen Medical)
Hydrogel, semi-permeable dressing impregnated with medical grade honey, 10 cm × 10 cm = £2.55, 15 cm × 20 cm = £5.31; with adhesive border, 10 cm × 10 cm = £2.66, 15 cm × 13 cm (sacral) = £4.50, 15 cm × 15 cm = £4.70

**Mesitran® Mesh**, hydrogel, non-adherent wound contact layer, without adhesive border, 10 cm × 10 cm = £2.45
### Honey-based topical application

Medical grade honey is applied directly to the wound and covered with a primary low adherence wound dressing; an additional secondary dressing may be required for exuding wounds.

**Activen®** (Advancis)

- **Honey** (medical grade, manuka), 25-g tube = £2.02

**MANUKApli®** (Manuka Medical)

- **Honey** (medical grade, manuka), 15-g tube = £2.95

**Medihoney®** (Derma Sciences Europe)

- **Antibacterial Medical Honey**, honey (medical grade, Leptospermum sp.), 20-g tube = £3.96, 50-g tube = £9.90

**Antibacterial Wound Gel**, honey (medical grade, Leptospermum sp.), 80% in natural waxes and oils, 10-g tube = £2.69, 20-g tube = £4.02

**Note**: Antibacterial Wound Gel is not recommended for use in deep wounds or body cavities where removal of waxes may be difficult.

**Melladerm® Plus** (SanoMed)

- **Honey** (medical grade; Bulgarian, mountain flower) 85% in resin containing polyethylene glycol, 20-g tube = £3.98, 50-g tube = £8.50

**Mesitran®** (Aspen Medical)

- **Ointment**, honey (medical grade) 47%, 15-g tube = £3.47, 50-g tube = £9.55
- **Excipients** include lanolin

- **Ointment S**, honey (medical grade) 40%, 15-g tube = £3.46
- **Excipients** include lanolin

### Iodine

**Cadexomer–iodine**, like povidone–iodine, releases free iodine when exposed to wound exudate. The free iodine acts as an antiseptic on the wound surface, the cadexomerabsorbs wound exudate and encourages desloughing.

Two-component hydrogel dressings containing glucose oxidase and iodide ions generate a low level of free iodine in the presence of moisture and oxygen.

**Povidone–iodine fabric dressing** is a knitted viscose dressing with povidone–iodine incorporated in a hydrophilic polyethylene glycol basis; this facilitates diffusion of the iodine into the wound and permits removal of the dressing by irrigation. The iodine has a wide spectrum of antimicrobial activity but it is rapidly deactivated by wound exudate.

Systemic absorption of iodine may occur, particularly from large wounds or with prolonged use.

**Iodoflex®** (S&N Hlth.)

- **Paste**, iodine 0.9% as cadexomer–iodine in a paste basis with gauze backing, 5-g unit = £3.88; 10-g = £7.76; 17 g = £12.29

**Uses** for treatment of chronic exuding wounds; max. single application 50 g, max. weekly application 150 g, max. duration up to 3 months in any single course of treatment

**Cautions** iodine may be absorbed, particularly from large wounds or during prolonged use; severe renal impairment; history of thyroid disorder

**Contra-indications** children; patients receiving lithium; thyroid disorders; pregnancy and breast-feeding

### Iodosorb® (S&N Hlth.)

- **Ointment**, iodine 0.9% as cadexomer–iodine in an ointment basis, 10 g = £4.29; 20 g = £8.58

**Powder**, iodine 0.9% as cadexomer–iodine microbeads, 3-g sachet = £1.84

**Uses** for treatment of chronic exuding wounds; max. single application 50 g, max. weekly application 150 g, max. duration up to 3 months in any single course of treatment

**Cautions** iodine may be absorbed, particularly from large wounds or during prolonged use; severe renal impairment; history of thyroid disorder

**Contra-indications** children; patients receiving lithium; thyroid disorders; pregnancy and breast-feeding

### Iodozyme® (Archimed)

- **Hydrogel** (two-component dressing containing glucose oxidase and iodide ions), 6.5 cm × 5 cm = £7.50, 10 cm × 10 cm = £12.50

**Uses** antimicrobial dressing for lightly to moderately exuding wounds

**Cautions** children; pregnancy and breast-feeding

**Contra-indications** thyroid disorders; patients receiving lithium

### Oxyzyme® (Archimed)

- **Hydrogel** (two-component dressing containing glucose oxidase and iodide ions), 6.5 cm × 5 cm = £6.00, 10 cm × 10 cm = £10.00

**Uses** non-infected, dry to moderately exuding wounds

**Cautions** children; pregnancy and breast-feeding

**Contra-indications** thyroid disorders; patients receiving lithium

### Povidone–iodine fabric dressing

(Drug Tariff specification 43). Knitted viscose primary dressing impregnated with povidone–iodine ointment 10%, 5 cm × 5 cm = £32p; 9.5 cm × 9.5 cm = 48p (Systagenix—Inadine®)

**Uses** wound contact layer for abrasions and superficial burns

**Cautions** iodine may be absorbed particularly if large wounds treated; children under 6 months; thyroid disease

**Contra-indications** severe renal impairment; pregnancy; breast-feeding

### Silver

Antimicrobial dressings containing silver should be used only when infection is suspected as a result of clinical signs or symptoms (see also p. 1073). Silver ions exert an antimicrobial effect in the presence of wound exudate; the volume of wound exudate as well as the presence of infection should be considered when selecting a silver-containing dressing. Silver-impregnated dressings should not be used routinely for the management of uncomplicated ulcers. It is recommended that these dressings should not be used on acute wounds as there is some evidence to suggest they delay wound healing.

Dressings impregnated with silver sulfadiazine have broad antimicrobial activity; if silver sulfadiazine is applied to large areas, or used for prolonged periods, there is a risk of blood disorders and skin discoloration (see section 13.10.1.1). The use of silver sulfadiazine-impregnated dressings is contra-indicated in neonates, in pregnancy, and in patients with significant renal or hepatic impairment, sensitivity to sulfonamides, or G6PD deficiency. Large amounts of silver sulfadiazine applied topically may interact with other drugs—see Appendix 1 (sulfonamides).
**Low adherence dressings**

**Acticoat®** (S&N Hlth.)
Three-layer antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 3-day wear), 5 cm × 5 cm = £3.30, 10 cm × 10 cm = £8.07, 10 cm × 20 cm = £12.62, 20 cm × 40 cm = £43.18

**Acticoat® 7** five-layer antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 7-day wear), 5 cm × 5 cm = £5.74, 10 cm × 12.5 cm = £17.11, 15 cm × 15 cm = £30.76

**Atrauman® Ag** (Hartmann)
Non-adherent polyamide fabric impregnated with silver and neutral triglycerides, 5 cm × 5 cm = 49p, 10 cm × 10 cm = £1.19, 10 cm × 20 cm = £2.32

**With charcoal**

**Actisorb® Silver 220** (Systagenix)
Knitted fabric of activated charcoal, with one-way stretch, with silver residues, within spun-bonded nylon sleeve. 6.5 cm × 9.5 cm = £1.64, 10.5 cm × 10.5 cm = £2.58, 10.5 cm × 19 cm = £4.70

**Soft polymer dressings**

**Allevyn® Ag Gentle** (S&N Hlth.)
Soft polymer wound contact dressing, with silver sulfadiazine impregnated polyurethane foam layer, with adhesive border, 7.5 cm × 7.5 cm = £3.99, 10 cm × 10 cm = £5.99, 12.5 cm × 12.5 cm = £7.71, 17.5 cm × 17.5 cm = £14.69; without adhesive border, 5 cm × 5 cm = £3.12, 10 cm × 10 cm = £5.82, 10 cm × 20 cm = £9.62, 15 cm × 15 cm = £10.83, 20 cm × 20 cm = £16.04

**Contra-indications** see notes above

**Mepilex® Ag** (Mölnlycke)
Soft silicone wound contact dressing with polyurethane foam film backing, with silver, with adhesive border, 7 cm × 7.5 cm = £3.30, 10 cm × 12.5 cm = £5.97, 10 cm × 20 cm = £8.69, 10 cm × 25 cm = £10.68, 10 cm × 30 cm = £13.04, 15 cm × 17.5 cm = £10.96, 17 cm × 20 cm = £14.20, 18 cm × 18 cm (sacral) = £11.46, 20 cm × 20 cm (sacral) = £13.93, 23 cm × 23 cm = £18.30; without adhesive border, 10 cm × 10 cm = £5.91, 10 cm × 20 cm = £9.75, 15 cm × 15 cm = £10.98, 20 cm × 20 cm = £16.27, 20 cm × 50 cm = £61.22, 13 cm × 20 cm (heel) = £12.38, 15 cm × 22 cm = £13.87

**Urgotul® Silver** (Urgo)
Non-adherent soft polymer wound contact dressing, with silver, 10 cm × 12 cm = £3.34, 15 cm × 20 cm = £9.09

**Urgotul® Duo Silver** (Urgo), non-adherent, soft polymer wound contact dressing, with silver, 5 cm × 7 cm = £1.95, 11 cm × 11 cm = £3.87, 15 cm × 20 cm = £9.35

**Urgotul® SSD** (Urgo)
Non-adherent, soft polymer wound contact dressing, with silver sulfadiazine, 11 cm × 11 cm = £2.99, 16 cm × 21 cm = £9.48

**Hydrocolloid dressings**

**Aquacel® Ag** (Convatec)
Soft non-woven pad containing hydrocolloid fibres, (silver impregnated), 4 cm × 10 cm = £2.70, 4 cm × 20 cm = £3.52, 4 cm × 30 cm = £5.27, 5 cm × 5 cm = £1.86, 10 cm × 10 cm = £4.44, 15 cm × 15 cm = £8.36, 20 cm × 30 cm = £20.73; 1 cm × 45 cm (ribbon) = £2.97, 2 cm × 45 cm (ribbon) = £4.46

**Physiostulle® Ag** (Coloplast)
Non-adherent polyester fabric with hydrocolloid and silver sulfadiazine, 10 cm × 10 cm = £2.14

**Contra-indications** see notes above

**Foam dressings**

**Acticoat® Moisture Control** (S&N Hlth.)
Three layer polyurethane dressing consisting of a silver coated layer, a foam layer, and a waterproof layer, 5 cm × 5 cm = £6.76, 10 cm × 10 cm = £15.82, 10 cm × 20 cm = £30.82

**Allevyn® Ag** (S&N Hlth.)
Silver sulfadiazine impregnated polyurethane foam film dressing with adhesive border, 7.5 cm × 7.5 cm = £3.27, 10 cm × 10 cm = £5.16, 12.5 cm × 12.5 cm = £6.78, 17.5 cm × 17.5 cm = £13.03, 17 cm × 17 cm (sacral) = £10.18, 22 cm × 22 cm (sacral) = £13.64; without adhesive border, 5 cm × 5 cm = £3.06, 10 cm × 10 cm = £5.76, 15 cm × 15 cm = £10.91, 20 cm × 20 cm = £15.99, 10.5 cm × 13.5 cm (heel) = £10.09

**Contra-indications** see notes above

**Biatain® Ag** (Coloplast)
Silver impregnated polyurethane foam film dressing with adhesive border, 12.5 cm × 12.5 cm = £8.71, 18 cm × 18 cm = £17.47, 19 cm × 20 cm (heel) = £17.23, 23 cm × 23 cm (sacral) = £18.31; without adhesive border, 10 cm × 10 cm = £7.61, 5 cm × 7 cm = £3.13, 10 cm × 20 cm = £13.99, 15 cm × 15 cm = £15.28, 20 cm × 20 cm = £21.55; 5 cm × 8 cm (cavity) = £3.79

**PolyMem® Silver** (Aspen Medical)
Silver impregnated polyurethane foam film dressing, with adhesive border, 5 cm × 7.6 cm (oval) = £2.20, 12.7 cm × 8.8 cm (oval) = £5.43; without adhesive border, 10.8 cm × 10.8 cm = £6.60, 17 cm × 19 cm = £17.22; 8 cm × 8 cm (cavity) = £6.84

**UroCell® Silver** (Urgo)
Non-adherent, polyurethane foam film dressing with silver in wound contact layer, 6 cm × 6 cm = £4.11, 10 cm × 10 cm = £5.65, 15 cm × 20 cm = £10.17
Appendix 5: Wound Management

#### Other antimicrobials

**Sorbsan**
Calcium alginate dressing with a silver coated antimicrobial barrier, 5 cm × 5 cm = £5.04, 10 cm × 12.5 cm = £12.11; 2 cm × 30 cm (cavity) = £12.18

**Algise® Ag** (S&N Hlth.)
Calcium alginate dressing, with silver, 5 cm × 5 cm = £1.56, 10 cm × 10 cm = £3.90, 10 cm × 20 cm = £7.17; 2 g, 30 cm (cavity) = £5.38

**Askina® Calgitrol (B. Braun)**
Askina® Calgitrol Ag, Calcium alginate and silver alginate dressing with polyurethane foam backing, 10 cm × 10 cm = £3.14, 15 cm × 15 cm = £6.08, 20 cm × 20 cm = £14.19

**Askina® Calgitrol Thin**
Calcium alginate and silver alginate matrix, for use with absorptive secondary dressings, 5 cm × 5 cm = £1.94, 10 cm × 10 cm = £4.03, 15 cm × 15 cm = £9.04, 20 cm × 20 cm = £15.97

**Melgisorb® Ag** (Mölînycke)
Alginate and carboxymethylcellulose dressing, with ionic silver, 5 cm × 5 cm = £1.53, 10 cm × 10 cm = £3.43, 15 cm × 15 cm = £7.25; 3 cm × 44 cm (cavity) = £4.32

**Silvercel®** (Systagenix)
Alginate and carboxymethylcellulose dressing impregnated with silver, 2.5 cm × 30.5 cm = £4.45, 5 cm × 5 cm = £1.68, 10 cm × 20 cm = £7.68, 11 cm × 11 cm = £4.14

**Silvercel® Non-Adherent**
Alginate and carboxymethylcellulose dressing with film wound contact layer, impregnated with silver, 5 cm × 5 cm = £1.62, 11 cm × 11 cm = £3.89, 10 cm × 20 cm = £7.25; 2.5 cm × 30.5 cm (cavity) = £3.94

**Sorbsan® Silver (Aspen Medical)**
Sorbsan® Silver Flat, calcium alginate fibre, highly absorbent, flat non-woven pads, with silver, 5 cm × 5 cm = £1.57, 10 cm × 10 cm = £3.97, 10 cm × 20 cm = £7.26

**Sorbsan® Silver Plus**
Calcium alginate dressing with absorbent backing, with silver, 7.5 cm × 10 cm = £3.31, 10 cm × 15 cm = £5.50, 10 cm × 20 cm = £6.69, 15 cm × 20 cm = £8.98

**Sorbsan® Silver Plus SA**
Calcium alginate dressing with absorbent backing and adhesive border, with silver, 11.5 cm × 14 cm = £5.38, 14 cm × 19 cm = £7.73, 14 cm × 24 cm = £8.51, 19 cm × 24 cm = £9.49

**Sorbsan® Silver Ribbon**
, with silver, 40 cm (with probe) = £4.15

**Sorbsan® Silver Surgical Packing**
, with silver, 30 cm (2 g, with probe) = £5.76

**Superisorb® A + Ag** (Activia)
Calcium alginate dressing, with silver, 5 cm × 5 cm = £1.54, 10 cm × 10 cm = £3.87, 10 cm × 20 cm = £7.14; cavity dressing, 30 cm (2 g) = £5.72

**Tegaderm® Alginate Ag** (3M)
Calcium alginate and carboxymethylcellulose dressing, with silver, 5 cm × 5 cm = £1.35, 10 cm × 10 cm = £3.15; cavity dressing 3 cm × 30 cm = £3.60

**Urgosorb® Silver** (Urgo)
Alginate and carboxymethylcellulose dressing, impregnated with silver, 5 cm × 5 cm = £1.44, 10 cm × 10 cm = £3.44, 10 cm × 20 cm = £6.48; cavity dressing, 2.5 cm × 30 cm = £3.46

#### Chlorhexidine Gauze Dressing, BP 1993
Fabric of leno weave, wool and warp threads of cotton and/or viscose yarn, impregnated with ointment containing chlorhexidine acetate, 5 cm × 5 cm = 28p; 10 cm × 10 cm = 58p (S&N Hlth.—Bactiglars®)

**Cutimed® Sorbact** (BSH Medical)
Low adherence adhesive dressing impregnated with dialky carbamoyl chloride, (dressing pad) 7 cm × 9 cm = £3.42, 10 cm × 10 cm = £5.34, 10 cm × 20 cm = £8.33; (swabs) 4 cm × 6 cm = £1.60, 7 cm × 9 cm = £2.67, (round swabs) 3 cm, 5 pad pack = £3.20, (ribbon gauze, cotton) 2 cm × 50 cm = £3.92, 5 cm × 2 m = £7.72

**Gel**
Hydrogel dressing impregnated with dialky carbamoyl chloride, 7.5 cm × 7.5 cm = £2.58, 7.5 cm × 15 cm = £4.35

**Cutimed® Sorbact Hydroactive**, non-adhesive gel dressing with hydrogel matrix and acetate fabric coated with dialky carbamoyl chloride, 7 cm × 8.5 cm = £3.57, 14 cm × 14 cm = £5.21, 14 cm × 24 cm = £8.35, 19 cm × 19 cm = £9.81, 24 cm × 24 cm = £14.87

**Cutimed® Sorbact Hydroactive B**
, gel dressing with hydrogel matrix and acetate fabric coated with dialky carbamoyl chloride, with adhesive border, 5 cm × 6.5 cm = £3.86, 10 cm × 10 cm = £6.88, 10 cm × 20 cm = £11.02, 15 cm × 15 cm = £12.95, 20 cm × 20 cm = £19.63

**Cutimed® Siltek Sorbact**
, polyurethane foam dressing with acetate fabric coated with dialky carbamoyl chloride, with adhesive border, 7.5 cm × 7.5 cm = £2.47, 12.5 cm × 12.5 cm = £6.33, 15 cm × 15 cm = £7.84, 17.5 cm × 17.5 cm = £10.97, 22.5 cm × 22.5 cm = £16.69, 17.5 cm × 17.5 cm (sacral) = £7.93, 23 cm × 23 cm (sacral) = £11.92

**Flaman®** (Crawford)
Forte gel, alginate with glucose oxidase and lactoperoxidase, for moderately to heavily exuding wounds, 15 g = £7.26, 50 g = £24.04

**Hydro gel**
, alginate with glucose oxidase and lactoperoxidase, for lightly to moderately exuding wounds, 15 g = £7.26, 50 g = £24.04

**Kendall AMD®** (Covidien)
Foam dressing with polyhexanide, without adhesive border, 5 cm × 5 cm = £2.45, 10 cm × 10 cm = £4.62, 15 cm × 15 cm = £8.75, 20 cm × 20 cm = £12.82, 8.8 cm × 7.5 cm (fenestrated) = £4.15, 10 cm × 20 cm = £8.75

**Kendall AMD® Plus**
10 cm × 10 cm = £4.85, 8.8 cm × 7.5 cm (fenestrated) = £4.35
Octenilin® (Schülke)
Wound gel, hydroxyethylcellulose and propylene glycol, with octenidine hydrochloride, 20 mL = £4.78

Prontosan® Wound Gel (B. Braun)
Hydrogel containing betaine surfactant and polyhexanide, 30 mL = £6.12

Suprasorb® X + PHMB (Activa)
Biocytin covalently modified polyurethane foam dressing, 5 cm × 5 cm = £2.42, 9 cm × 9 cm = £4.81, 14 cm × 20 cm = £10.95; 2 cm × 21 cm (rope) = £6.82

Telfa® AMD (Covidien)
Low adherence absorbent perforated plastic film faced dressing with polyhexanide, 7.5 cm × 10 cm = 17p, 7.5 cm × 20 cm = 28p

Suprasorb® AMD Island, low adherence dressing with adhesive border and absorbent pad, with polyhexanide, 10 cm × 12.5 cm = 58p, 10 cm × 20 cm = 85p, 10 cm × 25.5 cm = 96p, 10 cm × 35 cm = £1.19

Irrigation fluids

Octenilin® (Schülke)
Wound irrigation solution, aqueous solution containing glycerol, ethyleneglycol and octenidine hydrochloride, 350 mL = £4.60

Prontosan® Wound Irrigation Solution (B. Braun)
Aqueous solution containing betaine surfactant and polyhexanide, 40 mL = £0.58, 350 mL = £4.66

A5.4 Specialised dressings

A5.4.1 Protease-modulating matrix dressings

Protease-modulating matrix dressings alter the activity of proteolytic enzymes in chronic wounds; the clinical significance of this approach is yet to be demonstrated.

Cadesorb® (S&N Hlth.)
Ointment, starch-based, 10 g = £5.10, 20 g = £8.69

Catrix® (Crane)
Powder, collagen matrix (cartilage, bovine), 1-g sachet = £3.90

Promogran® (Systagenix)
Collagen and oxidised regenerated cellulose matrix, applied directly to wound and covered with suitable dressing, 28 cm² (hexagonal) = £5.19, 123 cm² (hexagonal) = £15.62

Promogran® Prisma® Matrix, collagen, silver and oxidised regenerated cellulose matrix, applied directly to wound and covered with suitable dressing, 28 cm² (hexagonal) = £6.31, 123 cm² (hexagonal) = £17.98

Tegaderm® Matrix (3M)
Cellulose acetate matrix, impregnated with polyhydrated ionogens ointment in polyethylene glycol basis, 5 cm × 6 cm = £4.75, 8 cm × 10 cm = £9.75

UrgoStart® (Urgo)
Soft adherent polymer matrix containing nano-oligosaccharide factor (NOSF), with polyurethane foam film backing, 6 cm × 6 cm = £4.30, 10 cm × 10 cm = £5.95, 15 cm × 20 cm = £10.70, 12 cm × 19 cm (heel) = £8.20

UrgoStart® Contact (Urgo)
Non-adherent soft polymer wound contact dressing containing nano-oligosaccharide factor (NOSF), 5 cm × 7 cm = £2.80, 11 cm × 11 cm = £3.98, 16 cm × 21 cm = £9.50

Xelma® (Möllycke)
Gel, alginate and propylene glycol with extracellular matrix proteins (amelenogen), 0.5-mL syringe = £56.98, 1-mL syringe = £99.72

A5.4.2 Silicone keloid dressings

Silicone gel and gel sheets are used to reduce or prevent hypertrophic and keloid scarring. They should not be used on open wounds. Application times should be increased gradually. Silicone sheets can be washed and reused.

Silicone sheets

Advasil® Conform (Advancis)
Self-adhesive silicone gel sheet with polyurethane film backing, 10 cm × 10 cm = £5.20, 10 cm × 15 cm = £9.17

BAP Scar Care T® (BAP)
Self-adhesive silicone gel sheet, 5 cm × 7 cm = £3.15, 5 cm × 30 cm = £9.00, 10 cm × 15 cm = £9.00

Cica-Care® (S&N Hlth.)
Soft, self-adhesive, semi-occlusive silicone gel sheet with backing. 6 cm × 12 cm = £13.79; 15 cm × 12 cm = £26.89

Ciltech® (Su-Med)
Silicone gel sheet, 10 cm × 10 cm = £7.50, 15 cm × 15 cm = £14.00, 20 cm × 20 cm = £12.50

Dermatix® (Meda)
Self-adhesive silicone gel sheet (clear- or fabric-backed), 4 cm × 13 cm = £6.69, 13 cm × 13 cm = £15.34, 13 cm × 25 cm = £27.73, 20 cm × 30 cm = £50.49

Mepiform® (Möllycke)
Self-adhesive silicone gel sheet with polyurethane film backing, 5 cm × 7 cm = £3.26, 9 cm × 18 cm = £12.76, 4 cm × 31 cm = £10.31

Scar FX® (Jobskin)
Self-adhesive, transparent, silicone gel sheet, 10 cm × 20 cm = £16.00, 25.5 cm × 30.5 cm = £60.00, 3.75 cm × 22.5 cm = £12.00, 7.5 cm diameter = £8.50, 22.5 cm × 14.5 cm = £12.00

Siligel® (Nagor)
Silicone gel sheet, 10 cm × 10 cm = £13.50; 20 cm × 20 cm = £40.00; 40 cm × 40 cm = £144.00; 10 cm × 5 cm = £7.50; 15 cm × 10 cm = £19.50; 30 cm × 5 cm = £19.50; 10 cm × 30 cm = £31.50; 25 cm × 15 cm (submammary) = £21.12; 46 cm × 8.5 cm (abdominal) = £39.46; 5.5 cm diameter (circular) = £4.00
A5.5 Adjunct dressings and appliances

A5.5.1 Surgical absorbents

Surgical absorbents applied directly to the wound have many disadvantages—dehydration of and adherence to the wound, shedding of fibres, and the leakage of exudate (‘strike through’) with an associated risk of infection. Gauze and cotton absorbent dressings can be used as secondary layers in the management of heavily exuding wounds (but see also Capillary-action dressings, section A5.2.7). Absorbent cotton gauze fabric can be used for swabbing and cleaning skin. Ribbon gauze can be used post-operatively to pack wound cavities, but adherence to the wound bed will cause bleeding and tissue damage on removal of the dressing—an advanced wound dressing (e.g. hydrocolloid-fibrous (section A5.2.4), foam (section A5.2.5), or alginate (section A5.2.6)) layered into the cavity is often more suitable.

A5.5.2 Wound drainage pouches

Wound drainage pouches can be used in the management of wounds and fistulas with significant levels of exudate.

**Biotrol® (B. Braun)**

- Draina S Fistula, wound drainage pouch, mini (cut to 20 mm), 150-mL capacity = £2.44; medium (cut to 50 mm), 350-mL capacity = £3.64; large (cut to 88 mm), 500-mL capacity = £4.48
- Draina S Vision, wound drainage pouch, (cut to 50 mm), 250-mL capacity = £9.39; (cut to 88 mm), 250-mL capacity = £9.92; (cut to 100 mm), 300-mL capacity = £11.51
Eakin® (Eakin)

Wound pouch, fold and tuck closure, small (wound size up to 45 mm × 30 mm) = £4.50; medium (wound size up to 110 mm × 75 mm) = £6.50; large (wound size up to 175 mm × 110 mm) = £8.50; extra large (horizontal wound up to 245 mm × 160 mm) = £15.00.

Wound pouch, bung closure, small (wound size up to 45 mm × 30 mm) = £5.00; medium (wound size up to 110 mm × 75 mm) = £7.00; large (wound size up to 175 mm × 110 mm) = £9.50; extra large (horizontal or vertical wound up to 245 mm × 160 mm) = £17.00, (vertical incision wound up to 290 mm × 130 mm) = £17.00; (horizontal wound up to 245 mm × 160 mm), with access window = £19.00.

Access window, for use with Eakin® pouches = £7.00.

Oakmed® Option (OakMed)

Wound Manager, extra small (wound size up to 90 mm × 180 mm) = £11.00; small (horizontal wound size up to 245 mm × 160 mm) = £12.23; medium (vertical wound size up to 90 mm × 260 mm) = £12.50; large (wound size up to 160 mm × 260 mm) = £14.90; square (wound size up to 160 mm × 200 mm) = £13.05.

Wound Manager, with access port, extra small (wound size up to 90 mm × 180 mm) = £12.02; small (horizontal wound size up to 245 mm × 160 mm) = £12.77; medium (vertical wound size up to 90 mm × 260 mm) = £13.05; large (wound size up to 160 mm × 260 mm) = £15.93; square (vertical wound size up to 160 mm × 200 mm) = £13.59.

Wound Manager, cut-to-fit, small (10–30 mm) = £2.25, medium (10–50 mm) = £2.49, large (10–50 mm) = £2.61.

Welland® (CliniMed)

Fistula bag, wound manager, cut-to-fit (wound size up to 40 mm × 70 mm) = £2.54.

Wound Drainage Collector (Hollister)

Pouch, drainable, small (wound size up to 76 mm) = £7.45, medium (wound size up to 95 mm) = £8.13, large (wound size up to 100 mm × 200 mm) = £16.10.

A5.5.3 Physical debridement pads

DebriSoft® is a pad that is used for the debridement of superficial wounds containing loose slough and debris, and for the removal of hyperkeratosis from the skin. DebriSoft® must be fully moistened with a wound cleansing solution before use and is not appropriate for use as a wound dressing.

DebriSoft® (Activa)

Pad, polyester fibres with bound edges and knitted outer surface coated with polyacrylate, 10 cm × 10 cm = £6.19.

A5.6 Complex adjunct therapies

Topical negative pressure (or vacuum-assisted) therapy requires specific wound dressings for use with the vacuum-pump equipment.

Other complex adjunct therapies include sterile larvae (maggots).
Appendix 5: Wound Management

Sterile Dressing Pack with Non-woven Pads

Multiple Pack Dressing No. 1
(Drug Tariff). Contains absorbent cotton, absorbent cotton gauze type 13 light (sterile), open-wove bandages (banded). 1 pack = £4.09

Non-Drug Tariff Specification Sterile Dressing Pack

Dressit® contains vitrex gloves, large apron, disposable bag, paper towel, softswabs, absorbent pad, sterile field = 60p (Richardson)

Nurse It® contains latex-free, powder-free nitrile gloves, sterile laminated paper sheet, large apron, non-woven swabs, paper towel, disposable bag, compartmented tray, disposable forceps, paper measuring tape = 52p (Medicare)

Polyfield® Nitrile Patient Pack contains powder-free nitrite gloves, laminate sheet, non-woven swabs, towel, polyethylene disposable bag, apron = 52p (Shermond)

Propax® SDP. contains paper towel, disposable bag, gauze swabs, dressing pad, sterile field = 46p (BSN Medical)

Woundcare® contains nitrite gloves, sterile field, compartmented tray, large apron, disposable bag, non-woven swabs, drape = 44p (Frontier)

Sterile Dressing Pack
(Drug Tariff specification 10). Contains gauge and cotton tissue pad, gauge swabs, absorbent cotton wool balls, absorbent paper towel, water repellent inner wrapper. 1 pack = 51p (Synergy Healthcare—Vernaid®)

Sterile Dressing Pack with Non-woven Pads

Gauze Swab, BP 1988
Consists of absorbent cotton gauze type 13 light or absorbent cotton and viscose gauze type I folded into squares or rectangles of 8-ply with no cut edges exposed, sterile, 7.5 cm × 7.5 cm 5-pad packet = 39p; non-sterile, 10 cm × 10 cm, 100-pad packet = £1.37 (most suppliers)

Filmated Gauze Swab, BP 1988
As for Gauze Swab, but with thin layer of Absorbent Cotton enclosed within, non-sterile, 10 cm × 10 cm, 100-pad packet = £3.67 (Synergy Healthcare—Cotfil®)

Non-woven Fabric Swab
(Drug Tariff specification 28). Consists of non-woven fabric folded 4-ply; alternative to gauze swabs, type 13 light, sterile, 7.5 cm × 7.5 cm, 5-pad packet = 25p; non-sterile, 10 cm × 10 cm, 100-pad packet = 79p

Filmated Non-woven Fabric Swab
(Drug Tariff specification 29). Film of viscose fibres enclosed within non-woven viscose fabric folded 8-ply, non-sterile, 10 cm × 10 cm, 100-pad packet = £3.55 (Syngagenix—Regaf®)

Surgical adhesive tapes
Adhesive tapes are useful for retaining dressings on joints or awkward body parts. These tapes, particularly those containing rubber, can cause irritant and allergic reactions in susceptible patients; synthetic adhesives have been developed to overcome this problem, but they, too, may sometimes be associated with reactions. Synthetic adhesive, or silicon adhesive, tapes can be used for patients with skin reactions to plasters and strapping containing rubber, or undergoing prolonged treatment. Adhesive tapes that are occlusive may cause skin maceration. Care is needed not to apply these tapes under tension, to avoid creating a tourniquet effect. If applied over joints they need to be orientated so that the area of maximum extensibility of the fabric is in the direction of movement of the limb.

Permeable adhesive tapes
Elastic Adhesive Tape, BP 1988
(Elastic Adhesive Plaster). Woven fabric, elastic in warp (crepe-twisted cotton threads), weft of cotton and/or viscose threads, spread with adhesive mass containing zinc oxide. 4.5 m stretched × 2.5 cm = £1.71 (S&N—Elastoplast®)
For 5 cm width, see Elastic Adhesive Bandage

Permeable, Apertured Non-Woven Synthetic Adhesive Tape, BP 1988
Non-woven fabric with a polyacrylate adhesive. Chemifix®, 2.5 cm × 5 m = 90p, 5 cm × 5 m = £1.25, 10 cm × 5 m = £2.10, 2.5 cm × 10 m = £1.00, 5 cm × 10 m = £1.40, 10 cm × 10 m = £2.10 (Medicareplus International)
Hypafix®, 5 cm × 5 m = £1.36, 10 cm × 5 m = £2.28, 10 m (all): 2.5 cm = £1.58, 5 cm = £2.51, 10 cm = £4.38, 15 cm = £6.49, 20 cm = £8.61, 30 cm = £12.45 (BSN Medical)
Impermeable Plastic Adhesive Tape, BP 1988
Extensible water-impermeable plastic film spread with a polymeric adhesive mass. 2.5 cm × 5 m = £1.38; 2.5 cm × 5 m = £2.03; 5 cm × 5 m = £2.57; 7.5 cm × 5 m = £3.74 (BSN Medical—Sleek®)

Zinc Oxide Adhesive Tape
Mediplast®, 5 m (all): 2.5 cm = £1.27; 5 cm = £2.27 (most suppliers)

Zinc Oxide Plaster. Fabric, plain weave, warp and weft of cotton and/or viscose, spread with an adhesive containing zinc oxide. 5 m (all): 1.25 cm = 97p; 2.5 cm = £1.40; 5 cm = £2.37; 7.5 cm = £3.57 (most suppliers)

Cotton cloth, plain weave, warp of cotton, weft of viscose, or combination, one continuous length. 5 m (all): 2.5 cm = 31p; 5 cm = 53p; 7.5 cm = 75p; 10 cm = 98p (most suppliers)

Unbleached calico right-angled triangle, 90 cm × 90 cm × 1.27 m = £1.17 (most suppliers)
Appendix 5: Wound Management

A5.8.2 Light-weight conforming bandages

Lightweight conforming bandages are used for dressing retention, with the aim of keeping the dressing close to the wound without inhibiting movement or restricting blood flow. The elasticity of conforming-stretch bandages (also termed contoured bandages) is greater than that of cotton conforming bandages.

Conforming Bandage (Synthetic)
Fabric, plain weave, warp of polyamide, weft of viscose. 4 m stretched (all):
Hospiform®, 6 cm = 13p, 8 cm = 16p, 10 cm = 18p, 12 cm = 22p (Hartmann)

Cotton Conforming Bandage, BP 1988
Cotton fabric, plain weave, treated to impart some elasticity to warp and weft. 3.5 m (all): type A, 5 cm = 64p, 7.5 cm = 78p, 10 cm = 97p, 15 cm = £1.32 (BSN Medical—Easifix Crina®)

Knitted Polyamide and Cellulose Contour Bandage, BP 1988
Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length. 4 m stretched (all):
Easifix®, 2.5 cm = 9p, 5 cm = 10p, 7.5 cm = 15p, 10 cm = 17p, 15 cm = 30p (BSN Medical)
K-Band®, 5 cm = 19p, 7 cm = 24p, 10 cm = 27p, 15 cm = 47p (Urgo)
Knit-It®, 5 cm = 10p, 7 cm = 15p, 10 cm = 17p, 15 cm = 30p (CliniMed)
Knit Fix®, 5 cm = 12p, 7 cm = 17p, 10 cm = 17p, 15 cm = 33p (Steraid)

Polyamide and Cellulose Contour Bandage
Peha-haft®, cohesive, latex-free, 4 m (all): 2.5 cm = 69p, 4 cm = 45p, 6 cm = 53p, 8 cm = 63p, 10 cm = 72p, 12 cm = 85p (Hartmann)
PremierBand®, 4 m (all), 5 cm = 12p, 7.5 cm = 14p, 10 cm = 17p, 15 cm = 25p (Sherronrd)

Polyamide and Cellulose Contour Bandage, BP 1988
(Nylon and Viscose Stretch Bandage)
Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all):
Acti-Wrap®, cohesive, latex-free, 6 cm = 44p, 8 cm = 64p, 10 cm = 76p (Activa)
Easifix®, 2.5 cm = 9p, 5 cm = 33p, 7.5 cm = 40p, 10 cm = 48p, 15 cm = 81p (BSN Medical)
Kontou®, cohesive, 5 cm = 28p, 7.5 cm = 35p, 10 cm = 40p, 15 cm = 66p (Easigrrip)
Mollelast®, latex-free, 4 cm = 28p (Activa)
Slinky®, 7.5 cm = 57p, 10 cm = 68p, 15 cm = 98p (Mohlycke)
Stayform®, 5 cm = 29p, 7.5 cm = 36p, 10 cm = 40p, 15 cm = 68p (Robinsons)

A5.8.3 Tubular bandages and garments

Tubular bandages are available in different forms, according to the function required of them. Some are used under orthopaedic casts and some are suitable for protecting areas to which creams or ointments (other than those containing potent corticosteroids) have been applied. The conformability of the elasticated versions makes them particularly suitable for retaining dressings on difficult parts of the body or for soft tissue injury, but their use as the only means of applying pressure to an oedematous limb or to a varicose ulcer is not appropriate, since the pressure they exert is inadequate.

Compression hosiery (section A5.9.1) reduces the recurrence of venous leg ulcers and should be considered for use after wound healing.

Silk clothing is available as an alternative to elasticised viscose stockinette garments, for use in the management of severe eczema and allergic skin conditions (see below).

Elasticated Surgical Tubular Stockinette, Foam padded
(Drug Tariff specification 25). Fabric as for Elasticated Tubular Bandage with polyurethane foam lining. Heel, elbow, knee, small = £3.00, medium = £3.23, large = £3.46; sacral, medium, and large (all) = £15.28 (Mohlycke—Tubipad®)
Uses relief of pressure and elimination of friction in relevant area; porosity of foam lining allows normal water loss from skin surface

Elasticated Tubular Bandage, BP 1993
(formerly Elasticated Surgical Tubular Stockinette). Knitted fabric, elasticised threads of rubber-cored polyamide or polyester with cotton or cotton and viscose yarn, tubular. Lengths 50 cm and 1 m, widths 6.25 cm, 6.75 cm, 7.5 cm, 8.75 cm, 10 cm, 12 cm; Synergy—Confitrip®; Easigrrip—Easigrip®; Saliss—Eisiban®; Mohlycke—Tubipad®. Where no size stated by the prescriber the 50 cm length should be supplied and width endorsed

Elasticated Viscose Stockinette
(Drug Tariff specification 46). Lightweight plain-knitted elasticated tubular bandage. Acti-Fast®, 3.5 cm red line (small limb), length 1 m = £1.62; 5 cm green line (medium limb), length 1 m = £1.65, 3 m = £1.90, 5 m = £3.30; 7.5 cm blue line (large limb), length 1 m = 90p, 3 m = £2.50, 5 m = £4.40; 10.75 cm yellow line (child trunk), length 1 m = £1.45, 3 m = £4.10, 5 m = £7.10; 17.5 cm beige line (adult trunk), length 1 m = £2.15, 20 cm purple line (large adult trunk), length 1 m = £3.20, 5 m = £16.15 (Activa)
CliniFast®, 3.5 cm red line (small limb), length 1 m = 65p, 5 cm green line (medium limb), length 1 m = 65p, 3 m = £1.90, 5 m = £3.30; 7.5 cm blue line (large limb), length 1 m = 90p, 3 m = £2.13, 5 m = £3.74; 10.75 cm yellow line (child trunk), length 1 m = £1.45, 3 m = £3.49, 5 m = £6.04; 17.5 cm beige line (adult trunk), length 1 m = £1.83; vest (long-sleeved), 6–24 months = £7.13, 2–5 years = £9.50, 5–8 years = £10.69, 8–11 years = £11.88, 11–14 years = £11.88, adult, small = £12.75, medium = £14.54, large = £16.58; vest (short-sleeved), adult, small = £12.50, medium = £14.25, large = £16.25; tights (pair) 6–24 months = £7.13; leggings (pair) 2–5 years = £9.50, 5–8 years = £10.69, 8–11 years = £11.88, 11–14 years = £11.88, adult, small = £12.25, large = £16.25; socks (pair) up to 8 years = £2.97, 8–14 years = £2.97; mittens (pair) up to 24 months = £2.97, 2–8 years = £2.97, 8–14 years = £2.97; gloves,
BNF 68

A5.8.3 Tubular bandages and garments

Tubifast® 2-way stretch, 3.5 cm red line (small limb),
length 1 m = 88p; 5 cm green line (medium limb),
length 1 m = 95p, 3 m = £2.70, 5 m = £4.61; 7.5 cm
blue line (large limb), length 1 m = £1.26, 3 m =
£3.55, 5 m = £6.19; 10.75 cm yellow line (child
trunk), length 1 m = £2.02, 3 m = £5.78, 5 m =
£9.92; 20 cm purple line (large adult trunk), length
1 m = £3.27, 5 m = £16.00; vest (long-sleeved), 6–24
months = £10.97, 2–5 years = £14.63, 5–8 years =
£16.46, 8–11 years = £18.28, 11–14 years = £18.28;
tights (pair), 6–24 months = £10.97; leggings (pair), 2–
5 years = £14.63, 5–8 years = £16.46, 8–11 years =
£18.28, 11–14 years = £18.28; socks (pair), one-size
= £4.58; gloves, (small-medium or medium-large
adult, extra small or small child) = £5.50
(Mölnlycke)

Non-elasticated
Cotton Stockinette, Bleached, BP 1988
Knitted fabric, cotton yarn, tubular length, 1 m (all),
2.5 cm = 37p; 5 cm = 58p; 7.5 cm = 69p; 6 m 6
10 cm = £4.75 (Sallis—Eesiban ®)
Uses 1 m lengths, basis (with wadding) for Plaster of Paris
bandages etc.; 6 m length, compression bandage

Ribbed Cotton and Viscose Surgical Tubular
Stockinette, BP 1988
Knitted fabric of 1:1 ribbed structure, singles yarn
spun from blend of two-thirds cotton and one-third
viscose fibres, tubular. Length 5 m (all):
Type A (lightweight): arm/leg (child), arm (adult) 5 cm =
£2.45; arm (OS adult), leg (adult) 7.5 cm = £3.22; leg (OS
adult) 10 cm = £4.27; trunk (child) 15 cm = £6.15; trunk
(adult) 20 cm = £7.11; trunk (OS adult) 25 cm = £8.50
(Mölnlycke)
Type B (heavyweight): sizes as for Type A, net price
£2.55–£8.83 (Sallis—Eesiban ®)
Drug Tariff specifies various combinations of sizes to
provide sufficient material for part or full body coverage
Uses protective dressings with tar-based and other nonsteroid ointments

Silk Clothing
Knitted, medical grade silk clothing can be used as an
adjunct to normal treatment for severe eczema and
allergic skin conditions. When used in combination
with medical creams and ointments, care should be
taken to ensure that the medication is fully absorbed
into the skin before the silk clothing is worn; silk garments are not suitable for use in direct contact with
emollients used in ‘wet wrapping techniques’.

DermaSilk® (Espere)
Knitted silk fabric, hypoallergenic, sericin-free, body
suit, child 0–3 months (height 62 cm) = £36.18, 3–6
months (height 68 cm) = £36.82, 6–9 months (height
74 cm) = £37.87, 9–12 months (height 74 cm) =
38.25, 12–18 months (height 86 cm) = £38.92, 18–24
months (height 92 cm) = £39.29, 2–3 years (height
98 cm) = £38.71, 3–4 years (height 110 cm) =
£41.03; boxer shorts, adult (male), small–XXXL =
£39.95; briefs, 3–4 years = £20.95, 5–6 years =
£20.95, 7–8 years = £20.95, 10–12 years = £20.95,
adult (female), small–XXL = £29.39; facial mask,
child (head circumference up to 47 cm) = £15.80,
child (head circumference up to 50 cm) = £15.80,
teen or adult = £20.19; gloves, adult (small, medium,
large, or extra large) = £19.96, child (small or
medium) = £14.22; leggings, child 0–3 months
(height 62 cm) = £25.83, 3–6 months (height 68 cm)
= £26.28, 6–9 months (height 74 cm) = £27.34, 9–12

A5.8.4 Support bandages
Light support bandages, which include the various forms of crepe bandage, are used in the prevention of oedema; they are also used to provide support for mild sprains and joints but their effectiveness has not been proven for this purpose. Since they have limited extensibility, they are able to provide light support without exerting undue pressure. For a warning against injudicious compression see section A5.8.7.

Crepe Bandage, BP 1988
Fabric, plain weave, warp of wool threads and crepe-twisted cotton threads, weft of cotton threads; stretch bandage. 4.5 m stretched (all): 5 cm = 93p; 7.5 cm = £1.31; 10 cm = £1.71; 15 cm = £2.48 (most suppliers)

Cotton Crepe Bandage
Light support bandage, 4.5 m stretched (all): 5 cm = 44p; 7.5 cm = 62p; 10 cm = 80p; 15 cm = £1.17 (Hartmann—Hospicare® 229) 4.5 m stretched (all), 5 cm = 44p, 7.5 cm = 61p, 10 cm = 79p, 15 cm = £1.16 (Hartmann—Hospicare® 229)

Cotton Crepe Bandage, BP 1988
Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton and/or viscose threads; stretch bandage. 4.5 m stretched (both): 7.5 cm = £2.93; 10 cm = £3.76 (most suppliers)

Cotton, Polyamide and Elastane Bandage
Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all) Hospilite®, 5 cm = 35p, 7.5 cm = 48p, 10 cm = 58p, 15 cm = 85p (Hartmann) Neosport®, 5 cm = 54p, 7.5 cm = 73p, 10 cm = 91p, 15 cm = £1.12 (Neomedic) Profore® #2, 10 cm = £1.27, latex-free = £1.35 (S&N Hilt) Setocrepe®, 10 cm = £1.13 (Mölnlycke) Softcrepe®, 5 cm = 65p, 7.5 cm = 92p, 10 cm = £1.16, 15 cm = £1.69 (BSN Medical)

Cotton Stretch Bandage, BP 1988
Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton threads; stretch bandage, lighter than cotton crepe, 4.5 m stretched (all): Hospicare® 233, 5 cm = 52p, 7.5 cm = 72p, 10 cm = 96p; 15 cm = £1.36 (Steraid) PremierBand®, 5 cm = 45p, 7.5 cm = 63p, 10 cm = 79p, 15 cm = £1.18 (Shermond)

Cotton Suspensory Bandage
(Drug Tariff). Type 1: cotton net bag with draw tapes and webbing waistband; small, medium, and large (all) = £1.62, extra large = £1.71. Type 2: cotton net bag with elastic edge and webbing waistband; small = £1.79, medium = £1.84, large = £1.91, extra large = £1.98. Type 3: cotton net bag with elastic edge and webbing waistband with elastic insertion; small, medium, and large (all) = £1.93; extra large = £2.00. Type supplied to be endorsed

Knitted Elastomer and Viscose Bandage
Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage) ClniLite®, 4.5 m (all), 5 cm = 44p, 7.5 cm = 61p, 10 cm = 80p, 15 cm = £1.16 (Clinisupplies) K-Lite®, 4.5 m stretched, 5 cm = 52p, 7 cm = 73p, 10 cm = 95p, 15 cm = £1.38; 5.2 m stretched, 10 cm = £1.09 (Urgo) Knit-Firm®, 4.5 m stretched, 5 cm = 36p, 7 cm = 51p, 10 cm = 66p, 15 cm = 96p (Steraid) Type 3a (light compression bandage): ClniPlus®, 8.7 m × 10 cm = £1.80 (Clinisupplies)
Elastic adhesive bandages are used to provide compression in the treatment of varicose veins and for the support of injured joints; they should no longer be used for the support of fractured ribs and clavicles. They have also been used with zinc paste bandage in the treatment of venous ulcers, but they can cause skin reactions in susceptible patients and may not produce sufficient pressures for healing (significantly lower than those provided by other compression bandages).

**Elastic Adhesive Bandage, BP 1993**

Woven fabric, elastic in warp (crepe-twisted cotton threads), weft of cotton and/or viscose threads spread with adhesive mass containing zinc oxide. 4.5 m stretched (all): 5 cm = £3.56; 7.5 cm = £5.15; 10 cm = £6.85

Drug Tariff specifies 7.5 cm width supplied when size not stated.

### A5.8.5 Adhesive bandages

### A5.8.6 Cohesive bandages

Cohesive bandages adhere to themselves, but not to the skin, and are useful for providing support for sports use where ordinary stretch bandages might become displaced and adhesive bandages are inappropriate. Care is needed in their application, however, since the loss of ability for movement between turns of the bandage to equalise local areas of high tension carries the potential for creating a tourniquet effect. Cohesive bandages can be used to support sprained joints and as an outer layer for multi-layer compression bandaging; they should not be used if arterial disease is suspected.

**Cohesive extensible bandages**

- **Coban®** (3M)
  - Bandage, 6 m (stretched), 10 cm = £2.79

- **K-Press®** (Urgo)
  - Bandage, 6.5 m × 10 cm (0, short) = £2.78; 7.5 m, 18–25 cm ankle circumference, 8 cm = £3.06, 10 cm = £3.25, 12 cm = £4.09; 10.5 m, 25–32 cm ankle circumference, 8 cm = £3.33, 10 cm = £3.55, 12 cm = £4.48

- **Profore® #4** (S&N Hlth.)
  - Bandage, 2.5 m (unstretched) = £3.06, latex-free = £3.32

- **Ultra Fast®** (Robinsons)
  - Bandage, 6.3 m (stretched), 10 cm = £2.59

### A5.8.7 Compression bandages

High compression products are used to provide the high compression needed for the management of gross varices, post-thrombotic venous insufficiency, venous leg ulcers, and gross oedema in average-sized limbs. Their use calls for an expert knowledge of the elastic properties of the products and experience in the technique of providing careful graduated compression. Incorrect application can lead to uneven and inadequate pressures or to hazardous levels of pressure. In particular, injudicious use of compression in limbs with arterial disease has been reported to cause severe skin and tissue necrosis (in some instances calling for amputation). Doppler testing is required before treatment with compression. Oral pentoxifylline (section 2.6.4) can be used as adjunct therapy if a chronic venous leg ulcer does not respond to compression bandaging [unlicensed indication].

**High compression bandages**

**PEC High Compression Bandage**

Polyamide, elastane, and cotton compression (high) extensible bandage, 3.5 m unstretched, 10 cm = £3.34 (Molnylycke—Setopress®)

**VEC High Compression Bandage**

Viscose, elastane, and cotton compression (high) extensible bandage, 3 m unstretched (both); 7.5 cm = £2.56; 10 cm = £3.29 (S&N—Tensopress®)

**High Compression Bandage**

Cotton, viscose, nylon, and Lycra® extensible bandage, 3 m (unstretched), 10 cm = £3.42 (Convatec—SurePress®); 3 m (unstretched), 10 cm = £2.66 (Urgo—K-ThreeC®)

**Short stretch compression bandage**

Short stretch bandages help to reduce oedema and promote healing of venous leg ulcers. They are also used to reduce swelling associated with lymphoedema. They are applied at full stretch over padding (see Sub-compression Wadding Bandage below) which protects areas of high pressure and sites at high risk of pressure damage.

**Actico®** (Activa)

- **Bandage**, cohesive, 6 m (all), 4 cm = £2.25, 6 cm = £2.64, 8 cm = £3.03, 10 cm = £3.15, 12 cm = £4.02

**Comprilan®** (BSN Medical)

- **Bandage**, 5 m (all), 6 cm = £2.55, 8 cm = £2.99; 10 cm = £3.22; 12 cm = £3.92

**Rosidal K®** (Activa)

- **Bandage**, 5 m (all), 4 cm = £1.79, 6 cm = £2.50, 8 cm = £2.90, 10 cm = £3.26, 12 cm = £3.95; 10 m x 10cm = £5.67

**Silkolan®** (Urgo)

- **Bandage**, 5 m (all), 8 cm = £3.00; 10 cm = £3.39

**Sub-compression wadding bandage**

**Cellona® Undercast Padding** (Activa)

- **Padding**, 2.75 m unstretched (all): 5 cm = 29p, 7.5 cm = 36p; 10 cm = 44p; 15 cm = 57p

**Flexi-Ban®** (Activa)

- **Padding**, 3.5 m unstretched, 10 cm = 47p

**K-Soft®** (Urgo)

- **Padding**, absorbent, 3.5 m unstretched, 10 cm = 43p; 4.5 m unstretched, 10 cm = 53p
Appendix 5: Wound Management

K-Four®
Padding, 5 m x 10 cm (0, short) = £3.76; 6 m, 18–25 cm ankle circumference, 8 cm = £4.26, 10 cm = £4.51, 12 cm = £5.69; 7.3 m, 25–32 cm ankle circumference, 8 cm = £6.64, 10 cm = £6.91, 12 cm = £8.21.

Note: K-Four® also includes a short stretch compressive fabric component.

K-Four® Reduced (Urgo)
Padding, 6 m x 10 cm, 18–25 cm ankle circumference = £4.51; 7.3 m x 10 cm, 25–32 cm ankle circumference = £4.92.

Note: K-Four® Reduced also includes a short stretch compressive fabric component.

Ortho-Band Plus® (SteriAd)
Packing, 10 cm x 3.5 m unstretched = 37p.

Profore® #1 (S&N Hlth.)
Packing, viscose fleece, 3.5 m unstretched, 10 cm = 66p, latex-free = 72p.

Softexe® (Mölnlycke)
Packing, absorbent, 3.5 m unstretched, 10 cm = 60p.

SurePress® (ConvaTec)
Packing, absorbent, 3 m unstretched, 10 cm = 56p.

Ultra Soft® (Robinsons)
Packing, absorbent, 3.5 m unstretched, 10 cm = 39p.

Velband® (BSN Medical)
Packing, absorbent, 4.5 m unstretched, 10 cm = 68p.

A5.8.8 Multi-layer compression bandaging

Multi-layer compression bandaging systems are an alternative to High Compression Bandages (section A5.8.7) for the treatment of venous leg ulcers. Compression is achieved by the combined effects of two or three extensible bandages applied over a layer of orthopaedic wadding and a wound contact dressing.

Four layer systems

K-Four® (Urgo)
K-Four® #1 (K-Soft®—see Sub-compression Wadding Bandage, p. 1085); K-Four® #2 (K-Lite®—see Knitted Elastomer and Viscose Bandage, p. 1084); K-Four® #3 (K-Plus®—see Knitted Elastomer and Viscose Bandage, p. 1084); K-Three #6—see High compression bandages, p. 1085; K-Four® #4 (Ko-Flex®), 6 m (stretched), 10 cm = £2.84; 7 m (stretched), 10 cm = £3.25.

Multi-layer compression bandaging kit, four layer system, for ankle circumference up to 18 cm = £6.73, 18–25 cm = £8.64, 25–30 cm = £6.44, above 30 cm = £8.87; reduced compression, 18 cm and above = £4.21.

Profore® (S&N Hlth.)
Profore® wound contact layer (see Knitted Viscose Primary Dressing, p. 1063); Profore® #1 (see Sub-compression Wadding Bandage, p. 1086); Profore® #2 (see Cotton, Polyamide and Elastane Bandage, p. 1084); Profore® #3 (see Knitted Elastomer and Viscose Bandage, p. 1084); Profore® #4 (see Cohesive bandages, p. 1085); Profore® Plus 3 m (unstretched), 10 cm = £3.46, latex-free = £3.70.

Multi-layer compression bandaging kit, four layer system, for ankle circumference up to 18 cm = £9.58, 18–25 cm = £8.92, 25–30 cm = £7.41, above 30 cm = £11.09, latex-free, 18–25 cm = £9.53; Profore Lite® above 18 cm = £5.15, latex-free = £5.60.

System 4® (Mölnlycke)
System 4® #1 (Softexe®—see Sub-compression Wadding Bandage, p. 1086); System 4® #2 (Setocrepe®—see Cotton, Polyamide and Elastane Bandage, p. 1084); System 4® #3 (Elset®—see Knitted Elastomer and Viscose Bandage, p. 1084); System 4® #4 (Mebean®)

Multi-layer compression bandaging kit, four layer system, for ankle circumference 18–25 cm = £7.46.

Ultra Four® (Robinsons)
Ultra Four® #1 (Ultra Soft®—see Sub-compression Wadding Bandage, p. 1086); Ultra Four® #2 (Ultra Lite®), 10 cm x 4.5 cm (stretched) = 85p; Ultra Four® #3 (Ultra Plus®), 10 cm x 8.7 cm (stretched) = £1.89; Ultra Four® #4 (Ultra Fast®—see Cohesive Bandages, p. 1085).

Multi-layer compression bandaging kit, four layer system, for ankle circumference up to 18 cm = £6.41, 18–25 cm = £5.67; Ultra Four® RC (reduced compression) 18–25 cm = £4.14.

Two layer systems

Coban® 2 (3M)
Multi-layer compression bandaging kit, two layer system (latex-free, foam bandage and cohesive compression bandage), one size = £8.08; Coban® 2 Lite (reduced compression), one size = £8.08.

K-Two® (Urgo)
K-Tech® (see Sub-compression Wadding Bandages, p. 1086); K-Press® (see Cohesive bandages, p. 1085)

Multi-layer compression bandaging kit, two layer system, size 0 (short) = £6.55; 18–25 cm ankle circumference, 8 cm = £7.32, 10 cm = £7.76, 12 cm = £9.78; 25–32 cm ankle circumference, 8 cm = £9.76, 10 cm = £8.48, 12 cm = £10.69.

K-Two® Reduced, K-Tech® (see Sub-compression Wadding Bandages, above); K-Press® Latex Free, K-Tech® (see Sub-compression Wadding Bandages, above); K-Press® Latex Free

Multi-layer compression bandaging kit, two layer system, for ankle circumference 18–25 cm = £8.38; 25–32 cm = £9.16.

K-Two® Reduced, K-Tech® Reduced (see Sub-compression Wadding Bandages, above); K-Press® (see Cohesive Bandages, p. 1085).

Multi-layer compression bandaging kit, two layer system, for ankle circumference 18–25 cm = £7.76; 25–32 cm = £8.48.

K-Two® Reduced Latex Free, K-Tech® (see Sub-compression Wadding Bandages, above); K-Press® Reduced Latex Free

Multi-layer compression bandaging kit, two layer system, for ankle circumference 18–25 cm = £8.38; 25–32 cm = £9.16.

K-Two® Start, UrgoStart® (see Protease-modulating matrix, p. 1077); K-Tech® (see Sub-compression Wadding Bandages, p. 1086); K-Press® (see Cohesive Bandages, p. 1085).

Multi-layer compression bandaging kit, two-layer system, for ankle circumference 18–25 cm = £9.68; 25–32 cm = £10.33.
A5.8.9 Medicated bandages

Zinc Paste Bandage has been used with compression bandaging for the treatment of venous leg ulcers. However, paste bandages are associated with hypersensitivity reactions and should be used with caution.

Zinc paste bandages are also used with coal tar or ichthammol in chronic lichenified skin conditions such as chronic eczema (ichthammol often being preferred since its action is considered to be milder). They are also used with calamine in milder eczematous skin conditions.

Zinc Paste Bandage, BP 1993
Cotton fabric, plain weave, impregnated with suitable paste containing zinc oxide; requires additional bandaging, 6 m x 7.5 cm = £3.44 (S&N Hlth.—Viscopaste PB7® (10%), excipients: include cetostearyl alcohol, hydroxybenzoates)

Zinc Paste and Ichthammol Bandage, BP 1993
Cotton fabric, plain weave, impregnated with suitable paste containing zinc oxide and ichthammol; requires additional bandaging, 6 m x 7.5 cm = £3.47 S&N Hlth.—Ichthopaste® (6/2%), excipients: include cetostearyl alcohol
Uses see section 13.5

Steripaste® (Mölnlycke)
Cotton fabric, selvedge weave impregnated with paste containing zinc oxide (requires additional bandaging), 6 m x 7.5 cm = £3.24
Excipients include polysorbate 80

Medicated stocking

Zipzoc® (S&N Hlth.)
Sterile rayon stocking impregnated with ointment containing zinc oxide 20%. 4-pouch carton = £12.52; 10-pouch carton = £31.30
Note Can be used under appropriate compression bandages or hosiery in chronic venous insufficiency

A5.9 Compression hosiery and garments

Compression (elastic) hosiery is used to treat conditions associated with chronic venous insufficiency, to prevent recurrence of thrombosis, or to reduce the risk of further venous ulceration after treatment with compression bandaging (section A5.8.7). Doppler testing to confirm arterial sufficiency is required before recommending the use of compression hosiery.

Before elastic hosiery can be dispensed, the quantity (single or pair), article (including accessories), and compression class must be specified by the prescriber. There are different compression values for graduated compression hosiery and lymphoedema garments (see table below). All dispensed elastic hosiery articles must state on the packaging that they conform with Drug Tariff technical specification No. 40, for further details see Drug Tariff.

Note Graduated compression tights are.

A5.8.9.1 Graduated compression hosiery

Class 1 Light Support
Hosiery, compression at ankle 14–17 mmHg, thigh length or below knee with knitted in heel. 1 pair, circular knit (standard), thigh length = £7.61, below knee = £6.95, (made-to-measure), thigh length = £37.79, below knee = £23.64; lightweight elastic net (made-to-measure), thigh length = £20.38, below knee = £15.91
Uses superficial or early varices, varicosis during pregnancy

Class 2 Medium Support
Hosiery, compression at ankle 18–24 mmHg, thigh length or below knee with knitted in heel. 1 pair, circular knit (standard), thigh length = £11.31, below knee = £10.16, (made-to-measure), thigh length = £37.79, below knee = £23.64; net (made-to-measure), thigh length = £20.38, below knee = £15.91; flat bed (made-to-measure, only with closed heel and open toe), thigh length = £37.79, below knee = £23.64
Uses varices of medium severity, ulcer treatment and prophylaxis, mild oedema, varicosis during pregnancy

Class 3 Strong Support
Hosiery, compression at ankle 25–35 mmHg, thigh length or below knee with open or knitted in heel. 1 pair, circular knit (standard), thigh length = £13.40, below knee = £11.52, (made-to-measure) thigh length = £37.79, below knee = £23.64; flat bed (made-to-measure, only with open heel and open toe), thigh length = £37.79, below knee = £23.64
Uses gross varices, post thrombotic venous insufficiency, gross oedema, ulcer treatment and prophylaxis

Accessories
In addition to the product listed below, accessories such as application aids for hosiery are available, see Drug Tariff for details

Suspenders
Suspenders, for thigh stockings = £67p, belt (specification 13), = £5.16, fitted (additional price) = 62p

Anklets
Class 2 Medium Support
Anklets, compression 18–24 mmHg, circular knit (standard and made-to-measure), 1 pair = £6.66; flat bed (standard and made-to-measure) = £13.09,

A5.9.2 Lymphoedema garments

Class 3 Strong Support

Anklets, compression 25–35 mmHg, circular knit (standard and made-to-measure), 1 pair = £9.09; flat bed (standard) = £9.29, (made-to-measure) = £13.84

Knee caps

Class 2 Medium Support

Kneecaps, compression 18–24 mmHg, circular knit (standard and made-to-measure), 1 pair = £6.66; flat bed (standard and made-to-measure) = £13.84; net (made-to-measure) = £10.87

Class 3 Strong Support

Kneecaps, compression 25–35 mmHg, circular knit (standard and made-to-measure), 1 pair = £8.88; flat bed (standard) = £8.88, (made-to-measure) = £13.84

Lymphoedema compression garments are used to maintain limb shape and prevent additional fluid retention. Either flat-bed or circular knitting methods are used in the manufacture of elasticated compression garments. Seamless, circular-knitted garments (in standard sizes) can be used to prevent swelling if the lymphoedema is well controlled and if the limb is in good shape and without skin folds. Flat-knitted garments (usually made-to-measure) with a seam, provide greater rigidity and stiffness to maintain reduction of lymphoedema following treatment with compression bandages.

A standard range of light, medium, or high compression garments are available, as well as low compression (12–16 mmHg) arm sleeves, made-to-measure garments up to compression 90 mmHg, and accessories—see Drug Tariff for details.

Note: There are different compression values for lymphoedema garments and graduated compression hosiery, see table, p. 1087.
List of Dental Preparations

The following list has been approved by the appropriate Secretaries of State, and the preparations therein may be prescribed by dental practitioners on form FP10D (GP14 in Scotland, WP10D in Wales).

Licensed sugar-free versions, where available, are preferred.
Licensed alcohol-free mouthwashes, where available, are preferred.

1. Indications approved by the ACBS are: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy or sicca syndrome
2. The BP directs that when soluble aspirin tablets are prescribed, dispersible aspirin tablets should be dispensed
3. May be difficult to obtain
4. This preparation does not appear in subsequent editions of the BP
5. The BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed and no strength stated Paracetamol Oral Suspension 120 mg/5 mL should be dispensed
Sodium Fluoride Tablets, BP
Sodium Fluoride Toothpaste 0.619%, DPF
Sodium Fluoride Toothpaste 1.1%, DPF
Sodium Fusidate Ointment, BP
Temazepam Oral Solution, BP
Temazepam Tablets, BP
Tetracycline Tablets, BP

Preparations in this list which are not included in the BP or BPC are described under Details of DPF preparations, p. 1090. For details of preparations that can be prescribed, see individual entries under the relevant drug monographs throughout the BNF.

Details of DPF preparations
Preparations on the List of Dental Preparations which are specified as DPF are described as follows in the DPF.
Although brand names have sometimes been included for identification purposes preparations on the list should be prescribed by non-proprietary name.

Amoxicillin Oral Powder (proprietary product: Amoxil), amoxicillin (as trihydrate) 3 g sachet

Artificial Saliva Gel (proprietary product: Biotene Oralbalance), lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis

Artificial Saliva Oral Spray (proprietary product: Xerotine) consists of water, sorbitol, carmellose (carboxymethylcellulose), potassium chloride, sodium chloride, magnesium chloride, calcium chloride and other ingredients, pH neutral

Artificial Saliva Pastilles (proprietary product: Salivex), consists of acacia, malic acid, and other ingredients

Artificial Saliva Protective Spray (proprietary product: Aquoral) consists of oxidised glycerol triesters, silicon dioxide, flavouring agents, aspartame (section 9.4.1)

Azithromycin Capsules (proprietary product: Zithromax), azithromycin 250 mg

Azithromycin Oral Suspension 200 mg/5 mL (proprietary product: Zithromax), azithromycin 200 mg/5 mL when reconstituted with water

Azithromycin Tablets (proprietary product: Zithromax), azithromycin 250 mg and 500 mg

Betamethasone Soluble Tablets 500 micrograms (proprietary product: Betnovate), betamethasone (as sodium phosphate) 500 micrograms

Chlorhexidine Oral Spray (proprietary product: Corsodyl Oral Spray), chlorhexidine gluconate 0.2%

Clarithromycin Oral Suspension 125 mg/5 mL (proprietary product: Paris), clarithromycin 125 mg/5 mL when reconstituted with water

Clarithromycin Oral Suspension 250 mg/5 mL (proprietary product: Paris), clarithromycin 250 mg/5 mL when reconstituted with water

Doxycycline Tablets 20 mg (proprietary product: Periostat), doxycycline (as hyclate) 20 mg

Fluconazole Capsules 50 mg (proprietary product: Diflucan), fluconazole 50 mg

Fluconazole Oral Suspension 50 mg/5 mL (proprietary product: Diflucan), fluconazole 50 mg/5 mL when reconstituted with water

Lidocaine Spray 10% (proprietary product: Xylocaine Spray), lidocaine 10% supplying 10 mg lidocaine/spray

Loratadine Syrup 5 mg/5 mL (proprietary product: ALB), loratadine 5 mg/5 mL

Penciclovir Cream (proprietary product: Vectovir Cream), penciclovir 1%

Saliva Stimulating Tablets (proprietary product: SST), citric acid, malic acid and other ingredients in a sorbitol base

Sodium Fluoride Toothpaste 0.619% (proprietary product: Duraphat ‘2800 ppm’ Toothpaste), sodium fluoride 0.619%

Sodium Fluoride Toothpaste 1.1% (proprietary product: Duraphat ‘5000 ppm’ Toothpaste), sodium fluoride 1.1%

Changes to Dental Practitioners’ Formulary since September 2013

Additions
Artificial Saliva Pastilles, DPF
Artificial Saliva Protective Spray, DPF

Deletions
Ampicillin Capsules, BP
Ampicillin Oral Suspension, BP
Mouthwash Solution-tablets, DPF

Changes of title
None
Nurse Prescribers’ Formulary

Nurse Prescribers’ Formulary for Community Practitioners

Nurse Prescribers’ Formulary Appendix (Appendix NPF). List of preparations approved by the Secretary of State which may be prescribed on form FP10P (form HS21(N) in Northern Ireland, form GF10(N) in Scotland, forms WP10CN and WP10PN in Wales) by Nurses for National Health Service patients.

Community practitioners who have completed the necessary training may only prescribe items appearing in the nurse prescribers’ list set out below. Community Practitioner Nurse Prescribers are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved generic name.

Medicinal Preparations

Preparations on this list which are not included in the BP or BPC are described on p. 1092

Almond Oil Ear Drops, BP
Arachis Oil Enema, NPF
1 Aspirin Tablets, Dispersible, 300 mg, BP
Bisacodyl Suppositories, BP (includes 5-mg and 10-mg strengths)
Bisacodyl Tablets, BP
Catheter Maintenance Solution, Sodium Chloride, NPF
Catheter Maintenance Solution, ‘Solution G’, NPF
Catheter Maintenance Solution, ‘Solution R’, NPF
Chlorhexidine Gluconate Alcoholic Solutions containing at least 0.05%
Chlorhexidine Gluconate Aqueous Solutions containing at least 0.05%
Choline Salicylate Dental Gel, BP
Clotrimazole Cream 1%, BP
Co-danthramer Capsules, NPF
Co-danthramer Capsules, Strong, NPF
Co-danthramer Oral Suspension, NPF
Co-danthramer Oral Suspension, Strong, NPF
Co-danthrusate Capsules, BP
Co-danthrusate Oral Suspension, NPF
Crotamiton Cream, BP
Crotamiton Lotion, BP
Dimeticone barrier creams containing at least 10%
Dimeticone Lotion, NPF
Docusate Capsules, BP
Docusate Enema, NPF
Docusate Oral Solution, BP
Docusate Oral Solution, Paediatric, BP
Econazole Cream 1%, BP
Emollients as listed below:
Aquadrate® 10% w/w Cream
Arachis Oil, BP
Balneum® Plus Cream
Cetabren® Emollient Cream
Dermamint®
Diprobase® Cream
Diprobase® Ointment
Doublebase®
Doublebase® Dayleve Gel
E45® Cream
E45® Itch Relief Cream
Emulsifying Ointment, BP
Eucerin® Intensive 10% w/w Urea Treatment Cream
Eucerin® Intensive 10% w/w Urea Treatment Lotion
Hydromol® Cream
Hydromol® Intensive
Hydrous Ointment, BP
Lipobase®
Liquid and White Soft Paraffin Ointment, NPF
Neutrogena® Norwegian Formula Dermatological Cream
Nutraplus® Cream
Oiatum® Cream
Oiatum® Junior Cream
Paraffin, White Soft, BP
Paraffin, Yellow Soft, BP
Ultrace®
Unguentum M®
Emollient Bath and Shower Preparations as listed below:
Aqueous Cream, BP
2 Balneum®
2 Balneum Plus® Bath Oil
Cetabren® Emollient Bath Additive
Dermalo® Bath Emollient
Doublebase® Emollient Bath Additive
Doublebase® Emollient Shower Gel
Doublebase® Emollient Wash Gel
Hydromol® Bath and Shower Emollient
Oiatum® Emollient
Oiatum® Gel
Oiatum® Junior Bath Additive
Zerotum® Emollient Medicinal Bath Oil
Folic Acid Tablets 400 micrograms, BP
Glycerol Suppositories, BP
Ibuprofen Oral Suspension, BP
Ibuprofen Tablets, BP
Ispaghula Husk Granules, BP
Ispaghula Husk Granules, Effervescent, BP
Ispaghula Husk Oral Powder, BP
Lactulose Solution, BP
Lidocaine Ointment, BP
Lidocaine and Chlorhexidine Gel, BP
Macrogol Oral Liquid, Compound, NPF
Macrogol Oral Powder, Compound, NPF
Macrogol Oral Powder, Compound, Half-strength, NPF
Magnesium Hydroxide Mixture, BP
Magnesium Sulfate Paste, BP
Malathion aqueous lotions containing at least 0.5%
Mebendazole Oral Suspension, NPF
Mebendazole Tablets, NPF
Methylcellulose Tablets, BP

1. Max. 96 tablets; max. pack size 32 tablets
2. Except pack sizes that are not to be prescribed under the NHS (see Part XVIIA of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff)
3. Except for indications and doses that are

BNF 68

Nurse Prescribers’ Formulary

Miconazole Cream 2%, BP
Miconazole Oromucosal Gel, BP
Mouthwash Preparation—tablets, NPF
Nicotine Inhalation Cartridge for Oromucosal Use, NPF
Nicotine Lozenge, NPF
Nicotine Medicated Chewing Gum, NPF
Nicotine Nasal Spray, NPF
Nicotine Oral Spray, NPF
Nicotine Sublingual Tablets, NPF
Nicotine Transdermal Patches, NPF
Nystatin Oral Suspension, BP
Olive Oil Ear Drops, BP
Paracetamol Oral Suspension, BP (includes 120 mg/5 mL and 250 mg/5 mL strengths—both of which are available as sugar-free formulations)
Paracetamol Tablets, BP
Paracetamol Tablets, Soluble, BP (includes 120-mg and 500-mg tablets)
Permethrin Cream, NPF
Phosphates Enema, BP
Povidone–Iodine Solution, BP
Phosphates Enema, BP
Permethrin Cream, NPF

Chemical Reagents as listed in Part IX of the Drug Tariff (Part II of the Northern Ireland Drug Tariff, Part 9 of the Scottish Drug Tariff)

The Drug Tariffs can be accessed online at:
National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm
Health and Personal Social Services for Northern Ireland Drug Tariff: www.dhsspsni.gov.uk/pas-tariff

Details of NPF preparations

Preparations on the Nurse Prescribers’ Formulary which are not included in the BP or BPC are described as follows in the Nurse Prescribers’ Formulary.

Although brand names have sometimes been included for identification purposes, it is recommended that non-proprietary names should be used for prescribing medicinal preparations in the NPF except where a non-proprietary name is not available.

Arachis Oil Enema

archic oil 100%

Catheter Maintenance Solution, Sodium Chloride

(proprietary products: OptiFlo S, Uro-Tainer Sodium Chloride; Uriflex-S), sodium chloride 0.9%

Catheter Maintenance Solution, ‘Solution G’

(proprietary products: OptiFlo G, Uro-Tainer Syby G, Uriflex G), citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%

Catheter Maintenance Solution, ‘Solution R’

(proprietary products: OptiFlo R, Uro-Tainer Solution R, Uriflex R), citric acid 6%, glaconolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%

Chlorhexidine gluconate alcoholic solutions

(proprietary products: ChloraPrep, Hydrex Solution; Hydrex spray), chlorhexidine gluconate in alcoholic solution

Chlorhexidine gluconate aqueous solutions

(proprietary product: Unisept) chlorhexidine gluconate in aqueous solution

Co-danthramer Capsules

(co-danthramer 25/200 (dantron 25 mg, poloxamer ‘188’ 200 mg)

Co-danthramer Capsules, Strong

(co-danthramer 37.5/500 (dantron 37.5 mg, poloxamer ‘188’ 500 mg)

Co-danthramer Oral Suspension

(proprietary product: Codalax), co-danthramer 25/200 in 5 mL (dantron 25 mg, poloxamer ‘188’ 200 mg/5 mL)

Co-danthramer Oral Suspension, Strong

(proprietary product: Codalax Forte), co-danthramer 75/1000 in 5 mL (dantron 75 mg, poloxamer ‘188’ 1 g/5 mL)

Co-danthrusate Oral Suspension

(proprietary product: Normax), co-danthrusate 50/60 (dantron 50 mg, docusate sodium 60 mg/5 mL)

Appliances and Reagents (including Wound Management Products)

Community Practitioner Nurse Prescribers in England, Wales and Northern Ireland can prescribe any appliance or reagent in the relevant Drug Tariff. In the Scottish Drug Tariff, Appliances and Reagents which may not be prescribed by Nurses are annotated ‘ Nx.

Appliances (including Contraceptive Devices) as listed in Part I 1XA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 (Appliances) and Part 2 (Dressings) of the Scottish Drug Tariff)

Incontinence Appliances as listed in Part IXB of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 5 of the Scottish Drug Tariff)

Stoma Appliances and Associated Products as listed in Part IXC of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 6 of the Scottish Drug Tariff)

1. Max. 96 tablets; max. pack size 32 tablets
2. Nurse Prescribers in Family Planning Clinics—where it is not appropriate for nurse prescribers in family planning clinics to prescribe contraceptive devices using form FP10(P) (forms WP10CN and WP10PN in Wales), they may prescribe using the same system as doctors in the clinic.
Dimeticone barrier creams (proprietary products: Conotran Cream, dimeticone '350' 22%, Sopel Barrier Cream, dimeticone '1000' 10%), dimeticone 10–22%

Dimeticone Lotion (proprietary product: Hedrin), dimeticone 4%

Docucate Enema (proprietary product: Norgalax Micro-enema) docucate sodium 120 mg in 10 g

Liquid and White Soft Paraffin Ointment liquid paraffin 50%, white soft paraffin 50%

Macrogol Oral Liquid, Compound (proprietary product: Movicol Liquid), macrogol '3350' (polyethylene glycol '3350') 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/25 mL

Macrogol Oral Powder, Compound (proprietary products: Laxido Orange, Molaxole, Movicol) macrogol '3350' (polyethylene glycol '3350') 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet

Note Amount of potassium chloride varies according to flavour of Movicol® as follows: plain-flavour (sugar-free) = 50.2 mg/sachet; lime and lemon flavour = 46.6 mg/sachet; chocolate flavour = 31.7 mg/sachet. 1 sachet when reconstituted with 125 mL water provides K⁺ 5.4 mmol/litre

Macrogol Oral Powder, Compound, Half-strength (proprietary product: Movicol-Half), macrogol '3350' (polyethylene glycol '3350') 6.563 g, sodium bicarbonate 89.3 g, sodium chloride 175.4 mg, potassium chloride 23.3 mg/sachet

Malathion aqueous lotions (proprietary products: Derbac-M Liquid), malathion 0.5% in an aqueous basis

Mebendazole Oral Suspension (proprietary product: Vermox), mebendazole 100 mg/5 mL

Mebendazole Tablets (proprietary products: Ovex, Vermox), mebendazole 100 mg

Mouthwash Solution-tablets consist of tablets which may contain antimicrobial, colouring and flavouring agents in a suitable soluble effervescent basis to make a mouthwash

Nicotine Inhalation Cartridge for Oromucosal Use (proprietary products: NicAssist Inhalator, Nicorette Inhalator), nicotine 10 mg or 15 mg

Nicotine Lozenge nicotine (as bitartrate) 1 mg or 2 mg (proprietary product: Nicorette Mint Lozenge, Nicotinell Mint Lozenge), or nicotine (as resinate) 1.5 mg, 2 mg, or 4 mg (proprietary product: NiQuitin Lozenges, NiQuitin Mini, NiQuitin Pre-quit)

Nicotine Medicated Chewing Gum (proprietary products: NicAssist Gum, Nicorette Gum, Nicotinell Gum, NiQuitin Gum), nicotine 2 mg or 4 mg

Nicotine Nasal Spray (proprietary product: NicAssist Nasal Spray, Nicorette Nasal Spray), nicotine 500 micrograms/metered spray

Nicotine Oral Spray (proprietary product: Nicorette Quickmist), nicotine 1 mg/metered spray

Nicotine Sublingual Tablets (proprietary product: NicAssist Microtab, Nicorette Microtab), nicotine (as a cyclodextrin complex) 2 mg

Nicotine Transdermal Patches releasing in each 16 hours, nicotine approx. 5 mg, 10 mg, or 15 mg (proprietary products: Boots NicAssist Patch, Nicorette Patch) or releasing in each 16 hours approx. 10 mg, 15 mg, or 25 mg (proprietary products: NicAssist Translucent Patch, Nicorette Invisi Patch), or releasing in each 24 hours nicotine approx. 7 mg, 14 mg, or 21 mg (proprietary products: Nicopatch, Nicotinell TTS, NiQuitin, NiQuitin Clear)

Permethrin Cream (proprietary product: Lyclear Dermal Cream), permethrin 5%

Senna Oral Solution (proprietary product: Senokot Syrup), sennosides 7.5 mg/5 mL

Senna and Ispaghula Granules (proprietary product: Manuclax Granules), senna fruit 12.4%, ispaghula 54.2%

Sodium Citrate Compound Enema (proprietary products: Nicolette Micro-enema; Microlax Micro-enema; Relaxit Micro-enema), sodium citrate 450 mg with glycerol, sorbitol and an anionic surfactant

Sodium Picosulfate Capsules (proprietary products: Dulcolax Perles), sodium picosulfate 2.5 mg

Sodium Picosulfate Elixir (proprietary products: Dulcolax Liquid), sodium picosulfate 5 mg/5 mL

Sterculia Granules (proprietary product: Normacol Granules), sterculia 62%

Sterculia and Frangula Granules (proprietary product: Normacol Plus Granules), sterculia 62%, frangula (standardised) 8%

Zinc Oxide and Dimeticone Spray (proprietary product: Spiron), dimeticone 1.04%, zinc oxide 12.5% in a pressurised aerosol unit

Zinc Oxide Impregnated Medicated Bandage (proprietary product: Steripaste), sterile cotton bandage impregnated with paste containing zinc oxide 15%

Zinc Oxide Impregnated Medicated Stocking (proprietary product: Zipoc), sterile rayon stocking impregnated with ointment containing zinc oxide 20%

1 For exemption, see p. 452
2 For use with inhalation mouthpiece; to be prescribed as either a starter pack (6 cartridges with inhalator device and holder) or refill pack (42 cartridges with inhalator device)
3 To be prescribed as either a starter pack (2 x 15-tablet discs with dispenser) or refill pack (7 x 15-tablet discs)
4 Prescriber should specify the brand to be dispensed
Non-medical prescribing

A range of non-medical healthcare professionals can prescribe medicines for patients as either Independent or Supplementary Prescribers.

Independent prescribers are practitioners responsible and accountable for the assessment of patients with previously undiagnosed or diagnosed conditions and for decisions about the clinical management required, including prescribing. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name.

Supplementary prescribing is a partnership between an independent prescriber (a doctor or a dentist) and a supplementary prescriber to implement an agreed Clinical Management Plan for an individual patient with that patient’s agreement.

Independent and Supplementary Prescribers are identified by an annotation next to their name in the relevant professional register.

Information and guidance on non-medical prescribing is available on the Department of Health website at www.dh.gov.uk/health/2012/04/prescribing-change.

For information on the mixing of medicines by Independent and Supplementary Prescribers, see Mixing of medicines prior to administration in clinical practice—responding to legislative changes, National Prescribing Centre, May 2010 (available at www.npc.nhs.uk/improving_safety/mixing_meds/resources/mixing_of_medicines.pdf).

For information on the supply and administration of medicines to groups of patients using Patient Group Directions, see p. 3.

Nurses

Nurse Independent Prescribers (formerly known as Extended Formulary Nurse Prescribers) are able to prescribe any medicine for any medical condition.

Nurse Independent Prescribers are able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine, dipipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Nurse Independent Prescribers must work within their own level of professional competence and expertise.

For information on prescribing from the Nurse Prescribers’ Formulary for Community Practitioners, see Nurse Prescribers’ Formulary for Community Practitioners p. 1091.

Optometrists

Optometrist Independent Prescribers can prescribe any licensed medicine for ocular conditions affecting the eye and the tissues surrounding the eye, except Controlled Drugs or medicines for parenteral administration. Optometrist Independent Prescribers must work within their own level of professional competence and expertise.

Pharmacists

Pharmacist Independent Prescribers can prescribe any medicine for any medical condition.

They are also able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine,
Index of manufacturers

The following is an alphabetical list of manufacturers and other companies referenced in the BNF, with their medicines information or general contact details. For information on ‘special-order’ manufacturers and specialist importing companies see p. 1104.

Unlicensed medicines are available from ‘special-order’ manufacturers and specialist-importing companies; the MHRA maintains a register of these companies at http://tinyurl.com/cdslke

Licensed hospital manufacturing units also manufacture ‘special-order’ products as unlicensed medicines, the principal NHS units are listed below. A database (Pro-File; www.pro-file.nhs.uk) provides information on medicines manufactured in the NHS; access is restricted to NHS pharmacy staff. The Association of Pharmaceutical Specials Manufacturers may also be able to provide further information about commercial companies (www.apsm-uk.com).

The MHRA recommends that an unlicensed medicine should only be used when a patient has special requirements that cannot be met by use of a licensed medicine.

As well as being available direct from the hospital manufacturer(s) concerned, many NHS-manufactured Specials may be bought from the Oxford Pharmacy Store, owned and operated by Oxford Health NHS Foundation Trust.

Advisory—Amodocides

Amodocides are a class of medications used to treat various conditions such as acne, infections, and skin disorders. They work by killing bacteria or fungi that cause these infections. Here are some key points about amodocides:

1. **Acriderm**: This medication is used for the treatment of acne vulgaris, which is a common skin condition characterized by the buildup of oil and dead skin cells in the pores of the skin. Acriderm helps to reduce the inflammation and redness associated with acne.
2. **Amodex**: This is another product used for the treatment of acne vulgaris. It works by controlling the production of oil and dead skin cells in the pores, thus reducing the formation of acne lesions.
3. **Amodex 5%**: Similar to Amodex, this product is also used for the treatment of acne vulgaris, providing a concentrated form of the active ingredient for more targeted treatment.

Amodocides are generally safe to use, but like any medication, they can cause side effects. It is important to follow the instructions provided by your healthcare professional and to report any unusual symptoms. If you experience any severe or persistent side effects, contact your doctor immediately.

Remember, the information provided here is a general overview and should not be used as a substitute for professional medical advice. Always consult your healthcare provider for personalized advice.

REPORT OF SUSPECTED ADVERSE DRUG REACTIONS

If you suspect an adverse reaction may be related to one or more drugs/vaccines/complementary remedies, please complete this Yellow Card. See 'Adverse reactions to drugs' section in BNF or www.mhra.gov.uk/yellowcard for guidance. Do not be put off reporting because some details are not known.

**PATIENT DETAILS**

- **Patient Initials:**
- **Sex:** M / F
- **Is the patient pregnant?** Y / N
- **Ethnicity:**
- **Age (at time of reaction):**
- **Weight (kg):**
- **Identification number (e.g. Practice or Hospital Ref):**

**SUSPECTED DRUG(S)/VACCINE(S)**

- **Drug/Vaccine (Brand if known):**
- **Batch:**
- **Route:**
- **Dosage:**
- **Date started:**
- **Date stopped:**
- **Prescribed for:**

**SUSPECTED REACTION(S)**

Please describe the reaction(s) and any treatment given. (Please attach additional pages if necessary):

<table>
<thead>
<tr>
<th>Date reaction(s) started:</th>
<th>Date reaction(s) stopped:</th>
</tr>
</thead>
</table>

**Outcome**

- Recovered
- Recovering
- Continuing
- Other

If yes, please indicate why the reaction is considered to be serious (please tick all that apply):

- Patient died due to reaction
- Life threatening
- Congenital abnormality
- Involved or prolonged inpatient hospitalisation
- Involved persistent or significant disability or incapacity
- Medically significant; please give details:

If the reactions were not serious according to the categories above, how bad was the suspected reaction?

- Mild
- Unpleasant, but did not affect everyday activities
- Bad enough to affect everyday activities
Other drug(s) (including self-medication and complementary remedies)

Did the patient take any other medicines/vaccines/complementary remedies in the last 3 months prior to the reaction? Yes / No
If yes, please give the following information if known:

<table>
<thead>
<tr>
<th>Drug/Vaccine (Brand if known)</th>
<th>Batch</th>
<th>Route</th>
<th>Dosage</th>
<th>Date started</th>
<th>Date stopped</th>
<th>Prescribed for</th>

How to use the Cardiovascular Risk Prediction Charts for Primary Prevention

These charts are for estimating cardiovascular disease (CVD) risk (non-fatal myocardial infarction and stroke, coronary and stroke death and new angina pectoris) for individuals who have not already developed coronary heart disease (CHD) or other major atherosclerotic disease. They are an aid to making clinical decisions about how intensively to intervene on lifestyle and whether to use antihypertensive, lipid lowering and anti-platelet medication, but should not replace clinical judgment.

- The use of these charts is not appropriate for patients who have existing diseases which already put them at high risk such as:
  - coronary heart disease or other major atherosclerotic disease;
  - familial hypercholesterolaemia or other inherited dyslipidaemias;
  - renal dysfunction including diabetic nephropathy;
  - type 1 and 2 diabetes mellitus.
- The charts should not be used to decide whether to introduce antihypertensive medication when blood pressure is persistently at or above 160/100 mmHg or when target organ damage due to hypertension is present. In both cases antihypertensive medication is recommended regardless of CVD risk. Similarly the charts should not be used to decide whether to introduce lipid-lowering medication when the ratio of serum total to HDL cholesterol exceeds 6. Such medication is generally then indicated regardless of estimated CVD risk.
- To estimate an individual’s absolute 10-year risk of developing CVD choose the chart for his or her sex, lifetime smoking status and age. Within this square identify the level of risk according to the point where the coordinates for systolic blood pressure and the ratio of total cholesterol to high density lipoprotein (HDL) cholesterol meet. If no HDL cholesterol result is available, then assume this is 1.0 mmol/litre and the lipid scale can be used for total cholesterol alone.
- Higher risk individuals (red areas) are defined as those whose 10-year CVD risk exceeds 20%, which is approximately equivalent to the coronary heart disease risk of > 15% over the same period.
- The chart also assists in identifying individuals whose 10-year CVD risk is moderately increased in the range 10–20% (orange areas) and those in whom risk is lower than 10% over 10 years (green areas).
- Smoking status should reflect lifetime exposure to tobacco and not simply tobacco use at the time of assessment. For example, those who have given up smoking within 5 years should be regarded as current smokers for the purposes of the charts.
- The initial blood pressure and the first random (non-fasting) total cholesterol and HDL cholesterol can be used to estimate an individual’s risk. However, the decision on using drug therapy should generally be based on repeat risk factor measurements over a period of time.
- Men and women do not reach the level of risk predicted by the charts for the three age bands until they reach the ages 49, 59, and 69 years respectively. The charts will overestimate current risk most in the under 40s. Clinical judgement must be exercised in deciding on treatment in younger patients. However, it should be recognised that blood pressure and cholesterol tend to rise most and HDL cholesterol to decline most in younger people already with adverse levels. Left untreated, their risk at the age of 49 years is likely to be higher than the projected risk shown on the age-under-50-years chart. From age 70 years the CVD risk, especially for men, is usually ≥ 20% over 10 years and the charts will underestimate true total CVD risk.
- These charts (and all other currently available methods of CVD risk prediction) are based on groups of people with untreated levels of blood pressure, total cholesterol and HDL cholesterol. In patients already receiving antihypertensive therapy in whom the decision is to be made about whether to introduce lipid-lowering medication, or vice versa, the charts can only act as a guide. Unless recent pre-treatment risk factor values are available it is generally safest to assume that CVD risk is higher than that predicted by current levels of blood pressure or lipids on treatment.
- CVD risk is also higher than indicated in the charts for:
  - those with a family history of premature CVD (male first-degree relatives aged < 55 years and female first-degree relatives aged < 65 years) which increases the risk by a factor of approximately 1.5;
  - men with HDL cholesterol < 1 mmol/litre or women with HDL cholesterol < 1.2 mmol/litre;
  - those with raised triglyceride levels (> 1.7 mmol/litre);
  - those with BMI > 30 kg/m²;
  - women with premature menopause;
  - those who are not yet diabetic, but have impaired fasting glycaemia (6.1–6.9 mmol/litre) or impaired glucose tolerance (2 hour glucose ≥ 7.8 mmol/litre but < 11.1 mmol/litre in an oral glucose tolerance test).
- The charts have not been validated in ethnic minorities and in some may underestimate CVD risk. For example, in people originating from the Indian subcontinent it is safest to assume that the CVD risk is higher than predicted from the charts (1.4 times).

(Continued over)
An individual can be shown on the chart the direction in which his or her risk of CVD can be reduced by changing smoking status, blood pressure, or cholesterol, but it should be borne in mind that the estimate of risk is for a group of people with similar risk factors and that within that group there will be considerable variation in risk. It should also be pointed out in younger people that the estimated risk will generally not be reached before the age of 50, if their current blood pressure and lipid levels remain unchanged. The charts are primarily to assist in directing intervention to those who typically stand to benefit most.

The estimation of CVD risk in NICE clinical guideline 67 (May 2008): Lipid modification–Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease (available at www.nice.org.uk) differs from that shown here as follows:

- Estimated CVD risk increases by a factor of 1.5 in those with a family history of premature CHD (male first-degree relatives aged < 55 years and female first-degree relatives aged < 65 years).
- Estimated CVD risk increases by a factor of 1.5–2 if more than one first-degree relative has a history of premature CHD.
- Estimated CVD risk for South Asian men is increased by a factor of 1.4.
- CVD risk is higher than estimated in those with BMI > 40 kg/m².

The NICE guideline does not include the recommendation to treat all patients with a serum total to HDL cholesterol ratio of greater than 6 with lipid-lowering drugs.

The NICE guideline advises that the following factor is also taken into account when calculating CVD risk:

- Presence of left ventricular hypertrophy.

In addition, NICE advises that all patients over the age of 75 years should be considered at increased risk of CVD, and are likely to benefit from treatment.

In February 2010, NICE withdrew the recommendation that the Framingham risk equation should be the equation of choice for assessment of CVD risk, but agreed that it should be considered as one of the possible equations to use.
ADULT ADVANCED LIFE SUPPORT ALGORITHM

Unresponsive?
Not breathing or only occasional gasps

Call Resuscitation Team

CPR 30:2
Attach defibrillator/monitor
Minimise interruptions

Assess rhythm

Shockable (VF/pulseless VT)

1 Shock
Immediately resume
CPR for 2 min
Minimise interruptions

Non-shockable (PEA/Asystole)

Return of spontaneous circulation

Immediate post cardiac arrest treatment
- Use ABCDE approach
- Controlled oxygenation and ventilation
- 12-lead ECG
- Treat precipitating cause
- Temperature control / therapeutic hypothermia

Immediately resume
CPR for 2 min
Minimise interruptions

During CPR
- Ensure high-quality CPR: rate, depth, recoil
- Plan actions before interrupting CPR
- Give oxygen
- Consider advanced airway and capnography
- Continuous chest compressions when advanced airway in place
- Vascular access (intravenous, intraosseous)
- Give adrenaline every 3-5 min
- Correct reversible causes

Reversible causes
- Hypoxia
- Hypovolaemia
- Hypo-/hyperkalaemia / metabolic
- Hypothermia
- Thrombosis - coronary or pulmonary
- Tamponade - cardiac
- Toxins
- Tension pneumothorax

Resuscitation Council (UK)

Reproduced with the kind permission of the Resuscitation Council (UK) from Resuscitation Guidelines, October 2010
Medical emergencies in the community

Drug treatment outlined below is intended for use by appropriately qualified healthcare professionals. Only drugs that are used for immediate relief are shown; advice on supporting care is not given. Where the patient’s condition requires investigation and further treatment, the patient should be transferred to hospital promptly.

Anaphylaxis (section 3.4.3)

Adrenaline injection (1 mg/mL (1 in 1000))
- By intramuscular injection
  CHILD UNDER 6 YEARS 150 micrograms (0.15 mL), repeated every 5 minutes if necessary
  CHILD 6–12 YEARS 300 micrograms (0.3 mL), repeated every 5 minutes if necessary
  CHILD 12–18 YEARS 500 micrograms (0.5 mL), repeated every 5 minutes if necessary; 300 micrograms (0.3 mL) if CHILD is small or prepubertal
  ADULT 500 micrograms (0.5 mL), repeated every 5 minutes if necessary
- By intravenous injection
  CHILD UNDER 6 YEARS 150 micrograms (0.15 mL), repeated every 5 minutes if necessary
  CHILD 6–12 YEARS 300 micrograms (0.3 mL), repeated every 5 minutes if necessary
  CHILD 12–18 YEARS 500 micrograms (0.5 mL), repeated every 5 minutes if necessary; 300 micrograms (0.3 mL) if CHILD is small or prepubertal
  ADULT 500 micrograms (0.5 mL), repeated every 5 minutes if necessary

High-flow oxygen (section 3.6) and intravenous fluids should be given as soon as available.

Chlorphenamine injection by intramuscular or intravenous injection (section 3.4.1) may help counter histamine-mediated vasodilation and bronchoconstriction.

Hydrocortisone (preferably as sodium succinate) by intravenous injection (section 6.3.2) has delayed action but should be given to severely affected patients to prevent further deterioration.

Angina: unstable (section 2.10.1)

Aspirin dispersible tablets (75 mg, 300 mg)
- By mouth (dispersed in water or chewed)
  ADULT 300 mg

Plus

either Glycer cyclent trinitrate aerosol spray (400 micrograms/metered dose)
- Sublingually
  ADULT 1–2 sprays, repeated as required
or Glycer cyclent trinitrate tablets (300 micrograms, 500 micrograms, 600 micrograms)
- Sublingually
  ADULT 0.3–1 mg, repeated as required

Asthma: acute (section 3.1)

Regard each emergency consultation as being for severe acute asthma until shown otherwise; failure to respond adequately at any time requires immediate transfer to hospital.

Either salbutamol aerosol inhaler (100 micrograms/metered inhalation)
- By aerosol inhalation via large-volume spacer (and a close-fitting face mask if child under 3 years)
  ADULT and CHILD 2–10 puffs each inhaled separately, repeated every 10–20 minutes or as necessary
or salbutamol nebuliser solution (1 mg/mL, 2 mg/mL)
- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)
  CHILD UNDER 5 YEARS 2.5 mg every 20–30 minutes or as necessary
  CHILD 5–12 YEARS 2.5–5 mg every 20–30 minutes or as necessary
  ADULT 5 mg every 20–30 minutes or as necessary

or terbutaline nebuliser solution (2.5 mg/mL)
- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)
  CHILD UNDER 5 YEARS 5 mg every 20–30 minutes or as necessary
  CHILD 5–12 YEARS 5–10 mg every 20–30 minutes or as necessary
  ADULT 10 mg every 20–30 minutes or as necessary

Plus (in all cases)

either prednisolone tablets (or prednisolone soluble tablets) (5 mg)
- By mouth
  CHILD UNDER 12 YEARS 1–2 mg/kg (max. 40 mg) once daily for up to 3 days or longer if necessary; if child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (max. 60 mg) once daily
  ADULT 40–50 mg once daily for at least 5 days

or hydrocortisone (preferably as sodium succinate)
- By intravenous injection
  CHILD UNDER 12 YEARS 4 mg/kg (max. 100 mg) every 6 hours until conversion to oral prednisolone is possible; alternative dose if weight unavailable.
  CHILD UNDER 2 YEARS 25 mg, 2–5 YEARS 50 mg, 5–12 YEARS 100 mg
  ADULT 100 mg every 6 hours until conversion to oral prednisolone is possible

High-flow oxygen (section 3.6) if available (via face mask in children)

Monitor response 15 to 30 minutes after nebulisation; if any signs of acute asthma persist, arrange hospital admission. While awaiting ambulance, repeat nebulised beta, agonist (as above) and give with ipratropium nebuliser solution (250 micrograms/mL)
- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)
  CHILD UNDER 12 YEARS 250 micrograms, repeated every 20–30 minutes for the first 2 hours, then every 4–6 hours as necessary
  ADULT 500 micrograms every 4–6 hours as necessary
**Convulsive (including febrile) seizures lasting longer than 5 minutes**  
(section 4.8.2 and section 4.8.3)

*Either* diazepam rectal solution (2 mg/mL, 4 mg/mL)  
*By rectum*  
**NEONATE** 1.25–2.5 mg, repeated once after 10–15 minutes if necessary  
**CHILD 1 MONTH–3 YEARS** 5 mg, repeated once after 10–15 minutes if necessary  
**CHILD 3–12 YEARS** 5–10 mg, repeated once after 10–15 minutes if necessary  
**ADULT** and **CHILD OVER 12 YEARS** 10–20 mg  
*or* midazolam oromucosal solution  
*By buccal administration, repeated once after 10 minutes if necessary*  
**NEONATE** 300 micrograms/kg  
**CHILD 1–3 MONTHS** 300 micrograms/kg (max. 2.5 mg)  
**CHILD 3 MONTHS–1 YEAR** 2.5 mg  
**CHILD 1–5 YEARS** 5 mg  
**CHILD 5–10 YEARS** 7.5 mg  
**ADULT** and **CHILD OVER 10 YEARS** 10 mg

**Croup**  
(section 3.1)

Dexamethasone oral solution (2 mg/5 mL)  
*By mouth*  
**CHILD 1 MONTH–2 YEARS** 150 micrograms/kg as a single dose

**Diabetic hypoglycaemia**  
(section 6.1.4)

Glucose or sucrose  
*By mouth*  
**ADULT** and **CHILD OVER 2 YEARS** approx. 10–20 g (55–110 mL Lucozade® Energy Original or 100–200 mL Coca-Cola®—both non-diet versions or 2–4 teaspoonsfuls of sugar or 3–6 sugar lumps) repeated after 10–15 minutes if necessary  
*or if hypoglycaemia unresponsive or if oral route cannot be used*

Glucagon injection (1 mg/mL)  
*By subcutaneous or intramuscular injection*  
**CHILD BODY-WEIGHT UNDER 25 KG** 500 micrograms (0.5 mL)  
**CHILD BODY-WEIGHT OVER 25 KG** 1 mg (1 mL)  
**ADULT** 1 mg (1 mL)  
*or if hypoglycaemia prolonged or unresponsive to glucagon after 10 minutes*

Glucose intravenous infusion (10%)  
*By intravenous injection into large vein*  
**CHILD 1 MONTH–18 YEARS** 5 mL/kg (glucose 500 mg/kg)

**Glucose intravenous infusion (20%)**  
*By intravenous injection into large vein*  
**ADULT** 50 mL

**Meningococcal disease**  
(Table 1, section 5.1)

Benzylenicillin sodium injection (600 mg, 1.2 g)  
*By intravenous injection (or by intramuscular injection if venous access not available)*  
**NEONATE** 300 mg  
**CHILD 1 MONTH–1 YEAR** 300 mg  
**CHILD 1–10 YEARS** 600 mg  
**CHILD 10–18 YEARS** 1.2 g  
**ADULT** 1.2 g  
*Note* A single dose should be given before urgent transfer to hospital, so long as this does not delay the transfer  
*or if history of allergy to penicillin*

Cefotaxime injection (1 g)  
*By intravenous injection (or by intramuscular injection if venous access not available)*  
**NEONATE** 50 mg/kg  
**CHILD 1 MONTH–12 YEARS** 50 mg/kg (max. 1 g)  
**CHILD 12–18 YEARS** 1 g  
**ADULT** 1 g  
*Note* A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer  
*or if history of immediate hypersensitivity reaction (including anaphylaxis, angioedema, urticaria, or rash immediately after administration) to penicillin or to cephalosporins*

Chloramphenicol injection (1 g)  
*By intravenous injection*  
**CHILD 1 MONTH–18 YEARS** 12.5–25 mg/kg  
**ADULT** 12.5–25 mg/kg  
*Note* A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer

**Myocardial infarction: ST-segment elevation**  
(section 2.10.1)

Aspirin dispersible tablets (75 mg, 300 mg)  
*By mouth (dispersed in water or chewed)*  
**ADULT** 300 mg

Glyceryl trinitrate aerosol spray (400 micrograms/ metered dose)  
*Sublingually*  
**ADULT** 1–2 sprays, repeated as required  
*or Glyceryl trinitrate tablets* (300 micrograms, 500 micrograms, 600 micrograms)  
*Sublingually*  
**ADULT** 0.3–1 mg, repeated as required

Metoclopramide injection (5 mg/mL)  
*By intravenous injection*  
**ADULT (UNDER 60 KG) 18–19 YEARS** 5 mg  
**ADULT (OVER 60 KG) 18–19 YEARS** 10 mg  
**ADULT OVER 19 YEARS** 10 mg
Diamorphine injection (5 mg powder for reconstitution)

- By slow intravenous injection (1–2 mg/minute)
  - **ADULT** 5 mg followed by a further 2.5–5 mg if necessary; **ELDERLY** or **FRAIL** patients, reduce dose by half

*or* Morphine sulphate injection (10 mg/mL)

- By slow intravenous injection (1–2 mg/minute)
  - **ADULT** 5–10 mg followed by a further 5–10 mg if necessary; **ELDERLY** or **FRAIL** patients, reduce dose by half

Oxygen, if appropriate

---

**Myocardial infarction: non-ST-segment elevation**

Treat as for **Angina: unstable**, above
**Approximate conversions and units**

| 1 kilopascal (kPa) | = 7.5 mmHg (pressure) |

**Prescribing for children**

**Weight, height, and gender**

The table below shows the **mean values** for weight, height, and gender by age; these values have been derived from the UK-WHO growth charts 2009 and UK1990 standard centile charts, by extrapolating the 50th centile, and may be used to calculate doses in the absence of measurements. However, an individual’s weight and height might vary considerably from the values in the table and it is important to ensure that the value chosen is appropriate. In most cases the actual measurement should be obtained as soon as possible and the dose re-calculated.

**Plasma-drug concentrations** in the BNF are expressed in mass units per litre (e.g. mg/litre). The approximate equivalent in terms of amount of substance units (e.g. micromol/litre) is given in brackets.
Recommended wording of cautionary and advisory labels

For details see Appendix 3

1. Warning: This medicine may make you sleepy
2. Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol
3. Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines
4. Warning: Do not drink alcohol
5. Do not take indigestion remedies 2 hours before or after you take this medicine
6. Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
7. Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
8. Warning: Do not stop taking this medicine unless your doctor tells you to stop
9. Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop
10. Warning: Read the additional information given with this medicine
11. Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds
12. Do not take anything containing aspirin while taking this medicine
13. Dissolve or mix with water before taking
14. This medicine may colour your urine. This is harmless
15. Caution: Flammable. Keep your body away from fire or flames after you have put on the medicine
16. Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening
17. Do not take more than... in 24 hours
18. Do not take more than... in 24 hours. Also, do not take more than... in any one week
19. Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol
21. Take with or just after food, or a meal
22. Take 30 to 60 minutes before food
23. Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food
24. Suck or chew this medicine
25. Swallow this medicine whole. Do not chew or crush
26. Dissolve this medicine under your tongue
27. Take with a full glass of water
28. Spread thinly on the affected skin only
29. Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
30. Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine. Talk to a doctor at once if you take too much of this medicine, even if you feel well
32. Contains aspirin. Do not take anything else containing aspirin while taking this medicine
Abbreviations and symbols

Internationally recognised units and symbols are used in the BNF where possible.

Latin abbreviations

Directions should be in English without abbreviation. However, Latin abbreviations have been used when prescribing.

The following is a list of appropriate abbreviations. It should be noted that the English version is not always an exact translation.

- a. c. = ante cibum (before food)
- b. d. = bis die (twice daily)
- o. d. = omni die (every day)
- o. m. = omni mane (every morning)
- o. n. = omni nocte (every night)
- p. c. = post cibum (after food)
- p. r. n. = pro re nata (when required)
- q. d. s. = quater die sumendum (to be taken four times daily)
- q. q. h. = quarta quaque hora (every four hours)
- stat = immediately
- t. d. s. = ter die sumendum (to be taken three times daily)
- t.i.d. = ter in die (three times daily)

E numbers

The following is a list of common E numbers and the inactive ingredients to which they correspond.
